Table of Contents

16 June 2010

Human Capital and Knowledge Management

S1-1 Strategic Alliances Performance Enhancing by Knowledge Innovation
Tsai-Mei Lin , Hsiao-Chen Chang , Kai-Ling Chen and Ching-Wen Lin

S1-17 Interactions Between Burnout Syndrome, Learning Styles and Features of Personality Among Polish Managers
Katarzyna Iwanicka

S1-24 Tariff Groups as A Basis of Financing of Higher Education Institutions/Programs
Dušan Lesjak and Duša Marjetič

S1-39 The Effectiveness of E-Mail Reference Services of Malaysian Academic Libraries in Facilitating E-Learning
Wan Ab. Kadir Wan Dollah, Khalid Abdul Wahid and Zulkharnain Yusoff

S1-55 Human Capital Scenario Analysis for Performance Analysis and Management
Marko Kesti, Antti Syväjärvi and Jari Stenvall

S1-70 Managing Intellectual Capital and R&D Knowledge in The Successful Research Units in Thailand
Haruthai Numprasertchai and Somchai Numprasertchai

Quality and Performance Management

S2-1 Modeling The Evaluation of Business External Competitive Capabilities
Chinho Lin, Hua-Ling Tsai, Tsung-Hsien Kuo, Li-An Ho and Teresa L. Ju

S2-7 Water Footprint an Indicator to Manage Water Resource. A Case of Italian Olive Oil
Vera Amicarelli, Giovanni Lagioia, Vesselina Dimitrova and Teodoro Gallucci

S2-17 The Roles of Quality, Marketing and Knowledge System in Business Competitiveness
Kwan Pay Yee and Uchenna C. Eze

S2-38 The Effects of The HRM Departmant's Role on Organization Competitive
Han-Jen Niu and Yau-De Wang

S2-47 A Fuzzy Quality Function Deployment Constructing Model for Product Planning
Wen-Chang Ko and Liang-Hsuan Chen

S2-64 Firm Size, Core Competences, Firms Internationalization and Performance: An Empirical Study
Tsui-Yii Shih and Li-Chi Yang

S2-79 A Study of Inter-Organization Information Systems Performance Evaluation: Balance Scorecard Approach
Yi-Hui Liang, Chi-Ming Hung and Dan Jiang

S2-89 Does Gender Explain Financial Performance? Case of Warsaw Stock Exchange Listed Companies
Mariusz Kicia

Table of Contents

(Continued)

S2-101 Assessing Cost of Qualiy in A Plastics Injection Molding Company: A Case Study
Promporn Poowadin, Pensuda Phanritdum and Rapee Kanchana

S2-109 A Study of The Multiple-Source Feedback for General Competence and Core Competence Performance Evaluation of Taipei 101
Yu Chin-Cheh, Liao Pei-Wen, Chao Chia-Chi and Chang Chin-Shin

S2-117 The Study of The Employee Use E-Learning Behavior of Influencing Factors on Multi-Level Analysis: The Basis of Utaut Model
Yu Chin-Cheh, Liao Pei-Wen, Chao and Fur-Hsing Wen

S2-128 Profile of Consumer Decision-Making Styles as The Predecessor of References for Retail Format Choice
Radosław Mącik and Dorota Mącik

Innovation Management

S3-1 Research and Development and Manufacturing Trade
Štefan Bojnec and Imre Fertő

S3-18 The Use of Governance Mechanisms in The Context of Open Innovation: A Study of Convenience Store Industry in Taiwan
Kuo-Nan Hsieh

S3-32 Customers' Responses and The Formation of A Dominant Design: The Early Mp3 Innovation Evolution
Yi-Nung Peng

S3-49 The Innovation in Modelling The Import Demand
Sue Ling Lai and Juang-Horng Chueh

S3-57 Acceptability of Wind Power
Tomi Mäkipelto

S3-70 Comparison of Commercial ERP and Open Source ERP in Production Planning and Control Module
Pailn Udomsanti and Pornthep Anussornntisarn

Strategic Management

S4-1 E-Commerce - Customer and Digital Native Generation Protection and New Market Opportunity
Augusto Sebastio

S4-11 The Impacts of Cooperation and Competition on Subsidiary's Capabilities Building: An Empirical Study of Foreign Subsidiaries in Taiwan
Ya-Jung Wu

S4-20 Information Use and Organizational Culture of Malaysian Exporters
Maimun Simun, Uchenna Cyril Eze, Hishamuddin Ismail and Mazuki Jusoh

S4-36 Determining The Impact of Logistics Factors on The Business Success of The Electrical and Electronics Industry in Thailand Based on Different Sizes of The Firms
Navee Chiadamrong

S4-51 Role of Higher Educational Classification and Standardization Enhancing Global Competitiveness
Suphattra Ketsarapong and Kongkiti Phusavat

Table of Contents

(Continued)

Process Management

S5-1 Export Multipliers and The Defence Sector Supply in Return Export Management
Štefan Bojnec

S5-14 Challenges of Collaborative Product Development in High-Tech Company Environment
Anyanitha Distanont, Harri Haapasalo, Pekka Kess and Hanna Kropsu-Vehkapera

S5-28 A Double Screening Procedure for Melamine Inspection
Hsien-Tang Tsai and Shih-hsiung Lo

S5-38 An Investigation on Importance of Integrating Assembly Details with Machining Operations in Cell Formation Problem
Mir Bahadorgholi Aryanezhad, Jamal Aliabadi and Reza Tavakkoli-Moghaddam

S5-49 An Implementation on Improving Efficiency and Anonymous Key Pair for The Vehicular Ad Hoc Network
Chei Chung Lu and Henry Ker-Chang Chang

Investment and Financial Management

S6-1 Market Reaction to The Rating Reports with Mixed or Consistent Follow-Ups: A Price and Trading Behavior Analysis
Chuang-Min Chao and Fu-Cheng Fang

S6-11 Does Information Value of The Analysts' Stock Recommendations Still Exist?
Yi-Hsien Wang, Fu-Ju Yang, Huang-Husn Shih and Tung-Cheng Hu

S6-18 Stock Market Returns, Systematic Risks, and Corporate Characteristics in The Taiwan Stock Exchange Market Around The Bearish-Bullish Turning Points
Chuang-Min Chao, Shu-Ling Lin and Jung- Chung Tsao

S6-28 Investor Sentiments as The Conditioning Information in Asset Pricing Model During The Bullish and Bearish Periods in Taiwan Stock Exchange
Chuang-Min Chao, Shu-Ling Lin and Luo-Chiun Tian

S6-38 An Analysis of Demand for Life Insurance – Profitability Regions. An Empirical Study
Adam Sliwinski

ICT Applications

S7-1 Service-Oriented Electronic Township Governance: Case Study on Street Light Maintenance System in Taiwan
Hui-Fun Yu, Kuo-Yan Wang and Jung-Hui Liang

S7-7 Luxury in Information and Communication Technology Products
Weichen Teng and Tientien Liao

S7-24 Developing The Research Model of Internet Banking Customers' Loyalty
Szu-Yuan Sun, Chang-Yao Wu, Hao-Fan Chumg and Wei-Tang Kuo

S7-40 A Strategic Analysis of The Companies Operating in The ICT Sales and Distribution Channel: The European Case
R. Balocco, A. Ciappini, R. Pilenga and R. Pandolfi

Table of Contents

(Continued)

S7-61 Development of A Theoretical Framework and Management Information System for Prison Management
Sastry KS Musti

S7-63 Imrpovement of The Customer Focus – Theoretical Model of The Customer Perceived Value
Harri Karkkila and Pekka Kess

Value-Based and Contemporary Management

S8-1 Brand Personality and Psychographic Approach for Party Identification, Voting Behavior, and Voting Intention
Kevin Kuan-Shun Chiu, Maxwell K. Hsu, Shih-Chih Chen and Hsin-Chieh Lin

S8-3 A General Approach to Uncertain Multiple Attribute Decision Making
Quan Zhang, Xin Li and BinShan Lin

S8-11 Environmental Management of An Industrial Sector: The Case of Italian Drinking Water Supply
Giovanni Lagioia, Grazia Calabrò and Vera Amicarelli

S8-20 Developing an Economic Cost Model for A Supply Chain
Pitchasinee Wajcharapornjinda and Navee Chiadamrong

S8-47 Environmental Management for Cultural Events: Case Study from Apulia Region, Italy
Giovanni Lagioia, Teodoro Gallucci and Vesselina Dimitrova

S8-57 Ontology-Based Reasoning for Context-Awareness Environment
Sung-Shun Weng, Shang-Chia Liu, Tsung-Hsien Wu and Shuenn-Ren Cheng

S8-75 Loyalty- Based Customer Relationship Management
Chin Li Tseng

S8-87 The Effects of Mobile Ads, Ads Values And Privacy Protection on Consumer Adoption Intention
Tsui-Yii Shih and Li-Chi Yang

S8-102 Green Clothing and Eco-Fashion: A Growing Sustainable Market for SME's.
Naila Aaijaz and Mohamed Dahlan bin Ibrahim

S8-124 Regional Diffusion for Tied Products in Green Conscious Consumers
Yenming J. CHEN

S8-132 Opportunities In The Markets From Technology And Logistics Points Of View
Hilla Savola and Josu Takala

S8-149 An Investigation of The Environmental Beliefs and Attitudes of Managers in Poland and Ukraine
Agnieszka Leszczynska

Table of Contents

ABSTRACT

This paper investigates the relationships among merge & acquisition and strategic alliances, and organizational performance constructs. This paper compares the influences of merge & acquisition and strategic alliances from 1993 to 2008 on both price and trading volumes of underlying stock around the announcement date on Taiwanese stock market. The empirical results demonstrate that the merge & acquisition announcement has statistically strong positive SCAR and SCAV in whole listed companies and non-electronics industries.

The result finds M&A can help save costs and achieve economies of scale among the same industry, and the acquiring firm requires fewer resources to integrate the difference with organization, creasing a corporate M&A effect and increasing investor investment willingness. Strategic alliances are characterized by elasticity, lower risk and smaller capital requirements, particularly in the case of high-technology companies which frequently use strategic alliances to enter new markets, invest in new talent and improve their manufacturing ability.

Keywords: Merge & Acquisition; Strategic Alliance; Trading Volumes; Stock Price; Knowledge Innovation

INTRODUCTION

In knowledge innovation-based environments, those businesses that can master knowledge and technology will be able to gain a competitive edge. An organization must respond quickly to all changes in its external environment, be able to handle large amounts of complex information, use new technology, and have proactive thinking and innovation for the most effective management of knowledge (Yeh, Lai, and Ho, 2006; Lin and Tseng, 2005; Wadhwa et al., 2005; Wei, Choy, and Yeow, 2006; Gottschalk, 2006). To enhance competitiveness, enterprises strive to create innovative knowledge approaches (Huang and Lin, 2006; Darroch, 2002; Porter and Scott, 2001; Wong, 2005) in order to enhance

performance (Beheshti, 2004). Therefore, knowledge management capabilities and knowledge innovation have become important topics for improving business performances (Yang and Yu, 2002; Wadhwa, Bhoon, and Chan, 2006; Lin and Kou, 2007; Ho, 2008; Omerzel and Antonc˘ic, 2008).

Individual companies cannot provide all the knowledge resources necessary to operate. Companies are forced to choose a cooperative co-existence business model to replace the traditional mutual competitiveness. Therefore, enterprises must have a sound business strategy to cope with foreign competition and challenges, and the ability to recognize and adopt new opportunities in order to continue in a leading position (Lin, Wang, and Chen, 2009). In order to adapt to changes in the environment, high-tech industries have, through horizontal and vertical integration, gained cross-sector combinations, or other forms of strategic alliances; such expanded scale of production maintains business competitiveness. As enterprises grow, they tend to generate economies of scale through external growth methods, such as merger & acquisition or strategic alliance (Porter, 1985). Lewis (1990) proposed that, when faced with resources, risks, and control demands, merger & acquisition and strategic alliance are important rapid growth strategies to achieve maximized shareholder equity.

Innovation in information technology promotes the development of a knowledge economy, making knowledge a major factor in the manufacturing processes of an enterprise. High-tech industries are knowledge-intensive industries, with competitiveness growing from the accumulation, creation, and application of knowledge. To avoid a rigidity of core technological capabilities of an enterprise, moderation of external resources that activate knowledge basics and the ability to pursue innovation are necessary conditions for continuity in high-tech enterprises. In addition, R&D investments cost large amounts of capital, and the life cycle of high-tech products tends to be relatively short; therefore, high-tech products generated from internal R&D often result in an inability to take advantage of the expected benefits due to a high attrition rate. Hence, through merge & acquisition, enterprises often directly access R&D resources, technologies, knowledge, and achievements of a target companies to strengthen and build innovation capabilities and core competencies, as well as establishing durable competitive advantages (Anand and Khanna, 2000; Helfat and Peteraf, 2003).

Merge & acquisition is an important strategic operation acquired through the external growth of an enterprise (Glueck, 1979; PwC/ EIU, 2005, 2007). It enables the enterprise to expand business and technological scopes, change original paths of learning (path breaking), overcome rigid core crisis, integrate internal resources and external learning opportunities, and it is the best way to create dynamic capabilities for an enterprise (Eisenhardt and Martin, 2000; Karim and Mitchell, 2000; Luo, 2002; Seth, Song, and Pettit, 2002). In addition to comprehensive benefits through complementary combinations of merge & acquisition (Hoskisson and Hitt, 1990; Krishnan, Joshi, and Krishnan, 2004; Chung, Singh, and Lee, 2000), the processes of merger & acquisition will enable the enterprise to integrate learning resources, reconfigure resources, and regroup internal and external resources (Teece, Pisano, and Shuen, 1997). It contributes to increased constructs of competitiveness for the enterprise and improves business operational efficiency (Capron, 1999; Hoskisson, Hitt, Hoskisson, and Ireland, 2001).

After merge & acquisition, an enterprise can construct and promote a combined learning and knowledge database from the two parties (Helfat and Peteraf, 2003; King et al, 2004). Through resource transfers, the acquirer and the target company combine resources, which enable both parties to increase external technical support on the basis of the existing capabilities (Szulanski, 2000; Seth et al, 2002; Chung et al, 2000). At the same time, some enterprises conduct cross-organizational cooperation through strategic alliance to obtain external resources and knowledge. Strategic alliance is a key strategic choice of an official and long-term alliance, which links activities of the companies strategies (Porter and Fuller, 1986) to ensure, maintain, or enhance competitive advantages (Harrigan, 1988). For mutual needs, risk pooling, and cooperation of common goals (Lewis, 1990), it is a commitment maintained through mutually beneficial processes and interdependence (James, 2001). Through strategic alliance, enterprises exchange knowledge with partners, and then, integrate it into its own organization, which is also an effective way to strengthen the competitive advantage of an enterprise. Hence, numerous high-tech companies take advantage of mergers & acquisitions and strategic alliances to obtain external R&D capabilities and achievements for external growth (Bertrand and Zuniga, 2006; Puranam, Singh, and Zollo, 2006; Smith, 1991).

Although merge & acquisition and strategic alliance can integrate R&D strengths and achievements of enterprises in order to obtain external resources and external growth strategies, they may have positive or negative impact on business performance. No consensus has been reached in the verification of past literature (Cassiman et al., 2005). Although, merge & acquisition and strategic alliance may create positive economic impact on the enterprises, it may also create negative rivalry, transfer of benefits, or have indirect and adverse affects on investors or creditors. Some scholars advocate that merge & acquisition integrates the R&D strengths of the acquirer and the target company, which enhances R&D innovation investments and achievements after integration (Ahuja and Katila, 2001; Bertrand and Zuniga, 2006; Prabhu, Chandy, and Ellis, 2005). However, other scholars argue that, to improve market force after a merger & acquisition, redundant resources will be abolished for reduced investment by the enterprise in R&D innovative activities (Ernst and Vitt, 2000; Hitt et al., 1996), and thus, merge & acquisition does not create value for an enterprises, and may even result in damage to the corporate value (DeLong, 2001; Houston, James and Ryngaert, 2001).

In the past, enterprises used merger & acquisition to achieve business growth, however, current investment-laws and regulations governing merge & acquisition are relatively more complex compared with strategic alliance. The reactions of employees and management issues in cases of strategic alliance are less severe than merger & acquisition. However, as the involvement of strategic alliance is not as high as merge & acquisition, in addition to low frequency of interactions, it may lead to difficulties in internalization of external knowledge (Karim and Mitchell, 2000; Makadok, 2001).

Discussions in literature and empirical studies on knowledge innovation have failed to define the impact relationships of merge & acquisition and strategic alliances on business performances. Therefore, this study plans to discuss and compare Taiwan's high-tech industry as subjects, as well as the impacts of merge & acquisition and strategic alliance on business performance, on the basis of knowledge innovation.

Whether merger & acquisition and strategic alliance can create values for shareholders has been a topic of considerable concern in global capital markets. Many past scholars have pointed that, both merge & acquisition and strategic alliance can create unique and hard-to-imitate comprehensive effects, which generate relatively long standing competitive advantages, as well as positive abnormal returns for the enterprises (Harrison et al, 2001; Luo, 2002; Jensen and Ruback, 1983; Jarrell and Poulsen, 1989; Schwert, 1996; Cotter, Shivdasani, and Zenner, 1997; Akhigbe, Borde, and Whyte, 2000; Billett, King, and Mauer, 2004; Fee and Thomas, 2004; Spyros and Georgia, 2007; Travlos, 1987). In addition, stock prices and share trading performances of an enterprise are subject to investors' expectations of business performance after merge & acquisition or strategic alliance. Therefore, analysis of the stock price and share trading volume will allow better understanding of the real benefits of the two strategies of business operations. Therefore, this paper infers that, both merge & acquisition and strategic alliance can generate abnormal returns, as well as considerable enhancements to stock trading volume and stock prices.

This paper is organized as follows. Section 2 presents a study model of financial returns. Section 3 describes the empirical results and analysis. Finally, Section 4 discusses the results and presents conclusions.

SAMPLE SELECTION AND RESEARCH DESIGN

The purpose of this study is to discuss the differences on impact statements of merger & acquisition and strategic alliance on stock prices and stock trading volumes between 1993 to March 2008. The data are taken from company trading information and major information published in the "Market Observation Post System" of the Taiwan Stock Exchange, and data matrix subject to the declaration date of merger & acquisition or strategic alliance.

Regarding the data of listed company merger & acquisition samples, there are a total of 110 initial screening samples. 22 samples are deleted due to insufficient estimation periods or event periods. There are to-be-listed, listed companies, and companies disappeared after merger & acquisition; 17 such samples are removed, as the data are not applicable, with 81 merger & acquisition sample companies remaining; upon removal of non-electronic companies, 53 electronic companies remain as samples of this study.

Regarding strategic alliance data, there are 100 initial screening samples, with 24 samples deleted due to insufficient estimation periods or event periods, and 16 samples are removed due to improper data, leaving 60 companies of strategic alliance remaining; upon removal of non-electronic samples, 54 non-electronic companies of strategic alliance are chosen as samples of this study.

This study executes tests to determine whether there is any related information effects on the M&A and strategic alliance occurring near the announcement date, a described event study is performed. The event date is defined as the announcement date of M&A and strategic alliance, and the announcement date of information disclosure, namely Day 0, with the estimation period from Days -105 to -16. The event window of interest begins from Day -15 and ends on Day +15, and the total observational period covers 121 trading days.

This study executes the tests whether there is related information effect on the M&A and strategic alliance around the announcement date, an event study described is performed. The event date is defined as the announcement date of M&A and strategic alliance. The event date is defined as the announcement date of information disclosure, namely Day 0, and the estimation period is from Days -105 to -16. The event window of interest begins from Day -15 and ends on Day +15, and total observational period covers 121 trading days.

The research of system process and framework is as follows Figure 1 and Figure 2:

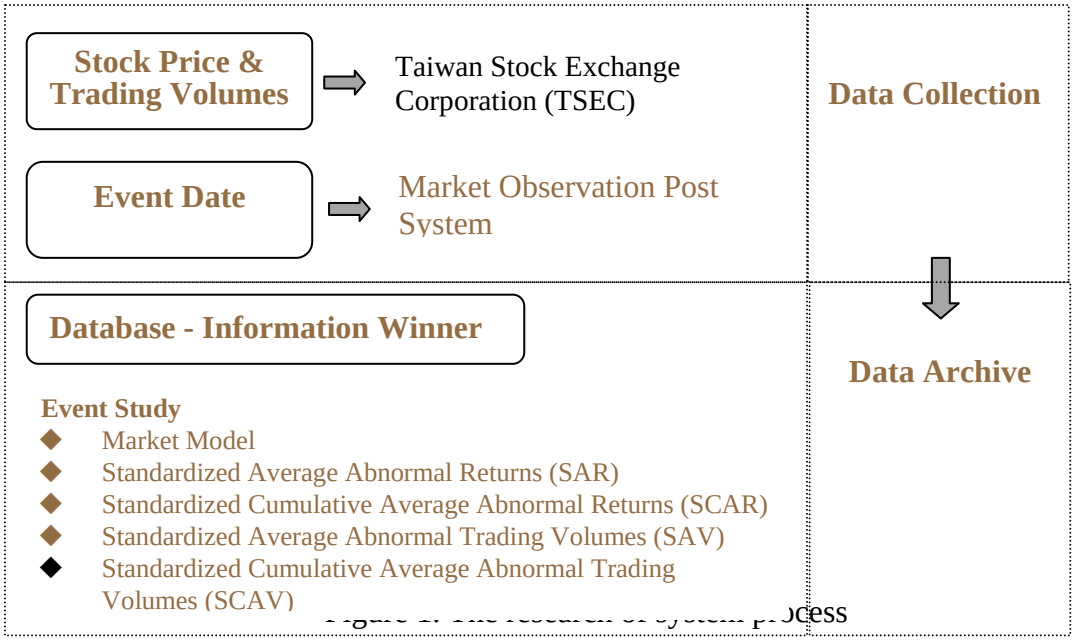

Figure 1. The research of system process

Figure 2. The research of framework

This investigation adopted event study (Brown & Zhang, 1997) **t**o explore stock price whether it will receive the influence of the specific event. The method had already been applied extensively in the finance and the accounting research domain, on the research approach of the real example so far, still plays a very important role.

Probing into the stock price will declare to enterprises M&A and strategic alliance change the response of information, the expected return was derived using the market model where the model parameters α and β were obtained from the estimation period, namely $R_{it} = \alpha_i + \beta_i R_{mt} + \varepsilon_{it}$,where R_{it} indicates the expected return on stock *i* on trading day *t* and R_{mt} denotes the return on the market portfolio on day *t*. α_i is the intercept, β_i is the systematic risk of individual stock and ε_{it} residuals is the component of returns which is abnormal or unexpected.

Abnormal returns on stock *i* on day *t* (AR_{it}) are calculated for a reference period surrounding the event date. These are obtained as the difference between the observed returns and those predicted by the market model

$$AR_{it} = R_{it} - \hat{\alpha}_i - \hat{\beta}_i R_{mt} \quad \ldots\ldots\ldots (1)$$

Next, we compute the average abnormal returns for day *t* as $\overline{AR_t} = \frac{1}{N}\sum_{i=1}^{N} AR_{it}$ where *t = -15, -14, …, 0, …, 14, 15.*

The cumulative average abnormal returns (CAR_t) through τ days ($\tau = \tau_2 - \tau_1$) for a portfolio of *N* stocks can be calculated as:

$$CAR_i(\tau) = \frac{1}{N}\sum_{t=\tau_1}^{\tau_2}\sum_{i=1}^{N} AR_{it} \quad \ldots\ldots\ldots (2)$$

The standardized cumulative average abnormal returns (SCAR) will start from special date τ_1 accumulate to the τ_2 day in event period, it may obtain the SCAR, the event period of the SCAR from the τ_1 to the τ_2 total *t* day, namely

$$SCAR\ (\tau) = \frac{1}{N}\sum_{t=\tau_1}^{\tau_2}\sum_{i=1}^{N}\frac{AR_{it}}{S_{it}} \quad \ldots\ldots\ldots (3)$$

where τ indicates event date from the τ_1 to τ_2 as a examination period.
The standardized residual cross-sectional method ignores estimation period estimates of variance, thus, this paper uses the standardized residual cross-sectional for its *t-test* (Boehmer et al., 1991). The resulting of *t-test* statistic for AR_{it} is

$$t_{SROCSM}^{AR} = \frac{\frac{1}{N}\sum_{i=1}^{N} SAR_{iE}}{\sqrt{\frac{1}{N(N-1)}\sum_{i=1}^{N}\left(SAR_{iE} - \sum_{i=1}^{N}\frac{SAR_{iE}}{N}\right)^2}} \quad \ldots\ldots\ldots (4)$$

The *t-test* statistic for the CAR_t for standardized residual cross-sectional is calculated as

$$t_{SROCSM}^{SCAR} = \frac{SCAR(\tau_1,\tau_2)}{\sqrt{\frac{1}{N(N-1)}\sum_{i=1}^{N}\left(SCAR_i(\tau_1,\tau_2) - \sum_{i=1}^{N}\frac{SCAR_i(\tau_1,\tau_2)}{N}\right)^2}} \quad \ldots\ldots\ldots (5)$$

where $SCAR_i(\tau_1,\tau_2) = \sum_{E=\tau_1}^{\tau_2} SAR_{iE}$

Certain empirical results have an association between abnormal returns and abnormal trading volumes, including Campbell et al. (1993), Chan & Wei (2001) and Chen & Wu (2001). Hence, stock trading volumes around announcement date was inspected. Trading turnover

rate is substituted for trading volumes (*Vol*it) in studies such as those of Michaely et al. (1995) and Chan & Wei (2001). Daily trading turnover rate for stock *i* on day *t* is defined as

$$Vol_{it} = \frac{Number\ of\ \ shares\ traded_{it}}{Number\ of\ \ shares\ outs\tan ding_{it}} \quad \ldots\ldots\ldots\ldots\ (6)$$

where *t = -106, -105, …, -16.*

Normal trading volumes *(NVol*i) for stock *i* are defined as the average trading turnover rate of the stock as estimated for the 90 days prior to the event window, namely,

$$NVol_i = \frac{1}{90}\sum_{t=-106}^{-16} Vol_{it} \quad \ldots\ldots\ldots\ldots\ldots\ (7)$$

By average trading turnover rate (AV_t) before the event window, AV_t can be compared across different stocks of various sizes. Therefore, the AV_t for a portfolio of *N* stocks on day *t* is calculated as

$$AV_t = \frac{1}{N}\sum_{i=1}^{N} \frac{Vol_{it}}{NVol_i} \quad \ldots\ldots\ldots\ldots\ (8)$$

where *t = -15, -14,…, 15.*

The abnormal trading volumes ($AVol_t$) in percentage terms on day *t* for a portfolio of *N* stocks and its standard deviation (*SD*) can be calculated as $AVOL_t = AV_t - 1$

where
$$SD = \sqrt{\frac{1}{31}\sum_{t=-15}^{15}\left(AV_t - \overline{AV}\right)^2} \quad \ldots\ldots\ldots\ldots\ (10)$$
$$\overline{AV} = \frac{1}{31}\sum_{t=-15}^{15} AV_t$$

EMPIRICAL RESULTS

This section debates the empirical results for stock price and trading volumes for electronics industries, non-electronics industries and whole listed companies.

Table 1 uses the *t-test* statistics to examine the standardized average abnormal returns (SAR) and standardized average abnormal trading volumes (SAV) that appear in the event window from Days -15 to +15. For enterprises announcing M&A, the results demonstrate positive SAR and SAV, 0.1661 and 0.3822, for days -12 and 0, with the results being statistically significant at the 0.05 and 0.01 levels using the *t-test*. For strategic alliances, the results indicate positive SAR, 0.3503 and 0.2482 for days -1 and 13 and negative SAR, -0.2395, for day -10, with the results being statistically significant at 0.05 level by *t-test*. However, a significant and positive response is found for SAV, for days -11, -2 to 1, 3, 6 to 8, 13 and 15. Hence, the results indicate that if an electronics industry announces a strategic alliance, industry trading volumes will increase. Summing up the above results, the information effect of strategic alliances is significantly greater than that for M&A, especially for trading volume.

Table 2 shows the information effect of disclosure M&A and strategic alliance plans in the event window for electronics industries. This investigation adopts standardized cumulative average abnormal returns (SCAR) and standardized cumulative average abnormal trading volumes (SCAV) to determine the reaction strength of M&A and strategic alliances around the event period. The empirical results by this study reveal statistically significant and positive SCAR in the event window for days -4 to 1. Thus it can be inferred that M&A news leakage exerts a sustained influence on the stock market. For strategic alliance events, the empirical evidence indicates positive SCAR for days -12, -11, -2 to 3, 6 to 9, and 11 to 15, which is statistically significant at the 0.05 level based on *t-test*. Furthermore, there is positive SCAV for days -2, -1 and 0 to 15, which is statistically significant at the 0.05 and 0.01 levels using the *t-test*. The empirical results indicate a strong relationship between SCAR and SCAV.

For non-electronics industries, the results of the SAR and SAV lists in Table 3 demonstrate statistically significant and positive SAV around the M&A event divulgence date for days -8 to 9 using the t-test. Corporate law stipulates that convener convened board of directors of the director and supervisor and states the matter clearly seven days prior. Owing to inside information being disclosed ahead of time, industry declares that M&A events result from reaction to trading volumes. Furthermore, SAR is positive and statistically significant, with a value of 0.1694, on day 4. The empirical results listed in Table 3 show that message disclosure of strategic alliances have statistically significant and negative SAR, of -0.2504 and -0.2364, for days -7 and 4, and have statistically significant and positive SAR, of 0.2318, for day -4. The results reveal positive and abnormal trading volumes around the strategic alliance announcement date, 0.4292, for day 11. Therefore, SAV around announcement date of strategic alliance for non-electronics industry is insignificant. Overall, the SAV results for M&A are very positive.

According to the results of Table 4 show, for M&A events, positive SCAR is observed for days 0, 1, 4 to 10. The SCAV for the event window from -8 to 15 shows statistically significant at the 0.05 and 0.01 levels. Thus, before disclosure of M&A information for non-electronics industries, trading volumes can increase, indicating that investors maintain an optimistic attitude and results from market trading volumes increase continuously. For strategic alliance events occurring in non-electronics industry, standardized cumulative average abnormal returns and standardized cumulative average abnormal trading volumes were shown not to be affected; namely, no strong relationship was identified between two SCAR and SCAV. Thus investor behavior appears not to be influenced by strategic alliance announce during the event window.

Table 5 lists the results for SAR, SAV and the related t-test statistics for whole listed companies of stock and trading volumes in the event window around the M&A and strategic alliance announcement date. For M&A events of whole listed industry, the empirical evidence indicates positive SAR, 0.0921, for day 6, which is statistically significant at the 0.05 level using the *t-test.* Moreover, SAV is positive and statistically significantly on days -8 to 10 and day 12. For strategic alliance announcement events, the empirical result found that the positive SAR 0.1504, 0.2088, 0.1978, for days -4, 6, 11 is statistically significant at the 0.05 level by t-test. Statistically markedly shows the positive SAV for days -8, -3 to 1, 6 to 8, 11, 13 and 15. Table 6 lists SCAR, SCAV and their *t-test* statistics for whole listed

companies of stock price and trading volumes in the event window around the M&A and strategic alliance announcement date. For M&A events, the research results of event window reveal positive SCAR for days -10 to 15 by *t-test.* Statistically significantly shows the positive SCAV for days -8 to 15. Substantially, when M&A information had leaked to the market, stock price and trading volumes are clearly influenced. The empirical results presented in this study demonstrate the positive SCAR around the strategic alliance event disclosure date, 0.8661, 1.0276, 0.9537 and 0.9947 for days -1 to 1 and 7 using the *t-test*. For strategic alliance announcement events, the result presented in this study demonstrate positive SCAV for days -2, 1, days 0 to 15, which is statistically significant at the 0.05 and 0.01 levels by *t-test* respectively.

CONCLUSION

Today's fiercely competitive and fast-changing environment shortens product life cycles, prompting enterprises to recognize that effective management and operation of knowledge has become a very important topic, as knowledge innovation is strength in competition (Huang and Lin, 2006; Wadhwa, Bhoon, and Chan, 2006).

Based on the findings, it is known that when faced with the pressures of knowledge innovation, enterprises will choose merge & acquisition or strategic alliance to learn, build, and add innovation to knowledge. However, investors prefer merge & acquisition as the response strategy. The possible reason may be that, strategic alliance is established based on specific goals, which may cause cooperative processes to be lacking in flexibility (Das and Teng, 2000), and when the alliance goals are achieved, the partners will end the alliance; therefore, alliance is often relatively short-lived (Hatfield and Pearce, 1994). On the contrary, in merge & acquisition, the acquirer and target company can learn and duplicate technological capabilities of each other to enhance the knowledge basis of both parties (Seth et al., 2002). Therefore, as far as the enterprise is concerned, on the basis of knowledge innovation, merge & acquisition can be regarded as the best method of organizational learning and innovation (Eisenhardt and Martin, 2000; Karim and Mitchell, 2000; Seth et al., 2002).

In recent years, governments have developed enterprise merger & acquisition laws to promote large-scale enterprises to adopt this method in an attempt to expand the economies of scale of enterprises and enhance business performances, thus maintaining proper

competitive environments for improving business performances. It is recommended that enterprises should first understand the nature of merger & acquisition, and then adopt a proper merger & acquisition model in order to effectively integrate the enterprises, and generate comprehensive benefits from merger & acquisition.

INTERACTIONS BETWEEN BURNOUT SYNDROME, LEARNING STYLES AND FEATURES OF PERSONALITY AMONG POLISH MANAGERS

Katarzyna Iwanicka, University of Warsaw, Poland
iwanicka.kasia@gmail.com

ABSTRACT

Managers, working under a constant stress and pressure of making decisions are a social group that is highly prone to burnout syndrome. A research taking into consideration variables such as learning styles, features of personality such as extraversion vs introversion, sensing vs intuition, thinking vs feeling and judging vs perceiving may provide data essential to protect managers from this unwanted psychological phenomenon. Burnout syndrome, invented as a concept in 1970, according to the Maslah Burnout Inventory (MBI) is consisted of three aspects: emotional exhaustion, depersonalization and reduced personal accomplishment. Burnout syndrome is indicated by lower scores on the personal accomplishment and higher scores on the emotional exhaustion and depersonalization. This psychological phenomenon leads to gaining less satisfaction from work that seems to be a significantly important problem in the contemporary job market, especially among managers. It is strongly connected with the intensity of stress at work. If stress is permanent and not handled appropriately impairments of cognitive abilities such as declined attention and perception may occur. Some features of personality can also be correlated with higher susceptibility to stress and the risk of burnout syndrome.

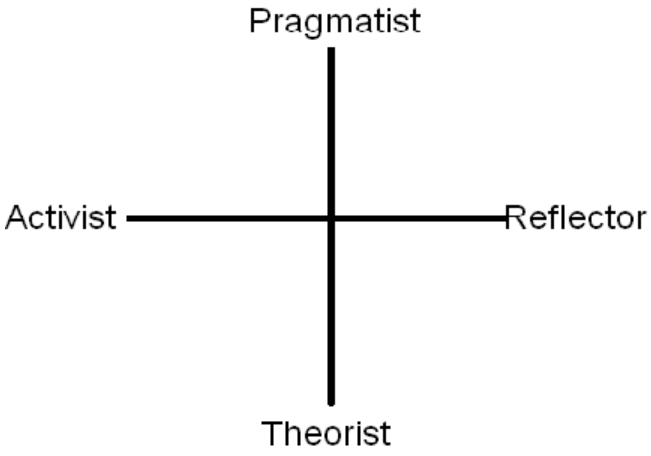
Keywords: burning out syndrome, learning styles, MBTI, managers

INTRODUCTION

This article attempts to demonstrate the interaction between personality types, learning styles and burnout. Without a shadow of a doubt, much attention was paid to the interaction between burnout and features of personality such as “Big Five” (NEO FFI) or MMPI (Munn – Giddings, Hart, Ramon , 2005) where the neuroticism was a predictor of depersonalization among the professional caregivers; however the MBTI questionnaire was not so frequently applied in the studies among managers. The correlation between MBTI types of personality and learning styles was also not so in deep examined apart from some studies, for example one examining upper-level civilian managers of US Army that proofed relationships existing between Kolb's LSI dimension of concrete vs abstract and the MBTI dimension of feeling vs thinking and between the LSI dimension of active vs reflective and the MBTI dimension of extrovert vs introvert (Konopka, George, 1999) MBTI concentrates on four basic aspects of human personality – interactions of humans and widely taken environment, the way people make decisions, preference of living in more structured or more spontaneous world and the type of information they receive from their surroundings. The view on the learning styles has been developed in the recent years (De Bello, 1990). Theoretical research concept is derived from Kolb’s learning cycle. The learning cycle covered all areas of the learning process: concrete experience (CE); reflective observation (RO); abstract coneptualization (AC); active

experimentation (AE). The learning cycle has the underlying assumption that the most effective learning will include all parts of this process. Research has consistently demonstrated that most people have strengths in some areas and weaknesses in others and this has led to the popularity of learning styles. The learning styles allow us to identify how an individual prefers to learn. There is debate in the application of learning styles however. Should learning styles predict who will be more successful when a learning experience matches styles? (Allinson & Hayes, 1988). As for the burnout, Christina Maslach et al. (2001) describes it as a *prolonged response to a chronic emotional and interpersonal stressors on the job and it is defined by the three dimensions: exhaustion, cynicism and inefficiency*. So the researches of this phenomena are of the opinion that burnout consists of three aspects: emotional exhaustion (reduced energy and ob enthusiasm), depersonalization (cynic approach to clients or co – workers) and reduced personal accomplishment (capacity to innovate and a sense of efficacy).

Figure I



Source: Honey and Mumford (1986)

Figure 1 shows that the activist and reflective learning styles are placed on opposing sides of the profile. To take a true measure of the preference for an activist style it is necessary to consider the reflective preferences at the same time (Wells et al, 1991). The following table shows a combined measure of the two scores.

METHOD

Participants

Descriptive analyses were used to summarize the demographic characterization of the participants. The studied group was consisted of 110 middle managers and executives, aged 25 – 58 years. All of them came both from the public and private sector. The average seniority in this group was 13,5 years and the managerial serenity amounted 6,43 years. In the survey were not included managers with the managerial experience less than 1 year, because this period of time is needed to get accustomed to the change, what could have blurred the results of the survey. The majority were men (58%); 87 per cent lived together with a partner; 85 per cent of them declared having many friends and acquaintances, only 15 per cent of the

group admitted having severe problems in the private life, while 26 per cent declared having severe problems in the occupational life. In the survey participants were also asked about job satisfaction; 6 per cent estimated their satisfaction as low, 71 per cent as an average and 23 per cent assessed it as high. The majority were non smoking (71%) and taking sport occasionally (66%). Thus it was dealt with a typical managerial sample consisted of predominantly middle aged and married men.

MEASURES

Burnout was measured using Maslach Burnout Inventory (MBI) having three subscales – depersonalization, emotional exhaustion and personal accomplishment. All items are scored on a 7 – point frequency rating scale from 0 (meaning "never") to 6 (meaning daily). According to the author burnout is indicated both by high scores on the emotional exhaustion and depersonalization subscale and low scores on personal accomplishment subscale. The learning styles were measured in this study using Learning Styles Questionnaire (LSQ) developed by Honey and Mumford and consisted of four stressed styles – activist, reflector, theorist and pragmatist. This questionnaire is consisted of 80 affirmations (e.g. "I like to try new and different things without too much preparation") and each style correspond with 20 items. The personality test used in this study was Myers – Briggs Type Indicator (MBTI) - short version, having four subscales – extraversion vs introversion; intuition vs sensing; thinking vs feeling and perceiving vs judging. Myers-Briggs Type Indicator (MBTI) personality inventory based on the C.G. Jung theory of personality was chosen, because it was rather designed for non clinical use.

RESULTS

Table II shows the mean and standard deviation of the study variables. The most common learning style among surveyed managers was pragmatist (mean = 11,97; SD = 3,61), while the most rare learning style seemed to be an activist (mean = 7,66; SD = 3,91). In comparison with results from British, Canadian and American surveys, showed in the Table I, the Polish sample scores relatively lower for all styles. As for theorist (mean = 10,48; SD = 3,63), the nominal score is almost three full points lower than for Canadian and British managers and almost four points lower than American managers. Correlations among the study variables are presented in the Table III. In terms of the outcome, extraversion was correlated with activist learning style (r = 0, 21, p < 0,05) and there was negative correlated with reflector learning style (r = - 0, 19, p < 0,05). Moreover, there was a significant correlation between intuition and activist learning style (r = 0, 5, p < 0,01), while activist correlates negatively with sensing (r = 0, 44, p < 0,01). Sensing also correlates with reflector (r = 0, 22, p < 0,05) and theorist (r = 0, 23, p < 0,05). Furthermore, it occurred that negative correlation was between intuition and theorist learning style (r = - 0, 32, p < 0,01) as well as reflector learning style (r = - 0, 31, p < 0,05). Thinking correlates with reflector (r = 0, 36, p < 0,01), theorist (r = 0, 38, p < 0,01), and pragmatist (r = 0, 22 p < 0,05), but negatively with activist(r = - 0, 23, p < 0,05) . Feeling correlates with activist (r = 0, 26, p < 0,01), however negatively with both reflector (r = 0, 36, p < 0,01), and theorist (r = 0, 4, p < 0,01). As far as burnout is concerned, only sub scale of depersonalization seemed to be significant in the correlation with the learning styles. Depersonalization correlates with activist (r = 0, 3, p <

0,01), and pragmatist (r = 0, 23, p < 0,01). There were no significant correlations between two other sub scale of burnout as emotional exhaustion and personal accomplishment.

Table I
Learning styles distribution in Great Britain, Canada and the United States

Nationality	Activist	Reflector	Theorist	Pragmatist
British	8,7	12,9	13,5	14,5
Canadian	8,5	13,9	13,7	14,0
American	9,5	12,0	14,5	14,5

DISCUSSION

The results suggests that some of the learning styles correlates with both personality types from MBTI, as well as sub scales of burnout. Extravertic types of personalities seems to be more active learning types. As the days of activists are filled with activity, it must be strongly connected with facing with situations, in which other people are involved, such as meetings, panel discussions and conferences. In this type of social situations contact with other people is inevitable, what makes these managers more sensitive to horizontal and vertical interactions with other people. Some other studies shows the correlations between the LSQ and the big-five factors (NEO-PI-R) showed that the activist learning style was correlated with agreeableness, conscientiousness, and extroversion (Gentry, Mondore, Cox, 2007). In the shadow of this data, another correlations seems to be easier to explained. While activist tends to act first and then consider the consequences afterwards, the reflector at first collect date and observe people in the process of doing the activity, instead of actively taking part in it. This kind of attitude needs more philosophy of cautiousness. It is easier to be an observant being outside a social group than taking part in its work. The results shown also a negative

correlation between activist and the way of judging - thinking that is based on logical process aimed at the impersonal findings, which is the reverse to feeling. Feeling types are naturally friendly and sociable, finding it difficult to be businesslike (Brigs Myers; Myers, 1995), which closely corresponds with activist preferring sharing ideas with other people. Negative correlation between perceiving and theorist seems to be expected, since perceive type, who is active and empirical appears to be disconjoining with precise and detailed - focused theorist. Essential information from this survey is that only two learning styles are prone to depersonalization. Being an activist means tackling problems by brainstorming, while being pragmatist means trying out new ideas in practice; so both learning styles are strongly connected with being in touch with others who either accompany activist in the process of creative thinking or give pragmatist the feedback about applied solutions. The more interactions with co - workers or clients managers have, the more potential stressful situation may occur. If the satisfaction from work is low and stress become to be chronic, managers can treat people around as unfeeling objects, which leads to distancing from them and cynical attitude towards them. In the light of this results, the question if the reflector and theorist can protect from the burnout syndrome should be asked. As for the learning styles, the overall learning profile is lower for Polish managers and this may mean that they will be more selective or less interested in learning. The dominant style is clearly pragmatist and the sample scored very low on the activist style. This shows that Polish managers are passive, not very willing to take actions or to make changes. From the research it is difficult to evaluate the reasons for this. It may be the educational system, which did not use active methods or applications but focused on acquiring theoretical knowledge. The result of this study can be used in academic education among students of management, business, marketing etc, who after getting know their personality styles and learning styles can more consciously affect their educational attainment. As well as in the higher education, the results of this survey have practical implications in MBA programs and courses designed especially for managers, as Wells; Layne; Allen, 1991) suggested in the literature, because the better methods of teaching are matched , the greater chances for success can be observed. Further study is needed on the correlation between learning styles, burnout and cognitive functioning of Polish managers, to examine potential interaction between attention, memory, perceptiveness and learning styles.

TARIFF GROUPS AS A BASIS OF FINANCING OF HIGHER EDUCATION INSTITUTIONS/PROGRAMS

ABSTRACT

During the past 10 years European higher education (HE) has experienced radical changes with the aim to make the higher education area more responsive to society and to stimulate the transfer of knowledge in the triangle of research, education and innovation and in this way contribute to the economic development and increased competitiveness and enable the transition into knowledge-based society. Key obstacles are limited available public and scarce private financial resources. Thus, new and mixed financial resources are needed and, consequently, »distribution« and »control« instruments and mechanisms which will encourage economical and cost-effective use of limited resources and ensure more effective achievement of HE objectives. One of the most commonly used mechanisms for the allocation of public funds is a formula based on tariff groups which should reflect the cost of individual study programmes in different fields of study. The key question is how many tariff groups are needed and what their factors are. Keeping in mind that the formula is one of possible mechanisms for the implementation of national HE policy, it has to be structured in a transparent way with a combination of formula elements (including tariff groups) which stimulate higher education institutions (HEIs) to achieve national strategic objectives. If, for instance, tariff groups and factors fail to reflect the cost of study programmes from different fields of study, we have to either change (lower) their number and factors value or, what is much more difficult to implement, another mechanism should be used for the allocation of (public) funds for higher education.

Keywords: higher education, public funding, lump sum, tariff groups

INTRODUCTION

Higher education (HE) in all EU member states falls within national responsibility and focuses on governmental policy goals together with the EU policy. With the Bologna reform[1], HE is faced with numerous challenges, e.g. various choices of study possibilities, flexibility of study paths, student and teacher mobility, inclusion of increasingly diverse student population and its ageing, openness and innovativeness of HE area in its wider environment, transfer of knowledge in the economy and vice versa (the so called knowledge triangle), internationalisation and globalisation, and increased financial needs and requirements which have to be balanced with financial limitations. Currently, the main

[1] The Bologna reform includes and is open to countries that have signed or ratified the European Cultural Convention (Paris, 19 December 1954). The process currently includes 47 countries (all EU member states and others; the last to join was Kazakhstan in March 2010).

guidelines in the field of funding of HE in the EU is the Resolution of the Council of the European Union, dated November 23, 2007, on the modernisation of universities in order to increase competitiveness of Europe in a global knowledge-based economy.

The OECD (Tertiary Education for the Knowledge Society, 2008) forecasts that the main challenges in adopting policies in HE will include among other areas transfer of international strategies to the national context, achieving equity, enhancing the role of tertiary education in research and innovation, strengthening ties with the labour market, assuring and improving quality and matching funding strategies with national priorities.

Many HE experts and government officials agree that the development of HE is limited mainly due to the availability of public funds for financing HE. Therefore, special attention must be given to equitable redistribution of funds among HE institutions (HEIs) which should ensure effective[2] use of limited public funds. For this reason the integrated, lump-sum or block-grant funding is being so widely introduced not only in Europe and there is a belief that it can lead to rationalisation on the level of HEIs. By making HEIs more accountable for their actions and at the same time giving them more autonomy and flexibility for funds management and distribution, they should be able to do more with existing funds than the government or any other actor on the national level.

Most commonly used funding mechanism for delivering public funds to HEIs by governments is based on a funding formula which groups study programmes (or HEIs) in different tariff groups in relation to their complexity and costs (or the price) the government is prepared to pay. According to Eurydice, in the academic year 2006/07 all EU member states except for Cyprus, Luxemburg and Malta (for Germany and Spain this can vary by region) used the funding formula as the main mechanism for direct public funding (Higher Education Governance in Europe, Eurydice, 2008). According to the OECD, the funding formula is also used in Australia, Japan, New Zealand, Switzerland, Chile and Russia (Education at a glance, OECD, 2008).

The question we are exploring in this paper is how well tariff groups and their factors express the differences in costs of delivery of study programmes taking into consideration their field of study. Furthermore, we would like to find out what has to be taken into account when setting the "right" number of tariff groups in a national HE system (for example, Australia has 16 tariff groups while other countries like the Netherlands get by with only 4) and what should the scale of factors be so that they would properly reflect the costs of study programmes in a particular tariff group (for example, factors of tariff groups in Australian funding formula range from 1 to 10.2, while in Denmark they only range from 1.1 to 2.4). (Deen et. Al: Bekostigingstarieven in het hoger onderwijs, Een vergelijking tussen zeven landen, 2005)

A glance at the Slovenian HE area would reveal that discussion about the expenses and insufficient financing of HE from public finances has accompanied the HE reform according

[2] Effectiveness of HE is the relationship between HE activities and HE goals. What really matters is that money and resources are spent in such a way that one gets outputs that in a broader sense layer are related to the productivity and growth (Study on the Efficiency and Effectiveness of Public Spending on Tertiary Education, 2009).

to the guidelines of the Bologna process since 2004. In the same year Slovenia also introduced the lump-sum funding of HE teaching.

The Slovenian case of introduction of performance-based lump-sum public financing demonstrates that HEIs are able to adapt to system changes more quickly than expected and not always in a direction anticipated by the government. Being used to the old norms and standards set by the government, HEIs recalculated what behaviour (taking into account the elements of the formula) would bring them more money. At the same time most institutions have not significantly improved their internal management practices. The reason for this could be that the formula in use for the redistribution of public funding on the national level does not include qualitative elements that focus on the accountability and performance other than the number of students and graduates which are distributed in six tariff groups according to the field of study.

Because of mentioned goals, trends, reasons and facts we have decided to thoroughly analyse the role and the influence of tariff groups and their factors, which altogether have a strong effect on (effective) funding of HE.

BACKGROUND

HE trends in Europe

Lately, nowhere in the world HE has been faced with such radical changes as in Europe. During the past ten years, changes have been based on three key developmental efforts:

- Sorbonne Declaration (1998): harmonisation of the European HE system;
- The Bologna Process (since 1999): to create an open and competitive European HE area by setting up unique European higher education (EHEA) and research area (ERA).
- The Lisbon Strategy (2000): transformation of fragmented European economic systems into united, knowledge-based economy. The key document in the area of HE, the Council Resolution on modernising universities for Europe's competitiveness in a global knowledge economy (2007), stresses that education, research, innovation and modernisation of HE institutions represent key elements of the Lisbon Strategy.

HEIs as well as governments and other actors should be aware of their key role in the »knowledge-based society i.e. Europe« and should assume responsibilities in ensuring the expected economic, social and cultural welfare. For this reason countries have been particularly active in the integration policies regarding their economies, political and social systems and wider HE systems.

In general, European HE systems have been facing numerous changes and are increasingly becoming more and more internationalised, deregulated, liberalised, and market-oriented which has its advantages and disadvantages, supporters and opponents.

Economics of HE

Financing has a direct influence on the HE reform and therefore on the efficiency, equity and quality of HE. In Europe, government budgets represent the main source of HEIs funding, as demonstrated in Figure 1.

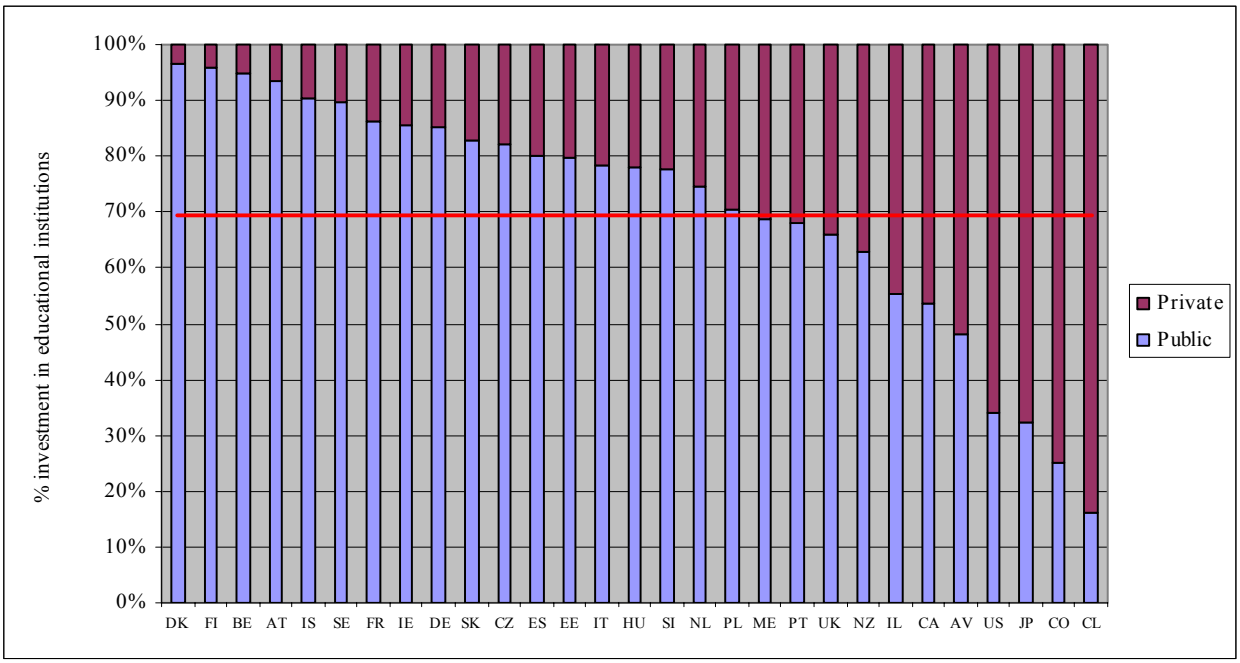

Figure 1: Public and private investments in tertiary education institutions in 2006 (Education at a Glance, 2009, OECD)

In most analysed countries, tertiary education institutions are mainly financed from public resources. In OECD member states in 2006, 69.4% of tertiary education institutions funding came from public resources. However, the share of public funding of tertiary education institutions in most analysed countries is decreasing. In OECD member states, the share of public resources in the period 1995-2006 decreased by 7.1%.

It is expected that public funds will have an important role in financing of HEIs in the EU also in the future, since the Communiqué of the Conference of European Ministers Responsible for Higher Education, Leuven and Louvain-la-Neuve, 28-29 April 2009, confirmed public funding as one of the main HE priorities until 2020 in order to guarantee equitable access and further sustainable development of autonomous HEIs. The Communiqué also stressed that greater attention should be paid to seeking new and diversified funding sources and methods.

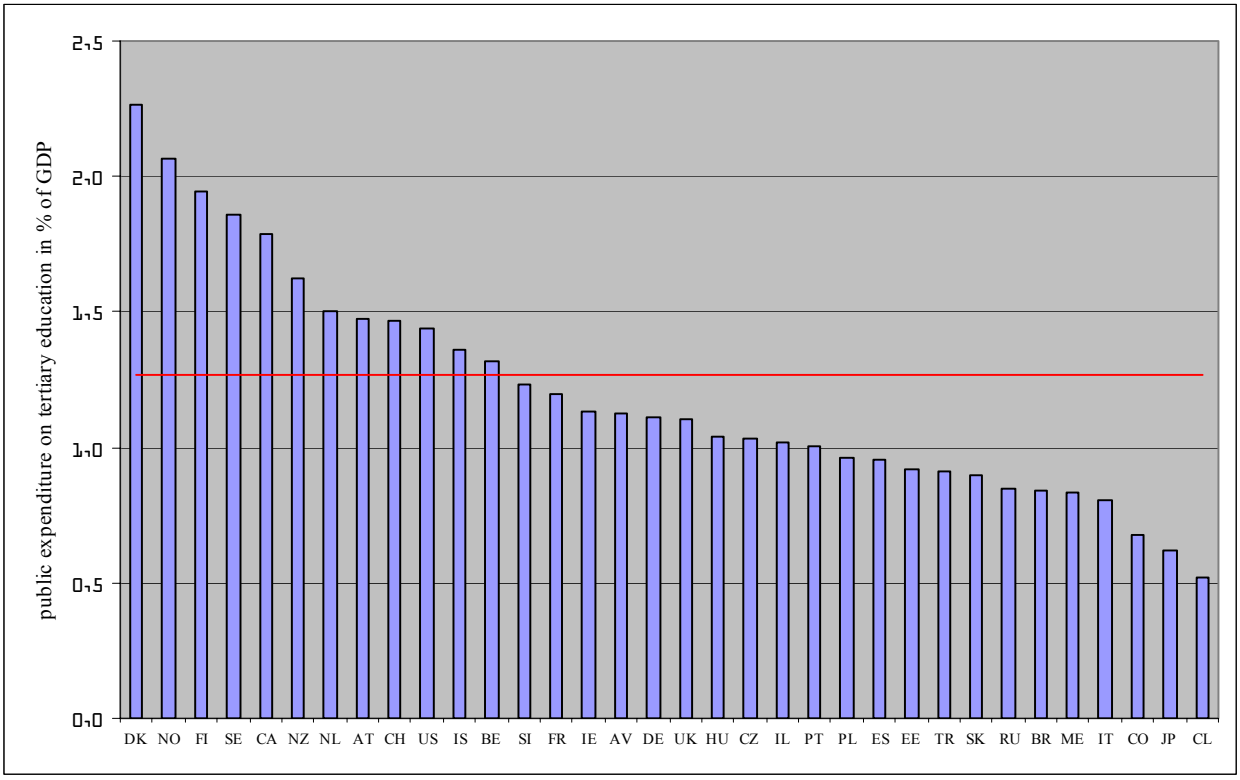

Figure 2: Public expenditure for tertiary education in % of GDP in 2006 (Education at a Glance, 2009, OECD)

However, European investments in education, research and development, especially from private sector, do not place the EU close to the USA and Japan, but on the contrary, increase the gap between the countries. EU investments in HE lag behind those of the USA and Japan. Therefore, Europe in the so-called Lisbon strategy set the goal to invest 2% of GDP in financing HE (1% from public and 1% from private sources). As demonstrated in Figure 2, the goal of 1% of GDP from public funding has been achieved by many countries. However, the remaining problems are the matching investments from private sources which can, but not necessary, mean tuition fees.

HE funding systems and mechanisms

The direct influence of funding on HE has been acknowledged also by the Bologna process in 2009 when it included among its priorities the funding of HE with the need for new and diversified funding sources and methods. Governments are facing a challenge of ensuring equitable access to HE and accountability of HEIs without breaching their autonomy. Although in the past decade the financial autonomy of HEIs in EU countries has increased,

the recent recession has revealed weaknesses of many HE funding mechanisms and national policies they have been more or less supporting.

A key factor which clearly demonstrates the trend from complete and direct governmental control over HE is its funding. Relatively high presence of public spending (taking into account the budget volume) is not enough to meet financial needs and requirements of constantly developing and growing HE systems. Thus, new and mixed financial resources are needed and, consequently, also monitoring and »control« instruments and mechanisms. Governments have realised that control and oversight are not the only way to steer the behaviour of HEIs and that institutions would be able to use the public funds more cost-effectively than the government if they were given the appropriate financial autonomy. The current trend in public funding became performance-based funding (not taking into account "history") and looking for ways and means of cost-sharing through additional non-public funds (tuition fees, commercialisation of research, private use of staff, etc.).

Funding mechanisms differ between countries. Among important factors are national funding rules (especially for funds allocated to HEIs), evaluation systems and staff policy. What is getting increasingly obvious is the fact that countries do not properly relate their HE funding mechanisms to their HE policies which contributes to the inefficiency and ineffectiveness of public (and private) spending on HE. Furthermore, in these instances HEIs are not stimulated to actively follow up on the situation and trends in the economy and society and position themselves as the driving force in the development of the economy as well as wider society.

Efficient and economical use of these resources depends on the system of financing of HE in individual states. During the past 10 to 20 years, the majority of European countries changed the system of their HE financing. The scope of these reforms varies considerably with regard to individual states, but not a single country could have avoided these changes completely. There are many similarities in these reforms (Kaiser et al., 2002; Strehl et al., 2006; CEGES, 2007; Lepori et al., 2007, EUA: Financially Sustainable Universities – Towards Full Costing in European Universities, 2008):

- in general, there is a trend of increased autonomy of the use of public finances within HEIs;
- there are efforts regarding the introduction or use of the full-cost model for HE activities by HEIs. According to EUA, the primary question for universities in the 21st century are risks related to the sustainability of their mission, due to increasing expenses of HE activities;
- the introduction of more transparent and simple financing of HE on a national level,
- cost of education should be only one i.e. government responsibility.

Mutual interdependence between financing systems and HE and its policy differ considerably among individual countries, as can be seen from the OECD research mentioned in Strehl et al. (2006).

According to the OECD (Tertiary Education for the Knowledge Society, 2008), the main challenges in funding tertiary education are ensuring the long-term financial sustainability of tertiary education, devising a funding strategy consistent with the goal of the tertiary

education system and using public funds efficiently. To match these challenges the following policy directions are suggested to the governments:

- Develop a funding strategy that facilitates the contribution of the tertiary system to society and the economy.
- Publicly subsidise tertiary study programmes in relation to the benefits they bring to society.
- Use cost-sharing between the state and students as the principle to shape the funding of tertiary education.
- Back the overall funding approach with a comprehensive student support system.
- Make **institutional funding for instruction formula-driven**, related to both input and output indicators and including strategically targeted components.
- Improve **cost-effectiveness**.

Tariff groups and funding formulas

Tariff groups appear in HE funding formulas for the redistribution of public funds as parameters for setting value of individual fields of study. To account for differences in the costs of training across disciplines, different funding rates – tariff factors are applied (to the number of students and degrees), which are more or less based on the estimation of teaching costs per student in a particular field of study. Studies that take place in classrooms (*classroom-based subjects*) have lower tariffs i.e. a lower amount of public funding than studies taking place also in laboratories (*laboratory-based subjects*).

The value of tariff groups (relative factor) represents a ratio to the value of funds for financing of studies in the tariff group with the lowest factor.

The number of tariff groups varies among different countries (e.g. the Netherlands and the United Kingdom have 4 while Australia has 16). The variation is also in the difference between values of factors of individual tariff groups. Both can be seen in Table 1 which includes data from the CHEPS study (Deen et. Al: Bekostigingstarieven in het hoger onderwijs, Een vergelijking tussen zeven landen, 2005) and data for Slovenia.

Table 1: Relative factors set for public financing

* The financing is regulated by special rules.

Deen et al: Bekostigingstarieven in het hoger onderwijs, Een vergelijking tussen zeven landen, 2005; data for Slovenia is set by the Decree on public financing of higher education and other institutions from 2004 to 2009 (Official Gazette of the RS, no. 132/04, 72/04, 4/06, 132/06 and 99/08)

A comparison of seven countries shows that relative amounts for the same field of study are similar. In Austria and Sweden the amounts differ more than in other countries. Australia, Sweden and Denmark have higher factors for technical and natural sciences than other countries. In all eight countries the relative amount of public financing for education of students (or for a different work unit invested in education) is the lowest for law. On the other hand, it is the highest for medicine.

There are differences among countries with regard to the number of tariff groups. Table 1 shows that the UK and the Netherlands have the lowest number of tariff groups, only four. In Scandinavian countries and in New Zealand the number of tariff groups varies, with Australia having the largest number of tariff groups. The range of factor value is also the greatest in Australia. In Australia, the most expensive studies (medicine, agronomy) get more than ten times the amount of funding than the least expensive studies.

When studying tariff groups and their factors, it is necessary to take into account institutional differences among countries (how education is integrated within HEIs, how much public funds are received directly by HEIs and how much funds are given directly to students). The allocation of public finances is also influenced by political and governmental decisions. First,

it is necessary to decide on the relative volume of public and private financing. Then, it is necessary to decide on the acceptable share of funds for educational activities of HEIs, depending, for instance, on the number of students, and how much money is allocated as a fixed amount (the fixed amount can vary among HEIs). In addition, it is necessary to take into consideration if a country has tuition fees. Relative factors are more equalised in systems with tuition fees.

HE funding in Slovenia[3]

Slovenia introduced lump-sum financing based on formula in 2004. The so-called integral financing of HEIs teaching activities meant abolishing norms and standards set by the government and to some extent turned towards remuneration of educational results – determining funds with regard to the number of students and graduates which together influence the allocation of 30-40% of funds for educational activities. The main reasons for the introduction of lump-sum financing were the weaknesses of the previous system of financing:

- The funds for study activities were mostly distributed by the ministry on the level of salaries and material costs, which prevented HEIs to govern received funds.
- The controls[4] were focused mainly on how the money was spent and not on the quality of the performance of HEIs.
- Slow responsiveness of HEIs to the trends and needs of the economy and society.

Desirable qualities of the new funding model were:

- Flexibility: the funding mechanism should recognise differences between HEIs and allow their flexibility to maximise autonomy (academic and financial) so that they can achieve their mission.
- Choice: HEIs should not be limited in offering a selection of study programmes.
- Quality: funding should reward and promote excellence of results in education.
- Simplicity/efficiency: the model must be simple for governing by the state and comprehensible for HEIs and students. It should assure the best results for invested funds.
- Predictability: the system of financing must enable planning with a certain level of predictability both, for the state and HEIs.

The introduced formula fulfilled some of these criteria. It is composed of a fixed and a flexible part. For the initial year the value of the fixed amount represented 80% of the annual funds for study activities of HEIs in 2003. The percentage decreases every year and was set at 60% in 2009. The flexible amount of the financing is calculated on the basis of the number of enrolled students in the ongoing academic year, number of graduates of the past calendar year and the field of study, which are classified in six tariff groups. The factor of the tariff group expresses the ratio between the funds allocated for the provision of study in an individual tariff group compared to the first tariff group. The values of factors range from 1.00 to 4.50.

[3] The information in this paragraph is related to the funding of full-time undergraduate studies and 2nd cycle study programmes.

[4] The controls of the use of public expenditure conducted by the ministry, the Budget Supervision Office of the Ministry of Finance and the Court of Auditors.

Tariff groups in Slovenia combine study programmes (until 2009 they combined HEIs) by fields or subfields of study defined by ISCED classification (UNESCO, November 1997) taking into the account the annual public funds received by HEIs in 2003 based on old norms and standards. This way the factors reflected the cost ratio between different fields of study including the anomalies of the old funding system.

The described formula was introduced for a limited transition period into lump-sum funding which was supposed to end in 2008, but is still in use with some minor adjustments in 2010. Management and administration of both, HEIs and the government, had to adapt to the new funding mechanism. The government had to learn how to work in a system which gives it less direct power and brings new type of monitoring tasks. Already at the beginning they realised that certain vital data for monitoring the efficiency of HE was not being collected on the national level or was only available on an aggregated level. On the other hand, HEIs realised that by establishing a more efficient internal use of resources they could redirect "additional" funds to underfinanced activities and development and increase the quality of teaching.

EMPIRICAL STUDY: TARIFF GROUPS IN SLOVENIAN FUNDING MECHANISM

Purpose (objectives) of the study

We decided to research tariff groups because disadvantages of HE funding in Slovenia are becoming increasingly obvious, especially its justification and the issue of the number of tariff groups and values of their factors. Due to the following reasons, it is also questionable how fair the allocation of public funds among HEIs is:

- historical reason: funds allocated to HEIs in 2003 were used as a basis for the new system of funding without looking into whether HEIs received funds in accordance with their activities and expenses,
- number of tariff groups and their factors which should reflect differences in costs of carrying out different study programmes according to their fields of study, which require groups of different sizes as well as different material and spatial conditions.

That was the reason that we wanted to tackle tariff groups with the appropriate analysis.

Methodology (type, data collections, techniques of analysis and data treatment)

The analysis of suitability of the existing system of HE funding in Slovenia was carried out on a basis of the analysis of the existing method of distributing funds for study activities among HEIs, with the emphasis on their placement in tariff groups for 2009, which means that we have taken into account:

- the number of undergraduate full-time students (49,818) and graduates (7,825) in 2003 since this year was the basis from the perspective of HEIs funds on which lump sum was introduced;
- the number of undergraduate full-time students (50,622) and graduates (7,850) in 2004 since these numbers were used in the first lump-sum formula; and
- the number of undergraduate full-time students (53,021) and gradates (8,418) in 2009 since these numbers were used in the latest formula.

Table 2: Students and graduates in tariff groups as included in the lump-sum formula*

Tar. Gr.	Year 2003				Year 2004				Year 2009			
	Stud. 02/03	Grad. 2002	Stud. in total	Grad. in total	Stud. 03/04	Grad. 2003	Stud. in total	Grad. in total	Stud. 08/09	Grad. 2008	Stud. in total	Grad. in total

6.	2,378	416	4.8%	5.3%	2,467	395	4.9%	5.0%	3,341	526	6.3%	6.2%
Tot.	**49,818**	**7,825**	**100%**	**100%**	**50,622**	**7,850**	**100%**	**100%**	**53,021**	**8,418**	**100%**	**100%**

*The number of enrolled students and graduates differs slightly from the actual number of enrolled students and graduates due to the calculation of these numbers for new HEIs based on offered study places and not actual enrolment.

As demonstrated in Table 2, from 2004 to 2009 the number of students in the formula increased for 2,399 or 4.7%, and the number of graduates increased for 568 or 7.2%. It is interesting that in the period analysed the number of students decreased only in the 1st tariff group, namely for 1.098 or 7.1%, while in all other tariff groups the number of students increased. In 2004, students of the 1st tariff group represented 30.6% of all students, while in 2009 their share decreased to 27.2%. However, the number of graduates in this group increased the most (for 363 or 12.5%), representing 38.8% of all graduates in 2009 (in 2004 they accounted for 36.9% of all graduates).

Reasons for these changes are mainly the following:
- new Bologna study programmes were first and to the highest extent introduced in the 1st tariff group, where at least in the field of business studies new programmes were introduced according to the formula 3+2;
- policy of promoting enrolment in study programmes in the fields of science, medicine and technology, implemented by the previous government.

Findings and discussion

To be able to correctly analyse and understand tariff groups and their role in the funding formula we have to take into account that the factors such as students and graduates have influence only on the variable (normative) part of the formula which represents a relatively small part of total funding (20% in 2004 and close to 40% in 2009). The rest, i.e. 80% in 2004 and 60% in 2009, depends on the basis of funds given to HEIs in 2003.
Annual Funds (AF) = Fixed AF (FAF) + Normative AF (NAF)

$$AIV = (AF - \Sigma FAF / \Sigma ((S + G * Wg) * f(tg))$$

The annual initial value (AIV) represents the standard annual funds per student in the first tariff group and is calculated as the quotient of the difference of annual budget funds (**AF**) and the basic annual funds of all HEIs (Σ FAF) and the total number of students (**S**) and the number of graduates (**G**) multiplied by the weighting of the graduates (**Wg**) and the factor

f(tg) of the tariff group to which HEIs or their study programmes belong. Wg represents the length of a certain study programme and is calculated on the basis of the number of semesters divided by 2 for the old study programmes. The Bologna study programmes have a fixed value of the weight at 4.

With the analysis of tariff groups we wanted to compare the calculated factor of tariff groups (on the basis of funds per student in a particular tariff group) to factors of tariff groups to see how they match in the first year when the formula was used (2004) and in 2009 (see Table 3).

Table 3: Comparison of the ratio between factors of tariff groups as set by the formula in 2004 and calculated on the basis of the funding allocated to HEIs in 2004 and 2009

Tariff groups	**Ratio of amount per student in a tariff group in comparison to the first tariff group**			**Factors set by the formula**
	Fixed amount	**Variable amount**	**Total funding**	
Year 2009				
1.	1.00	1.00	1.00	1.00
2.	1.35	1.50	1.41	1.75
3.	1.65	1.96	1.76	2.50
4.	2.17	2.48	2.28	3.00
5.	2.14	2.80	2.36	3.50
6.	3.67	4.49	3.95	4.50
Total	**1.58**	**1.81**	**1.66**	**-**
Year 2004				
1.	1.00	1.00	1.00	1.00
2.	1.94	1.73	1.89	1.75
3.	2.15	1.99	2.12	2.50
4.	2.47	2.68	2.51	3.00
5.	3.46	3.00	3.36	3.50
6.	5.51	4.89	5.38	4.50
Total	**1.99**	**1.86**	**1.96**	**-**
Year 2003 (the base year)				
1.			1.00	1.00
2.			1.84	1.75
3.			2.16	2.50
4.			2.40	3.00
5.			3.41	3.50
6.			5.50	4.50
Total			**1.95**	**-**

Main findings:

- Due to the use of lump sum the ratio of allocated funds per student has gradually begun to decrease which is clearly evident from the average factors calculated for 2009 compared to those for 2004 and 2003. Factors of the fixed amount have decreased significantly (from 1.99 to 1.58) and so did the total funding (from 1.96 to 1.66).

- It is understandable that this is not obvious from the factors calculated for the variable amount since they mostly depend on the factors of tariff groups. However, we can note that values of all calculated factors of the variable amount are lower than values of factors of tariff groups (for the 2nd tariff group the calculated factor is 1.5 which is 0.25 lower than the factor of the tariff group, for the 3rd tariff group the calculated factor is 1.96 which is 0.54 lower than the factor of the tariff group; similar goes for other tariff groups).

The calculation demonstrated that calculated ratios, in particular normative annual funds per student, are much lower than the factors of tariff groups. We also found out that factors calculated for the 2nd and 3rd tariff group, and in particular for the 4th and 5th tariff group, are rather similar which indicates the possibility to reduce the number of tariff groups and values of their factors.

Another problem highlighted by this calculation is the fixed part, i.e. fixed annual funds, that carries the history of 2003 which should be eliminated and a new method of calculating the (potential) fixed part of funds received by HEIs should be found.

CONCLUSION

We tried to highlight the role and dilemmas of tariff groups as instruments to ensure efficient and effective "distribution" of public funds for HE by the government and its use by HEIs. The question is whether HE funding based on the formula using a system of tariff groups supports and encourages the key components of the HE reform imposed by contemporary knowledge-based society, and whether the system of financing motivates and stimulates HEIs to manage their funds more efficiently and economically than the government could on a centralised level.

As demonstrated by the international comparison and the Slovenian example, tariff groups are a complex and demanding subject. Their main role is to follow the actual costs of conducting various study programmes. This raises the question of the capability of HEIs to determine actual costs of teaching activities carried out.

As demonstrated in the Slovenian example, HEIs cannot ensure appropriate data for determining efficiency and economy of HE activities. To be able to estimate, i.e. measure, efficient use of funds, the question arises on the national level, namely the appropriate cost of HE activities. This also requires from governments to define the minimum quality criteria for the delivery of HE at the institutional level.

Another aspect of tariff groups and factors is to what extent they should relate to the actual costs of HEIs activities in a given time and to what extent they should include quality factors and additional funding to stimulate HEIs to experiment with new approaches and solutions concerning the innovation in teaching and research.

The findings have led us to the basic question whether the formula is still the right instrument to ensure the effective use of public funding. The reason for this dilemma lies partly in the

fact that many countries (like Slovenia)[5] have not introduced a fully flexible funding formula but have kept a part of funding fixed (e.g. based on historical trends or past costs) for the sake of the stability of HEIs. Furthermore, the government should be able to ensure that the public funding invested in HE will be efficiently returned to society in the form of a more responsive and innovative labour market and consequently improved social conditions and increased economic growth.

THE EFFECTIVENESS OF E-MAIL REFERENCE SERVICES OF MALAYSIAN ACADEMIC LIBRARIES IN FACILITATING E-LEARNING

Wan Ab. Kadir Wan Dollah, MARA University of Technology, Malaysia
wkadir@salam.uitm.edu.my

awkhalid@kelantan.uitm.edu.my

Zulkharnain Yusoff, MARA University of Technology, Malaysia
zulyus@kelantan.uitm.edu.my

ABSTRACT

E-mail reference services are becoming widely available in Malaysian academic libraries. The purpose of this study was to examine the effectiveness of e-mail reference services in selected academic libraries in Malaysia. The researchers attempt to focus on the awareness, usage and at the same time look at the perceived needs, issues and problems faced by librarians and students. The research methodology employed was a case study approach that combined three data collection methods, i.e. questionnaires, interviews and systematic observations. This paper concludes that e-mail reference services are effective forms of service delivery in Malaysian major academic libraries. E-mail reference was the main format used in providing digital reference, although academic libraries are planning to implement synchronous DRS and collaborative digital reference.

Keywords: digital reference, academic library, e-learning, email reference

INTRODUCTION

Reference work has been an integral part of library activities for more than a century (Ford, 2003). Over time, new technologies have been used to assist in a variety of functions in library and information units, including in the provision of reference services. Smith (2001) urged that there is no need to limit reference interviews to in-person or face-to-face and telephone conversations, especially when many users are researching from their home and office computers. Librarians should take full advantage of e-mail, web and other means of digital reference services in this digital library environment.

STATEMENT OF PROBLEM

New technologies have dominated all spheres of human activity and the academic libraries are not an exception to this. McClure, Lankes, Gross and Choltco-Devlin (2002) noted that people have become increasingly comfortable utilizing and indeed relying on digital services as part of their way of life. For instance, many people are now using various electronic and digital technologies. They also communicate with others in their personal and business lives by using e-mail or real-time services such as online chat, instant message services, or video

conferencing. In the context of library science, the users are hoping libraries to provide more services online. These services include access to on-line catalog, the ability to place request on-line, access to electronic resources and the provision of some type of on-line reference services.

The researchers' realized that most academic libraries in Malaysia have moved towards digital concept. However the reference services and the digital reference services were not fully utilized and the services provided not being used effectively. Despite the advances brought by technology and they are in the more privileged position to provide better and more services, the structure and organization of reference service in academic libraries have changed little since its inception. Services continue to be tied to the physical desk, requiring that users come into the library building for assistance. Reference librarians in academic libraries should play an important role in assisting students and faculty in teaching, learning and research process by providing digital reference services.

OPERATIONAL DEFINITIONS

The following definitions are used in this research:
Effectiveness can be defined as the capability of producing an effect. In this study, effectiveness was measured based on Whitlatch's (1990a) measurement of reference effectiveness mainly through users' satisfaction, users' perception and library's performance. The other key factors used were awareness, usage and perceived needs.
Academic libraries in this study refer to libraries attached to academic institutions above the secondary or high school level, serving the teaching and research needs of students and staff (Feather and Sturges, 2003, 3).
Case study is a research design that entails the detailed and intensive analysis of a single case (Bryman, 2004).
E-mail reference is a major format of digital reference services which user sends the library an e-mail with a reference query and the library may reply by e-mail, telephone, fax, correspondence etc.
Digital reference service refers to a mechanism by which people can submit their questions and have them answered by a library staff member through some electronic means (e-mail, chat, web forms, etc.) not in person or over the phone (Janes, Carter and Memmott, 1999, 146). A digital reference service generally comprises the following elements: (1) the user of the service, (2) the interface (e-mail, web form, chat, videoconference, etc.), (3) the information professional, and (4) electronic resources (including electronic or CD-based resources, web resources, local digitized material etc.), as well as print resources (Berube, 2003, 1)

STUDY OBJECTIVES

The study attempts to achieve the following objectives:

a) To examine the awareness of e-mail reference services in Malaysian higher educational institutions
b) To identify the usage of e-mail reference services in academic libraries in Malaysia

c) To determine the effectiveness of e-mail reference services in academic libraries in Malaysia

RESEARCH QUESTIONS

The study explores the following research questions:

a) How aware are the students of the availability of e-mail reference in academic libraries in Malaysia?
b) How are e-mail reference services used by students of universities?
c) How effective is the e-mail reference services offered by academic libraries in Malaysia?

LITERATURE REVIEW

Academic libraries have experienced major changes in technology over the last two decades. The emergence of the Internet and its related technology has challenged academic libraries to provide digital reference services to their university populations. Nowadays, more and more academic libraries are developing their own websites and the interest has shifted from processing printed materials to providing access to information via the web.
Tenopir and Ennis (2002) conducted four surveys over a decade (in 1991, 1995, 1997 and 2000) to the academic members the Association of Research Libraries (ARL) provide insights about changes that have occurred in academic library reference services due to new and rapidly evolving technologies. The surveys contained both open-ended questions to gather opinions and factual questions to measure what libraries offer. Libraries adopted digital information sources and services at an increasingly accelerated rate in the 1990s due to the availability of the Internet, in particular the World Wide Web. Digital sources have brought about changes in the physical environment of the reference room, in the type and range of resources available, and in the attitudes and expectations of reference librarians and users. The Web is changing what resources are searched, how results are distributed, how instruction is delivered, and relations with faculty. The reference librarians surveyed think that as the reference environment has changed, it has helped them to provide better services to users.

In 2002, Janes surveyed a total of 648 reference librarians in USA on the use of digital and networked technologies and resources in the libraries. Some 83% of academic libraries at that time offered digital reference service. Others were still in the planning stage. The researcher found that the use of digital reference service by the university students had reduced the number of reference questions received by 39.1%. Some 78.8% of the reference librarians surveyed had used e-mail while only 46.6% used web forms. A majority of the respondents strongly agreed that the use of digital technologies had made reference work more accessible, more challenging and more interesting. According to the respondents, 80% of ready reference questions would be well served by digital reference services.

Johnson (2004) carried out a survey at two four-year public universities in South Atlantic region in USA. The survey inquired about university affiliates' awareness of, use of, and the interest in reference services, with a particular focus on online chat reference (synchronous digital reference). Survey respondents reported strong prior use of face-to-face reference and

a desire to use this service first when pursuing research topics. Awareness and use of the online chat reference service at each institution was comparatively low, but respondents forecasted the service would be among the most heavily used in ten years.

Looking at the earlier studies, the researcher found the following: (1) There were no local studies on e-mail reference. Most of the studies were conducted in the context of United States and United Kingdom, (2) There were lack of studies on the perception, usage, satisfaction and effectiveness of e-mail reference.

METHODOLOGY

The case study was designed to collect information needed to fulfill research objectives and to provide responses for research questions. Case study is a valuable method of research, with distinctive characteristics that make it ideal for many types of investigations. Eisenhardt (1999, 138) noted that case studies typically combine data collection methods such as questionnaires, interviews, observation and archives. The evidence may be quantitative (e.g. numbers), qualitative (e.g. words), or both.

The population of this study comprised the following: a) The students (n=1,250) of the Faculty of Information Management, UiTM and Faculties of Computer Science and Information Technology in UiTM, UM, UKM and UPM.

Questionnaires were chosen as the main research instruments in data gathering. To measure the effectiveness of DRS the researcher developed the questionnaires based on series of quality standards that can be used to evaluate quality of DRS by McClure, Lankes, Gross and Choltco-Devlin (2002) and Kasowitz, Bennett and Lankes (2000).

DATA ANALYSIS AND FINDINGS

The findings of the study are presented according to the research questions. Analysis for the survey questionnaires was done using the Statistical Package for Social Sciences (SPSS) version 12.0 for Windows. The descriptive analysis has been performed to produce significant result that can be used to reflect the research objectives.

Data Analysis for Questionnaire

A total of 1,250 questionnaires were distributed to students of the Faculty of Information Management, UiTM and Faculties of Computer Science and Information Technology in UiTM, UM, UPM and UKM.

A total of 670 (53.6%) questionnaires were returned of which 121 (18.1%) were from Faculty of Computer Science and information Technology, UM, 223 (33.3%) were from the Faculty of Information Management, UiTM, 105 (15.7%) from Faculty of Computer Science and Information Technology, UPM, 108 (16.1%) from Faculty of Information Science and Technology, UKM, and 113 (16.9%) from Faculty of Quantitative Sciences and Information Technology, UiTM.

Demographic Data

The demographic data of students' respondents are as follows:

Table 1: Demographic Data of Students

Demographic variable	Categories	Percentage (Frequency)
Gender	Male Female	34.3 (230) 65.7 (440)
Age	Below 20 20-22 23-25 Above 26	35.2 (236) 45.1 (302) 14.2 (95) 5.5 (37)
Student Level	Undergraduate Postgraduate	82.7 (554) 17.3 (116)
Semester	Semester 1 Semester 2 Semester 3 Semester 4 Semester 5 Semester 6 Semester 7	4.6 (31) 38.7 (259) 24.9 (167) 11.9 (80) 7.8 (52) 7.0 (47) 1.8 (12)
Currently Living	On Campus Outside	62.8 (421) 37.2 (249)
Mode of Study	Full Time Part Time	80.9 (542) 15.5 (104)

Table 1 shows that majority of the respondents 440 (65.7%) were female and 230 (34.3%) were male. This is expected due to the fact that the numbers of female students were larger compared to male student in Malaysian public universities. In terms of age, 236 (35.2%) of the respondents were below 20 years. The largest group of respondents 302 (45.1%) belonged to the age group of 20-22 years, 95 (14.2%) of the age group of 23-25 years and only 37 (5.5%) respondents were in the age group of 26 years and above.

Majority of the students 554 (82.7%) were undergraduate and 116 (17.3%) were postgraduate students. The breakdown of the respondents represented a reasonable cross-section of users in the campus. In this study, 31 (4.6%) of the students were in semester 1, 259(38.7%) semester 2, 167 (24.9%) semester 3, 80 (11.9%) semester 4, 52 (7.8%) semester 5, 47 (7.0%) semester 6 and 12 (1.8%) from semester 7. Most of the students 421 (62.8%) were staying on campus and 249 (37.2%) outside. In terms of mode of study, 542 (80.9%) of the students were full time and 104 (15.5%) were part time students. **Awareness of E-mail Reference**

Respondents were asked whether they were aware of their university library's offering e-mail reference or not. As can be seen in Table 2 that majority of the respondents were aware of their university library's offering e-mail reference.

Table 2: Awareness of E-mail Reference (N=670)

Awareness of E-mail	Frequency	Percentage
Yes	456	68.1
No	214	31.9

Usage of E-mail Reference among Students

Respondents were asked to tick the appropriate formats of reference service/digital reference services that they have used. Referring to Table 3, the study found that face-to-face consultation were used by 426 (63.6%) respondents, telephone consultation 77 (11.5%) and correspondence 48 (7.2%). Web forms were used by 273 (40.7%) of the respondents, Ask-A Librarian 265 (39.6%), online chat reference by 40 (6.0%) respondents and 15 (2.1%) others.

Table 3: Usage of DRS

Reference Services/DRS	Frequency	Percentage
Face-to-face consultation	426	63.6
Telephone consultation	77	11.5
Correspondence	48	7.2
E-Mail Reference	175	26.1
Web form	273	40.7
Ask-A Librarian	265	39.6
Online Chat Reference	40	6.0
Others	15	2.1

The finding is similar to Johnson (2004) who found that the survey respondents reported prior use of face-to-face reference and a desire to use this service first when pursuing research topics.

Table 4: Frequency of Use

	Frequency	Percentage
Always	33	4.9
Frequently	93	13.9
Sometimes	185	27.6
Rarely	211	31.5
Never	117	17.5

Referring to Table 4, 33 (4.9%) of the respondents always used DRS, 93 (13.9%) frequently, 185 (27.6%) sometimes, 211 (31.5%) of the respondents used DRS rarely and 117 (17.5%) never used DRS last semester.

Table 5: Time of Use

	Frequency	Percentage
12.00 am – 6.00 am	48	7.2
6.00 am – 12.00 noon	53	7.9
12.00 – 6.00 pm	157	23.4
6.00 pm – 12.00 mn	80	11.9
Not sure	286	42.7

Table 5 shows that 48 (7.2%) of the respondents used the service from 12.00 am to 6.00 am, 53 (7.9%) used the service from 6.00 am to 12.00 noon, 157 (23.4%) from 12.00 to 6.00 pm, 80 (11.9%) from 6.00 pm to 12.00 midnight and 286 (42.7%) were not sure of the time they used DRS.

Table 6: Do Not Use the Service

	Frequency	Percentage
Do not need for it	118	17.6
Not Interested	119	17.7
Don't Know How to Use	118	17.6
Complicated	102	15.2
Others	25	3.6

For the respondents who did not use the services, as shown in Table 6, the reasons were 118 (17.6%) do not need for it, 119 (17.7%) not interested, 118 (17.6%) do not know how to use, 102 (15.2%) complicated and 25 (3.6%) others.

Effectiveness of E-mail Reference Services in academic libraries in Malaysia.

In this study, the three factors used to measure the effectiveness of DRS are: users' perception, users' satisfaction and library's performance.

Users' Perception

In this section, respondents were asked to rate the quality of service/information they acquire from DRS. The study found that 338 (50.4%) of the respondents regard the service as somewhat high quality, 216 (32.2%) high quality and 31 (4.6%) as very high quality. It is also found that 19 (2.8%) of the respondents regard the service as poor quality and 3 (0.4%) as very poor quality.

Table 7: Quality of Service

	Frequency	Percentage
Very High quality	31	4.6
High quality	216	32.2
Somewhat High Quality	338	50.4
Poor quality	19	2.8
Very poor	3	0.4

Respondents were also asked to rate the usability of DRS. The study found that 312 (46.6%) respondents regard the usability as somewhat easy, 214 (31.9%) as easy, 44 (6.6%) as difficult, 35 (5.2%) as very easy and 4 (0.6%) as very difficult.

Table 8: Usability

	Frequency	Percentage
Very Easy	35	5.2
Easy	214	31.9
Somewhat easy	312	46.6
Difficult	44	6.6
Very Difficult	4	0.6

In terms of typical access time, majority of the respondents 339 (50.6%) rated it as somewhat fast, 145 (21.6%) as fast and 25 (3.7%) as very fast. 96 (14.3%) of the respondents rated it as slow and 3 (0.4%) as very slow.

Table 9: Typical Access Time

	Frequency	Percentage
Very Fast	25	3.7
Fast	145	21.6
Somewhat Fast	339	50.6
Slow	96	14.3
Very Slow	3	0.4

Users' Satisfaction

In order to investigate how satisfied the users were with DRS the survey asked the respondents to indicate their level of satisfaction. From the table 10, it can be seen that overall respondents were very satisfied, satisfied or somewhat satisfied with the DRS provided by the libraries.

Table 10: User Satisfaction of DRS

	Very Satisfied	**Satisfied**	**Somewhat Satisfied**	**Unsatisfied**	**Very Unsatisfied**
Access to Information	34 (5.1%)	221(33%)	206 (30.7%)	27 (4.0%)	4 (0.6%)
Availability of Resources	34 (5.1%)	210 (31.3%)	204 (30.4%)	37 (5.5%)	4 (0.6%)
Accuracy	32 (4.8%)	201 (30%)	204 (30.4%)	23 (3.4%)	3 (0.4%)
Current Information	45 (6.7%)	217 (32.4%)	226 (33.7%)	23 (3.4%)	2 (0.3%)
Response Time	24 (3.6%)	185 (27.6%)	196 (29.3%)	52 (7.8%)	5 (0.7%)
Answer Given	25 (3.7%)	194 (29%)	218 (32.5%)	41 (6.1%)	5 (0.7%)
Efficiency of library staff	27 (4%)	218 (32.5%)	217 (32.4%)	23 (3.4%)	4 (0.6%)
Knowledge of library staff	30 (4.5%)	222 (33.1%)	202 (30.1%)	23 (3.4%)	1 (1%)
Courtesy of library staff	21 (3.1%)	194 (29.0%)	202 (30.1%)	29 (4.3%)	1 (0.1%)
Cooperation of library staff	27 (4%)	221 (33%)	228 (34%) 190 (28.4%)	39 (5.8%)	5 (0.7)

Library's Performance

The study found that most of the respondents also agree that the libraries have provided sufficient access to electronic resources, information literacy skills' programs and guidance and training on how to use DRS.

Table 11: Library's Performance

	Strongly Agree	Agree	Somewhat Agree	Disagree	Strongly Disagree
Library provide sufficient access to electronic resources	43 (6.4%)	348 (51.9)	192 (28.7%)	29 (4.3%)	5 (0.7%)
Librarians offer sufficient information literacy skills	35 (5.2%)	240 (35.8)	274 (40.9%)	61 (9.1%)	6 (0.9%)
Library provide sufficient guidance and training	34 (5.1%)	229 (34.2)	250 (37.3%)	90 (13.4%)	9 (1.3%)

Perceived Needs of E-mail Reference among university students in Malaysia

In this section, respondents were asked on the options of assistance that they would most likely choose. Table 12 shows that majority of the respondents would like to choose face-to-face consultation 422 (62.9%). It was followed by E-Mail Reference 186 (27.8%), online chat reference 81 (12.1%), telephone consultation 61 (9.1%) and others 27 (4.0%).

Table 12: Options for Assistance

	Frequency	Percentage
Face-to-face Consultation	422	62.9
Telephone Consultation	61	9.1
E-Mail Reference	186	27.8
Online Chat Reference	81	12.1
Others	27	4.0

Respondents were asked to predict the most heavily used of reference services in the next five years. The study found that 285 (42.5) of the respondents choose online chat reference, 263 (39.3%) respondents choose video conferencing and 257 (38.4%) choose E-Mail reference. It was followed by face-to-face consultation 163 (24.3%), telephone consultation 95 (14.2%) and others 39 (5.8%).

Table 13: Most Heavily Used in Five Years

	Frequency	Percentage
Face-to-face	163	24.3
Consultation	95	14.2
Telephone	257	38.4
Consultation	285	42.5
E-Mail Reference	263	39.3
Online Chat Reference	39	5.8
Video Conferencing		
Others		

The respondents were also asked to give their perception to describe the future. The study found that 484 (72.2%) of the respondents thought that as technology makes more information accessible, people will need less human help in doing research. 125 (18.7%) thought that as technology makes more information accessible, people will need more human help in doing research. 29 (4.3%) thought no human help at all. The finding is similar to Johnson (2004) who noted that respondents forecast DRS would be the most heavily used in 10 years.

Table 14: Best Describe the Future

Statements	Frequency	Percentage
As technology makes more information accessible, people will need less human help in doing research	484	72.2
As technology makes more information accessible, people will need more human help in doing research	125	18.7
No human help at all	29	4.3

IMPLICATIONS

It is hoped that the findings of the study can be a useful guide for the Ministry of Higher Education and university administrators to draw up policies for provision of academic library services in the country. For the university administrators, especially the Chief Librarians who involved in planning and implementing online services in academic libraries in Malaysia, this research provides insights into a range of digital reference services' format that can assist students' awareness, learning and motivation. Leadership is the key factor to improvement and effectiveness in the institutions of higher learning. Chief Librarians play a crucial role in establishing new systems and policies as well as a positive and healthy work environment for better organizational performance.

This research also provides academic librarians (particularly those working in the Reference Division/unit) with snapshots of the effective digital reference services' formats that can be used by students and at the same time can increase students' knowledge, awareness and motivation. The process of solving problems would be time consuming if done manually but with the advancement of ICT had allowed the libraries and other organizations to get things done faster. Although it will burden the library, it will definitely help improve their service and encourage them to work harder. The study findings also show that professional reference librarians were still needed to handle complicated searches and to help users deal with information overload.

For the students/users, they should work hard to move forward in the ICT era. With the development of information and communication technology, people could find out the answers or what is happening on all parts of the world in just seconds. If the students want to keep up with the pace of the world, they must shift from doing things manually to using the computer technology. Students can ask questions by visiting the websites of their own library or the library elsewhere.

The present services for example E-Mail reference, Web forms and Ask-A Librarian have to be more effective and efficient. Based on students' comments, the DRS offered need to be improved in terms of systems instability, answers given need to be fast (faster answer), accurate and complete and user friendly services. The students also need more sophisticated DRS /synchronous DRS (real time) online chat reference and web cam services. They also suggest for working culture change in the library.

The findings of the study revealed that in spite access to DRS, most students still prefer to use face-to-face formats. One possible reason for this might be due to the lack of knowledge about their availability and/or unfamiliarity with their capabilities and proper use. Users should be exposed to the benefits and effectiveness of DRS in getting current and up-to-date information. In fact, user education program may also be useful in this regard. Such user education program may help library users learn the effective use of DRS.

It was also noted that a considerable number of respondents raised the issue of promoting the service to the user, providing training programs and giving more help guidance to users which are related to the above issue. The training of the end users in the use of DRS and online resources should be one of the central activities in academic libraries so that students and other users can effectively search and utilized these resources.

The findings can also be used as inputs on how far ICT can be used in teaching and learning. DRS hold great promise in enhancing learning as well as improving the quality of education. There are a number of learning characteristics that can be identified in DRS in enhancing learning especially in the institution of higher learning such as active learning promotion, interactivity and can increase motivation.

FUTURE RESEARCH

The results of the study suggest a more detailed coverage of DRS in academic libraries which will include other public universities, teacher training institution libraries, private universities

and colleges in Malaysia. Further research also should include students from other faculties such as from social sciences and humanities, science and technology faculties. Lecturers as well as general staff can also be involved.

RECOMMENDATIONS

Below are some recommendations for further improvement of DRS in academic libraries in Malaysia:

1. Adequate training should be conducted in public academic libraries in Malaysia to make staff feel confident of using the new technology as well as to persuade positive attitude and enthusiasm towards the use of DRS. They also need to be trained on interview techniques, communications' skills, organization of information as well as other aspects of knowledge so that they will provide standard answers/information to the users and this will increase the quality of service.
2. The main responsibilities of the academic library managers is to promote and encourage the use of all library services including DRS. The introduction of DRS requires users to be informed of their existence by means of well coordinated promotional programs.
3. The academic libraries that have introduced access to DRS should make an effort to educate users on how to use it. There is also a need to educate the users on asking serious reference questions, instead of simple frivolous enquiries that can be done by themselves with knowledge of library use.
4. The academic libraries in Malaysia should also use the latest formats of digital reference services such as online chat reference, video conferencing and collaborative DRS.
5. The academic libraries in Malaysia should stabilize the system and infrastructure of the services. The academic libraries need to increase their own IT staff that would solve any technical problem.
6. Academic libraries in Malaysia should co-operate each other in offering the digital reference services. Collaborative DRS provide many benefits, such allowing individual institutions to share expertise and resources, expanding hours of service and providing access to a larger collection of knowledge resulting from digital reference services (e.g., question-answer archives).

CONCLUSION

This study has identified the effectiveness of e-mail reference services in academic libraries in Malaysia. It provides data on the extent to which format of e-mail reference has contributed to reference services in online environment. The study also has revealed several important profiles, practices of librarians and students from information studies, computer science and information technology background with regard to DRS in academic libraries. It contributes to the understanding of the awareness, uses, satisfaction and perceived needs of DRS in academic libraries in Malaysia. The effective use of DRS in academic libraries helps to increase motivation and a lifelong love of learning. It is hoped that this study will contribute positively towards the development of online services in academic libraries in Malaysia. The study is also hoped to encourage future research in the area of reference services by both researchers and librarians.

ACKNOWLEDGEMENT

We wish to thank librarians and students in University of Malaya (UM), MARA University of Technology (UiTM) who gives me an opportunity to present the paper in this conference, National University of Malaysia (UKM) and University Putra Malaysia (UPM) for participating in this study.

HUMAN CAPITAL SCENARIO ANALYSIS FOR PERFORMANCE ANALYSIS AND MANAGEMENT

MSc Marko Kesti, Researcher at University of Lapland, Finland
marko.kesti@mcompetence.com

Dr Antti Syväjärvi, University of Lapland, Finland
antti.syvajarvi@ulapland.fi

PhD Jari Stenvall, Management Science at University of Tampere, Finland
jari.stenvall@uta.fi

ABSTRACT

Purpose – Article describes human capital scenario analysis that is used at performance development and human related risks identification. Organization is complex system including human intangible assets. Scenario analysis is needed for understanding organization as a system.

Design/methodology/approach – Human capital scenario analysis is part of M. Kesti Doctoral thesis study and is using system dynamics methodology. Organization intangible assets are included as competences which are identified as management, leadership, culture, skills and processes. Competences can be measured by tacit signals. Scenario analysis equations are developed at empirically grounded research that has been done at several years period.

Findings – Scenario-tool connects human competencies and other HR-metrics to business scenario forecast. Through interaction with the scenario-tool the managers can improve their mental models and learn about the organization behavior in long term perspective. Human resources and competences can be analyzed so that the factors affecting to the performance comes in attention at management decision making.
Research limitations/implications – Scenario analysis principles are developed during steady economical growth period in Finland. Equations are tested and improved at global depression where many steady growing companies were downsizing business to changed market. Analysis mental models and equations are created using literature and empirically grounded research at several business organizations and is applicable at companies where revenue is created through human resources.

Originality/value – Article describes how human resource metrics and competences affect to business scorecards. Competences development improves the performance which is visualized at business results. Competences can be measured and developed using tacit signals so the managers have possibility to affect the positive scenario realization.
Keywords – tacit signal, competence, human capital, employee performance, scenario analysis.

INTRODUCTION

Human capital productivity has been calculated with metrics like revenue, sales margin, staff expenses, transfer, absence, revenue/person e. g. (Kesti 2007). One of the best human productivity indicators is HCROI (Human Capital Return On Investment), which is sales margin divided by staff costs. Following these metrics is essential but there should also be understanding on how these scorecards can be affected and how they affect to business. Jack Welch (2005) point out that human capital metrics should be as important for management decision making as financial data. If human related metrics could be linked to business scorecards they will be more considered when deciding investments on human resources. Investments in human capital are shown to be profitable and important in preventing business risks. (Kesti et al. 2009, Kesti & Syväjärvi 2008, TYKES 2009).

Tacit signal based organization development research has raised the possibility to estimate human capital risks and business possibilities in advance (Kesti et al. 2009). This scenario-analysis includes human related metrics like absence and transfer but also organization competences as intangible assets. This research study will present Human capital scenario-analysis (HC-scenario) where mathematical link is created between HR-metrics and business scorecards. Scenario helps in planning human capital development investments and avoiding human related risks like workforce ageing or staff transfer. This way management gets more strategic view to organization human capital development.

Scenario analysis is used for analyzing possible alternative future outcomes. Using scenario analysis at business possibilities and risks forecasting support management in their decision making so that desired outcome can be achieved. Shell has used scenario planning for helping managers constructing new mental models for alternative future trends (Senge, 2006). Managers should observe possible crises assuming worst possible scenario can happen and take responsibility on preventing the crisis or recovering from it the best possible way (see Welsh 2005).

Human resource scenario planning consist the intelligence how human capabilities affect to business. This has been difficult to analyze because the pluralistic nature of human resources. For understanding human working capabilities and limitations it is essential to know in-depth the complex factors of the overall work system (Kleiner, 2006). Managers should be able to generate knowhow of the organization as a system to see the actions implications in longer term. Generative learning is not gained if only event thinking is driving the decision making (Senge 2006).

HUMAN CAPITAL SCENARIO ANALYSIS THEORETICAL BACKGROUND

It is strategically wise to improve human capabilities in advance. Underestimating human behavioral psychology is shown to be pad for the business (Goleman 2002). Stress and mental workload has great effect on productivity and therefore it is important for management point of view (Putkonen, 2009). In Everaert and Bruggeman (2002) case study the high time pressure with cost targets lead to a longer project time without a desired cost advantage. It seems that mental workload can be kept at a manageable level by predicting or avoiding possible unfavorable work situations (Young and Santon, 2001).

System dynamics is a method for modeling complex systems by using computer aided simulation. During the mid-1950s Jay Forrester was able to show with his simulation calculations that instability in General Electric employment was due to the internal structure of the firm and not due to external forces as business cycle (Forrester, 1961). His system dynamics used stock-flow-feedback structure of GE plants with equations describing corporate decision-making system for hiring and layoffs. Personnel performance has been modeled using system dynamics approach which consider workload and exhaustion (Rodrigues et al., 2006; Lyneis et al., 2001; Sterman, 2000).

Human Capital Scenario Analysis aim is to describe complex organization system contributing business results using system dynamics methodology. It links organization human resource (HR) metrics, competences and organization competence development to the business scorecards. Organization competences are guiding the human resources utilization efficiency as known performance drivers. These competences are management, leadership, culture, skills and processes (Kesti & Syväjärvi, 2009).

Organization competences can be measured and improved by tacit signal based development process. Scenario analysis principles are developed at large Finnish company with 19 business units during steady economical growth period in Finland (years 2005 – 2008). Later on the equations are tested and improved at global depression where many steady growing companies were downsizing business to changed market.

System dynamics validation has two main viewpoints: structure and behavior validation (Barlas et al., 2000). Structure validation means that the model includes necessary factors that consist also in the real world system. Human Capital Scenario Analysis hypothesis are developed during several years with multiple empirically grounded field tests, corrections and adjustments of the equations. Boundary tests have been done using existing field data and increasing or reducing chosen variables and finding out that outcome is predictable and derivative. Sensitivity tests have been carried out by statistical average business data of some different branch of business. According Sterman (2000) the simulation model can be gradually evaluated with expertise and available field data. This is necessary since the expertise and field data increase requires time to evolve (Sterman, 2000).

HUMAN CAPITAL SCENARIO ANALYSIS

The basis of the scenario analysis is that there has to be causal relationship between human resources and business results. Analysis main calculation principles should meet the three cause-effect rules which are (Cascio and Boudreau, 2008):

- effect does not happen until after the cause
- cause and effect is actually shown to be related
- cause-effect has no rival plausible rival hypothesis

Human Capital Scenario Analysis has following three meta-principles that in most companies meet the cause-effect requirements:

- Revenue comes from staff activities (effective working time)
- Staff cause direct costs (pay and benefits)
- Staff activities cause indirect costs (quality costs)

In addition to these meta-principles the analysis utilizes a number of simultaneously affecting sub-hypothesis:

- Organization performance continuous development will
- reduce employee absence and transfer
- increase competences
- bring quality cost savings (reduce quality costs)
- Transfer will increase work orientation time which decrease effective working time.
- Absence will decrease effective working time.
- Competence improvement will increase effective working time.
- Competence are improved by systematic own development and training.
- Reducing the number of employees will increase competence development needs.
- Increasing the number of employees will increase competence development needs.
- Increasing effective working time will increase the revenue.
- Business branch depression will decrease the capacity utilization.

Before actual scenario estimations the analysis tool adequate reliability can be checked using realized scorecards. Some of the calculation variables may be estimated if the exact value is not available. In the estimation there can be used the business branch statistics or some suitable research studies. If competences are not measured it is also possible to estimate them roughly by using three years realized business and HR scorecards.
Finnish ministry of trade and industry launched research indicate that known quality costs are approximately 6 % from revenue and the main cause for these quality costs are human error and waste labor (Andersson at al. 2004). By continuous organization competence improvement the quality costs can be reduced significantly. Beside the quality cost the reduced absence and transfer will also bring cost savings. Studies show also that high competence working society will orientate new worker much faster and this way profitable growth is possible (Kesti et al. 2009).

Competencies and effective development

Organization intangible performance drivers can be identified as competences which are management, leadership, operating culture, skills and processes (Kesti & Syväjärvi 2009). Competences include critical attributes which are essential for productivity and growth. These work quality and engagement improving competence attributes can be listed and they seem to be quite similar for different type of organizations (Kesti 2005, 2007; Bakker & Demerouti 2007; Hackman & Oldham 1980). Competences can be measured from each organization group using tacit signal method (Kesti et al. 2008). Measured competences are linked to the scorecards like quality costs, work absence, disembarkation rate and profitability. Therefore measuring tacit signals fits well for the Balanced Scorecard measures for the learning and growth perspective (Kaplan & Norton, 1996). In system dynamics point of view the competences determine the human resource capacity utilization as flow parameter like valve controlling the flow between two tanks.
Competence development is done with systematic process that will lead to the most optimal improvement actions at each working unit (Kesti & Syväjärvi, 2009). When each group starts optimal improvement there seems to be positive cumulative effect to the organization productivity (Kesti and Syväjärvi, 2009; Welch and Welch, 2005).

Empirically grounded studies at several private and municipal organizations indicate that tacit signal development process where each group collectively agree optimal improvement action requires approximately 0.25 % yearly working time from each group member (Kesti and Syväjärvi, 2009; Kesti, Syväjärvi and Stenvall, 2009). This means for example at 8 person team that one week working hours are needed to find out, agree and implement the chosen improvement action. In scenario analysis the effective development correspond to this phenomen in average.

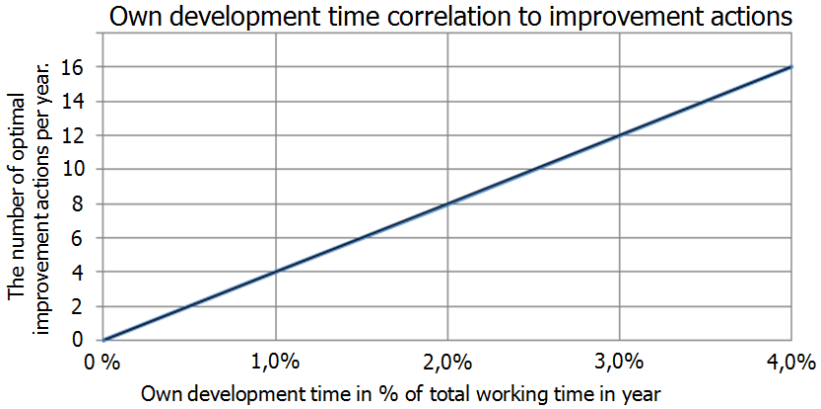

Figure 1. Effective own development time correlation to improvement actions at each team.

This means that succeeding to implement 4 optimal improvement actions throughout the organization, will need 2.5 days or 18 to 20 hours invested to systematic development for each group and its member. The systematic development process can be seem as one accomplished improvement action since agreeing the optimal development seems itself improve the group performance (Kesti & Syväjärvi 2009).

Effective systematic work practices development means that 1 % invested in own development contributes 4 optimal improvement actions at each working community in year. These actions are best value practices for the group. Contingency theory implies that there is no absolute best solution or design but rather multitude of possibilities where we can choose the most valuable choice that is contingent on the situation being analyzed. (Hunt 1992). If group use 4 % (10 days) to development but achieves only 4 improvements in practice, the effective own development is 1 % at scenario analysis. Development can include improvements at different areas of importance like working practices, co-operation, communication, skills and tools depending on the groups needs.

Empirically grounded studies indicate that working group structural changes affect to the competencies and increase their development needs. Therefore the changes at group size tend to reduce the competencies (Kesti & Syväjärvi, 2009). At the scenario analysis the group size increase and decrease reduces the competence at the same rate. Both changes need some rearrangement of the work practices and organizing which cause the development needs at the existing competences. In learning organization this phenomen create possibilities for learning and development. Each working community reflects the competencies towards the existing needs and challenges. The more they feel development needs the smaller the percentual competence level is.

Next figure illustrates how 70 % level competence development can be simulated. If for example group size decreases 7 % then investing 1 % (2.5 days) to own development will increase the competence to 78 % (8 % increase). If new staff is more than the decrease of group the new staff percentage is used for it gives the lowest absolute value as decisive factor. In the scenario analysis it is recommended that no higher competence values than 95 % is used for in practice the higher values have been very unusual.

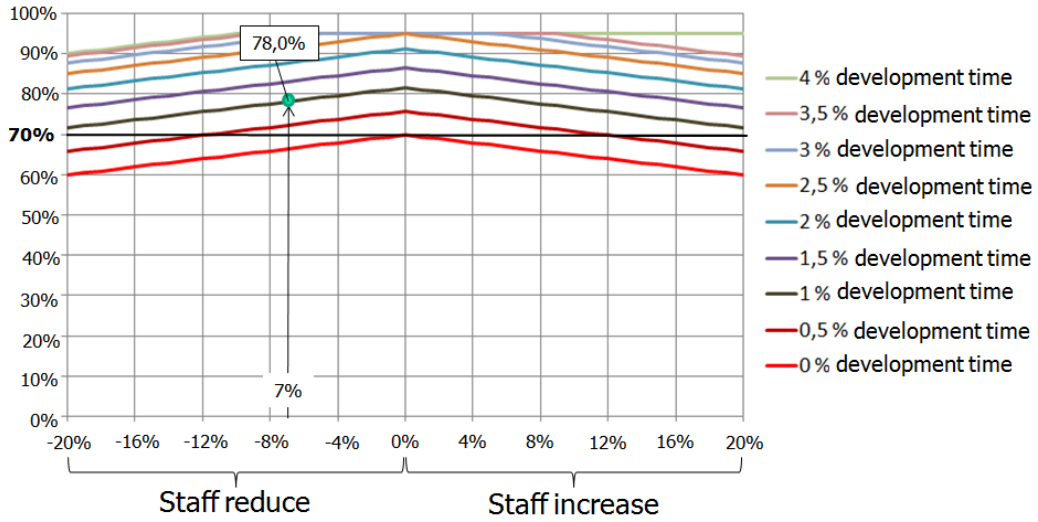

Figure 2. Competence (70%) change when combining the development and group changes.

Effective own development affect to competences is according sine curve and staff increase and reduce affect linear. When these two phenomen are simultaneous the result can be shown by set of curves.

In Human Capital Scenario analysis the performance increase or decrease can be analyzed proactively so that the causal connections to human capital and competences development can be seen. Management competence is important for organization strategy and sustainable development. Leadership and culture competences include attributes that are essential for group emotional intelligence (see Goleman 2002). Process competence attributes are chosen so that they corresponds the group working tasks and procedures for example production or sales. Processes are also seen as social competence because process development should be collective. Skills are more personal related and therefore skills development is estimated according effective training time consumed. In scenario-analysis the competences are estimated for each competence area separately.

Introduction of performance indicators HCROI, HCROI(2) and OSVA

Human capital productivity ratio HCROI (Human Capital Return On Investment) tells how staff investment creates sales margin (Fitz-Enz 2000). HCROI is calculated by dividing sales margin (€) by staff costs (pay and benefits, €).

$$\text{HCROI} = \frac{\text{Revenue} - (\text{Materials and supplies} + \text{Outsourcing costs})}{\text{Staff costs}}$$

Sales margin is revenue reduced by organization variable costs (materials, supplies and outsourcing costs). Therefore sales margin includes part of the quality costs (material waste ect.). HCROI is good employee profitability index. Sales Margin level is determined at initial data, which is then used at basis for calculating the performance development.
In the HCROI equation the staff costs are denominator so the staff increase will drop the ratio until staff increase investment starts to pay back which should happen soon after new persons are fully trained and oriented to the organization. To see that HCROI has this investment related phenomen we have created additional HCROI which includes the affect of staff increase investment.

$$\text{HCROI(2)} = \frac{\text{Revenue} - \text{Variable costs}}{\text{Staff costs}} * (1 + \text{Staff increase\%})$$

It should also be noticed that HCROI varies quite a lot between different business branches.
Outsourcing has become very popular way to reduce costs. Sometimes it has been argued whether the outsourcing has been valuable or not. We have created ratio for evaluating outsourcing return on investment. This ratio is called OSVA (OutSourcing Value Added) and it follows the same principle as HCROI and is calculated with following equation.

$$\text{OSVA} = \frac{\text{Revenue} - (\text{Materials and supplies} + \text{Staff costs})}{\text{Outsourcing costs}}$$

All there human capital and outsourcing return on investment ratios should be followed together.

Initial data for human capital scenario analysis

Initial data to the scenario comes from last annual account figures added with business prospect and certain human related estimations like new worker orientation time. For example if orientation time is decreased from 12 months to 10 months it should be justified. Initial data specifies the possibilities to improve performance and reduce the costs. For example if competences are low there are possibilities to improve the performance.

In the tool the red marked data is for realized data and after that the scenario-data is either calculated automatically or can be input manually. Scenario includes following initial data:
Organization size is average full time equivalent (FTE) personnel per year. It includes all wageworkers. Part time workers are included calculated by working time divided by total working hours (1850 h). For example if part time worker has done 140 h, her full time equivalent is 140/1850 = 0,076 FTE worker.
Revenue is from one year period.
Sales margin is revenue reduced by organization variable costs. Therefore sales margin includes part of the quality costs (material waste e.g.).
Employee costs include pays and benefits with additional labor costs.
Quality costs can be estimated for example using PAF quality cost division. Finnish ministry of trading and industry has studied that average known quality costs are 6 % from revenue. (Andersson et al., 2004) However there are major differences between business areas and

companies. In the analysis the value of 6 % from revenue is used at default value. Chosen value estimates the organization cost savings potential.

Generally quality costs can be divided to following areas (PAF):
a. The cost of preventive actions (prevention costs)
- Training, guiding, instructing, quality system, preventive maintenance, auditing, cleaning, alarm systems, maintaining order.
b. Appraisal costs)
- Checking, testing, measuring, quality control, piloting, sample taking and analyzing.
c. Internal failure costs)
- Waste, scrap, redoing, fixing, rechecking, defects finding, correction, repairing.
d. External failure costs
- Customer reclaims corrections, returned products, guarantee costs.

Orientation time means average period for new employee to become experienced. This means that after orientation time the new worker can achieve same effectiveness in work as experienced staff. Orientation time depends on business area competence requirements. Scenario analysis maximum orientation time is two years (24 months).

Labor cost increase are normally in accordance with general consumer prize costs.

Business area market change can be estimated for example by business statistics. When business area change is positive the organization can fully benefit the effective working time increase (capacity). When business market is in depression the organization effective capacity convert to revenue is downsized by the negative change.

Additional labor costs are taken from human resource account. Additional labor costs are needed for calculating average employee salary per hour. Salary is used when absence and employee transfer cost savings are estimated. Default value 21.5 % is taken from general statistic (StatFin 2007).

Increase of personnel has great affect to the business scorecards for it increases the orientation time and decreases competences. Organization size is a strategic figure which should be planned in several years ahead. Increasing personnel is investment which payback time is usually several years or at least the general orientation time. Therefore this investment return should be ensured as good as possible.

Average employee absence is calculated in percentage from total working time. Both short and long absence is included. For example if there has been 970 days absence in 100 persons organization, percentage is calculated following way:(970*7,5)/(100 * 1850) * 100 = 3,93 %.

Employee transfer means that for every person leaving there is taken one new employee so that FTE does not change.

Continuous improvement and training

Continuous performance development means organization own development which leads to improvement actions. In scenario planning the development has to be done effectively. This means that each 1 % time used at development there should be average 4 improvement actions implemented in each working community (team). Training increase skills and other competences are improved by continuous development. Personnel training are given in percentage of the total working time (1850 h per year in Finland). For example if each employee has average 40 hours training per year the percentage is 40/1850 *100 = 2.2 %.

Training affect to skills competence same way as continuous performance development affects to other competences.

Competences (management, leadership, culture, skills and process)

Continuous development improves organization intangible drivers of performance. Competences can be measured using tacit signal method and they affect to work time distribution and costs. Default competences 76.5 % comes from measured average competences from approximately 150 working groups from 20 different organizations covering around 2000 employees. To get more accurately scenario the competences should be measured ones a year.
Outsourcing is outside service costs in general. Value is used at calculating OSVA index. Outsourcing costs are part of variable costs.
Revenue change per year is essential feedback data. This change is calculated automatically based on the effective working time capacity correlation to revenue.

	1. year

Figure 3. Scenario-tool initial data and scenario at example Company.

Cost savings achieved by continuous development

Organization continuous development brings along cost savings which comes from reduced absence transfer and quality costs.

At workforce absence the maximum reduce is 20 % which is possible by effective own development of 2 % from working time. This means at least eight improvement actions per each working community per year. This development must be collective and solution based. Minimum calculated absence is 3 % for it is not intention that employees are working sick. The absence cost savings calculation principle is so that absent persons effective working time has to be done by overtime work by other workers. Reduced absence decrease next year staff costs.

Employee transfer is depending on workforce commitment and many other things. Continuous development is estimated to reduce transfer. Maximum reduce is 25 % which is possible by at least 2 % effective development per year in each working community. In employee transfer the 3 % level is desired for maintain organization renewing. Each transferred person costs half a year average salary cost (Fiz-Enz, 2000). Transfer cost savings increase sales margin by reducing variable costs.
Quality costs can be decreased by effective continuous improvement and employee training. Continuous own development affects 80 % and training 20 % to the quality cost. One percent working time investment to training and own development will reduce quality costs for 10 %. This means that 2.5 days training per employee and four improvement actions per working community is needed for 10 % quality cost savings. Maximum savings is 20 % per year which needs 2 % training and development time investment. Quality costs decrease will increase the sales margin.

Improving competencies reduces quality costs, absence and transfer. Competence improvement by continuous development increases the performance with cost savings. To illustrate the phenomen the cost savings are divided to each competence. Management, leadership and operating culture competences development brings 30 % from absence and transfer cost savings and also 20 % from the quality cost savings. Skills and process competences development brings 20 % savings from quality costs. These cost savings calculation and distribution is of course rough and for visualizing how the saving are formed. In our own empirically grounded studies the leadership and culture competences seemed to have clear correlation to the business scorecards (Kesti et al. 2008).
Cost savings are divided to five competences so that management, leadership and culture will each affect one third of absence and transfer cost savings. Quality cost saving are divided even to all five competences.

	1. year	2. year	3. year	4. year	5. year
Organization size	965	1013	1044	1085	1140
Average absence	8,7 %	8,7 %	8,4 %	7,7 %	7,1 %

OSVA	4,041	4,072	4,124	4,189	4,234

Figure 4. Scenario-tool cost saving scenario.

In this cost saving calculation the revenue growth has important meaning since it increase especially the quality cost volume despite the percentual potential reduces.

New worker orientation

Organization work resources are increased in two ways:

- increase effective working time consumption
- increase organization size with new workers

Effective working time consumption is increased by improving the competences and this affects to the absolute working capacity directly without increasing the costs. Increasing organization employees affect to absolute capacity in delay, depending on the orientation time needed. At the beginning the new worker cost is usually more than generated new gross margin. During the orientation time the new worker consumes own time and trainers time on orientating to the work. Total orientation time needed is estimated using linear decline curve. It the orientation time is more than 12 months the exceeding part is transferred to second year (see figure). It the orientation time is less than 12 months the time consumption is ½*Pt, where Pt is the orientation time. After the orientation time the new worker is as effective as experienced average worker.

Working time distribution

Scenario-analysis estimates automatically the employee average working time distribution. Effective working time means time consumed to the work done in accordance with the organization mission, creating the organization revenue. This effective working time includes the necessary breaks which are part of normal effective working. First the time spend to absence, orientation, training, vacation and own development is summed. This sum is multiplied by average competence percentage which set the effective working time. The rest is other working time including waste labor time.

	1. year	2. year	3. year	4. year	5. year
Organization size (FTE)	965	1013	1044	1085	1140
Absence	8,7 %	8,7 %	8,4 %	7,7 %	7,1 %
Orientation	1,7 %	3,3 %	2,6 %	2,8 %	2,9 %
Training	0,5 %	0,5 %	0,7 %	1,0 %	1,0 %
Vacation	12,0 %	11,9 %	12,0 %	12,0 %	11,9 %
Own development time	0,5 %	0,5 %	0,7 %	1,0 %	1,0 %
Other working time (e.g. waste labour)	18,0 %	16,7 %	14,2 %	10,8 %	9,0 %
Effective working time	58,6 %	58,5 %	61,5 %	64,7 %	67,1 %
	100 %	100 %	100 %	100 %	100 %

Figure 5. Scenario-tool working time distribution scenario.

At initial data there is certain effective working time that contributes to the revenue. In accordance to this the change on effective working time changes also the revenue. Effective absolute working time generates certain revenue in linear connection determined at initial data. This way the revenue is influenced by all factors that change the absolute effective working time (FTE, transfer, absence, vacancies, orientation and competences).

BUSINESS RESULTS

In business results the necessary scorecards are collected for five years scenario period. Basic initial data is for organization that is in steady growing market and is improving performance through continuous development and training. This case organization is also investing to personnel increase which is visible in HCROI(2) index.

	1. year	2. year	3. year	4. year	5. year
Organization size (TFE)	965	1013	1044	1085	1140

Growth profitability (Revenue*HCROI, index 1)	1	1,05	1,17	1,33	1,49

Figure 6. Scenario-tool business results scenario.

Strategic human capital risk factors like transfer and absence should not let rise too much because it complicates or even totally prevent organization development. By continuous competence development these risks can be prevented and same time the organization capacity and productivity will be increased.

Scenario-analysis has shown to be realistic and based mostly on actual measured scorecards. Some factors like orientation time and quality costs are not so easy to determine. Those factors are however important to estimate for initial data so that their meaning can be included. Those values are chosen values for as initial data and the changes must be justified

by actions. For example if orientation time is decreased from 12 months to 10 months it should be justified.

CONCLUSION

Article describes the principles of human capital scenario analysis that has been construed to a scenario-tool. This tool is so-called beta version which is under tests and improvements. However it is already shown to be useful for management decision making so that human resource issues could rise as important as financial calculations. Tool represents human resource business intelligence (HR-BI). We believe these kinds of tools are the part of new generation human resource management. It connects human competencies and other HR-metrics to business forecast and survey which helps managers preventing human related risks and utilizing better the possibilities. Improving the business via employee performance development needs management commitment and mental attitude, because the human resources have to be developed in longer term to get sustainable results. This mental attitude can be achieves when human capital can be analyzed so that the factors affecting to the performance comes in attention and can be improved by right investments on human resources.

Management should be able to balance productivity, profitability and fairness by utilizing the resources as good as possible (Naylor 2004). Through interaction with the scenario-tool the decision makers can improve their mental models and learn about the organization behavior as a system in longer-term. For example the business meaning of ageing can be analyzed by increasing the retention and absence which are expected due to workers age distribution. Managers understand better the nature of the organization, which helps in deciding the investments on employee performance development more sustainable perspective. Results are promising; however there are plenty of issues that need more practical research studies and verification. Evaluating the organization system and finding mental models for describing the phenomen has been valuable process in itself.

ABSTRACT

Knowledge and Intellectual Capital (IC) are recommended as the most important assets of innovative organization. Research units in the public university are the main organizations to conduct research for creating new knowledge and innovation in the developing countries. As such, knowledge management (KM) and intellectual capital management (ICM) are likely to play significant roles in enhancing research performance.

This paper presents the findings on integration between knowledge management and intellectual capital management for enhancing the research performance, achieving research goals and creating intellectual properties at three successful science-based research units of public universities in Thailand. Initial findings indicate that IC and knowledge can create a high potential strategy for managing science based R&D processes. IC has a direct and substantial impact on managing knowledge in the R&D processes. KM can improve the quality of intellectual capital. A strong impact of human capital and relational capital can improve the potential of KM practices which help organization to achieve research goals. Human capital supports knowledge creation, relational capital and organizational capital support knowledge acquisition, knowledge transfer/sharing and research collaborations.

These three successful R&D units have extended their research potential to create new R&D knowledge by the integration of human capital and relational capital through in-house research development and a strong interaction with external research partners.

Keyword: Intellectual Capital, Knowledge Management, Innovation, Science-Based R&D

INTRODUCTION

The knowledge management (KM) and intellectual capital management (ICM) are the rising topics being of interest of organizations that derive their competitive advantage. Knowledge becomes not only an important factor but also the main asset of organizations. Knowledge is described as the main source and potential element of creating both innovation and sustainable competitive advantage [Johannessen et al, 1999]. Knowledge is more than information. It is considered as the most important source of innovation that represents the organization's future potential.

Intellectual capital (IC) is simply the collection of intangible resources [Bontis, Dragonetti, Jacobsen, and Roos, 1999]. Many academic researchers and practitioners propose different models and elements to classify intellectual capital**.** Indeed, IC is generally composed of two main sets of intellectual assets: human capital and structural capital [Edvinsson and Sulivan, 1996; Bontis et al, 1999]. Human capital is the collection of intangible resources that are embedded in the members of organization [Edvinsson and Sulivan, 1996; Bontis et al, 1999]. Employee competence, one of elements in human capital, is regarded as the capability to act in a wide variety to create both tangible and intangible assets [Sveiby, 1997]. Structural capital is the infrastructure that organizations develop to commercialize their human capital [Edvinsson and Sulivan, 1996]. Structural capital can be divided into relational capital, organizational capital, and renewal and development [Bontis et al, 1999]. Relational capital represents the relationships between internal and external actors [Roos, 1998]. The organizational capital is referred as knowledge that stays within an organization [Roos, Roos, and Edvinsson, 1997]. In this study, IC is composed of human capital, organizational capital and relational capital. Therefore, intellectual capital management (ICM) requires the capability to manage intellectual capital and transform it into research results such as new products, patents, publications, and innovations.

Successful research units often face a big challenge to sustain their competitive advantages when they lose knowledge workers. In order to build up and sustain competitive advantage, the knowledge and expertise of an organization's staff (human capital) is a critical resource and needs to be preserved as the organizations intellectual capital. Accordingly, the research units should benefit tremendously from the implementation of the KM and ICM for building up their knowledge and intellectual capital that helps them to achieve their research goals that lead to innovations and intellectual properties.

KM AND ICM IN THE R&D PROCESSES

Coombs and Hull [1998] define knowledge management practices (KMP) as specific routines that shape the knowledge base of the firm and make it accessible in the innovation process. Knowledge sharing allows organizations to access the basic knowledge inputs and to transform those inputs into new knowledge. Johannessen et al. [1999] state that organization has to manage the processes to create new

knowledge, especially tacit knowledge for creating innovations. The integration of employees' knowledge is a fundamental enabler for innovation [Tang, 1998].

Innovation is expected as one of needed R&D results from research processes. It is perceived as a competitive strength needed for successful organizations. Tang [1998] argues that the core process of innovation is enabled by knowledge, skills, and motivation. Braganza, Edwards, and Lambert [1999] suggest that KM contributes to an organization's ability to innovate, and ultimately to be competitive. Numprasertchai and Igel [2005] suggested that knowledge management supported the management of research and innovation through creating, transferring and integrating new knowledge with the existing knowledge in order to enhance research capability and achieve innovation. The use of KM leading to innovation is found critical for increasing new products and service development within the organization [McAdam, 2000]. Concisely, KM is an important catalyst in the R&D process for managing innovation success.

Managing knowledge for innovation in the science-based research have grown to touch so many different disciplines that it is almost impossible for a specific R&D unit to keep up to date in every field of such complex research. Knowledge integration is most effective when it draws on diverse sources of knowledge, through organizational partnerships with government agencies, universities, and industries [Wen and Kobayashi, 2001]. Thus research unit needs a good relationship (relational capital) with research partners and stakeholders for acquiring and integrating research knowledge to fulfill research gap from external sources. However, none of the previous studies described above is satisfactory in depicting the relationship between ICM and KM in the R&D process.

SCIENCE-BASED R&D UNITS IN THAI PUBLIC UNIVERSITIES

One of the primary mandates of Thai public universities is to conduct research, discover new knowledge, make a contribution to the society. However, academic researchers are also burdened with other mandates, namely teaching, community service and administrative duties, all of which drain time away from the research activities. As a result, most academic research units have adopted some systematic approach to manage R&D processes. For example, many leading research units of public universities in Thailand have implemented their own KM strategies to enhance their research capability and reach research goals [Numprasertchai, Kanchanasanpetch and Numprasertchai, 2009].

Although the National Innovation System (NIS) of Thailand has been found less developed than the ones of more successful and innovative countries [Intarakumnerd, Chairatana, and Tangchitpiboon, 2002], some research units in the leading Thai universities have done excellent research especially, in the fields of agriculture and biotechnology. A central research funding organization called the "National Research Council of Thailand (NRCT)" was established to support high potential researchers to conduct quality research projects. Science-based research projects are usually considered as high impact research area on social issues and the economic

development and given priority in the selection process. Through this funding, a lot of research units in the universities have improved their research potential and increased the quality of projects to compete with research conducted by other leading units worldwide.

The R&D processes of academic research units differ in some aspects from innovation in industry. Unique tasks added to the management process are the submission of research proposal to the president of university for approval, while other process elements are frequently omitted, namely market research before conducting projects and the commercialization of research results**.** Most academic R&D units manage the innovation process until they achieve product prototype while a few R&D units continue involvement until final products, services, or processes are launched to the market.

RESEARCH METHODOLOGY

A Case study with a qualitative approach was used to gain in-depth insights into the managerial practices of managing intellectual capital and knowledge within the R&D process [Rowley, 2002]. The reason for this approach is that there is an unclear boundary between phenomenon and context. Information was obtained by conducting in-depth interviews with research stakeholders. The KM and ICM of these research units relate to their research routines for developing research outputs.

In this research, three successful science-based research units were selected as case studies for exploring the management of IC and knowledge in the R&D processes. These science-based researches are very important to Thailand and other developing countries, in which a major part of economic growth and quality of life depend on this research area. These three units were selected based on their excellent research outputs in terms of publications, patents and new products from their research. In addition, research members of these three units have been awarded by the National Research Consortium (NRC) as excellent researchers. This award is indeed granted yearly to only few outstanding researchers. However, due to the requests from these three research units to keep confidential some of the information provided to us, we refer these three research units as research unit A, B, and C.

In these three research units, ICM and KM practices in the R&D processes were obtained from interviews with the research team over a period of two years. During each round, detailed semi-structured interviews were conducted with the research heads, researchers, and their students. In addition, research and project data of these units were collected from several sources such as scientific journals, research proceedings, annual reports, research news, announcements from research funding organizations and universities.

ICM AND KM IN THE R&D PROCESS MANAGEMENT

These three research units have their own ICM and KM practices in academic research units for managing knowledge throughout the entire innovation process from

idea generation until the practical products are launched in the market [Igel and Numprasertchai, 2004]. Most previous research outputs in these three units have been produced as incremental and radical innovations. All research units have emphasized researcher selection process and improvement of research capability for creating new knowledge and building all types of intellectual capital.

Team building

All research units give a high priority on selecting researchers for their team. They have selected highly skilled research personnel and research partner to increase the quality of their human capital. All researchers were selected through intensive interviews. This allows them to handle complex research projects covering many areas of biotechnology. All research units also invest budgets to improve structural capital by creating the research environment and culture (relational capital) to facilitate their researchers doing their jobs and motivate them to transform new created knowledge to organizational competence (organization capital).

Idea generation & projects selection

Research ideas in science-based projects are not generated easily. They emerge through the integration of research experience, existing research knowledge of the researchers, research teams, partners, and knowledge created in the previous research. Research ideas in units are also acquired from the related research projects, significant and high-impact problems, the need of research outputs, and other internal and external sources of information and knowledge. When integrating researchers with different educational background into same projects, usually interesting ideas occur and a wide variety of knowledge is gathered. Some ideas in laboratories are created through conflicting ideas in research discussions and brainstorming.

Researchers of these three research units have supporting tools and knowledge resources to implement their research ideas. They have sufficient capability to identify and access needed knowledge to support ideas. Researchers usually share their ideas, opinions, and comments with others.

All these research units evaluate and select research projects based on available budgets, the readiness of researchers, existing knowledge and research contribution. For example, R&D unit A has its own research strategy to submit research proposals to research funding organizations only if the projects are evaluated as high-impact projects and can be managed on schedule.

Multiple R&D process and knowledge integration

The strategy for managing research projects in unit A and Unit C is a combination of in-house development (human capital & organization capital) and network research with alliances (human capital and relational capital). Responsibility is distributed to a researcher in a team based on their research potential, skills, and readiness in order to optimize research outputs. A project team usually consists of 2 to 3 researchers. A

young researcher of unit C asserted that good teamwork and experience of professors were important factors for success. He stated that "*We usually reach our research goals with help from professors' invaluable direction and comments*".

The research strategy found in unit B is a combination of in-house development and research network, supported by information technologies. However, it was difficult to find research partners in the research network model. Most projects were conducted by researchers through in-house development. Only a large project of rice gene discovery was collaborated with research partners. This is due to the fact that it is very complicated and its cost is very high. This unit manages an in-house R&D through the cross functional teamwork. Research students were assigned to join at least 2 teams for improving their research skills through learning by doing and sharing experience with other members.

In summary, the heads of these research units usually monitors research activities by working very closely with their staff and students in the phase of knowledge integration. They track the research status through shared notes and discussion in formal and informal meetings. This helps them to understand, interpret, and integrate the research information and knowledge from their members and to internalize new knowledge.

Testing and overall evaluation

Research prototypes in these three research units are preliminary tested and evaluated by the research members under the support of professors. Research prototypes are tested again and again until they are accepted as appropriate prototypes. However, there are some different activities among research units. For example, the final prototypes of research unit A and unit B are evaluated and tested in parallel by groups of experts and partners. The parallel testing strategy does not only help this research team to reduce testing time and increase the number of tests, but also to increase credibility of the product. Research prototypes of R&D unit C are usually developed by each cross functional team in the lab under the supervision of the head and two senior researchers. All test results are captured and stored in the shared database such as CD-ROM, web-based knowledge pool, and shared research notes for reuse in the future.

In this stage, research units need past experiences for judging whether to do the next step or to go back to the previous design phase.

Production and market entry

Several research units managed their projects until they submitted publications or research report to research funding organizations. A few research projects have reached commercialization. The research funding organizations in Thailand have created policies to improve the quality of research in Thailand and help private companies to reduce costs by creating collaboration among government, university, and industry (GUI). The final research prototypes and outputs of academic research

laboratories are the properties of research funding organizations. Therefore, a decision on production and market entry is managed by the research funding organizations. Many research prototypes with market potential, created by the successful research units, were commercialized by local private companies.

The head of Unit A has a long experience in his research area and conduct lots of research projects which are contributive to the country. The research projects with market potential of this unit are carried on and collaborated with a local company and adapted for commercial purpose. Therefore, the stage of production and market entry is normally managed by the partners.

Many prototypes of unit B and unit C are developed in-house for commercial products. The heads of both units are usually invited to present their research outputs and new products in both national and international exhibitions and conferences. Both units also disseminate their research results to the public through a large local company.

A summary of KM Practices in research units classified by R&D process is as shown in Table 1.

Table 1 KM Practices in research units classified by R&D process

R&D Processes	Research Unit A	Research Unit B	Research Unit C
Idea generation and projects selection	• Acquire research ideas from several sources such as alumni, conferences, journals, magazines and so on • Acquire research ideas by discussing with other researchers in national and international conferences • Create meetings and brainstorming with research partners abroad • Create ideas from a multidisciplinary research team • Acquire new research knowledge from academics papers • Invite alumni to discuss about research trends • Invite visiting professors to join projects • Use the evaluation and selection policy based on social impact, budget, and existing knowledge • Mapping the readiness of research teams and needs and impact of research projects to the country	• Acquire ideas from other researchers in international conferences • Integrate research ideas from several sources such as in-house R&D, experience, and organizational knowledge • Generate ideas from the country's problems • In-house team-based research design • Designing research details by research team • Use previous research knowledge as a basis for designing new research plan in terms of costing, timing and impact of expected outputs. • Brainstorming with team leaders and researchers • Use the evaluation and selection policy based on social impact and existing knowledge • Mapping the readiness of research teams to research projects	• Acquire ideas from several sources such as journals, magazines, external experts and funding organizations • Generate ideas from the country's problems • Continue and extend the previous projects • Design and create research plan by discussing with research team • Invite external partners help to design research plans and research details only for large projects • Analyzing projects based on the readiness and research potential of teams • Use the evaluation and selection policy based on research contribution • Select plans by team leaders •

Table 1 (continued)

R&D Processes	Research Unit A	Research Unit B	Research Unit C
Multiple R&D processes Knowledge integration	• In-house R&D using cross functional team • Acquire external knowledge by exchanging researchers with 39 research partners in 19 countries. • Conduct multiple research experiments in the critical parts at least by two teams in parallel • Create formal and informal meetings for transferring and integrating knowledge • Keep information about both success and failure in research experiments for the reuse.	• In-house R&D using cross functional team • Conduct research experiments • Use knowledge repository to share and retrieve internal knowledge • Use knowledge portal to acquire external knowledge • Conduct only informal meetings for transferring and integrating knowledge from research teams. • Store Information and knowledge about success and failure in research experiments in research repository	• Create research team based on skills and personal relationship • Conduct experiments at the research stations or partners' laboratories • Research collaboration with domestic academic partners • Integrates research results, information and knowledge from research results and analysis reports • Track and collect research results from members and partners through informal meetings
Testing and overall evaluation	• Keep information and knowledge in this process in shared research notes for tracking errors if any unexpected results occur and reusing in the future. • Internal testing by researchers. • External testing by partners. • All outputs and evaluation results are stored in the CD-Rom for analysis and reuse	• Keep information and knowledge in a web-based knowledge pool for tracking errors and reuse • Internal testing by researchers. • External testing by research partners. • Outputs and testing results are stored in a web-based knowledge pool.	• Internal testing by other research members in different team and staff. • Research analysis and evaluation is done by team leaders and researchers • Store testing results&information in shared research notes

Production and market entry	• In-house development. • Transfer knowledge to company for mass production • Patent is owned by research funding organization • Publicize research knowledge by presenting their work at research exhibitions, international conferences, and journals.	• In-house development • Mass production by local companies • Publicize research outputs through commercializing new products and service • Distribute products through government agency and private companies	• In-house production • Supported by industries and funding organizations • Distribute research results to public or funding organizations • Publicize knowledge and research results through training classes

DISCUSSION

The KM practices found in these three successful R&D units are embedded in the R&D processes which require knowledge and IC as important resources (See Figure 1). Most new research knowledge is created based on research experience of the research head and the integration of knowledge from research teams.

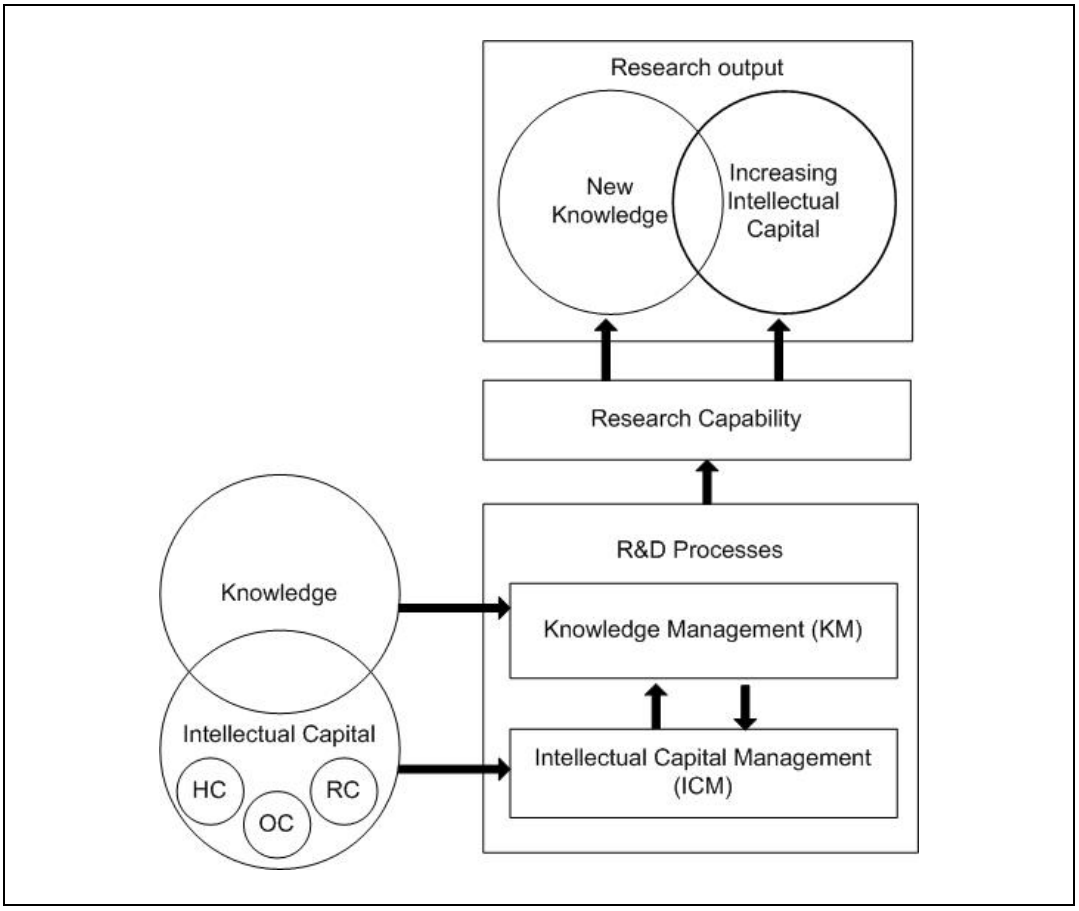

Figure 1. KM and ICM in the R&D processes

In the team-based research of these three successful research units, all researchers are encouraged to share research knowledge including tacit knowledge within research team. In this context, trust, personal relationship, and commitment are very important factors for the success of knowledge transfer, sharing and integration.

These three research units have research staff to work as the knowledge bridge to fill a gap between the professors and research students. Researchers are encouraged to store research experiment and knowledge in shared media such as research notes and web-based knowledge pool for both success and failure cases. Even though professors and research students work together very closely, a good personal relationship among

research members also creates a better opportunity for knowledge sharing. Therefore, relational capital is a critical for transferring and sharing research knowledge.

All research units try to sustain their research capability by transforming their research knowledge and intellectual capital to innovation and intellectual property. For example, alumni of the research unit A are invited as partners for transforming research prototypes to commercial products and launching products to the market. The R&D unit B provides funds and opportunity for their staff to enhance their research competency, encouraging them to further their study for a higher degree, utilizing resources in the research unit. Consequently, after their graduation, they commit to continue research work as full-time researchers. The research head of R&D unit B stated that "*We are interested in not only the quality of current research outputs but also the improvement of our researchers who are the most important key for the success in a long-term*".

The new knowledge from research processes are codified and stored as organization capital in the different formats. For example, unit A stores its research knowledge in CD-ROM for internal access. Unit B stores research knowledge in web-based research database and unit C stores in the shared research notes.

In summary, IC increases the performance of KM practices. On the other hand, effective KM practices help researchers improve their skills and create the excellent outputs which strengthen the organizational competence and the increase of IC. All research units confirm that IC and knowledge are important for research success and try to preserve them in organization as an intellectual property. The research head of unit B stated that "*The success or failure of research depends on the competence of researchers and relationship between researchers. Therefore, we have to improve and maintain human capital and relational capital in my research unit by creating research climate, culture, and incentive system to motivate researchers*".

CONCLUSION

Based upon the assessment of the managing IC and knowledge in the R&D processes in these three research units, we found that IC and knowledge were important assets for research organizations. IC is used as a resource for supporting KM. Human capital supports knowledge creation. Relational and organizational capital support knowledge acquisition, knowledge transfer/sharing, and research collaborations. IC has a direct and substantial impact on managing knowledge in the research processes.

The relationship between ICM and KM can create a high potential strategy for managing R&D processes in science-based research which requires multi-disciplinary knowledge. KM can improve the quality of intellectual capital. There is no doubt that these three successful research units have extended their potential to create new knowledge by combining human capital and relational capital through in-house research development and a strong interaction with external research partners.

In summary, our case studies found a strong impact of human capital and relational capital on the improvement of KM which helps research units to achieve research goals. To improve the country's competitiveness, the research units in the developing countries still need to improve those ICM and KM that create a strong basis for relevant research outputs of good quality and thus become an innovation. .

ABSTRACT

Quality is considered by many to be a critical strategic importance for achieving competitiveness in the global market. Many quality and productivity improvement techniques are generally implemented to rise up its performance. The cost of quality (COQ) system can be one of the most effective performance measurement techniques. The objective of this paper is to present results of quality costing practices at a case company since the quality costing approach was introduced. Then the four basic elements of COQ were collected namely prevention, appraisal, internal failure and external failure. The total cost of quality was computed and benchmark against the quality improvement level. The correlations between COQ and difference performance indicators were determined by the Spearman's rho correlation coefficient. The findings show that 70.14% of the COQ is expended for corrective action while prevention and appraisal costs are spent on 25.72% and 4.14% of the COQ, respectively. From correlation analysis, it illustrates the total quality cost per unit have significantly strong positive relationships between prevention cost and failure cost. Methodology and findings of the study can be further strengthened through implementation at others.

Keywords: Cost of quality (COQ), Injection Molding, Case study

INTRODUCTION

Many companies have promoted quality as the central customer value and regard it as a key concept of company strategy in order to achieve the competitive edge. They have worked hard to create methods and execute activities to minimize costs and improve the quality of their products and services. There is one factor that makes the difference between the costly way and beneficial way of achieving quality. This factor is quality costs. Measuring and reporting cost of quality is very important in building the foundation for quality improvement. One must stress the fact that the objective of understanding and measuring cost of quality is not just to reduce the costs but to ensure that the costs associated with quality are right kind of costs that maximizes benefits. In the literature, there are several methods that can be used to collect, categorize and measure quality costs. The traditional P-A-F method suggested by Juran (1951) and Feigenbaum (1991) classifies quality costs into prevention,

appraisal, and failure costs. Prevention costs are associated with activities taken to ensure that a process provides quality products and services. Examples of prevention activities are quality planning, quality circle meetings, training programs, written procedures, and quality improvement projects. Appraisal costs are incurred to ascertain the product or service whether it conforms to quality standards. Examples of appraisal activities are inspection of incoming work, supplies and materials, periodic inspection of work in process, final inspection and collecting quality data. Failure costs are incurred to correct quality in products and services before (internal) or after (external) delivery to customer. Examples of internal failure costs are scrap, rework, and machine downtime while examples of external failure are warranty, complaint administration, sales return, and product liability.

Establishing the quality cost (COQ) program becomes useful technique in increasing business competitiveness and improving profit margin within manufacturing sector. The quality cost information can be used as a basis for decision making. It allows for more accurate setting of future budgets; the setting of realistic improvement targets and goals; and focused investment in prevention techniques to produce quantifiable savings (Bamford and Land, 2006). Typical figure given in the literature for quality costs range from Crosby's (1996) view of 25 to 30 percent of turnover while Dale and Plunkett (1991) suggested that quality costs can range from 5 to 25 percent of a company's annual sales turnover. Furthermore, Burgess (1996) gathered quality cost data from several studies between 1970s and 1990s; for example, Webb (1972) presented the percentage of total quality costs in the general industry: prevention costs (10 percent), appraisal costs (25 percent) and failure costs (65 percent); Veen (1974) indicated quality costs categories at average: prevention costs (9.1 percent), appraisal costs (27.3 percent) and failure costs (63.6 percent). As literature, even though there has been found on various methods of categorization, collection and measurement of quality costs see Dale and Plunkett (1991), Schiffauerova and Thomson (2006) and Desai (2008), there is scare available quality costing literature particularly from industry within Asian countries. This paper intends to contribute and share experience of COQ measuring from Thai small-medium sized enterprises based plastic injection molding sector.

OBJECTIVES

The objective of this paper were to collect and monitor the practical aspects of data concerning the quality cost system within a plastic injection molding company as a case study. The COQ approach is used to gather the four main classifications of quality costs: prevention, appraisal, internal failure and external failure costs.

RESEARCH METHODLOGY

The methodology adopted was the carrying out of a case analysis. The following major analysis steps were carried out in sequence as below detail:

- Identifying and collecting the data for each element of quality costs.
- Measuring and quantifying the elements.
- Analyzing the quality cost scenario and locating the improvement areas.

RESULTS AND DISCUSSIONS

The case company

The company selected for the study started in 1995 as a SMEs manufacturing firm producing a variety of plastic injection for electric, electronic, machinery, furniture, automotive parts and components. The operation is mainly of a 'made to order' nature. Design and specification demanded by the customers are being met and the company says that they are capable of providing a solution to the special needs for any customers. Many quality tools and techniques like 5s, QCC, KAIZEN, Zero Defect and ISO9000, have been continuously implemented within the company to improve the product quality in order to satisfy the customer's requirements. Around 90% of the company output is mainly supported for domestic markets within electric, electronic, and automotive industries.

Identifying and collecting the elements of quality costs

The list of quality cost elements are detailed and collected during January to December in 2009, see as Table 1 and Table 2, respectively.

Table 1: The elements of quality costs

Cost Element	
Prevention Cost	**Internal Failure Cost**
P1:Training	IF1: Scrap
P2: Quality audit	IF2: Defect Disposal
P3: Quality improvement	IF3: Breakdown Maintenance
P4: Preventive maintenance	
P5: Equipment upgrade	
Appraisal Cost	**External Failure Costs**
A1: Material Testing	EF1: Product returned due to defect
A2: Calibration	

Table 2: Summary of total COQ for twelve months data of 2009 (x1,000 Baths)

Cost Element	Jan'09	Feb'09	Mar'09	Apr'09	May'09	Jun'09	Jul'09	Aug'09	Sep'09	Oct'09	Nov'09	Dec'09

Measuring and quantifying the elements

After identifying the relevant quality cost elements, they were quantified Total cost of quality as calculated from four basic cost elements is summarized and illustrated in Table 3. The contribution of four basic categories in the overall quality cost as illustrated in Figure 1 was the scenario of the company in quality expenditure with the present quality level. As Figure 1, failure costs (70.14%) are the highest cost of TQC that have been a critical problem for the company in product recalls. The finding has consistent with the literatures (Webb, 1972; Veen,1974; Dale and Plunkett,1991; Schiffauerova and Thomson, 2006 and Desai, 2008). While the appraisal cost is minimum. This means that the company still has the problem on internal process improvement such as equipment/machine downtime, scrap, and defect disposal. In other word, the company should increasingly focus on the appraisal plans and activities. All equipments and machines must be promptly used for any circumstances.

Table 3: Summary total COQ

Element	Cost (Baths)	Percent contribution into TQC
Total Prevention cost (TPC)	539,981.51	25.72%
Total Appraisal cost (TAC)	86,900.00	4.14%
Total Internal Failure cost (TIF)	1,030,980.62	49.11%
Total External Failure cost (TEF)	441,578.10	21.03%
Total quality cost (TQC)	2,099,440.23	100.00%

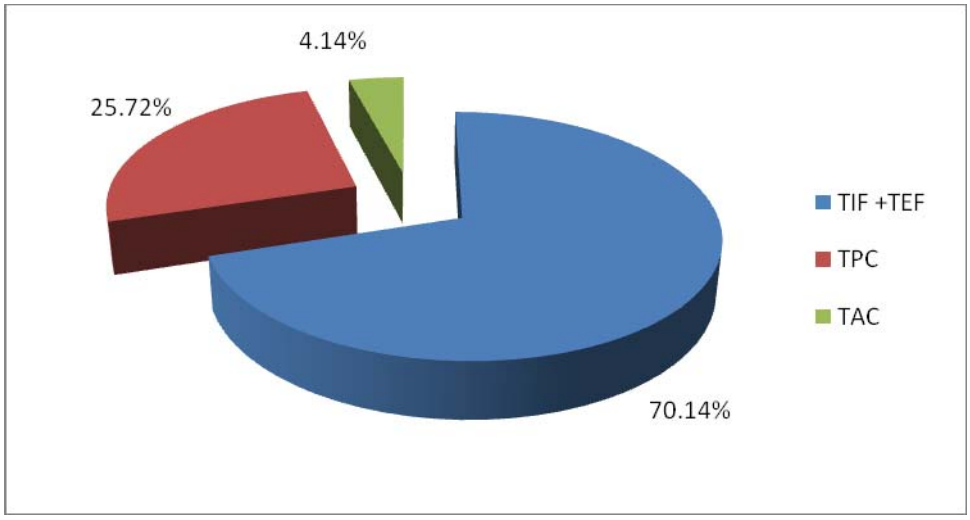

Figure 1: Contribution of four basic elements into total quality cost

Analyzing the quality cost scenario and locating the improvement areas

Referring to Table 1, the element of quality costs can be classified into two types: (1) costs that invest for preventive activities and (2) costs incur for corrective activities. Then, the two types were plotted against each other over twelve months as shown in Figure 2 and is used for giving valuable suggestions for improvements. It has seen that even though the company spent more on preventive activities, the cost for corrective activities still highly remains.

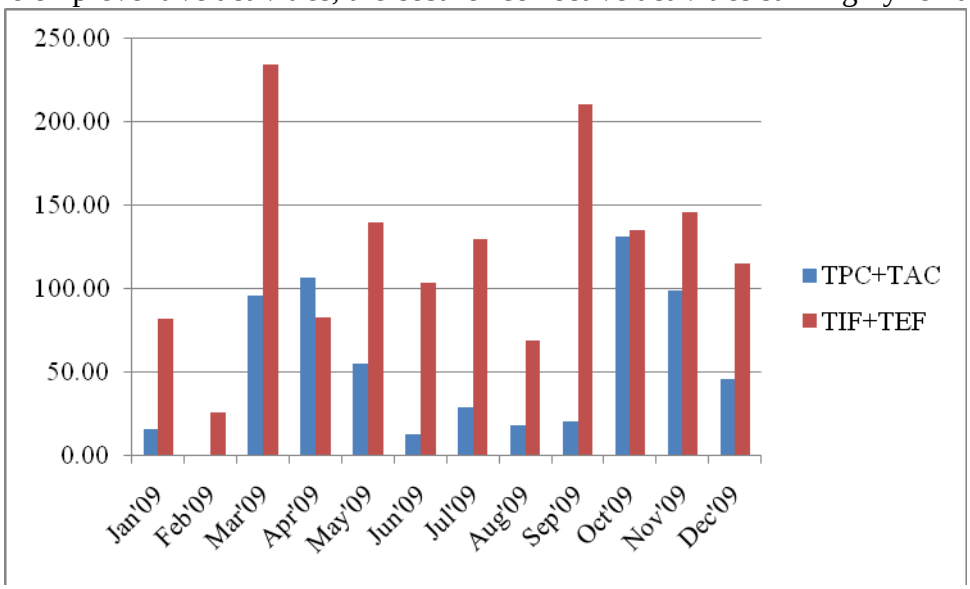

Figure 2: Comparison between quality costs incurred on preventive action and on corrective action

Furthermore, correlation analysis is used to understand the strength of the relationship among cost elements of total quality cost. The degree of the relationship is measured by the Spearman's rho correlation coefficient. The findings show that the total quality cost per unit has significantly strong positive relationships between prevention cost and failure cost at 0.01 level. See as Table 4. It can be said that the expenditure for preventive and failure activities

much more impact on the total amount of COQ. Then the company should more focus on these two types.

Table 4: Correlation analysis between cost elements and total quality cost

		TPC_Unit	TAC_Unit	TFC_Unit	TQC_Unit
TPC_Unit	Correlation coefficient	1.00	-0.03	0.52	0.83**
	Sig. (2-tailed)	.	0.92	0.08	0.00
TAC_Unit	Correlation Coefficient		1.00	0.36	0.25
	Sig. (2-tailed)		.	0.24	0.43
TFC_Unit	Correlation Coefficient			1.00	0.85**
	Sig. (2-tailed)			.	0.00

** Correlation is significant at the 0.01 level (2-tailed).

Then, to emphasize the improvement area, firstly collecting the data on percentage of defects in each process section is needed. After that the correlation analysis is also used to investigate the relationship between quality expenditures with failure rate in seven process sections is presented. See Table 5 and 6. The result as shown in Table 6 reveals that the prevention cost has a significantly strong positive relationship with failure rate in the mold section at 0.01 level. This means that as a company expends more of its budget on prevention activities the quality level at the mold section should be improved and increased to meet the target value. On the other hand, the internal failure cost has moderate positive relationship with the press section at 0.05 level. This indicates that increasing the quality improvement the company has to more emphasize on the cost spending for corrective activities at press section. In short it can said that apart from seven section, the mold and press sections are being two significant area for product quality improvement and quality-cost controlling.

Table 5: Percentage of failure in each process section for twelve months of 2009

* Correlation is significant at the 0.05 level (2-tailed).

CONCLUSION

The research was focused on gathering and investigating the practical of data collation and measurement of COQ within plastic injection molding company; and to examine the manner in which the resulting information was used as part of business improvement. From the summary sheet it is noted that appraisal cost is minimum (4.14%). Main target area is failure cost: internal failure (49.11%) and external failure cost (21.03%). The internal failure cost, equipment/machine downtime, scrap, and defect disposal is a majority proportion of COQ, this becomes the root points to be critically analysed. The finding has consistent with the literatures (Webb, 1972; Veen,1974; Dale and Plunkett,1991; Schiffauerova and Thomson, 2006 and Desai, 2008). Beside this, using correlation analysis, it found that prevention and failure costs have significant impact on the total amount of COQ. The findings also pointed that there are two significant process areas; mold and press sections for product quality improvement and quality-cost controlling. Even though a case analysis is used it provided in-depth information on quality cost which is not usually revealed to public. This research has provided a foundation for future work. The interesting areas for future investigation would be to study on a larger-sized company and wider range of industries such as automotive, healthcare, service and education.

ABSTRACT

Multisource feedback ratings are related to other measures of competence effectiveness and that different rater sources conceptualize performance in a similar manner. The scale set by the Taipei 101 core value. This study use of Delphi questionnaire to the Taipei 101 manager as an expert on the object to construct the general competence, and finally we use questionnaire survey conducted multi-feedback analysis of general competence and core competence. A total of 250 questionnaires were sent, and use descriptive analysis, T-test to explore the Taipei 101 employees and supervisors on the self-assessment under the assessment, and finally back to the multi-evaluation system to explore the feasibility of the implementation of the objectivity and in the future. We found multiple feedback to assess the general competence and core competence of the overestimate, in general competence are the Financial, Engineering, Operations, Building rental department, Observation deck department, Observation deck souvenirs, Building property management projects up the difference. In the core competence are the Viewing platform sector, Shopping malls property management department, Building lease, Finance shopping accounts, Shopping malls operating and Viewing the most souvenirs sector discrepancies. We focused on evaluation results are different projects, consider them in depth to find self-assessment and the reasons for his assessment of the differences. For the cases of staff can effectively self-understanding and improvement the indicators item.

Keywords - Taipei 101, Multiple-source feedback, General competence, Core competence, performance evaluation

INTRODUCTION

In the last 20 years, industrial and organizational psychology has developed rapidly in Taiwen. This is mostly due to the significant development of economic reform and social changes and the great demand for organizational psychology and human resource management research and applications in Taiwan organizations. As a result, the cross-cultural–socioeconomic perspective has been emphasized in relation to developments in various fields of psychology and human resource management in Taiwan [1][2][3][4][5]. During last few years, competence paradigm has become a standard for the modern Human

Resources Management (HRM). The importance and the impact of this concept have headed industries to develop a set of solutions to help the introduction of Competence Management into organizations [6]. Using Competency model on profit and prosperity of enterprises generally used in the recruitment of functions for selection, Training development, performance evaluation, succession planning and other. The purpose is to help organizations and individuals understand how to improve their organization performance [7]. [8]have suggested In the knowledge economy environment of the change, because science and technology drive global economy and enable receiving employee's engineering, the jobs of human resources expert and management rapidly, besides impelling important information to share, it accords with the challenge of the human resources in the future core competency as the key point. Great manager have management competence in order to change the keen competition with the international market fast in conformity with the environment. It is their key point of the success, what a focal point of operating and setting up the niche efficiently.
In the global marketplace of the twenty-first century, we know that employee are being called upon to lead their organization forward in new and creative ways and that improving their performance is no longer optional, but rather an imperative. Significant increases in competence were perceived by the managers and by their subordinates themselves, development needs were seen to reduce ratings were largely seen to become more congruent. Multisource feedback ratings are related to other measures of competence effectiveness and that different rater sources conceptualize performance in a similar manner. The scale set by the Taipei 101 core value.

Taipei 101 is the most important reason why there is: Invent the most privileged working and life style to the world (External). Define the world's most privileged working and life experiences (Internal). Bring Taipei 101 to the world by being the benchmark of outstanding office leasing, observatory and shopping center in Asia! We look forward to every 101 head of colleagues who can demonstrate a code of conduct:

1. Service: We commit to offer the most privileged and intimate customer services.
2. Passion: We pursue company and personal excellence with great passion for 101 brand and work.
3. Integrity: We insist on integrity and walk the talk.
4. Respect: We respect our clients and people by empowerment and trust.
5. Innovation: We lead the examples by unlimited creativity, aggressive learning and trials.
6. Teamwork: We achieve challenging objectives by helping and encouraging each other.

RESEARCH METHODOLOGY

This study use of Delphi questionnaire to the Taipei 101 manager as an expert on the object to construct the general competence, and finally we use questionnaire survey conducted multi-feedback analysis. A total of 250 questionnaires were sent, and use descriptive analysis, T-test to explore the Taipei 101 employees and supervisors on the self-assessment under the assessment, and finally back to the multi-evaluation system to explore the feasibility of the implementation of the objectivity and in the future.

ANALYSIS

Reliability analysis of the General competence

After the Delphi experts survey and using the reliability analysis, to understand the questionnaire is consistency. In the overall reliability analysis Cronbach α is .963, as shown in Table 1, the Cronbach α was more than .70. The construction of Taipei 101 cases in the general functions of the scale with a consistency and stability.

Table1 reliability analysis of the general competence

Factor	Item	Cronbach α
Word processing capabilities	1-5	.846
Communication and written language	6-10	.857
Problem analysis and solving ability	11-15	.880
Emotional control	16-20	.821
Time management	21-24	.852
Planning capacity	25-28	.877
Continuous learning	29-33	.841
Continuous improvement capability	34-38	.912
Vision and Values drive capability	39-43	.917
Ability of self-reflection	44-46	.825

Multiple feedback analysis

In the multi-feedback analysis, this case study the company paid all employees, not net manager of their own assessment, pre-assessment of its employee's total of the 400 questionnaires, 200 staff self-assessment, 200 manager of assessment, and the total 386 valid questionnaires. The following analysis for the general competence and the core competence of the multiple feedback.

The general competence

From Table 2, all the staff self-assessment and director assessment of the general competence were significantly different ($p < .05$), from average point of view, self-assessment are higher. Therefore, this study further feedback from the department self and manager assessment to explore, the departments of number of people are less than 30, so using non-parametric analysis.

1. In word processing capabilities, self-assessment overestimation department of the, Building lease, Engineering Operations, Market Operations, Viewing platform sector, Viewing platform souvenirs.
2. In Communication and written language, self-assessment overestimation department of the, Building Rental Department, Trading Department, viewing platform sector, viewing platform ticket.
3. In Problem analysis and solving ability, self-assessment overestimation department of the, Building Rental Department, Trading Department, Financial Market Accounts.
4. In Emotional control, self-assessment overestimation department of the, Engineering Operations, Financial Market Accounts, shopping malls, marketing service, shopping centers, operations, viewing platform sector.
5. In Time management, self-assessment overestimation department of the, Building, property management, finance shopping accounts, shopping malls property management department, observation deck department, Viewing platform Souvenirs.
6. In Planning capacity, self-assessment overestimation department of the, Trading department, observation deck department, observation deck Souvenirs.
7. In Continuous learning, self-assessment overestimation department of the, Building Rental Department, Trading Department, Financial Market Accounts, shopping malls property management department.
8. In Continuous improvement capability, self-assessment overestimation department of the, Financial Market Accounts, shopping malls property management department, observation deck department.
9. In Vision and Values drive capability, self-assessment overestimation department of the, Financial Market Accounts, shopping malls Operations.
10. In Ability of self-reflection, self-assessment overestimation department of the, Building Services Management Division, building lease, finance shopping accounts, shopping malls Operations.

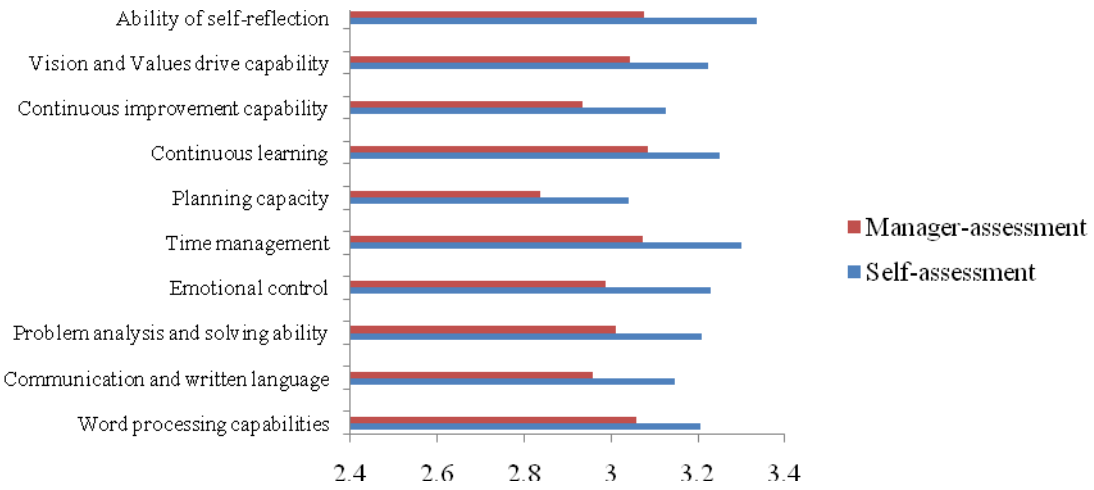

Figure2 the multiple feedback analysis of the general competence Bar chart

The core competence

From Table 3, all the staff self-assessment and director assessment of the core competence were significantly different (p <.05), from average point of view, self-assessment are higher.

Therefore, this study further feedback from the department self and manager assessment to explore, the departments of number of people are less than 30, so using non-parametric analysis.

1. In Service, self-assessment overestimation department of the, Building Property Management Division, Department of Building lease, observation deck department, observation deck Souvenirs.
2. In Passion, self-assessment overestimation department of the, Building lease, finance shopping accounts, shopping malls property management department, observation deck department.
3. In Integrity, self-assessment overestimation department of the, Financial sector, financial accounting business malls, shopping malls property management department, shopping malls Operations, observation deck department, observation deck Souvenirs.
4. In Respect, self-assessment overestimation department of the, Shopping property management department, observation deck department.
5. In Innovation, self-assessment overestimation department of the, Building lease, finance shopping accounts, shopping malls Operations, viewing platform sector.
6. In Teamwork, self-assessment overestimation department of the, Building lease, shopping mall property management, viewing platform sector.

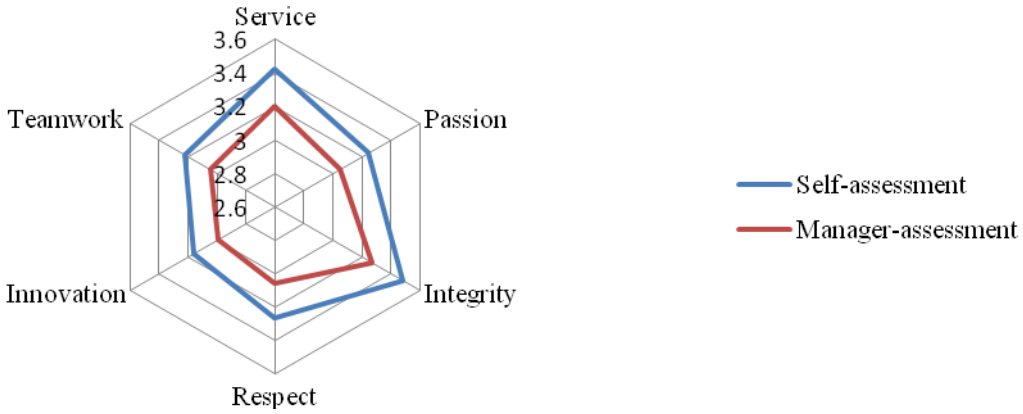

Figure3 the multiple feedback analysis of the core competence Radar chart

SUMMARY AND CONCLUSIONS

We found multiple feedback to assess the general competence and core competence of the overestimate, in general competence are the Financial, Engineering, Operations, Building rental department, Observation deck department, Observation deck souvenirs, Building property management projects up the difference. In the core competence are the Viewing platform sector, Shopping malls property management department, Building lease, Finance shopping accounts, Shopping malls operating and Viewing the most souvenirs sector discrepancies. Self-assessment at this time may be good, but the manager of the assessment or indeed do not agree, it is suggested the case study should address the problem of the department to be depth, or from the individual interviews begin to improve. We focused on evaluation results are different projects, consider them in depth to find self-assessment and the reasons for his assessment of the differences. For the cases of staff can effectively self-understanding and improvement the indicators item.

ACKNOWLEDGMENT

The author would like to thank the Associate Editor and the anonymous reviewers for their valuable comments, which substantially improved the quality of this paper. This research was substantially supported by the National Science Council (NSC) of Taiwan under grant number NSC98-2622-H-003-004-CC3.

ABSTRACT

The study based on the unified theory of acceptance and use of technology (UTAUT), this study was to investigate the determinants of e-learning acceptance. We create a multilevel variable of learning environment to explore with the other variable context effect and the interaction effects in the acceptance of e-learning. Data collected from 932 respondents in Taiwan were tested against the research model using the Hierarchical linear model approach. The results showed that performance expectation, social impact and learning environment (Group-level) will have positive impact on behavior intention. The Learning environment (Group-level) and performance expectation (Individual-level) will have negative interaction significant effect. And the Group-level of the learning environment with level 1of the effort expectancy will have positive interaction effects.

Key words: Unified theory of acceptance and use of technology Model (UTAUT), e-learning, learning environment

INTRODUCTION

Several global trends have compelled business to reconsider the design and implementation of their technology management education programs. These developments have influenced a wide variety of agents and institutions, including scientists and engineers industry and academia, entrepreneurs, technology managers, firms, universities, federal/national laboratories, science parks, regions, states, and nations. They also have important implications for the manner in which we educate technology managers in business and for those individuals who wish to launch and sustain new technology-based firms (Siegel, 2009). In the information era, knowledge and skills need to be continually updated and refreshed to keep up with today's fast-paced business environment. Gates (1999) pointed out that e-learning system of multimedia streaming technology will facilitate self-paced training. Liaw and Huang (2002) also contended that e-learning make learning less frustrating by making more interactive and engaging, be able to adjust the time, location, content, and speed of learning according to their own personal schedules. Turban et al. (2006) argued that e-learning can be useful as an environment for efficient and effective corporate training and add value to traditional classroom learning settings.

Wang et al. (2009) write acceptance of mobile learning, the objective of this study was to investigate the determinants, as well as the age and gender differences, in the acceptance of m-learning based on the unified theory of acceptance and use of technology (UTAUT) proposed by Venkatesh et al. (2003). The remainder of this paper is organised as follows. In the next section, we review the UTAUT and show our reasoning for adopting it as the theoretical framework of this study. This is followed by descriptions of the research model and methods. We then present the results of the data analysis and hypotheses testing. Finally, the implications and limitations of this study are discussed.

Groupware has been shown to provide a supportive environment for collaborative learning (Sclater et al., 2001; Shaikh and Macauley, 2001; Sikkel et al., 2002). Therefore, this paper breaks with the traditional UTAUT under a single-level research methods, we join to the learning environment of multi-level approach using statistical software Hierarchical linear model. Hierarchical linear model can be improved the accuracy of statistical inference, that is better to ensure that research results are closer to the scene found the reality. This paper review the Unified theory of acceptance and use of technology Model (UTAUT), to explore the factors affecting e-learning, and view the learning environment is capable of interaction effect. This study is structured as follows describe the model and analysis methods, and accordance with empirical information data for statistical analysis and hypothesis validation, finally conclusion and discussion.

THEORETICAL BACKGROUND

Unified theory of acceptance and use of technology (UTAUT)

Many scholars have examined the impact of personal use of information technology in a variety of factors, including the Fishbein and Ajzen (1975) of Theory of Reasoned Action, TRA, Davis (1989) of the Technology Acceptance Model (TAM), Ajzen (1991) Theory of Planned Behavior (TPB), Venkatesh and Davis (2000) of the TAM2, Rogers (1995) Innovation Diffusion Theory, Venkatesh et al (2003) of the Unified Theory of Acceptance and Use of Technology (UTAUT).

In this model, performance expectancy (PE), effort expectancy (EE), social influence (SI), perceived playfulness (PP) and self-management of learning (SL) were hypothesised to be determinants of behavioural intention (BI) to use m-learning. We also hypothesised that age and gender differences would moderate the influence of these determinants on behavioural intention. The proposed constructs and hypotheses are supported by previous literature. Venkatesh proposed a UTAUT, which posited three direct determinants of intention to use (i.e. performance expectancy, effort expectancy, and social influence), two direct determinants of usage behavior (i.e. intention and facilitating conditions), and four moderators of key relationships (i.e. gender, age, experience, and voluntariness), to further integrate the essential elements of eight previously established IT acceptance research models into a unified theoretical model. Venkatesh claimed that UTAUT was able to account for 70 percent of the variance in usage intention and could become a useful tool for IS managers to assess the likelihood of success for new technology implementations. They also argued that UTAUT could help managers to understand the drivers of technology acceptance in order to proactively design intervention (e.g. user training or design participation of users) and increase the utilization of new IT system.

Contingency theory

According to contingency theory, the widely used perspective in understanding the strategy-performance relationship, there is no one best way to strategize, and no strategic choice is universally beneficial in all conditions (Lawrence and Lorsch, 1967; Ginsberg and Venkatraman, 1985; Donaldson, 2000). To achieve a competitive advantage, companies must match their strategic decisions to certain sets of contingency factors, including external (e.g., market conditions, buying behavior) and internal (e.g., organizational structures, characteristics, resources) environments (Lawrence and Lorsch, 1967; Donaldson, 2000). What intrigues strategy scholars most, and also addresses the heart of contingency theory, is how external environments moderate the strength of the strategy-performance relationship (Ginsberg and Venkatraman, 1985: 422). Farashahi and Hafsi (2009) say it is argued that power and legitimacy are key resources for firms' survival in institutionally unstable environments. Some theoretical foundations for the strategy of firms in unstable institutional environments are developed.
Johnson et al. (2008) highlighted the importance of creating a shared, peer-connected, learning environment. Mintzberg et al. (2006) mentioned that the school environment, environmental factors

and leadership ability, organization tied to strategy formation process, one of the three major forces to help give a comprehensive view of strategy formation process to reach its equilibrium. At first, the environment, the so-called contingency theory school, this theory, the specific aspects of the environment and organization between the individual properties with a variety of relationships such as the environment become more stable, the internal structure will be more institutionalized. Schneider (1990) mention the organization of the environment is a common perception of organizational members to the organization's policies, procedures and practices. Such as Altmann (2000) that the organizational climate within the organization attributed to staff awareness of the work environment, their response to the employees to describe their feelings in the workplace and the environment, which is affected by the interaction posed by members of the Organization to form a unique and enduring style, can be by members of the cognition to describe them. The above-mentioned organization, the concept of the environment and organizational climate is like in this study wishes to explore the learning environment.

The organization into information technology system is the concept of a strategy, so into e-learning is also a strategy for the planning, organization into e-learning that is hoped that through this system to assist staff education and training. However, this system is the use of security so that employees will change, whether it is because contingency theory of organizations mentioned in different environments resulting from structural changes within the organization. Special Hellriegel and Slocum (1974) mentioned that the environment is part of the overall non-specific in nature, Naishi organizational system or unit formed. Zohar (2000) referred to climate essentially belong to a multi-level can be derived from observation of team interaction. Therefore, more and more compelling case in this study, analysis of multi-layered approach to be explored.

RESEARCH MODEL AND HYPOTHESES

Performance expectancy, Effort expectancy, Social influence, and Perceived behavioral control

Prformance expectations (PE), Effort expectancy (EE), Social impact (SI), in line with the technology acceptance model, will conduct impact the Behavioral intention (BI) (Chen et al., 2002; Davis, 1989; Davis et al., 1989; Davis et al., 1992; Venkatesh, 2000; Venkatesh and Davis, 2000; Venkatesh et al., 2003). Performance expectations for learners that the e-learning is effective because it allows learners more rapid, flexible and completes the learning activities, and even contribute to learning outcomes. According to UTAUT and previous studies revealed that (Venkatesh and Morris, 2000). There are many scholars TAM's model of e-learning research (Lee and Lee, 2008; Ong and Lai, 2006; Ong et al., 2004; Pituch and Lee, 2006), they have shown the usefulness of cognitive behavioral willingness have a significant impact. In addition, the cognitive usefulness (PU) the main source, that is, to build UTAUT performance expectations (PE) (Venkatesh et al., 2003: 448). Therefore, in UTAUT model, the performance expectations can indeed directly affect behavioral intention (Venkatesh et al., 2003). Therefore, this study believe that performance expectations will be an impact on behavior. H1. (Individual-level) The performance expectancy is positively related to the behavioral intention.

Venkatesh et al. (2003) determined effort is expected that this dimension of the use of the information system. From three different tectonic models, to expect to be considered and ease of use (TAM/TAM2), complexity (MPCU), as well as ease of use (IDT) on Venkatesh, and its willingness to act with The key deciding factor. Therefore, this study believes that hard work will expect an influence on behavior. H2. (Individual-level) The effort expectancy is positively related to the behavioral intention.

Venkatesh determine the social impact, to a certain extent, personal use of new information systems, is important. This study obtained by the existing theory of the social impact of the concept: subjective norm (TRA, TAM2, TPB and C-TAM-TPB), social factors (MPCU), image ((IDT) Venkatesh et al.,

2003). These studies all indicate that the social impact is to create individual intended to use the key concepts of the new technology (Venkatesh and Davis, 2000; Harrison et al., 1997; Moore and Benbasat, 1991; Mathieson, 1991; Thompson et al., 1991). Therefore, this study believe that the wishes of the social impact of an influence on behavior. H3. (Individual-level) The social influence is positively related to the behavioral intention.

Ajzen (1991, 2002) that all human behavior is not controlled by the will, there are more cases are subject to other external environmental factors that influence the objective, in order to be more appropriate increase in rational action theory of human behavior prediction and interpretation of force structure to be extended and therefore proposed an amendment, in addition to attitude and subjective norms, the increase in perceived behavior control an important variable. The so-called perceived behavioral control (perceived behavioral control) refers to the behavior of individuals perceived to take a certain degree of easy or difficult, which reflects the individual's past experience and anticipated obstacles. Forecasts for the behavior of the intended impact. Again from perceived behavior control-related empirical studies found that, in addition to perceived behavioral control on behavioral intentions for the positive impact of perceived behavioral control for the effects of behavioral intentions as the first priority (Atsalakis and Sleap, 1996; Mummery, 1994; Suzanne et al., 1996). If the personal view is that they lack resources and opportunities to complete an act, it cannot form a strong intention to act, so this study, perceived behavior control that can directly affect behavior. H4. (Individual-level) The perceived behavioral control is positively related to the behavioral intention.

Learning environment

In the virtual world, we are able to create an environment where young people learn by doing. They encounter obstacles that are relevant to what they are trying to do and figure out how to overcome these obstacles (Shaffer, 2007). Gee (2003) notes that such lateral movement, as opposed to mere linear progression, is itself a new cultural model of learning, one in which students learn to appreciate the importance of fully exploring and interacting with the environment to help them make better decisions and come up with better solutions. For an open learning environment with no identifiable structure, such individualized support is not feasible. However, because participants in any given affinity group vary in knowledge and experience, it is possible for those who are less accustomed to negotiation to pick up skills from observing their peers. Students could have worked in pairs to conduct negotiations with representatives of the other groups (Rappa et al., 2009). During the course of the project implementation, the authors noted that several measures were necessary to enhance that ‘real world’ quality of the students’ online interaction and the learning environment. Accordingly, H5. (Group-level) The learning environment is positively related to the behavioral intention.

Work climate concept is rooted in social psychology, the general organization decided to organize the influence of environmental factors, such as the incentive structure, so a direct investigation of employees of the organization's existing policies and practices of awareness, it is feasible to be used to study learning environment (Kaplan and Norton, 2004). When the organization implementation e-learning to encouraged and authentication mechanisms of the environment, was to make staff performance expectations, and strive to expectations, social impact, the higher the perceived behavioral control, may cause higher willingness behavior. Therefore, the research hypotheses are follows:
H6. (Group-level) The learning environment and the performance expectations are relation interaction to the behavioral intention.
H7. (Group-level) The learning environment and the Effort expectancy are relation interaction to the behavioral intention.
H8. (Group-level) The learning environment and the Social impact are relation interaction to the behavioral intention.

H9. (Group-level) The learning environment and the perceived behavioral control are relation interaction to the behavioral intention.

Research model

Furthermore, member loyalty and intention to use should be positively influenced by member satisfaction. Fig. 1 depicts the research model of this study.

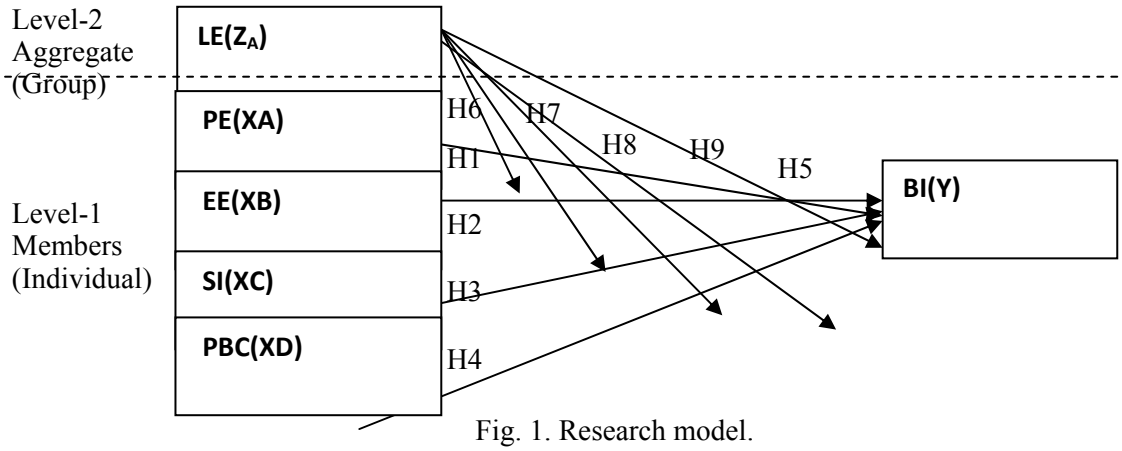

Fig. 1. Research model.

METHODOLOGY

Sampling and data collection

On this basis, a sample of 330 usable responses was obtained from a variety of respondents with different levels of computer or Internet experience. The respondents had an average of 11.39 years of use e-learning experience. The characteristics of the respondents are shown in Table 1.

Table 1 Characteristics of the respondents

Characteristics	Frequency	Percentage
Gender		
Female	444	47.6
Male	463	49.7
Missing	25	*2.7*
Age		
<25	117	12.6
25-30	284	30.5
30-35	254	27.3
35-40	110	11.8
40-45	64	6.9

Education		
Senior high school	69	7.4
Colleges or University	673	72.2
Graduate	181	19.4
Missing	9	1.0
Industry		
Services industry	294	31.5
Traditional manufacturing	30	3.2
High-tech manufacturing	323	34.7
Finance industry	245	26.3
Other	40	4.3

Measures

To ensure the content validity of the scales, the items selected must represent the concept about which generalisations are to be made. Therefore, the items used to measure performance expectancy, effort expectancy, social influence and the behavioural intention were adapted from Venkatesh.
The items were modified to make them relevant to the e-learning context. Pretesting of the measures was conducted by users and experts selected from the e-learning field.
The instrument's survey items were derived from the existing literature and modified slightly to fit the context of e-learning. We developed outcome variables, which were measured using a five-point Likert scale (1, strongly disagree; 5, strongly agree).
Table 1 contains descriptive statistics and reliabilities for the variables in this study. Since Learning environment is considered to be on different levels of analysis, we use Hierarchical Linear Modeling (HLM) (Raudenbush and Bryk 2002) for our analyses. In addition, we also followed Hofmann and Stetzer's (1996) recommended procedures for testing mediation in a multilevel framework.
The internal consistency reliability of the variables was assessed using SPSS 17.0 to compute Cronbach's alpha. The Cronbach's alpha values of all the variables, ranging from .836 to .912, were well over .7, which is considered satisfactory for measures (Nunally, 1978).
A principle components factor analysis with VARIMAX rotation was conducted to assess the validity of the constructs. The items loaded at .5 or better with their corresponding constructs, which is considered very significant. Thus, convergent validity was confirmed. In addition, with respect to discriminant validity, the items loaded higher on their predicted construct than on their cross-loadings. Six factors were identified: learning environment, performance expectancy, effort expectancy, social influence, perceived behavioral control, and behavioral intention.

Table 1 Descriptive statistics and correlations

	Mean	SD	1	2	3	4	5	VIF
Group-level								
learning environment	**3.26**	**0.91**						
Individual-level								
1. PE	**3.75**	**0.66**	**(0.870)**					**1.560**
2. EE	**3.60**	**0.73**	.515**	**(0.850)**				**3.204**
3. SI	**3.51**	**0.79**	.530**	.735**	**(0.911)**			**2.342**
4. PBC	**3.64**	**0.78**	.542**	.750**	.606**	**(0.860)**		**2.477**
5. BI	**3.74**	**0.75**	.650**	.547**	.567**	.587**	**(0.899)**	

N = 932; reliability coefficients for the scales are in parentheses along the diagonal
* p<0.05; ** p<0.01
[a] Although the correlations between all variables were computed by using N = 932, This variables scores were assigned down to individual. Thus, the effective N for Group level is 33
[a] BI is DV， other variable are IV， if VIF<10， no multicollinearity.

HLM analysis

This study collected the learning environment variables are shared construct, data collected from individual employees (Klein et al., 1994). Prior to conducting cross-level analysis, one must view the variables of aggregating to the appropriateness of group-level variables. In order to verify the information within the existing homogeneity within a group and the degree of interrater agreement, use r_{wg} to test indicators (James et al., 1993), if r_{wg}> .70 judgments suited to integrating data table. The difference between the validation group to η2 calculation, if the outcome was a significant difference between the standard form groups that may affect the level -2. Assessing the hypotheses of this study requires a sequence of hierarchical linear models: the null (one-way ANOVA), random-coefficient regression (member-level predictors only), intercepts-as-outcomes (adding group-level predictors), and slopes-as-out-comes models (testing cross-level predictors).

Null model

Dependent variable is behavioral intention. The ICC (1) was 0.332(Chi-square=478.327, p<0.01). ICC (2) was 0.956. Both of them were greater than 0.12 (James 1982), indicating that appropriate variance in Individual contracts exists between-groups. In addition, using information estimated in the null model, an intraclass correlation coefficient (ICC(1)) and reliability of the mean (ICC(2)) were computed, representing the percentage of the total between-group variance in the dependent variable (Raudenbush and Bryk, 2002). The result of ICC(1) marginally satisfied the critical value, .331 (Wen, 2006). Meanwhile, ICC(2) value was satisfactory at .956, which surpassed the minimum .7 requirement (Schneider et al., 1998).

Random-coefficient regression model

After examining the null model, we assessed whether significant between-group variance existed in the intercepts and slopes using a random-coefficient regression model. Hypotheses 1 to 4 predicted that the proposed factors would contribute to member satisfaction. We estimated a level-1 model including these variables, with no predictors specified for the level-2 model. Specifically, performance expectancy (τ_{00} = 9.471, p < .01), and social influence (τ_{00} = 4.104, p < .01), and PBC (τ40 = 6.023, p < .01) had significantly positive relationships with behavioral intention. Therefore, Hypotheses 1, 3 and 4were supported. Contrary to the prediction of Hypothesis 2, off-site interaction was not significantly related to behavioral intention.
Intercepts-as-outcomes model

After establishing that significant variance exists across groups in the level-1 intercepts, the cross-level hypothesis was directly tested. To test Hypothesis 5, we estimated an HLM model in which the member engagement variables were the level-1 predictors and then regressed the intercept coefficients obtained from level-1 on the measures of aggregated learning environment at level-2. aggregated learning environment ($\tau 00 = 7.511$, $p < .001$) demonstrated a significant learning environment with behavioral intention, after accounting for member-level predictors. As a group, the specified group-level variables accounted for 66.5% of the between- VCs variance in behavioral intention. Hence, Hypothesis 5 was supported.

Slopes-as-outcomes model

After confirming that significant group variance in the slopes was present in the random-coefficient regression model, we then examined whether the variance in the slope across groups was significantly related to the group-level independent variable (behavioral intention). This is a direct test for the cross-level moderator (Hypothesis 6-9). Performance expectancy, effort expectancy, social influence, and perceived behavioral control were significantly related to behavioral intention. Add Learning environment will change the four variable (PE, EE, SI, and PBC) impact on behavioral intention. We further investigated whether aggregated learning environment was related to desirable behavioral intention. An HLM analysis was performed, with behavioral intention as the dependent variable, at the group-level, aggregated learning environment was significantly related to behavioral intention ($\tau 00 = -2.768$, $p < .05$; $\tau 00 = 3.633$, $p < .01$). Therefore, Hypothesis 6 and 7 were supported, but Hypothesis 8 and 9 were not supported ($\tau 00 = 0.923$ $p > .05$; $\tau 00 = -0.912$, $p > .05$).

CONCLUSINS

Many studies discuss e-learning models such as the TAM (Ong et al., 2004; Pituch and Lee, 2006) and to explore the UTUAT model of gender and age differences (Wang et al., 2009). But few care about the environment factors into the model (Walumbwa et al., 2008; Tse et al., 2008; Miller, Murdock, 2007; Brutsaert, 2004; Davis, 1989; Davis et al., 1989; Venkatesh and Davis, 2000; Venkatesh et al., 2003; Ong et al., 2004; Pituch and Lee, 2006; Ong and Lai, 2006; Wang et al., 2009; Venkatesh et al., 2003). This study based on the UTAUT in order to level the concept, to discuss context effect and interaction effect. The research confirms the direct effect, the performance expectations and social influence will have a direct impact on behavior intention. And considering the group level of the learning environment, the performance expectations is negative impact the behavior intention. Organization incentives or related to certification e-learning were high, employees will lower behavior intention. And the social impact of the interaction with the learning environment but not significant, but to look forward to interaction with the learning environment has a significant positive effect, Organization has more incentives to employees, or e-learning related to certification and more employees are e-learning easy to use, the staff of its e-learning behavior intention.

SUGGESTIONS AND FUTURE RESEARCH

Future research can be considered collecting data from different organizational cultures, and more variable for research. In addition to adding age, gender, experience, etc. the individual-level variables of the conditioning effect; even try to multi-moderator-mediation. Secondly, the research data collection in order to cross-sectional research, can be added to the time order to Longitudinal data collection will come back to explore the factors influencing behavior. Finally, this study due to time constraints, only the recovery of 932 questionnaires were distributed, a total of 33 different companies, it is recommended to increase the number of samples next study to conduct the three-level(individual, unit departments, organizations) of the study.

ABSTRACT

In this paper profile of consumer decision-making style is treated as predecessor of preferences for retail format choice. Particular consumer's decision-making styles profile influence shopping behavior. The authors wanted to explore if, and in what sense, the revealed preferences for choosing particular retail formats (measured as declared frequency of shopping) can be described in more detail, and connected with perceived consumer decision-making styles concept. Results shown, that eight form nine consumer decision-making styles are predecessors of retail format choice in terms of causality assessed using structural equation techniques. More pronounced styles like: compulsive orientation toward shopping, recreational/hedonistic style as well as price-value consciousness are influencing shopping activities in 4 to 8 retail types. Research has been done on sample of Polish consumers representative to Internet users (regarding Internet shopping), gathered using paper-and-pencil interview. Presented analysis uses a data from research project funded by Polish Ministry of Science and Higher Education (grant number 1 H02C 077 30).

Keywords: retail format perception, retail format choice, decision-making style, Polish consumers

INTRODUCTION

The main aim of this paper is to explore connections between profile of consumer styles and preferences for retail format choice. Main approach taken by authors is to:

- look into perception of different retail formats by consumers comparing 12 store formats using multidimensional scaling,
- explore typical profile of consumer decision-making styles (PCS) of Polish consumers,
- estimate structural equations testing significance of relationship between particular styles and shopping behavior.

In Poland domestic trade (including retail and wholesale) is the second source of GDP (after industry), having a share in GDP creation close to 15.8% in 2008, and slightly decreasing during last 10 years (GUS, 2009; p. 29). The increase in total turnover of retailers in 2008 was 9.5% comparing year 2007 in current prices, giving a growth of about 5% in real prices

(GUS, 2009; p. 39). Economic slowdown during 2009 decreased growth rate of retail turnover, which is estimated on the level of 2.7% (GUS, 2010).

Polish Central Statistical Office estimates number of retailers as close to 385 thousand (excluding internet shops using "pure-play" business model), increasing with rate of 3.9% year over year (GUS, 2009; p. 41). In Polish retail structure, 92.4% of stores have sales area 99m^2 or less, but in total sales area, this group has a share of 52.8%. From mentioned 385 thousands of stores slightly more than 3600 outlets is classified as supermarkets (ca. 0.9%) and about 460 ones – as hypermarkets (ca. 0.1%) according to Polish CSO (GUS, 2009; p. 41).

There are also over 7000 internet stores (Internet Standard, 2009; p. 11). From them about 39% were a "brick-and-mortar" model followers, and ¾ of such store owners also performed come sales activities on Internet auction platforms (Internet Standard, 2009; p. 19) The share of the Internet channel (internet stores and auction platforms together) in total retail turnover is estimated as close to 2% (Internet Standard, 2009; p. 5). The share of Internet stores in this turnover is over 41%, the rest is the share of auction platforms, mainly Allegro.pl (Internet Standard, 2009; p. 5).

There should be noted that our research and conclusions refers to Polish consumers only, and to Polish retail structure. For other markets and countries, also from cultural differences reasons, the care must be taken when this approach is applied.

PREFERENCES FOR RETAIL FORMAT CHOICE

Preferences for retail format choice depend on factors external to the consumer and internal ones. External factors among others include (Peter & Olson, 2002): perceived price level (for the format, and particular place), physical effort to buy (including commuting), amount of time designated for shopping – most of external factor are creating perceived total cost of buying for the consumer. Among internal factors there are i.e.: consumer demographics, and – which is important from this paper aims – consumer personality manifesting in decision-making styles and perceived level of emotional effort connected with shopping (mostly in terms of perceived risk and trust for retail format and particular shop).

There should be noted that literature devoted to store choice issues has a long tradition, starting mainly in the 70's of the 20th century. The authors of many of earlier studies - among others: Monroe & Guiltinan (1975), Darden (1979), Arnold, Ma & Tigert (1978), Arnold, Oum & Tigert (1983), Mason, Durand & Taylor (1983), Keng & Ehrenberg (1984), Eagle (1984), Louviere & Gaeth (1987), Spiggle & Sewall (1987), Dawson, Bloch & Ridgway (1990), Burke et al. (1992), Arnold, Handelman & Tigert (1996) - have tried to rationalize store choice using different approaches, regarding external and internal factors to the consumer. For instance the store attributes and situational factors were studied, as well as shoppers and their households demographics, shopping patterns, attitudes toward stores, implied importance weights of factors like price level.

Some more recent research examined i.e. the impact of task definition on store choice (Kenhove, Wulf & Waterschoot, 1999), but most of mentioned store choice studies have been restricted to the same format, i.e., supermarkets, discount stores. Another problematic approach is arising when a complete overlap of assortments in different formats is assumed, like in studies by Lal & Rao (1997) or by Krider &Weinberg (1998), because is very easy to empirically observe that only for selected product categories it can be true. There also exist some studies examining the influence of retail pricing formats on shopping behavior (Bell, Ho & Tang, 1998; Ho, Tang & Bell, 1998), often assuming that one store format has in general higher prices than the other one.

Bhatnagar, & Ratchford (2004) represent interesting approach, but limited to non-durable goods. Exploring fixed and variable costs of shopping, including assumption about consumers preferring to shop at minimum total cost, and different price levels between formats, they found conditions in which the store format choice would be optimal.
Looking for general factors influencing store format choice, we assumed that consumer mental characteristic should explain attitudes to particular store formats and chains/outlets. Because of exploratory character of this study, we focused on measuring shopping outcome only, dropping attitudes from direct consideration.

CONSUMER DECISION-MAKING STYLES

A consumer decision-making style concept introduced by Sproles & Kendall (1986), is defined as "a mental orientation characterizing a consumer's approach to making choices" (p. 268). Those styles should be perceived as "basic buying-decision making attitudes that consumers adhere to, even when they are applied to different goods, services or purchasing decisions" (Walsh et al., 2001, p. 121). They are relatively stable constructs, connected to consumer personality (Sproles & Kendall, 1986), and particular shopping activities and attitudes toward shopping are direct outcomes of consumer's decision-making style (Tai, 2005).

Sproles & Kendall (1986) developed two multidimensional scales to measure consumer decision-making styles – "longer" version called CSI – Consumer Styles Inventory (with 40 items), and more concise one – PCS – Profile of Consumer Style (with 24 items) (Sproles & Kendall, 1986). Both have eight following dimensions (decision-making styles):

1) perfectionism or high-quality consciousness (PERF),
2) brand consciousness or "price equals quality" (BC),
3) novelty-fashion consciousness (NFC),
4) recreational or hedonistic consciousness (RSC),
5) price-value consciousness or "value for money" (PVC),
6) impulsiveness or carelessness (IMP),
7) confusion from overchoice (CO),
8) habitual, brand loyal orientation toward consumption (HBL).

Perfectionism as a consumer decision-making style exhibits in tendency to buy or prefer only the best quality and/or high tech products offering unique value for the user. Perfectionists "must have" those special products, i.e. advanced smartphones, high-end audio equipment,

not considering high prices as a barrier to buy. Consumers higher in this style often shop carefully, systematically and compare many products before take decision. This style is typically more pronounced in men, and consumers with high income.

Brand consciousness is connected with high preference to buy particular more expensive and well-known world and national brands, mostly having large market share, and intensive advertising. Brand conscious consumers often think that "price equals quality", and perceive buying cheaper brands as risky in terms of quality or image, so not worth considering. Sometimes they are strong brand's "advocates" swearing loyalty for i.e. Apple products.

Novelty-fashion consciousness is a tendency to seek new products, recently introduced on the market, products that are perceived as stylish, trendy (i.e. clothing, electronics), not because of their utility value but because of fashion issues. High scores on this style are likely for people gaining pleasure from seeking new up-to-date things, including shopping from variety-seeking reasons. Usually women have higher scores in this style than men, and similarly younger people comparing o older ones.

Consumers exhibiting high scores on recreational (hedonistic) style like shopping (in this case not exactly equal to buying, but rather perceived as a form of entertainment), and like to "feel" retail environments, their atmosphere, image and other people.

Price-value conscious consumers represent the "value for money" shopping orientation. They like sales and low prices in general, but are likely comparison shoppers – trying to get the best value for their spending.

Consumers high on impulsive or careless orientation don't like to plan their shopping, not think about the way and amounts they spent, and about "big deals".

Confused by overchoice consumers have difficulty in making choices during shopping – too many brands and/or stores drives them to experience the information overload.

Pronounced habitual, brand-loyal orientation for shopping means that consumers have favorite stores and brands, and formed habits in making decisions, often based on simple repetition of previous choices. Men and older consumers more likely represent this style.

It is important to note, that those styles are not independent – particular person does not possess only a single style, but rather an individual combination of them, creating personal profile of all styles manifesting itself on different levels, from those some are more intense or prominent (Sproles & Kendall 1986). Consequently, each person possesses a specific profile of decision-making styles.

Since original research of Sproles & Kendall (1986) several studies applied consumer decision-making styles approach to different cultures, recently including among others: German consumers (Walsh et al, 2002), Chinese ones (Tai, 2005), and Polish (authors studies – Mącik & Mącik, 2009).

METHODOLOGY

Subjects and procedures

The sample of 1067 Polish consumers (aged at least 15 years old) gathered by paper-and-pencil interview (PAPI) has been used to gather the data. Nationwide sample representative to the Internet users' population has been used, taken during two-stage sampling processes. In each of 16 voivodships (NUTS 3 level territories), three towns were selected on first stage, differing by number of inhabitants. On second stage, quota sampling has been used, taking into account participant gender, age and earned income.

For this sample used data on shopping formats preferences and consumer decision-making styles were only a part of the questionnaire – other gathered data, regarding more detail about Internet Shopping adoption are not discussed in this paper.

Scales development

Scales used in this paper include:

- Polish adaptation of PCS scale,
- multi-item scales measuring declared frequency of shopping at 12 selected retail outlet types (single item for each type), including 10 conventional types and 2 e-retail types and demographic factors (age, gender, disposable income and type of residence place),

Authors of this paper reconstructed the used version of PCS scale by Sproles & Kendall (1986) earlier. Our polish adaptation of PCS consists of 27 items selected using factor and reliability analyses in 9 dimensions. Eight dimensions are styles present in CSI and PCS, and the ninth additional one – compulsiveness (COMP) – has been added on the base of previous authors research on unplanned buying and its determinants (Mącik & Mącik, 2005). For that the Unplanned Buying Scale (UBS) by Mącik & Mącik (2005) has been used, being a reception of hedonic, impulsive and compulsive buying tendencies, described for instance by Hirschman & Holbrook (1982), Rook & Fisher (1995), and Faber & O'Guinn (1992).

Added compulsive orientation toward shopping includes items measuring facets of uncontrolled buying behavior and spending too much in relation to income.

All constructs from PCS scale were measured using Likert-type scale of 1-5 with ends worded "strongly agree" and "strongly disagree". Scale measuring declared frequency of shopping used 5 frequency descriptions ranging from "never" to "daily".

For modeling purposes, data from the focus groups were also used– regarding perceived differences between retail formats and factors influencing consumers' store choices.

Internal consistency and construct validity

Internal consistency of individual scales for measuring particular construct has been assessed by using Cronbach's Alpha coefficient (Cronbach, 1951).

The results are shown in table 1 for PCS. For 6 of 9 identified consumer's decision-making styles Cronbach's Alpha is over or close to typical value 0.70, suggesting enough internal consistency (table 2). For 2 other dimensions Alphas are over or close to acceptable minimum for short scales of 0.6, and for impulsiveness scale the reliability is too low. This suggests the need to improve their wording in the future. Intercorrelations between particular styles are low (the highest less than 0.45) – each style is distinct from others – this suggests good discriminant validity.

Table 1. Internal consistency of consumer styles (PCS dimensions) and their intercorrelations

Con-struct	# of items	Cronbach's Alpha	Pearson's correlation coefficient between constructs								
			PERF	BC	NFC	RSC	PVC	IMP	CO	HBL	COMP
PERF	3	0,58	1,00	0,09**	0,23**	0,10**	-0,16*	-0,13**	-0,04	0,10**	-0,06
BC	3	0,71		1,00	0,38**	0,28**	0,03	0,17**	0,03	0,02	0,27**
NFC	3	0,82			1,00	0,45**	-0,12**	0,12**	-0,02	0,07*	0,24**
RSC	3	0,85				1,00	0,02	0,19**	0,06	-0,05	0,45**
PVC	3	0,65					1,00	0,00	0,18**	-0,01	0,05
IMP	3	0,45						1,00	0,14**	-0,03	0,33**
CO	3	0,69							1,00	0,02	0,07*
HBL	3	0,69								1,00	-0,19**
COMP	3	0,83									1,00

** $p < 0.05$ * $p < 0.01$

Next step in assessing construct validity was exploratory factor analysis using principal component extraction method with varimax rotation. This procedure has been performed to confirm that all scales are measuring distinct constructs. For adapted PCS existence of 9 proposed consumer's decision-making styles was confirmed – table 2. Nine factors with eigenvalues greater than 1 explained about 66.8% of total variance. Each style is separated factor with high loadings in both samples, with no cross loadings above 0.44, this indicates very good discriminant validity.

Table 2. Exploratory principal components analysis for PCS subscales[a]

Scale items	Factors								
	1 (RSC)	2 (COMP)	3 (NFC)	4 (BC)	5 (CO)	6 (HBL)	7 (PVC)	8 (PERF)	9 (IMP)
PERF1								0.818	
PERF2								0.778	
PERF3								0.512	
BC1				0.778					
BC2				0.796					
BC3				0.701					
NFC1			0.825						
NFC2			0.851						
NFC3			0.716						
RSC1	0.820								
RSC2	0.829								
RSC3	0.792								
PVC1							0.755		
PVC2							0.723		
PVC3							0.753		
IMP1									0.768
IMP2									0.720
IMP3									0.424
CO1					0.793				
CO2					0.799				
CO3					0.716				
HBL1						0.848			
HBL2						0.853			
HBL3						0.622			
COMP1		0.747							
COMP2		0.811							
COMP3		0.852							
Eigenvalue	2.44	2.38	2.26	2.05	1.93	1.89	1.83	1.80	1.43
Cumulative % of explained variance	9.05	17.86	26.23	33.82	40.99	48.00	54.80	61.48	66.80

[a] low factor stores are omitted for the sake of presentation clarity, no omitted score has been greater than 0.4

Also for the scale measuring declared frequency of shopping in particular format of retail Cronbach's alpha has been calculated being equal 0.73. Because each format has been treated individually for modeling there was no factor analysis performed in that case.

Data analysis

Presented analyses have been made using SPSS 14.0PL (for preliminary purposes) and AMOS 7.0 structural equation modeling software (used to identify and test causal relationships). Structural equations modeling – a "path analysis" may be shortly explained following way: "Path analysis is a method of measuring the influence of explanatory variables along each separate path in a system and finding the degree to which variation of a given effect is determined by each particular cause" (Teo, Lim & Lai, 1999; p. 30). This approach allowed to calculate measures of fit for models reported in the paper, and made comparisons across those models.

There should be noted that presented analysis has an exploratory character. No exact hypotheses have been settled and tested in this case. The sets of descriptors for modeling influence of particular consumer decision-making style were chosen on the basis of author judgments coming from preliminary study using focus groups and analysis of correlations between styles from PCS and declared frequency of shopping in particular retail format.

RESULTS

Perception of retail formats

For visual interpretation of perceived attributes of analyzed retail formats, one from typical algorithms for multidimensional scaling (namely ALSCAL procedure) has been performed. Figure 1 contains graphical representation of 2 main dimensions got during this phase of research.

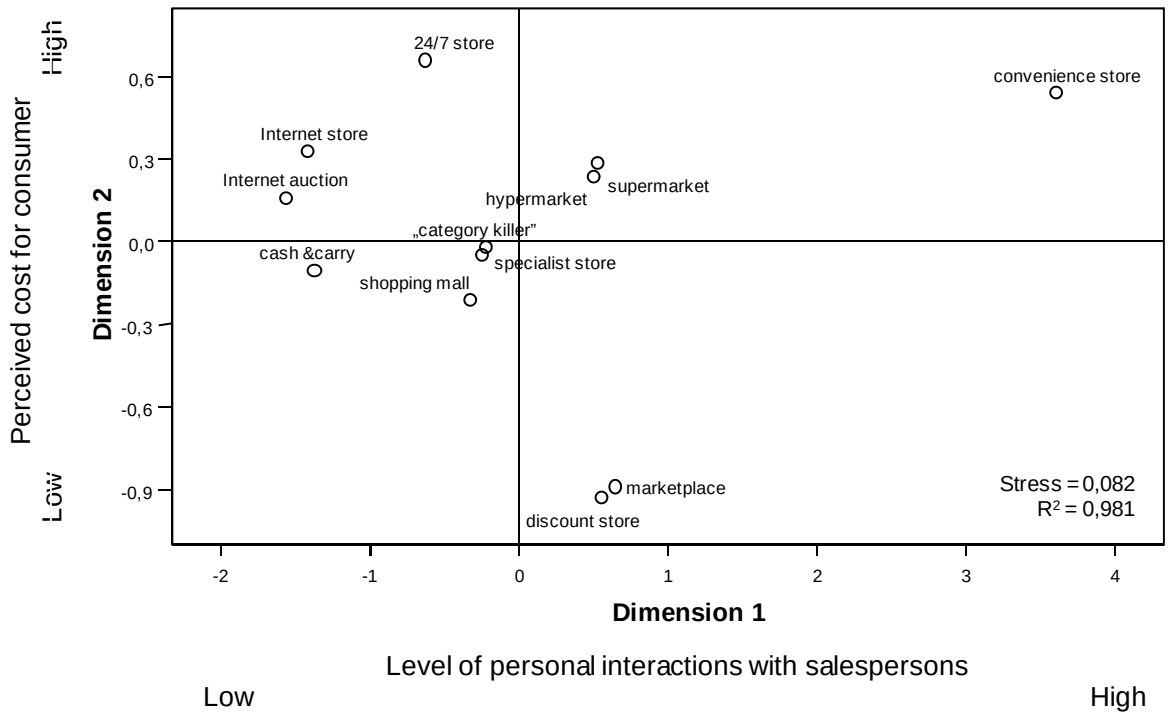

Figure 1. Perception map of retail types on the base of declared shopping frequency – multidimensional scaling approach (ALSCAL procedure, Euclidean distances)

Two-dimensional solution for this case fits the data very well. Stress value is lower than acceptable 0.1, and R^2 statistic is very high, exceeding minimum of 0.6 (Borg & Gronen, 2005; p. 48)

Dimensions in this case can be interpreted as:

- perceived level of personal interactions with the salespersons in particular retail format – dimension 1 – horizontal in figure 1,
- perceived total cost for consumer in sense described by Peter & Olson (2002, p. 459-461) – dimension 2 – vertical in figure 2.

The highest level of personal interactions with the salespersons is perceived in convenience stores (some stores of this type in Poland are still using traditional type service or limited level of self-service). Shopping over the Internet creates the second pole for this dimension – buying in Internet stores and auctions requires mostly "machine-type" interactions with the Internet as a medium (using hyperlinks, forms, e-mails sent by auto responders etc.), and interactions "over the medium" with particular person are much rarer. Such interactions to be successful are performed mostly using instant messaging tools or phone calls. The most similar to both types of Internet shopping is cash & carry format – there are also not too many occasions to interact with sales force. Other formats are "in the middle" between described poles for this dimension.

In second dimension – recognized as perceived total cost for consumer as described by Peter & Olson (2002, p. 459-461) – are included following factors:

- perceived price level for particular retail format,
- physical effort of shopping, including travelling time and cost,
- time spent for shopping – in case of stores and Internet auctions this factor contains also the time of waiting for bought products delivery.

The lowest total cost for consumer is perceived for buying in discount stores and traditional marketplaces (bazaars) – probably because of perception that those places are cheap, and buying there gives opportunity to save money. On the other hand, the highest perceived total cost is for 24/7 type stores and convenience stores, mostly because of relatively higher price level.

There should be noted that in Poland discount stores are rather small comparing to other outlets, and localized often inside or close to larger clusters of inhabitants, so their usage patterns and assortment (in terms of product categories available – not brands) in some situations are more similar to typical convenience store than to the supermarket.

Relatively high position in this dimension of Internet shopping (both formats) is influenced by typically long time for product delivery, and possible problems with purchase handling, product returns ect., despite perception of low prices over the Internet and the most extensive assortment available in this channel. In this dimension buying over the Internet is similar to shopping in supermarkets and hypermarkets – average prices are in this case connected with a perception of loosing time during seeking products and standing in queues, giving mentioned position on the map.

Profile of Consumer Styles – descriptive statistics

Because used sample was representative to the Polish Internet users population and enough large to get relatively low sampling errors, there was calculated descriptive statistics for each subscale of PCS (table 3), giving a reference point to further analyses.

Averages as well as media values for results recalculated to initial code values from 1 to 5 are in most case close to the midpoint of the scales. Only for compulsive decision-making style those measures are substantially lower. Standard deviation is highest for recreational style (RSC), as well as for perfectionist shopping orientation and compulsive dimension, being lowest for impulsive decision-making style.

Table 3. Descriptive statistics for PCS subscales for whole sample

PCS subscale	Mean	Standard deviation	1st quartile	Median	3rd quartile
PERF	3.44	0.73	3.00	3.33	4.00

Models connecting decision-making styles with shopping frequency

Preliminary analyses gave some suggestions for expecting specific profiles of consumer decision-making styles for consumers preferring particular retail format. For instance consumers preferring buying in shopping malls have more pronounced compulsive style, have relatively high scores on recreational shopping consciousness (hedonic) scale, and also are novelty-fashion conscious and brand conscious.

Because of only slight, but statistically significant differences on the level of particular decision-making styles, for people preferring particular retail type, the results are omitted.

Instead, there is a more detailed description of the results of structural equation modeling for causal relationships between the score on some consumer decision-making styles according to PCS and declared frequency of shopping in particular retail format (as a simplified measured of reveled preferences for choosing retail outlet types in everyday life). Detailed figures showing graphically particular models (there were 12 models estimated) and their paths including covariances between styles are not shown – this would need more space than is allowed for this paper. But detailed description of standardized regression weights in each model for particular styles are shown in table 4.

We need to note, that because of exploratory character of this study we didn't expect to test any hypotheses regarding models, and from each model not significant paths representing influence of particular decision-making style on dependent variable were dropped from the model, "purifying" it from not significant paths, and helping to improve models' fit to the data.

Table 4 contains standardized regression weights for all considered models with typical measures of model fit. In general the models are fitting the data well in all cases, but predictive value of such model in some cases is very low considering their R^2 values, especially for hypermarket, supermarket and convenience store (not exceeding 0.02 for each case). The highest R^2 had models for shopping mall and cash & carry store formats (in both cases over 0.066). Low R^2 values are suggesting that in our models important descriptors are omitted (which was expected), but quite good fit of all models confirms the existence of causal relationships between shopping behavior and profile of consumer styles.

Notes:

[a] "rules of the thumb" suggested by Carmines and McIver (1981, p. 80) or Byrne (1989, p. 55).

[b] for lager samples it is often unreasonable to have significant p value (Jöreskog, 1969, p. 200).

[c] "p value" for testing the null hypothesis that the population RMSEA is no greater than .05 indicating close fit (Browne & Cudeck, 1993).

Preference for buying in hypermarkets is caused by higher level of recreational/hedonistic shopping orientation, and higher level of perfectionism (model fits the data less in comparison to other ones). People more often buying in supermarkets are also recreational shopping-oriented, but also less price-value conscious. More frequent buying in specialized large stores (so called "category killers") is caused by the same styles than shopping in supermarket, with addition of the positive influence of compulsive decision-making style.

As has been observed during preliminary research, shopping malls attract more compulsive consumers, they are higher on perfectionism, novelty-fashion conscious and brand conscious.

Frequent shopping in convenience stores is caused only by one form nine styles: higher than usual confusion by overchoice – not so wide assortment and small infrastructure attracts such consumers to this store format. From the same reason people sensitive on overchoice prefer buying in discount stores, also higher recreational shopping orientation is connected with references of choosing discounters.

Key characteristic of consumers liking and buying more often in specialist stores is low price-value consciousness, higher brand consciousness, and higher compulsiveness. 24/7 stores are opened non stop (some of them excluding some national holidays), and they attracts people more compulsive, less price-value sensitive (sometimes of seriousness of needs to buy something), and less recreational-oriented.

Buying on traditional marketplace/bazaar is likely performed by consumers price-value sensitive, recreational-oriented during shopping, rather not habitual-brand loyal, and not brand conscious.

Cash & carry type outlets are perceived well by compulsive consumers, perfectionists seeking always best products, people less sensitive on price-value issues, as well as not easily confused by overchoice.

Two consumer decision-making styles are predictors of Internet shopping – this means that consumers less price-value oriented and more recreational-oriented are likely to shop more frequently. Additional style connected with buying in Internet stores is brand consciousness – more products of well-known brands is easier available in Internet stores than in conventional retail. Consumers preferring Internet auctions are less likely to be confused by overchoice – large number of items offered on such platforms not confuses them, they often use some strategies to minimize the information overload by using searching tools.

Approach taken by the authors has some limitations discussed in last part of this paper, but if such results will replicated, should give many insights for retail practitioners.

CONCLUSION

As noted before this research gave some answers for similarities and differences between retail formats as perceived by consumers, and also for connections between consumer decision-making styles and actual store format choice.

It seems important to show that some retail formats are perceived as similar, for instance marketplaces and discount stores, hypermarkets and supermarkets, Internet shops and Internet auctions, while convenience stores seem to be very distinct in comparisons to other formats.

From nine consumer decision-making styles analyzed, eight influenced significantly frequency of shopping in at least one type of retail outlets. In two cases: recreational/hedonistic shopping consciousness and price-value consciousness eight from twelve formats are affected.

Level of recreational/hedonistic decision-making style significantly influencd buying in discount stores, supermarkets, hypermarkets, and so called "category killer" specialized stores, as well as in Internet auctions, Internet stores and classical marketplaces (having positive impact on frequency of shopping). However, for 24/7 type stores this style has negative impact, and – rather surprisingly – there is no significant relationship between this style and shopping in shopping malls.

The degree of price-value consciousness had mostly negative impact for shopping in 24/7 stores, Internet stores and Internet auctions, specialist stores, "category killers" supermarkets, and cash & carry places. Only buying in marketplaces was positively connected with mentioned decision-making style.
Compulsive orientation, connects significantly with shopping in cash & carry places (maybe bulk quantities are teasing compulsive shoppers), shopping malls (as expected), 24/7 stores (probably giving "instant relief" for consumers addicted to shopping), "category killers" and specialist stores.

High sensitivity to be information overloaded because of overchoice was present for convenience stores and discounts. In opposite way this style affected buying cash & carry, as well as on Internet auctions.

High perfectionism increases frequency of shopping in shopping malls, hypermarkets, cash& carry and Internet stores, while having more pronounced brand-conscious shopping orientation connects positively with buying in specialist stores, shopping malls (easier to buy better brands), and negatively with buying in traditional marketplaces.

Novelty-fashion conscious orientation, as well as habitual brand-loyal one affected only shopping in shopping malls and marketplaces respectively. Impulsive orientation was not included in any model – there is a possibility that low reliability of that construct is the reason of such situation.

The effects of this research should have several practical implications. Firstly, knowledge of the nature of consumer decision-making style profiles leading to preferences to retail format choice should lead to better marketing planning, positioning and other merchants' decisions. Secondly, the research results should give a possibility to explore similarities and differences between different store formats using gathered data. Thirdly, this study should have also valuable suggestions for e-commerce practitioners connecting some decision–making styles with possible threats and difficulties in e-commerce adoption perceived by consumers: fraud, getting not-original products, information overload, too high prices (adding delivery costs), and lack of enjoyment.

Unfortunately, this study has also some important limitations, including:

- single-item measure for shopping behavior in terms of frequency of buying, as a measure of revealed preferences is too simple – there is a need to develop a better measure for such thing,
- low possibility of results generalization to the other cultures and retail structures – comparative study including at least 3 countries with differences in both mentioned factors should be done,
- results have been not replicated so far,
- demographic factors, not considered here, might influence the results – because of it and also from previous reason there is a need to redesign measures and sample structure (for instant trying to replicate results on the sample which is less diversified in terms of i.e. age, income and so on),
- not best possible reliability of used measures of consumer decision-making style factors, leading to some wording changes for some items,
- lack in the catalog of styles form PCS, the style including some ecological shopping orientation – there is a need to develop items for such style, and test them for possible inclusion to the adapted by authors 9-factor structure of PCS as a 10th factor.

ABSTRACT

In today's ever-changing business environment, it is imperative for a firm to be able to dynamically adapt to the changes in order to maintain and enhance its competitive advantages. Therefore, the evaluation and selection of the best business strategy, given the company's limited resources and capabilities, could be a vital task. Due to the uncertainty and dynamics of the business environment, previous research in strategic management has mainly focused on using qualitative research methodology to understand the process of forming business strategy. In this research, we propose a comprehensive quantitative model, which is considered the influence of dynamics of the external environment by referring the "normal mode" of nature science, to evaluate the performance of business capabilities. To explore the conditions of firms and to propose some directions with business tactics are the major contributions of this model. Organizations would enhance their competitive capabilities by reallocating the resources, and make their decisions for sustainable development through the more holistic approach.

Keywords: mathematic model, competitive capabilities, environmental dynamics

INTRODUCTION

Research on the environmental dynamics and strategic management has made significant progress in recent years. In 1950s, system dynamics proposed by Forrester, has been developed to model, it analyzes and describes the dynamics of the scenarios of business operating by providing a kind of simulation program. In 1970s he published "World Dynamics" which tried to find and explain some trends via setting relative variables and parameters through a macroscopic view of industries, using a feed back perspective. On the other side, the early development of business strategy is primarily due to the work of Alfred Chandler and others at Harvard Business School (Chandler, 1962). Strategic management is a

multi-disciplinary field that encompasses from economics to organizational theory, and is also closely related to the development of enterprise. There are increasing interests from both researchers and practitioners in the field of business strategies (Boulianne, 2007; Nerur, et al., 2008). Therefore, Dynamic strategic management problems are investigated by more and more scholars with different background such as the field of economics, organizations, education and management (Senge, 1990; Sterman, 2000).

Furthermore, firms are under the rising global competition and ever evolving business environment changes. It is vital for a firm to thoroughly understand the effects and interactions between uncertain business environment and organization capabilities in order to enhance the performance of the business strategy implemented. Superior performance often depends on the quality and consistency of the firm's strategic orientation, and a right business strategy would help in achieving the organization's goals and objectives (Reeves, et al., 2003). Therefore, one of the critical tasks tackled by a firm today is to maintain sustainable competitiveness through utilizing effective techniques to help selecting the right business strategy.

The extant research in strategic management has mostly adopted qualitative research methodology that collected data to explore the relationship between strategy measurement and organizations' performance using questionnaires or in-depth interviews (e.g., Song, et al., 2007; Apigian, et al., 2006; Hult, et al., 2006). In this research, we propose a quantitative method to select the appropriate strategy for firms based on system dynamics and fuzzy theory. The model will be constructed by combining the key factors of external environment and the key performance indicators of internal capabilities, which are involved the influence of dynamic environment. The model can be used to evaluate the degree of environment dynamics, and rank the appropriateness of the four basic strategy types of Miles and Snow (1978). According to considering the effects of the opportunities and threats of industrial environment and impacts of organizational institution of internal environment, the model is useful to support the decision making in selecting the business generic strategy and enhance the competitive advantages of enterprises.

LITERATURE REVIEW

The success of business strategies depends on their capacities in responding to the feedback of dynamic and uncertain environment by avoiding threats and catching opportunities. There are a great number of tools be developed not only to help firms to analyze the situations of them, but also assist firms in implementing, applying and evaluating the strategies.

External Environment

The external environment includes all kinds of elements existing outside the boundary of firms that have the potential to influence the life and development of organizations. The affecting forces of external environment are uncontrollable, because they are made from the uncertain and dynamic environment. The external environment can be conceptualized as two layers: general and industrial environment, the general environment is the outer layer and the industrial is closer to the firms. In 1967s, Aguilar analyzed the external environment by using a framework which combines four perspectives: politics, economics, socioculture and

technology (PEST analysis), and it is important for a firm to consider its environment before making some strategic policies. In step with the progress of science and culture, some widespread use of the PEST analysis such as SLEPT which added legal, and PESTEL which inserted environment and legal, etc. Enterprises can survey themselves and summarize their opportunities and threats in the general environment. On the other side, in 1980s, Porter's Five Forces tool can be used to analyze the influence of the industrial environment, the Five Forces includes potential latest entrants, bargaining power of buyers, bargaining power of suppliers, threat of substitute products and rivalry among competitors. This tool is a powerful for assessing the nature of competition in the industry, and it will help firms to understand the strength of the current competitive position.

Internal Environment

Adopting key performance indicators (KPI) of balance scorecard (BSC, Kaplan and Norton, 1992) is suitable to evaluate the performance of organization in the internal environment. Companies can design the KPI to estimate the performance of organizations, and assign the responded goal to achieve. Due to the model in this research is constructed by the concept of mathematic method, herein, the quantitative KPI are chosen from the indicator pools. The KPI of our model are shown in Table 1 as below.

Table 1 The KPI of the internal environment

BSC perspective	Financial perspective	Customer perspective	Internal process perspective	Learning perspective
KPI	- Return on investment - Return on assets	- Market value - Sales Growth Rate	- R&D efficiency index - Operating cycle	- Operating revenue per employee - Employee

The tools mentioned above are useful for describing the conditions of companies by using qualitative or nominal term, but they can't show up the information in number formats. The next section will review the concept of system dynamics, which is a quantitative approach to investigate the performance of a "system."

System dynamics

In 1950s, Forrester pointed out the perspective of system dynamics, he argued that this new method is useful to model, analyze and describe the dynamics of the scenarios of business operating. People can find the developing trend in the system which they are interested by using this approach. In this research, we will combine the elements of PEST analysis, Five Forces analysis and BSC, and describe them via the concept of system dynamics. Figure 1 is the research framework in this study, and we will propose a mathematic model to evaluate the competitive capabilities through the dimensions mentioned in Figure 1.

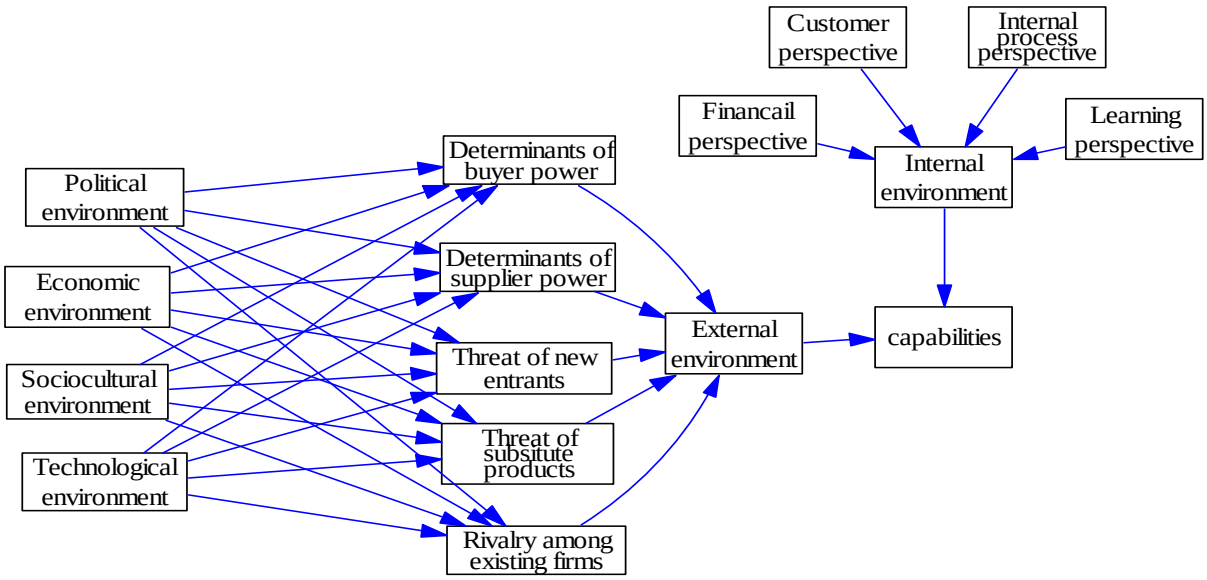

Figure 1 Research framework

MODELING

The challenge of modeling interdependent variables had recently received considerable attention in the economics and management literatures. Our model was revised and derived from the "utility function of risk" to adapt it to the problem about the uncertain and dynamics of external environment in this research. Adapted from Arrow-Pratt measure of risk taking, three commonly used types are employed in the model as alternative decisions for firms: risk averse, risk neutral and risk prone. The three decisions will bring different performance of the business, and can be represented by three kinds of utility functions, respectively. (Keeney, 1980).

$$U_1(x) = a_i + b_i(-x^{-c(t_i)x}) \quad \text{risk averse}$$
$$U_2(x) = a_i + b_i\left(c\left(t_i\right)x\right) \quad \text{risk neutral}$$
$$U_3(x) = a_i + b_i(x^{c(t_i)x}) \quad \text{risk prone}$$

$U_i(x)$ represents the performance of organization which use ith risk type, and a_i, $b_i > 0$ are constants, and $c(t_i)$ indicates the degree of risk aversion, neutral and proneness in time t. Our model combines the decision variables (x) of the operating process in internal environment and the moderating variables between industrial and general environment in external environment to describe the growth of the businesses. Based on the dynamics of external environment, we refer the concept of "Normal mode" in the nature science to describe the dynamics in the general environment, and apply the perspectives of "life cycle" to express the development in the industrial environment. Herein, we assume that the dynamics of external environment as "Normal mode", and based on the Hooke's Law, the conditions and scenario in a dynamic system can be expressed as following functions.

$$c(t_i) = c_0 \cos \omega t_i$$

c_0 is the initial value of the normal mode system. ω represents the intrinsic characteristics of the external environment, and the more intense environmental turbulence, the larger value of ω. In order to the impacts of external environment are important to the utility function, we redefine the parameter c_0 to be the influence of the external environment. And then,

$$c_0 = (O^G + O^I) - (T^G + T^I)$$

$$O^G = \sum_{k=1}^{4} (\sum_{j=1}^{n} w_{kj} \times v_{kj}^{o})$$

$$T^G = \sum_{k=1}^{4} (\sum_{j=1}^{n} w_{kj} \times v_{kj}^{T})$$

$$O^I = \sum_{m=1}^{5} (\sum_{s=1}^{s} w_{ms} \times v_{ms}^{o})$$

$$T^I = \sum_{i=1}^{4} (\sum_{j=1}^{n} w_{ij} \times v_{ij}^{T})$$

O^G, T^G is the opportunities and threats of general environment, respectively. W_{kj} represents the weight of j^{th} factor of k^{th} general factor, and $v_{kj}{}^{o}$ is the value of opportunity of j^{th} factor of k^{th} general factor. k = 1,2,…,4. O^I, T^I is the opportunities and threats of industrial environment, respectively. w_{ms} represents the weight of s^{th} factor of m^{th} general factor, and $v_{ms}{}^{o}$ is the value of opportunity of s^{th} factor of m^{th} general factor. m = 1,2,…,5.

DATA COLLECTION

The data of internal environment can be collected in Compustat database (S&P), and the data of external environment can use the format and content of Table 2.

External factors	Opportunities					Threats			
	9	7	5	3	1	3	5	7	9
Political Factors									
Economic Factors									
Sociocultural Factors									
Technological Factors									

Table 2 the values of external factors

CONCLUSION

The main contribution of this research is involved with the influences of dynamics of external environment and capabilities of internal environment on the risk functions. The Figure 2 shows the dynamics of the organizational environment.

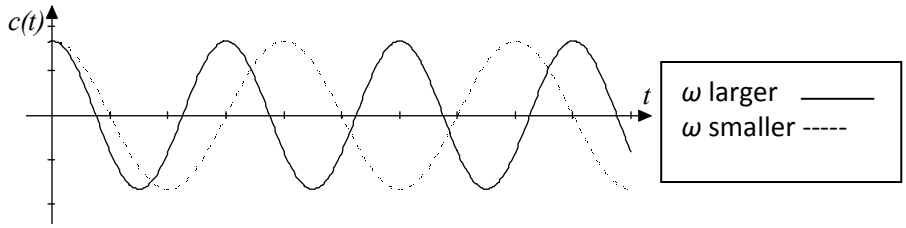

Figure 2 The dynamics of organizational environment

At the same level of external forces, the capabilities of internal environment will determine the dynamic situations of the companies. If the capability of internal environment is larger, the ability of fighting the influence of external environment is larger.

ABSTRACT

The fast changing internet world has revolutionized the way firms conduct business, relate to partners, customers and suppliers. The internet technology has also enabled a competitive business landscape, which has created opportunities and challenges for a variety of businesses in meeting customers' needs. Customers are now better educated and informed on specific products and services, partly, because of the roles of the internet, hence greater alternatives for customer. This research provides three key management-focused constructs for building business competitiveness. The objective of this paper is to examine the key determinants of firm competitiveness on three fronts: Quality Management, Marketing Management, and Knowledge Management. We collected the data for this research through questionnaire survey from a sample of 690 participants in Malaysia. The analysis was based on a valid response of 193. The findings revealed significant relationships between the dependent and independent variables. This research provides useful information for businesses in building critical capabilities to create and maintain competitive positions in the marketplace. The paper would also be useful in enriching theory for future research.

Keywords: Quality Management, Marketing Management, Knowledge Management, Business Competitiveness, Malaysia

RESEARCH BACKGROUND

Most companies are struggling to sustain business revenue because of the global financial crisis. Most companies find it difficult to sustain their business with existing customer due to the slump down global demand. In addition, the fast internet technology diffusion creates avenues for customers to search for alternative products. More companies are trying to expand their businesses in to global market via internet, which could help to expand their market share. As a result, firms are not only facing local competition and also the global competition pressure, firm need to develop comprehensive strategies to overcome rival competition and survive in contemporary marketplace.

Firms now find it difficult to maintain customer loyalty as opposed to decades ago. This is because most companies work aggressively to expand new market base as they strive to compete for better positions in niche market. Rival competition force companies to formulate idea strategies to survive in this recession market. Therefore, company need to develop an effective defensive strategy, and also offensive strategies in order to strengthen their firms' competitive advantage. This is because defensive strategies do not sustain competitive

advantage. They enable firms to remain afloat in the market, but the danger it posses is that competitors could easily imitate firms that use defensive strategies as the strategy does not aid in improving advantages. Beside, offensive actions will delay competitors speed to attack existing market share. Consequently, defensive and offensive actions are required to implement maintain a strong market position. .

Defensive strategy plays an important role in sustain customer loyalty and in securing profitability. The defensive tool in this paper will be quality management; this is because offering customers higher quality would positively influence customer satisfaction. Thus, quality serves as key criteria for firm to gain competitive advantage. In other words, better quality enables a firm to have sufficient defending power to prevent competitors from taking over its market share. Generally, there are various quality perceptions from the customer view point and therefore we will focus on the view of intangible quality service such as knowledge service, commitment and responsiveness in this paper. The intangible quality service is difficult to imitate by competitors and this could have business competitiveness building capability.

Besides the aforementioned, a company is required to defend its existing customers. Offensive strategy also plays an important role in improving the firm's competitive advantage, marketing management should consider as one of the offensive strategy in the marketing world. Usually explore new market or attack competitors market base is consider as offensive activity in the company, and a series of offensive activity will support by marketing tools such as promotion, differentiation and diversification strategies. Therefore, this paper will focus on the impact of promotion, differentiation and diversification on the business competitiveness. For example, company need effective promotion and differentiate product to attract new customer, diversification will enable firm to expand their business revenue and achieved business competitiveness.

Both defensive and offensive strategies are important for the firm to sustain their competitive advantage. It is important to note that, both strategies correlate with each other and that they should used in a complementary manner to help achieve specific objectives for the firm. Thus, interfacing instrument is essential in between the defensive and offensive strategies. Information system will act as a communication centre for the information sharing. For example, company can adapt the successful selling method on existing customer and apply to the new customer, this method will enable firm to have better convincing power to convince new customer. Or company may discover new opportunity from new customer and firm may find a similar opportunity on their existing customer. Therefore, information system is essential for the interaction between internal and external.

As a result, companies need to develop comprehensive strategies to sustain business competitiveness. We will focus on the impact of quality management (QM), Marketing management (MM), and Knowledge management (KM) on the business competitiveness. As mentioned earlier, companies require defensive, offensive and the knowledge manipulation systems to form as a complete solution to sustain business competitiveness. Furthermore, the comprehensive model would serve as a proactive solution for the firm to think ahead of competitors, the complete solution would help to overcome the competitive intensity in the industry, as competitors may find it difficult to imitate the firms' capabilities. Therefore, the

framework would help companies act effectively to improve business competitiveness, which may in turn enable firms to overcome economic crisis such as the one we have been facing since late 2008.

CONCEPTUAL FRAMEWORK

Many firm are not only competing with the local competition because many firm enter global market to compete with domestic firm. Most of the firms need to develop comprehensive and proactive strategies to over come rival competition and continuing improves company competitive advantages. Therefore, this paper examines the impact of quality management, marketing management and knowledge management on business competitiveness.

Figure 1 shows the research framework for this paper and illustrates nine independent variables for the three constructs: knowledge service, commitment, responsiveness, promotion, differentiation, diversification, interactive data base, knowledge sharing and web services. We also generated nine hypotheses – three for each of the constructs namely quality management, marketing management and knowledge management – to test the influence of each independent variable on business competitiveness.

Figure 1: A Research Framework for Business Competitiveness

Hypotheses Development

Quality Management

Quality Management can be considered as business a survival instrument in a firm. Cheng & Choy [8] also points out that quality management plays an important role to enable firm to achieve superior performance. Excellent quality provided by the firm will enhance the satisfaction level of the customer. In addition, higher customer satisfactions will positive influence the customer loyalty. Thus, the level of quality a firm provides plays an important role in a firm's ability to achieve competitiveness. Cheng & Choy [8] also identified company commitment, continuous quality improvement and measurement, customer focus as a success factor of quality management. Therefore, we identified three quality dimensions that could be used to build business competitiveness in the firm: Knowledge service, Commitment, and Responsiveness in this paper.

Knowledge Service

Knowledge service in this paper will focus on customer knowledge and product knowledge. According to Liang, Liang & Duan [16], higher customer information would have a positive on product knowledge and that would induce customer purchasing behaviour. Customer knowledge would result in better understanding of customer's needs according to the well exposure of customer information. A firm can define its direction from existing customer information, and therefore satisfy customer expectation. Product knowledge would be a secondary stage of knowledge service after identifying customers' needs made possible with the exposure to customer information. Firms will also deliver appropriate product information to customers based on the identified customer needs. According to Mersha, Tigineh, Adlakha & Veena [17], knowledge service is one of the important factors of good quality service**.** As a result, this factor would help to achieve good quality serive, and as a consequence, would enable business competitiveness.

Many firms find it difficult to maintain their revenues from its existing customer base. Most firms are trying to expand customer base by seeking avenue to win competitors' market share Increased knowledge service would result in higher level of customer service by address customer knowledge and product knowledge to achieve better customer satisfaction. For example, a firm can train knowledgeable sales people to advice on customers' need immediately. Sales people able to offered appropriate product information according to customer requirement. Therefore, knowledge service is playing an important role in its capability to provide customer loyalty because customers would feel comfortable to deal with knowledgeable sales people than otherwise. Ball, Coelho & Manuel [1] claim that better customer service, could lead to higher levels of customer satisfaction, which could also lower price sensitivity..

Hypothesis 1: Good knowledge of service will have a positive influence on business competitiveness.

Commitment

Commitment can be defined as an important variable that enables businesses to grow. According to Fullerton [11], high commitment from a firm will have a negative impact on customers' willingness or intentions to switch, which could enhance the relationship with customers. Caceres & Paparoidamis [5] also points out that relationship commitment has a positive impact on customer loyalty. Effective sales persons are very important for a firm to establish a strong position on the commitment given to customer. This is because poor commitment may result in negative impacts on customers' dissatisfaction, which could also affect the loyalty to the firm. Furthermore, achieving effective commitment not only relies on front line personnel, but it also depends on the top management to ensure that the required structures and framework are in place to support the processes. Firms must be highly committed to their staff in order to enhance employees' job satisfaction, and therefore the employees' commitment towards customers.

Nowadays, the perception of customer on commitment can be considered as an assurance and responsible provided by the firm. For example, customer would feel comfortable to have transaction with those company will compensate discounted voucher during late delivery happen. Customer willing to purchase goods or services with those companies can provide extended warranty or 24hours service response and part replacement service. The higher level commitment provided will highly influence on customer loyalty and lower customer comparison on pricing as mentioned earlier on previous researcher. In contrast, it is important that how firm can deliver commitment to customer and the commitment might influence on the customer repurchase decision. Therefore, commitment is one of the important factors to influence the firm business competitiveness. Hence, the

Hypothesis 2: High level of commitment will have a positive influence on business competitiveness.

Responsiveness

Responsiveness can be considered as a customer care instrument to show that the firm values its customers. Usually customers expect fast response on any request from suppliers and this could include response to complaints, problem solving matters, inquiries etc. One of the previous research found that the effectiveness of service recovery strategies will result in higher customer satisfaction Jayachandran, Hewett, & Kaufman [14]. In addition, responsiveness serve as a tool to minimize customers' complaint and enhance customer satisfaction. Especially in this economic crisis year, fast responses to custmers' issues would provide a strong advantage for a firm to build upon in developing capabilities for business competitiveness.

In the current market circumstances, customers are able to find alternative sources of products and services they may need through the Internet and this will create avenue for possible multiple suppliers from all around the globe. It is important for firms to maintain a strong relationship with custmers by being more responsiveness to theur needs. Disatisfied customers may find it easier to wsitch to competitors' product than otherwise, and some cases, may provide competitors some privileaged information about a firm. Meanwhile, firms

frequently seek customers' feedback on how the employees handle customers' complaint and inquiries. And majority of firms have begun to implement The Internet system to serve customers better and faster, and providing customers with enhance service quality. Brown [4] points out that greather speed in responding to customers' complaints will enhance the ability of the firm to maintain a steady market share and possibility improve the overall business position in the marketplace.

Hypothesis 3: Responsiveness will have a positive influence on business competitiveness.

Marketing management (MM)

Marketing management serves as a new market development weapon and business growth instrument among firms. Gok [13] mentioned that marketing is the key factor for the company to sustain its competitive adcvantage. Propoer marketing management planning will enable a firm to create outstanding performance compared to their competittors. As a result, outstanding performance will lead the firm to create customer awareness and effectively explore the new markets for new business opportunity. Firms are able to attract new customers by attracting more market share, and hence the firms will sustain their business competitiveness. This article identified three marketing dimensions that could be used to create business competitiveness in the firm: Promotion, Differentiation, and Diversification.

Promotion

Promotion is an activity to create customer awareness on a firms' product, service and brand name. According to the previous research, advertising relates positively with a firm's sales revenue (Kim, Wilcox & Drumwright) [15]. In other words, promotion serves as an important variable to develop business stability and growth, which could translate into bigger sales in the market. Meanwhile, promotion also acts as a new market development tool because promotion such as discounted price, new product demonstration and mobile marketing would help a firm to attract new customer. In addition, promotion activities work hand in hand with marketing strategies in response to market competition in order to expand market share.

New global business enforced promotion transit from conventional paper broacher marketing to telephone/internet marketing. Telemarketing is one of the important elements in sales and marketing strategies because telephone account management is able to cover wider areas of customer (Oetting, Rudy, Gantman & Geri) [20]. Firms can adapt telemarketing strategies on their promotion and this could result in more customers covered compared to face to face visit. Firm can email promotion materials to targeted customers after telemarketing activity. As a result, this method seems to be cost effective and efficient than traditional promotion methods. More over, firms can effectively identify new potential opportunities after telemarketing screening process. Firms can also minimize business travelling cost by using telephone/internet marketing. Bravo, Mugica, & Sanz [3] claim that promoting products will increase brand awareness and loyalty, which could in turn improve the firm's competitive advantage.

Hypothesis 4: Effective promotion activity will have a positive influence on business competitiveness.

Differentiation

Differentiation can be considered as an offensive weapon to build more market power and economies of scope. Customers will be attracted to the uniqueness of a product and this could increase the firm's ability to increase the number of customers who are insensitive to price, wich in trn may enable the firm to earn more revenue (Tan, Kwan & Eze) [22]. Usually, industry new entrants must act differently or produce some special products to be able to maintain a stake in any industry, especially in this competitive business era. This is because the existing players in the industry will concentrate their efforts on protecting their own market base with well established customer relationship. Customers would feel reluctant to switch over to other firms that provide similar/homogeneous product and services. Therefore, new firms should perform outstanding works and formulate specific strategies strong enough to create a good impression in a market. The differentiate solution will effectively minimize an unnecessary competition with existing firm.

Firms may select differentiation in pricing, product features, service quality and sales people knowledge for their marketing strategies. For pricing and product features, differentiation can be classified as tangible differentiation, while, service quality and employees' knowledge can be classified as intangible differentiation. Tangible differentiation could be easy and the fastest to approach to implement a firm's short term strategy. However, price and product features are easier for competitors to imitate. Intangible differentiation would require longer time to establish but it is difficult to imitate by competitors. Therefore, firms would use tangible differentiation as short term market penetration and intangible differentiation would be a long term solution to sustain the firm's competitive position in the market place. For example, firms offer cheaper price range product to enter new market for business opportunity. A firm can also build up customer relationship with differentiated service and quality after the firm's successful entrance into the market. According to Fisher & Robert [10], firms can sustain superior competitive position when durable differentiation is achieved. Dumovic [9] also claims that product driven differentiation will sustain the competitive advantage. Consequently, differentiation acts as an important offensive weapon to develop new markets and also defend existing customer base.

Hypothesis 5: Differentiation initiatives will have a positive influence on business competitiveness.

Diversification

Diversification plays an important role on business expansion and enhances business competitiveness. According to Bobillo, Iturriaga & Gaite [2], firms internal and external advantages have certain correlation with the international market diversification. Tan, Kwan & Eze [23] mentioned that the comprehensive range of product offered will enhance the customer loyalty. Diversification can be through market or product diversification. Both business diversifications would also increase the firms' revenue and business competitiveness. Therefore, diversification would facilitate the firm to move towards higher levels and could enhance the firm's capabilities. In other words, the enhancement of the firm's capabilities will enable the firm to deal with the existing competition in the

marketplace, and hence the possibility for the firm to achieve a competitive position in the industry.

In this economic crisis, most of the firms find it difficult to grow or even maintain existing market position because of global demand contraction. In this case, diversification becomes crucial for the firm to survive in this economic down turn. Firms can use diversification strategy to improve sales, which could also help to overcome this crisis. The diversification strategies can be applied in two ways. For example, well established firms may implement product diversification to improve in flattening sales situation, while medium and small scale businesses can implement market diversification method to overcome sales contraction in existing customer base. Alternatively, firms can also mix strategies of market and product diversification to improve firm revenue. As a result, diversification strategies would be useful for firm's expansion and also diversify the firm's risk to achieve business competitiveness.

Hypothesis 6: Business diversification will have a positive influence on business competitiveness.

Knowledge management (KM)

Knowledge management plays an important role in building a firm's capabilities. Moustaghfir [18] indicates that effective knowledge asset management would have a positive impact on the firm performance. In other words, knowledge management system (KMS) can act as a supporting tool for the firm quality management and marketing management process. Effective knowledge management will enable firm to speed up the employee knowledge learning process and firm capabilities building process. In addition, KMS could assist firms manage customers' information, which could enable better customer understanding. KMS would also help firms to publish comprehensive product information according to specific requirements by consumers. In this paper, we identified three knowledge management dimensions that could be used to create business competitiveness in the firms and they are Interactive data base, Knowledge sharing, and Web services.

Interactive data base

Interactive data base is one of the interfacing instruments involve in buyer and seller. Excellent customer interaction will enhanced customer knowledge and these will lead to higher customer relationship (Cardwell) [6]. A two-way communication is important to the firm because effective communication will enable firm to aware on customer needs and behaviour. Furthermore, data base will reserved all customer information for firm to develop appropriate strategies on customer loyalty program. While, the interactive activities can effectively build up the customer relationship. To improve customer relationship and increase customer loyalty is depend on firm managing interaction with customer (Calhoun) [7].

The interactive data base would be online interaction and the feedback of sales people. Online interaction would be the faster way to acknowledge the customer voice. Unfortunately, there is some missing screening on mute customer are feel reluctant to feedback their needs via internet. Therefore, personal visit and phone call will be effective in this situation, face to face and phone call can well mange on those "mute customer" and

search out their expectation and needs. This is because the customer information is the key information for the firm to address customer properly. There will be an advantage if the firm have extra information than their competitors. Firm are able to develop appropriate marketing strategies to have outstanding performance than competitors. Consequently, interactive data base act as an important tools to enhance company competitive advantage.

Hypothesis 7: Effective interactive system will have a positive influence on business competitiveness.

Knowledge Sharing

Knowledge sharing is internal knowledge transfer of information among the staff. Knowledge sharing will enable firms to improve their capabilities and business competitiveness by maximizing the firms' ability to satisfy customers' needs and generate solutions to increase the firm's efficiency (Reid) [21]. Proper knowledge management involves manipulating explicit and implicit knowledge to improve efficiency and this will help a firm to achieve competitive advantage (Nunes, Annansingh & Eaglestone) [19]. Knowledge sharing plays an important role to improve employee's knowledge; this would improve the firms' capabilities. Especially in the hypercompetitive business era, intangible capabilities are not easy to imitate by competitors and the firm will sustain competitive advantage. Therefore, knowledge sharing is becoming an important process to develop employees; knowledge capabilities. And these would improve communication frequency among the staff for better team work in the firm.

The knowledge shared among the employees could include customer knowledge, successful selling method and the most sellable products to specific industries. Firms currently are trying to optimise efficiency in order to compete effectively. Knowledge sharing would assist firms to effectively adopt strategies through knowledge sharing processes. Further more, knowledge sharing also helps to support the firm's knowledge service quality and differentiation initiatives. For example, sales personnel could be able to share their customer, industries, and product knowledge through the knowledge sharing process. They can also apply specific knowledge sharing ability to similar circumstances outside the current market. This would increase the firm's business opportunities and it would result in better business competitive position.

Hypothesis 8: Effective knowledge sharing will have a positive influence on business competitiveness.

Web Service

Web service can be defined as convenience service or fast response service to the customer. According to Yang & Lieh [25], web services enable firms to simplify the process of business transaction and hence improve the business efficiency. The electronic service may minimize customer complaint and hence the faster feedback will result higher level of customer satisfaction (Goetzinger, Park & Widdows) [12]. Web service will speed up the service process and the fast response will improve the service quality. Customer would highly satisfy with the immediate response service; the fastest service will become a value added service to

customer. Web service will delivered convenience value customer or reduce the customer waiting time, customer can login to the web page and search for assistant like user guide line or provide comprehensive product information. Or customers can speak to service officer through online conference web page and the conference will offer customer "close to you" perception.

Web service could be designed in question and answer format, online video conference, online order, e-payment service, and email complaint service product information data base such as user guide line. All these services will assist a firm to improve responsiveness. In addition, web service also offers convenience value to customers, and this would enhance the customer's interest in the firm, which could also influence the sales potentials. Trabold, Heim & Field [24] claim that electronic services are significant in most of the service industries and it would positively influence the firm's performance. As a result, web service will assist firms to satisfy customers and achieve optimum service quality, which could translate into enhanced business competitiveness.

Hypothesis 9: Effective web service will have a positive influence on business competitiveness.

RESEARCH METHODOLOGY

This paper focuses on the key determinants for business competitiveness. The research questions for this paper will be designed around the three management-focused constructs introduced earlier, which inlcude quality management, marketing management and knowledge management. These questions will also be designed to achieve the specific objectives in line with the hypotheses discussed above. Two types of data will be collected which are primary and secondary data. Primary data will be collected using survey questionnaire, while secondary data will be drived from printed resources such as journal articles, magazines, newspapers etc. Participants in this for this research will be selected through cluster sampling method. We have selected four key states in Malaysia for this research and they inlcude Malacca, Kuala Lumpur, Johor and Penang. We chose these four states because of their standing in application of new developments in technology, the location of key business operations, and economic contributions to Malaysia. Furthermore, face-to-face interviews will be considered as an additional data collection method both before and after main data collection. This is to make provision for complemetary materials that may be useful in the final discussion.

Basically, the survey questionnaire will be divided into two sections. The first section will contain questions on the respondents' background (age, gender, job title, year of working experience, business field etc), while the second section will contain questions relating to the conceptual framework. We will use a 5-point Likert scale in designing questions relating to the framework. In the design, "1" will mean "strongly disagree" and "5" will represent "strongly agree."

DATA ANALYSIS AND FINADINGS

The details of the respondent demographic profile as shown in table 1. According to the demographic profile table shows that male respondent contribution to this survey is more than female respondent which is 82.4% of male respondent participated. While the status of marital for the respondents are equally contributed and the age for the respondent is fall in between 21 years old to 50 years old. In addition, Chinese respondent is the highest participants in this survey with 60.1%. Fifty two percent of degree qualification respondents and 46.2% respondents with managerial position are participate in this survey. Most of the participants is work in sales and marketing department with 71.5% and major participants of years working experience is fall in four to six years which is 44.6%. Electronic and electrical industries background participants will be the largest contribution group in this survey with 52.8%.

Table 1: Respondent Demographic Profile

	Frequency	Percent
Gender		
Female	34	17.6
Male	159	82.4
Marital Status		
Single	97	50.3
Married	96	49.7
Age		
Below 21	0	0
21 – 30	89	46.1
31 – 40	84	43.5
41 – 50	20	10.4
Above 50	0	0
Educational Level		
Secondary School graduate	12	6.2
Diploma/Advance Diploma graduate	80	41.5

Machine Equipment Engineering	14	7.3
IT & Networking	15	7.8

Table 2: Mean Analysis for Knowledge Service Value

Item ID	Item Description	Mean (n=100)	Std Dev
KS1	Sales people with good product knowledge will be able to offer better service.	6.3161	0.69866
KS2	Sales people with well acknowledge of customer needs will enhance the level of customer satisfaction.	6.2021	0.74694
KS3	Sales people with better understanding of customer requirement will enhance product/service quality.	5.9067	0.86699
KS4	Sales people with good product knowledge will significantly reduce problem-solving time.	5.7927	0.82824
KS5	Well customer knowledge management will enable firm to develop accurate business strategies.	5.8912	0.59824

Table 2 presents the mean and standard deviation for the responses on knowledge service value. In general, most of the respondents agreed that knowledge service value is important with average mean exceeding 4.00 for KS1, KS2, KS3, KS4, and KS5. The results further indicate that most respondents rated their knowledge service value is important in improving firm business competitiveness. In addition, results show that sales people with better product knowledge will be able to offer better service to customer as the mean value indicates (KS1 6.3161).

Table 3 presents the mean and standard deviation for the responses on commitment. From the result, the average mean for commitment is above 5.00 the results further indicate that most respondents rated their commitment to customer is important in improving firm business competitiveness. In addition, results show that high commitment towards customer will positively influence business competitiveness as the mean value indicates (CM1 5.7876).

Table 3: Mean Analysis for Commitment

Item ID	Item Description	Mean (n=100)	Std Dev
CM1	High commitment towards customer will positively influence business competitiveness.	5.7876	0.55099
CM2	Continuance commitment delivered to customer will minimize customer switching intention to the competitors.	5.7098	0.65252
CM3	Customers are willing to recommend highly committed company to others and hence improved firm reputation.	5.6839	0.76961
CM4	Customer may consider firm is highly committed if firm can provide ac-hoc responds.	5.7047	0.67764
CM5	The firm commitment provided to the customer is solely dependent on front line personnel performance.	5.3990	0.68572

Table 4 presents the mean and standard deviation for the responses on Responsiveness to customer. From the result, the average mean for responsiveness is above 5.0000 (RE1, RE2, RE3, RE4, and RE5). The respondents highly agreed that the commitment is important in building firm business competitiveness (RE3 = 5.8808), followed by immediate response to corrective action (RE1 = 5.8187), shorter time for problem solving (RE5 = 5.6839), proactive response factor (RE4 = 5.6218) and faster response to customer factor (RE2 = 5.4041). Thus, responsiveness would play an important role in business compositeness.

Table 4: Mean Analysis for Responsiveness

Item ID	Item Description	Mean (n=100)	Std Dev
RE1	Customer will be highly satisfied if firm can provide immediate response to customer needs.	5.8187	0.73120
RE2	Fast responses to customer request will positive influence customers' purchase intention.	5.4041	0.83690
RE3	A firm must take corrective actions immediately when the firm observes customers are feeling unhappy with the appropriateness of the product/services.	5.8808	0.78481
RE4	A firm should be proactive to shape market demand than being reactive.	5.6218	0.98792
RE5	Shorter time of problem solving is considered as one of the good quality services.	5.6839	0.86518

Table 5 presents the mean and standard deviation for the responses on promotion. From the result, respondents feel more important in promotion activities because promotion will help firm to enhance business competitiveness. (PR1 = 5.7979). This followed by free trial sample promotion to retain existing customer (PR4 = 5.3472), telemarketing promotion (PR3 = 5.1295), free trial sample to win new business (PR5 = 5.1192), and price promotion (PR2 = 4.7772).

Table 5: Mean Analysis for Promotion

Item ID	Item Description	Mean (n=100)	Std Dev
PR1	Increased promotion activity will enhance brand awareness.	5.7979	0.89884
PR2	Price promotion activities will directly increase sales revenue.	4.7772	0.81464
PR3	Telemarketing promotion activity is one of the cost effective methods to increase brand awareness.	5.1295	0.91219
PR4	Free trail sample for new product promotion will help to retain existing customer.	5.3472	0.98885
PR5	Free trial sample for new product promotion will enable firm to win new business.	5.1192	0.97430

Table 6 presents the mean and standard deviation for the responses on knowledge service value. In general, most of the respondents agreed that knowledge service value is important with average mean exceeding 5.00 for DF1, DF2, DF3, DF4, and DF5. The results further indicate that most respondents rated differentiation is important in improving firm business competitiveness. In addition, results show that differentiated product/services will create value added for firm customers as the mean value indicates (KS1 6.3161).

Table 6: Mean Analysis for Differentiation

Item ID	Item Description	Mean (n=100)	Std Dev
DF1	Differentiated product/service will create value added for a firm' customers.	5.7617	0.55451
DF2	A differentiation strategy is considered a proactive motive to improve business competitiveness.	5.6062	0.69997
DF3	Innovative product will win new business opportunities.	5.4456	0.62782
DF4	Product/services differentiation would increase company reputation compared to its competitors.	5.5492	0.79642
DF5	Product/services differentiation would minimize customer sensitivity towards pricing.	5.4560	0.49935

Table 7 presents the mean and standard deviation for the responses on diversification. From the result, respondents believed that diversification will help firm to gain superior business competitiveness. (DV1 = 5.4301). This followed by globalization and market diversification (DV2 = 5.3316, and DV3 = 5.3264) and Product/services & business diversification (DV4 = 5.2746, DV5 = 5.1969).

Table 7: Mean Analysis for Diversification

Item ID	Item Description	Mean (n=100)	Std Dev
DV1	Globalization of business will enable a firm to increase its market share.	5.4301	0.80138
DV2	Globalization of business will lower the cost by offering standardized product.	5.3316	0.67228
DV3	Market diversification will enable firm to have large economic scale advantage compared to its competitors.	5.3264	0.83677
DV4	Geographic diversification will improve a firm's competitive performance by minimizing risk.	5.2746	0.74458
DV5	Business diversification motive would sustain firm business competitiveness.	5.1969	0.73072

Table 8 presents the mean and standard deviation for the responses on interactive database. From the result, most respondents agree that interactive database will positively influence business competitiveness. They believe that key customer information is important to them (ID2 = 5.5130), key customer information database (ID4 = 5.5026), interactive activity (ID3 = 5.3886) and address customer needs (ID1 = 5.2435). However, most respondent was neutral that the communication or active-interaction will enhance communication with customer (ID5 = 4.32).

Table 8: Mean Analysis for Interactive Database

Item ID	Item Description	Mean (n=100)	Std Dev
ID1	Interactive activities will enable a firm to be aware of its customer needs.	5.2435	0.68296
ID2	Interactive database would help firm to address customer inquiry and needs properly.	5.5130	0.63005
ID3	Interactive activities will encourage customer to provide feedback to a firm for the purchased product/services.	5.3886	0.67644
ID4	Interactive database will effectively support a firm to develop key customer information.	5.5026	0.80444
ID5	An interactive database will enhance communication with customer.	4.3200	0.61759

Table 9 presents the mean and standard deviation for the responses on knowledge management. In general, most of the respondents strongly agreed that transaction processing

is important with average mean exceeded 5.00 (KM1, KM2, KM3, KM4 and KM5). The results further indicate that most respondents rated knowledge management will improve firm competitive advantage. Furthermore, successful knowledge sharing will enhance employee capabilities (KM3 = 5.7047).

Table 9: Mean Analysis for Knowledge management

Item ID	Item Description	Mean (n=100)	Std Dev
KM1	Internal staff knowledge exchange will improve firm capabilities to achieve competitive advantage.	5.6010	0.67035
KM2	Knowledge sharing among employees will shorten the customer/product knowledge learning process of employees.	5.6373	0.58901
KM3	Successful knowledge sharing experience will enhance employee problem solving skills.	5.7047	0.90762
KM4	Successful sales experience sharing would improve firm sales people's capabilities.	5.1658	0.88003
KM5	Effective knowledge sharing program will help a firm to improve team member cooperation.	5.5907	0.49299

Table 10 presents the mean and standard deviation for the responses on knowledge management. In general, most of the respondents strongly agreed that transaction processing is important with average mean exceeded 5.00 (WS1, WS2, WS3, WS4 and WS5). The results further indicate that most respondents rated knowledge management will improve firm competitive advantage. Furthermore, online business will enable firm to gain superior competitive advantage (WS3 = 5.4508).

Table 10: Mean Analysis for Web Service

Item ID	Item Description	Mean (n=100)	Std Dev
WS1	Web services will help firms to deliver convenience value to the customer.	5.4093	0.83748
WS2	Web services can navigate customer to download desired product information and hence increase customer purchase intention.	5.2487	0.82305
WS3	Online business activities will enable firm to respond efficiently to customer inquiry/complaint.	5.4508	0.91794
WS4	Online tracking of shipment will increase customer interest to do business with the firm.	5.3368	0.83886
WS5	Web service would enhance business competitiveness by simplify business transactions.	5.3316	0.99681

Table 11 presents the mean and standard deviation for the responses on knowledge management. In general, most of the respondents strongly agreed that transaction processing is important with average mean exceeded 5.00 (BC1, BC2, BC3, BC4, BC5, BC6, BC7, BC8 and BC9). The results further indicate that most respondents rated knowledge service, commitment, responsiveness, promotion, differentiation, diversification, interactive database, knowledge management and web services will improve firm competitive advantage.

Table 11: Mean for Business Competitiveness

Item ID	Item Description	Mean (n=100)	Std Dev
BC1	Knowledge service will enable firm to improve competitive advantage.	4.5400	.59323
BC2	High commitment will have a positive influence on business competitiveness.	4.4500	.57516
BC3	Fast responsiveness will improve firm competitive advantage.	4.1700	.65219
BC4	Effective promotion activity will have a positive influence on business competitiveness.	4.4000	.72474
BC5	Differentiation initiatives will enable firm to enhance business competitiveness.	4.3200	.61759
BC6	Business diversification will have a positive influence on business competitiveness.	4.4500	.57516
BC7	Effective interactive system will have a positive influence on business competitiveness.	4.1700	.65219
BC8	Effective knowledge sharing will improve firm competitive advantage.	4.4000	.72474
BC9	Effective web service will have a positive influence on business competitiveness.	4.3200	.61759

Table 12: Reliability Test Result

Item ID	Cronbach's Alpha
KS	0.826
CM	0.677
RE	0.796
PR	0.581
DF	0.810
DV	0.782
ID	0.824
KM	0.757
WS	0.830
BC	0.886

Table 12 result shows that all variables cronbach alpha value is above 0.50. Therefore, all the data collected are reliable and all these data can be used for further analysis. Business

competitiveness shows high reliability which is 0.886; follow by web services (0.830), knowledge service (0.826), interactive database (0.824), differentiation (0.810), responsiveness (0.796), diversification (0.782), knowledge management (0.757), commitment (0.677), and promotion (0.581).

Table 13 shows the correlation matrix of all the variables in this research paper. This table would focus on the relationship between each and every independent variable with the dependent variable. From the table results shows that all the independent variables show significantly positive relationship correlation with the dependent variable (business competitiveness) and all the correlations do not exceed 0.90. This mean the data collected is no colinearity problems.

CONCLUSION

Business competitiveness is considered as an important factor in the business world. Based on the findings in this paper, the respective firms in Malaysia would able to identify the critical factor to achieve business competitiveness, and may be able to sustain their competitive advantage from the internal capabilities improvement. A good quality management system will enable a firm to provide excelent service quality to satisfy customers' needs. This may enhance customer satisfaction, and the highest customer satisfaction will help to reduce customers swtiching capabilities and intentions. Usually, excelent quality service is considered an intangible capability, which is, more often than not, diffucult to imitate by competitors. In addition, knowledge management would effectively enhance a firm's internal capabilities through knowledge sharing process among staff, interactive data base by catering to customers' information needs. Web services will enable a firm to improve service effeciency and potentially enhance customer satisfaction. In addition,, knowledge management would also enable firms to develop solid marketing strategies to improve a firm's competitive position in the marketplace. As a result, a firm would be able to retain its customers through good quality management and appropriate marketing strategies, which could help attract greater market share, and possibily sustain a firm's business competitiveness. Finally, this research may benefi firms to based on the three

construct mentioned in this paper as the firm strategies to serving their existing and potential customer. We hope that firm can, based on our finding, improve their competitiveness by effectively managing and delivering effiency services to customers.

THE EFFECTS OF THE HRM DEPARTMANT'S ROLE ON ORGANIZATION COMPETITIVE

Han-Jen Niu, Tamkang University, Taiwan

ABSTRACT

Globalization dominates the competitive horizon and an HRD deal is at the heart of organizational success. HRD should create new models and processes for attaining global agility, effectiveness, and competitiveness. This study recognizes the roles of HRD from the viewpoint of role theory and discusses its influence on organizational performance within four HRD characters: strategic partner, administrative expert, employee champion, and change agent. We conducted a survey of 112 companies in Taiwan, the results of which demonstrate that the role of HRD influences corporate performance, particularly the performances of an employee champion and change agent. Although HRD has eliminated the role of a transitional affair worker, being a strategy partner requires greater effort.

Keywords: role theory, HRD's role, performance, Ulrich's multiple role model

INTRODUCTION

Role theory has been used effectively by researchers in the fields of psychology, social psychology, sociology, organization behavior, and human resource management since the early 1930s (Welbourne, Johnson & Erez, 1998). Role theory is based on a dramaturgical metaphor (Solomon, 1985) that explains how people send and adopt specific roles. Recently, this theory was used to analyze various forms of social systems. Biddle (1986) states that role theory comprises one of the most important characteristics of social behavior—the fact that human beings behave in ways that are different and predictable, depending on their respective social identities and the situation (Biddle, 1986). Drawing on a behavioral perspective, role theory is attractive and useful in ameliorating human problems.

Multiple researchers from various fields have concluded that roles are important in social structure (Mead, 1934; Turner, 1978; Welbourne, Johnson & Erez, 1998), and roles have been recognized as central to understanding employee behavior in organizations (Katz & Kahn, 1987; Welbourne, Johnson & Erez, 1998). Additionally, role theory has also been proposed to explain teamwork. Belbins' role theory (1981), Benne & Sheats (1948), and Heap (1977) indicate the functionality of member roles that affect group performance (Chen, et al., 2002). Chen et al. (2002) provide experimental results demonstrating that role theory is effective in predicting group performance.

According to role theory, employee performance is a function of both the individual and the organization. Welbourne, Johnson, and Erez (1998) support that this theory represents a milestone in explaining performance since it combines the psychological (individual contributions) and sociological (organizational framework) perspectives. Consequently, this study recognizes the roles of HRD and discusses its influence on organizational performance within four HRD characters: strategic partner, administrative expert, employee champion, and change agent.

ROLE OF HRD

The phrase "HR professional" has long remained an oxymoron. If HR practices are to be leveraged by the HR function, HR professionals must begin to act professionally. Therefore, the new competitive reality is a new agenda for HR, that is championing competitiveness. As champions of competitiveness, HR professionals must focus more on the deliverables of their work than on doing their work better. Ulrich (1997) supports the argument that HR should define their roles in terms of value created, and develop HR mechanisms that will allow for prompt business results. They must also learn to measure results in terms of business profitability and to lead cultural transformation.

HR professionals must fulfill four key roles in order to make their business partnership a reality (Figure 1). Ulrich (1997) devises this framework over the course of his work with dozens of companies and hundreds of HR professionals; many companies have since used it as a way to describe the deliverables of their HR work.

Insert Figure 1 about here

In Figure 1, the two axes represent the HR professional's focus and activities. In fact, these two axes delineate four principal HR roles: (1) management of strategic human resources, (2) management of firm infrastructure, (3) management of employee contribution, and (4) management of transformation and change (Ulrich, 1997). Table 1 summarizes these issues for each of the roles identified in Figure 1.

Insert Table 1 about here

Management of Strategic Human Resources

The primary actions of the strategic HR manager translate business strategies into HR priorities. In fulfilling this role, HR professionals increase the capacity of a business to execute its strategies. The management of strategic human resources is based on strategy execution. In fact, HR practices help accomplish business objectives.

Management of Firm Infrastructure

Creating an organizational infrastructure is a traditional HR function; successfully achieving it continues to add value to a business. HR professionals—caretakers of the corporate infrastructure—ensure that these organizational processes are designed and implemented efficiently. The infrastructure role is based on administrative efficiency. In fact, HR professionals acting as administrative experts ferret out unnecessary costs, improve efficiency, and continuously find new ways to do things better.

Management of Employee Contribution

Intellectual capital is a critical source of the firm's value; HR professionals should be active and aggressive in developing this form of capital. The management of employee contribution leads to increased employee commitment and competence. Overall employee contribution increases when HR is able to understand the employees' needs and ensure that these needs are met.

Management of Transformation and Change

As change agents, HR professionals face a paradox inherent in any organizational change. HR serves as a business partner by helping employees to relinquish the old culture and adapt to a new one as the firm undergoes transformation. HR helps an organization to identify a process for managing change.

PERFORMANCE

Organizational performance is also a kind of competitive ability in which to estimate a firm's value (Yang, Wang & Niu, 2007). Quinn and Rohrbaugh (1983) divide their performance evaluation index into three dimensions: focus (e.g., productivity, profit, job satisfaction, and growth), structure (e.g., expressed in terms of control and flexibility), and advantage (e.g., information flow and management, and employee training and development). Ford and Schellenberg (1982) provide three dimensions to evaluating performance: goal, system, and process indicate the employees' learning and resolution behaviors.

Yang et al. (2007) mention that given the potential competitive implications of revealing such information, it is not surprising that many respondents are hesitant to report information pertaining to indicators such as profitability and return on investment (ROI). Profit rate, comparative market position, sales volume, and market share can be used to evaluate performance effectively (Woo & Willard, 1983; Venkatraman & Ramanujam, 1986; Miler, 1990).

More recently, researchers have been considering both financial and work aspects to be important when evaluating a firm's performance. High performance is a kind of resource that depends upon, among other factors, both financial content and work factors (Dyer & Reeves, 1995; Lumpkin & Dess, 1996; Delaney & Huselid, 1996; Yang et al., 2007).

METHODOLOGY

Participants

The names of firms belonging to various industries were selected from a publicly available list compiled by the Taiwan Stock Exchange Corp. Convenience sampling was utilized in this study where a total of 300 prospective respondents were contacted by telephone to solicit

their agreement to participate. Approximately 57% of the subjects contacted agreed to participate in the study.

Questionnaires were administered via mail along with a self-addressed stamped envelope. After one reminder by telephone, 112 completed questionnaires were received—a response rate of 66%. The profile of the sample is shown in Table 2. Of particular interest are the following three categories: gender distribution, age, and education.

Insert Table 2 about here

Measures

All variables were measured using multi-item Likert-type scales. The scale items and measures used in the present study are given below.

The Role of HR Professionals

We use Ulrich's definition (2001), according to which the roles undertaken by HR professionals are, in reality, multiple, not single. In fact, HR professionals must fulfill both operational and strategic roles, must function as both the police and partners, and must assume responsibility for both qualitative and quantitative goals over the short and long terms. Five concepts were used to assess the extent to which HR roles are functional. Participants indicated their agreement with each item using a five-point Likert scale ranging from "strongly disagree" to "strongly agree." Higher scores reflect higher levels of role identification. The alpha coefficients of the four concepts were 0.90, 0.96, 0.93, 0.97 (see Table 3).

Organizational Performance

As mentioned earlier, organizational performance was measured in terms of financial and work performance. Similar to the case of HR professionals' roles, five-point Likert scales were also used to measure the dimensions of organizational performance. With regard to financial performance, a four-item measuring tool was used, which included sales growth, profitability, market share, and ROI. The scale was adapted from Tippins and Sohi (2003). A four-item measurement tool was used to measure work performance; its three dimensions—

efficiency, effectiveness, and satisfaction and timeliness—were adapted from Henderson & Lee (1992) and Janz & Prasarnphanich (2003). The alpha coefficient of the scale for this study was 0.91 (see Table 2).

Insert Table 3 about here

RESULTS

Descriptive Statistics and Correlation

Table 2 presents the means, standard deviations, Cronbach's α, and correlations for the variables investigated in this study. From the participants' perspective, four roles of HR do not act strongly, particularly the role of strategic partner, which is extremely low (M = 1.54). The other roles score fairly well in this survey (M = 2.05 ~ 2.60).

An analysis of the correlations reveals that, as expected, the roles of HR acting significantly positive correlated to organizational performance.

Regression

Regression analyses were conducted to detect the relationship between HR roles and organizational performance. In the direct model, the relationship between HR professionals' roles and organizational performance was proven by Equation 1 as a significant positive relationship ($p < 0.05$). Consequently, considering the evidence, we can deduce that performance can be explained by HR professionals' roles. However, this result is partly supported by the more detailed analysis of the partial model. Only the HR roles of employee champion and change agent explain organizational performance ($p < 0.05$).

$$P1\ (Performance) = 1 + \beta 11 * OL1 + \beta 12 * OL2 + \beta 13 * OL3 + \beta 14 * OL4 + e1\ Bij = slop,$$

$ei = error$ <equation 1>

DISCUSSION AND CONCLUSION

Globalization dominates the competitive horizon. This concept is not new, but the intensity of the challenge to get ahead is. If organization capability has become a source of competitiveness and HR professionals are to be the champions of organization capability (Walker & Reif, 1999), then a new agenda for both HR practices and HR professionals must emerge. This entails shifting the focus from things that can be done easily to challenging traditional beliefs and assumptions about HRD. In delivering value, HR professionals must become partners, players, and pioneers (Guest & King, 2004).

From the perspective of the value chain theory, firms are more likely to succeed when HR practices are aligned with the needs of internal and external customers. Ulrich (1997) defines the roles and activities of HR professionals' into four principal characters: strategic partner, administrative expert, employee champion, and change agent. Indeed, in this case, this research also supports the principal roles of the employee champion and the change agent.

The deliverable results of HR professionals are currently in use. However, the roles of the strategic partner and administrative expert are not apparent. On one hand, in practice, approximately 85% of the ownership of strategy formulation belongs to the general manager or line manager (Ulrich, 1997, p.33). Sometimes, HRD is carried out by an assistant or staff department, actually act as a strategy bulletined not a formulator. On the other hand, the information system has transformed the traditional paperwork system through the use of the intranet. As is often the case, most HR competencies involving process improvement and information technology are shifted to the information department. While developing e-learning, HRD focuses on content, rather than building up the learning system.

Even so, HRD cannot be a participant in major strategy formulation. In light of the shifting environment, HR professionals can still enhance the roles of administrative experts by playing the role of organizational diagnostician. In addition, HR professionals can follow the organizational diagnostic process to become a strategic partner.

This study has several limitations. First, the sample is not representative of the general population. Due to time and financial constraints, the researcher has selected a convenient sample of companies within Hsing Chu Science Park. Thus, the results must be interpreted with considerable caution. Second, this study is based on cross-sectional data; thus, no causal relationship should be inferred. More longitudinal studies across organizations are required.

ABSTRACT

Quality function deployment (QFD) is an important and useful tool in processing new product design planning in order to maximum customer satisfaction. Product planning is the first deploying process in QFD activities for a new product development (NPD). Recognizing and ranking the importance levels of customer requirements (CRs) are vital issues due to the explicit and implicit voices of the customer leading the determinations of design requirements (DRs) and the relationship between CRs and DRs in the QFD activities for product planning. Unlike the existing researches, this study considers three different perspectives, including customer perspective, competition perspective and value perspective, to evaluate the importance levels of CRs. To cope with the vague and uncertainty nature in product planning stage, fuzzy approaches are adopted in the proposed methods which including the modified fuzzy Delphi, entropy and value analysis methods with the concept of α-cut. Besides, dissimilar to prior studies which ignored the interactive influences between CRs themselves, this paper not only consider the relationship between DRs themselves but also take the relationship between CRs themselves into account to determine the relationship between CRs and DRs. From an illustrative example, the proposed methods indicate that the total degree of customer satisfaction achieved is greater than the previous methods.

Keywords**:** quality function deployment (QFD), fuzzy set theory, product planning, customer requirements

1. INTRODUCTION

Quality function deployment (QFD) is a useful customer-driven tool for new product development (NPD), devoted to translating customer requirements (CRs) into well communication to leading better efficiency in the downstream processes of NPD for maximizing customer satisfaction [5, 6]. A general QFD process consists of four phases which is start with CRs to product design requirements (DRs) and then translating DRs into critical part characteristics (PCs) (or sub-system), engineering process parameters (PPs), and establishing production requirements (PRs) in ending process for a NPD. House of quality (HOQ) is consists of relevant information on CRs, DRs, the relationships between CRs themselves, the relationships between DR themselves, and the relationship between CRs and DRs. Based on the relevant outcomes above, the importance ratings of DRs can be determined. Furthermore, QFD team can figure out the fulfillment level to each DR to achieve the maximum customer satisfaction. Chan and Wu [7] and Carnevalli and Miguel [5] argued that interpreting and analyzing the customer voice is one of the major difficulties in

QFD application. This study attempts developing methods to elaborate the understanding of CRs for enhancing customer satisfaction.

To this purpose, this study considers three different perspectives to interpreting and analyzing the CRs including the customer perspective, the competition perspective and the value perspective, respectively, to determine the importance levels of CRs. In the customer perspective, a modified fuzzy Delphi method is proposed to determine the importance level to each CR based on the current and potential customers' response and feedback. In regard to the competition perspective, the relative performance between firm and its competitors are analyzed to determine the sales point of each CR using the concept of information entropy with fuzzy means. As for the value perspective, the worth and the cost of CRs are considered to establish the value level for each CR to reflect firm position. Finally, combining three different perspective considerations above, the importance scores of CRs can be determined.

In general, the relationship degree in HOQ is expressed on a scale or point system such as 1-3-9 or 1-5-9, representing linguistic statements such as "weak", "moderate", and "strong", respectively [15]. But, QFD members usually experienced the predicament to accumulate experiment, information and knowledge about the influence of DRs because the lack of information or language hedge from the CRs during product planning stage [8, 9]. These considerations have led to the application of fuzzy approaches which are essential in addressing the diversity and imprecision issues in determining the relationships in HOQ [8-14, 19]. Dissimilar to existing studies which only focused the interactive influences of the relationship between DRs themselves to determine the relationship between CRs and DRs, this paper not only considers the relationship between DRs themselves but also take the relationship between CRs themselves into account to determine the relationship between CRs and DRs to obtain a more adequate and realistic relationship levels between CRs and DRs.

Based on the outcomes of importance levels of CRs and relationship levels between CRs and DRs, the fulfillment level of the each DR to maximize customer satisfaction can be achieved. In the following section, the CRs analyzing approaches with three different perspectives are introduced to determine the importance score of each CR. In Section 3, a fuzzy HOQ construction model is developed to determine the performance levels of DRs that will be produced maximum customer satisfaction. An example of a semiconductor packing case is given to demonstrate the proposed approaches in Section 4. Finally, the concluding remarks are summarized in Section 5.

2. THE CUSTOMER REQUIREMENTS ANALYZING APPROACHES

As mentioned previous, the determination of importance score of each CR is an important issue for enhancing customer satisfaction. In the existing literature, Kano's model [18] is considered to classify customer demand attributes due to some customer requirements more important to the customer than others [25, 29, 30]. Karsak [19] and Chen and Ko [10, 11] applied the fuzzy Delphi method to determine the fuzzy importance scores of CRs. Büyüközkan and Feyzioğlu [3] and Büyüközkan et al. [4] considered multiple preference ways and fused different expressions into a uniform group decision approach to reflect CRs assessment with fuzzy set theory in the collaborative circumstance. In addition, the importance ranking of CRs is argued as multi-criteria decision making issue, some

researchers applied analytic hierarchy process (AHP), or fuzzy AHP to determine the importance ranking of CRs in QFD application [1, 22, 23]. However, the existing literature above only focuses on unique perspective, i.e., importance to customer to determine the importance scores of CRs. Lai et al. [24] emphasized the competition perspective besides the importance to customer perspective to ranking CRs importance levels.

To elaborate the understanding of CRs for enhancing customer satisfaction, this study considers three different perspectives to determine CRs' importance scores, including the customer perspective, the competition perspective and the value perspective, respectively. To cope with the vague nature of customer requirements evaluation processes, fuzzy approaches are used to each evaluation way. The relevant decision-making approaches in the each perspective are discussed as follows.

2.1 Customer perspective

Customer perspective is a common sense for determining the importance levels of CRs. In this point of view, the consideration focused on each CR how important to customer. In this study, the current customers and potential customer are regarded as the experts who assess the importance degree to each CR. To aggregate experts' assessment, the fuzzy Delphi method [20] is applied to determine the importance levels of CRs. In original rule, the assessment from each expert is assigned with the same weight in fuzzy Delphi processes [19]. This study proposes the modified fuzzy Delphi method to deal with the different weighting consideration to determine importance scores of CRs. The relevant steps are described as follows.

Step 1. Each expert provides the assessment of importance scores of CRs. Suppose that a triangular fuzzy number is assigned to the format of assessment as:

$$\tilde{k}_{i,e} = \left[\left(k_{i,e}\right)^{\mathrm{L}^*}, \left(k_{i,e}\right)^{\mathrm{M}^*}, \left(k_{i,e}\right)^{\mathrm{H}^*} \right], e = 1, 2, \ldots, \mathrm{E}; i = 1, 2, \ldots, I, \quad (1)$$

where $\tilde{k}_{i,e}$ is described by linguistic terms and defined as the fuzzy subsets of [0, 1] and denoted the importance score of CR_i by the expert e; the indexes "L*", "M*", "H*" represent the lowest, the most likely and the highest level of $\tilde{k}_{i,e}$.

Step 2. Computing the weighted-average of all $\tilde{k}_{i,e}$, the formulation is expressed as

$$\tilde{\bar{k}}_i = \left[\left(\bar{k}_i\right)^{\mathrm{L}^*}, \left(\bar{k}_i\right)^{\mathrm{M}^*}, \left(\bar{k}_i\right)^{\mathrm{H}^*} \right] = \left[\frac{\sum_{e=1}^{\mathrm{E}} w_e \left(k_{i,e}\right)^{\mathrm{L}^*}}{\sum_{e=1}^{\mathrm{E}} w_e}, \frac{\sum_{e=1}^{\mathrm{E}} w_e \left(k_{i,e}\right)^{\mathrm{M}^*}}{\sum_{e=1}^{\mathrm{E}} w_e}, \frac{\sum_{e=1}^{\mathrm{E}} w_e \left(k_{i,e}\right)^{\mathrm{H}^*}}{\sum_{e=1}^{\mathrm{E}} w_e} \right], \quad (2)$$

where $i = 1, 2, \ldots, I$; w_e represents the importance weight of current or potential customer e. Calculating the differences between $\tilde{k}_{i,e}$ and $\tilde{\bar{k}}_i$, and then, return to each expert for the next re-evaluation run.

Step 3. Taking the differences in the prior step as a reference base, each expert provides a

revised linguistic variable (if necessary) of the importance scores as

$$\tilde{k}'_{i,e} = \left[\left(k'_{i,e}\right)^{\mathrm{L}^*}, \left(k'_{i,e}\right)^{\mathrm{M}^*}, \left(k'_{i,e}\right)^{\mathrm{H}^*} \right], e = 1, 2, \ldots, \mathrm{E}; i = 1, 2, \ldots, I. \quad (3)$$

The weighted-average $\tilde{\bar{k}}'_i$ can also be determined using (2). The difference between $\tilde{\bar{k}}'_i$ and $\tilde{\bar{k}}_i$ can be calculated using a distance measure as below [2]:

$$d\left(\tilde{\bar{k}}_i, \tilde{\bar{k}}'_i\right) = 0.5\left\{\max\left[\left|\left(\bar{k}_i\right)^{\mathrm{L}^*} - \left(\bar{k}'_i\right)^{\mathrm{L}^*}\right|, \left|\left(\bar{k}_i\right)^{\mathrm{H}^*} - \left(\bar{k}'_i\right)^{\mathrm{H}^*}\right|\right] + \left|\left(\bar{k}_i\right)^{\mathrm{M}^*} - \left(\bar{k}'_i\right)^{\mathrm{M}^*}\right|\right\} \quad (4)$$

Step 2 and *Step* 3 could be repeated until the distance measure becomes reasonably close to meet the consensus criteria. The consensus criteria is assumed to be a small distance, such as $d \le 0.2$.

Step 4. If there is any change or update information that may lead to start a new evaluation-round process from *Step* 1.

Finally, the assessment consequences of importance degree to CRs can be obtained and expressed as a triangular fuzzy number $\tilde{k}'_i = \left[\left(k'_i\right)^{\mathrm{L}^*}, \left(k'_i\right)^{\mathrm{M}^*}, \left(k'_i\right)^{\mathrm{H}^*} \right]$.

2.2 Competition perspective

Facing the short life-cycles and global dynamic competition environment, taking the competition perspective into account for improving the understanding of CRs is an essential and vital deliberation. Cohen [15] defined a sales point is the ability to sell the product or service, based on how well each customer requirement is satisfied.. In traditional practice, the sales point is set as a crisp value such as 1.5, 1.25 and 1 to reflect the strong, moderate and none sales point to competitors. In competition analysis, considering that a company has many customers and competitors in the competition market, the different customer will set various satisfaction weights to different suppliers based on how well the product or service is met its expectation. In this study, a sales point evaluation is based on a performance standpoint of customer satisfaction to each CR. Suppose that $\tilde{Y}_{\psi i,t}$ is a triangular fuzzy number represented the tth customer who evaluates the satisfaction performance of ψ th supplier on ith CR. Therefore, $\tilde{Y}_{\psi i,t}$ can be expressed as

$$\tilde{Y}_{\psi i,t} = \begin{bmatrix} \tilde{y}_{11,t} & \cdots & \tilde{y}_{1I,t} \\ \vdots & \tilde{y}_{\psi i,t} & \vdots \\ \tilde{y}_{\Psi 1,t} & \cdots & \tilde{y}_{\Psi I,t} \end{bmatrix} = \begin{bmatrix} (y_{11}^{\mathrm{L}^*}, y_{11}^{\mathrm{M}^*}, y_{11}^{\mathrm{H}^*})_t & \cdots & (y_{1I}^{\mathrm{L}^*}, y_{1I}^{\mathrm{M}^*}, y_{1I}^{\mathrm{H}^*})_t \\ \vdots & (y_{\psi i}^{\mathrm{L}^*}, y_{\psi i}^{\mathrm{M}^*}, y_{\psi i}^{\mathrm{H}^*})_t & \vdots \\ (y_{\Psi 1}^{\mathrm{L}^*}, y_{\Psi 1}^{\mathrm{M}^*}, y_{\Psi 1}^{\mathrm{H}^*})_t & \cdots & (y_{\Psi I}^{\mathrm{L}^*}, y_{\Psi I}^{\mathrm{M}^*}, y_{\Psi I}^{\mathrm{H}^*})_t \end{bmatrix}, \quad \text{and} \quad (5)$$

$$\left(y_{\psi i}^{\mathrm{L}^*}, y_{\psi i}^{\mathrm{M}^*}, y_{\psi i}^{\mathrm{H}^*}\right)_t = \left(y_{\psi i}^{\mathrm{L}^*} = \frac{\sum_{t=1}^{T} v_{\psi,t} \cdot \left(y_{\psi i}^{\mathrm{L}^*}\right)_t}{\sum_t v_{\psi,t}}, y_{\psi i}^{\mathrm{M}^*} = \frac{\sum_{t=1}^{T} v_{\psi,t} \cdot \left(y_{\psi i}^{\mathrm{M}^*}\right)_t}{\sum_t v_{\psi,t}}, y_{\psi i}^{\mathrm{H}^*} = \frac{\sum_{t=1}^{T} v_{\psi,t} \cdot \left(y_{\psi i}^{\mathrm{H}^*}\right)_t}{\sum_t v_{\psi,t}} \right) \quad (6)$$

where $\psi = 1,...,\Psi$, $t = 1,...,T$, and $v_{\psi,t}$ represents the weights of performance satisfaction of tth customer to ψth supplier; $v_{\psi,t} \in [0,1]$. The assessment of customer satisfaction performance $\tilde{y}_{\psi i,t}$ is described by linguistic terms and defined as the fuzzy subsets of [0, 1] and surveyed from each customer who concerned the product development.

Once the customer satisfaction performance is collected and treated using (5) and (6), the sales point of a firm can be determined by (7).

$$\begin{aligned} SP_i &= \left[SP_i^{\mathrm{L}^*}, SP_i^{\mathrm{M}^*}, SP_i^{\mathrm{H}^*}\right] \\ &= \left[\sum_{\psi=1}^{\Psi} y_{\psi i}^{\mathrm{L}^*} \cdot \log\left(\frac{1}{y_{\psi i}^{\mathrm{H}^*}}\right), \sum_{\psi=1}^{\Psi} y_{\psi i}^{\mathrm{M}^*} \cdot \log\left(\frac{1}{y_{\psi i}^{\mathrm{M}^*}}\right), \sum_{\psi=1}^{\Psi} y_{\psi i}^{\mathrm{H}^*} \cdot \log\left(\frac{1}{y_{\psi i}^{\mathrm{L}^*}}\right)\right]. \end{aligned} \quad (7)$$

Eq. (7) is considered the concept of entropy in information theory [28].

2.3 Value perspective

Understanding what customer values within CRs is the third perspective for determining the importance score of CRs. DeSarbo et al. [16] noted that performing customer value analysis to articulate the "voice of customer" is applied in more and more firms. This study concerned the economics value which is defined by Elias [17] and expressed as worth w_i divided by cost C_i^* of the each CR.

$$V_i = \frac{w_i}{C_i^*},\ i=1,\ldots,I. \quad (8)$$

where w_i represents each current and potential customer's perception on CR$_i$; C_i^* is the initial cost evaluated by QFD team to CR$_i$ for the new product planning. Same as the customer perspective stage, to address the fuzzy nature in worth and initial cost evaluation to each CR, the modified fuzzy Delphi method is employed to determine the worth $\tilde{w}_{i,e}$ of CR$_i$. $\tilde{w}_{i,e}$ is described by linguistic terms and defined as the fuzzy subsets of [0, 1] and provided by the expert (customer) e. Assuming the assessments of the worth and the initial cost to CR$_i$ are $\left[\left(\overline{w}_{i,}'\right)^{\mathrm{L}^*}, \left(\overline{w}_i'\right)^{\mathrm{M}^*}, \left(\overline{w}_i'\right)^{\mathrm{H}^*}\right]$ and $\left[\left(C_i^*\right)^{\mathrm{L}^*}, \left(C_i^*\right)^{\mathrm{M}^*}, \left(C_i^*\right)^{\mathrm{H}^*}\right]$, respectively, then eq.(8) can be modified as

$$\tilde{V} = \left(V_i^{\mathrm{L}^*}, V_i^{\mathrm{M}^*}, V_i^{\mathrm{H}^*}\right) = \left[\frac{\left(\overline{w}_i'\right)^{\mathrm{L}^*}}{\left(C_i^*\right)^{\mathrm{H}^*}}, \frac{\left(\overline{w}_i'\right)^{\mathrm{M}^*}}{\left(C_i^*\right)^{\mathrm{M}^*}}, \frac{\left(\overline{w}_i'\right)^{\mathrm{H}^*}}{\left(C_i^*\right)^{\mathrm{L}^*}}\right] \quad i=1,\ldots,I. \tag{9}$$

Once the assessments of customer perspective, competition perspective and value perspective are determined, the fuzzy importance score of CR_i can be expressed as

$$\tilde{K}_i = \tilde{k}_i' \otimes \tilde{SP}_i \otimes \tilde{V}_i \quad i=1,\ldots,I. \tag{10}$$

where the symbol $\otimes$ represents the fuzzy multiplication operator. To treat fuzzy multiplication, a fuzzy set can fully and uniquely be represented by its α-cuts [21]. For example, the α-cut of the fuzzy set $\tilde{V}_i$ at the level, $\alpha \in [0,1]$, can be expressed by its lower and upper bounds as $[(V_i)_\alpha^L, (V_i)_\alpha^U]$, which is defined as:

$$\left(V_i\right)_\alpha^L = \inf_{x\in[0,1]}\left\{x \middle| \mu_{\tilde{V}_i}(x) \geq \alpha\right\}, \text{ and} \tag{11a}$$

$$\left(V_i\right)_\alpha^U = \sup_{x\in[0,1]}\left\{x \middle| \mu_{\tilde{V}_i}(x) \geq \alpha\right\} \tag{11b}$$

where $\mu_{\tilde{V}_i}(x)$ is the membership degree of x belonging to $\tilde{V}_i$; the indexes "L", "U" represent the lower and upper bound of $\tilde{V}_i$ at α level, respectively. According to α-cuts and the extension principle in fuzzy set theory [32, 33], the membership function of the fuzzy importance score $\tilde{K}_i$ can be defined by the lower and upper bounds of each α-cut of $\tilde{k}_i'$, $\tilde{SP}_i$, and $\tilde{V}_i$ as well as formulated as:

$$\left(K_i\right)_\alpha^L = \left(k_i'\right)_\alpha^L \cdot \left(SP_i\right)_\alpha^L \cdot \left(V_i\right)_\alpha^L \text{ and} \tag{12a}$$

$$\left(K_i\right)_\alpha^U = \left(k_i'\right)_\alpha^U \cdot \left(SP_i\right)_\alpha^U \cdot \left(V_i\right)_\alpha^U \tag{12b}$$

For simplification of QFD application, the fuzzy importance score can be defuzzified so as to combine with the modified fuzzy normalized relationship in determining the fuzzy technical importance ratings. The fuzzy mean (FM) method [26] is employed to carry out the defuzzification of $\tilde{K}_i$ due to consider its simplicity and efficiency. The FM method is expressed as

$$D = \frac{\sum_{i=1}^{I} \alpha_i x_i}{\sum_{i=1}^{I} \alpha_i}, \tag{13}$$

where α_i and x_i denote the membership degree and the representative (pre-calculated) numerical value of the ith output, respectively; D is the defuzzification value of interval

values [x_i^L , x_i^U], i.e., the *i*th α-cut of fuzzy number. Based on Mabuchi's idea [27], the representative value of the *i*th output is defined as the average of lower and upper bounds of the interval by $x_i = \frac{1}{2}\left(x_i^L + x_i^U\right)$. Therefore, the average value of the α-cut of $\tilde{K}_i$ at the α_i level, i.e., $\left(K_i\right)_{\alpha_i} = \frac{1}{2}\left[\left(K_i\right)_{\alpha_i}^L + \left(K_i\right)_{\alpha_i}^U\right]$ is used as the representative value in this study. According to the FM method, the $\tilde{K}_i$ can be defuzzified as

$$K_i' = \frac{\sum_i \alpha_i \cdot \left(K_i\right)_{\alpha_i}}{\sum_i \alpha_i}, \; i = 1, \ldots, I. \tag{14}$$

3. A FUZZY HOQ CONSTRUCTION MODEL

In product planning, a QFD team collects a set of CRs, assesses and treats their importance scores as described in prior section afterward a number of appropriated DRs that affect the CRs are identified. Based on CRs and DRs, the relevant relationship matrixes will be assessed in HOQ construction. A HOQ is shown in Figure 1. In Figure 1, R_{ij} denotes the relation level in terms of score between the CR_i and DR_j, L_{iI} is the correlation score between CR_i and CR_I; T_{jJ} is the correlation score between DR_j and DR_J, and W_j represents the importance rating of DR_j which is then applied to determine the fulfillment level of the each DR to maximize customer satisfaction.

Considering the imprecise nature of the relationships evaluation, Chen and Weng [8] proposed the fuzzified formulation as (15a) and (15b) based on Wasserman's idea [31] which considered the relationships between the DRs themselves to determine the normalized fuzzy relationship value between CRs and DRs.

$$\left(R_{ij}'\right)_\alpha^L = \frac{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_\alpha^L\left(T_{\zeta j}\right)_\alpha^L}{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_\alpha^L\left(T_{\zeta j}\right)_\alpha^L + \sum_{\substack{\phi=1 \\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_\alpha^U\left(T_{\zeta\phi}\right)_\alpha^U}, \text{ and} \tag{15a}$$

$$\left(R_{ij}'\right)_\alpha^U = \frac{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_\alpha^U\left(T_{\zeta j}\right)_\alpha^U}{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_\alpha^U\left(T_{\zeta j}\right)_\alpha^U + \sum_{\substack{\phi=1 \\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_\alpha^L\left(T_{\zeta\phi}\right)_\alpha^L}, \tag{15b}$$

where $\left(R_{i\zeta}\right)_\alpha^L / \left(R_{i\zeta}\right)_\alpha^U$ denoted the lower/upper bound of the fuzzy relationship $\tilde{R}_{i\zeta}$ at α level for CR_i to DR_ζ, $\left(T_{\zeta j}\right)_\alpha^L / \left(T_{\zeta j}\right)_\alpha^U$ denoted the lower/upper bound of the fuzzy correlation score $\tilde{T}_{\zeta j}$ at α level for DR_ζ to DR_j. In (15a) or (15b), if

$\sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{U}\left(T_{\zeta\phi}\right)_{\alpha}^{U}=0$ or $\sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{L}\left(T_{\zeta\phi}\right)_{\alpha}^{L}=0$, then $\left(R'_{ij}\right)_{\alpha}^{L}=1$ or $\left(R'_{ij}\right)_{\alpha}^{U}=1$. Obviously, the situation above is not reasonable while the original relationship $\tilde{R}'_{ij}=\left[R_{ij}^{L},R_{ij}^{U}\right]$ is evaluated with low or moderate linguistic level. The situation of $\sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{U}\left(T_{\zeta\phi}\right)_{\alpha}^{U}=0$ or $\sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{L}\left(T_{\zeta\phi}\right)_{\alpha}^{L}=0$ will be found while only one DR impact to one CR and no any other DRs correlated with this DR. To improve this critical issue, (15a)

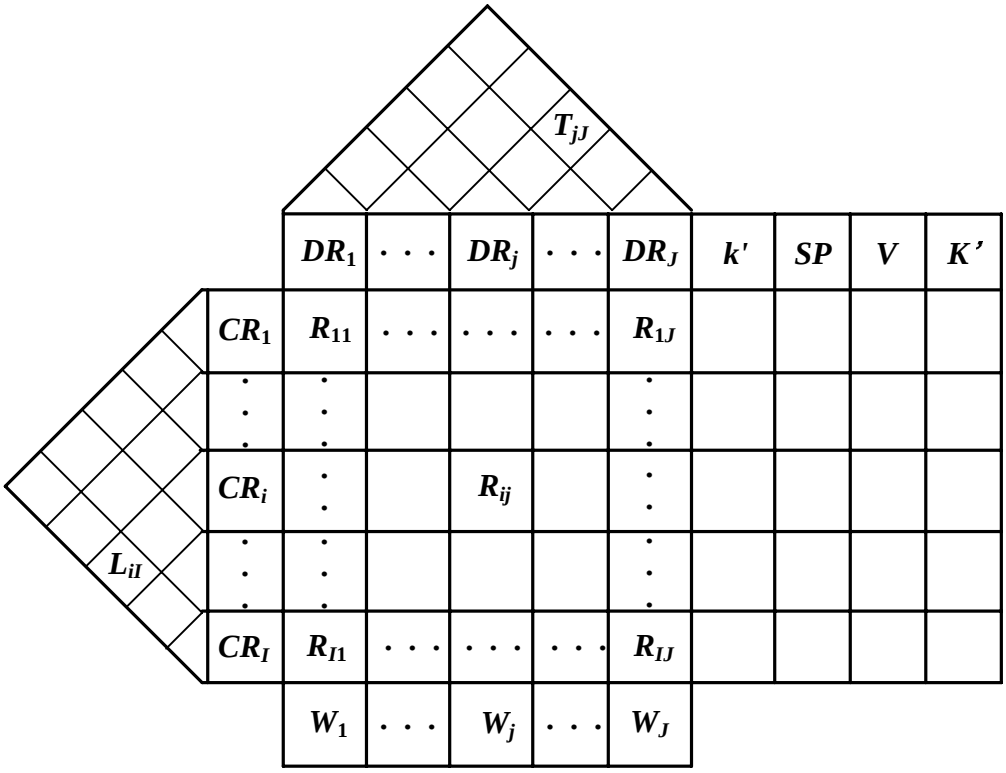

Figure 1. House of Quality

and (15b) should be modified as

$$\left(R'_{ij}\right)_{\alpha}^{L}=\begin{cases}\dfrac{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{L}\left(T_{\zeta j}\right)_{\alpha}^{L}}{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{L}\left(T_{\zeta j}\right)_{\alpha}^{L}+\sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{U}\left(T_{\zeta\phi}\right)_{\alpha}^{U}}, \text{ and} \\ R_{ij}^{L}, \text{ if } \sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)_{\alpha}^{U}\left(T_{\zeta\phi}\right)_{\alpha}^{U}=0\end{cases} \tag{16a}$$

$$\left(R'_{ij}\right)^U_\alpha = \begin{cases} \dfrac{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)^U_\alpha\left(T_{\zeta j}\right)^U_\alpha}{\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)^U_\alpha\left(T_{\zeta j}\right)^U_\alpha + \sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)^L_\alpha\left(T_{\zeta\phi}\right)^L_\alpha}, \\ R^U_{ij}, \text{ if } \sum_{\substack{\phi=1\\ \phi\neq j}}^{J}\sum_{\zeta=1}^{J}\left(R_{i\zeta}\right)^L_\alpha\left(T_{\zeta\phi}\right)^L_\alpha = 0 \end{cases} \quad (16b)$$

Besides, considering the influence of the relationships between the CRs themselves $\tilde{L}_{i\zeta}$ to (16a) and (16b), the normalized fuzzy relationship value between CRs and DRs can be further upgraded as

$$\left(R''_{ij}\right)^L_\alpha = \begin{cases} \dfrac{\sum_{\zeta=1}^{I}\left(L_{i\zeta}\right)^L_\alpha\left(R'_{\zeta j}\right)^L_\alpha}{\sum_{\zeta=1}^{I}\left(L_{i\zeta}\right)^L_\alpha\left(R'_{\zeta j}\right)^L_\alpha + \sum_{\substack{\phi=1\\ \phi\neq i}}^{I}\sum_{\zeta=1}^{I}\left(L_{\phi\zeta}\right)^U_\alpha\left(R'_{\zeta j}\right)^U_\alpha}, \\ \left(R'_{ij}\right)^L_\alpha, \text{if } \sum_{\substack{\phi=1\\ \phi\neq i}}^{I}\sum_{\zeta=1}^{I}\left(L_{\phi\zeta}\right)^U_\alpha\left(R'_{\zeta j}\right)^U_\alpha = 0, \end{cases} \quad (17a)$$

$$\left(R''_{ij}\right)^U_\alpha = \begin{cases} \dfrac{\sum_{\zeta=1}^{I}\left(L_{i\zeta}\right)^U_\alpha\left(R'_{\zeta j}\right)^U_\alpha}{\sum_{\zeta=1}^{I}\left(L_{i\zeta}\right)^U_\alpha\left(R'_{\zeta j}\right)^U_\alpha + \sum_{\substack{\phi=1\\ \phi\neq i}}^{I}\sum_{\zeta=1}^{I}\left(L_{\phi\zeta}\right)^L_\alpha\left(R'_{\zeta j}\right)^L_\alpha}, \\ \left(R'_{ij}\right)^U_\alpha, \text{if } \sum_{\substack{\phi=1\\ \phi\neq i}}^{I}\sum_{\zeta=1}^{I}\left(L_{\phi\zeta}\right)^L_\alpha\left(R'_{\zeta j}\right)^L_\alpha = 0 \end{cases} \quad (17b)$$

where $\left(L_{i\zeta}\right)^L_\alpha / \left(L_{i\zeta}\right)^U_\alpha$ denoted the lower/upper bound of the fuzzy correlation score $\tilde{L}_{i\zeta}$ at α level for CR_i to CR_ζ. Once the lower and upper bounds of α-cuts of the fuzzy normalized relationship are obtained, the fuzzy technical importance ratings $\tilde{W}_j$ can be simplified and expressed as:

$$\left(\tilde{W}_j\right)_\alpha = \left[\left(W_j\right)^L_\alpha, \left(W_j\right)^U_\alpha\right] = \left[\frac{\sum_{i=1}^{I} K'_i \cdot \left(R''_{ij}\right)^L_\alpha}{\sum_{i=1}^{I} K'_i}, \frac{\sum_{i=1}^{I} K'_i \cdot \left(R''_{ij}\right)^U_\alpha}{\sum_{i=1}^{I} K'_i}\right]. \quad (18)$$

The results from (18) can be employed to find the fulfillment level of the each DR to maximize the overall customer satisfaction.

4. AN ILLUSTRATIVE EXAMPLE

A semiconductor packing case of the turbo thermal ball grid array (T^2-BGA) package is introduced to exemplify the applicability of the proposed methods.

4.1. CRs' importance scores

According to product characteristics and performance specifications of T^2-BGA, a QFD team surveyed and collected the opinions of customers during the product planning stage. Suppose that the CRs are determined as "package profile" (CR_1), "thermal performance" (CR_2), "electrical performance" (CR_3), "reliability" (CR_4), and "co-planarity" (CR_5). Considering the above CRs, three different perspectives are applied to determine the importance scores of CRs.

4.1.1. Customer perspective

In customer perspective, the fuzzy Delphi method is applied to determine the importance levels of CRs. Suppose that a QFD team forwards a questionnaire with linguistic evaluation levels, "very low (VL)", "low (L)", "medium (M)", "high (H)" or "very high (VH)", to eight current and potential customers in order to obtain the importance level of five CRs. The relevant computational procedures are described as follows:

Step 1. The first assessing outcomes are listed in Table 1. The QFD team member has to translate linguistic terms i.e., VL, L, M, H, and VH into the triangular fuzzy numbers as the lowest, the most likely and the highest level set, namely (0, 0, 0.2), (0, 0.2, 0.4), (0.3, 0.5, 0.7), (0.6, 0.8, 1), and (0.8, 1, 1), respectively. For example, in Table 1, the importance levels of the first CR evaluated by the second customer is expressed as $\tilde{k}_{1,2} = (0, .2, .4)$.

Step 2. Computing the weighted-average of all $\tilde{k}_{i,e}$ by (2), assuming the importance weight set to eight current and potential customers is assigned as {1, 0.9, 0.9, 0.5, 0.5, 0.2, 0.2, 0.1} based on their real or potential contribution in business. The producing results of $\tilde{\tilde{k}}_i$ to each CR are (0.049, 0.202, 0.402), (0.293, 0.493, 0.693), (0.091, 0.244, 0.444), (0.512, 0.712, 0.888), and (0.035, 0.147, 0.347), respectively. Then, the differences between $\tilde{k}_{i,e}$ and $\tilde{\tilde{k}}_i$ are calculated and return to each customer for re-evaluation procedure.

Step 3. Same to *Step* 1, each customer provides the revised assessment outcomes which are listed in Table 1. The weighted-average of $\tilde{k}'_{i,e}$ can also be obtained by (2), and then the $\tilde{\tilde{k}}'_i$ of each CR is obtained as (0.014, 0.214, 0.414), (0.265, 0.465, 0.665), (0.091, 0.291, 0.491), (0.547, 0.747, 0.923), and (0, 0.181, 0.381), respectively. The difference between $\tilde{\tilde{k}}'_i$ and $\tilde{\tilde{k}}_i$ is calculated by (4) as 0.023, 0.028, 0.047, 0.035, and 0.035, respectively. The differences between two adjacent averages are all less than to 0.2,

therefore, the consensus condition is achieved.

Step 4. If the consensus condition was not obtained, the re-evaluation process would be performed in the next assessment cycle till the consensus condition is achieved.

Table 1. The first/ second round assessment of importance levels of CRs

Customer	CR_1	CR_2	CR_3	CR_4	CR_5
$Cust_1$	L/ L	M/ M	L/ L	H/ H	VL/ L
$Cust_2$	L/ L	M/ M	VL/ L	H/ H	L/ L
$Cust_3$	VL/ L	H/ M	M/ M	M/ M	L/ L
$Cust_4$	M/ L	L/ L	L/ L	H/ H	M/ L
$Cust_5$	L/ L	L/ M	L/ L	VH/ VH	VL/ L
$Cust_6$	L/ L	M/ M	H/ M	M/ H	VL/ VL
$Cust_7$	M/ M	M/ M	L/ L	L/ M	VL/ VL
$Cust_8$	VL/ L	M/ M	VL/ L	M/ H	L/ L

In this case, the fuzzy results $\tilde{\tilde{k}}_i'$ of importance level of CR_i, i=1,…,5, will be used to determine the fuzzy importance scores.

4.1.2. Competition perspective

Suppose that there are three major suppliers and four customers dedicate to T^2BGA development in the competition market. In competition analysis, a company (supplier) survey and asks it's four customers to evaluate the performance levels of each CR for T^2BGA product planning with linguistic evaluation level set {VL, L, M, H, VH} to three major suppliers. Furthermore, inviting customers to provide the corresponding performance satisfaction weights to different suppliers based on how well the product or service is met its expectation. Assuming the performance satisfaction weights are defined as 1.8, 1.5, 1.2, and 1 in this case. Table 2 is listed the outcomes of performance assessment of CRs from customers for T^2BGA product planning. Based on the assessment outcomes in Table 3, the fuzzy sales points of each CR can be determined by (6) and (7) as (0, 0.018, 0.314), (0.087, 0.452, 1.255), (0.087, 0.452, 1.255), (0.031, 0.299, 0.798) and (0.011, 0.120, 0.465). The fuzzy sales point of each supplier is listed in Table 3. In Table 3, the each competitor has the same results of fuzzy sales point at CR_2 and CR_3, that represent there is a good opportunity to be distinguished in the current competition situation by CR_2 and CR_3. Moreover, the third supplier possesses better competition situation at CR_1 and CR_5, while supplier 2 at CR_4 holds the better competition advantage.

4.1.3. Value perspective

To understanding the economic value of CRs, the worth and cost of each CR has to determined. According to the procedures of fuzzy Delphi method, the first round assessment

Table 2. The performance assessing outcomes of CRs

$comp_1$	**0.001**	**0**	**0.097**	**0.029**	**0.151**	**0.418**	**0.029**	**0.151**	**0.418**	**0**	**0.078**	**0.222**	**0**	**0**	**0.097**
$comp_2$	**0**	**0**	**0.097**	**0.029**	**0.151**	**0.418**	**0.029**	**0.151**	**0.418**	**0.022**	**0.124**	**0.318**	**0**	**0.047**	**0.164**
$comp_3$	**0**	**0.018**	**0.12**	**0.029**	**0.151**	**0.418**	**0.029**	**0.151**	**0.418**	**0.01**	**0.098**	**0.258**	**0.011**	**0.073**	**0.204**
$\tilde{SP}_i$	**0**	**0.018**	**0.314**	**0.087**	**0.452**	**1.255**	**0.087**	**0.452**	**1.255**	**0.031**	**0.299**	**0.798**	**0.011**	**0.12**	**0.465**

outcomes are listed in Table 4. Assuming the worth weight set is same to importance weight set to eight current and potential customers based on their real or potential contribution in business. The weighted-average of all $\tilde{w}_{i,e}$ can be obtained by (2), producing results of $\tilde{\tilde{w}}_i$ to each CR are (0.398, 0.598, 0.798), (0.647, 0.847, 1), (0.647, 0.847, 1), (0.481, 0.681, 0.881), and (0.453, 0.653, 0.853), respectively. The calculation result has to send to each participant for second round evaluation. Following the performing step 3 of fuzzy Delphi method, each customer provides the revised assessment outcomes which are listed in Table 4. And then, the weighted-average results of $\tilde{\tilde{w}}_i'$ to each CR are calculated by (2) as (0.349, 0.549, 0.749), (0.712, 0.912, 1), (0.74, 0.94, 1), (0.412, 0.612, 0.812), and (0.398, 0.598, 0.798). Furthermore, the difference between $\tilde{\tilde{w}}_i'$ and $\tilde{\tilde{w}}_i$, i=1,…,5, are calculated by (4) as 0.184, 0.065, 0.033, 0.07, and 0.056, respectively. Obviously, the differences between two adjacent averages are all less than the consensus condition. Consequently, the outcomes of $\tilde{\tilde{w}}_i'$, i=1,…,5, are the final worth results of CRs. Assuming the lowest, the most likely and the highest initial fuzzy cost of CR_i, i=1,…,5, are (0.1, 0.2, 0.3), (0.3, 0.5, 0.7), (0.3, 0.5, 0.7),

Table 4. The first/ second round assessment of the worth of CRs

Customer	CR_1	CR_2	CR_3	CR_4	CR_5
$Cust_1$	M/ M	H/ H	VH/ VH	H/ H	H/ M
$Cust_2$	M/ M	VH/ VH	H/ H	H/ M	M/ M
$Cust_3$	H/ M	H/ VH	H/ VH	M/ M	H/ H
$Cust_4$	M/ M	H/ H	H/ VH	H/ H	M/ M
$Cust_5$	H/ H	H/ VH	VH/ VH	M/ M	M/ M
$Cust_6$	M/ H	H/ H	H/ H	M/ M	M/ H
$Cust_7$	M/ M	H/ H	H/ H	H/ M	H/ H
$Cust_8$	M/ M	VH/ VH	VH/ VH	M/ H	H/ M

(0.15, 0.3, 0.45), and (0.1, 0.3, 0.5), respectively, which assessed by QFD team. In the fuzzy sense, the value of CRs then can be determined using (9) which are (1.163, 2.745, 7.49), (1.017, 1.824, 3.333), (1.057, 1.88, 3.333), (0.916, 2.04, 5.413), and (0.796, 1.993, 7.98).

4. 2. DRs' importance rating and total customer satisfaction

Once the importance level, the sales points, and value of CR_i are obtained, all of this outcomes could be transferred into the α-cut expression of the fuzzy sets $\tilde{k}_i'$, $\tilde{SP}_i$, and $\tilde{V}_i$ by (11). For example, $[(V_2)_\alpha^L, (V_2)_\alpha^U] = [1.017 + 0.807\alpha,\ 3.333 - 1.509\alpha]$. Without any biases, the α levels in this paper are evenly distributed in [0, 1]. Let α_ξ denote the ξth level, and $\alpha_\xi = \xi / \lambda$, $\xi \in \{0,1,\cdots,\lambda\}$, thus the distance between each two adjacent levels is equal, i.e. $\alpha_\xi - \alpha_{\xi-1} = \lambda^{-1}$, $\xi \geq 1$. Based on the transformation above, the lower and upper bounds of the fuzzy technical importance score $\tilde{K}_i$, i=1,…,5, at each α level, can be determined by (12). And then, the final results of importance scores of each CR can be defuzzified by (14) as 0.043, 0.305, 0.206, 0.377, and 0.069, respectively.

To responding CRs for customer satisfaction, QFD team determines the corresponding design requirements (DRs) by design feasibility studies. Five DRs are proposed, including "heat slug exposed area" (DR_1), "heat slug attached material" (DR_2), "height of heat slug" (DR_3), "copper pattern" (DR_4), and "molding flow" (DR_5). The relationship between CR_i and CR_j, the relationship between CRs themselves, and the relationship between DRs themselves are evaluated by QFD team with the same linguistic evaluation levels set {VL, L, M, H, VH}. The initial HOQ is set and illustrated in Figure 2. According to the linguistic relationships in Figure 2, the fuzzy normalized relationship at each α-cut can be calculated using (16) and (17). An then, considering the importance scores of each CR, the lower and upper bounds of the fuzzy technical importance ratings $(\tilde{W}_j)_\alpha$, j = 1, 2, …, J, at each α level, can be obtained by (18) for determining the importance priority of each DR. The lower and upper bounds of $(\tilde{W}_j)_\alpha$ at various α levels are listed in Table 5. The results of fuzzy technical importance ratings of DRs can be applied to Chen and Weng's model [8] to determine the performance

level of each DR for maximizing customer satisfaction. The fulfillment level of each DR and the total customer satisfaction degree (the objective function value) are calculated and shown in Table 6. Figure 3 indicates the membership functions of the total customer satisfaction degree of the QFD processes as levels in the feasible regions using originally unique perspective and three perspectives for CRs ranking. Obviously, the membership function of the total customer satisfaction degree from proposed method is better than the unique perspective one, i.e., importance to customer requirements perspective, although all of them meet the requirement in new product planning.

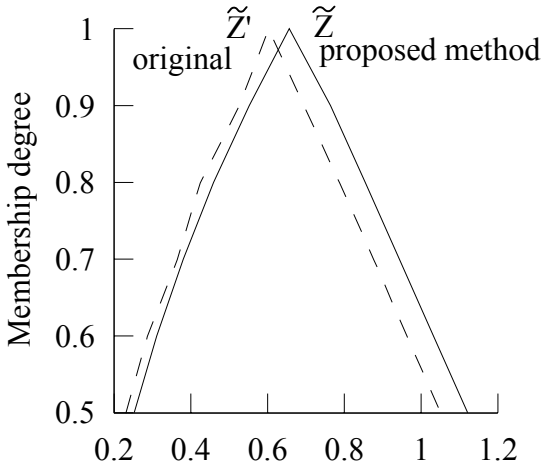

Figure 3. The membership functions of customer satisfaction with different approaches

5. CONCLUDING REMARKS

Determining the performance levels of DRs is an important decision problem in QFD applications, but recognizing and ranking the importance levels of customer requirements is more important issue for product planning. To improve the understanding of customer voice to obtain the better customer satisfaction, this study proposed a new method to aggregate the various assessment perspectives including, importance to customers, competition and value three perspectives to determine the importance scores of CRs. Moreover, determining the relationship between CRs and DRs and calculating the importance rating of DRs are further steps for a HOQ construction. This paper not only considered both relationship between DRs themselves but also take the relationship between CRs themselves into account to determine the relationship between CRs and DRs. A modified model is proposed to determine the relationship between CRs and DRs to improve the reasonability of the existing normalization model. Through the modification of the importance score of CRs and the the relationship between CRs and DRs, the importance rating DRs can be determine. The illustration of the proposed methods with a numerical example indicates that the total customer satisfaction degree is greater than that from the existing perspective of CRs evaluation while using the same fuzzy linear model. To enhance the customer satisfaction, the other considerations, such as the concept of theory of constraints or the group decision-making approaches could be modeled to improve the understanding of the voice of customer in the future study.

ABSTRACT

Core competences from either source could contribute to the business operations in the international markets. Firm-specific knowledge has been traditionally regarded as the important determinant of competitive advantage in the international market place. Drawing on previous research, this study verifies hypotheses with empirical data collected and explores the internationalization in Taiwan financial industry. Study findings of the research find support for the theoretical base that competence factors and firm size do have a significant impact on firms internationalization. Further, this study reveals that firms internationalization relates positively to the firms performance.

Keywords: resource, competence, firm size, market knowledge, internationalization

INTRODUCTION

When any market is crowded with competitors, the best strategic approach is differentiation, establishing a niche that builds a competitive advantage against competitors in the short term that can be leveraged against the major players in the long-term. But in many cases, even entering into the niche market game is difficult, and small firms often lose the competitive struggle, going out of business or being swallowed. Hence, firm size is defined as the determinant of firms competence [1] and internationalization [44]. In this study, the literature pertinent to competence, firm size and their effects on internationalization is reviewed. At present, a number of different measures of the degree of internationalization (DOI) of a given firm are used by scholars. Therefore, in addition to financial indicators, we use the proxy of individual attributes for an organization's international attitudes. The study reviews approaches to measurement of DOI, and then defines, measures, and discusses the degree of internationalization of Taiwan financial companies. Finally, the effect of internationalization on a firm's performance is also verified by the research.

The objective of this study is to investigate and evaluate the business competences and firm size and, then, examine their importance in allowing Taiwan financial firms to develop a competitive position in the international marketplace. This study will contribute to the

literature on internationalization by focusing on financial firms with international operations within the context of developing markets and emerging countries. The findings have the potential to offer significant implications for theory and practice. This paper is organized as follows. Section 2 gives a review and construct of the literature in the areas of competences, firm sizes, and internationalization and outcomes. Section 3 presents data and methods. Section 4 gives the findings of the study. Finally, section 5 provides the discussion and managerial implication. The conceptual framework is illustrated in Figure 1.

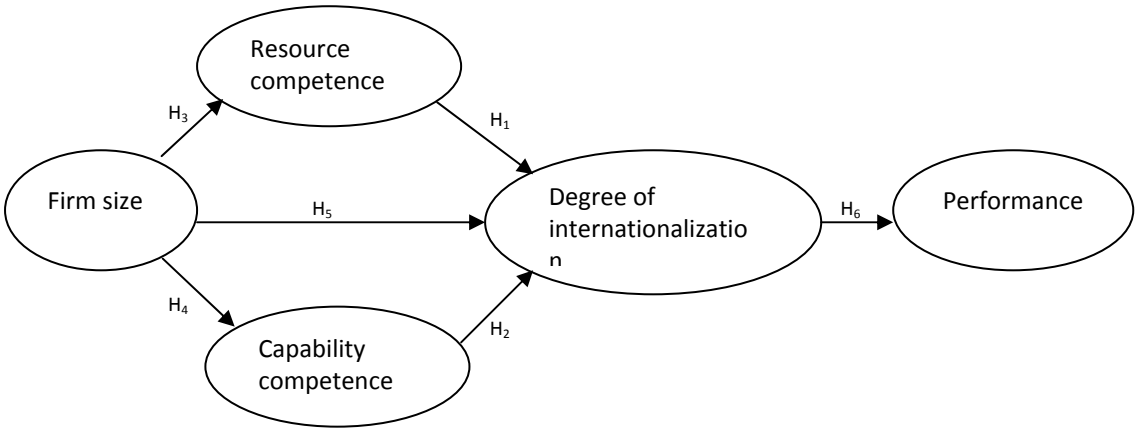

Figure 1. Concept framework

LITERATURE REVIEW

This section discusses the early contributions of the authors and the research that has stimulated others to study these issues.

Core competence: Retrospect and prospect

The concepts of competence and competitive advantage are not synonymous. Core competences make it possible for firms to build a framework that addresses the key dimensions of strategic management and competition [39]. Core competences or distinctive capabilities, are combinations of resources and capabilities, which are both unique to a specific organization and responsible for generating its competitive advantage [14]. For example, managerial competences help open up relationships, the capability to take action with insufficient information, and tolerance for behavioral flexibility [45]. Hence, competences can be manipulated by firms to generate competitive advantage and high performance. If a firm's strategy is inconsistent with its competences, its performance will be lower than that of other firms executing a similar strategy but enjoying better coherence with competences [36].

In academia, numerous researchers have attempted to integrate or review this vast array of literature and differentiate two sources of competitive advantages: unique resources and distinctive skills [34]. For service industries, three different types of competence are defined by scholars, including disciplinary knowledge and understanding of realities, competence in handling information, and communicative competence [21]. O'Farrell, Hitchens, and

Moffat (1993) consider the competitive advantages in the service industry include flexible pricing policies, network effects, competitive scope, proprietary technology, service differentiation, and reputation [36]. Bharadwaj, Varadarajan and Fahy (1993) suggest a conceptual model for sustainable competitive advantage in service industries [3]. Key factors considered in their model as major sources of competitive advantages include resources (e.g. cost and demand synergies, managerial innovation, brand equity, relationships contracts, etc.) and skills (e.g. customer service, functional and implementation skills, etc.). After assessing the insights of scholars and the attributes of financial industry, we choose resources competence (product and managerial innovation; branding and information technology) and capabilities competences (innovation and customer service skills; implementation skills and international market knowledge) to be the factors discussed in our model, and explored their importance in internationalization.

Resource competence

Product and managerial innovation. For the financial industry, product and managerial innovation are helpful for companies to creat diffenentiable and distinguished service quality identifed by consumer. Innovative products designed for customers bring new business. Successful enterprise analysis has clearly shown that business performance derives primarily from innovation oriented managerial and organizational processes [7]. It is is important that managers have a knowledgeable understanding of the processes and activities required for the successful integration of their management (e.g. [3]; [17]).
Branding. The difficulty in achieving sustainable form of product differentiation for most financial products means that branding is a critical issue for the companies concerned (e.g. [3]; [19]; [42]). Homogeneity of markets and services' distinct characteristics have made branding as a means of competitive advantage of financial companies. While international and even national brand owners may be more concerned with tailoring their brands for local markets, they aggressively expand in the international markets [31]. Hence, all financial services need to understand more about how individual brands are positioned and advertised as well as what portfolios are optimal [19].
Information technology. While firms' internatonalization, transnational integration implies dependence of subsidiaries on the multinational system for information, technology, management, funds, and products [27]. Reduced barriers to international trade and investment coupled with the advances in information technology have accorded opportunities for firms [40]. Hence, technology has been a significant variable in explaining the internationalization of a firm, as seen in international business literature [13]. Advancements in information technology and improvements in communication infrastructure have resulted in opportunities for financial firms to participate in global markets [46]. Therefore, to competing with global financial companies and be an international firm, product and management innovation, branding and information technology are key factors in the operating and internationalization decisions of financial firms

Capability competences

Innovation and customer service skills and implementational skills. Skills are important and can be fostered via training and learning in the firms' educational processes. Creative skills are quite flexible as they apply to different outputs and environments and this makes them

especially useful in a changing, uncertain environment [47]. For financial companies, whose financial products are largely similar, innovation and customer services skills are important to increase firms' image identification and satisfaction by customers and then strengthen customer loyalty. Effective and efficience implementaion skills of employees are helpful to the business operations [3].

International market knowledge. The internationalization process model developed by Johanson and Vahlne (1977) is based on an analysis of the firm's market knowledge, market commitment, commitment decision and activities [23]. Internationalization behavior is often decided by a combination of learning through the experience and incorporation of members that have international knowledge [26]. Firm-specific knowledge has been traditionally regarded as the important determinant of competitive advantage in the international market place. The lag between start up and internationalization is necessary to gain the requisite market knowledge in order to culturally adapt service offerings and marketing strategies for foreign consumers (e.g. [16]; [29]). In sum, we consider skills and international market knowledge as important factors in firm capability during operation and internationalization process.

The positive relationship of competence to a firm's internationalization

For international firms, core competences and firm-specific resources may be transferred from the parent company to the subsidiaries. Firm-specific sources of competitive advantage are significant predictors of why firms go abroad [28]. The resource-based theory developed by numerous scholars is used to explain resource relationship to internationalization (e.g. [5]; [13]). Xia, Qiu and Zafar (2007) indicate that the factors influence on a firm's internatinalization can be largely explained by the dimensions of firm competences: technological resources; owner/top manager's managerial skills and capabilities; employee's Guanxi skills and professional/technical knowledge; the firm's internal and external relationships [47].

Cuervo-Cazurra, Maloney, and Manrakhan (2007) build on the resource-based theory to argue that the successful in internationalization include: advantage provided by resources transferred abroad, and complementary resources required operating abroad [11]. The competences of firms across different phases of the internationalization process are based on the resources and capabilities used by industries in their development and growth [4]. Therefore firms possessing strong distinct competences are likely to be more successful in international markets. Accordingly, we propose the following two hypotheses.
H_1: Perceived or actual firm resource competences are significant determinants of the degree of internationalization of a firm.
H_2: Perceived or actual firm capability competences are significant determinants of the degree of internationalization of a firm.

The effect of firm size on competences and internationalization

Firm size is assumed to be a proxy of firm resources and capabilities [1]. Hitt & Ireland (1984) indicate that the firm size has moderating effects on the relationships of firms' specific distinctive competencies [20]. Katsikeas (1994) suggests that the existence of significant

differences in perceived export competitive advantage between different exporter groups may be related to company size [24]. Moen (1999) identifies differences in export motivation and competitive advantage between firms of different size [33]. Onyeiwu (2003) uses the binary-logit model to explore the determinants of core competencies, and identifies firm size as one of significant determinants of core competencies [37]. Based on the above reviews, the positive effect of firm size to internatoinalization is explored.

Given the nature of service industry, scholars have argued that number of employees is more appropriate than financial capital as a measure of firm size (e.g. [5]; [22]). Xia, Qiu and Zafar (2007) measure firm size using the two most commonly used indicators: annual sales and number of employees [47]. In the study, we choose three items, including assets, annual sales, and the number of employees to measure the firm size. Based on the above reviews and samples, we conclude that firm size is the leading factor in firm competence, and formulate our third and fourth hypoetheses:
H_3: Firm size of a firm relates positively to the perceived or actual firm resource competences.
H_4: Firm size of a firm relates positively to the perceived or actual firm capability competences.

One stream of research has suggested a positive correlation between a firm size and international activities [44]. Dass (2000) find that firm size, international market diversification and product diversity have linear effects [12]. Whilst a positive impact has been found by many scholars [8], scholars have also reported a non-significant impact on relationship [5] or mixed results (e.g. [1]; [2]). The relationship between size and internationalization activity remains vague when firm size is measured differently [1]. For example, positive effects on performance are found when size is measured by total firm sales, while some negative effects are found when it is measured by number of employees ([1]; [25]). In the study, we use factor analysis method to produce the factor of firm size in term of three items (sales, number of employee and asset). To verify the relationship of firms size to firm internationalization for Taiwan financial companies, Hypothesis 5 is derived.
H_5: Firm size of a firm relate positively to the degree of internationalization of a firm.

Degree of Internationalization and performance

There are many ways to measure the degree of internationalization, but none of them leads to a completely satisfactory outcome [15]. Sullivan (1994) chooses five out of nine possible variables including foreign sales as to a percentage of total sales (FSTS), overseas subsidiaries as a percentage of total subsidiaries, foreign assets as a percentage of total assets (FATA), psychic (cultural) dispersion of international operations, and top managers' international experience, to measure internationalization [43]. Further, management problems caused by cultural heterogeneity in an MNE may not be neglected [15], for example, geographic dispersion and a straightforward count of the number of countries in which a firm operates [6]. The greater the number of countries of operation, the greater the cultural complexity. Based on the foregoing discussion, the study uses two items, attitudinal (managers' recognition plus number of countries invested) and financial (foreign assets as a percentage of the total assets: FATA) indicators, as the measures of the degree of internationalization.

The relationship between DOI and performance has been the subject of much research. Dhanaraj and Beamish (2003) study the degree of internationalization and its effect on the overall firm performance, using firm-level performance measures [13]. Chang (2007) indicates that firm performance will become negative if MNEs heavily expand their product range and geographic scope [9]. The performance gap between related and unrelated foreign investments diminishes in the more advanced stages of internationalization [18]. Companies operating at extreme (very high) degrees of internationalization face lower average performance and higher average performance variation [41].

Scholars have used a variety of indicators to measure performance, including ROE, ROA, IPO, and financial ratios (e.g. [10]; [32]). Financial measures of performance can be classified as sales-related, profit-related, and market share-related. Non-financial measures include those that are market-related or product-related, or are attitudes, such as managers' satisfaction or experiences [30]. Hence, to grasp the effect of the degree of internationalization on firms' performance, this research defines the measures of performance (EPS, ROE and income) and constructs Hypothesis 6.
H_6: Firms degree of internationalization relates positively to the financial performance of a firm.

DATA AND METHOD

Research methods used in the study include industrial analysis, manager surveys, and data analysis. Secondary data are collected through reliable databases (Market observation post system and company websites) (http://newmops.tse.com.tw/ accessed March 2008). Through secondary data, the study introduces the industry background and summarizes the current situation and internationalization of the Taiwan financial market. The sample population consists of both domestic and foreign firms in the Taiwan financial market, including banking, insurance, and securities firms. Over 280 questionnaires are sent out. The 102 returned questionnaires are used for this analysis. Fifty-five percent of the respondents are managers, while the remainders are senior and professional employees involved with the firm's internationalization. Telephone interviews, face-to-face interviews, and incentive gifts are used to find potential respondents and to increase the response rate. Results of the study are presented on the basis of a frequency distribution, ANOVA analysis, factor and reliability analysis, and regression models using SPSS [35].

Based on the returned questionnaires, data used in our study includes 9 foreign firms (one securities firm, 7 insurers and one bank) and 93 local financial firms. Respondents are asked to compare their firms' competences with those of their competitors, using a five-point Likert scale (e.g., 1 = much worse than competitors' and 5 = much better than competitors'). Firm size and performance measurements are established based on th concepts presented by scholars. We use number of employee, annual sales and total assets as the measures of firm size, and EPS, ROE, and income as the measures of firm performance.

Degree of internationaliztion is measured by two items: financial (foreign assets as a percetage of total assets: FATA), and attitudinal (managers recognition plus number of countries invested). Respondents are asked to indicate their firms' DOI using a five-point Likert scale (e.g., 1 = much low and 5 = much high). Another explanation of the five point

scale is provided for the respondents to ensure that their responses reflected the practical internationalization situations of the targeted firms. The five explanations for the DOI item are: "Option 1: focus on domestic market;" "Option 2: international market information collection but have not invested;" "Option 3: in the initial stage of international allocation;" "Option 4: in the growth stage of international allocation, focusing on specific countries;" and "Option 5: worldwide allocation". Thus, the higher the number, the higher the DOI.

STUDY FINDINGS

Exploration of the competences differences by industries

In order to distinguish the differences within the financial industries and varied internationalization degree of firms in Taiwan, Table 1 lists the ANOVA analysis of mean values of items by industries and DOI. In Table 1, the study finds two statistically significant factors within Taiwan financial industries: "product and management innovation" and "branding". The current industrial situations through respondents' investigations and companies' information are summarized as follows.

Product and management innovation. Table 1 shows that the insurers and bankers have higher perception of product and management innovation than securities. Taiwan banks and insurance firms actively research and develop various products to support market development. Through the competitiveness of subsidiary cross selling and common marketing, Taiwan financial holding companies have developed extensive business sources and innovative management, provided overall financial services, and created cost and demand synergy (e.g. FuBon, Cathy and MEGA). Compared to banks and insurance firms, though given lower scores by respondents on product and management innovation item, Taiwan securities firms (e.g. Cathy, TopTrade securities, TISC) have gone beyond traditional services and focused on R & D in derivatives, trades of local and foreign securities and bonds, and risk management. In term of the property management and customization services, securities firms assist clients in maximizing their investment results.

Branding. Brands are regarded as significant and valuable intangible assets for building corporate wealth. A growing number of Taiwan financial companies have developed new brands and strengthened existing brands to win customer brand loyalty and market share. An imitative strategy by the financial companies is always valid if the brand images are strong and welcomed by consumers, enabling financial firms to enhance their performance. Taiwan securities firms emphasize a professional image, spatial convenience, trade fee discount or gifts, and seldom use animated brand emblems. Hence, the brand identification of securities firms seems less clear than that of banks and insurance firms.

Information technology. Different information technologies are used in Taiwan financial markets based on the firms' wealth and strategic plans. For instance, MasterLink securities corporation HongKong creates a trade system. The trade system provides stocks, fund, derivatives, options and foreign stocks and diversification and reliable financial services for customers (http://www.masterlink.com.tw/ accessed 25 May 2008). Through aggressive planning of data warehouse systems, large Taiwan financial firms now offer their clients higher quality value-added service. Financial holding companies such as FuBon and TaiShi

have created optimal value and customer satisfaction via utilization of CRM (customer relationship management) and database technologies such as data mining.

Capability. According to the respondents, there are no significant differences on the perception of innovation customer service skill, implementational skills of employees and international market knowledge of managers among three industries (Table 2). The mean analysis of Table 1 shows that most respondents give higher scores on capability competences. According to the respondents, capability competences are important, and most of the respondents are confident in their skills and abilities, and in the needed training provided by the firms. Through sustained education training, financial firms increase the professional service skills, product and international market knowledge of staff and employees.

Table 1. ANOVA analysis of mean values of question items by industries and DOI

Competence, firm size and internationalization

To verify the hypotheses, we next perform factor analysis, reliability analysis, and linear regression analysis as discussed below. This entailed a two stage process. The first step is to reduce the data to a smaller number of underlying and theoretically plausible variables that could be entered into a linear regression analysis. Factor analysis is undertaken to identify underlying constructs from among sets of many interrelated items using the SPSS statistical package. The principal-component method is used for factor extraction, with factor interpretation carried out by variamax rotation. Five factors produced by factor analysis include "resource competence", "capability competence", "firm size", "DOI" and "performance. As shown in Table 2, all factor loadings of variables and Cronbach's α exceeded 0.6, while the α values of item to total correlation exceed 0.4. As a result, the five factors appear to be appropriate for the next step of regression analysis.

Table 2. Factor and reliability analysis of competence factors and decision factors

Factors and variables	Mean	std	Factor loadings	Eigenvalues	Item to Total correlation	Cronbach's α
*Resource competence (KMO: 0.64***)*				2.21		0.82
Process and managerial innovation	3.06	1.05	0.92		0.81	
Brand equity	3.04	1.12	0.88		0.72	
Information technology	3.29	0.79	0.77		0.55	
*Capability competence (KMO: 0.64***)*				1.87		0.67
Innovation, quality and customer service related skills	3.46	0.66	0.82		0.53	
Implementational skills	3.58	0.62	0.83		0.55	
International market knowledge	3.25	0.84	0.70		0.42	
*Firm size (KMO: 0.57***)*				2.40		0.87
Assets	2.95E+08	5.68E+08	0.89		0.73	
Employee	2323.51	4742.32	0.97		0.91	
Sales	2.64E+07	9.09E+07	0.83		0.65	
*DOI (KMO: 0.50***)*				1.44		0.61
Manager attitude	2.61	1.30	0.85		0.43	
FATA	4.54E-02	9.89E-02	0.85		0.43	
*Performance (KMO: 0.61***)*				1.85		0.69
EPS	0.75	3.11	0.86		0.61	
ROE	-9.99E-02	0.75	0.80		0.50	
Income	1.38E+06	4.64E+06	0.69		0.40	

See Table 1, all competence items exhibit a significant difference in the means under the varying degrees of internationalization. In Table 3, regression models are used to test the determinant effect of competence factors and firm size on firm internationalization, and the results of these models are presented. In the regression models, higher F statistics indicate better overall model fits [35]. The research omits the parameter intercept, hence, the value of constant is zero and does not appear in the regression models. Further, one of the assumptions of regression analysis is that the residuals for consecutive observations are uncorrelated. If this is true, the expected value of the Durbin-Watson statistic is 2. Table 3 shows that the value of the Durbin-Watson of the model 5 is near 2, which fits the requirement of the assumptions of regression analysis. R square, the Goodness-of-fit measure of a linear model,

varies between zero and one, with higher values indicating higher explanatory power, and good fit of the specified models [38]. Table 4 shows that the models 1, 2, and 3 are statistically significant in explaining the degree of firm internationalization. The test results suggest that resource competences and firm size are positively and significantly associated with a higher degree of internationalization of firms. Meanwhile, higher resource competence and size of firms are helpful in internationalization. Further, model 4 and 5 verify the effect of the leading factor of firm size determinants on the resource and capability competences of firms. In practice, in addition to multinational financial firms and financial holding companies, small Taiwan domestic financial firms primarily chose "focus on domestic market" or "in the preparation stage" for their attitudinal measures of DOI. Their competences (resource and capability) and firm size are apparently not as great as those of large financial firms, leading to unwillingness or inability to internationalize unless there is an intervening act of external force such as a merger or venture.

Table 3. Regression models for the degree of internationalization, competence and performance

Factors	Degree of internationalization			Resource	Capability	Performance

Internationalization and performance

In Table 1, except EPS and ROE, the income performance is significantly different among varied internationalization of firms. Further, in model 6 (Table 3), the degree of internationalization of firms appears to be linearly and positively related to firm performance. The results appear to show that firm internationalization has positive effects on profit. The results of our analysis for performance and DOI for Taiwan financial firms shows that firms possessing higher DOI can obtain good business performance (Table 3). However, beside income, the EPS and ROE of firms are not significantly different among firms' DOI (see Table 1). Apparently, compared to small and non-international firms, larger and international firms with high scales and sales can generate high income. However, according to EPS and ROE indicators, the operation performances of small firms are not absolutely lower than those of larger financial companies. Hence, while using varied financial ratios, the degree of internationalization of a firm can not be defined to have the absolute and positive relationship

to business performance. For instance, the business performance of small securities firms mainly depends on their trading activities in the stock market. If investors have optimistic expectations and are willing to enter the stock market, then the business performance of securities firms is strong. Therefore, the performance of firms is largely driven by the direction of business operations, strategies and management, not depending on the degree of internationalization. In sum, the results of models 1, 2, 3, and 4 suggest support for H_1 and H_3 but not H_2, and the findings of model 4, 5 and 6 suggest support of H_4, H_5 and H_6 ($p < 0.05$).

DISCUSSION AND CONCLUSION

Drawing on previous research, this study verifies hypotheses with empirical data collected and explores the internationalization in Taiwan financial industry. Study findings of the research find support for the theoretical base that some competence factors and firm size do have a significant impact on firms internationalization. Further, this study reveals that firms internationalization relates positively to the firms performance. We offer the following conclusions. First, competitive advantage derived from competence positively determine to the degree of firm internationalization. The results show that the resource competence has more significant impact than capability competence in a given firm's internationalization. This may be due to the fact that "capability" can be improved by firms through training and education, or that it is sometimes difficult for respondents to compare skills and market knowledge among firms. In our sample, most respondents are confident of their own skills and international market knowledge. Hence, capability competence display less significant differences across, or less significant positively relationships with, the degree of internationalization of firms. However, based on the high mean values, we conclude that "capability" is an important factor in the operations of firms.

Second, our results indicate that firm size significantly and positively relates to firm competences and internationalization. Hence, moves by the Taiwan government to guide financial institution mergers and enlarge their economic scale to foster one or more international financial holding companies represent sound public policy. Taiwan financial firms are starting to consolidate, since the global trend is toward fewer and bigger firms that offer professional services with an international vision. Taiwan financial firms cannot avoid the transformation from being local to acting global. Firm size, product and management innovation, branding, information technology, good skills and international market knowledge, and other distinct competences are required to support the internationalization process. Therefore, while companies possessing competitive advantages in a native market, the ambition of corporate internationalization could apply, transfer and reformulate adaptive competences to foreign countries, using abundant international experience and market knowledge. Then the probability of high profit could be obtained from the increase of overseas operation.

Because the targeted financial firms of the research vary in size, and most Taiwan financial firms treat overseas investment ratios as confidential information, and lack abundant financial data offered by the Taiwan government database, the study uses visible and limited secondary data, and the author's and respondents' subjective measurements for model development. A broader approach (e.g. multidimensional scale, structure equation model, etc.) would be valuable in analyzing the causal relationships among the factors. Another

limitation of this research is that it is based on only 102 respondents. However, respondents include managers or professional employees who are involved in the decision and execution processes of internationalization. Further, the competence levels among the firms, compared with competitors in the same industries, are sometimes difficult for respondents to measure. Hence, telephone interviews, face-to-face interviews, and confirmation of the actual industrial situation are all important for improving the quality of the responses. Future research could enlarge the sample, competence factors or choose other industries to verify the conceptual framework and generalize the model.

ABSTRACT

It is long time since the efforts of researchers, politicians and decision makers are engaged, overall the world, to find the "recipe" to reach a sustainable economic growth. Even if significant steps are made, it is still far the final goal. In this contest, growing is the international interest towards Material Accounting and Material Indicators, useful tools to evaluate human activities impacts on natural system (air, water, ground, fauna, flora and climate). According to the common certainty that water scarcity will be one of the first limits to the future growth, the objective of this paper is to evaluate if a specific material indicator, the "Water footprint" (WF), represents a profitable tool to manage water natural resources. The aim is to underline pros and cons of this tool for private managers and public decision makers. In particular, WF has been applied to a specific product, the Italian extra virgin olive oil, with the aim to evaluate the effects of olive oil production chain on domestic water resource and to highlight suggestions for managers.

Keywords: water footprint, physical indicators, sustainability, environmental management system.

INTRODUCTION

Water scarcity is nowadays a fast growing sustainability problem across the world and needs innovative actions at regional, national and international levels. Agricultural, livestock and energy sectors consume over 80% of all renewable and accessible freshwater and considering the population growth rate expecting for the next decades and the effects of clime changes, water availability could turn its role from development factor into a constraint of growing [10]. For this reason it is necessary a deep change in water management passing from a demand-side to a supply-side approach like suggested into the European Environmental Agency last report [6]. The topic of water management requires a multidisciplinary approach, which affects in sustainable way the whole processes in water governance. A multidisciplinary approach has to overcome the classic engineering ones and, instead, to adopt new indicators, which combines material base of water use with information on the

efficiency, carrying capacity and resilience of natural basins. The choice of appropriate material indicators can become strategic for setting new targets and giving help in reformulating policies and programmes. The indicators can also be used both for benchmarking and encouraging better performance from, for instance, water service providers. It is not sufficient to know water or energy costs of products and services; it is necessary to recognize if the natural system is able to "sustain" that production chains. The goal of material indicators is to show if human appropriation of natural resources is above or below of natural system capacities and if natural capital is capable of providing material inputs of economic activities. Utilizing material indicators it should be possible to answer to questions like: What consumers and businesses can do to reduce their water consumptions?
In order to construct the material indicators, it is elemental topic to apply the material approach for analysing economic activities and for describing the quantity and quality of natural capital involved. The latter is also called "material basis" of an economic activities. The comparison between the material basis of economy and the available natural capital gives basal data for decision-making. In other words, based on the principle of conservation of matter and using as unit of account the weight rather than the value, the Material Account (MA), allowed to record quantitative information concerning the amount of natural resources used and the amount of waste produced by human system. An MA is therefore capable of quantifying the Total Material Requirement of an economic system. Apply an MA methodology, like a Material Flow Analysis (MFA), means to improve the integration of environmental and economic activities in a model of sustainability because it makes possible the identification of system potentialities and critic points. For instance, MFA shows the opportunity of by-product synergies reducing natural resources use or, quantifying, qualifying and highlighting the source of environmental impacts, an MFA gives the opportunity to business managers and to policymakers to operate in time to choose the best possible solution [4-5].

The aim of this note is to illustrate the material indicator capable of describing the state of art of sustainability of water resources: water footprint (WF). The concept of the "water footprint" has received attention from governments, non-governmental organizations, businesses and media as a useful indicator of water use. WF measures water volumes consumed (evaporated) and/or polluted at both direct and indirect water use. It is more than a figure for the total water volume used but it refers to the type of water use and where and when the water was used. It is a versatile indicator, which is possible to apply to a product, an individual, a business or a community in order to account both the negative externalities and the vulnerability of water systems. After the illustration of the methodology of this indicator, the authors have been analysed the Italian WF of extra virgin olive oil[1] production. This case study allows a discussion regarding the application of this indicator and the pros and cons for decision-making process.

The paper is split into different parts. First part analyzes the WF indicator; second one describes the WF application to Italian olive oil. On the basis of the results obtained, the authors illustrate the impacts of olive oil on domestic water resources. This analysis is useful for industry because it points out critic points and also for policy makers because it is the

1) All references to olive oil in this text refer to extra virgin olive oil.

base on which focusing new programs towards a sustainable economic growth. How much water it is necessary to produce olive oil, how much water goes out of the country through exportation and how much arrives through the importation, which are Italian olive oil industry critic points are some of the questions to which it will be possible to answer using WF indicator.

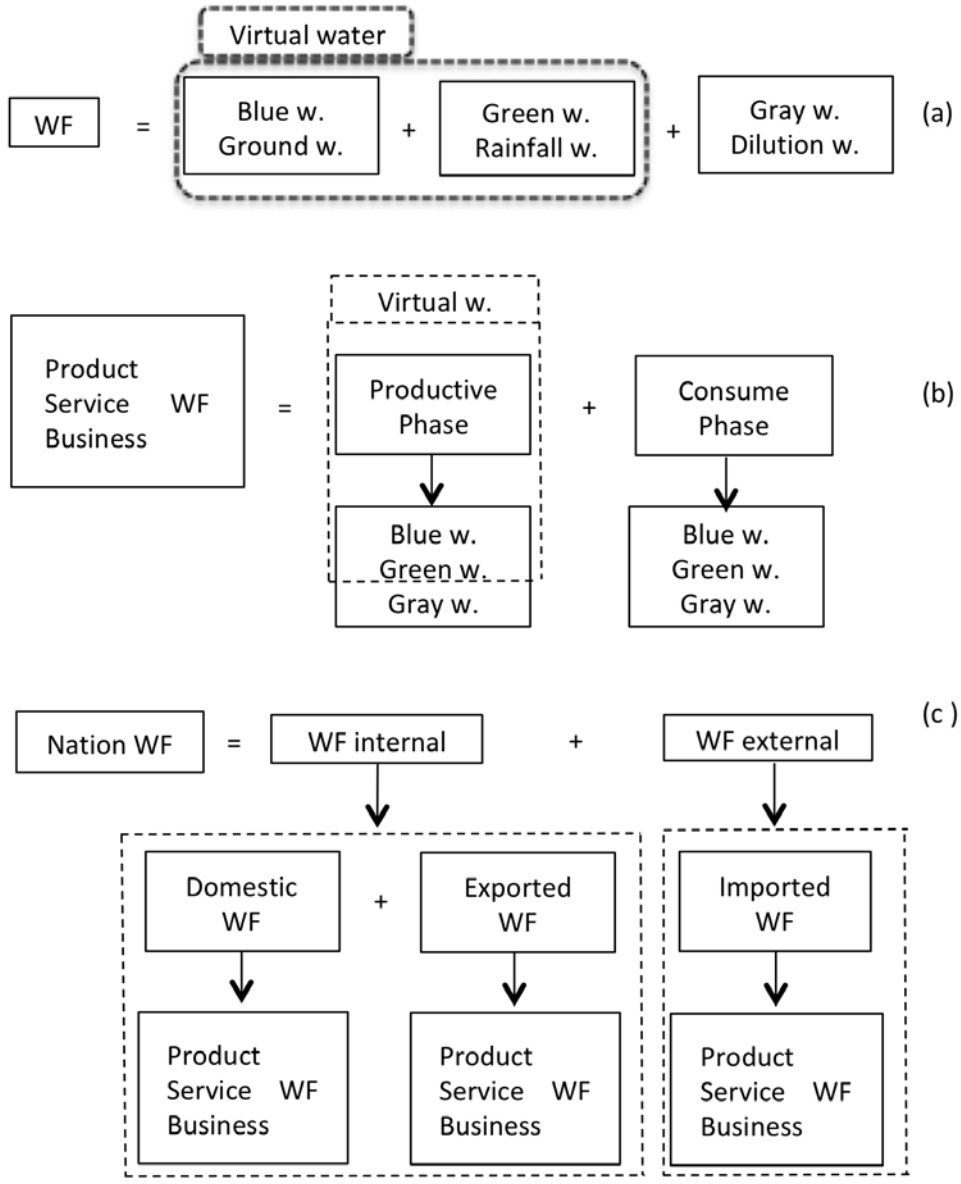
What distinguishes this paper is its focus on consideration of the full product life cycle from primary olives production to olive oil final use. Its advantage is to emphasized the details but it is much more laborious because it is necessary a data collection hard to find and to record. The choice of reporting a case of study is another peculiarity of this paper because against a variety of studies on MA methodologies or Material Indicator construction there is a lack of studies on material basis of productive chains and/or goods during all their life cycle from "economic" cradle to "environmental" grave. According to authors' idea, this work could contribute to enlarge product material basis knowledge testing, in the same time, the WF indicator.

BACKGROUND: WATER FOOTPRINT INDICATOR

The WF concept was first introduced in 2002 by Arjen Hoekstra, teacher of Multidisciplinary Water Management at Twente University (Holland) during the International Expert Meeting of Virtual Water Trade and received immediate international attention due to its efficacy to water resources sustainable management [7]. Like other material indicators, such as Ecological footprint, the WF aim is to translate human consumption into natural water resource use - generally expressed in cubic meter per year (m^3/y) - showing the hidden relations between human activities and freshwater appropriation and between global trade and freshwater resources management.

The term "water footprint" was choose first referring to the meaning of "footprint" in environmental science by which it indicates a measure of human appropriations of natural resources and also in analogy with Ecological footprint (EF) and Carbon footprint (CF) The first (EF) quantifies the use of bio-productive space (hectares), the second (CF), measuring CO_2 total emissions evaluates the use of energy (m^3/year) and the WF refers to the volume of fresh water use and/or polluted [8]. The idea of WF started from the intention to enlarge the utility of Virtual Water (VW) a concept introduced by Allan in the early 1990s [1-2]. The VW is older than the WF and it refers to the sum of water used during the different productive chain steps. The adjective "virtual" is justified by the fact that a large part of water used during the production chain is not contained in the product it-self. Obviously there is a big difference between real-water content and VW. One olive oil litre is water free but its estimated Italian VW is 5 – 11 m^3. Moreover, utilising VW it is possible to investigate if water imported by goods and services could be considered a sort of fresh water alternative source. WF differs from VW because it considers the amount of water used and polluted during productive and consumption phases, because it makes seeable the relations between fresh water local consumption and correlated global appropriation and because it quantifies the volume of water necessary to assimilate polluted water. For all these reasons WF is considered a contemporary geographically and temporally indicator.

Figure 1 – Water Footprint components and comparison between different typologies.



Source: personal elaboration by the authors.

WF is defined also a multi-dimensional indicator because contemporary focus on water volumes consumed and polluted respectively by source (rainwater and/or fresh surface or groundwater) and by type of pollution.

According to a common definition, and as mentioned before, WF refers to the total volume of water used and/or polluted to produces goods and services consumed by a person, a nation or a business activity. WF is constituted by three different components so-called: Green water, Blue water and Gray water (figure 1).

Green water refers to precipitations on land stored in the soil that does not run off or renew groundwater. The green water is the volume of rainwater used by crops to growth. Obviously it is mainly calculated for the agricultural products and indicates total rainwater consumed during crops vegetative period plus the amount of water incorporated into the same product.
Blue water refers to global surface and groundwater human appropriation to produce goods and services consumed by an individual, a community or economic activities. Compared to the total amount of available freshwater it measures the water consumed in the technosphere and the water available to sustain the ecosystem.

Gray water refers to the volume of water that is polluted during a production process. This component is quantified calculating volume of water necessary to dilute the pollutants discharged into natural water system in such measure that the final water quality remains constant compared with specific quality standard [9].

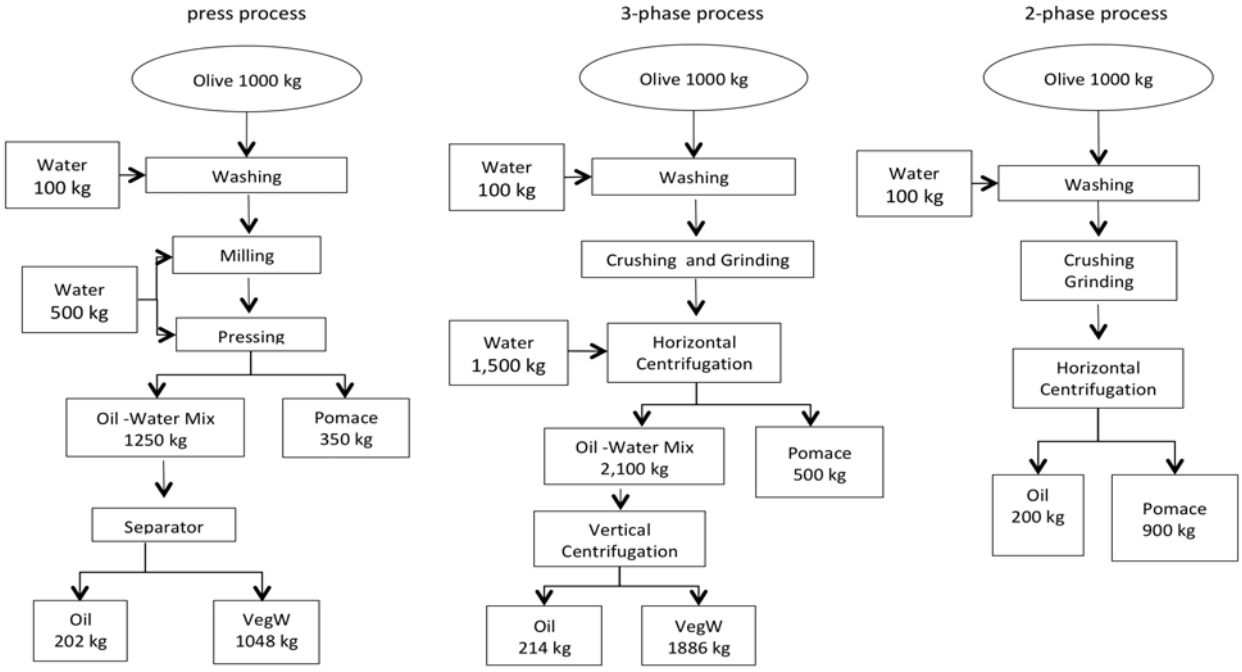
WF can be calculated for a person, a well-defined group of persons (a family, a city, a nation), for a specific service or commodity and also for a business. Figure 1 shows WF components, the relations between different WF typologies and between WF and VW.

Particularly a *product* WF is the volume of freshwater used during the entire production chain measured right at site. The WF of a product coincides with VW, but WF includes a temporal and spatial dimension, that it to say when and where water was used. To avoid WF underestimation it is usually calculated dividing raw material VW by the "fraction of product" (pf), intending with this expression the ratio between weight of final product and raw material used. For instance, if a primary crop is processed into a crop product (e.g. olive into olive oil) very often, there is a loss in weight, because only a part of the primary crop is used (180-200 kg of olive oil for 1000 kg of olive). In such a case, it is necessary to calculate the processed product VW by dividing the primary crop VW by the just mentioned "pf". This index denotes the weight of crop product (expressed in t) obtained per unit of primary crop (expressed in t) used. Obviously crop product VW (expressed in m^3/ton) is larger than the virtual water content of the primary crop [3].

CASE STUDY: ITALIAN OLIVE OIL WATER FOOTPRINT

The globalization market processes, which characterized the agro-food sector in the last decades, affect the olive oil market too. Olive oil is the principal flavouring produced and consumed in Mediterranean states even if its world market is increasing in a gradual but significant way chiefly due to the enlarging demand of quality and safety food products.
The first step of this analysis is the study of the diagram flows (figure 1) of olive oil chain. The result was a summary picture of different phases for growing olive tree, processing and delivering oil to family. Hence, a collection of data regarding the material and energy consumption has been carried out. In order to gather information, a review study of company reports, interviews with managers and visits to plants have been conducted. The data gathered has been compared with data from national and international literature. The analysis of energy, water, and waste flows and their external effects has allowed constructing environmental indicator, as water footprint, and making a representation of their environmental performance.

Figure 1 – Diagram flows of the production chain of olive oil.



In the final step of our analysis we discussed critical points of these chains and we focused on waste management issues and strategies to reduce environmental burdens.

Olive oil is a vegetable oil obtained from olive (Olea europaea) known throughout the world especially in the Mediterranean countries. In Mediterranean diet, it is considered the main vegetable fat source with a very good taste and several beneficial properties. In olive oil extraction industry, olive drupes are processed using solely mechanical or other physical equipments to obtain olive oil for food use and, as by-products, vegetative water (VegW) and crude olive cakes. Olive oil extraction process includes different steps. First of all, olives have to be clean to remove the stems, leaves, twigs, rocks, pesticides and dirt. Subsequently olives are crushing into a paste to facilitate oil release from the vacuoles. Crushing phase may be done with stone mills as well as with hammer mills. Usually obtained paste is malaxing in covered and jacketed holding tanks in which the paste is constantly agitated at controlled temperature. This is a very important phase by which good rates of antioxidants and flavour depends. Malaxing paste is then treated to separate oil from the other olive components (VegW and crude olive cakes) in presses or centrifuges. Until thirty years ago the press extraction process was almost the unique but, during the 1970s, a new process, the continuous 3-phase centrifugation was introduced with the aim to increase mills productivity. Its higher water consumption and the correlated larger amount of VegW produced compared to the press process represented the opportunity for developing a new technology, the 2-phase in which water is used only to wash olives to process and no more (figure 1). Obviously, water input influence quantity and quality of by-products obtained in each processes. As concerning the olive oil quality (referred to nutritional and organoleptic characteristics) the press process is still considered the best way to produce olive oil.

Materials and methods

The evaluation of Italian olive oil WF proposed is based on bottom-up approach by which, the authors try to evaluate its impact on domestic natural fresh water resources reflecting, in the same time, spatial, temporal and technological peculiarities of olive oil industry.

Domestic data collection mainly coming from ISMEA, the National Agricultural Institute, ISTAT, the Institute of Statistics and related specific reports and, as concerning Spanish and Greek ones, they have been gathered from national and international statistics, Eurostat and FaoStat and correlated reports.

This study considers a time course of 4 years from 2003 to 2006 and analyzes olive oil production, starting from olives production (agricultural phase) and ending with their industrial transformation. It is also considered that both of them happened on the same territory on which olives are produced and no industrial packaging phase was included in the analysis.

Climatic and crop growing parameters utilized to calculate agricultural phase refer to the local conditions and traditions of principal Italian, Spanish and Greek producer areas. In particular Puglia and Calabria for Italy, Andalusia for Spain and Crete for Greece. First of all crop water requirement (CWR expressed in m^3/t) of primary crop (olives) has been calculated. This allows calculating green (rainfall) and blue water (irrigation) contribution to olive cultivation. CWR has been obviously calculated for Italy, Spain and Greece and it has been obtained following the ratio of the methodology developed by FAO. As concerning grey water (pollution) estimation, directly linked to fertilizer and pesticide impacts on water sources, it has been used NO_3 impact indicator. The European Nitrates, Groundwater and Drinking Water Directives have referred it to permissible limit of nitrate in surface and groundwater as recommended for nitrate in water (equal to 50 mg nitrate-NO_3 per liter). The sum of the three components, green, blue and gray shows the total crop water requirement.

The evaluation of water industrial requirement (WIR expressed in m^3/t) takes into account the "fraction of product" (pf), intending with this expression the proportion between final product and raw material used (olive/oil) and the technology used. The average *pf*, apply for all the countries involved in the study is equal to 0.18. As concerning the technology, the analysis proposed, based on available data, splits olive production among the three different mill typologies in which they are really treated. For instance the 50% of Italian olive production is treated in traditionally press mills and the other part in 3-phase centrifuges. The 2-phase centrifuges technology is not applied in Italy. This distinction is important because direct linked to different water input and VegW production, principal cause of potential pollution problems. Almost in all olive oil producer countries the direct discharge of VegW into receiving natural water body is strictly forbidden, it is also no possible to treat them directly into public urban waste water treatment plants so, the most common practice is the illegal dispose on land or in aquatic body. Because of in Italy VegW are considered fertilizers whose use is controlled, in Spain olive oil industry is VegW free and in Greece VegW are uncontrolled spread on the land, in this analysis, no grey water related to VegW has been calculated.

Results and discussion

Based on the methodology and simplifications mentioned in the previous paragraphs, the total internal WF for annual Italian olive oil production has been evaluated in 3,250 – 7,400 Mm^3 (4.8 – 11 m^3/kg of oil generated). This value refers to the average production approximately equal to 670,000 t of olive oil during the period 2003-2006 of which approximately 71% produced in Apulia (37%) and Calabria (34%).

The large size of estimated WF range is due especially to the agricultural phase. Crop growing parameters and climatic factors justify and explain this result. As a matter of fact, the differentiation between the crop evapotraspiration, the disparity in the annual yield; the different extension of irrigated dedicated area and the difference in the water input for the two main olive producer regions are relevant. On the basis of the evaluation of crop primary production WF components, Calabrian production seems to be more efficient and more sustainable than Apulia.

As regard the industrial phase, based on just discuss methodology, the olive transformation happened into different mill typologies with a water input equally different. The analysis shows that olive oil industrial chain in Italy represents less than 0.1 % of total domestic olive oil WF (3,250 – 7,400 Mm^3) but, following the Spanish experience, the possibility to save water is still possible.

The domestic production of olive oil is not sufficient to satisfy local demand (approximately in 840,000 t) and in the same time, Italy is a great exporter of olive oil above all olive oil of high quality. The amount of olive oil exported from Italy is more than 200,000 t, so that 970 – 2,200 Mm^3 "leave" our country "virtually" enclosed into Italian olive oil. Assuming that the exportation are equally distributed between Apulia and Calabria and thank to the bottom-up approach it has been possible to note that the most relevant part of this water exported was Apulia water. This means that a region like Apulia, historically suffering water scarcity, is involved in VW olive oil exportation in the reason of 60% of WFe (equal to 4.8 – 9.6 Mm^3).
As concerning import, the only two Italian importer countries considered are Spain and Greece. For both of them WF has been calculated and it is respectively equal to 7,916 – 12,827 m^3/t and 6,081 -11,534 m^3/t. The Spanish olive oil WF shows the highest figure. Also in this case the crop primary production is the phase adsorbing the major part of water. Spain is penalized above all by the amount of fertilizer used (gray water increment) on the contrary Greek olive oil production suffers for climatic condition reflecting on intensive irrigation practice. The industrial phase undoubtedly advantage Spain because, as just mentioned before, it utilises 2-phase centrifuges where water input is lower than traditionally press mills and 3-phase centrifuges (respectively: 0.1 m^3/t of olives treated; 0.4-0.8 /t of olives treated and 1-1.5 /t of olives treated) [11].

CONCLUSION

The main objective of this paper is to describe WF indicator and to verify its utility to improve the management of water resources. The construction of Water Footprint needs a huge amount of data reflecting the different aspects of the same phenomena and the result is summarized in one figure. Furthermore, WF considers pollutions (grey water) in the sense

that it calculates the water needed to restore water initial quality. Unlike other more general indicators such as Ecological Footprint, WF gives a detailed illustration of human appropriation of water natural resources allowing to a specific planning policy. Considering that water resources scarcity in the near future will be the massive constraint of economical growing, decision makers have to use both indicators: the general one, as EF, and the analytic indicator, as WF. They differ from each other because EF gives an overview, summarized in a unique value (expressed in ha), of the total natural resource consumed, whereas WF focuses on water issues only.

According to the findings of this case study, WF is useful for companies in setting their strategic planning in order to improve the allocation of natural resources used during the production chain (agricultural and industrial phases). Our results confirm that the agricultural phase is the main responsible for water used and polluted during olive oil production. However Italian olive oil system has the possibility to become more efficient both in the agricultural phase than in industrial one.

As concerning the first phase olive cultivation could be better distributed on Italian territory in function of yield per hectare and annual average precipitations. It could be possible to limit the *Blue water* contribution or to improve irrigation system performances. Reducing irrigation not always means yields decreasing, above all in the case of olives. Also in the case of fertilizers the analysis focuses that their use is linked much to agricultural traditions than to an effective need by crop. Probably this is caused by farmers' lack of information about the related pollution problems. Minimal reductions in fertilizers use correspond to a substantial reduction in *Gray water* contribute, very often, without sensible reduction in yields.

For instance farmers could contribute to the reduction of blue and gray water by shifting to a different irrigation practice (different in efficiency and modality) or choosing another crop varieties more compatible with local conditions and apply less quantity of fertilizers or using them in a form able to decrease leaching. Reducing the blue and gray water footprint per ton of crop in one place means to realize a reduction of crop water footprint as a whole.

The industrial phase shows the larger possibilities of improvement and Spanish realty, based on 2-phase centrifuges, could represent a good model to follow.

Finally, companies and decision makers, together, could influence consumption patterns by addressing them toward those with a lower WF.

As already mentioned, WF supplies facts and figures of water resources and it illustrates if economy requires more water than ones available. We underline that WF should be introduced at legislative level for planning the economical regional development. For instance, it should be possible to approve new industrial activities after the result of water footprint benchmarking process capable of describing the effects on water resource, such as the decreasing of human appropriation of water or the mitigation of pollution.

An opportunity to apply this could come from European Union Commission that is working to the fourth edition of Common Agricultural Policy (CAP). During the debate, it is a common and clear idea that the new CAP has to be a guarantee for farmer incomes but the

subsidies have to be calculated based on farmer contribution to environmental sustainability. WF in this sense could play the role of planning tool because farmer by them-selves, knowing CAP new mechanism and basing on local pedo-climatic and water availability conditions will decide to plant the best environmental friendly crops.

In conclusion it should be introduced a non-stop efficiency revision of the whole production and supply chain, a costs reduction and a best satisfaction and involvement of stakeholders more and more interested to environmental performances. Hence managers of companies are claimed to introduce new management tools, as WF, for describing and managing the effects on environment caused by their activity.

ABSTRACT

Previous information systems of inner organizations mostly were constructed depending on the requirement of various function department, such as finance, production, and sales information systems etc. These information systems separately operated, do not integrate and connect each other, not communicate with external organizations. Now, under the dramatic change of business environment, organizations must break up the boundary of organization, share and transfer information with strategic alliance partners or customers more closely to promote collaboration each other in order to improve enterprises' competitiveness. Therefore, enterprises increasingly place more importance on Inter-Organizational Systems (IOS).Many studied indicate that introducing IOS would benefit enterprises.

The purpose of this study is to establish performance evaluation indicators for IOS using Balanced Scorecard (BSC) approach, and provide references for managers and future researches when measuring the performance of inter-organizational information systems.

The results demonstrated that the importance weights of all dimensions were ordered as follows: financial dimension, internal processes dimension, learning and growth dimension and customer dimension when managers measure inter-organizational information systems performance. Additionally, the importance weights of performance evaluation indicators were ordered as follows: increase inventory turnover rate, accelerate the process of dealing which suppliers and customers, reduce transaction cost, reduce the cost of information exchange cost and boost organization internal process elasticity.

Keywords: IOS, Balanced Scorecard, FAHP, Performance measure

INTRODUCTION

Previous information systems of inner organizations mostly were constructed depend on requirement of various function department, such as finance, production, and sales etc., information systems. These information systems separately operated, did not integrate and connect each other, did not communicate with external organizations. Now, under the

dramatic change of business environment, organizations must break up the boundary of organization, share and transfer information with strategic alliance partners or customers more closely to promote collaboration each other in order to improve enterprises' competitiveness. Therefore, enterprises increasing place more importance on Inter-Organizational Systems (IOS).

IOS cross the formal boundaries of organization and is utilized technologies to connect its partnership and customer by organization in order to promote connection, information integration and support transactions based information and communication technology (ICT). Numerous studies have demonstrated that enterprises can benefit from introducing IOS. For instance, Turban et al., (1999) posited that introducing IOS can improve organizational operating effectiveness, internal operating efficiency, and relations with customers and suppliers, while simultaneously helping achieve strategic goals and enhance enterprise competitiveness. Prasad et al. (1996) indicated that after introducing IOS, enterprises quickly respond to customer requirements, and reduce order processing and production times.

Introducing IOS is costly for enterprises. Thus the problem of whether organizations benefit from introducing IOS is extremely important. How to measure enterprise performance following the introduction of IOS is the key objective of this study. IOS is designed to handle internal organizational operations and communication between organizations. Organizations generally first organize internal organization via business process reengineering (BPR) and integration of inter-departmental information systems, then employ IOS to create external connections, for business introduction of IOS. Therefore, following its introduction, IOS is not the same as general information systems in terms of measuring enterprise performance. Measurement of enterprise performance following the introduction of IOS must consider both internal and external organizational perspectives.

Consequently, the study explored IOS performance from inner organization and outside organization view. The study utilized balanced scorecard approach to measure IOS performance. The result of the study offer organizations to understand the benefit of IOS.

Based above, this study conducts a literature review to collect performance evaluation indicators in order to construct the research model based BSC approach (Kaplan. and Norton, 1992; 2001) and designed a questionnaire, and sent out the managers from the high-tech information and electronics industries to fill out the questionnaire. Next, calculate the weights of all dimensions and indicators of the model using Fuzzy AHP (FAHP) method.

1. The study collected the performance evaluation indicators for IOS information systems through literature reviews.
2. The study researches applied BSC approach to design a feasible performance evaluation construct for IOS in order to measure the benefit of introducing IOS.

LITERATURE RIEVIEW

The definition of IOS

The concept of IOS stemmed from inter-organizational information sharing system which Barrett and Konsynski (1982) bring up. IOS is first formally defined by Cash and Konsynski

(1985), and Cash and Konsynski (1985) supposed that IOS mean two or two more companies mutually share the same automated information systems. Grover （1993） supposed that two more organizations employ automated information systems to achieve information sharing. Organizations can easily creative, store, transfer and communicate information based Information Technologies (IT) through IOS. Kumar and Dissel (1996) though that IOS promote inter-organization cooperation, collaboration connection grounded on Information and Communication Technologies (ICT). IOS could be viewed as planning and managing inter-organization cooperation mechanism. Soliman（2003）though that IOS which is automated information systems can cross organization obstacles through various technologies.

The benefit of IOS

Cash and Konsyns（1985）supposed that enterprises applying IOS could increase exit barrier and transfer cost, further prevent from other potential opponent entering the market. Malone et al. (1987) indicated that owing to introducing IOS, enterprises reduced communication cost, touched more suppliers through market mechanism, closely integrated upstream companies, and further form electronic market in order to tightly couple with other organizations. Johnston and Vitale (1988) supposed that IOS not only improve enterprise competitiveness, but also bring many resources to gain competitive advantage, and support new strategy and reduce costs.

1. The factors which effect organizational benefit from introducing IOS

Many factors influenced organizational benefit from introducing IOS. This study explored these factors from both internal and external organizational perspectives.

(1) internal organizational perspective

Back and Bell (1994) considered that integration of organizational inter-departmental information systems is an important factor for business introduction of IOS from internal organizational perspective. Sriram and **Banerjee** (1994) supposed that technology maturity effect business introduction of IOS. Crook and Kumar (1998) indicated that scale of organization, information technology capability, and senior executive support are all influences for business introduction of IOS. Vijayasarathy and Tyler (1997) supposed that internal organizational factors that influence business introduction of IOS include cost saving, strategic benefits, cooperative partner pressures, and improvement and management of channel relation. Premkumar et al. (1995) indicated internal requirement, senior executive support, originators, information infrastructure and organizational capability are internal factor for business introduction of IOS.

(2) external organizational perspective

The use of IOS involved in internal operation and message transmission of organizations. Inner operation standards, hardware facility integration and information system usage of organizations are factors which effect organizational benefit from introducing IOS. Suomi (1994) indicated that communication standards are common and technology-intensive. Information standards are industry specific and focus on user requirement. Saunders and Clark (1992) supposed that the power between organizations, recognized benefit, perceived cost and the trust between organizations are factors which influence benefit

from introducing IOS. Premkumar et al. (1995) indicated that external organizational factors which introducing IOS include dependency, power, transactions trend and competition pressure. Hart and Saunders (1997) supposed that main factor that effect introducing IOS is the trust between organizations. Vijayasarathy and Tyler (1997) supposed that industrial experience introducing IOS, the characteristics of suppliers and customers, are important factors that influence introducing IOS. Teo et al. (2003) supposed that the factors that enable the adoption intention of IOS comprise mimetic pressures, coercive pressures, and normative pressures from an institutional perspective. Sriram and Banerjee (1994) indicated that the impact of IOS is moderated by the volume of transactions using IOS.

RESEARCH METHOD

Step 1: Construct hierarchical framework of the BSC performance evaluation criteria

From the four BSC perspectives, the hierarchical framework of the BSC performance evaluation criteria is constructed.

Step 2: Using AHP method to calculate the weight

If get the weightmatrix W in pairwise comparison matrix A, standardize geometrical mean of row vectors, multiply element in every row, get geometrical mean and normalize it.

Step 3: Construct Positive Reciprocal Matrix

Every evaluation member use fuzzy AHP evaluation scale to express relative weight between each dimensions and criteria, and construct fuzzy Positive Reciprocal Matrix.

Step 4: Consistency Check

The check methods are as follows:

4.1 Consistency Index (C.I.)

According to Consistency Index (C.I.), C.I=0 indicate that evaluation has perfect consistency; C.I>0 indicate that evaluation has consistency; C.I. <0.1 indicate that evaluation has evaluation has tolerant bias.

4.2 Consistency Rate (C.R.)

Saaty (1980) supposed that Consistency Rate (C.R.) to evaluate the consistency of pairwise comparisons in a matrix among criterions. Under the condition of different rank of matrix, it produce different random index (R.I.). Under the condition of the same rank of matrix, the ratio of C.I. to R.I. is called C.R.. When C.R≤0.1, the consistency level is acceptable.

Step5: Calculate fuzzy weight value

Utilize the Lambda-Max method which Csutora and Buckley (2001) proposed, calculate the fuzzy weight of evaluation criterions. The steps of calculation are as follows:

5.1 When α=1, use α-cut to get median Positive Reciprocal Matrix. Then, calculate the weight use AHP method to get the weight matrix.

5.2 When α=0, use α-cut to get minimum positive reciprocal matrix and maximum positive reciprocal matrix. Then, calculate the weight use AHP method to obtain the weight matrix.

5.3 In order to make sure that calculated weight value is fuzzy number, therefore, adjusted the coefficient.

5.4 After obtained adjusted coefficient, calculate minimum positive reciprocal weight matrix and maximum positive reciprocal weight matrix of every measurement dimension.

5.5 Combing adjusted minimum, maximum and median values to get the fuzzy weight in kth evaluation member and kth measurement dimension.

5.6 Utilize average method to integrate the fuzzy weight of evaluation members and measurement dimensions.

RESULTS

Based on previous studies on applying the BSC approach to information systems, this study collected numerous indicators of information system performance, after screening, and used the remaining 17 indicators as performance evaluation indicators to construct the research model and develop the questionnaire items based the model. The 17 indicators are showed in and Table 1 and Figure 1.

Table 1 The indicators of IOS from the BSC approach

Dimension	Indicator		Cause
Financial Dimension	Reduce information exchange cost	Beamon(1998), Milis and Mercken (2004)	external organizational perspective (external connection)
	Increase inventory turnover rate	Clemons and Weber (1990), Beamon(1998), Mabert and Venkataramanan (2007)	external organizational perspective external connection)
	Reduce transaction cost		external organizational perspective (external connection)
	Reduce IT repetition investment expense		internal organizational perspective (internal integration)
Internal Processes Dimension	Boost organization internal process elasticity	Clemons and Weber (1990), Bhagwat and Sharma(2007), Mabert and Venkataramanan (2007)	internal organizational perspective (internal integration)
	Increase the information integration level of inner organizations	Bhagwat and Sharma(2007)	internal organizational perspective (internal integration)
	Increase the information share level between organizations		external organizational perspective (external connection)
	Decrease organization internal process lead time	Beamon(1998), Milis and Mercken (2004)	internal organizational perspective (internal integration)

Dimension	Indicator		Cause
Internal Processes Dimension	Accelerate the process speed of dealing which suppliers and customers	Beamon(1998), Milis and Mercken (2004), Bhagwat and Sharma(2007), Mabert and Venkataramanan (2007)	external organizational perspective (external connection)
Customer Dimension	Decrease the response time of customer requests	Milis and Mercken (2004), Bhagwat and Sharma (2007),	internal organizational perspective (internal integration)
	Increase the quality of consignment archives		external organizational perspective(external connection)
	Increase invoice transmitting effect	Bhagwat and Sharma (2007)	external organizational perspective(external connection)
	Improve the ability of handling emergent customer' demand		internal organizational perspective (internal integration)
Learning and Growth Dimension	Improve data quality	Beamon (1998), Milis and Mercken (2004)	external organizational perspective(external connection)
	Shorten information handling time	Clemons and Weber (1990), Beamon (1998), Milis and Mercken (2004)	external organizational perspective(external connection)
	Increase manager' decision-making ability	Beamon (1998)	internal organizational perspective (internal integration)
	Increase information exchange speed between organizations	Beamon(1998), Bhagwat and Sharma(2007)	external organizational perspective (external connection)

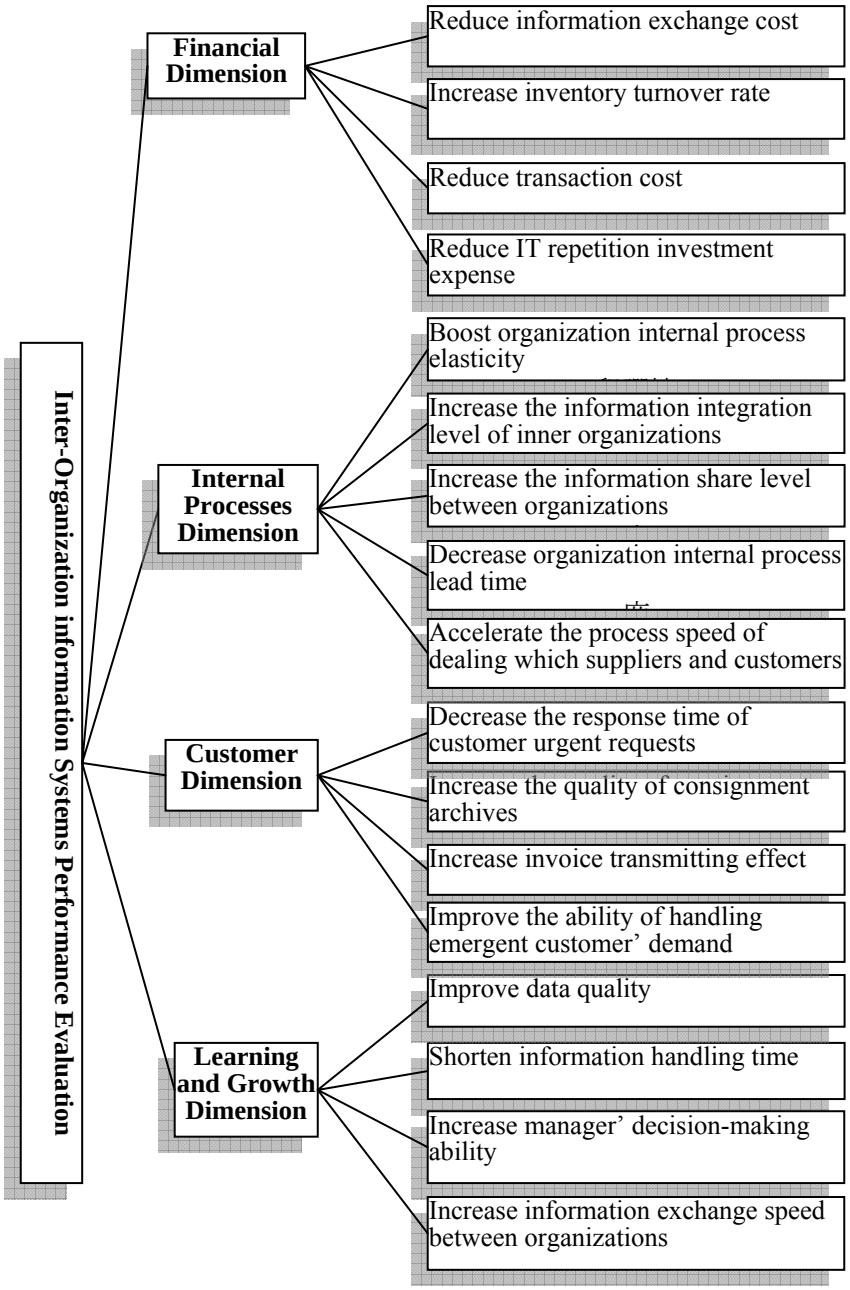

Figure 1 The hierarchical framework of the BSC performance evaluation criteria

Next, calculate the weights of all dimensions and indicators of the model using Fuzzy AHP method. The questionnaire was distributed among managers in the Taiwan' information and electronic industries, and a total of 20 valid questionnaires were returned from 20 different companies. The result of this study is showed in Figure 2.

The results demonstrated that the importance weights of all dimensions were ordered as follows: financial dimension, internal processes dimension, learning and growth dimension and customer dimension when managers measure inter-organizational information systems performance. Additionally, the importance weights of performance evaluation indicators

were ordered as follows: increase inventory turnover rate, accelerate the process of dealing which suppliers and customers, reduce transaction cost, reduce the cost of information exchange cost and boost organization internal process elasticity.

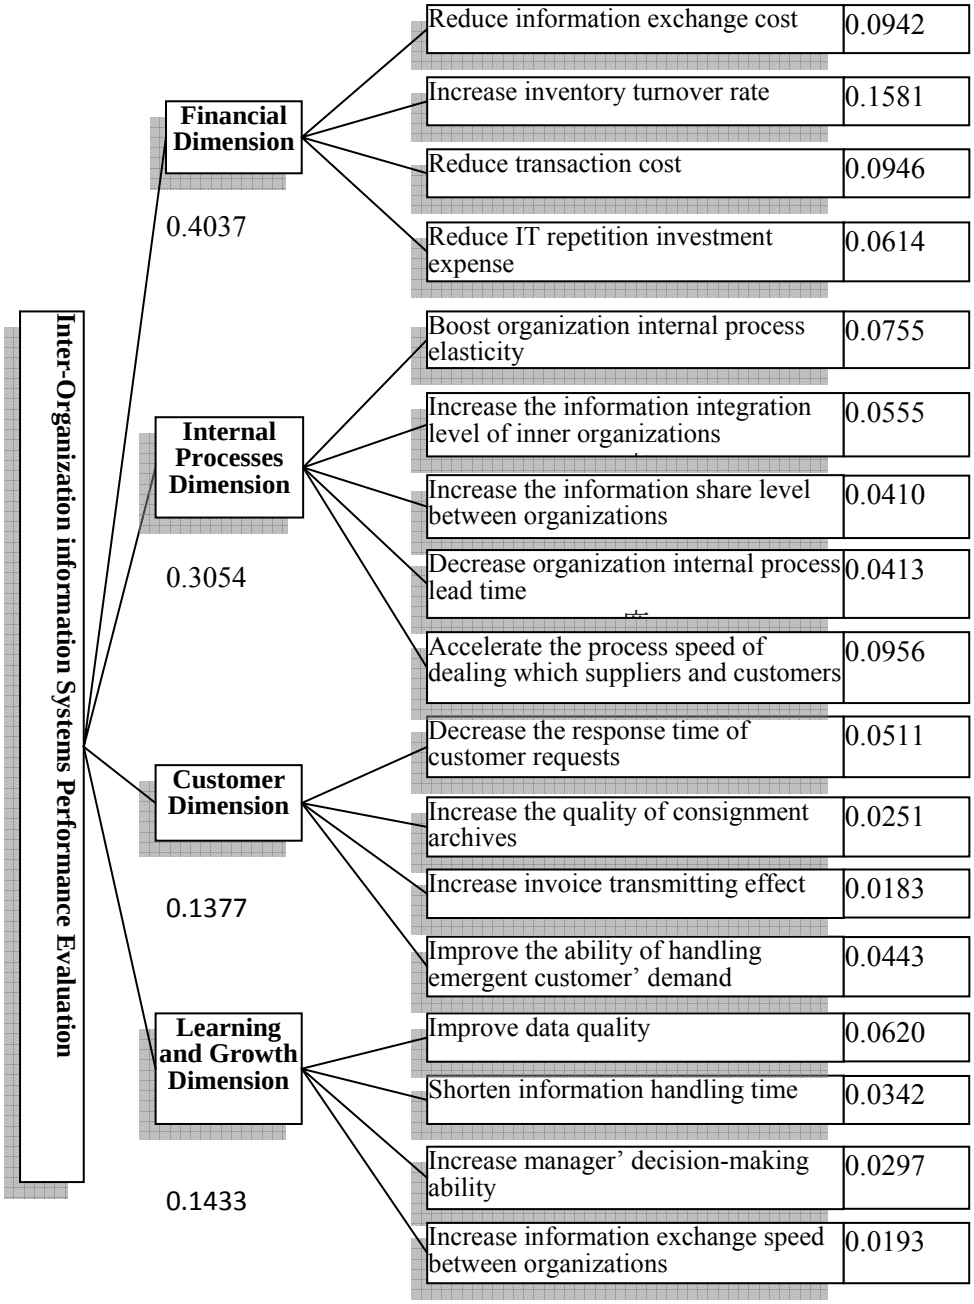

Figure 2 The result of this study

CONCLUSIONS

The result of the study could supply enterprises references for Taiwan' information and electronic industries when managers make related decisions on IOS.

DOES GENDER EXPLAIN FINANCIAL PERFORMANCE? CASE OF WARSAW STOCK EXCHANGE LISTED COMPANIES

Mariusz Kicia, Ph.D., Maria Curie-Sklodowska University, Lublin, Poland
The College of Enterprise and Administration in Lublin, Poland
mariusz.kicia@umcs.lublin.pl

ABSTRACT

131 Warsaw Stock Exchange listed companies were analyzed to examine correlation between the balance of men and women at management boards and companies financial performance (ROE) between 2001 and 2009. A multifactor regression model was estimated with women number and women parity in management board as factors explaining ROE changes. The analysis generally confirms that the number of board members changes when company size increases. Unfortunately the number of women as management board members decreases with the company growth, especially when large companies are considered. The size of the company has positive correlation with number of management board members and negative with number of women as management boards members although the dependence is not linear. The results show that increasing parity of women at management board increases ROE for small companies with ROE over 3,04% and all the large companies. Unfortunately ROE growth for all middle size and the least effective small companies (with ROE under 3,04%) depends on decreasing women parity at top management board. However, no matter the company size, women parity has stronger impact on ROE than other analyzed variables like company sales level or GDP growth.

Keywords: behavioral finance, gender, risk tolerance, financial effectiveness.

I. GENDER, RISK TOLERANCE AND GENDER (IN)EQUALITY

A success in business in most cases depends on risk taking and self-confidence. Healthy appetite for risk and self-confidence should be natural for all entrepreneurs, both men and women. In 2005 Cranfield School of Management conducted study examining 50 entrepreneurs to assess their willingness to take risk and their varying levels of confidence. The best combination that corresponded with the strongest sales and profit was a maximum of risk tolerance and a minimum of confidence. The second strongest combination, which led to slower sales but higher profits, was lower tolerance for risk and less confidence. The worst-case combination that ended with weak sales and/or poor profits were specific for those with low risk tolerance and lots of confidence. The Cranfield framework show that the collision of overconfidence and risk tolerance may lead to overexpanding, failing to respond to market signals, misjudging the strength of competitors, and failing to pursue one initiative to its conclusion before the next is launched (Hanft, 2005).

The combination of situational and individual approaches to risk propensity through consideration of individual responses to different risk domains is an interesting and promising

stream of research. The work of Weber and Milliman (1997), and subsequent work by Weber et al. (2002) represents an important development in this field. These authors found that while the degree of risk perceived in a situation can vary according to the characteristics of the situation, attitude to perceived risk (the degree to which people find perceived risk attractive) remained stable across situations for a significant portion of their sample. Work in this area (Fagley and Miller, 1997; Weber and Milliman, 1997) shows that it is possible to be risk seeking in some areas of one's life and risk averse in others while having a relatively consistent view of risk.

More and more studies, intensified recently as a natural consequence of behavioral finance, biological finance or neurofinance development, explain human risk taking behavior and processes of decision making. Many of them focus on differences in risk tolerance for men and women. Roszkowski and Grable (2005) examined a sample of 183 financial advisors and 290 advisory clients to determine the degree of correspondence between advisors' subjective clinical judgments about their clients' financial risk tolerance and the clients' actual financial risk tolerance. The correlation between the estimates and the actual measures was 0.41. It was further determined that advisors overestimated the risk tolerance of men and underestimated the risk tolerance of women. This distortion could not be attributed to income or wealth differences between the males and females.

Iqbal et al. (2006) provided additional evidence on this issue by examining the stock selling behavior of male and female executives in response to stock option awards. When corporate executives sell shares of their firm upon new stock option awards, it is an indication that they are attempting to reduce risk through diversification of their personal portfolio. More rigorous stock sales by female executives indicated that they were more risk averse than their male counterparts. However, male executives were more risk averse by engaging in higher diversification-related stock sales than the female executives.

Finally, in 2004 New York-based research group Catalyst published its study, called "The Bottom Line: Connecting Corporate Performance and Gender Diversity". The study was based on 353 Fortune 500 companies sampled between 1996 and 2000. They showed the existing link between largest US companies' financial performance and the percentage of women in senior management. It was proved that companies ranked in the upper quartile in terms of percentage of women in top management had ROE that were on average 35,1% higher and total shareholder returns that were 34% higher than those in the lowest quartile (No Gender…, 2004). The results may be surprising but remained unexplained by Catalyst. However similar findings have been noted by other researchers. A 1998 survey by the American Management Association found that a mixture of genders, ethnic backgrounds and ages in senior management teams consistently correlates to superior corporate performance. A comprehensive Finnish study of nearly 13 000 limited companies with more than ten employees found that firms with a female CEO were in practice around 10 percent more profitable than comparable firms with a male CEO. A similar effect was found for companies with gender balanced boards compared to those with all male boards (Kotiranta et al., 2007).

The researches mentioned suggest that proper balance of men and women managing companies or taking other parts in public activity leads to a better performance. The practice of business and economy as a whole should have noticed this fact and appreciate it as a

source of competitive advantage. Unfortunately, the economy does not confirm it. Although equality between women and men is a fundamental right and a common principle of the European Union and since the 1970s, the European Union has adopted an extensive body of equal treatment legislation, gender inequalities persist, predominantly to the disadvantage of women. If gender equality is to be fully realized further action is needed to eliminate gender stereotypes, close the gender pay gap, combat gender-based violence and increase the number of women in decision-making. According to the report on gender equalities by European Commission, Europeans believe that all sectors of society are impacted by gender inequality, and sexist stereotypes, primarily present in working life and advertising, reinforce the situation. One of the 'work-related stereotypes': the existence of 'female' or 'male' types of work is still present in European citizens' answers in 2009. It is also felt that women are under-represented in top positions not because they are less interested in positions of responsibility than men, but because of heavy family responsibilities (Gender equality…, 2010).

Table 1. Men and women as heads of businesses in the EU in 2009

EU Member State	Heads of businesses (1000s)

Across Europe in 2009, every central bank has a male governor and more than four out of every five members of key decision-making bodies are men. The central banks of Germany, Cyprus, Luxembourg, Austria and Slovenia do not have a single female representative on the main decision-making bodies and it is only in Hungary (33%), Sweden (41%) and Serbia (38%) where women account for at least one in three members. The situation is no different in the three main financial institutions of the EU (European Central Bank, European Investment Bank and European Investment Fund), which all have a man at the helm and an 89:11 male to female ratio amongst the combined members of their key decision-making bodies (More women…, 2010).

In the aftermath of the financial crisis, various commentators and even government ministers have suggested that the collapse of some of the major institutions might have been mitigated had there been more women on the boards to moderate the risk-taking culture. This view is given credence by an increasing number of research studies on the effect of gender on risk-taking, which tend to concur in showing that women are more risk averse than men as mentioned earlier. There is even evidence from the stock market to support this further. A study of companies from the French CAC40 suggests that those with the most women in management positions were also the ones that were affected least during the crisis (in terms of stock market value), though it must be said that from such a small sample this cannot conclusively be taken to be a cause and effect relationship.

The largest companies listed on the stock exchanges around Europe play a significant role in global business as well as contributing significantly to the national economies within which they operate. During the course of the recession, the decisions taken by these companies have had ramifications not only for their businesses and their employees but for the whole economy. In all but isolated cases these decisions are taken by a sizeable majority of men as women are still under-represented on company boards. In 2009, women account for an average of just 3% of the presidents of the largest companies in each of the EU Member States and less than 11% of board members (More women…, 2010). Fortunately, taking SME and self-employment into account, women lead about 33% of businesses (table 1).

II. GENDER PARITIES AT MANAGEMENT BOARDS OF WARSAW STOCK EXCHANGE LISTED COMPANIES

Behavioral finance proves that men are in general more risk tolerant than women, especially when financial issues are considered. The question is to what extend that differences explains financial performance of public companies in Poland. Regarding the current state of knowledge this kind of research was not provided yet for Polish companies so it seems to be relevant. The main purpose of the study is to examine the impact of men to women ratio at management boards of Polish companies on their financial performance.

The sample of organizational, financial and macroeconomic quarterly data for 131 Warsaw Stock Exchange (WSE) listed companies was collected for years from 2001 to 2009. The data was provided by WSE, Notoria Service and Polish Court of Registration (PCR). There were 372 companies listed at the main and parallel market of WSE in the end of 2009 so the sample provides data for 35,2% of public listed companies (excluding New/Connect WSE Alternative Trading System operating since August 31, 2007). The research period includes two subperiods of economic slowdown of the Polish economy, 2001-2002 and 2009 with global financial crisis influencing companies' operational and financial performance.

The sample of 131 Polish companies (foreign WSE listed companies were excluded) consisted of 3 main WSE indices companies:

1. 20 companies from WIG20 index of the 20 biggest and most liquid companies,
2. 37 companies from mWIG40 index of the 40 mid size companies,
3. 74 companies from sWIG80 index of the 80 small size companies.

A multifactor econometric model was estimated as the main analytical method. Men and women number and parity at management boards, company size and GDP growth were

assumed as factors explaining changes in ROE as the measure of financial effectiveness. Statistical measures for sample data are presented in table 2.

Table 2. Basic statistical measures for model variables

	$LSAL_T$	BM_T	WBM_T	WBR_T	GDP_T	ROE_T
Number of observations	3614	4031	4031	4031	4716	3278
Mean	5,4293	3,6735	0,3458	0,0968	3,8917	0,0722
Confidence interval (-95%)	5,3241	3,6150	0,3270	0,0911	3,8288	0,0633
Confidence interval (+95%)	5,5345	3,7320	0,3646	0,1025	3,9546	0,0810
Median	5,7585	3,0000	0,0000	0,0000	4,0000	0,0810
Minimal	-6,2150	1,0000	0,0000	0,0000	0,2000	-1,9940
Maximal	101,0000	16,0000	4,0000	1,0000	7,5000	1,9760
Lower quartile	4,4250	2,0000	0,0000	0,0000	2,0000	0,0170
Upper quartile	6,8510	5,0000	1,0000	0,1670	6,1000	0,1670
Standard deviation	3,2257	1,8939	0,6093	0,1844	2,2037	0,2576

Men and women parity at management boards. The data on number of management boards' members (BM_T) and women as their members (WBM_T) for all companies from 2001 to 2009 were collected. All active stock companies are obliged to inform PCR and Polish Financial Supervision Authority (PFSA) about changes in top management and supervisory boards so the data is dispersed but available to collect. For the research purpose it was assumed that new management board member can influence financial performance of a company no sooner than in the next quarter after the change took place. For example, if any change in management board takes place in Q1 the new board make-up is assumed as Q2 ROE explaining factor and so on. Woman to number of top management board members ratio was also calculated (WBR_T).

Company size. It was assumed that changes of the management board members number was related to company operating scale. Total sales for the last 4 quarters were taken as a measure of a company size. The larger the company the more duties and responsibility needs to be shared by managers and – to some limits – should lead to increase in number of positions in management board. The largest companies have more management board members than small companies so with the same number of women in management board their influence can be weaken. Due to wide range of sales for smallest and biggest companies natural logarithm of sales (in millions of PLN) was taken to narrow it ($LSAL_T$).

GDP growth. GDP annual growth providing better or worse economy conditions for most of companies operating in the country can be important factor influencing financial performance with no relation to management board members quantity and quality. GDP annual growth

provided quarterly by Polish Central Statistical Office (GUS) was included then to ROE explaining set of variables (GDP_T).

III. MODEL OF MANAGEMENT BOARD GENDER PARITY IMPACT ON COMPANY FINANCIAL PERFORMANCE

In the period from 2001 to 2009 mean for management board members number of all analyzed 131 Polish companies was 3,6735 and mean for number of women as management board members was only 0,3458. It means that the result for the sample is no significantly different than for all EU Member States largest companies with 9,68% mean of women parity at management boards in Poland. Nevertheless, the results vary when company size is considered. Table 3 presents details for WIG20 (largest), mWIG40 (middle size) and sWIG80 (small size) companies.

Table 3. Number of women as management board and company size

	Observations	BM_T		WBM_T		WBR_T, %	
	N	Mean	Std	Mean	Std	Mean	Std
largest	622	5,28	2,24	0,25	0,54	4,71	10,88
middle size	1154	3,90	1,84	0,35*	0,53	8,54	14,92
small size	2255	3,12	1,50	0,37*	0,66	11,64	21,22

* Statistical no difference (p=0,05).

The number of board members changes when company size increases with natural business constrains. All kind of companies differ in management board members number with the largest boards for the largest companies, as expected. Unfortunately number of women as top management board members decreases with a company growth especially when large companies are considered. It means that the size of the company has positive influence on number of management board members and negative on number of women as management boards members although the dependence is not linear. The polynomial functions of board members number depending on 4-quarters sales were estimated for all three groups of companies. Estimated parameters and functions graphs are presented below. Estimation results show that sales can explain about 22% of changes in management board size for small and middle companies and only 6,1% for largest companies.

Table 4. Estimated parameters of management board members number depending on last 4-quarters sale

$$BM_T = A_0 + A_1 \cdot (LSAL_T) + A_2 \cdot (LSAL_T)^2 + A_3 \cdot (LSAL_T)^3$$

	N	A_0	A_1	A_2	A_3	R	$LSAL_{min}$	$LSAL_{max}$
small	1868	1,8469	0,0897	0,0339	-0,0003	0,4658	-4,13	8,09
mid	1074	2,9128	0,0204	-0,0379	0,0100	0,4666	-2,60	8,44
large	528	-3,534	2,3340	-0,1532	0,0011	0,2472	3,05	10,97

Figure 1. Estimated number of management board members depending on last 4-quarters sale (smallest companies)

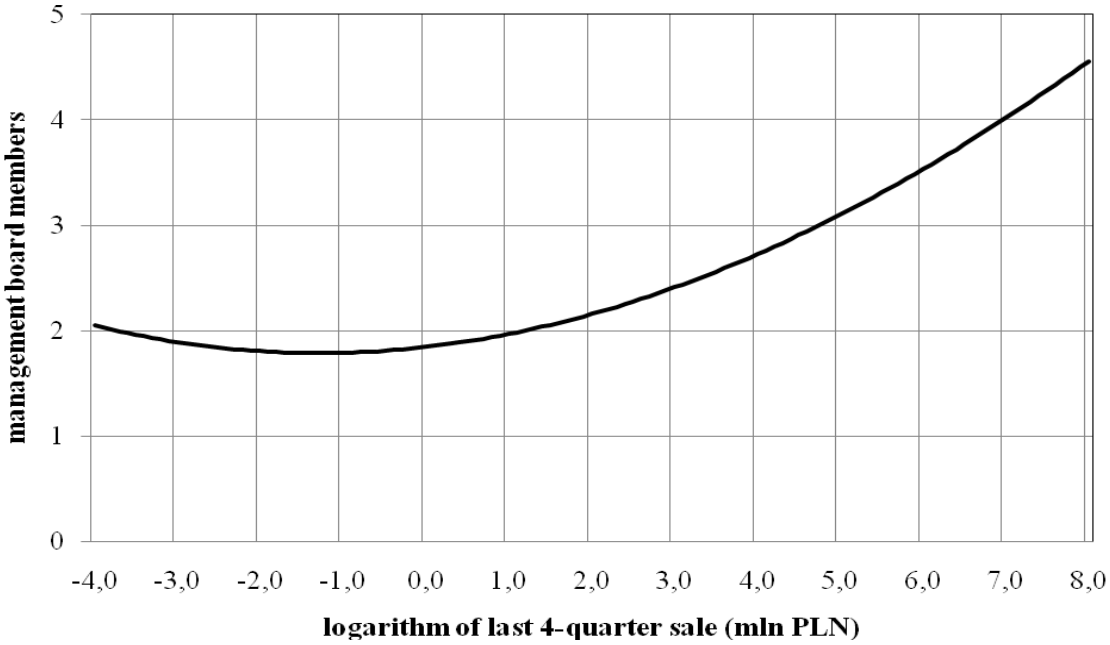

Figure 2. Estimated number of management board members depending on last 4-quarters sale (middle size companies)

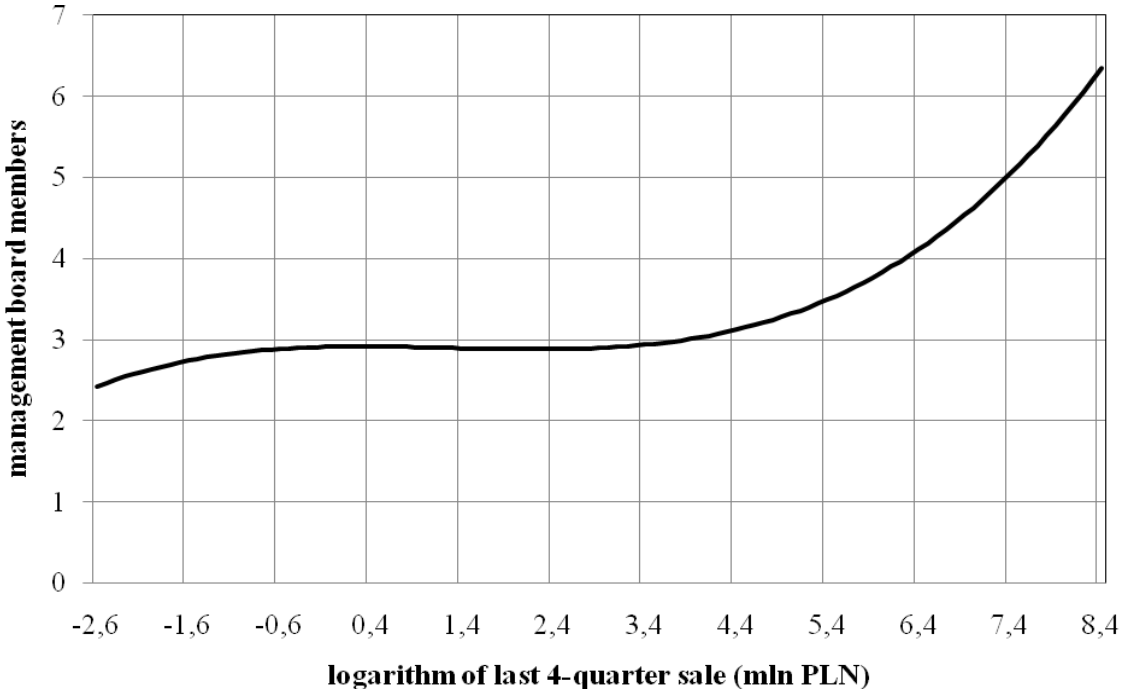

Figure 3. Estimated number of management board members depending on last 4-quarters sale (large size companies)

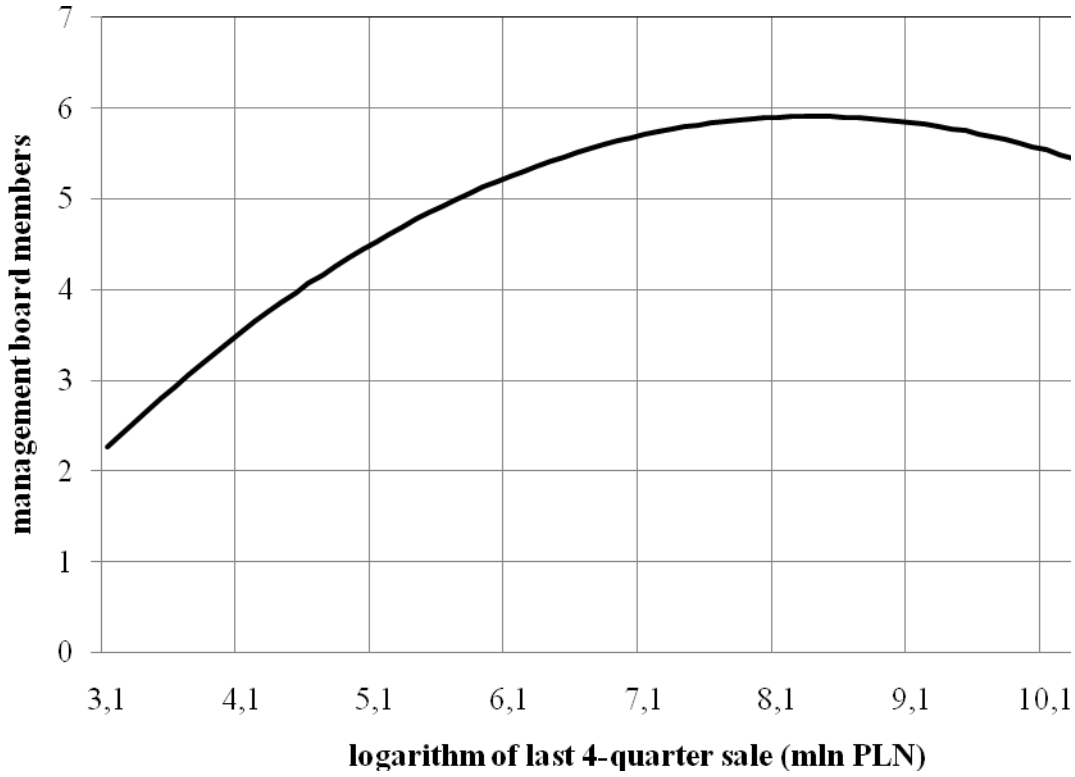

Finally, a simple linear model was proposed to estimate how ROE from 2001 to 2009 was influenced by women parity in top management boards and other factors. The model of linear regression with model-estimated breaking level of dependent variable is presented below as well as estimation results for all three classes of companies. Initial estimates proved that this kind of models better fitted than a single model with no breaking-points.

$$ROE_T = A_0 + A_1 \cdot LSAL_T + A_2 \cdot BM_T + A_3 \cdot WBM_T + A_4 \cdot WBR_T + A_5 \cdot GDP_T$$

Table 5. Estimation results for small companies (sWIG80)

ROE	**A_0**	**A_1**	**A_2**	**A_3**	**A_4**	**A_5**
under 3,04%	0,6064	-0,0311	-0,0894	0,2767	**-2,0658**	0,0121
over 3,04%	-0,0332	0,0020	0,0086	-0,0762	**0,5860**	0,0149
N = 425		R =0,7318		R^2 =53,55%		

Table 6. Estimation results for middle size companies (mWIG40)

ROE	**A_0**	**A_1**	**A_2**	**A_3**	**A_4**	**A_5**
under 10,77%	-0,2654	0,0308	-0,0166	0,1077	**-0,2025**	0,0249
over 10,77%	0,4551	-0,0309	-0,0038	-0,0269	**-0,2410**	0,0166
N = 312		R =0,6561		R^2 =43,04%		

Table 7. Estimation results for large companies (WIG20)

ROE	**A_0**	**A_1**	**A_2**	**A_3**	**A_4**	**A_5**
under 10,98%	-0,2405	0,0202	0,0079	-0,0115	**0,2318**	0,0054
over 10,98%	-0,0434	0,0036	0,0224	-0,0067	**0,1719**	0,0053
N = 101		R =0,8690		R^2 =75,17%		

The results are ambiguous and prove that number of women in management board may affect financial performance in both directions even within the same class of business size. The results show that increasing share of women in management board increases ROE for small companies with ROE over 3,04% and all the large companies. Unfortunately, the effect of ROE increase for middle and the least effective small companies (with ROE under 3,04%) have been obtained by decreasing share of women in top management. However, no matter

the company size, women parity in top management out of all variables had the strongest influence on ROE of analyzed companies.

Table 8. Decisions in management board structure towards ROE increase

Company	Number of women	Share of women	Suggested action
small company low ROE	increase	decrease	Increase number of board members, add more men than women
small company high ROE	decrease	increase	Decrease number of board members, reduce more men than women
mid company low ROE	increase	decrease	Increase number of board members, add more men than women
mid company high ROE	increase	increase	Increase number of board members, add more women than men
large company low ROE	decrease	increase	Decrease number of board members, reduce more men than women
large company high ROE	decrease	increase	Decrease number of board members, reduce more men than women

Desirable actions towards ROE increasing may consider above discoveries for business practice. For example, for middle size companies with relatively low ROE (up to 10,77 % in case of analyzed WSE listed companies) ROE enlarges if the number of women at the management board increase (A_3 = +0,1077) but enlargement of women part at the board reduces ROE simultaneously (A_4 = -0,2025). Decisions aiming to the enlargement of ROE through changes of the management board - if they are considered - should lead then to women number increase and simultaneously decrease of their participation. All other cases of decision depending on company size and financial performance are presented in table 8.

CONCLUSION

The above analysis leads to some general remarks on men and women impact on financial effectiveness measured by ROE. Suppose a company that is interested in increasing ROE. For all kind of companies men seem to be a force that leads to increase of financial effectiveness especially when it is relatively low. It is confirmed by positive influences of men participation at the board (e.g. negative influence of women participation) for small and middle companies with relatively low ROE. When ROE raises women participation should also rise (probably) to ensure some stability of financial situation. This kind of action should have strongest positive consequences for large companies and that confirms general results of researches provided in other countries.

ABSTRACT

This paper investigates the impact of research and development (R&D) on manufacturing trade using the panel adjusted gravity equation model for OECD countries during the period 1995-2003. We find that R&D is positively associated with manufacturing trade for exporting countries, while results are mixed for importing countries. The results reject the non-linear relationship between R&D and manufacturing exports. Estimations suggest that R&D may contribute to overcoming the effects of distance on manufacturing exports and may strengthen import specialization. R&D is found as the way to foster exports of manufacturing products from developing to developed OECD countries. Gross domestic product and gross domestic product per capita positively affect manufacturing trade. The distance influences negatively, while having a common border, common language, and regional free trade agreement membership positively enhances manufacturing trade between the eighteen analyzed OECD countries.

Keywords: manufacturing, R&D, distance, level of development, OECD countries, panel data analysis

INTRODUCTION

Theories in the literature explain various internal and external factors of technological sources, technology acquisition, R&D intensity and innovation at firm, industrial sector, and nation levels. The changing global competitiveness and trade patterns between the nations have generated a search for the determinants which are causing these changes. R&D intensity and innovation activities are seen as key factors in explaining the changes in technological gaps and in competitiveness in world trade (e.g. Freeman *et al.* 1991, Wakelin 1998). There is a growing literature on the determinants of trade performance, either for one country (e.g. Özçelik and Taymaz 2004), or for more or a group of countries (Roper and Love 2002), in order to assess and point to a role for R&D intensity and innovation activities as factors influencing the trade performance of developed

industrialized countries (Fagerberg 1988, Greenhalgh 1990) and developing countries (Montobbio and Rampa 2005).

This paper investigates the impact of R&D intensity on trade by analysing the determinants of the bilateral manufacturing trade flows between eighteen OECD countries. We employ adjusted gravity equations to identify the effects of R&D on bilateral manufacturing trade using a panel data analysis (Anderson and van Wincoop 2004). Our paper aims to contribute to the literature in four significant directions. First, the starting point of our investigation is the relationship between R&D and manufacturing trade performance in the OECD countries using a panel data analysis by applying the baseline adjusted gravity equation model. We integrate the Ghazalian and Furtan (2007) econometric approach in our estimation. So far there are scare similar studies in the literature. Second, we analyse whether the R&D intensities have mitigated the effect of distance on manufacturing trade, and therefore we check the rationale for long-distance on manufacturing trade. We employ the Freund and Weinhold (2002, 2004) and Bojnec and Fertő (2009, 2010) specification for the investigation of the effects of R&D on distance and long-distance into the adjusted gravity equation model. Third, we investigate for the impact of the level of economic development on manufacturing trade and check the sensitivity of the panel regression results to the choice of R&D by investigating the effects of R&D by the level of countries' economic development. Finally, the robustness test is conducted by years and for non-linearity.

The rest of the paper is organized as follows. The first section presents the literature review. In the next section after that we present the methodology and data used by focusing on the R&D intensity in the adjusted gravity regression analysis. After that, we present and discuss the regression results for alternative specifications of adjusted gravity models and for a robustness check. In the final section we summarise the main findings and give conclusions.

LITERATURE REVIEW

The literature provides a theoretical background for export and R&D relationship at both macroeconomic and microeconomic level. Since our study focuses on the macroeconomic level, we concentrate mainly on the former literature. The macroeconomic research offers two main theoretical perspectives to account for the relationship between R&D and exports. First, the neo-endowment models which concentrate on trade specialisation on the basis of factor endowments, such as materials, labour capital, knowledge and human capital (Wakelin 1998). Second, neo-technology models which predict innovative industries will be net exporters instead of importers. The latter type of models provides an extension of the conventional technology-based models such as the product life-cycle theory (Vernon 1966) and technology gap theory (Posner 1961).

In his seminal work, Krugman (1979) showed that countries and products can be ranked by technological level and that economies ahead on this scale specialize in the technological intensive goods. Increasing returns to scale and product innovations generate trade specialization and first mover advantages. But in equilibrium, imitation reduces technological gaps between countries, and the monopolistic power of leaders is temporary. In addition, he argued that the causal chain ran from R&D and innovation to international trade and not the other way round.

Grossman and Helpman (1995) argued that, in a framework of monopolistic competition, a country could shift its export demand curve outwards by increasing the quality of goods it produces; meanwhile, it could shift its import demand curve inwards by increasing the quality of goods produced for the domestic market. These demand-shift factors can possibly be proxied by factors that represent improvements in product quality, i.e. R&D and technological innovation.

A wealth of literature provides evidence at the macroeconomic level on the linkage between a country's export performance and its R&D pertained with creativity/innovation. Various empirical studies confirm the importance of R&D, technology and innovation as one of the major factors contributing to facilitating entry into global markets and thereafter maintaining competitiveness and boosting export performance (e.g. Fagerberg 1988, Greenhalgh 1990, Wakelin 1998, Montobbio 2003, Narula and Wakelin 1998, Leon-Ledesma 2005, DiPietro and Anoruo 2006).

The literature highlights three channels for R&D and innovation influencing the level of trade (Ghazalian and Furtan 2007). First, R&D and innovation may foster the product differentiation, allowing for more product variety choices and higher quality products for consumers. Second, R&D and innovation may reduce the production costs, making firms more competitive on the international markets. Third, R&D and innovation may reduce the transaction costs along the supply chain and between trading partners, making exports more competitive. For example, the literature on international trade emphasises the role of institutions and infrastructure in export growth (e.g. Anderson and Marcouiller 2002, Dollar and Kray 2002, de Groot *et al.* 2004, Francois and Manchin 2007, Depken and Sonora 2005, Levchenko 2007).

METHODOLOGY AND DATA USED

Traditional gravity trade theory indicates that bilateral trade is positively associated with their national incomes and negatively associated with their geographical distance (e.g. Frankel and Rose 2002, Baier and Bergstrand 2006). We apply adjusted gravity model variables including market size (real gross domestic product (GDP) of host *i* and destination *j* countries, geographical factors like the distance between capital cities (Distance) and common border (Contiguity), common cultural linkage (Language), and a dummy variable for Regional Free Trade Agreement (RFTA) membership as explanatory variables. First, we specify the following baseline adjusted gravity model:

$$\ln X_{ij,t}=\alpha_0+ \alpha_1 \ln GDP_{i,t}+\alpha_2 \ln GDP_{j,t}+\alpha_3 \ln GDPCAP_{i,t}+\alpha_4 \ln GDPCAP_{j,t}+\alpha_5 \ln Distance_{ij}+ \alpha_6 Contiguity_{ij}+\alpha_7 Language_{ij}+\alpha_8 RFTA_{ij}+u_1 \quad (1)$$

The trade data used is supplied by the OECD Bilateral Trade Database at the two-digit level of the ISIC in US dollars. We use data for the manufacturing exports (X_{ij}). The sample contains 18 OECD countries[1] between 1995 and 2003 resulting in 2,754 observations. GDP is a proxy for the market size, and GDPCAP is a general proxy for the level of economic development as an important demand factor for both exporter and importer countries. The source of data is the World Bank, World Development Indicators (WDI) database. The $Distance_{ij}$ variable measures the geographic distance between the countries' capitals *i* and *j*, whereas the other dummies reflect whether *i* and *j* share: a land border ($Contiguity_{ij}$), their primary language (Language), and membership in a RFTA. The source of these data is the Centre d'Etudes Prospectives et d'Informations Internationales (CEPII): http://www.cepii.fr/anglaisgraph/bdd/distances.htm) database.

The literature argues that richer and larger exporters and importers trade more, as do countries linked by regional trade agreements, a land border, or a common language; and landlocked and physically large countries do less trade, while that trade falls with geographic distance (e.g. Leamer and Levinsohn 1995). Distance can have an influence on technology transfer (Eaton and Kortum 2002, Kneller 2005).

Second, we are interested in the role of R&D on manufacturing trade. The previous section provides some evidence on how R&D inputs/innovation-related variables are expected to directly raise export intensity. Thus, we employ an adjusted gravity model with R&D expenditure variables:

$$\ln X_{ij,t}=\beta_0+ \beta_1 \ln GDP_{i,t}+\beta_2 \ln GDP_{j,t}+\beta_3 \ln GDPCAP_{i,t}+\beta_4 \ln GDPCAP_{j,t}+\beta_5 \ln Distance_{ij}+ \beta_6 Contiguity_{ij}+\beta_7 Language_{ij}+\beta_8 RFTA_{ij}+\beta_9 R\&D_{it}+\beta_{10} R\&D_{jt}+u_1 \quad (2)$$

The variables of particular interest are the expenditures on R&D. The data for governmental R&D outlays are collected from the OECD STAN R&D dataset. The R&D intensity is measured as the OECD R&D expenditure for total manufacturing (in million constant US$ in 2000 purchasing power parity – PPP – prices). In the light of previous research, we would expect that the higher the R&D intensity, the higher would be the export activity performance.

We check the robustness of our results in two steps using different specifications. First, recent research emphasises the existence of a possible non-linear relationship between R&D and exports (Estrada *et al.* 2006), because the effect of R&D and thus improved technological innovation on trade could vary according to the technological achievement

[1] The list of countries included in the data sample: Australia, Belgium, Canada, the Czech Republic, Finland, France, Germany, Ireland, Italy, Japan, South Korea, the Netherlands, Norway, Poland, Spain, Sweden, the United Kingdom, and the United States of America.

in countries. To check for a possible a non-linear relationship between R&D and manufacturing exports, two additional terms are included in the model:

$$\ln X_{ij,t}=\beta_0+\beta_1 \ln GDP_{i,t}+\beta_2 \ln GDP_{j,t}+\beta_3 \ln GDPCAP_{i,t}+\beta_4 \ln GDPCAP_{j,t}+\beta_5 \ln Distance_{ij}+ {}_6Contiguity_{ij}+\beta_7 Language_{ij}+\beta_8 RFTA_{ij}+\beta_9 R\&D_{it}+\beta_{10} R\&D_{jt}+\beta_{11} R\&D2_{it}+\beta_{12} R\&D2_{jt}+u_1 \quad (3),$$

where the variables R&D2 describe the squared terms of innovation proxies.

Second, our panel regression specifications have been chosen to minimize the possibility of omitted variable bias and to capture some of the impact of the R&D on manufacturing trade. Cross-section estimation is more prone to these problems, as it is impossible to control for country-fixed effects while using country-specific variables. Nevertheless, cross-section estimation eliminates the possibility of co-trending variables over time and thus provides a useful robustness check of our results.

Finally, there are some issues that we have to address when we estimate such panel models (Ghazalian and Furtan 2007). First, heteroskedasticity may occur because trade between two smaller countries or between a smaller and larger country is probably more volatile than trade between two larger countries (Frankel 1997). The panel dataset is also subject to the existence of autocorrelation. Contemporaneous correlation across panels may occur because exporting to one country can take place as an alternative to exporting to another country. Similarly, adjacent exporter(s)'/importer(s)' time specific shocks result in larger correlated error terms of their trade with their partners. To deal with issues of contemporaneous correlation we apply the panel corrected standard error model (PCSE) which controls for heteroskedasticity and the AR(1) type of autocorrelation and contemporaneous correlation across panels (Beck and Katz 1995, 1996).

EMPIRICAL RESULTS

R&D expenditures

The impact of R&D on trade performance may vary by sectors in the economy which are either net users or net producers of R&D-based innovations. Some sectors in the economy might be characterized by high levels of R&D-based innovation, while some other sectors might be characterized by few R&D-based innovations. There might be also differences in production and use of R&D-based innovations by different sectors.

Before estimating the panel regression models, the main model variables are pre-tested for unit root tests. A number of panel unit root tests are available. Considering the well known low power properties of unit root tests, in this paper we employ a battery of unit root tests: Levin, Lin and Chu (2002) method (common unit root process), Im, Pesharan and Shin (2003) method (assuming individual unit root processes), ADF-Chi square, PP-Chi square. Table 2 presents the results of four different panel unit root tests (Levin, Lin and Chu; Im, Pesaran and Shin; ADF-Fisher Chi square, PP-Fisher Chi square), with different deterministic specifications (with constant, and with constant and trend). Mixed results were obtained. The most important model variables such as the bilateral trade flows and R&D expenditures in countries i and j do not have unit roots, i.e. are stationary, with individual effects and individual trend specifications. The panel unit root null hypothesis is also rejected with constant only deterministic specification for Levin, Lin and Chu and PP-Fisher Chi square tests. Other variables such as GDP and GDPCAP are more ambiguous in terms of unit root in a panel context. We may conclude that with individual effects only specification both variables of the panel dataset are stationary, while the majority of test results accept the panel unit root null hypothesis.

To ensure that both variables are I(0) and not integrated of a higher order, we apply unit root tests on first differences of all variables. Table 3 presents unit root test results for the first differences with constant specification only (it is not likely that first differences are trended). All tests reject the unit root null hypothesis for the first differences. In sum, we may conclude that panel is likely stationary.

The baseline adjusted gravity model estimations

We start to present our regression results based on the adjusted gravity model without R&D variables. The equation (1) in Table 4 shows our baseline adjusted gravity model estimations for manufacturing trade. The baseline adjusted gravity models indicate that the size of GDP has a positive and statistically significant impact on bilateral manufacturing trade for exporting and importing countries. The size of the economy and its growth over time encourages bilateral manufacturing trade between the OECD countries. The level of development measured by GDPCAP has also a positive and statistically significant impact on bilateral manufacturing trade for exporting and importing OECD countries. As expected, the Distance between the countries' capitals has a negative and statistically significant impact on bilateral manufacturing trade between

the OECD countries, indicating the importance of geographical proximity and trade costs in conducting international manufacturing trade business. The regression coefficients of the Contiguity, Language, and RFTA are positive and statistically significant, confirming the importance of geographical and cultural proximity as well as the importance of the bilateral and multilateral trade liberalisation for increases in bilateral manufacturing trade between the OECD countries.

The effects of R&D on manufacturing trade

In the process of international expansion, R&D with innovation is a significant determinant for the development of competitive advantage (Krugman 1979). In general, a positive relation between a country's export performance and its R&D intensity /creativity/innovation has been confirmed by previous studies (e.g. Greenhalgh 1990, Verspagen and Wakelin 1997, DiPietro and Anoruo 2006).

In the equation (2) in Table 4 we extend the baseline adjusted gravity model specification with the R&D expenditure variables. The signs of the associations and statistical significance of the regression parameters have remained unchanged. Only the negative

association for the Distance variable has been strengthened, whereas the absolute size for the other regression coefficient has declined. A significant decline of the regression parameter is seen for the GDP exporter variable, which implies some correlation between the level of R&D expenditures and the level of GDP in exporting OECD countries. The regression coefficients that are pertaining to the R&D expenditure variables are positive and statistically significant at the higher degree for exporting than for importing countries. We do confirm the importance of R&D for competitiveness in manufacturing exports, but to a lesser degree also for the manufacturing import specializations.

Robustness test for non-linear relationship

The robustness test for non-linear relationship is included by the square of the R&D variable for exporter and importer countries. The regression (3) in Table 4 reinforces the findings that are consistent with the previous baseline adjusted gravity regression, whereas the regression parameters for the square of the R&D exporter and importer countries, respectively, are of a negative sign, but statistically not significant. This implies that we have not confirmed a non-linear relationship for the R&D variables.

Sensitivity check: cross-section estimations for the baseline model

We check for cross-section estimations stability for the baseline model by the analyzed years. As can be seen from Table 5, the regression coefficients that pertain to GDP exporter and importer countries, respectively, tend to increase, and after that are stabilized, and are statistically significant. These patterns confirm the importance of the economic size and economic growth of the exporting and importing OECD economies for manufacturing trade. There are diverging patterns in the importance that is seen for the GDPCAP for exporter OECD countries, which the regression parameters tend to decrease over time and vice versa for the GDPCAP for importer OECD countries, which the regression parameters tend to increase and after that stabilize. The importance of the Distance has increased over time. The importance of the Contiguity dummy and the RTFA dummy, respectively, on manufacturing exports between the OECD countries tends to decline, which is consistent with the ongoing process of manufacturing trade liberalization and advances in information and communication (Bojnec and Fertő, 2009). The importance of the Language dummy tends to increase slightly and after that stabilize. Our particular interest is in the R&D variables: the importance of the R&D variables for manufacturing exporters tends to decline slightly, but has remained statistically significant, while the importance of the R&D variables for manufacturing importers has become insignificant. These findings reinforce the importance of the R&D expenditures for exports to compete and sustain competitiveness in the exporting of manufacturing products, while it is becoming less important for manufacturing import specialization.

The effects of R&D on distance

R&D with pertaining innovation may also reduce the transaction costs fostering the exports. Thus we check whether R&D intensity influences the distance effect between trading partners. Following Freund and Weinhold (2004) we re-estimated our model to check the effect of R&D intensity on distance:

$$\ln X_{ij,t}=\beta_0+ \beta_1 \ln GDP_{i,t}+\beta_2 \ln GDP_{j,t}+\beta_3 \ln GDPCAP_{i,t}+\beta_4 \ln GDPCAP_{j,t}+\beta_5 \ln Distance_{ij}+ \beta_6 Contiguity_{ij}+\beta_7 Language_{ij}+\beta_8 RFTA_{ij}+\beta_9 R\&D_{it}+\beta_{10} R\&D_{jt}+ \beta_{11} R\&D_{it}*Longdistance_{ij}+ \beta_{12} R\&D_{jt}*Longdistance_{ij}+u_1 \quad (4)$$

where $Longdistance_{ij}$ is a dummy variable, which equals one if the distance between countries *i* and *j* exceeds the average distance between all countries. The rationale for use of the interaction effect of R&D and Longdistance is that with more R&D intensity it would be possible to overcome the greater distance. If a particular R&D variable has reduced (increased) the effect of distance on manufacturing trade, then the regression coefficient on the interaction R&D*Longdistance term should be positive (negative).

Notes: * p<0.1; ** p<0.05; *** p<0.01. Parameters are estimated by the Prais-Winsten estimator. The common AR(1) parameter is denoted by rho. The z values are computed from standard errors that are corrected for heteroscedasticity and contemporaneous correlation of error terms across panels.

This model specification assumes, and empirical estimates in regression (4) in Table 6 confirm, that the regression coefficient pertaining to the Distance is negative. However, the regression coefficients have changed or decreased only slightly when the

(R&D*Longdistance) variables are included in the models. The regression coefficients on R&D variables remain positive and statistically significant. These results indicate that R&D intensity has strong impacts on the distance and manufacturing trade, particularly for encouraging manufacturing trade by exporting countries. This is further confirmed by the regression coefficients for the interaction R&D variables. There is a positive and statistically significant association for the exporting countries, and a negative and statistically significant association for the importing countries. These results imply that the R&D variable has reduced (increased) the effect of distance on bilateral manufacturing trade for exporting (importing) OECD countries. The OECD countries, which have invested more in R&D have also expanded and strengthened their manufacturing exports on longer distances, while the manufacturing import specialization by importing OECD countries has become weaker.

Constant	-57.257***
N	2754
R^2	0.9942
Rho	0.845

Notes: * p<0.1; ** p<0.05; *** p<0.01. Parameters are estimated by the Prais-Winsten estimator. The common AR(1) parameter is denoted by rho. The z values are computed from standard errors that are corrected for heteroscedasticity and contemporaneous correlation of error terms across panels.

Barrios *et al.* (2003) argue that the effects of R&D do matter more for exports to technologically advanced countries, such as the European Union and other OECD countries where exporters have to improve technology in order to be able to compete on those markets successfully. Thus the effects of the R&D variables are empirically tested in association with the level of economic development:

$$\ln X_{ij,t}=\beta_0+ \beta_1\ln GDP_{i,t}+\beta_2\ln GDP_{j,t}+\beta_3\ln GDPCAP_{i,t}+\beta_4\ln GDPCAP_{j,t}+\beta_5\ln Distance_{ij}+ \beta_6 Contiguity_{ij}+\beta_7 Language_{ij}+\beta_8 RFTA_{ij}+\beta_9 R\&D_{it}+\beta_{10} R\&D_{jt}+ \beta_{11} R\&D_{it}*GDPCAP_{it}+ \beta_{12} R\&D_{jt}*GDPCAP_{jt}+u_1 \quad (5)$$

The rationale for use of the interaction effect of R&D and GDPCAP is that more economically developed countries with high higher GDPCAP invest more in R&D intensity and thus they can increase manufacturing exports through higher-valued product differentiation.

The effect of the level of economic development is included in the adjusted gravity regression model by the interaction effect of the R&D variables and GDPCAP variables, which is presented in regression (5) in Table 7. The negative absolute size of the Distance variable on bilateral manufacturing trade has increased, and particularly substantially has increased the impact of the R&D variable on manufacturing trade. This clearly confirms the important and statistically significant role of the R&D variables for increases of bilateral manufacturing trade in exporting OECD countries, and for import specialization by reduction in manufacturing trade in importing OECD countries. However, the regression coefficients that are pertaining to the interaction R&D*GDPCAP variables are negative and statistically significant for exporting countries and positive and statistically significant for importing countries, indicating the increasing importance of developing OECD countries in competitive manufacturing exports and successful import specialization in bilateral trade between the OECD countries.

IMPLICATIONS AND CONCLUSIONS

The paper provides empirical and policy insights into the effects of R&D on the bilateral manufactured goods trade between OECD countries in the panel data analysis. The emphasis is on whether R&D may help overcome the distance barriers among the countries and we find evidence in favour of this effect. We also test for possible non-linear effects of R&D on trade flows by including the square of the R&D variable. The adjusted gravity model allows the testing of a number of additional hypotheses, such as the role of economic development, the influence of common language, the effects of common borders, and the impact of a regional trading area. To be complete, various interaction effects between R&D investments and the other explanatory variables in the adjusted gravity model are tested. As a sensitivity test, the cross-section estimates by years are also provided. We find a catch-up effect in manufacturing trade, which is suggested by the interaction effect of R&D with GDPCAP.

Therefore, the contributions of the paper's results to the literature are both empirical and policy nature. The paper provides new empirical evidence on the relationship between R&D expenditure intensity and manufacturing trade between OECD countries using a large panel data sample. Our results show a positive relationship between R&D intensity and manufacturing exports. The R&D variable for exporting countries increases manufacturing exports, while the regression coefficients for the R&D variables for importing countries are mixed. The OECD countries, which invest more in R&D, have higher manufacturing export, but this varies for manufacturing imports. The greater R&D expenditure mitigates the importance of the distance for exporters by expanding their export opportunities, and reduces the distance for importers' countries.

The empirical novelty in this paper is the test for the interaction effect of the R&D with GDPCAP, and an important policy finding is that, with the R&D investments, the developing OECD countries are catching-up in manufacturing trade. This finding gives support for the importance of differences in R&D intensity and pertained innovation in influencing international manufacturing competitiveness, which is of importance to domestic government science, technology, and research and innovation policy with a positive impact on manufacturing trade performance. The R&D expenditures in the economically most developed OECD countries have not been sufficient to sustain a competitive position in manufacturing exports as well as in manufacturing import specialization, which has resulted in an increase of their manufacturing imports from developing OECD countries. The results imply structural changes that are caused by the R&D expenditure intensity with pertaining innovation in the developing OECD countries that improve their export competitiveness in more technological advanced manufacturing products, which are exported worldwide, particularly to the most developed OECD countries. Due to this, the results that are pertaining to the R&D variables and their interaction effects, particularly with the level of economic development (GDPCAP), in successful import specialization are mixed, but the R&D expenditures with successful innovations make domestic manufacturing more competitive particularly in technologically advanced developing OECD countries. As a result, some developing OECD countries, for example South Korea, have successfully entered in manufacturing trade between the OECD countries.

The results that are pertaining to the adjusted gravity equation variables are largely consistent with theoretical expectations. GDP and GDPCAP in exporter and importer countries, respectively, positively and statistically significantly affect manufacturing trade. The distance between the capital cities negatively affects manufacturing trade, implying that trade costs do matter for manufacturing trade, but can be mitigated by R&D intensity for transportation and communication costs. As expected, a common border, cultural linkage and common language, and regional free trade agreement membership positively affect manufacturing trade.

Among implications for research, we have conducted a cross-section sensitivity test and a test for a non-linear relationship by the square of the R&D for exporter and importer countries, respectively, but we have not confirmed a non-linear relationship for the R&D variables. However, we have confirmed that the R&D intensity fosters manufacturing exports between the OECD countries. The R&D intensity also has favourable impacts on the distance for both exporting and importing countries. These findings have important policy implications to consider concerning R&D and pertaining innovation activity on the importance of the R&D as a factor of export growth and for reduction of transaction costs, and thus for fostering manufacturing trade between countries.

Among the issues for future research are possible specifications adjustments of the tested hypotheses and models to include variables such as R&D sustained by foreign direct investment, global competitiveness indicators, innovation index, and creative climate indicators at the county level. To support the investigation of the sources of R&D funds that have been adopted from the public or private sectors or public-private partnership prevalent in R&D investment in some of the leading OECD countries is another challenging issue. The

data update and different other country data samples are also an additional issue for future research.

THE USE OF GOVERNANCE MECHANISMS IN THE CONTEXT OF OPEN INNOVATION: A STUDY OF CONVENIENCE STORE INDUSTRY IN TAIWAN

Kuo-Nan Hsieh, SPRU, University of Sussex, UK
kh87@sussex.ac.uk

ABSTRUCT

This paper draws on a comparative case study design to investigate how Taiwanese convenience store chains use governance mechanisms to develop new services with partner firms. Using empirical evidence from case studies of the development of two e-commerce services (Online shopping with pick-up at store service and Multiple media kiosk service) developed by convenience store chains in Taiwan, this study found that the convenience store chains under study cooperate with their partners on the basis of informal governance mechanisms such as social ties created by previous collaboration experience, mutual benefits and interpersonal trust. Formal governance mechanisms are also used to manage the relationships with their partner firms such as shared ownership control and high switching costs arising from investment of valuable resources. Comparing the governance mechanisms used in the two selected service developments, the main difference was found in using informal governance mechanisms when convenience store chains cooperate with non-strategic partners (e-shops and service content companies). In online shopping with pick-up at store service development, the collaborations between convenience store chains and e-shops were based on their trust in partners' reputation and capability. Previous collaboration experience was considered essential in multiple media kiosk service development. Service content companies that have existing partnerships with convenience store chains in other services will be the prioritized partners in MMK service.

Keywords: Governance mechanism, Open innovation, Trust

INTRODUCTION

The context of open innovation emphasizes the importance of collaboration beyond company boundaries to share related resources for value creation. Chesbrough (2007) argued that compared with traditional business model, open business model can help a firm save development costs of innovation by tapping into external sources of knowledge and leveraging external knowledge in the firm's innovation process. Due to short product life cycle, firms are drawing more frequently upon external sources of knowledge, and that is what has allowed them to reduce dependence on internal R&D functions and to accelerate innovation (Bartlett *et al*., 2008). Partnering with other companies shortens the time to enter new business markets through leveraging partners' expertise and their channels. Although many advantages of open innovation have been identified, some fundamental questions are still unanswered and their relevance to open innovation has been overlooked. Open innovation model suggests that firms should share their valuable knowledge/resources with external companies for commercialization. But on the other hand, it may lead to leakage of business secrets or sensitive knowledge during innovation process. The choice of governance

mechanism has wide implications on the outcome of open innovation (Scarbrough and Amaeshi, 2009). It is reasonable to argue that formal and informal governance mechanisms are crucial coordination mechanism in the context of open innovation in order to lower transaction costs and facilitate inter-organizational knowledge sharing.

This paper aims to investigate how formal and informal governance mechanisms are employed by Taiwanese convenience store chains to manage and cooperate with their external actors in order to avoid the leakage of valuable knowledge and to acquire necessary resources for new service creation. The main research questions include: 1) What governance mechanism should be used to coordinate new service development activities with external actors and in which combinations? 2) Does the pattern of governance vary with the type of service innovation? Based on Dyer (1997), formal and informal safeguards can be employed to ensure equity among participating firms. Formal safeguards include financial hostage and valuable resource. Informal safeguards include goodwill and reputation. Similarly, other studies (e.g. Smith et al., 1995; Dekker, 2004) suggest that firms can adopt formal and/or relational governance mechanisms to control inter-organizational collaboration. Formal governance consists of contractual obligations and organizational features such as legal contracts, structural design, and share ownership. Informal governance involves social control, trust or social ties created by previous collaboration experience. Most previous studies (e.g. Fey and Birkinshaw, 2005) have mainly focused on the choices of governance mode for external R&D activities in high-technology industries. There is much less empirical evidence on external knowledge search activities for innovative ideas in the service sector. The contribution that this study aims to make is to enhance understanding of the role of governance mechanisms in facilitating sourcing external knowledge during new service development process.

Taiwanese convenience store chains compete in introducing new products/services quickly to consumers in order to attract and retain them. To enable this, convenience store chains must integrate multiple sources of knowledge residing within their firms or outside the firms' boundaries to develop and launch new services in a timely manner. They combine acquired related resources with the existing advantages of 24-hour service, high store density, strong information system, and professional distribution systems to carry out "Clicks and Mortar" services, which in turn, help them respond quickly to market dynamics and consumers' needs.

This study draws on empirical evidence from the four convenience store chains in Taiwan. Two e-commerce services (Online shopping with store pick-up service and Multiple media kiosk service) in the convenience store industry were selected to address the issue of governance mechanisms during service innovation process. Formal and informal governance mechanisms are considered in this study. Particular attention is devoted to understanding what combinations of governance mechanisms are best suited for each type of new service development.

The rest of the paper is set out in the following way: In the next section, the open innovation literature and governance mechanisms are reviewed. The methodology of the research is then described, followed by a discussion of the findings. In the concluding section, the theoretical and managerial implications and limitations are discussed.

THEORETICAL BACKGROUND

The context of open innovation

The concept of open innovation has gained popularity in academic debate and analysis over recent years. Some studies (e.g. Pavitt, 1984; von Hippel, 1986; Tidd, 1993; Dahlander and Gann, 2007; Trott and Hartmann, 2009) suggest that it has been the tradition in research on innovation to interpret new product or service development from the notion of an open approach to innovation. Open innovation is widely acknowledged as being vital to a firm's innovation activities. The implementation of open innovation also differs across industries (Christensen, *et al*., 2005). But the success of open innovation model may depend on such factors as the product modularity, the requisite tacit knowledge, the speed of industrial change, and the complexity of interface (Gassmann and Enkel, 2004).

Innovation can stem from a firm's internal development, but it can also be acquired externally from the so-called "source of innovation", namely suppliers, consumers, competitors and research institutes (von Hippel, 1988). In order to acquire related resources and knowledge for new service development, firms may need to access different types of network and form different types of collaboration with network members. Similarly, open innovation model suggests that a firm should collaborate and share its valuable knowledge/resources with external companies, so as to take internal ideas to market through external paths (Chesbrough, 2006). Through an 'open business' model which emphasizes reaching out to external ideas and sources of knowledge, firms can ease the process of accessing new technologies and markets and unlock their economic potential. However, according to agency theory, external collaborators or partner firms may use partnership opportunistically to advance their interests. The cost incurred in managing unintended leakage of business secret or sensitive knowledge during innovation process can be high. This potential problem highlights the importance of considering not only effective partner selection, but also the forms of inter-firm relationships required for effective information flow in open innovation process.

Many previous studies suggest that when firms adopt an open business model, they need to have some formal or informal links with external companies in order to tap into their partners' specialized resources and strategic assets while protecting own sensitive knowledge. For example, Tidd *et al*., (2005) made a distinction between horizontal and vertical alliances. According to them, firms may engage in vertical alliances with suppliers or customers to share complementary know-how/resource and thus shorten time and reduce cost of new product/ service development. Horizontal alliances may be set up for exchanging valuable knowledge with peers and competitors in order to develop new products or services. von Zedtwitz and Gassmann(2002) argued that firms need to adopt some forms of governance in order to implement open innovation activities. More recently, a few studies (e.g. Fey and Birkinshaw, 2005) suggest that firms should use different governance modes (e.g. contract) to manage the relationships with external partners. Birkinshaw (2007) extended the open innovation theory and argued that fully open model and traditional closed model can be differentiated by considering the issues of distribution of knowledge (concentrated vs. dispersed), degree of control, and degree of trust and reciprocity.

Formal and informal governance mechanisms

Innovative knowledge that spans firm boundaries is often embedded in inter-firm relationships (Dyer and Singh, 1998). In order to share, transform and integrate related knowledge for innovation purposes, firms need to adopt different types of governance and organizational form to manage inter-organizational collaboration. Nooteboom (2001) identified two kinds of relational risk in inter-firm collaboration. These are risk of dependence ("hold-up" risk) and risk of knowledge loss (spillover risk). To minimize these risks, focal firms need to implement appropriate governance mechanisms. Dyer (1997) put forward two types of safeguard (formal and informal safeguards) which aim to bring equity among participating firms. Formal safeguards include financial hostage and valuable resource. Informal safeguards include goodwill and reputation. His research concluded that financial hostage hold by Japanese automakers will encourage their suppliers to make partner-specific investments, which in turn lead to the increasing interdependence between partner firms. Likewise, other studies (e.g. Smith *et al*., 1995; Dekker, 2004; Scarbrough and Amaeshi, 2009) suggest that firms can adopt formal and informal (relational) governance. Formal governance refers to contractual obligations and organizational features such as legal contracts, structural design, and share ownership (Scarbrough and Amaeshi, 2009). In general, governance can be classified as outcome, behavior, and social control mechanisms (Ouchi, 1979). Formal governance mainly consists of outcome and behavior control mechanisms. Outcome control mechanism includes ex-ante control (e.g. goal setting and incentive systems/reward structures) and ex-post control (e.g. performance monitoring and rewarding). Outcome mechanisms can be seen as a control to monitor and reward desirable performance targets. Behavior control includes ex-ante control (structural specifications: planning, procedures, and rules/ regulations) and ex-post control (e.g. behavior monitoring and rewarding). It concerns how firms monitor partners' behaviors in collaboration process.

In contrast, informal governance involves social control, trust or social ties created by repeated interactions between firms. Social control mechanisms also include ex-ante control (e.g. partner's goodwill and capabilities based on interaction, reputation, and social network) and ex-post control (e.g. trust building based on risk taking, joint decision making and problem solving). Trust is often argued to be the principal mode of social control in inter-organizational relationships which can ease the communication between cooperative firms and encourage information and knowledge sharing. In addition, mutual trust may motivate cooperative firms to invest specific assets and to refrain from opportunism and goals conflicts. Trust has been discussed from different theoretical perspectives. Sako and Helper (1998) combined economic, sociological and psychological theories and defined trust as: *"An expectation held by an agent that its trading partner will behave in a mutually acceptable manner, and will act fairly when the possibility for opportunism is present"*. Other studies on inter-firm relationships also identified different dimensions of trust such as reliability, benevolence and competence (Swan, *et al*., 1985; Medlin, 2002; Seppänen et al., 2007). Reliability is a belief that partner firms have the ability and competence to perform. Benevolence is a belief that the other partner firm will treat the risking partner well under new conditions. Similarly, Sako (1992) suggested a similar typology of trust. According to her, trust can be distinguished into contractual trust, competence trust, and goodwill trust. Contractual trust is shown when a partner firm fulfills the requirements of written contracts or oral agreements. Competence trust refers to the partner firm's ability to fulfill contracts.

Goodwill trust is the most abstract form focusing on the partner firm's intention to fulfill agreements. This classification is useful in identifying the characteristics of relationship between firms.

The complementary or substitute relationship between trust and formal governance (e.g. contracts and ownership) is still being debated. When formal governance mechanisms are unreliable, alliance partners may rely on relational-based governance mechanisms (Dyer and Singh, 1998; Dekker, 2004). Also, it has been argued that formal governance supplements and enhances the level of trust between cooperative firms by reducing the risk of inter-firm collaboration such as opportunism. Formal governance mechanisms may also improve the trust relationship between firms by objective monitoring of partners' performance and behaviors. The choice of form of collaboration may depend on prior social ties or repeated interactions between firms. When a reciprocal inter-organizational relationship is developed and sustained between firms, relational-based governance would allow the flexibility which partners need, to deal with future relational uncertainties (Poppo and Zenger, 2002).

Building on the above discussion, this paper argues that a better understanding of governance mechanisms which underpin the complex inter-firm relationships is necessary. The issues of formal and informal governances are discussed next in order to understand how a firm uses formal and/or informal relationships to share related knowledge with partner firms and to protect its own valuable knowledge.

The following questions will be answered in this paper:
1. What kinds of governance mechanism do the Taiwanese convenience store chains adopt with their partner firms in new service development process?
2. Does the use of governance mechanisms vary in different types of new service development?

RESEARCH DESIGN AND METHOD

This research uses a comparative case study design (Yin, 2003) and draws on empirical evidence from the four biggest convenience store chains in Taiwan. Two e-commerce services (Online shopping with store pick-up service and Multiple media kiosk service) in the convenience store industry were selected to address the research questions. Before developing a full-scale investigation, two of the biggest convenience store chains in Taiwan were selected as pilot cases to test the logic of the initial research design. Such pilot studies also help this research to unpack the complexity of factors that underlie inter-firm relationship.

Study Population and Unit of analysis

The study population of this research includes the Taiwanese convenience store chains and their cooperative firms involved in the selected service development. The four convenience store chains (including Company E, Company F, Company H, and Company O) which together control 95.51% of the market in Taiwan have been chosen in order to fulfill all the required data collection tasks in my research case. The unit of analysis of this research is the new service development project. Online shopping with pick-up at store service and multiple

media kiosk service were selected for investigating how convenience store chains use governance mechanisms with their partner firms to control and share related knowledge for new service development. Their partner firms include logistic companies, information system integrated companies, platform providers, service content companies, and hardware manufacturing companies and so forth.

Data collection and analysis

Two methods of data collection were used in this research: documentation and interviews. Secondary data were gathered from periodicals, books, magazines, newspapers, research reports published by research institutes, corporate websites, and annual reports published by case companies and their partners. Semi-structured interviews were also adopted in the data collection process as they allow for two-way communication and the flexibility to probe for details as well as gaining a range of insights on research issues. In total, there were 42 interviewees from the four convenience store chains and their partner firms participating in this study. Interviewees include managers and section staff of convenience store chains and the staff of partner firms who were involved in the selected service development projects. Some informants were interviewed twice. All together, 52 interviews were conducted.

The interviews were analyzed using the thematic framework approach (Gibbs, 2008). In developing a thematic framework which represents the patterns and relationships in the interview data, I drew on the existing literature and research questions to create codes and to identify key thematic ideas. The thematic framework was then applied to guide initial data analysis in order to understand how Taiwanese convenience store chains use different types of governance mechanisms with partner firms in order to acquire external resources/ knowledge and avoid leakage of sensitive knowledge in new service development. Moreover, cross-case synthesis (Yin, 2003) was chosen as the analytical technique to summarize the findings from the individual cases. This technique is also useful in identifying the similarities and the differences between the two service development projects. The findings of cases are presented next.

RESEARCH FINDINGS

Governance mechanisms adopted between convenience store chains and their partners

This section discusses the formal and informal governance mechanisms used by convenience store chains to manage their relationships with partner firms in the two selected new service development projects.

Online shopping with pick-up at store service- Formal governance mechanism

Company E cooperated with its affiliate companies in marketing, logistics, and IT functions. Their relationships tend to be characterized by shared ownership of specialized investments and switching costs. Company E mainly relied on these partner firms to develop and execute the same functions in the target services. As to dealing with suppliers of applied software system, Company E used annual contracts to manage the collaboration with different firms that have similar capability in the same domain. Compared with Company E, Companies F,

H, and O formed a joint venture to develop this service and used shared ownership mechanism to control the partnerships with a marketing company. The relationship between this group of companies and logistics companies tend to be characterized by shared ownership and switching costs. Convenience store chains relied on these logistics companies to deliver goods to each convenience store. This group of companies cooperated with an IT system supplier to develop and maintain IT system for the development of online shopping with pick-up at store service on the basis of incentive rewarding (profit sharing). Contracts were used to manage the cooperations with e-shops.

The main difference between Company E and Companies F, H, O can be explained by the level of interdependence between them and their third party distribution companies in service structure. Company E owned one distribution company which can provide the same service as third-party distribution companies in its service structure. In contrast, Companies F, H, and O relied on third-party distribution companies to manage and collect goods from e-shops. Then these third-party distribution companies redistributed and delivered these goods to this group of companies' self-owned distribution companies.

Table 1 shows that two groups used different formal governance mechanisms to cooperate with related actors in online shopping with pick-up at store service development.

Table 1: Two groups use different formal governance mechanisms with related actors in Online shopping with pick-up at store service development

Development actors	Company E	Companies F, H, and O
Owned distribution company	Shared ownership and switching cost	Shared ownership and switching cost
Software suppliers	Shared ownership and switching cost	Incentive rewarding - profit sharing
Third party distribution companies	Service contract and structural design	Service contract
E-shops	Service contract	Service contract
Marketing company	Shared ownership	Shared ownership

Source: Summarized by author

Online shopping with pick-up at store service- Informal governance mechanism
Company E had long-term cooperation experience with its affiliate companies in different functions (e.g. logistics and IT). Inter-personal trust underpins its cooperation with a marketing company. Company E also authorized the marketing company to continue developing this service because Company E's former employees who fully understood the development process were working at the marketing company. Company E cooperated with the suppliers of applied software system based on their previous interactions and the capability of suppliers. Companies F, H, and O also had long-term cooperative experiences with their own distribution companies. These distribution companies helped convenience store chains deliver goods for different services to each convenience store. Companies F, H, and O cooperated with a marketing company based on joint decision making and problem solving. The marketing company was responsible for developing this service and integrating different convenience store chains. The collaboration between this group of companies (Companies F, H, and O) and an IT system supplier was on the basis of shared development

risk and related knowledge. The IT system supplier also had good capability and reputation in this domain. Similarly, the cooperation between E-shops and convenience store chains is underpinned by reputation and capability. The main difference between Company E and Companies F, H, O can be explained by the different level of trust they have on third party distribution companies. Company E did not solely count on third party distribution companies to perform delivery service because its owned distribution system can provide the same service. This implies that Company E's self-owned distribution company has a potential competitive relationship with third party distribution companies. In contrast, Companies F, H, and O cooperated with third party distribution companies because of their previous cooperative experiences and the established inter-personal trust. Companies F, H, and O relied on these distribution companies to manage e-shops and deliver goods to their individual distribution system.

Table 2 shows that two groups used different informal governance mechanisms to cooperate with related actors in online shopping with pick-up at store service development.

Table 2: Two groups use different informal governance mechanisms with related actors in Online shopping with pick-up at store service development

Development actors	Company E	Companies F, H, and O
Owned distribution company	long-term cooperation experience	long-term cooperation experience
Software suppliers	long-term cooperation experience	shared development risk and related knowledge
Third party distribution companies	previous cooperative experiences, reputation and capability	previous cooperative experiences, inter-personal trust
E-shops	reputation and capability	reputation and capability
Marketing company	Inter-personal trust	Joint decision making and problem solving

Source: Summarized by author

In summary, for Online shopping with pick-up at store service development, Company E used formal governance mechanisms (e.g. shared ownership and switching cost) and informal governance mechanisms (long-term cooperative experience) to manage the collaboration with its group companies to develop fundamental functions such as IT system and logistics. Compared with Company E, Companies F, H, and O used formal governance (valuable resource) and informal governance mechanisms (risk sharing and good capability) to manage their cooperation with an external company to develop the IT platform. As to the development of logistic function, Companies F, H, and O used shared ownership mechanism to control their self-owned distribution companies. When the delivery process (from e-shops to the distribution system of convenience store chain) is considered, Companies F, H, and O used service contracts to control third party distribution firms. These third party distribution firms had good capability to deliver goods to each convenience store chain's owned distribution companies. In contrast, the relationship between Company E and third party distribution companies was potentially a competitive one as its own distribution company can provide the same service. All convenience store chains cooperate with e-shops on the basis of partner firm's reputation and capability. Regarding the development of marketing function,

shared ownership and inter-personal trust underpin the collaboration between Company E and its affiliate company. Companies F, H, and O, on the contrary, cooperated with their marketing company on the basis shared ownership and joint decision making and problem solving.

Multiple Media Kiosk service- Formal governance mechanism

The relationships between Company E and its affiliate companies (Company Q and two software suppliers) were characterized by shared ownership and switching costs. These affiliate companies execute the same functions for Company E in the target services. The suppliers of applied software system were contracted by Company Q to develop some kiosk's functions. Compared with Company E, Company F used shared ownership mechanism to cooperate with its affiliate company (applied software system supplier) to develop the MMK service and to develop certain parts of IT system. Company F provided system requirements and check lists to its partner firm. Their collaboration was characterized by high switching costs and the provision of valuable resources. Regarding the cooperation between convenience store chains and hardware manufacturers, Companies E and F used manufacturing contract mechanism. They relied on hardware manufacturing company for some development suggestions. Similarly, Company H also used contract mechanism to cooperate with its hardware manufacturing company. It only provided its requirements and specifications to the hardware manufacturer in order to produce hardware for use. Company O relied on software suppliers and hardware manufacturing company to develop this service because Company O did not invest any equipment in this service development. Companies E, F and H often signed a contract with service content companies in order to enrich service contents in kiosk.

Table 3 shows that four convenience store chains used different formal governance mechanisms to cooperate with related actors in Multiple Media Kiosk service development.

Table 3: Four convenience store chains use different formal governance mechanisms with related actors in Multiple Media Kiosk service development

Development actors	**Company E**	**Company F**	**Company H**	**Company O**
IT system suppliers	Ownership	Switching cost	Internal development	Contract
Applied software system suppliers	Contract	Ownership	Internal development	Contract
Hardware manufacturing company	Manufacturing contract	Manufacturing contract	Manufacturing contract	Manufacturing contract
Service content companies	Selling Contract	Selling Contract	Selling Contract	None. This company did not cooperate with them.

Source: Summarized by author

Multiple Media Kiosk service- Informal governance mechanism

Company E cooperated with its group companies in marketing and IT system functions on the basis of previous cooperative experiences and partner firm's good capability. The collaboration between suppliers of applied software system and Company E was based on their previous cooperative experience and partner's capability. But Company E also had cooperations with other applied software system suppliers that have the same capability to perform the same task. Compared with Company E, Company F had a long-term cooperation with an applied software system supplier and a long-term cooperative experience with a capable software supplier. The software supplier company also shared related knowledge and provided training courses to IT department's staff of Company F. Company H used cross-functional team within its company to develop the MMK service. The collaborations between Company O and software suppliers were underpinned by partners' reputation and capability in their domains. Regarding the collaborations between convenience store chains and their respective hardware manufacturing companies, previous cooperative experience and manufacturers' good reputation and capability were the main determinants of partner selection. Companies E, F and H cooperated with service content companies on the basis of previous cooperation experience and partner's reputation and capability. For example, some service content companies had joined the bill payment service of Companies E, F and H.

Table 4 shows that four convenience store chains used different informal governance mechanisms to cooperate with related actors in Multiple Media Kiosk service development.

Table 4: Four convenience store chains use different informal governance mechanisms with related actors in Multiple Media Kiosk service development

Development actors	Company E	Company F	Company H	Company O
Software suppliers	Long-term cooperation experience.	Long-term cooperation experience. Knowledge sharing and training.	Internal development	Partner's capability and reputation
Applied software system suppliers	Previous cooperation experience and capability	Long-term cooperation experience	Internal development	
Hardware manufacturing company	Partner's capability and reputation	Partner's capability and reputation	Previous cooperation experience	Partner's capability and reputation
Service content companies	Previous cooperation experience, reputation and capability	Previous cooperation experience, reputation and capability	Previous cooperation experience, reputation and capability	None. This company did not cooperate with them.

Source: Summarized by author

Based on the above discussion, convenience store chains used different formal and informal governance mechanisms with related actors in the two selected services. This research found that convenience store chains used shared ownership mechanism and had long-term interactions with partner firms in developing important functions of service such as IT system and logistics. These functions are important in constituting the online shopping with pick-up at store service and they have to be continuously improved at different stages of service development. Convenience store chains have to monitor the development progress and the quality of service development. The combination of formal and informal governance mechanisms may help convenience store chains to minimize transaction costs and to increase flexibility and openness between cooperative firms. In the MMK service, convenience store chains used similar governance mechanisms in developing the IT system. Given the availability of alternative partners in the market, convenience store chains often used the contract mechanism to manage their collaborations with e-shops and service content companies. The previous cooperation experience between convenience store chains and some service content companies in the bill payment service may reduce their communication barriers.

CONCLUSIONS AND MANAGERIAL IMPLICATIONS

This research found that Taiwanese convenience store chains often use formal governance mechanisms (e.g. shared ownership and switching cost) to collaborate with partner firms in developing strategic functions such as IT system and logistics. They rely on partner firms to develop and perform the same tasks in the target services. Affiliate companies depend on convenience store chains for financial provision, and in return they provide services to convenience store chains. The long-term cooperation between them also helps trust building, minimize monitoring costs and reduce communication barriers. Companies F, H, and O formed a joint venture in online shopping with pick-up at store service development. The joint venture then collaborated with subcontracting firms on the basis of mutual benefits and interpersonal trust for value creation. This mode of governance mechanism can reduce transaction cost and mitigate opportunistic behavior. In addition, the collaboration between convenience store chains and e-shops or service content companies tends to be characterized by contractual relations. Given the availability of alternative e-shops and service content companies with similar resources and capabilities, convenience store chains' choice of partners would depend on potential partners' reputation and capability in its domain. If potential partners have previous cooperative experience with convenience store chains in other service provision areas, they will be the prioritized partners of convenience store chains, especially in multiple media kiosk service developments. This is because some of the business modules developed during the existing cooperation between convenience store chains and partner firms can be simply transformed and moved to new client interface (Kiosk). To control non-strategic partners, convenience store chains should use more formal governance mechanism such as legal contract combined with non-compete clause.

This research offers some managerial implications. Firstly, firms should cooperate more closely with strategic partners (e.g. IT and logistics functions) by using the mechanisms of shared ownership and financial commitment initially and then developing long-term relationships and trust. Such a progressive approach can be very helpful in controlling the progress and quality of new service development, minimizing transaction costs, and

mitigating partners' opportunistic behavior. It can also facilitate knowledge and resource sharing between firms and speed up new service development. Secondly, it may be more appropriate for firms to cooperate less intensively with non-strategic partners, as these partners are less strategically important to the success of new service development. Formal governance mechanisms such as contractual obligations can be used to manage partnerships with non-strategic firms in order to prevent leakage of valuable knowledge. The appropriate combination of governance mechanisms would depend on the importance of partner firms' role in service development and the existence of market alternatives.

CUSTOMERS' RESPONSES AND THE FORMATION OF A DOMINANT DESIGN: THE EARLY MP3 INNOVATION EVOLUTION

Dr. Yi-Nung Peng, Yuan Ze University, Taiwan

ABSTRACT

The formation of a dominant design is an important milestone in the evolution of an innovation. Previous researches must focused on examining this process from the aspect of the firms. In this study, we incorporated the dominant design theory and the socio-cognitive theory to examined the customer's responses in the dominant design formation process. We studied the US portable MP3 player industry and found that dominant design (in this case the iPod) plays an important role in customers' understanding of the innovation.

Keywords: Dominant Design, Socio-cognitive Theory, MP3 Players

INTRODUCTION

This study takes two perspectives account for the emergence and the evolution of a new product within product-market. First, we take technological evolution perspective that focuses on the emergence of dominant design within the portable digital audio player industry. Second, we take socio-cognitive perspective that point at the interaction of tacit knowledge structure with respect to the new product at individual level in customer's mind and the dynamic of shared knowledge structure at societal level.

The Role of Dominant Design in Early Stage Innovation

The studies of dominant design began on industrial innovation in the 1970s (Srinivasan el at., 2006). In the early stage of industry evolution, both technology and market are highly uncertainty. Technological uncertainty associates with the degree of newness of knowledge and design solutions which is grounded on the nature of technology cycles (Tushman & Rosenkopf, 1992; Biazzo, 2009), while market uncertainty is the difficulty on understanding dynamic customer needs (even customers themselves have no idea what they really want) and capture these needs by transforming technologies into functional and symbolic aspects of a product (Tushman & Rosenkopf, 1992; Utterback, 1994; Klepper, 1996; Nelson & Winter, 2002; Biazzo, 2009). These uncertainties open a window for the diversity in product design. Firms strive to introduce wide variety of products to the emerging market in order to figure out what does the market really want. Under this circumstance, both producers and consumers are in the process of "probe and learn" and the competition between product designs may eventually catalyzes the appearance of dominant design (Utterback, 1994).
However, a dominant design is neither a radical innovation, nor necessarily the best technology. Dominant design is a set of features embedded in a particular design, which gain

significant market acceptability. The definitions of dominant design in extant literature are quite diverse (Srinivasan, Lilien, & Rangaswamy 2006). We adopted the definition offered by Utterback (1994) and operationalized the dominant design construct using Anderson and Tushman's (1990) suggestion. As they pointed out:

> *"…it accounts for over 50 percent of new product sales and acquires more than 50% market share of the product category and maintains it for four consecutive years."*

Source: (Anderson and Tushman 1990)

Anderson and Tushman (1990) syntheses previous literature and propose the concept of technology cycle which consists of four major components—technological discontinuities, era of ferment, dominant design and era of incremental change (Anderson & Tushman, 1990, 1991; Tushman & Rosenkopf, 1992). From technological evolution perspective, every technological cycle begins with technological discontinuity (breakthrough) in *stochastic* way. This implies that technological uncertainty is grounded in the nature of technology cycle and technology evolves through cycles of variation, selection and retention (Tushman & Rosenkopf, 1992).

In the era of design competition, new radical technologies are usually crude when they are first introduced and refinements are made frequently in order to compete with different technologies, thus, resulting in the *variation* of product designs. This competition between product designs may give birth of a dominant design. Once dominant design emerges, it serves as a transitional point that closed the era of ferment, and initiates the era of incremental change, which lies on the *selection* of a single product configuration.
After the dominant design appears, technologies are much more well-defined and product attributes turn out to be more specific. At this time, innovations are mostly elaborate and extend the dominant design in an incremental ways (*retention*).
In general, the era of ferment is associated with uncertainties in both technology and market. While new technology usually is not well understood as it first introduced, the product market is ill defined and product characteristics are in the absence of standard (Utterback & Abernathy, 1975; Anderson & Tushman, 1990). Both producers and consumers are in a process of experiment.

For producer, the competition is not only between variety of product design, but also between the old technology and the new technology (Anderson & Tushman, 1990). They tend to introduce wide variety of products in attempt to identify and to meet customer's needs and capture customer acceptance in shorter possible time (Clark, 1985; Sanderson & Uzumeri, 1995). The knowledge with respect to how technology should be improved and what customer really wants is remaining unclear in the era of ferment (Nelson & Winter, 2002). For consumer, choosing a new product among wide variety of product designs in the absence of standard come along with risk. When users encounter problems with the usage of product, they may provide feedback to the producer. In turn, producers learn from users' feedback and solve users' problems by launching a modified product subsequently to supplant the current model over time. This is how user and producer interact with each other and facilitates market learning (Utterback, 1994; Antonia Rosa et al., 1999). Beside, by staying close with product user, producers are able to observe how their product is actual used, what product

features are preferred and in what way to strike an effort in order to close the gap between user needs and product requirements (Utterback, 1994).

As years rolled on, due to the cumulative effort on the process of "learning by doing", the direction toward future development gradually turns out to be clear. While certain product design gradually captures considerable market acceptability, such product design is term as dominant design. Once the dominant design emerges, it reduces uncertainties in both technology and market, provides producers a clear direction for future technology development, encourages producers to make intensive investment on production, weaken consumer's 'wait-and-see' attitude, and catalyzes the diffusion of new technology and new product (Utterback & Abernathy, 1975; Anderson & Tushman, 1990). In this sense, the era of ferment is end by the emergence of dominant design.

The Emergence of Dominant Design

The emergence of dominant design is important to both producer and consumer since it serves as a guidepost to reduce uncertainties. However, there is no stand-alone theory or perspective that can completely explain what factors contribute to the emergence of dominant design.

Departing from technological evolution perspective, there are many factors contributing to the emergence of dominant design such as 1) a set of *complementary assets* (Teece, 1986), 2) the *network externalities* or *bandwagon effect* (Katz & Shapiro, 1985, 1986), 3) the *strategic maneuvering* at firm level (Cusumano, Mylonadis, & Rosenbloom, 1992) , and 5) *the communication between producers and users* (Utterback, 1994). In Srinivasan et al. (2006) findings, it showed that "dominant design is more likely to emerge with weak appropriability, weak network effects, low product radicalness, and high R&D intensity". Weak appropriability means "technology is almost impossible to protect" (Teece, 1986).

As dominant design emerges, it serves as a watershed that closes the era of ferment and initiates the era of incremental change as well as shapes the type of the innovation (from product to process innovation). This study will elaborate more on the era of incremental change in next section.

Hypothesis Development

Given the firm-customer interaction nature of the dominant design. While existing literature has been focusing on the firms' methods of promoting the formation of a dominant design; few researchers tried to understand the role of the customers in the dominant design formation process. We are trying to understand such question by examining the relationship between customer's responses and the formation of a dominant design.

Incidentally, this study using customer reviews from Amazon website as data source as well as defined it as a way of communication based on the definition of diffusion terms as "the process in which an innovation is communicated through certain channels over time among the members of a social system. It is a special type of communication, in that the messages are concerned with new ideas" (Rogers, 2003, p.5).

In addition, the formation of a dominant design stands for the resolution of the design competition and frequency of product innovation decreases. Customers, as the users, are likely mention less about the product design aspect of the innovation in question. Thus, we propose that,

***H_1**: The frequency for the customers mentioning about product innovations would decrease over time, as dominant design emerges*

Social Cognitive Perspective and the Formation of a Dominant

Taking only technological evolution perspective may not fully capture the phenomenon of market dynamic. This study also takes socio-cognitive perspective to discuss on how consumer and producer interact, make sense and shape each other's behaviors within the product market over time based on their knowledge structure at conceptual level. We tend to focus on consumer side.

Based on customer-oriented approach, product market is defined as "the *set of products* judged to be *substitutes* (Hill & Jones, 2007, p.44; Grant, 2008, p.85), within those usage situations in which similar patterns of benefits are sought, and the *customers* for whom such usages are relevant" (Day, Shocker & Srivastava, 1979). The definition implies that the substitutability of two products depends on the degree of similarity based on the product attributes within a product category and the way of usage condition (Antonia Rosa et al., 1999).

Furthermore, White (1981) proposed markets are "self-reproducing *social structures* among specific cliques of firms and other actors who evolve roles from observations of each other's behavior". Following the work of White, Antonio Rosa et al. (1999) defined product markets as "socially constructed knowledge structures that are *shared* among producers and consumers--sharing that enables consumers and producers to interact in the market". The definition implies that product markets are define by neither consumers nor producers but evolved from the interaction feedback between producers and consumers.

In addition, the demands of both parties—consumer and producer are different. While consumer demands grounded on the variety and usage of product (Day, Shocker, & Srivastava, 1979), whereas producer demands stem from the competitive positioning aim at achieving profitability and gaining market share (White, 1981; Antonio Rosa et al., 1999). While market provides a ground for both parties interact with each other.

In this sense, such a self-correction mechanism is spontaneously activated in the course of interaction and eventually an agreement at conceptual level is established and shared in between knowledge structure among both parties, which serves as guidance on how specific product are categorized (Clark, 1985; Antonio Rosa et al., 1999). This mechanism is similar to the process of the formation of a dominant design. Thus, we are trying to combine these two theories to describe the early evolution process from the customers' aspect.Under the Socio-cognitive View, the early stage of emerging product market, market conditions are always unstable and information is incomplete.

Portable MP3 Player Innovation and the iPod as a Dominant Design

Since the emergence and evolution of MP3 (MPEG-1 Audio Layer 3), a digital audio encoding format, which has brought a considerable impact on music industry as well as reshape the way people listening to music. In the period around late 90s' until the beginning of the millennium, the market opportunity was identified by great number of firms. These firms launched different brands and various models of portable MP3 player with large number of attributes to emphasize on differentiation within short period of time to the highly uncertainty market in order to catch up with the trend of music revolution. The evolution of portable MP3 player industry throughout these years provides fruitful evidence account for the industry evolution as well as product market evolution. Thus, this research selects portable MP3 player as product class to study.

Both producers and consumers have only little knowledge on each other. Once a new product (e.g., portable MP3 player) is debuted in a product market, consumer tends to deal with the novel experience arise by looking at the attributes of the new product which are similar to attributes of pre-existing product categories (e.g., CD walkman) in order to "know" the new product. Since new product usually combines both shared and unique attributes (Sujan & Tybout, 1988; Meyers-Levy & Tybout, 1989).

Based on cognitive science, people often rely on categorization or schemas to simplify and organize new things they encountered in complex environment in order to learn in an efficient way (Sujan & Tybout, 1988). By definition, a schema is "an organized mental or cognitive list that includes characteristics, facts, values, or beliefs about people, events, or objects" (Plotnik & Kouyoumdjian, 2008, p.420). The categorization activities in consumer's mind primarily involve grouping and distinguishing. This categorization process mostly rely on past experience, memory retrieval and other high-level processes which has been widely studies in marketing research such as beliefs, attitude and choice (Antonio Rosa & Porac, 2002).

Once a new product possesses certain attributes similar to the attributes of pre-existing products (previous innovations—CD walkman), the new product is consider as a member of existing product categories in consumer's mind. In contrast, if the novel product is highly innovative and incongruent with consumer's current knowledge structure, it is difficult for customer to assimilate the novel product into the existing product categories in mind. In this situation, the new product shakes the ground of customer's knowledge structure and destabilizes the boundary of existing product categories at conceptual level. As a result, the novel product tends to be positioned as product with unique core attributes in consumer mind (Clark, 1985; Antonio Rosa et al., 1999). In this sense, both cognitive knowledge structure and behavioral pattern need to be readjusted.

As new product continuous evolves over time within the product market, customer reviews contain information of new product disseminate through the market place and re-stabilize the product categories, thus the new product concept (portable MP3 players) would eventually integrates into pre-existing knowledge structure and becomes part of the knowledge structure. Thereafter, consumer relies on this "updated" knowledge structure to pilot within the "new"

product market. In this sense, the frequency of using pre-existing categories as a reference faded away as dominant design (iPod) emerges. Thus we propose that,
***H_2**: The frequency of using previous innovations as reference would decrease over time as dominant design emerges*

In the course of market dynamic which consist of mutual influence between conceptual knowledge and external stimulus, the pre-existing product category at conceptual level originally use to deal with "new" stimulus, once destabilized by new product concept gradually become stable again because of the diffusion of customer review over time. Thus, the new product "image" eventually stored in consumer's minds, consumers are gaining familiarity with the new product, in turn, the new product is gaining market acceptability, and becoming benchmark within the product category (Antonio Rosa et al., 1999). The benchmark in this study tends to derive from demand and usage condition of a product from customer viewpoint. Typically, the phenomenon of shifting in product acceptability is similar to the dominant design theory. Thus, we draw the following hypothesis that,
***H_3**: The frequency for the customer using a dominant design as benchmark would increases over time as the innovation be accepted by the market.*

METHODOLOTY

Research Design

Content analysis (Neuendorf, 2002), Z test for proportion (Berenson, Levine & Krehbiel, 2006, p.325) and logistic regression (Neter et al., 1996; Hosmer & Lemeshow, 2000; Hair et al., 2006 & Tabachnick et al., 2007) are employed in this study.

Content analysis, which is the study of recorded human communication (Babbie, 2007, p.320), is fit to the objective of this study--to investigate the interaction between consumer and dominant design, and how consumer views dominant design. The unit of analysis of this study is the customer review at message level. Content analysis is employed using *qualitative* judgment on text-form data and then coded into *quantitative* data for statistical data analysis. Human coding (2 observers) is applied in the text-form customer reviews. Both manifest content and latent content are used in the coding of this study (Babbie, 2007, p.325). While relying on human judgment, the quality of the data--the agreement among independent coders, is considered as a critical issue (Hayes & Krippendorff, 2007). In content analysis, *intercoder reliability*, which is different from other research's reliability measurement, is refers to "the amount of agreement or correspondence among two or more coders" (Neuendorf, 2002). Cohen's *kappa*, which is known as the most widely used reliability coefficient, is employed in this study (Perrault & Leigh, 1989).

Z-test for proportion and logistic regression are then applied for data analysis. Z test is employed on testing the differences between proportions of two groups of sample because of the comparison between proportions is considered to be more appropriate than directly counting on the frequencies between two sample groups in order to avoid bias. While logistic regression is used, mainly because of the dichotomous nature of dependent variable based on the coded frequencies from content analysis. For Z test and logistic regression, year 4th (2001) is used as a cut point in the period of time representing the debut of iPod in real world

as well as the emergence of dominant design in theory. The statistical analysis software SPSS (Statistical Package for the Social Sciences) 13.0 is applied in this study.

Data Source

The data of this study is the customer reviews (messages) of portable MP3 player posted on Amazon website. The main reason of choosing Amazon website as the source of data collection is because of the wide variety of portable MP3 players as well as a large pool of customer's reviews are available on Amazon website. In addition, Amazon website is considered as a platform where customers provide feedback and exchange information.

The nature of the text-form data can be counted as the way customer expresses and *communicate* their attitude and opinion toward the product under post-adoption situation, namely, the product adoption is an actual behavior and has already happened. While, there are several assumptions underlie in the customer reviews. First, the reviews are assumed written by the product users who *actual* owned the product. Second, the reviews are written by the product users who have *used experience* with the product. Third, the product users are *honest* with their written text. Forth, the reviews are *voluntary feedback* by the product users. Data are in the form of two hierarchical levels. According to the work of Tushman and Murmann (1998), dominant design is mostly describe at product level. Therefore, the first level data in this study is aim at product level that consists of different brands and various product models serves as an individual product design (n=796), which launched in between 1998 to 2006. The second level data are the customer reviews in text form under each product, which has a total of 31,830 messages (recorded on September 28, 2008). While, the unit of analysis in this study is the customer review at message-level.

Follow the work of Suarez and Utterback (1995) that separate the time period into pre-dominant design and post-dominant design. In this study, product-level data are divided into pre-iPod and post-iPod, which consists of three categories using the iPod[1] first launched date (October 23, 2001) as cut point. Three categories are pre-iPod (which portable MP3 player launched before iPod debut launched), non-iPod (which portable MP3 player launched after iPod debut launched by other firms), and iPod. iPod first launched date is defined as a watershed separated pre-iPod from iPod and non-iPod in term of time.

Among total samples (n=796) at product-level, 285 (36.8%) of the total samples are not available due to the absence of launched date, thus they are excluded in this study. The remained samples (n=511) at product-level fall into 3 categories, of which 70 samples belong to pre-iPod category, 410 samples include in non-iPod category, and 31 samples fall into iPod category, respectively. As for message-level sample, 25,963 (81.6%) samples out of 31,830 total samples remain in three categories, of which 3,050 samples under pre-iPod category, 16,501 samples under non-iPod category, and 6,412 samples under iPod category are served as sampling frame.

Sampling

Both stratified sampling and systematic sampling are employed in this study in order to draw appropriate proportion of samples from homogeneous subgroups to achieve greater degree of representativeness by decreasing the sampling error (Babbie, 2007, p.205) and to draw sample across the whole sampling frame with a random start to avoid human bias (Babbie, 2007, p.202). At first, 350 samples (68.5%) out of 511 samples at product-level are randomly draw in non-replacement way using Microsoft Excel. Among 350 product-level samples, of which 50 samples are stratified into Pre-iPod category, 19 samples are grouped into iPod category, and 281 samples are categorized into non-iPod category.

There are total 17,821 reviews at message-level under 350 product samples. The sampling interval is 16, which divided 17,821 by desired sample size 1,100 (Babbie, 2007, p.204). The desired sample size[2] is estimated by sampling error within 3 percent at 95 percent level of confidence (Neuendorf, 2002, p.83; Berenson, Levine & Krehbiel, 2006, p.278). Systematic sampling are then applied to message-level samples for each product respectively. Microsoft Excel is applied to select the first sample at random to avoid human bias (Babbie, 2007, p.202) based on the sampling interval between 1 and 16, and the sequential samples are then draw in every 16th samples in cyclical way (Neuman, 2006, p.232).

However, due to the "open system" on Amazon website, the number of customer reviews are different from the initial record date (September, 2008) and the actual data access date (April, 2009). As a result, there are 1,204 samples at message-level instead of original desire samples (n=1,100). The sample's distribution in this study will be reported in next chapter.

Operational Definitions

Product Innovation

As mentioned in previous section, both manifest content and latent content are applied in the coding of this study. Wordings such as "iPod is *new* to me, *innovative* features" are considered as latent and manifest content, respectively and defined as product innovation in this study.

Previous Innovations

Wordings such as "cassette walkman, CD walkman, MD walkman, cassette, CD, MD" are considered as manifest content in the coding process, and defined as previous innovations in this study.

iPod as Benchmark

Wording such as "iPod is the *best* player, buy iPod, get iPod" are considered to have an underlying meaning in benchmark from customer perspective. The operational definitions of variables in this study are show in Table 1.

[2] $n = (P*Q)(Z_{\alpha}/e)^2$

Table 1: Operation Definitions of Variables

Variables	Operational Definitions	Source/Reference
Product Innovation	"new technology or combination of technologies introduced commercially to meet a user or a market need."	Utterback & Abernathy, 1975
Previous Innovations	The product categories introduce prior to current product category. (eg. Portable cassette player, portable CD player, portable MD player)	Define by this study.
iPod as Benchmark	Using iPod as a point of reference from which measurement can be made.	Merriam-Webster's Collegiate Dictionary, 11e, 2003; define by this study.

DATA ANALYSIS

Sample's Distribution

Of which 350 product-level samples, there are 50 samples (14.3%) fall into pre-iPod category, 19 samples (5.4%) belong to iPod category, and 281 samples (80.3%) categorized into non-iPod category. As for message-level samples, there are 163 messages (13.5%) in Pre-iPod category, 270 messages (22.4%) in iPod category, and 771 messages (80.3%) in non-iPod category. The sample's distribution is showed in Table 2.

Inter-coder Reliability

2 human coders worked independently in the coding process in content analysis. A total of 1,204 text-form messages were coded. In the pilot study, we have a lower *kappa* values due to the disparate opinion, but after putting effort on communication and stick to the definition of coded variables, the final inter-coder reliability for each variables in this study are show in Table 3 measuring by Cohen's *kappa* values.

Although the standard of inter-coder reliability is still in debate, there is a widely accepted rule of thumb suggests that *Kappa* value achieves at .7 is consider as reliable, while above .75 is consider as high reliable (Neuendorf, 2002, p.143). In this study, the variable product innovation has a poor agreement with kappa value of .108, the variable previous innovations has a kappa value of .574, achieving a fair agreement, and the variable iPod as Benchmark has a kappa value of .734, which is consider achieving a good agreement (Byrt, 1996).

Table 2: Sample Descriptive Summary

Sample level	Product category			Total
	pre-iPod	iPod	non-iPod	
Product level	50	19	281	350
%	14.3%	5.4%	80.3%	100%
Message level	163	270	771	1,204
%	13.5%	22.4%	64%	100%
1998	20	0	0	20
1999	23	0	0	23
2000	30	0	0	30
2001	90	6	44	140
2002	0	7	136	143
2003	0	24	166	190
2004	0	65	126	191
2005	0	168	288	456
2006	0	0	11	11

Table 3: Cohen's Kappa

Variable	Cohen's *Kappa*	Agreement
Product Innovation (Y/N)	.108	Poor
Previous Innovations (Y/N)	.574	Fair
iPod as Benchmark (Y/N)	.734	Good

Hypothesis Testing & Results

Z test for proportion and logistic regression are applied in this study for testing on H_{1-3}. Z test is primarily used for testing on the differences between two proportions of consumer mentions about product innovation (H_1). While logistic regression is mainly testing on the probability of mentions previous innovations by consumer over time as iPod emerges (H_2) and the probability of using iPod as benchmark by consumer over time as iPod emerges (H_3). The independent variable is the introduction date (year) of each product models that transforms into numerical form. The summary of the hypothesis results is show in Table 4 and detailed data analysis will discuss in the following sections.

Table 4: Hypothesis Testing Results

Hypothesis	Statistical Method	Sig.	Result
H_1	*Z* Test for Proportion	.236	H_1 not supported
H_2	Logistic Regression	.000	H_2 partially supported
H_3	Logistic Regression	.097	H_3 supported

Product Innovation

Grounding on dominant design theory, as dominant design emerges, it diminishes the rate of product innovation and the innovation activities will shift from product innovation to process innovation. Hypothesis 1 predicts the frequency of mentions about product innovation by consumer would decrease over time as the dominant design (iPod) emerges. Using the year 4 (2001) as the cut point to classify data into pre-iPod and post-iPod. Z test for proportion is employed to test the different between two proportions of mention about product innovation. In Table 4-4, p1 is the proportion of mention about product innovation in pre-iPod years (1998-2001), while p2 is the proportion of mention about product innovation in post-iPod years (2002-2006).

The finding of this study suggests that there is no statistical significant different between pre-iPod period and post-iPod period (Z= -1.184, $p > .05$), Thus, H_1 is not supported. The finding is inconsistent with this study's prediction as well as the extant dominant design theory. One possible explanation for the finding might be attributed to the influence by the small portion of consumer mentions about product innovation. Overall, there are only 31 samples (2.6%) out of 1204 samples mentioned about product innovation (see Table 4-5).

Table 5: Z Test Result

D.V.	p1	p2	S.E.	Z	sig.
Product Innovation	.014	.028	.012	-1.184	.236

* $p < .05$

Table 6: Contingency Table (Product Innovation--Year)

Year	Mentioned Product Innovation		Total
	No	Yes	
Pre-iPod (1998-2001)	210 98.6%	3 1.4%	213 100%
Post-iPod (2002-2006)	963 97.2%	28 2.8%	991 100%
Total	1173 97.4%	31 2.6%	1204 100%

Previous Innovations

Based on the dominant design theory and socio-cognitive theory, this study expects the emergence of dominant design would reduce market uncertainty dramatically, while the decrease of ambiguity in consumer's knowledge structure leads to the decrease in frequency of using previous innovations as a reference to deal with new product. Hypothesis 2 predicts the frequency of mentions about previous innovations would decrease over time as dominant design (iPod) emerges.

In order to capture the drastic reduction in the phenomenon, piecewise logistic regression with two slopes is applied to test H_2. The result of the logistic regression show in Table 4-6 is the combination of two separate logistic regressions. Year 4th (2001) is used as a cut point to classify the total samples (n=1204) into 2 sub-samples (n_1=213, n_2=991) as well as to

separate new products' introduction date into 2 periods (PreiPod starts from 1998 to 2001; PostiPod starts from 2002 to 2006). The first logistic regression treats PreiPod as independent variable with n_1, while the second logistic regression using PostiPod as independent variable with n_2.

In Table 4-6, the variable PreiPod represents the effect of years for *before* iPod emerges, while the variable PostiPod represents the effect of years for *after* iPod emerges. As int1 represents the intercept for the years *before* iPod emerges, whereas int2 representing the intercept for years *after* iPod emerges. The finding shows that there is no significant (-.276, $p > .05$) prior to the emergence of iPod, whereas it is statistically significant (-.337, $p < .01$) once iPod emerges. Thus, H_2 is partiallt supported. The coefficients, B, is the natural logs of the odds ratio = e^B. The odds ratio of $e^{-.337}$=.714 means the odds of consumer using previous innovations to deal with new product (iPod) decreased by 28.6 percent (1-.714) as likely with one year passes by (Neter et al, 1996, p.577; Tabachnick et al, 2007, p.462). Note that, in this model, Cox & Snell R Square & Nagelkerke R Square are not valid and should not reported[3].

Table 7: Logistic Regaression Results on Previous Innovation

Variable	B	S.E.	Wald	df	Sig.	Exp(B)
int1	-1.572	.690	5.182	1	.023	.208
int2	-1.153	.156	54.615	1	.000	.316
PreiPod	-.276	.326	.718	1	.397	.759
PostiPod	-.337	.061	31.100	1	.000	.714

Note: Exp(B) = odds ratio

iPod as Benchmark

In this section, samples in pre-iPod category (n=163) are excluded due to the samples are prior to the debut of iPod. Only post-iPod category samples (n=1041) consists of iPod category and non-iPod category are used for data analysis.
This study expects the frequency of using iPod as benchmark would increase as iPod emerges as dominant design and gaining popularity over time. The finding is statistical significant ($p > .1$). The odds ratio of 1.108 suggests that the probability of consumer using iPod as benchmark increased by 10.8 percent as likely with one year passes by. Thus, H_3 is supported.

Table 8: Logistic Regaression Results (iPod as Benchmark)

Variable	B	S.E.	Wald	df	Sig.	Exp(B)
INTRO_D1	0.102	0.062	2.752	1	0.097	1.108
Constant	-2.048	0.436	22.016	1	0.000	0.129

Note: Exp(B) = odds ratio

DISCUSSIONS

Discussions

Product Innovation

The finding of this study on H_1 is not compatible with the existing dominant design theory. It indicates that there is no different in product innovation as iPod emerges. There are several possible reasons yield the finding. First, the different perspective in product innovation might cause different finding. While the product innovation in this study, is defined in the eyes of customer rather than firm's perspective. Second, the insufficient cases of consumer mentions about product innovation might fail to provide persuasive conclusion. Third, in high-tech industry, the fast changing rate in technology, the shorter product life cycle and the dynamic customer's demand might be the forces drive firms to innovate in order to strike for survival in competitive environment as well as distinguish from other competitors. Thus, the rate of product innovation persists, regardless of the emergence of dominant design. Fourth, the dominant design theory might not be able to generalize across industries (Klepper & Simons, 1996).

Previous Innovations and Using iPod as Benchmark

When portable MP3 player market first emerges, it is full of uncertainty in both technology and market needs. Typically, in the early of new emerging market, there are wide variety of new portable MP3 player. While customer encountered a new portable MP3 player which is not compatible with pre-existing product categories such as CD walkman and MD walkman, they feel ambiguous because of the unfamiliarity brought by innovativeness and tend to rely on existing knowledge structure on pre-existing product categories' attributes and retrieving own past memory or usage experience in order to deal with the new portable MP3 player. In this sense, attributes of pre-existing products are used as a point of reference in a reverse way to cope with ambiguity and to process information in an efficient way. Grounding on dominant design theory, as iPod appeared to be a dominant design in the portable MP3 player market, it reduces the market uncertainty as well as consumer's ambiguity. As a result, the frequency of mentions about pre-existing products decreases over time as iPod emerges. The finding of this study is compatible with the dominant design theory.

Although, iPod is not the first mover in portable MP3 player market, however, the empirical finding in this study shows that the frequency of using iPod as benchmark gradually increases over the years. This implies that iPod is not only captures market share in real world, but also gradually destabilizes the existing knowledge structure mainly grounded on pre-existing product category and eventually become the frame of reference for portable MP3 player in customer mind. In other words, as the product market evolving, customer's knowledge structure is changing! In this sense, iPod is facilitating the diffusion of innovations.

Managerial Contributions

The following are the contributions of this study.

1. This study is able to fill the gap in previous literature by providing empirical evidence

regarding the impact of iPod on portable digital audio player industry from customer perspective. The text-form customer review analyze by content analysis in this study is different from the existing viewpoint (i.e. producer-side) on dominant design. The nature of data is derived from customer's perception toward dominant design at product level.

2. This study is different from previous researches in technological evolution theory and socio-cognitive field that are conducted separately. This study combines both technological evolution theory and socio-cognitive theory to portray the evolution of an industry as well as the dynamic of product market.
3. This study can be a reference for managers in portable digital audio player industry. It portrays customer reviews on several issues, such as their feedback toward dominant design, how they mentioned about dominant design at product level, what kind of attributes or features are preferred in portable digital audio player.
4. This study provides an alternative method in measuring the impact of dominant design which is different from previous research. In the existing dominant design literature, the product innovation is count on the basis of an individual product, whereas in this study, product innovation is count on the frequency of mentions about product innovation which derive from customer perception.

Limitations

The limitations of this study are show as follow,

1. The varying quality of customer reviews on website is uncontrollable due to the open space for any customer without having any filtering on the reviews. While the customer reviews might be affected by perception and individual difference.
2. There might raise a challenge of assuring the customers who provide review on Amazon website can be the representative of the whole population of portable digital audio player's user.
3. Due to the poor agreement on the inter-coder reliability on product innovation with Kappa value of .108, it is difficult to operationalize on product innovation.
4. As years rolled on, same needs at different given point in a period of time are not grounded on the same property. For example, storage capacity with 512MB is considered as large storage capacity in the early stage of technology's development, whereas it is treated as insufficient storage as technology continue evolves and improves over time. In other words, both product's features and customer's needs are dynamics in longitudinal perspective. Thus, increase complexity and challenges for this research.
5. There are some interesting phenomena can only be captured in qualitative study. For example, once a new technology emerges, it serves as a solution for a particular problem, but at the same time; it opens a window for new problem. Say, as CD emerged when cassette was still served as mainstream in music industry, CD permits sustained storage life for keeping music relatively longer to cassette. However, it opened the skip problem for CD walkman at the same time. The skip problem remains through the development of portable digital audio player, until the hard drive based portable audio player shift to flash memory based player.

Future Research

The future researches for this study are show as follow.

1. Larger sample size can be considered in order to provide persuasive empirical evidence in the future study.
2. The data collected from Amazon website are mainly come from the customer in United Stated. Customer from different regions might yield different opinions.
3. The interaction between dominant design and other complementary assets such as iTunes and personal computer (PC) is consider to be included.
4. The complexity and dynamic of cognitive structure might be only partial understand, remain room for future study.

THE INNOVATION IN MODELLING THE IMPORT DEMAND

Dr. Sue Ling Lai, Chinese Culture University, Taiwan
sueling@faculty.pccu.edu.tw

Juang-Horng Chueh, Chinese Culture University, Taiwan
jiuhher@seed.net.tw

ABSTRACT

This study investigates the effect of real exchange rate and domestic production on import demand by using the evidence of Taiwan's Phosphor Bronze (PB), which is one of the most important materials for producing connectors of computer, communication and consumer electronic products. Monthly data for the period of January 1989 to December 2008 are used to estimate the import demand function. Time series methods applied in this research are cointegration tests and error correction models. The results suggest that the effect of domestic production on the import demand of PB is not significant. Real exchange rate serves as a more important indicator of the import demand. The evidence of Taiwan's imports of PB provides two implications in inventory management to the importers and exporters in the copper industry. First, the quantity of domestic production of PB does not influence the import demand of PB significantly. Second, any changes of real exchange rate may produce great uncertainty in the exporting countries of PB.

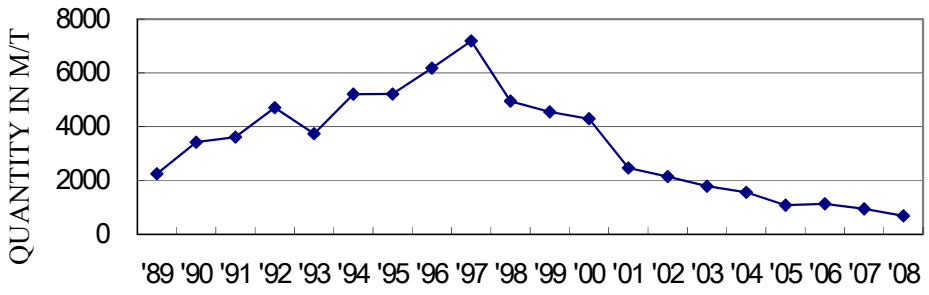
Keywords: Innovation, Inventory Management, Import Demand, Phosphor Bronze

INTRODUCTION

According to Greenspan (2009), Taiwan and China together are now the world's largest original euipment manufacturers (OEM) of computer, communication and consumer electronic products (3C-products). One of the most important materials in producing these products is Phosphor Bronze (PB). PB is an alloy of copper with 3.5% to 10% of tin. These alloys are known for their hardness, tension strength, and low resistance to electric current. Mostly, PB is used to make some electrical circuits due to its low resistance to electric current. ASTM C51000, C52100, and C50700 of PB are commonly used for many connectors in a wide variety of 3C-products.

Japan has been the biggest exporting country of PB since 1989. According to Taiwan's Bureau of Foreign Trade, about 93% of PB was imported from Japan in 2008. In 1989, about 2,225 metric tons of PB was imported from Japan. This was increased to 7,192 metric tons in 1997 and then gradually reduced to 688 metric tons in 2008 (FIG. 1).

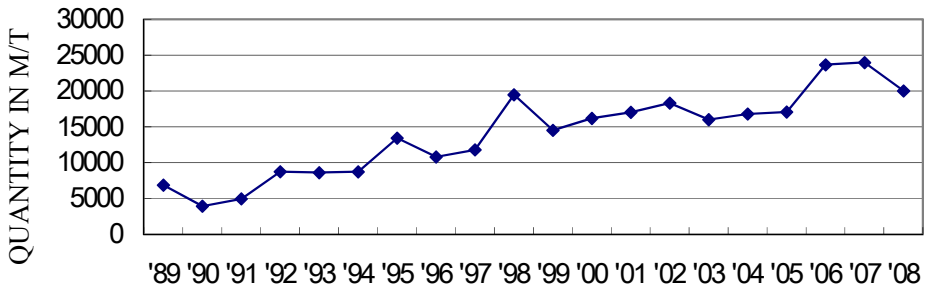
FIG. 1 *Quantity of PB imported from Japan*



Source:Taiwan's Bureau of Foreign Trade

In 1989, there are 6,897 metric tons of PB produced in Taiwan. The quantity was steadily increased to 23,972 metric tons in 2007 and slightly decreased to 20,024 metric tons in 2008 (FIG. 2).

FIG. 2 *Quantity of PB produced in Taiwan*



Source: AREMOS

At the beginning of the 1990s, personal computer (PC) industry was growing very fast in Taiwan, which increased the consumption of PB. On average, the growth rate of PB demand in Taiwan was more than 20 percent annually in the 1990s. In the meantime, the manufacturers in Taiwan gradually moved their factories to China to lower their manufacturing costs. In a very short time, Taiwan and China have become the largest 3C-product OEM countries in the world. However, the Chinese manufacturers were not able to supply high-quality PB. Therefore, Taiwan served as a material and component provider to China. However, Taiwan's PB producers had great difficulty in meeting the demand of the market. The manufacturers in Japan could meet the difference of PB and export more than 90% of PB to Taiwan. Because of the need for 3C-products in the global market, Taiwan has become a very important supplier of PB to China. Therefore, to estimate the import demand for PB and the effect of real exchange rate on import volume of PB in the Taiwan market have become an important issue. In this study, the effect of the domestic production of PB and the real exchange rate of the New Taiwan Dollars (NTD), the Taiwanese currency, on the import demand of PB from Japan will be examined.

LITERATURE REVIEW

In the past two decades, several studies have found the evidence of a negative relationship between real exchange rate and import demand (Kenen and Rodrik, 1986; Koray and Lastrapes, 1989; Arize, 1998; Arize and Shwiff, 1998). Some research use price elasticities to explain import demand. Stone (1978) found that the demand for steel was highly sensitive to price. Most studies use steel as evidence of import demand (Crandall, 1982; Foroutan, 1986). Williams and Botzman (1994) used the quarterly data between January 1981 and December 1990 and investigated the effect of the USA–Canada Free Trade Agreement (FTA) on imports and exports of steel products. These previous studies all shows that the import demand for steel is affected by the real exchange rate and domestic production of steel. However, whether we can apply the previous results of steel to PB has become an important issue since PB is such an important material for producing connectors of 3C products, but there were hardly any studies relating to the import demand for PB after the 1970s. In addition, these previous studies did not consider the problems of stationarity of the data. Therefore, this paper will find a suitable model for the import demand for PB and provide managerial suggestions to the importers and exporters in the copper industry.

MODEL SPECIFICATION

A traditional import demand model developed by Gotur (1985) explains the long-term equilibrium of supply and demand functions. Gotur's (1985) model is applied to investigate Taiwan's import demand for PB products. In this model, the volume of PB imports from Japan is assumed to depend on the domestic production of PB in Taiwan and the real exchange rate, i.e. the ratio of import price and domestic price of PB expressed in the same currency. The general function of the model is as follows:

$$M_t = f(Y_t, ER_t)$$

where M_t is the volume of Taiwan's imports in time period t, Y_t is Taiwan's domestic production of PB, ER_t is the real exchange rate measured in terms of NTD per US dollar. An increase of ER means a depreciation of NTD. This will make the costs of Taiwan's PB imports more expensive.

The formula for ERt is the following:

$$ER_t = EN_t * P_t^f / P_t^d$$

where EN is nominal exchange rate of NTD per US dollar, P_t^f is Taiwan's import price of PB, P_t^d is the PB price in Taiwan's domestic market.

Following Gotur (1985), we obtained the model as follows:

$$M_t = \beta_0 + \beta_1 Y_t + \beta_2 ER_t + \varepsilon_t$$

where β_0 is the intercept, β_1 is the coefficient of domestic production of PB in Taiwan, β_2 is the coefficient of the real exchange rate, andε_t is the residual.

METHODOLOGIES

This study uses unit-roor tests, cointegration tests, and error correction models (ECM) to analyze the effect of the domestic production of PB in Taiwan and the real exchange rate on the PB imports of Taiwan. The classical regression model assumes that the time series data of both the dependent variable and independent variables should be stationary and that the errors have a zero mean and a finite variance. If the time series data are not stationary, there might exist a spurious regression (Granger and Newbold, 1974), which has a high R^2 and t-statistics that are significant but the results are without any meaning. Therefore, augmented Dickey–Fuller (ADF) tests (Dickey and Fuller, 1981) are applied to examine the stationarity of the data for the higher order of integration. Then, the first cointegration relationship is established between the volume of Taiwan's PB imports and domestic production of PB in Taiwan. The second cointegration relationship is established between the volume of Taiwan's PB imports and real exchange rate. The short-run and long-run of the above relationship are examined by error correction models.

Unit Root Tests

In order to provide a stationary process, time series data must be examined by how many times they have to be differenced. These data are defined as first difference if they have to be differenced once to achieve stationary. ADF tests are applied to obtain the order of their integration.

Cointegration Tests

Granger (1981) and Engle and Granger (1987) first developed cointegration. If Taiwan's PB imports, Taiwan's domestic production of PB, and real exchange rate are separately integrated of first difference, then the cointegration is applied to investigate whether there is any long-run relationship between them. If these time series data have the conjoint movements, then we can define Taiwan's import demand for PB to be cointegrated with Taiwan's domestic production of PB and real exchange rate, respectively. Once there is a linear combination between them, the residual ε_t of the regression model of Taiwan's PB imports on Taiwan's domestic production of PB and real exchange rate is integrated of order zero.

Error Correction Model

If the import demand for PB is cointegrated with Taiwan's domestic production of PB and real exchange rate, respectively, we can continue to examine whether there are immediate adjustments in the changes of Taiwan's PB imports, their previous levels and domestic production of PB and the real exchange rate in term of their short-term and long-term equilibrium. The error correction model allows the long-term factors of PB imports to follow equilibrium constraints. In the mean time, their short-term factors have a flexible dynamic adjustment as well. Therefore, this model may explain the observed disequilibrium of PB imports in term of their long-term equilibrium behavior. The error correction model can be written as:

$\Delta M_t = \varphi + \lambda\varepsilon_{t-1} + w_0 \Delta Y_t + w_1 \Delta ER_t + e$
where Δ represents rate of change of variable; ε_{t-1} denotes residual of regression as
$M_t = \beta_0 + \beta_1 Y_t + \beta_2 ER_t + \varepsilon_t$

The error correction model not only suggests the immediate adjustments in the changes of PB imports, the short-term run changes in domestic production of PB and real exchange rate, but also relates the changes of the PB imports to the residual of the previous date. It allows the combination of long-term and short-term information on PB imports in the same model.

DATA AND RESULTS

We use monthly data for the period of January 1989 to December 2008, which allows us to obtain 240 observations for each of the data series for the unit-root and cointegration tests. The data are obtained from several sources. Data on Taiwan's imports of PB and the price of imported PB are from Bureau of Foreign Trade, Taiwan[1]. The domestic production, prices of PB in Taiwan and foreign exchange rate data are from AREMOS[2] of the Ministry of Education, Taiwan. The domestic PB prices are from the wholesale prices and the import prices are based on the CIF Taiwan.

Results of Unit Root Tests

Table I reports the results of unit root tests of Taiwan's PB imports, its domestic production of PB and real exchange rate. The ADF results show all the time series data tested are not stationary. However, Taiwan's PB imports, its domestic production of PB and real exchange rate are respectively stationary at first-difference level.

TABLE I THE RESULTS OF ADF TESTS

	Levels	First difference
PB IMPORTS	-1.317	-6.459*
DOMESTIC PRODUCTION OF PB	-1.697	-10.544*
REAL EXCHANGE RATE	-0.301	-6.413*

NOTE: * indicates 1% level of significance level

These results allow us to test if Taiwan's imports of PB move together with its level of domestic production of PB and real exchange rate, respectively.

[1] The website of Bureau of Foreign Trade, Taiwan is http://cus93.trade.gov.tw/FSCI.

[2] The website of AREMOS is http://www.aremos.org.tw.

Results of Cointegration Tests

Table II reports the results of the cointegration tests between Taiwan's imports of PB and the domestic production of PB. Our test statistic of 19.796 is greater than the critical value of 17.147. This means the rejection of the hypothesis of no cointegrating relationship.

TABLE II Unrestricted Cointegration Rank Test (Maximum Eigenvalue)

Hypothesized No. of CE(s)	Eigenvalue	Max-Eigen Statistic	0.05 Critical Value	Prob.**
None *	0.080788	19.79606	17.14769	0.0201
At most 1 *	0.035157	8.410516	3.841466	0.0037

Max-eigenvalue test indicates 2 cointegrating eqn(s) at the 0.05 level
* denotes rejection of the hypothesis at the 0.05 level
**MacKinnon-Haug-Michelis (1999) p-values

Table III reports the results of the cointegration test between Taiwan's imports of PB and real exchange rate. Our test statistic of 49.066 is greater than the critical value of 17.147. This means that we can reject the hypothesis of no cointegrating relationship.

TABLE III Unrestricted Cointegration Rank Test (Maximum Eigenvalue)

Hypothesized No. of CE(s)	Eigenvalue	Max-Eigen Statistic	0.05 Critical Value	Prob.**
None *	0.188438	49.06671	17.14769	0.0000
At most 1 *	0.136767	34.56164	3.841466	0.0000

Max-eigenvalue test indicates 2 cointegrating eqn(s) at the 0.05 level
* denotes rejection of the hypothesis at the 0.05 level
**MacKinnon-Haug-Michelis (1999) p-values

Therefore, these results support that Taiwan's PB imports are cointegrated with its domestic production of PB and real exchange rate.

Results of Error Correction Model

After we examined the regression equation of $M_t = \beta_0 + \beta_1 Y_t + \beta_2 ER_t + \varepsilon_t$, we found that the coefficient β_1 is not significant. Therefore, we decided to change the regression model to $M_t = \beta_0 + \beta_2 ER_t + \varepsilon_t$ and estimated the new regression equation again. The results are the following: $M_t = 643.665 + (-291.135) ER_t + \varepsilon_t$. Then we saved the residuals of the regression equation and used them to estimate the error correction model:

$\Delta M_t = \varphi + \lambda\varepsilon_{t-1} + w_1 \Delta ER_t + e$
The results of the error correction model is as follows,
$\Delta M_t = 0.029 + (-0.276)\varepsilon_{t-1} + (-89.558)\Delta ER_t + e$

CONCLUSION

This study models import demand of Taiwan's PB imports. The results show that Taiwan's import of PB is cointegrated with the real exchange rate and domestic production of PB. However, the effect of domestic production of PB on the import demand is not significant. The results of PB are different from those of steel products shown in the previous studies. The evidence of Taiwan's imports of PB is very important to the importers and exporters in the copper industry. First, the domestic production of PB may adversely affect the import demand of PB, but its effect is not significant. This means that the quantity of the domestic production is not very important to the import demand. Importers in the copper industry should pay more attention to the real exchange rate. Second, any changes of the real exchange rate may produce great uncertainty in the exports of PB. This is very important for importers and exporters to do inventory management. We suggest that future studies may use lagged variables to examine the simultaneous effect. In addition, we only examine the effect of domestic production and real exchange rate on the import demand for PB. We also suggest future studies to include wider product range to obtain more meaningful results.

ACCEPTABILITY OF WIND POWER

Tomi Mäkipelto, University of Vaasa, Finland
tomi.makipelto@student.uwasa.fi

ABSTRACT

The global economical crisis affects on the operating conditions of different business fields. The crisis has different kind of impacts on different fields depending on the capital intensity and the need of the product or service from the standpoint of the consumer. Energy industry is special due to its capital intensity, long pay back times for investments, regional political guidelines and general acceptability. In addition to economical crisis the need to cut down CO2 emissions because of the global warming has adapted the operating environment in the field.

The goal of this research is to evaluate and analyze the factors that have an affect on the acceptability of wind power investment in decisions making situation. The used research methodologies were an action analytical and a constructive case research. Empirical data was collected by using formal questionnaires, observations of the researcher and informal discussions.

The results showed that the support for wind power is high in EU-countries that have relatively little wind power in relation to country's surface area. Respectively the support for wind power varies depending on if there is visual contact or not to the property of the respondent. The resistance is higher among those who presume that they have direct view to the wind power project.

The results of this research help investors and decision makers to learn and understand how the operational environment affects on energy investments that are important for the society and also on the factors that have an effect on the growth of renewable energy forms.

Keywords: multi-criteria decision making, innovation and learning, wind power, strategic management, conditions of investment and energy industry

INTRODUCTION

The changes in energy politics have been rapid during the last few decades relative to the long pay back periods in the industry. The changes have been in the framework of the industry and in the single technical-economical guidelines. On one hand energy industry is local because of the restricted mobility of the final product (electricity). On other hand the industry is global because of the global fuel (etc. coal, nuclear and gas) and equipment market. This means that the guidelines made in EU affect differently on competitive advantage of each member country in energy production if the countries have the possibility to carry out the political goals. Parallel impact can be seen between Europe, Russia and China.

The changes in energy politics are causing modification or total renewals in the existing energy production plants. At the same time the need to build new plants is growing because of the rise in energy consumption (14).

In addition to global politics, energy production can be examined trough feelings of citizens. Politically accepted energy production form is not automatically accepted by the local people who live in the target area of the energy production project. In this research it is examined how people regard wind power in Finland, where there were only 119 wind power plants by the end of 2008 (13).

The amount of wind power construction can be reviewed with several specific indicators. These indicators can for example be the total built wind power efficiency and wind power efficiency per km^2. The relative amount of built wind power in relation to population and surface area can be reviewed with intensity factor. Intensity factor means the built wind power efficiency multiplied by the popular density per km^2 in the country in question. The intensity factor in Europe has been shown in figure 1.

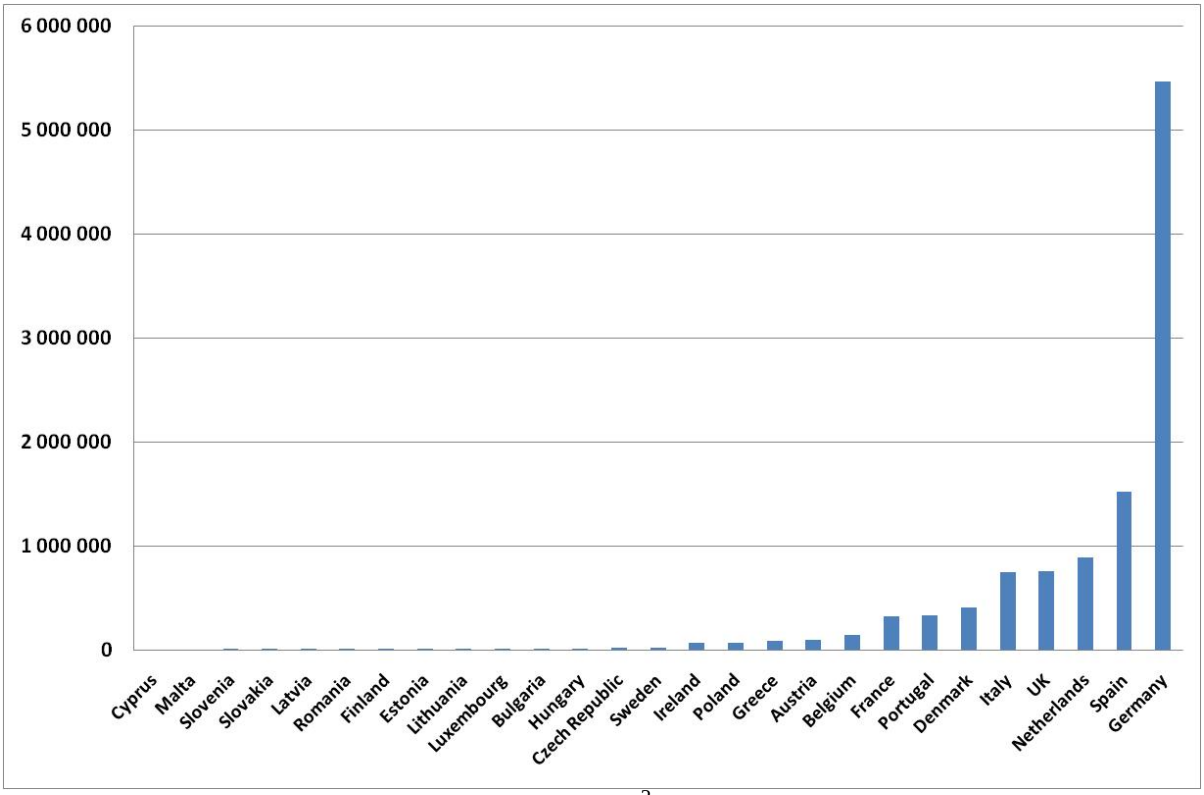

Figure 1: Population per square kilometer (km^2) multiple installed wind power capacity (MW) per each EU 27 country by the end of 2008 (9; 10)

According to figure 1 there are intensity factor about 2 200 in Finland. At the same time that factor is 888 000 in Netherlands, 1 520 000 in Spain and 5 472 000 in Germany. This means that the people experience different amounts of wind power in their everyday life depending on where in Europe they live. Maarten Wolsink (23) has researched how the wind power unit and also wind power park acceptability changes in different project phases.

Typically preparation for energy production investments can take several years, even a decade. Respectively the building stage takes typically from a year to five years and the production stage from several years to decades (cf. wind, nuclear and hydro power). This means that already during the planning process the framework can be changing. This creates a considerable uncertainty on how the operating conditions for energy power plants evolve over the years and decades.

The goal of the research

The goal of this research is to evaluate and analyze the factors that have an effect on the acceptability of wind power investment in decisions making situation. This research is restricted to apply only to wind power acceptability, because technological options are similar worldwide and economical profitability depends on each country's legislative framework. Evaluation is made by examining the acceptance of wind power projects in countries where the level of built wind power per surface area is relatively low in EU level but still produces remarkable amounts of wind power related technological products (workplace affect).

Niiniluoto (21) has used example the following formula with six Es in assessing (Technology Assessment) information and communication technology (ICT) and the qualities of technologies:

$$Technology\ Assessment = (Efficiency\ x\ Economy\ x\ Ergonomics\ x\ Ecology\ x\ Esthetics\ x\ Ethics) + Social\ consequences$$

The purpose of the formula is to make clear what factors have to be taken into account when launching ICT products. Because of the nature of the Formula, any of the Es cannot be left without consideration so that the qualities of the technology can meet the needs of the consumer.

From an ecological point of view there are several models that can be used in reviewing the consequences of the project. These models are for example the IPAT (12) and ImPACT-model (22). York et al. (24) have researched the detailed differences between these two models.

By utilizing these existing models, a specific and innovation formula can be constructed to wind power industry. With the help of the model the investment decision conditions of wind power construction can be assessed. The model consists of three factors: A= acceptance, E=economy and T=technology. In this research the model is called TEA-model.

When considering energy production projects innovation TEA-model points out on what technological (T) choices the investor can affect on. Economics (E) of the project are influenced by the price of energy, taxation and other economical and political guidelines. The acceptance (A) of the project is influenced by several outside factors, which are considered in this research.

In wind power industry TEA-model can also be reviewed as an equation:

$$F(x) = T(x) * E(x) * A(x)$$

$$0 \leq T(x) \leq 1$$

$$0 \leq E(x) \leq 1$$

$$0 \leq A(x) \leq 1$$

If $F(x) > 0$, a lot of wind power construction is taking place in the area in question. If $F(x) = 0$, wind power construction is not possible in the area.

The equation means that building wind power is possible if it is technically possible, it meets economical conditions and the project has general acceptance. Some of the factors can be left out of the equation on the grounds of obligations and entitlements based on local legislative decisions.

It can also be assumed that the same wind power technology is available everywhere in the area in question. This means that it doesn't explain the differences between countries in building wind power (see figure 1). Therefore TEA-model can be simplified in to $F(x) \sim E(x) * A(x)$.

Uncertain operating environment affects on the economical risk margins of the project and thereby required profit expectations. Anthoff and Tol (3) have researched the complexity of the planning by examining expectations for return on investment in different locations.

The large amount of technological solutions is part of the uncertainty of operating environment. When examining the development of sustainable energy production Lund (19) has found three starting points: savings in energy consumption will be remarkable when examining consumption (5; 18); energy production should be more and more efficient (16; 17); fossil fuels will be replaced by renewable energy fuels (1; 2). EU's climate and energy political decisions also support these three points (6; 7).

Wind power investments are typical capital intensive investments. The fixed costs are remarkable compared to variable costs. The length of absolute lifecycle of investments has a great impact on the profitability.

This also has a great affect on assessing the risk that has an impact on the whole profitability of the project. The framework of future is hard to asses and therefore the influence it has on energy investments future profits and costs structure.

With the technological choices of the energy production method it is possible to impact on the cost efficiency and therefore profitability. The relative efficiency of energy production in relation to investments in the long run tells about the efficiency of the production method.

RESEARCH DESIGN, STRATEGY AND THEORETICAL FRAMEWORK

The design of this research has been constructed so that it meets the epistemological and ontological world of the research. Research epistemology addresses how we come to know the reality by identifying the particular practices. Respectively ontology explains the relation of the research to the real world. Epistemological topic definitions are made in the part that

concerns the goals of the research. Ontological part is being answered trough observations that are made based on the research results. Empirical observations of the research increase the ontological relation to the real world.

In this research, an innovative and theoretically justified solution is created for a practical problem. Research approaches that are used in economic sciences can be classified with different methods. Neilimo and Näsi (20) have identified four different research approaches: nomothetical, decision oriented, action oriented and conceptual. Kasanen, Lukka and Siitonen added a constructive approach to the list above in their publication in 1993 (15). Respectively Arbnor and Bjerke (4) have identified three methodological approaches through the debates concerning research paradigms (figure 2).

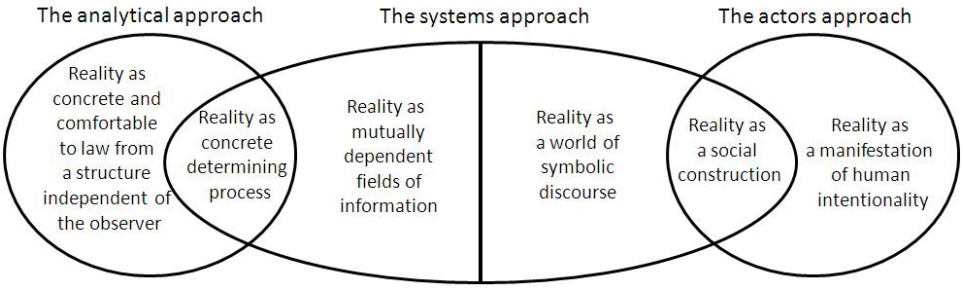

Figure 2: The three methodological approaches (4)

This research has features from several different research approaches. According to Neilimo's and Näsi's (20) definitions the research is closest to action oriented research approach. According to Neilimo and Näsi (20) characteristics of action research are the following

- teleological explaining method,
- action science,
- the goal is to understand,
- empirical part usually consists of only few units,
- there is no established methodological rules and
- results are often concept systems.

Respectively when reviewing the research with Arbnor's and Bjerke's (4) definitions the approach is closest to systems approach.

This research is constructed around qualitative research approach. In a qualitative research the goal is to understand the researched phenomenon. This means determining the meaning or purpose of the phenomenon and constituting a deeper conception on the topic (11).

In this research, empirical data was collected by using formal questionnaires and by using the researcher's observations including informal discussions. In this research, an innovative and theoretically justified solution has been created to answer a practical problem. The results have been tested with a weak market test. The approach is constructive (15).

The research method is an action research in which the research is combined with existing theoretical knowledge and after that empirical results are compared with existing theory. The external validity of the model has been tested with a "weak" market test including a questionnaire for citizens. The internal validity of the model was tested by raising the amount of applicants.

BUILDING THE RESEARCH METHOD

This research focuses on analyzing the acceptance of wind power and strategic decision making in changing operation environment. This is new because researched focusing country where wind power is quite new and viewpoint is different than researched which focusing general public acceptance or how to the acceptance develops during the project (8; 23).

The research method is based on large survey conducted by random sample in which the respondents were asked about their background, experiences and their ideas about future of energy industry in general and especially about wind power.

Research data was collected by a separate questionnaire. The questionnaire was implemented in native tongue of the respondents. (Finnish and Swedish). Questionnaire was targeted by a random sample so that it considered a real wind power plant and real project plans in Finland. Background of the respondent was examined and the fact if the respondent was able to see the planned wind power plant from his property. As an appendix of the questionnaire a report about the wind power plant and its details was delivered to the respondents so that they were able to relate their own positions toward the project.

The key questions focus on each

- project area and the familiarity of the respondent with and the use of the area,
- experiences of the respondent on wind power plants,
- attitude of the respondent toward different energy production modes,
- views of the respondent on the current stage of their living environment, the project and its impacts and
- background information of the respondent.

Questionnaire was constructed with the help of TEA-model so that the sub-groups of Acceptance (A) factors, which are required for external acceptance, were analyzed from the standpoint of wind power projects.

Planned wind power plants are located in an area, where there already exists a component industry that focuses on energy production. This means that the research focuses on areas where there already are wind power related jobs even though there is not a lot of wind power production.

RESULTS AND ANALYSIS

This research was conducted in Finland, in the area of western Finland, where the wind power industry has mainly focused. The results of the research form around nine different

wind power projects. People for this research were selected by a random sample selection and a standardized questionnaire was used in order to raise the quality of the answers.

The questionnaires were delivered by a random sample to households located near the project areas in spring and summer 2009. 2 782 persons answered the questionnaire; answering percentage was 30 per cent. 39 per cent of the respondents were females and 61 per cent males. The most active age group was 51-65 year olds.

The answers were gathered concerning both land and offshore wind power projects. Land wind power projects were quantitatively more but unit sizes were smaller than in offshore wind power projects. The impact factors were divided into positive and negative impacts. The questionnaire was conducted in a two-way manner so that the respondent was able to determine the level of negative or positive response.

In examining the positive impacts of wind power plants, separate surveys were made considering the impacts on image and economy of the city, employment rate and climate change. The results were compared between two groups; the respondents who have direct view to the wind power plants and the respondents who have not.

One interesting fact is that on the base of the research results the respondents expect that wind power plants have relatively more positive impact on the image and economy of the city and employment rate than on climate change. Other significant fact is that the direct view to the wind power plant has no remarkable significance when analyzing the positive impacts.

Respectively when analyzing negative impacts of wind power plants based on landscape, birdlife, cultural environment, residential satisfaction and noise it can be seen that the negative impacts accentuate among the respondents who have direct view to the plant. The negative impacts are largest among birdlife and landscape.

In addition to negative and positive impacts the respondents were asked how energy should be produced in the future in Finland. The citizens would like to have new wind power plants (72%), new incineration plants (42%) and new power plants in biofuels (41%) (figure 3).

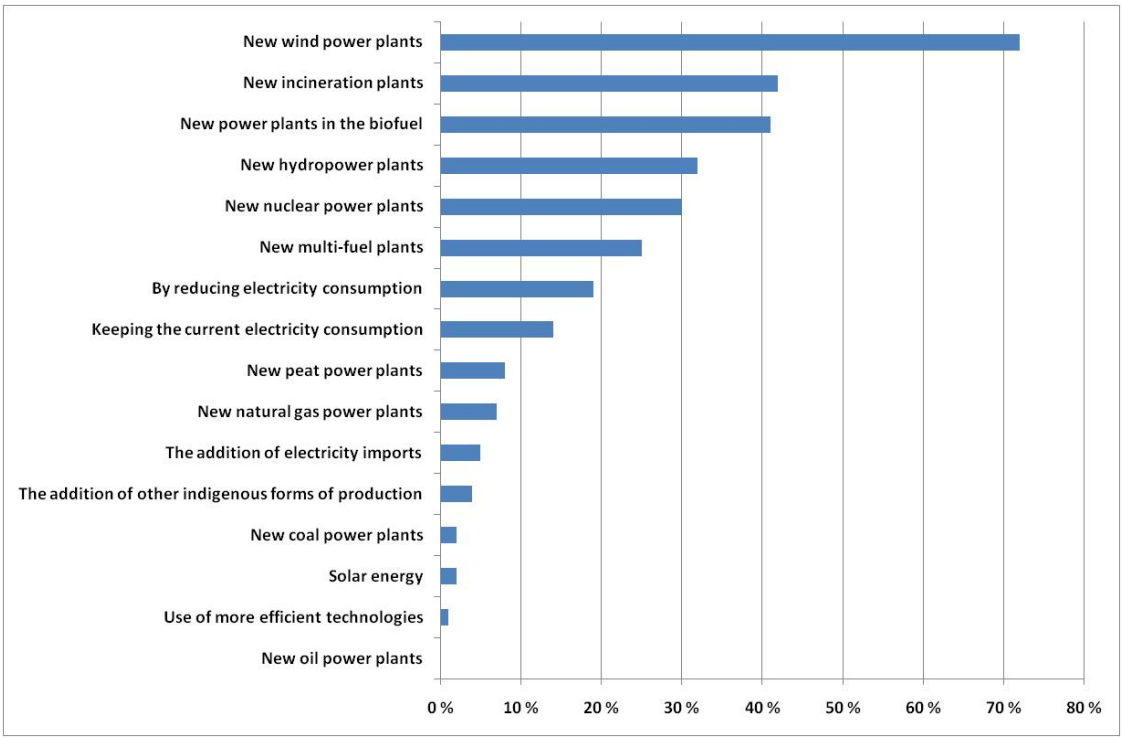

Figure 3: The desired way to produce future energy in Finland (n=2534)

When reviewing energy production in Finland on a general level, the respondents had the chance to comment energy production in general and therefore the weight towards the nearby designed wind power plant decreased. The results show that wind power is supported in general but not so strongly in nearby areas.

When accounting the Acceptance (A) factor, which is a precondition for realization of wind power plants, a clear connection is found between the two respondent groups: the ones who have direct view to the plant and the ones that have not. The location of the plant clearly has an effect on the attitude of the respondent towards the plant.

The accounting was implemented by transferring the responses of Acceptance factors into numerical form:

highly negative	0
rather negative	0.25
no effect	0.5
rather positive	0.75 and
highly positive	1.

Based on the responses a weighted average of Acceptance factors was calculated between two different respondent groups.

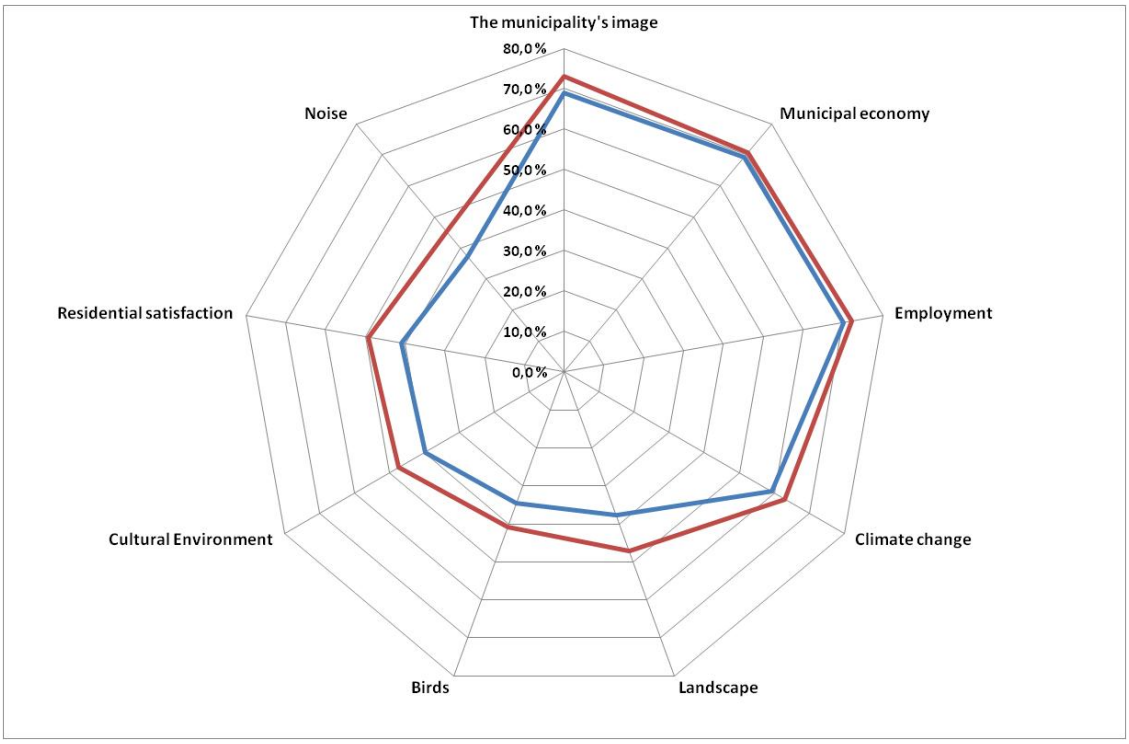

Figure 4: Differences on Acceptance factors of wind power between the respondent groups who live nearby the project area who have not direct view to the project area (red line) and who have direct view to the wind power plant (blue line)

According to the research 72 per cent of the respondents support wind power on a general level (compare figure 3). Respectively when examining the Acceptance factors among the group who live nearby the wind projects the support rate is 56.7 per cent and 50.9 per cent among those who have direct view to the project area (figure 4). Significant fact is that when reviewing group who have direct view to the project area, the impacts were seen more negative in every single Acceptance factor.

When reviewing the relative differences of the results between two different respondent groups, especially the impacts on landscape, residential satisfaction and noise come up. Irrespective of the respondent group the impacts on employment and municipal economy are seen parallel within both groups. Figure 5 clarifies the relative differences in the answers of two respondent groups: the ones who have direct view to the planned plant and the ones who have not.

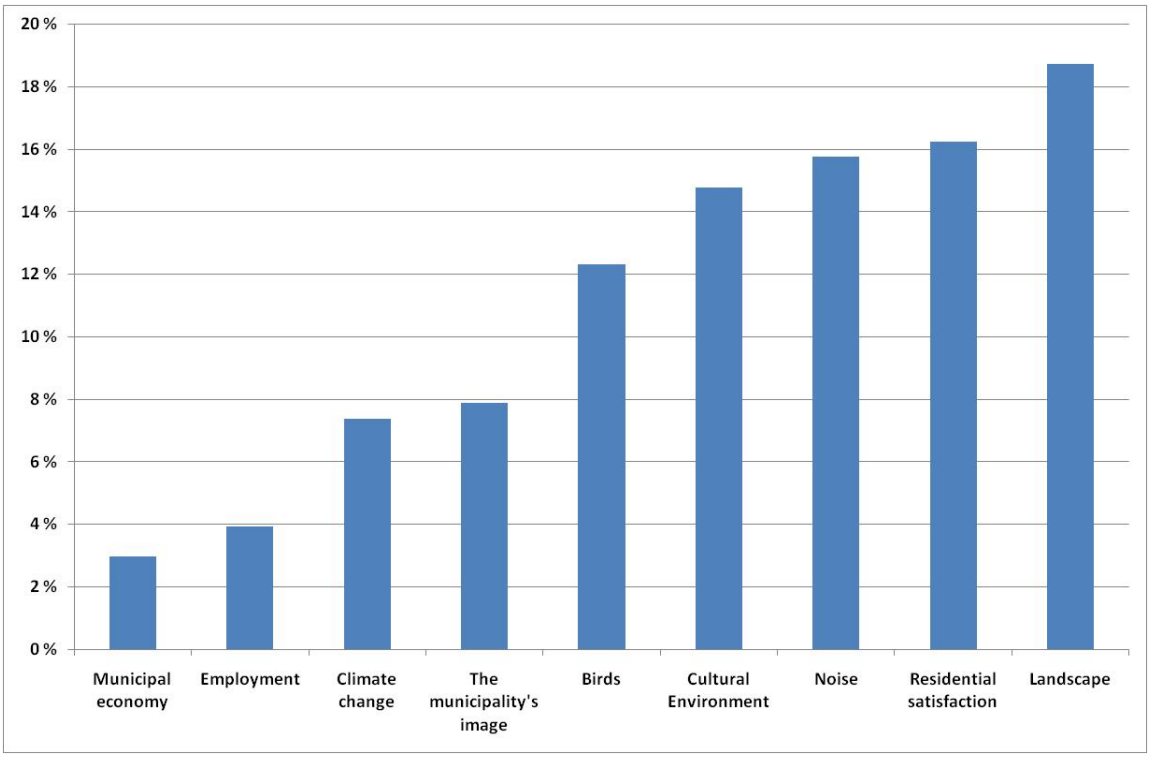

Figure 5: The relative difference of respondent groups on different impacts

According to the research results it can be seen that general acceptance for building wind power is on a relatively high level in Finland. The closer to the planned wind power plant people live the more the acceptance rate decreases.

Hence on the grounds of the research results the original TEA-model formula $F(x) = T(x) * E(x) * A(x)$ can be defined so that factor A(x) is dependent on the population rate in the area where wind power construction is being planned at. The effect of this factor can be reduced by legislative control.

Respectively economical means (factor E(x)) can be utilized in growing wind power construction. This means for example better ability to pay compensation for the people that are harmed by the project.

EVALUATION OF RESULTS AND FURTHER RESEARCH

At the moment wind power is something quite new in Finland. Finland has the thirteenth least installed wind power in Europe in 2008. The current energy and climate politics support the increase of renewable energy sources in EU and also Finland.

The results of the research are based on vast questionnaire partly conducted in areas in where there are plans for wind power parks. Based on the results it can be seen that Finns are ready for building of wind power, especially in cases where the plant is not planned in the nearby area of their property.

The research material was gathered by mail delivered questionnaire. In this research citizens were asked on their opinions about the wind power by several different questions. The research is partly quantitative and partly qualitative.

When reviewing the quantitative part of the research the validity and reliability of the methodologies of information gathering are crucial for research results. In this research the reliability was raised by measuring the same factor with several variables. Special attention was paid to most crucial factors, which delivered new scientific information for scientific discussions. Validity was tested by using evaluations of experts in the industry on how the asked questions measure the examined factor.

In wind power industry innovation TEA-model equation $F(x) = T(x) * E(x) * A(x)$ means that wind power construction comes possible if the building process is technically possible, if economical conditions are met and the project has general acceptability. Some of the factors in the equation can be disregarded on the grounds of legislative obligations and authorizations.

It can also be presumed that same wind power technology is available everywhere. Therefore it does not explain differences in wind power construction between countries (see figure 1). Hence TEA-model equation can be simplified into form $F(x) \sim E(x) * A(x)$. The acceptability factor A(x) of the equation is dependent on the population rate in the project area and the country's legislation. With economical factor E(x) it is possible to influence on factor A(x), so that the conditions for the investment are met.

Possibilities for further research are deepening the research results and improving the quality by conducting the surveys on every area where there are plans for wind power parks in Finland. It is also possible to widen the research by making international comparison between different countries.

CONCLUSION

The objective of the research was to evaluate and analyze the factors that have an effect on the acceptance of wind power and thereby on the conditions of investment decisions. The examination was made on three different levels: by examining the general acceptance of wind power, the acceptance in areas where wind power parks are planned and the attitude of those who have direct view to the planned park.

The goals that were set for the research were achieved. Based on the research it was found out that in a country where there is little wind power relative to surface area, the attitude towards wind power is mainly positive. The closer to the planned plant people live, the more the positive attitudes decrease. On deciding on the international emission reduction not only economical factors should be taken into account but also the impacts of general acceptance of wind power.

The research results help decision makers to learn the piece of the framework around building wind power and especially in Finland. The research is a contribution to science because they fulfill the goal that was set for this research and the research results fulfill scientific debate on

construction of energy production modes, especially wind power, from investors' point of view. This work links also to the existing scientific research.

In the future the research can be broadening to cover different countries. Comparison can also be made within the country in relation to time and examine more deeply how E(x) and A(x) are dependent on each other in different countries at different times.

COMPARISON OF COMMERCIAL ERP AND OPEN SOURCE ERP IN PRODUCTION PLANNING AND CONTROL MODULE

Pailn Udomsanti, International Graduate Program In Industrial Engineering
Department of Industrial Engineering, Kasetsart University

Pornthep Anussornntisarn, International Graduate Program In Industrial Engineering

ABSTRACT

An Enterprise Resource Planning (ERP) program is regarded as factory operating system. Due to a trend of using information technology in improving organization and the lower cost of information technology device, a lot of Small & Medium Enterprises (SMEs) have implemented the ERP systems in resent yeas. One of the obstacles in implementing computerized factory management system such as ERP for SMEs is the implementation cost. Currently, the ERP market is still dominated by big and expensive products such as SAP or Oracle. In 2007, SAP had 42% market share of ERP license and 27% of total ERP implementation market share. Therefore, many SMEs has looked into cost sensitive alternative, in this case, an open source ERP.

This research intends to access the gap and study the difference between SAP ERP package, the well-known open source ERP called "Openbravo", and theoretical framework in production planning and control proposed by APICS (the Association for Operations Management). The results of this research can be used as recommendations or guidelines for SMEs in implementing the open source ERP to achieve the similar results in production planning and control as SAP implementation. Based on the gap analysis, both of ERP packages: SAP and Openbravo, do not complied with APICS framework. However, most of SAP workflows in its production control module follow the APICS production planning and control framework except the supply plan. SAP only focuses on the finished product demand and its relationship with sale history and demand forecast. Supply plan is recommended by APICS framework which is a report the shows all available capacity of resources. The planners will able to see how much they can increase or decrease demand. The supply plan will help planner to quickly analyze and respond to management & marketing changes in strategy or execution. Unlike SAP, Openbravo has many missing features comparing to APICS framework. The significant missing features are the manufacturing resource planning and analysis such as rough cut capacity planning and capacity requirement planning. In other words, Openbravo is generally has a weakness in implementing MRP II concept (known as Manufacturing Resource Planning). However, this weakness does not lead to the conclusion that SMEs should avoid using Openbravo when manufacturing resource analysis is critical. Instead, a small program or application, such as spreadsheet, should be developed and linked with Openbravo database in order to analyze the capacity required by each resource in each production period.

Keywords: Open source ERP, MRP, MRPII, SAP, Production planning and control

1. INTRODUCTION

An Enterprise Resource Planning (ERP) program is regarded as factory operating system. Most of the large and successful companies commonly implemented the ERP application in their organizations. Similarly, the Small and Medium Enterprises (SMEs) also considered the benefits of implementing information technology like ERP to increase the effectiveness of their operations. Due to the trend of lowering cost of information technology device, a lot of SMES have implemented the ERP systems in resent yeas. One of the obstacles in implementing computerized factory management system such as ERP for SMEs is the implementation cost. Currently, the ERP market is still dominated by big and expensive products such as SAP or Oracle. In 2007, SAP had 42% market share of ERP license and 27% of total ERP implementation market share (Jacobson et. al., 2007). Therefore, many SMEs has looked into cost sensitive alternative, in this case, an open source ERP.

Recently, the open-source ERP have become a popular alternative and widely been implemented among small and medium enterprises (SMEs) due to a lower cost in particular license fees. In addition, source codes of open-source ERP always visible and available to download. Developers of each company can modify the program to be suitable for their business. The open source ERP vendor, Openbravo S.L., is selected as open source ERP application in this research. The Openbravo S.L. provides two software solutions which are ERP and POS (Point of sale). The ERP program is fully web-based system, so that the users can access the system from anywhere, if they have an internet connection. Head office of Openbravo S.L is in Spain. The company revenues are from sale and delivery of services to their partners around the world. Some service types are fee-based, like training, supporting, custom development, consultancy and providing an important source (McConnachie, 2007). The reason of selecting this vendor is Openbravo ERP is the successful installing in SME business (Serrano and Sarriegi, 2006), and it has the highest downloads and project activities in 2007 (Johansson and Sudzina, 2008). It represents that this ERP vendor has high potential grasping the market share from any other open-source vendors or even license ERP vendors.

Open source ERP	November 27	September 13	Downloads during ten weeks	Start of the project
Compiere	1,296,098	1,267,160	+28,938	June 8, 2001

Figure 1. Number of Downloads of open-source ERPs 2007
Source: ERP systems and open source: an initial review and some implications for SMEs (B. Johansson and F. Sudzina, 2008)

Although an idea ERP system should support the majority of enterprise business process, the production planning is the most complicated area for manufacturing company. Due to

changing demand and strategy, most of companies prefer flexible system more than constraint-based logical planning. SAP provides Production Planning and Control module (PP) which are many planning base such as discrete manufacturing or shop floor production, Repetitive manufacturing, Process manufacturing, Kanban and Engineering to order production. On the other hand Openbravo provides Material Requirement Planning module (MRP) and Production Management module (PM) which is orientated toward covering the usual necessities of a discrete production environment.

	Average Number of Users	Average Software $'s	Software $'s per User	Average Service $'s	Average SW+Service $'s	Software + Services $'s per User
Infor	104	$237,170	$2,290	$169,035	$406,205	$3,922
Lawson	195	$408,333	$2,086	$383,333	$791,667	$4,044
QAD	148	$328,706	$2,201	$301,633	$630,339	$4,221
Oracle	440	$1,159,091	$2,633	$960,455	$2,119,545	$4,816
SAP	385	$830,033	$2,249	$1,382,500	$2,212,533	$5,995

Source: AberdeenGroup, August 2006

Figure 2 Average Software and Service $'s by Vendor
Source: The Total Cost of ERP Ownership by Aberdeen Group (Jutras C., 2006)

In addition to the cost of SAP, customers have to pay license and service cost for SAP. The total cost is calculated by summation of software cost and service cost. From Figure 2, the company has to pay on the average at least $5,995 per one user. This amount considered as a huge amount in an emerging market such as South East Asia, South Asia, China or Africa.

Therefore, this research offers suggestions about what the SMEs needs to do if the SME want to implement the open source ERP system as cost-wise alternative as SAP implementation. However, the focus of this research is on the production planning and control module. The production planning and control module is considered as a critical module. From Metaxiotis et. al. (2003), they concluded that production planning and control area cover more than one-third of ERP areas. The company will save a lot of money if they use open source program instead. Also, by using APICS production planning and control framework as based line for this comparison, some suggestions about SAP implementation is included in this research.

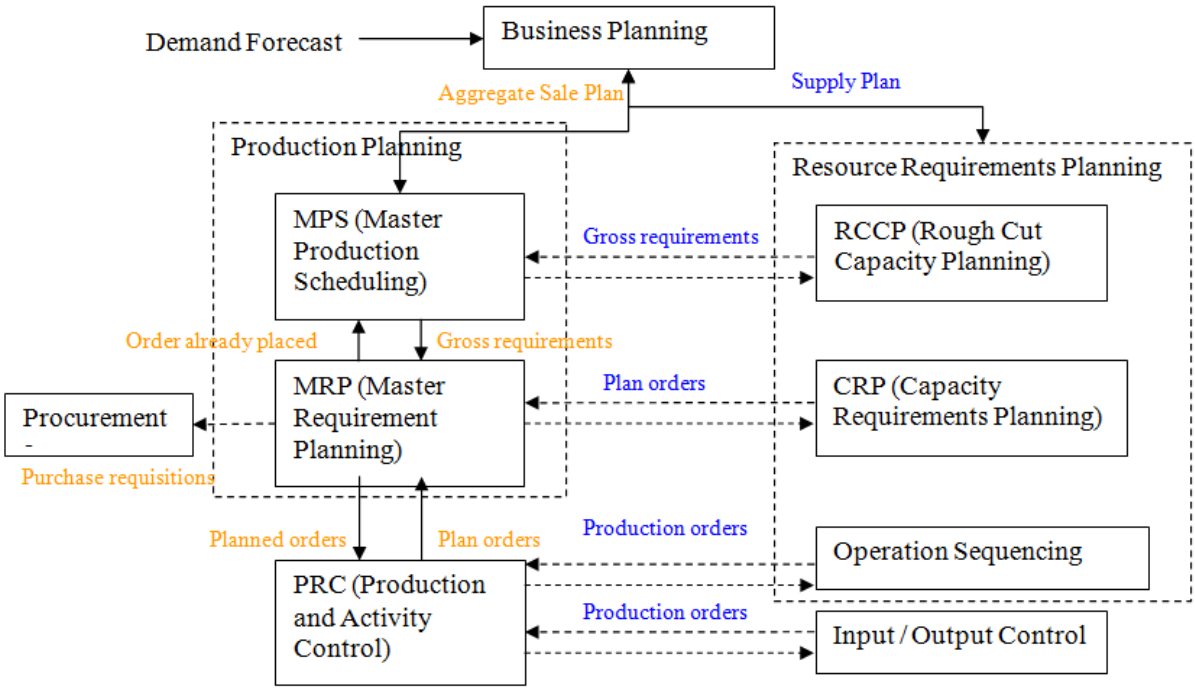

Figure 3 Traditional Material and Capacity Planning Hierarchy
Source: Enterprise Resource Planning and Beyond by APIC

2. PRODUCTION PLANNING AND CONTROL FRAMEWORKS

APICS (The Association for Operations Management) is a not-for-profit international education organization, offering certification programs, training tools and networking opportunities to increase workplace performance. It was founded in 1957 as the American Production and Inventory Control Society, and currently has more than 43,000 individual and corporate members in more than 10,000 companies worldwide. The module Production Planning and Control of APICS is named Traditional Material and Capacity Planning Hierarchy and the framework is as shown in Figure 4.

SAP (System Analysis and Program Development), the highest license revenue share (42%) of ERP license vendors and 27% of total market share in 2007. Recently, SAP officials said there are over 100,600 SAP installations serving more than 41,200 companies in 120 countries. SAP production planning and control framework is as shown in Figure 5.

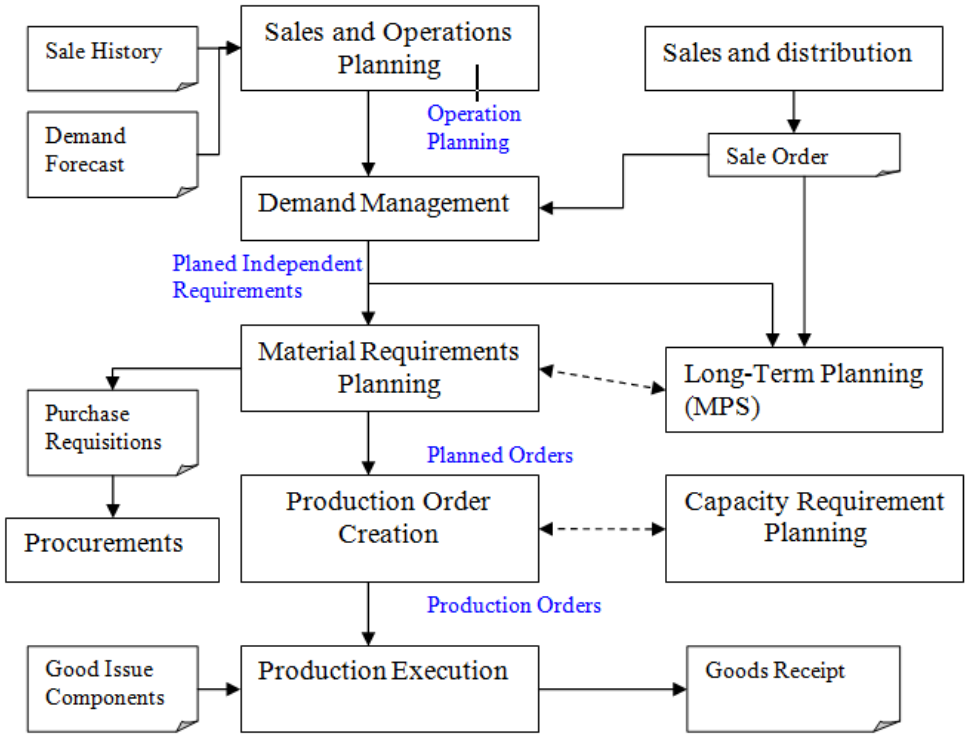

Figure 4 SAP Process in Production planning and Control
Source: Production Planning and Control with SAP® by SAP PRESS

Openbravo is the company that provide open-source software for ERP and POS (Point of Sale). It has the highest download open-source ERP in 2007-2008. Openbravo ERP is a fully web-based and it is the only one system that clearly describe itself as having a focus on SME business. The head office is in Spain. Openbravo has framework in Production Planning and Control area as shown in Figure 6.

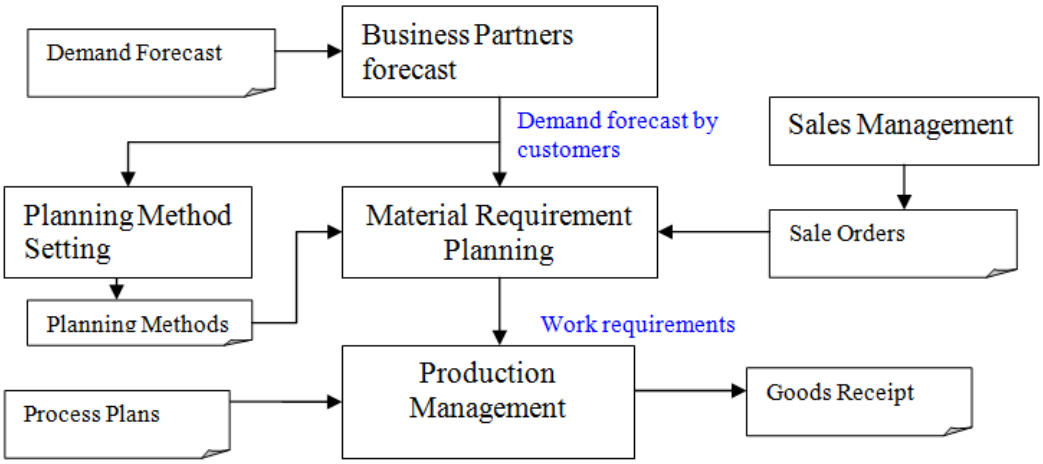

Figure 6 Openbravo framework in Production planning and Control

3. COMPARISON AND ANALYSIS

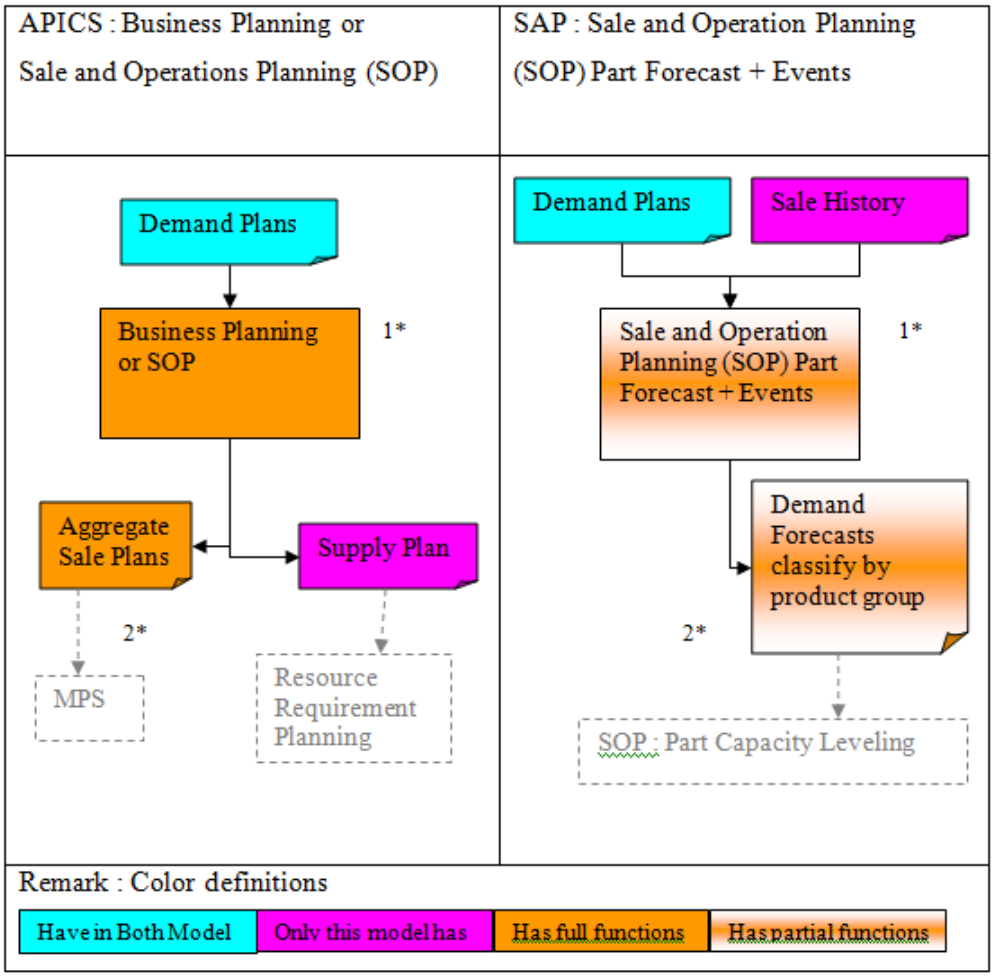

Figure 7 Comparison between APICS framework and SAP workflow

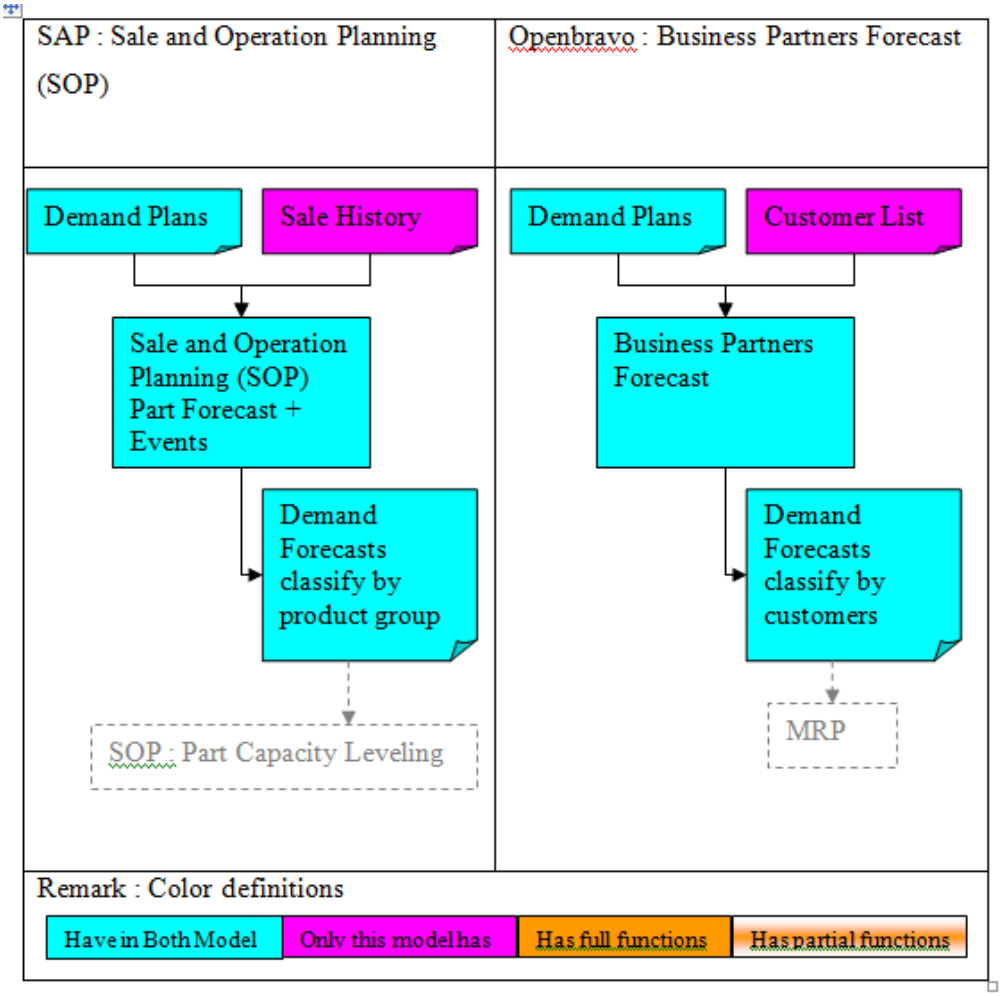

Figure 8 Comparison between SAP and Openbravo workflow

Table 1 Summary data of APICS Business Planning, SAP Sale and Operation Planning (SOP) and Openbravo Business Partners Forecast.

	APICS: Business Planning (Sale and Operations Planning)	SAP: Sale and Operation Planning (SOP)	Openbravo: Business Partners forecast
Purpose	Bring together all the plans for business into one integrated set of plans for minimum 12-18 months.	To define the product type and quantities to be sold for 4-12 months.	To define the product type and quantities to be sold for 4-12 months.
Input	• Demand Forecasts • Production factors • Supply constraints	• Demand Forecasts • Sales History	• Demand forecasts • Customer list
Process explanation	It is reviewed by top management at product group level.	Standard SOP use product groups in conjunction with level by level planning.	It is reviewed outside the system.
Method	• Linear Programming Mixed Integer Programming is in suggestion.	Basic Disaggregation • Level by Level Planning • Hierarchical Production Planning	The users have to created spreadsheet program manually and input to the system classified by customers.
	• Spreadsheet programs using demand and supply to formulate	Special quantity from events will be included in this step.	
Output	• Aggregate Sale Plans • Supply Plan	Demand forecast classify by product group.	Demand forecast classified by customers.

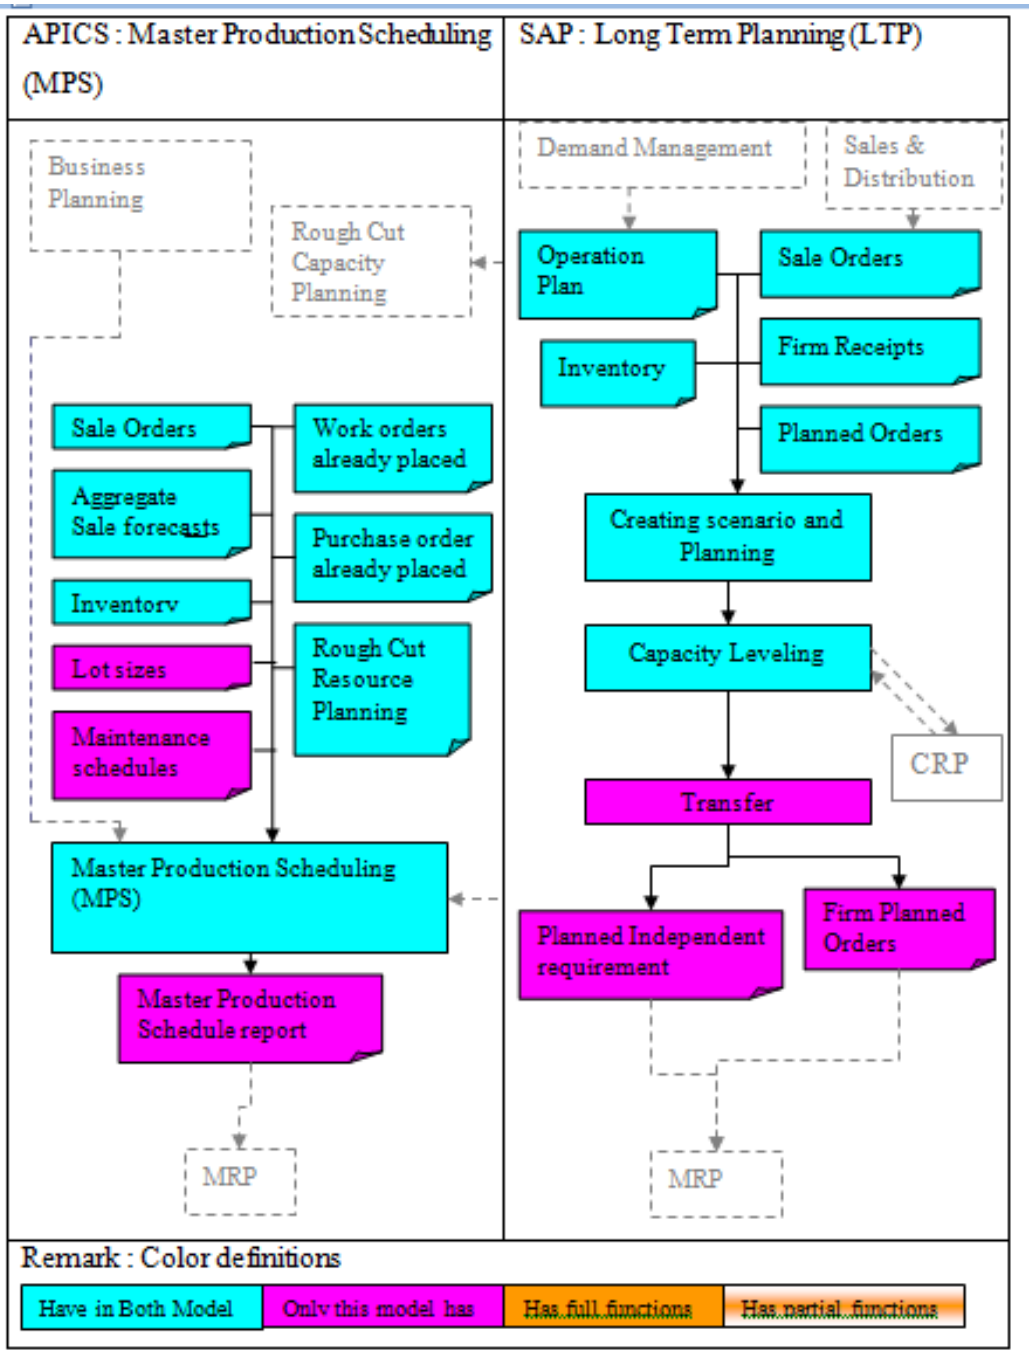

Figure 8 Comparison between APICS Master Production Scheduling framework and SAP Long Term Planning workflow

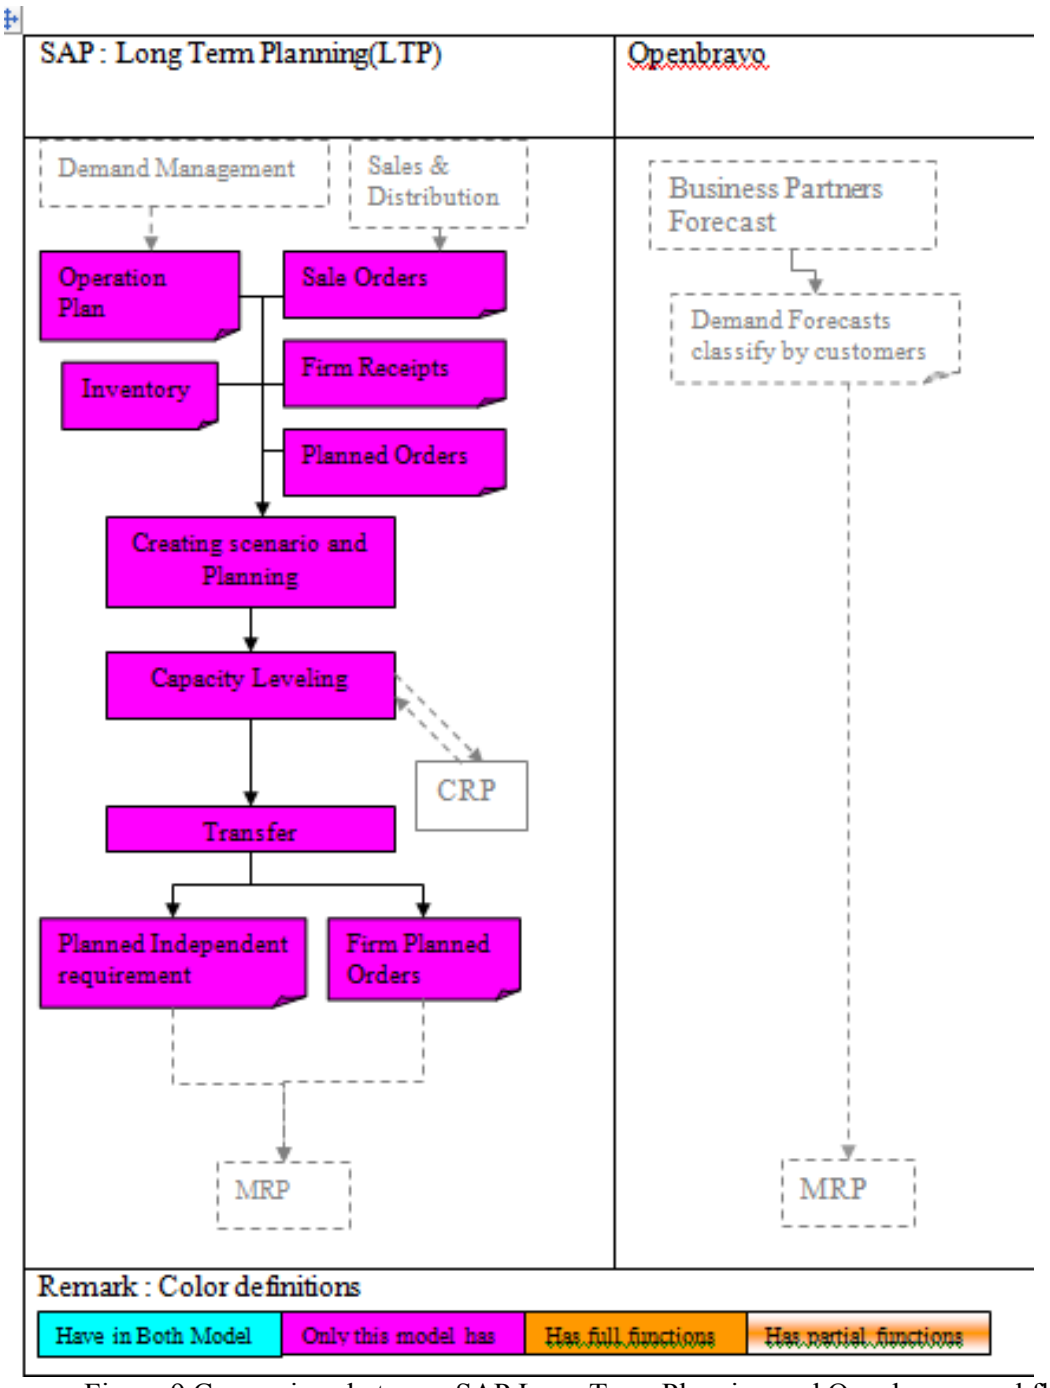

Figure 9 Comparison between SAP Long Term Planning and Openbravo workflow

Table 2 Summary data of APICS Master Production Scheduling (MPS), SAP Long Term Planning (LTP) and Openbravo.

	APICS: Master Production Scheduling	SAP: Long Term Planning (LTP)	Openbravo
Purpose	To plan how many of each item will be manufactured in each period.	To simulate planning on long-term to medium-term requirement and capacity	MPS is not represented in Openbravo. All product classes is calculated in MRP level.
Input	• Sale Orders • Aggregate Sale Plan • Inventory • Work orders already placed • Purchase order already placed • Lot sizes (user define) • Rough Cut Resource Planning • Maintenance schedules	• Planned Independent • requirement (from DM) • Sale orders • Inventory • planned order • Firm receipts	
Process explanation	MPS will be calculated when the available inventory is less than Actual orders or Sale forecasts (use the greater)	The system uses demand from DM which is fixed to calculate next period's plan then check capacity again.	
Method	Order promising On-Hand Available = Previous On-Hand + MPS – Actual order/Sale forecasts (use the larger) + order already placed MPS : Compute when Actual order/Sale forecasts is greater than On-Hand + order already placed, depends on how to define lot sizes. ATP = On-Hand + MPS - ∑Actual before next MPS	• Use Time-Phased record (MPS technique) • Capacity Leveling (To check capacity again)	ATP for Openbravo will represented in Sales Management (SM) Formula: ATP : = On-Hand – Order reserved
Output	Master Production Schedule report	• Planned Independent requirement • Firm planned orders	

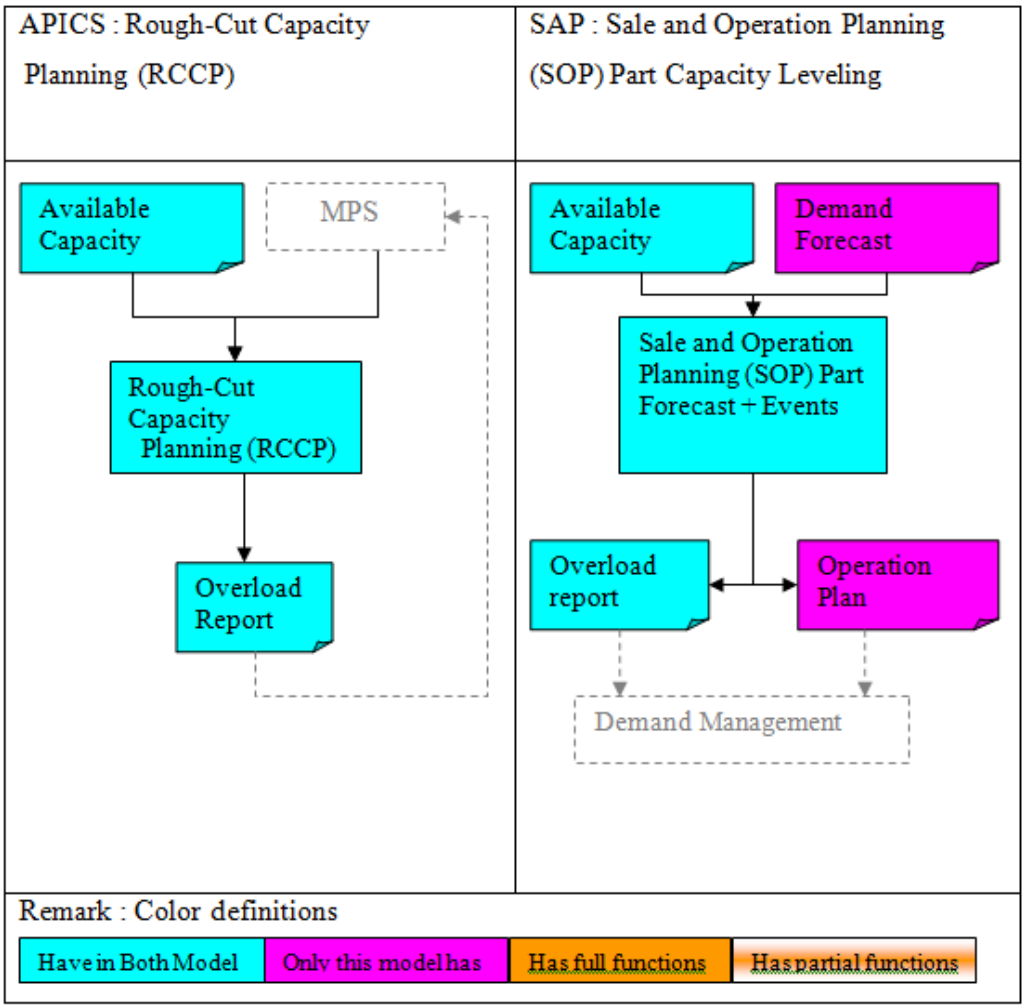

Figure 10 Comparison between APICS Rough-Cut Capacity planning framework and SAP Sale and Operation Part Capacity Leveling workflow

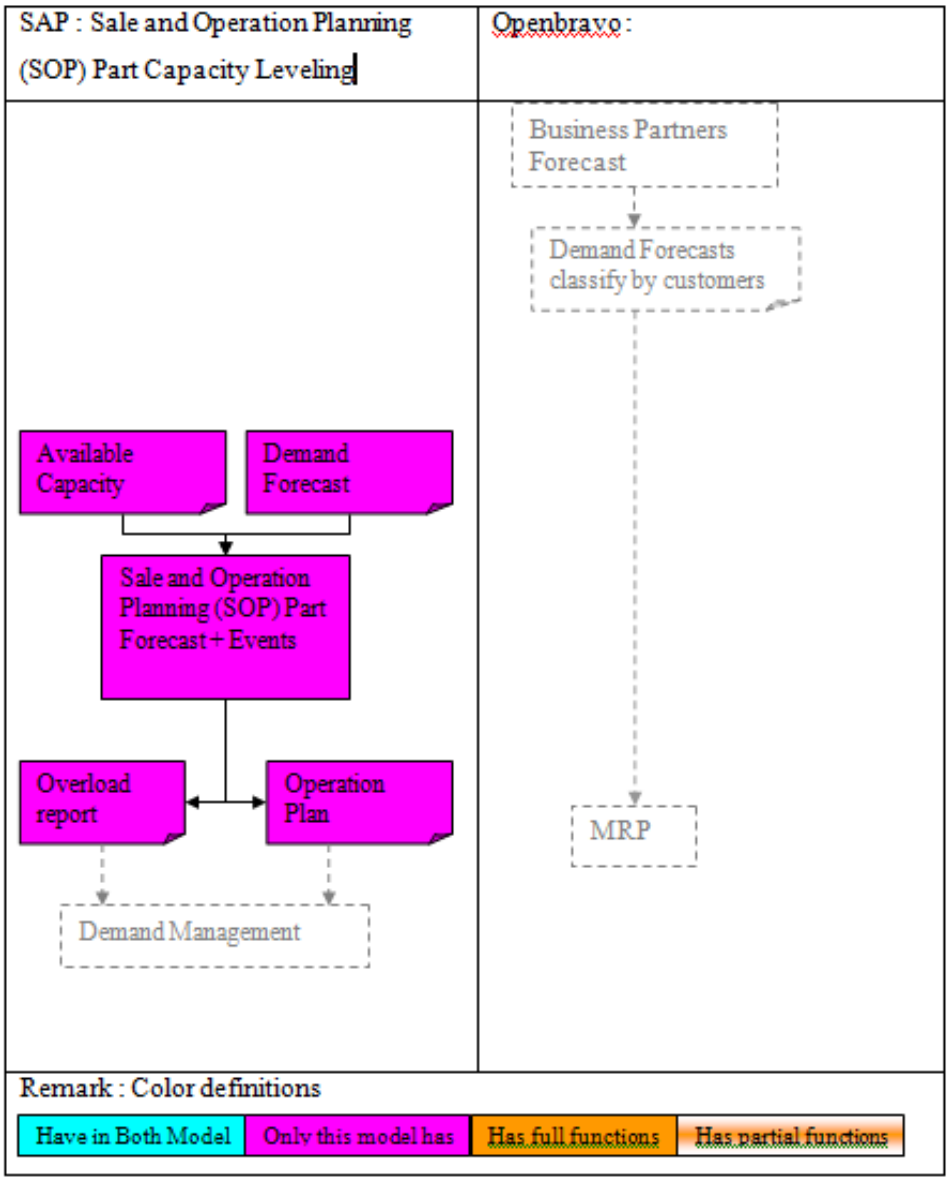

Figure 11 Comparison between SAP Sale and Operation Part Capacity Leveling workflow and Open bravo

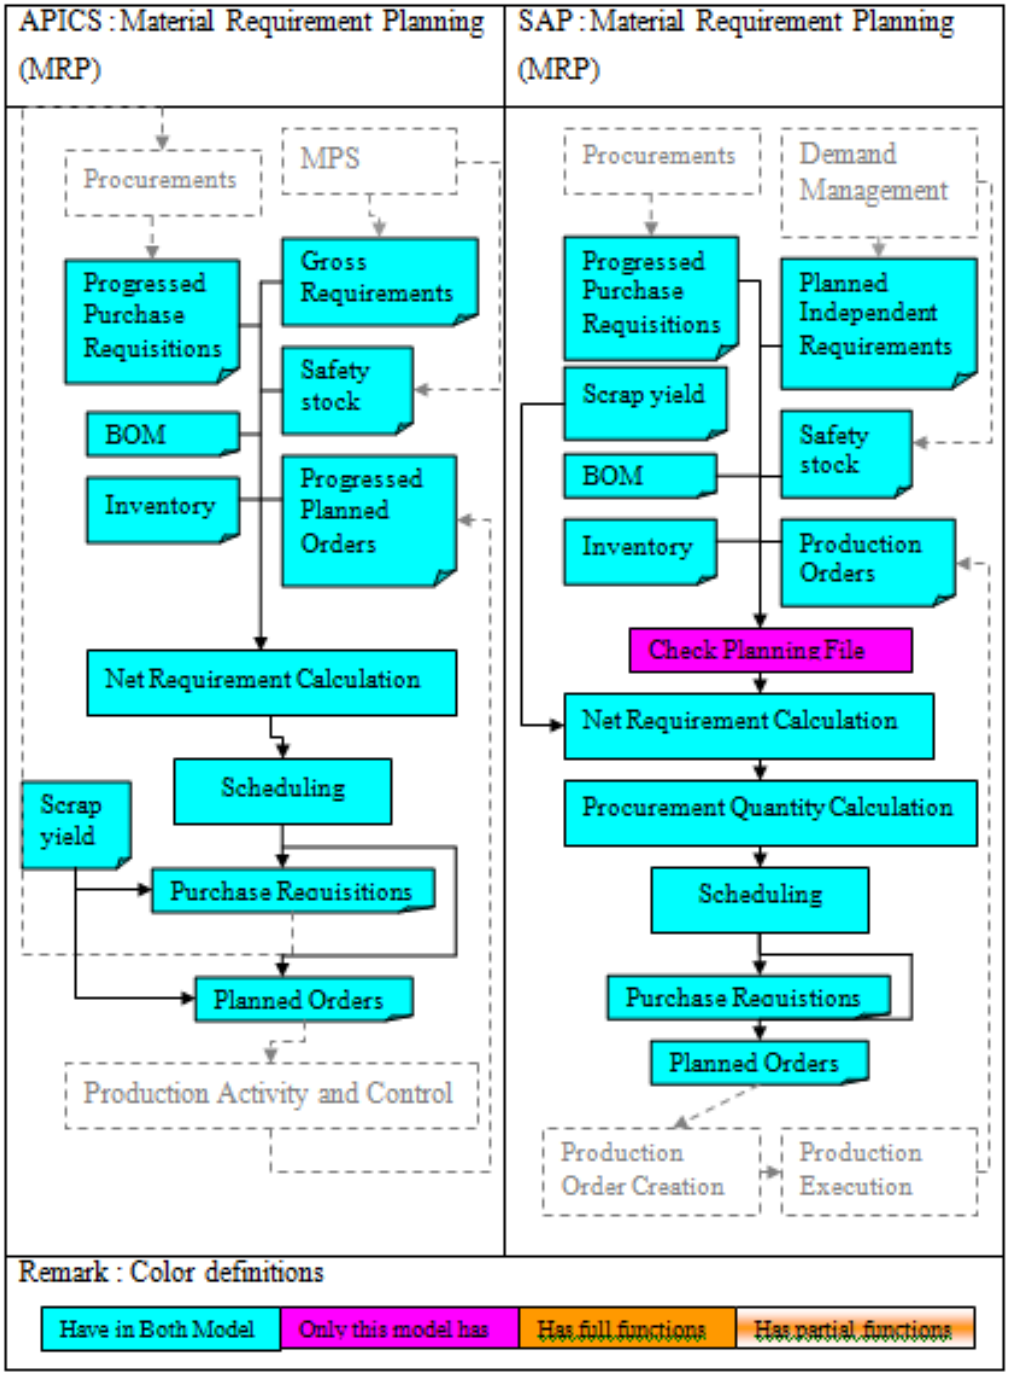

Figure 12 Comparison between APICS MRP framework and SAP MRP workflow

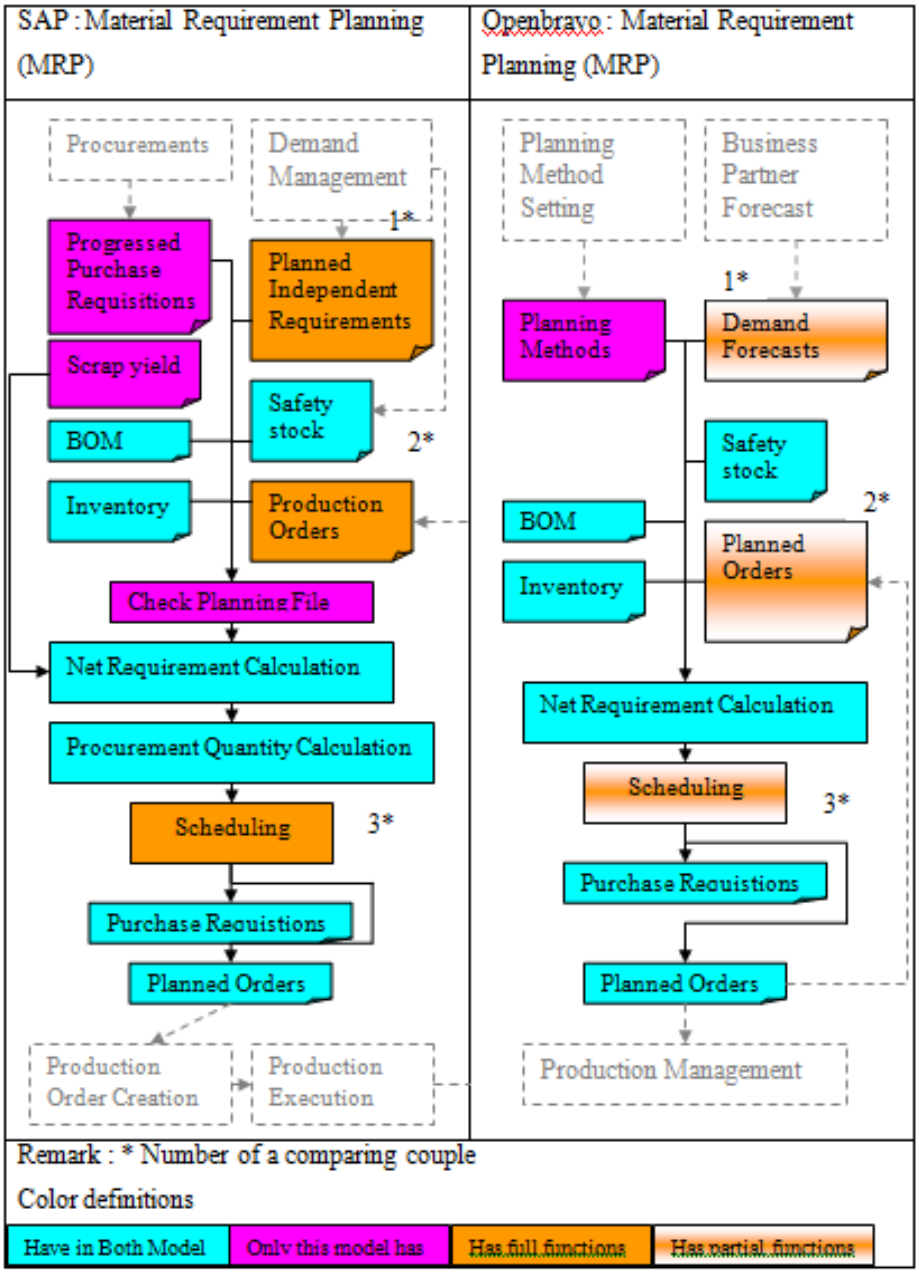

Figure 13 Comparison between SAP MRP and Openbravo MRP workflow

Table 5 Summary data of APICS Material Requirement Planning, SAP Material Requirement Planning and Openbravo Material Requirement Planning.

	APICS: Material Requirement Planning (MRP)	SAP: Material Requirement Planning (MRP)	Openbravo: Material Requirement Planning (MRP)
Purpose	To produce right item, in the right quantity, at the right time	To calculate net requirements of materials to fulfill demand program and create planned order.	To created work requirements and material requirements base on product demand.
Input	• MPS (Gross requirement) • Inventory • Safety stock • Progressed Purchase Requisition • Progressed Planned orders • Scrap yield • BOM	• Planned Independent requirements • Inventory • Safety stock • Progressed Purchase Requisition • Progressed Planned or production orders • Scrap yield • BOM	• Demand Forecasts • Inventory • Safety stock • Planning methods • Planned order (Suggested work requirements) • BOM
Process explanation	Compute Net requirements for each of their components by exploding the BOM.	Compute Net requirements for each of their components by exploding the BOM and determine basic dates again	The product trees are exploded and all products related are planned.

Table 5 (Continued)

	APICS: Material Requirement Planning (MRP)	SAP: Material Requirement Planning (MRP)	Openbravo: Material Requirement Planning
Method	Formula : Project Available = Previous + Schedule receipts + Planned order receipts – Gross requirement – safety stock Net requirements = Negative Project Available Lot size : Fixed, EOQ, lot for lot technique	• Material requirement planning method Available Stock = Plant stock – Safety stock + Planned order receipt + Schedule receipt – Requirement quantity x (1+ scrap yield) Net requirements = Negative Available stock • Backward scheduling method Lot sizes: SAP provide over 13 selection lot sizes including EOQ and fixed lot size.	Formula : Net requirements = Demand forecast+ Safety stock – Inventory – Planned Orders Proposal lot size : Selecting • Fix lot size and round up • Multiple fixed value • Lot for lot
Output	• Planned orders • Purchase requisition • MRP Reports	• Planned orders • Purchase requisition • MRP reports	• Planned orders (work requirements) • Purchase requisition • MRP reports

Table 6 Summary data of APICS Capacity Requirement Planning , SAP Capacity Requirement Planning and Openbravo.

	APICS: Capacity Requirement Planning (CRP)	SAP: Capacity Requirement Planning (CRP)	Openbravo: Business Partners forecast
Purpose	To predicts which resource will have capacity problems.	To check the feasibility of scheduling and create a sequence of operation.	There is no capacity planning for Openbravo. Users have to calculate outside base on daily capacity and set in product configurations. Formula: Daily capacity = Machine run rate x work hour To avoid overload in one period , before process work requirements user have to check: Work req. qty released ≤ (daily capacity x days of production)
Input	• Planned orders from MRP • Shop Floor control/feedback (delayed orders) • Work center capacity Maintenance schedule • Routings	• Planned orders from MRP • Shop Floor control/feedback (delayed orders) • Work center capacity • Routings	
Process explanation	Find the specific resources base on routings and check which resource constraint will be exceeded	Base on routings ,CRP check the overload of the capacity on each work center .	
Method	Capacity Leveling	Capacity Leveling: Time Consideration. Formula :	

Table 6 (Continued)

	APICS: Capacity Requirement Planning (CRP)	SAP: Capacity Requirement Planning (CRP)	Openbravo: Business Partners forecast
Method (Continued)	Over / Under Load = Delay from the previous + requirement capacity – available capacity Overload : Positive number Underload : Negative number	Capacity Req = (Standard value x Order quantity) / Base quantity Base qty: Max. qty of each work center Standard value: Setup time + Machine time + Labor time The capacity will not allowed to confirm if it is overload.	
Output	• Planned orders • The alarms or reports show which resources will have capacity problems	• Planned orders to Long Term Planning • Production orders to Production Order Creation • The alarms or reports show which	

Table 8 Summary of comparison analysis

Models / Functions	APICS	SAP	Openbravo	Remark
SOP	✓	☒☑ 50%	☒☑ 50%	Both SAP and Openbravo should create Supply Plan.
MPS	✓	✓	×	Openbravo user should monitor MPS by providing spreadsheets outside the system.
RCCP	✓	✓	×	Openbravo user should do RCCP by providing spreadsheets outside the system.
MRP	✓	✓	☒☑ 80%	Openbravo should add scheduling process in MRP.
CRP	✓	✓	×	Openbravo should add Capacity Requirement Planning Function.
PAC	✓	✓	☒☑ 80%	Scheduling in PAC can be ignored if Openbravo add it in MRP process
DM	×	✓	☒☑ 50%	This function is not necessary for SME. planning.

Symbol Remark : ✓ Have full function, × Not have function and ☒☑ % Have partial function.

4. CONCLUSION

In Business Planning area, by comparing with APICS model, SAP and Openbravo have partially function because they do not have Supply Plan . SAP and Openbravo have the same process in this area. The method of SAP is automatic while Openbravo is Manual. SME need Supply plan to be a guide line for capacity planning.

In Master Production Scheduling area, by comparing with APICS model, SAP has quite similar approach under the name of Long Term Planning (LTP). For Openbravo, MPS by tagging data from the system and do manually in spreadsheets. Therefore, SME need MPS to be a guide line for sale planning.

In Rough-Cut Capacity Planning, APICS RCCP framework operates data from MPS while SAP operates data from Raw Demand. In contrast, Openbravo does not have Rough-Cut capacity planning. SME should either has rough-cut capacity planning or calculate manually before sending data to MRP.

In Demand Management, APICS does not have Demand management in its ERP definition. By comparing with SAP, Openbravo has one same function that is defining time period for demand. However, there is a chance that demand management is not essential for SME production planning because the demand is less complex.

In Material Requirement Planning, APICS and SAP model have the same MRP process. By comparing with APICS model, Openbravo has partial function due to Demand data is raw and no scheduling theory in Openbravo. There is rough scheduling in Openbravo related with daily capacity of each product. However, most of the SMEs need only the net requirement process, but for scheduling, it can do manually. Since detail scheduling is the most complex process in ERP. The system needs more resources to create this function.

In Capacity Requirement Planning, both APICS and SAP model have Capacity Requirement Planning but different methods. Openbravo does not have Capacity Requirement Planning. If the production ro Capacity Requirement for SME is not essential in case of there is a supply plan using as guide line.

In shop floor control, APICS does not define details in shop-floor due to they are depend on individual specific for each ERP. SAP has all APICS requirements. Openbravo does not have scheduling in shop-floor control. SAP and Openbravo shop floor processes are totally different after releasing orders. Scheduling in Shop Floor is not essential for SME.

5. RECOMMENDATION

According to the conclusion from the previous part SAP and Openbravo have some recommendations to develop by following APICS model.

For SAP Production Planning and Control, although it can operate in SME but one of component that SAP should create for planners is supply plan. Supply plan is the report that shows all available capacity of resources. The planners will able to see how much they can

increase or reduce demand and then they can quickly respond to top managements. The suggestive framework for SAP is represented as below.

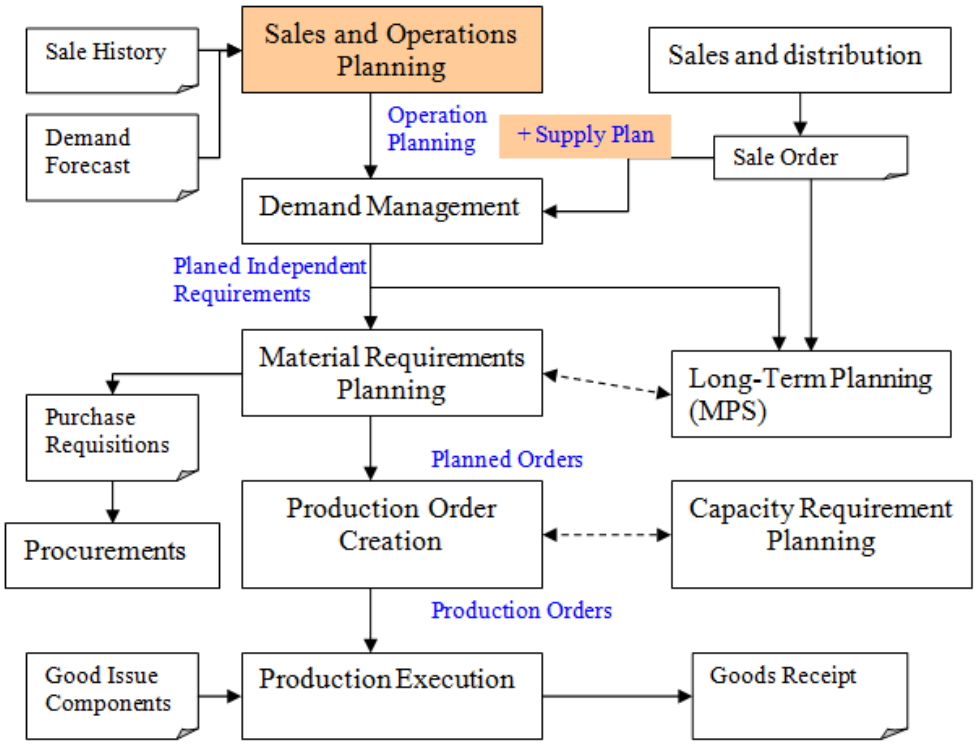

Figure 14 Recommended Production Planning and Control Framework for SAP that follows APICS (Additional workflow is highlighted)

For Openbravo, there is no MRP II functions (Resource Capacity Planning) in the tested version. To serve all types of SMEs, Openbravo teams should created MRP II functions in their ERP. By following APICS model, the recommeded framework for Openbravo is shown below.

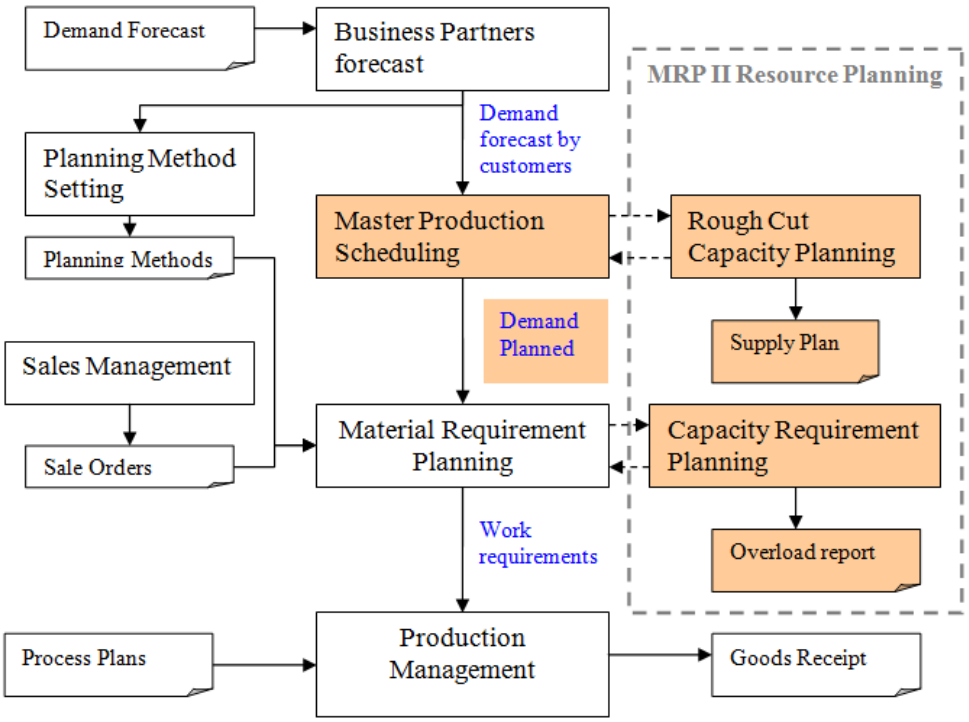

Figure 15 Recommended Production Planning and Control framework for Openbravo that follows APICS (Additional workflow is highlighted)

E-COMMERCE - CUSTOMER AND DIGITAL NATIVE GENERATION PROTECTION AND NEW MARKET OPPORTUNITY

Dr. Augusto Sebastio-University of Bari, Italy
ausebas@tin.it

ABSTRACT

The security of e-commerce system, which ensures authorized and correct transaction processing possibly without risks and threats, is one of the most critical issues in implementing the system. The return of investments in technology could be very fast even without a unique law system for international transaction in e-commerce, but on the other hand internet must be safe for customer of different age, different digital alphabetization, enormous digital divide gap. In this role of important part of our life it must be a service offered from the society to citizens without being afraid from technology.. This research illustrates the problem between ecommerce development and the difference of knowledge of customer. The digital divide between generations and between teachers, parents and children. A different way of approach the net in easy-way without considering risks and technological effects. The current research is an excursus of the state of Digital Knowledge and dangerous consequence of using web as a market without Knowing risks

Keywords: ecommerce, internet, security, risks, ecommerce, security seal, malware, Digital native, innovation, participation gap

INTRODUCTION

Internet is the greatest public space of the world. At the same time it is a new territory with rules and laws not enough completed. Today Internet is the first form of communication and the main market in the world. All the information across the world are faster then before and people are participating in the process of the information passing from a passive role to an active one. World wide web is un-material-un-territorial, virtual, digital but always a part of this world. What is legal off-line is legal on-line.

CONCLUSION

At the beginning world wide web was considered as a fast experience, a sort of game, now it's a market and an information media, in the future It will be our life, our digital life in every field. Considering this public space without rules and security systems is dangerous especially concerning that new generations, called Digital Natives, are faster customers and actively engaged with their parents, which are new "pupils" about what's going online. Parents and teachers are not in a strong position because they are not engaged as their children in online life. This dynamic gap of Internet knowledge is the first thing to try to reduce as the first part of Internet safe problem. The web is an incredible instrument of education, ecommerce, public administration, but it has to be developed in safety.

There are no easy answers for our digitally mediated life or for the participation gap but it's necessary to consider new solutions for the future digital age from this point of no return.

Internet is the greatest public space of the world. At the same time it is a new territory with rules and laws not enough completed. Today Internet is the first form of communication and the main market in the world. All the information across the world are faster then before and people are participating in the process of the information passing from a passive role to an active one. World wide web is un-material-un-territorial, virtual, digital but always a part of this world. What is legal off-line is legal on-line. The investment of production in technology is one of the most important part of the budget for companies and today it's impossible to have a role in markets without an internet site. This shop-window in the main street of the world, a virtual street, is the best investment to show products to people. We have to consider that one of the biggest problems in medieval age for merchants and trade relations in general was the absence of a single law for national and international markets, main rules followed between people from different countries. They decided to follow uses and rules self-made for markets and commercial relations and they were able to develop a market code. It was a sort of commercial code made by norms which was respected by all the people in commercial uses because it was the only system to be a part of the commercial trade in contracts composed by words, payments and deliveries without the burden of uncertainty. This complex of often unwritten uses and behaviours took the name of *lex mercatoria.* After hundreds of years in this historical moment of digital development of markets we have the same necessities, fears, lack of certain of medieval mediators. If we consider that the un-material World Wide Web market is composed by bits as a unit of measurement and that it's often impossible to know who is the person on the other side of world is, who is chatting, who is connected, who is writing me or asking me something, it becomes easy to understand difficulties of developing on-line markets. From many parts an international electronic law is always remarked as a necessity. As often happen in technological world everything is faster than law and politician intentions and we started using this new technology without rules to follow, without codes and without knowing risks, a sort of no man's land. Suddenly it appeared clear that we were living a point of no return and the digital reality have to be considered the present. Actually, internet landscape appears in the same condition, crowded, uncertain, full of thousands of web sites and companies, sometimes false, constant fighting to find space and to catch the attention of customers, interested in improving their position and developing on-line activities. On-line visibility it's a mirror of investments, an important part of the brand. Starting from the on-line position it's easy to understand and discover the position of a company in markets. Many companies try to have first position in search engine. From this position they can meet customers immediately, before other competitors in respect of a new marketing strategy. The target is changed and in strategies and plans of marketing one of the first point to remark is considered the problem of reaching customers, without considering the age of the customer, how to take the first position in search engine results, how to be the first on the on-line list, how to clean the on-line reputation, in case of difficulties, because it is difficult to cancel from the electronic memory of the world wrong information or bad information. It's a system used also in the political world, putting on the top level of search engine information better information and postponing the worst one pages and pages behind the important meaning. This is made by a software called reputation cleaner, but it could be very dangerous for the quality of the information, as a normal research on the web without considering the creator of the information and the quality of his

article because people can only evaluate the quality of a given peace of information after consuming it. One of the new on-line web business is to help companies to have a better position in online market research, to take a positive location in search engine results. On the web, marketing one-to-one and customer satisfaction, are keywords to take position in on-line markets and to win competitors by investing money in technological resources. Having a direct contact with the customer is one of the first point of winning strategy, offering services, especially online, and follow a product during his life, also in the hands of the customer, it's an important service and a marketing idea that could make the difference or more as FAQ(Free Asked Question) about the product, how to use it, giving site advices about the product and guaranty, ask directly to the company-site about claims for ADR(Alternative Dispute Resolution) or ODR(Online Dispute Resolution) to resolve law situation that could involve national and international courts. This kind of online services could do the difference between company and company and help the consumer to decide for a product instead of another(part of the customer satisfaction) and for a brand instead of another.

The security of e-commerce system, which ensures authorized and correct transaction processing possibly without risks and threats, is one of the most critical issues in implementing the system. The return of investments in technology could be very fast even without a unique law system for international transaction in e-commerce, but on the other hand internet must be an open-source technology to find information, a service offered from the society to citizens without being afraid from technology. In this present all the world is linked and if the analogical world seems unequal the digital world is worst. A part of the population of the world in this century doesn't yet reach the minimum power in material things and is now compelled to pursue the rest of the world in a crazy race of technology which is lost at the beginning. The result of this race without winners is digital divide. In 1923 Paul Valery has written: modern man-tired from technological instruments-is afraid form the excess of his wealth… an excessive capital not utilizable.

In this sentence there is an important warning: technology could not be a form of wealth if not well utilized.

Is now accepted, in all over the world that internet security and risks connected to the use of Internet are strictly related and have multiple steps in common. Internet security is not only a problem of safety of documents, contracts, information, but it's a problem of culture on different levels of the world society. It's a problem of education, of culture, a political problem of privacy, of economy. The discussion is huge and it involve human rights and social programs and it will probably absorb the work of the all world institutions and it will takes a new Breton Woods in the field of Democracy and Privacy.

The first point of view to discuss is what is generally known as digital divide. This concept means difficulties in using technology, necessity of technological alphabetization, division between generations, division between people at the same time, different possibilities of access on web, different capability of internet access, democracy problem of access to information, different approach of countries to technology. Another important problem of World Wide Web for the entire world is protection and privacy of information. The difference between rich countries and poor countries is increasing more and more and close

to the wound of analogical alphabetization there is what is called digital divide. Digital alphabetization is developing faster and faster and the division of the world in connected and unconnected people is a social weak point to handle with care. Facing this new social problem inside the same country or the same part of the world is a question of conscience. It's always correct talking about "population" rather than "generation" considering that just 1 billion of the six billion people in the world even have access to digital technologies and the real division is between who have and who have not technology and so the young population in the world is digital divided in native (kids)and Digital native(cyberkids). For billion people technology and cyber alphabetization are mere abstractions. It's not just a problem of access, but a not singular problem of learning digital literacy, of learning and improving the technological alphabet of this hybrid world. This type of inequality must be overcome. The costs of our absence in this field will be higher that we should be willing to bear. We have to consider that e-democracy it's only a part of the most important problem of democracy in particular geographic area but, as it's known, not all the population of the world has free access to internet services and information and it could be a consequence of money, or a politic choice based on the control of independence and information in countries against democracy. The real benefit of the diffusion of online culture is the increasing of participation starting from the developing of digital capability that can lead to stronger democracies. This will be the result of the involvement of people in culture movements, blogs, other sources of information and discussion, a long path called participatory culture.
So the meaning of the words "free access" is wide, too ample to close it in a few words.

In the new form of communication mediated by technology(CMT) there is the replace of the direct experience with a sort of mediated perception. In the electronic space there is not physical contact but a new virtual contact transferred by a mediator. Digital media have modified the growth of new generation called Digital native for the different confidence with technology which is very familiar and a form of natural expression very far from old generation.

As we said for companies strategies, in online world there is a difference to bring into relief between different types of consumer and customer. We have to distinguish who is the receiver, the addressee of the information and his grade of ripeness. Adults, old people, astute digital native and not digital kids read, at the same time, a mitigate information and it could be easy or not to understand the asymmetry between reality, commercial suggestion, marketing communication.

An interesting analysis is to remark the different of access on the web between generations, and more in the same generation between digital native and not digital native, between boys and girl, between parents and sons.

Let's analyze some interesting data: an important American research(Cyberatlas, 2002) showed the Internet was already the first instrument of information and communication for the new generation(12-17 years old),81% used email for communication with friends and relatives,70 % used chat line. This research shows that in USA the Internet was the first form of communication at the beginning of the century. In the research of Mediappro(2006) the result was that in Quebec 90% of "cyberkids" used Internet like Intranet like a sort of private net, and they don't use mobile phones. In Italy as Japan, the other way round, the mobile

generation (98%) preferred form of communication is mobile telephone(mediappro 2006) and it's used by "cyberkids" for normal communication (14 years old) and in the version smartphone for Internet (15-29 years old) Censis 2007.

The real result is that new media are new form of private personality a sort of new identity mediated by technology: more related to could be and not must be.
Other changes are becoming in the evolution of the utilization of the net. In particular the location of use of the net. A part form the case of mobile phone connection another difference it's easy to find comparing 2005 and 2008 concerns. In 2005 the use at school and at home, with a standard computer ,was very common in Europe. Starting from 2008 6-17 years old in European Community countries were much more likely to use the internet at home (65%) than school(57) or anywhere else, and 34% are now going online using their own computer.
An interesting research ,made by The London school of Economics and Political science in internet use by age shows that use increases with each year the child gets older by the age of 10-11, in 2005 it was by the age of 12-13 years old, but obviously the range is different cross-national difference. In countries with an overall higher internet use children are much younger when they start to use the internet. In this countries the internet use is very popular among the 6 to 7 years old children.

There are also a few difference in internet access and amount of use between boys and girls. It consist in a social inequality. There is an historical tendency for younger boys, digital native, to have more places to use the internet, to get online earlier and generally to use the internet more than girls. Most of all, the importance of the difference is made by education and parents that sometimes don't want to provide their children with an internet access. Sometimes the attention of girls in technology star later than for boys. It's easy to see the evidence that once they have gained access the use become so frequent with the age.

A very important result is the fact of the increasing of parents' use. Many parents are know online as children, reversing the first impact with technology and reversing the previous trend but the difference is still important just in countries where the internet is a relatively recent arrival. The other way round children whose parents use the internet are significantly more likely to use the internet(79%) than those whose parents are not online(54%).

In all the world there is an important gap between generations, between young people and their parents and teachers. The result of this gap is that new generation are often at risks in an environment that could be very unfriendly. This fault is the base to be afraid from technology and doesn't encourage positive steps. Fear could be the death of new technology, a ban would mean giving up on the many possibilities of the internet and giving up the future. It's very important to focus energy to analyze the cause of the problems and we have to be able to resolve problems without cutting the future at the beginning starting with the resolution of the risks with the help of companies that offer online services that, of course want to improve markets by helping customers, especially young unprotected customers, not just digital natives which are one step up than others.

Parents, teachers, companies and institutions must be part of the debate of digital culture and an important part to create safety in the online world.

In this online identity, just a part of a multiple identity, so important considering the development of e-commerce and e-marketing an interesting position is covered by multitasking, the new behaviour of multiple action started by the net population that change every form of interaction in analogical world and of course in the Digital one.

It's impossible to focus markets without considering the capability of Digital Native to consume more media content in the same time and this trend is rapidly going up but it's yet on discussion and difficult to demonstrate the role played by multitasking on learning.

People connected on internet are on shop-window, and we can say an effective definition of a connected man as a "glass-man". This problem is generally related to all people using internet, but in special way consumers connected for commercial reasons. In this case the problem involves e-commerce and in this field all the companies interested to web market. The sites must have privacy policies available on it, and any sites that targets a children's audience must have special concerns and requirements. If the customer on web is named "weak-consumer" a child connected without enough knowledge and malice could be in danger especially for malware (malicious software) and for the possibility of on-line meeting with dangerous people during a research of a favourite videogame, toy, cartoon, music.

Special form of privacy policy, especially forms of protection of "cyberkids", Digital Native or not, are studied in all the world. The incidence of risks experienced by children online varies cross-nationally this is the motive of the strong reflection made by countries which involve policy, laws, academics disciplines, media studies and consumer research. Starting with the lack of an international cyberlaw of protection children of "cybergeneration" we can just have a look on a not exhaustive list of form protection applied in the world is necessary to focus the attention on this transversal topic. For example in Japan there is a particular attention about safety and risks in young people's online behaviour, and in particular a sort of difficulty was identified and related when young people adopting mobile Internet as a moral panic and social isolation called "Hikikomori", a form of refusal of social life with the substitution of real life with technology and the world with their room. They live every difficult as a defeat and prefer to live in a software world in which they can be everything they want. Other topics included phishing, spamming and fraud and every sort of violation of a space often perceived as an intimate space of friendship as what happen in social-network and their concept of friendship. A particular law passed in Japan in 2003 "Legal Plan to Address Entrapment of Children through Internet Dating Industries", the criminalization of using online sites to arrange dates with minors.

In Australia as in Europe are suggested safety measures including Service Providers filter, parental control filters for monitoring and surveillance and in general the control of Internet content as application of international protocols. In USA there is a big policy discussion about online safety and Internet protection. It's one of the most salient issues and social networks are also perceived as problems with the necessity of a series of agreements with companies to add safety features and there is a particular act called COPPA (Children's Online Privacy Protection Act) concerning online protection for children and frequently Consumers take active part in decisions made by Federal Trade Commission according with companies and was promulgated a set of "Online behavioural Advertising Privacy Principles".

The time spent by net-generation connected to the internet is increasing day by day. In South Corea expert believe the average teenager spends two hours on line per day. China there is public concern about "Internet addiction" as a public problem of health with sophisticated centre of studying new form of illness related to technology. Information from the World Economic Forum indicates that while about half of the countries judge their system of regulation enough adequate on internet issues in general, other countries consider more regulation are needed to have a medium level between countries. It's obvious that cross-national difference between countries depend on different levels of general education, the higher general level of education of a country, the higher it's children online use, the higher is the level of regulation or the level of the request of safety.

Analyzing the contest of online safety we have to admit that we can find analogical problem transferred in online world. What it's considered illegal, what we consider as a crime in offline contest has a counterpart online. World wide web is just a new vast territory for using offline behaviour with the disadvantage that this behaviour is not immediately related to a person but just to an address. The most important thing to consider talking about online behaviour is that in many cases we have to talk about an invisible behaviour made by a glass-man. Starting from this reflection we have to improve our efforts in discovering online traces of malware and criminal behaviour or simply to help cyberkids in separate reality from just commercial offer and a correct information to a risky one.

A primary form of control used by parents in technological countries are filters(parental control)with the help of software companies. They play a concrete role to protect children from harmful online contents but they are often used and requested from "cyberparents", very close to Digital Native generations. Other kind of filters are located directly to the server but in this case they ensure a standard level of protection without considering the age of the consumer or his level of cyber experience. The activity of control is delegated to a software that help is work by keyword or blacklist sites to block the access to particular contents. A new search engine just for kids help them in searching on the web, answering questions after an evaluation of contents considered appropriated.

All the time spent online by digital native is studied by parents as a problem and by marketing as a resource for net-economy.
The difficult is to help kids to have skills and enough tools to spend, live safety, their time online and to consider themselves what is wrong and what is good without the supervision, if not possible, of parents, teachers, relatives but very important at the beginning of online impact.

The educational system is utterly confused about the impact of technology in learning. Giving computer to a student or a son is not a solution to be on time.

The best way to find solution for reducing safety risks is mix all the forms of help which are: education(familiar and school), technology development(markets and science), social norms and law. The first solution is to give, as a responsibility of the society and of the government, the skills to the digital native and new generations to defend themselves on web and to recognize a correct information from a wrong one. Second approach is to give, at the same time technological skills to parents and teachers, often related to old mechanism of learning

that needs to have the same step of technologies, to help them to walk in technology as a part of their time without being afraid from what is considered new. Follow every form of netiquette(net-etiquette) as a based rule of the technological society and teach technological rules as a materia. Sharing digital technologies in between cyberkids, parents, teachers, police, companies and work together in the same direction. Ask for international rules in online education, society, economy and markets starting from the a medium level of knowledge, a model of shared and distributed governance, administrated from adequate institutions.

Markets have a fundamental role. Companies have strong incentives to develop technologies in quality, they have the social responsibility to participate on safety projects. If we consider how many boys and girl daily took information from the web, buy things on web, especially from e-marketplace to spend less money without knowing risks and without considering the level of safety, judging the system at the end giving a feedback. They don't have an idea about who is giving the information, the safety of the information, the seller, his or her identity, the country of the server, of the seller, the country in which bought objects are. They buy in the dark. People can only evaluate the quality of a given information after consuming, and they start to ask themselves question just after being victims of fraud. Reputation systems and evaluation systems could help to point the attention but they are not enough. It's normal that market will find in their own systems and technology the solution to grow up. One of the best solution for quality of sites is the label of quality a sort of seal of guaranty for consumer and customer. They are symbols of the level of quality or accuracy of the information, products or service and help the buyer to consider safety what is sold. In e-commerce it's a good solution and it's also a great solution to protect minors from harmful content on websites. This sort of certification it's an index of serious content and of adhesion to a code of norms in respect of predicted standard. A constant control of contents is always necessary to decide if a site deserves the label and at the same time the participation of consumers in panels of decision is always promised.

Turning to market, consumer privacy, not just for a digital native or un protected generation is an increasingly important issue and there are areas of special concern, such as health-related information.

Many e-commerce providers have realized that the data they handle, even without care, may be the most valuable asset and will resist any attempt to limit their rights to use customer's profile. This kind of data, personal data are always objecting of a particular kind of law, usually very strict and protective. It's always good behaviour handle with care and proceed carefully in allowing usage because a customer can ask every time information about the way of handling his data and ask for punishment in any case of intrusion, not allowed, in his privacy.

All the norms related to customers and on –line customers must find enough space on internet sites, they must be listed in a particular part of the site (called "us-ability")for an easy reading and research from the customer.

All the data about the company, address, email, main office, fiscal data, owner, webmaster, must be at complete disposal of the customer, frequently asked questions, insurance

information, green number for immediate contact, possibility of solution for small claims without legal cases but using alternative dispute resolution (ADR) or On-line dispute resolution (ODR).

What we would like to focus is the problem of safe internet use, intended without any form of control and risks for people in general and children in particular. The web from the one hand, in his economical prospect, it's an un-material market and the best way to develop commerce easier, it appears to be essential for company's survival and growth developing e-commerce is possible to reach people on the other side of the world and reach new countries and markets improving capabilities and the time to market, but the other way round security of e-commerce system, which ensures authorized and correct transaction processing, possibly without risks and threats, is one of the most critical issues in implementing the system. The return of investments in technology could be very fast even without a unique law system for international transaction in e-commerce, but on the other hand internet must be an open-source technology to find information, a service offered from the society to citizens without being afraid from technology. The possibility of introducing a special seal on the website, as a symbol of security in dealing, as a part of a ratified code of commerce is always promising. A sort of serious credential demonstration for the companies and a small insurance for the consumer.

THE IMPACTS OF COOPERATION AND COMPETITION ON SUBSIDIARY'S CAPABILITIES BUILDING: AN EMPIRICAL STUDY OF FOREIGN SUBSIDIARIES IN TAIWAN

Ya-Jung Wu, Kao Yuan University, Taiwan
yajungwu@yahoo.com.tw

ABSTRACT

Given the importance of dynamic capabilities for the subsidiaries, the aim of this study is to focus on the question of how foreign subsidiaries actually develop dynamic capabilities that can be seen as critical for the entire MNC. Specifically, this study tries to identify the different impacts of internal and external network partners influencing the development of dynamic capabilities of subsidiaries. Based on the empirical study of 81 Taiwan's foreign subsidiaries, it is found that when facing higher level of competition, higher technology embeddedness with local external network, the subsidiaries' exploration capabilities will be enhanced. In addition, when the intra-firm climate is higher emphasis on cooperation, the subsidiaries' exploitation capabilities could be enhanced.

Keywords：MNC subsidiary, exploration, exploitation, dynamic capability, cooperation, competition.

INTRODUCTION

Knowledge is an important resource for firms to develop and retain competitive advantages (Grant, 1996). The ability of Multinational corporations (MNCs) to leverage their knowledge across dispersed foreign subsidiaries has become more essential than before (Gupta & Govindarajan, 1991). Evidently, these perspectives and related empirical efforts have offered rich insights into the importance of capability building for subsidiaries. However, one gap still remains: Most previous studies have investigated knowledge transfer between parent and subsidiary, but have not yet systematically explored the importance of how the acquired of shared resources and capabilities are further exploited in subsidiary (capability exploitation) and how new resources and capabilities are upgraded and built (capability exploration). From the dynamic capability perspective, capability exploitation and exploration is essential not only for survive of subsidiaries but also for MNCs' competitive advantage. Through learning and generating dynamic capabilities, subsidiaries could continuously renew their competitive advantage to ensure sustained financial performance, and could be centers of excellence to disseminate their capabilities to other subsidiaries to enhance MNC's competitive positions (Zhan& Luo, 2008).

A number of studies have examined such new phenomenon as center of excellence (Moore & Birkinshaw, 1998), subsidiary-specific advantages (Moore, 2001), and subsidiary entrepreneurship (Birkinshaw et al., 1998). Following this stream of literature, this study tries to address the importance of capability exploitation and exploration in subsidiaries. We

attempt to examine how capability exploitation and exploration are affected by cooperative and competitive environments in which subsidiaries are embedded.

Based on traditional view, headquarters is an important source of new knowledge for subsidiaries. Acting as a conduit, subsidiaries can exploit the knowledge transferred from parent MNC to prosper in local markets (Blanc & Sierra, 1999). The more recent literature on MNCs, influenced by the "market-as-networks" perspective, however, has argued that external partners can constitute a very powerful resource. External partners can be very important for capability development in subsidiaries (Birkinshaw & Hood, 1998). In this study, we take local embeddedness and intra-firm embeddedness as two major channels to learn for subsidiaries. Given the importance of dynamic capabilities for the subsidiaries, the aim of this study is to focus on the question of how foreign subsidiaries actually develop dynamic capabilities that can be seen as critical for the entire MNC. Specifically, this study tries to identify the different impacts of internal and external network partners influencing the development of dynamic capabilities of subsidiaries.

Further, while contextual factors are essential for subsidiaries learning activities, we would like to verify what kind of relationship climates could enhance learning more. Could both cooperative and competitive climates work for stimulating learning? Thus, in this study we aim to explore how cooperation and competition revealed in subsidiaries' local and intra-firm environments affect subsidiaries' exploitation and exploration capabilities building.

LITERATURE REVIEW

Dynamic capability can be defined as the firm's ability to integrate, build, and reconfigure internal and external competences to address rapidly changing environment (Teece, Pisano, and Shuen, 1997). It requires the capability to extract economic benefits from current resources and to develop new capabilities. Focusing on the international setting, Luo (2002) and Tallman and Fladmoe-Lindquist (2002) conceptualize dynamic capability as consisting of two dimensions: Capability exploitation and capability upgrading. Capability exploitation concerns the extent to which a firm exploits rent-generating resources that are firm-specific, difficult to imitate, and able to generate abnormal returns which capability upgrading involves the extent to which a firm commits to building new capabilities through learning from organizations, creating new skills, or revitalizing existing skills in new situations. Capability exploitation is critical for gaining competitive advantages and determining strategies for exploiting such advantages while capability upgrading ensures the growth of sustainable competitive advantage and generates new bundles of resources (Zhan & Luo, 2008).

Similarly, Yang et al. (2008) distinguish two subsidiary roles in terms of the subsidiary mandates: competence creation versus competence exploitation. Competence-exploiting subsidiaries are expected to transfer and adapt knowledge from their parent to local markets. These subsidiaries are engaged in implementing established home-based knowledge effectively in local environments (Cantwell & Piscitello, 2000). These processes require continual knowledge transfers from parent firms (Cantwell & Mudambi, 2005). On the other hand, competence-creating subsidiaries are expected to develop knowledge assets that are new to the MNC network, like new products, technologies, practices, and skills (McDonald et

al., 2005). Competence-creating subsidiaries are expected to diffuse knowledge to other units to the MNC network. A greater volume of distinctive and valuable knowledge is likely to be available in competence-creating subsidiaries than in competence-exploiting subsidiaries, simply by virtue of their organizational role.

Thus, according to Yang et al. (2008), it is expected that competence-exploiting subsidiaries are associated with significantly higher conventional knowledge transfers. Conversely, competence-creating subsidiaries are expected to be associated with significantly higher levels of reverse knowledge transfers.

HYPOTHESES DEVELOPMENT

The Impact of Local Cooperative Environments on Subsidiary Dynamic Capabilities

The literature on multinational corporations frequently emphasizes the point that a subsidiary unit faces competing pressures: for responsiveness to host country demands, and for conformity to corporate norms (Bartlett & Ghoshal, 1989; Prahalad & Doz, 1987). This means that subsidiary dynamic capabilities are shaped by the local environmental context as well as by elements of the organizational context.

In their everyday work, subsidiary employees will typically interact for more with customers and other firms in their local market than with corporate managers, so it seems likely that such interactions will be the stimuli for their dynamic capabilities building. According to the recent studies of economic geography, subsidiaries innovation, capability upgrading, and competitiveness can be related to the presence of industry clusters (Porter, 1990; Solvell & Zander, 1995). Based on these studies, it is argued that subsidiary's exploration capability will be promoted by the local cooperative environments. Thus,
Hypothesis 1: A high level of local cooperative environments will promote subsidiary's exploration capability.

The Impact of Local Competitive Environments on Subsidiary Dynamic Capabilities

It is argued the exploration capability is essential for subsidiary's survival especially under dynamic environments. Because increasingly competitive environments make building and sustaining firm owned competitive advantage increasingly difficult. Building new resources and capabilities could facilitate the responsiveness to meet the local needs.

Thus, it is expected that changing business environments, dynamic competitive forces and institutions, and unique and changing customer needs all imply that subsidiaries should pay more efforts on building exploration capabilities to create new subsidiary-specific advantage to replace subsidiaries' ownership advantage which may erode over time.

However, according to Birkinshaw (1999), the initiative was promoted in cases where there was weak local market competition. It seems that in very competitive local markets, many subsidiaries found themselves crowded out, they have no opportunities to build relationships with important local customers and suppliers. Thus,

Hypothesis 2: An appropriate level of local competitive environments will promote subsidiary's exploration capability.

The Impact of Intra-firm Cooperative Environments on Subsidiary Dynamic Capabilities

In the setting of a subsidiary, capability exploitation focuses on combining, integrating and reconfiguring parents' and local partners' resources so that these resources are best blended and utilized to create value-adding products and/ or services. Since resources of subsidiaries are originally derived from parent company and other subsidiaries, it is critical for subsidiaries to cooperate closely with parent and other subsidiaries to ensure resources acquisition and integrating. In addition, since subsidiaries involve repeated inter-organizational exchange that become socially embedded over time, cooperation is an important safeguard that can mitigate both external and internal hazards and a comprehensive and efficient form of governance for subsidiaries learning from parent company and other subsidiaries. Since cooperation plays an important role in tacit knowledge transferring, it is expected that cooperation with parent and other subsidiaries will enhance subsidiaries' exploitation capabilities.

Hypothesis 3: A high level of intra-firm cooperative environments will promote subsidiary's exploitation capability.

The Impact of Intra-firm Competitive Environments on Subsidiary Dynamic Capabilities

Though the MNCs have more integration pressure today to coordinate their dispersed subsidiaries, it seems that there is increasing internal competition between subsidiary units. According to Birkinshaw and Lingbland (2005), two major types of internal competition can be identified. The first one is internal competition for a charter, or the responsibility to perform certain activities for the corporation as a whole. Another one is internal competition for a customer in the next stage of the value chain. Under the coopetition scheme, Luo (2005) indicates that subunits compete for parent resources and support, system position, and market expansion. First, they compete for parent resources to reduce their dependence on indigenous resources and to strengthen their competitive strengths in a local market. Second, subunits generally compete for four interrelated types of position: (a) the value-chain position, (b) the knowledge flow position, (c) the competence excellence position, and (d) the influencing power position. Finally, competition arises when subunits are interested or active in some common markets and offer the same category of products or services to shared consumers.

Regarding the impact of intra-firm competition on firm performance, it is possible that a negative effect may occur. First, competitive rent-seeking behavior may encourage firms either to erect barriers around their distinctive competencies or to behave opportunistically toward others. Second, competitive rent-seeking behavior may fail to take into account the dense web of social relations in which firms are deeply embedded (Lado et at., 1997). Thus, it is expected that this intra-firm rivalry will decreases the level of trust in information sharing and knowledge transferring. It will hurdle internal efficiencies and sharing of best practice for successful deployment and exploitation of knowledge. However, many previous researches

assert that a combination of cross-functional cooperative ability and competition may nurture productive interactions (Tsai, 2002; Luo et al., 2006) that can facilitate internal efficiencies and sharing of best practice for successful deployment and exploitation of knowledge. In particular, cooperation among competitors can foster greater knowledge seeking and result in syncretic rents. Thus,

Hypothesis 4: An appropriate level of intra-firm competitive environments will promote subsidiary's exploitation capability.

The proposed framework is shown in Figure 1.

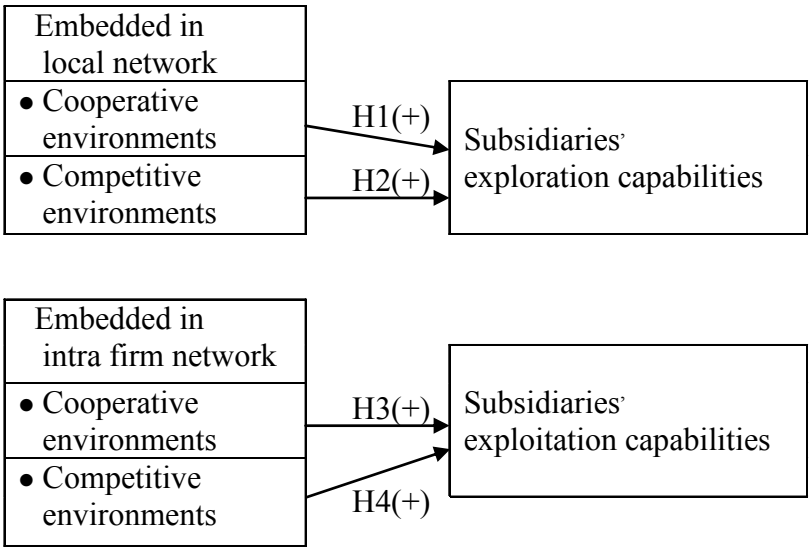

Figure 1 The Framework of Proposed Research Model

SAMPLE AND DATA COLLECTION

Data for this study were collected through structured questionnaire survey with top managers of Taiwan's subsidiaries of foreigner-owned MNCs. We assessed all constructs as multi-item measures. In addition, we scored each item on a seven-point scale, ranging from "strongly disagree" (1) to "strongly agree" (7). The questionnaire was then pretested with 3 Taiwanese managers in a pilot study. Reponses from the pretests ensured the relevance of the final measures. Then, the data collection started by calling to some foreigner-owned subsidiaries whose contact information were listed on name list of foreigner direct investment issued by Ministry of Economic Affairs of Taiwan government to invite them to join this project, resulting in a sample of two hundred subsidiaries agreeing to participate in the study. Then we sent questionnaires to them, and finally get 81 useful responses, including 47 Japan-owned, 19 US-owned, European-owned, and HK-owned units. They had been part of their parent corporations for an average of 21 years, had a mean of 265 employees, and average capital of 0.9 billion NT $. There are 41 respondents coming from the head of marketing departments and 40 respondents coming from manufacturing and R&D departments with average 10 years working experience who are supposed to have good enough knowledge to be in the best position to provide data on the full range of questions needed for this research.

Dependent Variables--Subsidiary Competence Building

In this study, exploitation and exploration are acted as two major roads for subsidiary's competence building. Following Bierly and Daly (2001) and Katila and Ahuja (2002), we regard exploration and exploitation as two distinct dimensions of learning behavior, rather than as two ends of a unidimensional scale. Drawing upon He and Wong (2004), we developed eight Likert-scale items to measure how firms divide attention and resources between innovation activities with explorative versus exploitative objectives. These items were designed to measure how important it is for a firm to carry out innovation projects to enter new product-market domains or to improve existing product-market efficiency (e.g., introduce new generation of products versus improve existing product quality; open up new markets versus reduce production cost).

Independent Variables

Subsidiary local embeddedness

Since subsidiaries are embedded in local environments, we divide local environments into cooperative environments and competitive environments. The former emphasizes the cooperative activities with local suppliers, customers, governments, and universities or other institutions, while the latter emphasizes the competition level of subsidiary of which his industry structure reveals. Following Lane & Lubatkin (1998), cooperation is defined as similar to embeddedness between two parties in a relationship which is usually measured as frequency of interaction and/or degree of mutual adaptation of resources/activities (Lane & Lubatkin, 1998). Drawing upon Andersson et al. (2002), six questions were used to measure subsidiary local cooperative activities. On Likert-type scales ranging from 1 "very little" to 7 "very much", the respondents were asked to indicate to what extent their subsidiaries had caused adaptations concerning (a) product technology, (b) production technology, (c) standard operating procedures, and (d) business practice with their major suppliers and customers.

Concerning the competitive environments faced by subsidiaries, based on previous literatures, a three-item scale was used for environmental competitiveness that measured the extent to which a unit's external environment is characterized by intense completion that is reflected in the number of competitors and the level of oversupply, and competing through only price (Jansen, et al., 2006). In addition, much research on competition derives from neo-classical economic theory, in which competition is analyzed as different structures within an industry, and structural entry barriers are often used to demarcate the industry. Thus, drawing from Porter (2000), a three-item scale was used for entry barriers that indicated the extent to which a subsidiary can earn positive economic profits via entry barriers while making it unprofitable for newcomers to enter an industry.

Subsidiary embedded in intra-firm network

In this study, we divide intra-firm network environments into intra-firm cooperation, and intra-firm competition. Drawing upon Luo et al. (2006), we measured *cross-functional cooperative intensity* with three items that we constructed to assess the degree to which the lateral cross-subsidiary interactions are frequent and close. Further, five-item scale was used to measure cross-subsidiary cooperative ability, which means the ability to assimilate and

deploy market knowledge in lateral interactions among subsidiaries. Concerning the intra-firm competition, there are 7 items to identify the degree to which departments compete both for limited tangible and intangible resources and for strategic importance, power, and department charter.

RESULTS

The four hypotheses may be summarized in two basic models as follows:

$$ER=\beta 11+\beta 12BE+\beta 13TE+\beta 14EB+\beta 15CI$$

Where ER: exploration capability; BE: business embeddedness; TE: Technology embeddedness; EB: entry barriers; CI: competition intensity;

$$ET=\beta 21+\beta 22CII+\beta 23CA+\beta 24RC+\beta 25MC$$

Where ET: exploitation capability; CII: cooperation intensity; CA: cooperation intensity; RC: compete for resource; MC: compete for market

Hypotheses 1 and 2 are reflected in model 1, while Hypotheses 3 and 4 are expressed in model 2. The results of these two models are reported in Table 1. Model 1 is highly significant. Hypothesis 1 examined the relationship between the local embeddedness (external cooperation) and the level of subsidiary exploration capability building. The result shows that the more technology embeddedness in local environments will highly enhance subsidiary exploration capability building. Thus, hypothesis 1 is supported. Further, a striking result is the clear impact of the level of competition intensity in local environments. When the competition intensity is heavy, it will stimulate subsidiary to pursue exploration capability building. Thus, hypothesis 2 is strongly supported, with a t value significant at the 0.5% level.

Concerning the impacts of intra-firm environments on subsidiaries' exploitation capabilities building, the results show that the intra-firm cooperation ability is the most relevant factor. The results indicate that the more the cross subsidiaries cooperation ability, the more easily to learn from other subsidiaries, thus enhances the ability to build exploitation capabilities for local subsidiary. Thus, the hypothesis 3 was supported. On the other hand, hypothesis 4 was not supported. In fact, the results indicate a negative but not significant relationship between intra-firm competition and exploitation capability building of subsidiary rather than the proposed positive relationship. This rather surprising result can have different explanations. First, our basic assumption behind hypothesis 4 may be wrong: too much emphasis on competition climate maybe impede knowledge transfer between subsidiaries, rather than encourage knowledge transfer. Second, maybe there exists an inverse U type relationship between intra-firm competition climate and subsidiaries' exploitation capabilities building. However, it needs to be verified in future study.

Table 1 Regression Analysis for the Relationship between Environmental aspects and capabilities building of subsidiaries

Independent Variable	Dependent Variable					
	Exploration capability			Exploitation capability		
	Beta	t value	VIF	Beta	t value	VIF
BE: business embeddedness	0.071	0.397	3.894			
TE: Technology embeddedness	0.437***	2.525	3.679

P-Value	0.000			0.020		

* : P<0.1 ; ** : P<0.05 ; *** : P<0.01*

CONCLUSION

This study has shifted the focus from the knowledge transfer to the exploitation and exploration capability of subsidiaries. Theoretically, this study may contribute to research on subsidiaries' dynamic capabilities. It is argued that for subsidiaries' evolution and success, possessing resources transferred from parent is not enough. How to effectively exploit parent-contributed resources and continuously explore new capabilities in local market may be more important. Especially, this study explains what type of antecedents in terms of internal environment (cooperate vs. competitive) and external environment (cooperate vs. competitive) may shape exploitation capabilities and exploration capabilities. It is verified that when subsidiaries operate in a more local embedded business environments, subsidiaries will more depend on exploration capability to offset the severer competitive condition. In addition, while subsidiaries face more intra-firm embedded environments, subsidiaries will more depend on exploitation capability to fully utilize the current resources contributed by

parent. These results shed lights on how different contextual conditions may lead subsidiaries to pursue exploitation capability or exploration capability to successfully respond to multiple environmental needs. Through this empirical study, we contribute to a greater clarity and better understanding of how multiple environmental conditions, namely local embeddedness, local competition intensity, intra-firm cooperation, as well as intra-firm competition impact subsidiaries' exploitation and exploration capabilities building, which are relevant to MNCs' sustainable competitive advantages.

ABSTRACT

Export information is a critical determinant for the competitive advantage and the success of an export venture. However, the ability to acquire information may not be sufficient enough to ensure effective decision-making by the exporting firms. The correct use of that information may result in better planning and actions, which may lead to enhanced performance. At the same time, the organizational culture may influence the use of information by organizations. Organizations with strong culture were able to gain sustained competitive advantages and superior performance [2]. As organization culture governs the behavior of its members, it is fair to say that the activities of the organization may be different with different prevailing culture within. Thus, this study will assess the relationship between information use and organizational culture, as well as looking at the patterns of information use and organizational culture among Malaysian exporters. A questionnaire-based survey is carried out among Malaysian exporters and the analysis of the results shows significant relationship between information use and organizational culture.

Keywords: Information use, organizational culture, export

INTRODUCTION

There has been a growing interest on the area of market information use [e.g.,28,42] with a realization of its importance to organizations [1]. The success or failure of a firm depends on the market information that it possesses [18,23,34]. According to Koh [22], information use results in improved plans and organizational responses, which, in turn, enhance performance.

Organizational culture guides the attitude of managers thus their strategic orientation [46]. Therefore, organizations with strong culture were able to gain sustained competitive advantages and superior performance [2]. As organizational culture governs the behavior of its members, it is fair to say that the activities of the organization may be different with different prevailing culture within. For example, firms with an adaptable, risk-taking orientation may find that international expansion is the next logical step, thus more likely to

make export decisions to diversify their market. As the risk is higher at the strategic level if the wrong decision is made [42], effective information use is necessary to reduce such risk [6].

In Malaysia, exporting is a major economic activity contributing to a major percentage of the country's gross domestic product (GDP). Malaysian exporters are relied upon to stimulate economic expansion and generate domestic-led investments as they contribute to 47.3% to the GDP/total value [7]. In view of this, it is important to determine whether organizational culture influences the export decision making through their information processing activities. Thus, this study will examine the relationship between information use and organizational culture within the context of Malaysian exporters.

LITERATURE REVIEW

Information use is defined as the extent to which research influences user's decision making [31]. There are three types of use distinguished in the literature: instrumental, conceptual, and symbolic. Instrumental use occurs when information is directly applied to the problems at hand, whereas conceptual use is for general enlightenment, and not gathered to be directly applied to a specific problem [5]. Diamantopoulos and Souchon [13] found that instrumental and conceptual use constituted two aspects of a single dimension, thus are taken together as one variable. Symbolic use, on the other hand, "involves the use of partial or distorted information for essentially political purposes, such as justifying actions already taken on the basis of instinct or intuition, or legitimizing views already held" [51, p.47].

A major factor that may influence organization's information use is its organizational culture. Deshpande and Webster [10] defined organizational culture as the pattern of shared values and beliefs that allows organization's members to understand the functions of an organization and also what governs the behavior of individuals within the organization. In understanding organizational culture in the perspective of information processing, Deshpande and Webster [10] reviewed five theoretical paradigms for studying culture originally proposed by Smircich [41]. One of the paradigms is organizational cognition which is based on the cognitive organization theory [48]. Organizational cognition views organizations as knowledge systems and focuses on managerial information processing. In their subsequent work, Webster and Deshpande [47] discussed how organizational information processing perspective can be applied to understand culture and subsequently its relationship to marketing strategy.

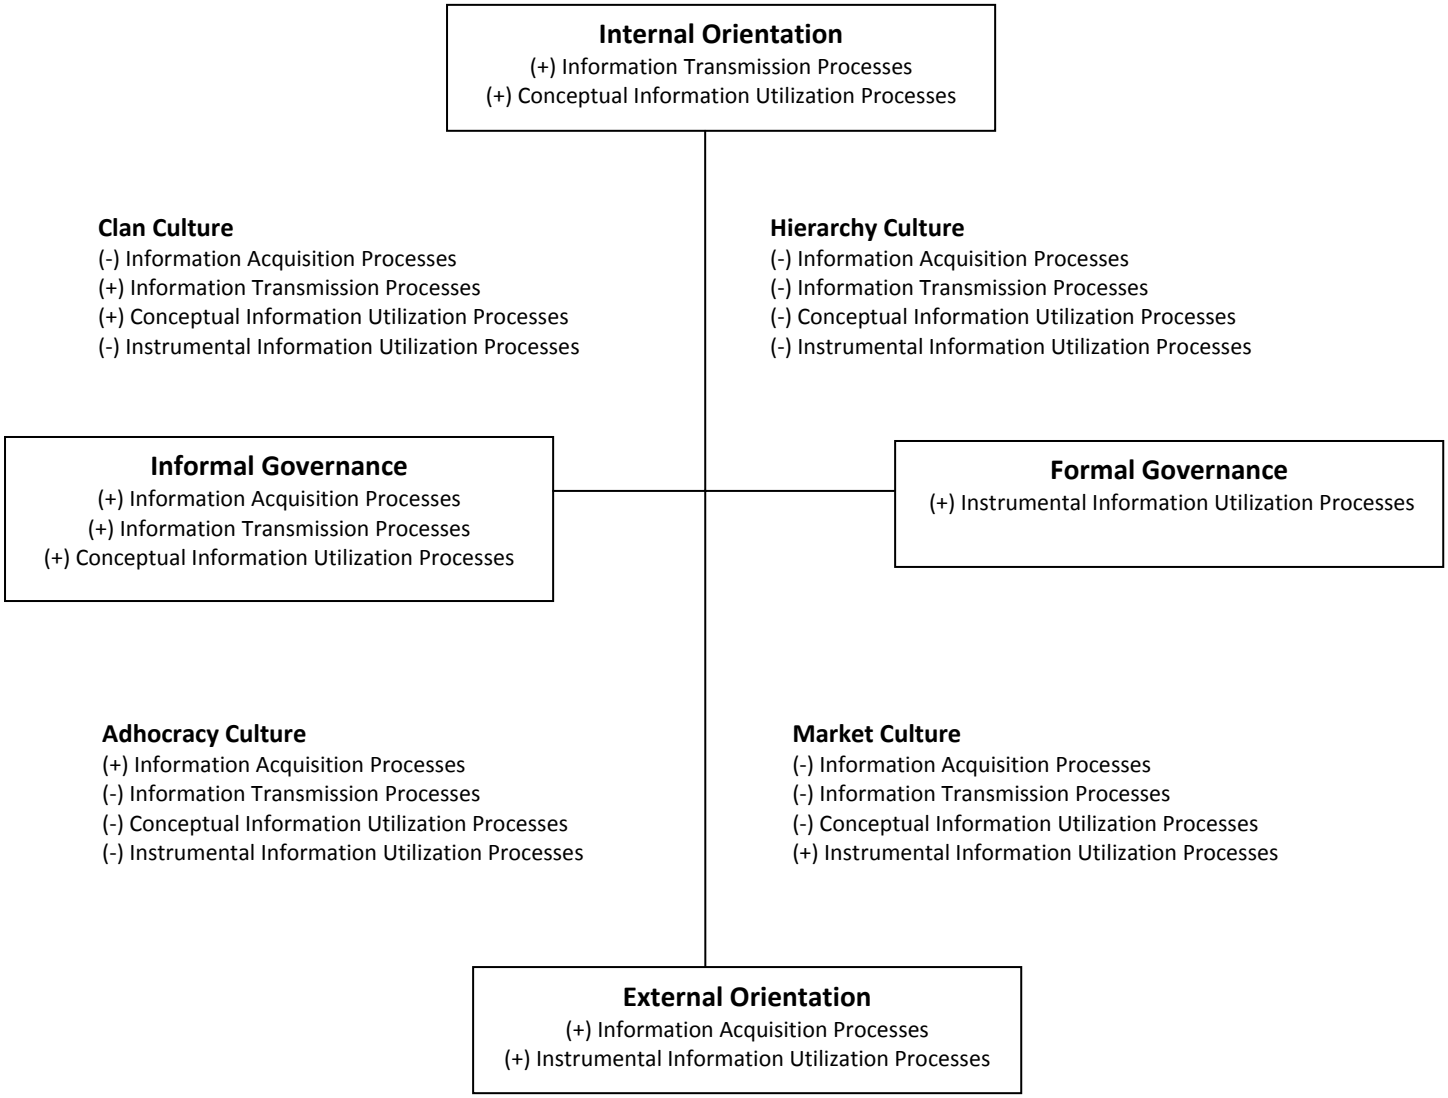
Webster and Deshpande [47] quoted the seminal work of Quinn and his colleagues [37,38,39], who have proposed the "competing values" model of organizational effectiveness. Quinn and Rohrbaugh [39] based their empirical study on the works of Jung [20] and Campbell [4]. Quinn and Rohrbaugh [39] used the organizational effectiveness criteria developed by Campbell [4] to reproduce clusters of values that matched the dimensions of psychological archetypes developed by Jung [20]. The study confirmed that individuals interpret the cultural information that they receive from within the organization according to the values that they hold [29].

Moorman [30] used the competing values model to show the impact of culture on organizational information processes, which include information acquisition, information

transmission, conceptual utilization and instrumental utilization processes. She proposed two predominant dimensions by which cultural values vary, which are the informal-formal dimensions and the internal-external dimensions. The informal-formal dimensions follow the organic to mechanistic processes continuum in the competing values model. The four cultures, clan, hierarchy, adhocracy and market, result from the intersection of the two dimensions. Culture is said to influence the various organizational market information processes in the organization [30]. Figure 1 depicts the proposed view.

Externally-focused cultures will have far developed information acquisition and instrumental utilization as both of these processes require interaction with the external environment. On the other hand, internally-focused cultures have better information transmission and conceptual utilization processes since both functions completely internal to the organization [30]. Generally, information utilization in firms has been found to be lower with formalization [8,11]. In the beginning stage of an adoption process, a formalized organization may hinder the process of adoption such as acquisition, understanding, and commitment to an innovation [52]. However, a formalized organization may facilitate the implementation stages of the adoption processes. Also, formalized cultures may facilitate instrumental utilization processes which involve direct use of information for marketing decisions. This would infer that informal cultures reduce instrumental utilization processes.

Figure 1 Cultural Antecedents of Organizational Market Information Processes*



*(+) denotes that the culture emphasizes the information process.
(-) denotes that the culture de-emphasises the information process.

Adapted from Moorman (1995)

The empirical findings of the study by Moorman [30] show that not all of the suggested hypotheses based on the model are supported. For example, none of the cultures are found to be significantly related to information acquisition even though it is predicted that adhocracy culture would encourage information acquisition processes more than the other cultures. However, the hypotheses that clan culture has the strongest positive effect on transmission processes and conceptual use processes are supported.

It is suggested that adhocracies may improvise decision making and implementation approaches and not follow the traditional information process [31,49,50]. In the past, managers in the adhocracy culture have a style of "play[ing] a best hunch and then learn[ing] and adapt[ing] as you go" [47, p.11].

In the clan culture, information intensity may be due to the internal orientation and informal structure which requires participation, teamwork, and cohesiveness among its members [30]. Cultures that are high in trust and mutual supportiveness will result in better communications and higher levels of commitment, and cooperation among members [33].

The inconclusive findings regarding the relationship between organization culture and information use lead us to ponder whether the result would be the same in the context of Malaysian exporters. To the best knowledge of the researcher, it is not known what the predominantly effective culture is as far as use of export information is concerned. As a result, this paper attempts to test the following non-directional hypothesis:

H1: There is a significant association between organizational culture and information use.

METHODOLOGY

Research Instrument

A survey questionnaire is developed for the purpose of data collection using several constructs adopted from the literature to measure the variables. The instrument elicits data on the organizations use of export information, their organizational culture as well as demographic information for the organization. The questionnaire is sent for face validity through a process of qualitative review by five subject-matter experts. Necessary modifications are made to the questionnaire based on the inputs given by the experts. After adjusting the questionnaire based on their comments, a pilot study is carried out using 30 exporting companies. To measure the consistency and reliability of the measures used, the Cronbach Alpha coefficient is utilized. In the analysis on the pilot study data, the alpha coefficient for all measures exceeded the minimum alpha of 0.6 [17,35]. Thus the constructs measured are deemed reliable and can be used for the main data collection.

Measures

Information use

Information use is the way that information is used in the organization. The measurement is adopted from the work of Diamantopoulos and Souchon [13]. The construct is further divided

into two dimensions namely instrumental/conceptual use and symbolic use. Twelve items for instrumental/conceptual use and nine items for symbolic use are measured by a 5-point Likert scale ranging from 1(strongly disagree) to 5(strongly agree). The respondents are asked about their perception on how information is used in the organization.

The instrumental/conceptual use and symbolic use variables have been used in their aggregate forms in previous studies. However, the literature has indicated that symbolic use may be manifested as, among others, distorted use [15], using information not for its intended purpose [28], or to justify a decision already made [21]. The studies of these different dimensions, nevertheless, have been mainly conceptual. The factor analysis may reveal the different sub-dimensions of symbolic use which will be used to study the relationships between the various symbolic use dimensions and organizational culture. Principal component factor analysis with varimax rotation is used to extract the factors of the independent variable, symbolic use.

Table 1: Varimax Rotated Factor Loading for Independent Variable: Symbolic Information Use

	Items	Factors		
		1	**2**	**3**
1	Information is sometimes taken into account to justify the cost of having acquired it	**.856**		
2	Information is often collected to justify a decision already made	**.846**		
3	Information is often gathered to maintain good relationship with information suppliers	**.691**		
4	Information is sometimes manipulated in order to justify company decisions made on the basis of instinct	**.562**		
5	Instinct/intuition is often combined with information when making decisions		**.858**	
6	If information is difficult to obtain, guesses are made instead		**.797**	
7	Information frequently supports decisions made for other reasons		**.372**	
8	Information is often not considered in the making of decisions for which it was originally requested.			**.883**
9	Key executives often distort information in passing it on			**.717**
	Eigenvalue	2.384	1.596	1.556
	Variance (Cumulative %)	26.491	44.219	61.503
	Coefficient alpha	0.751	0.655	0.623

In Table 1, the analysis identified three factors having eigenvalues of greater than 1, with 61.503 percent of the variance explained. Item 7 is dropped from Factor 2 due to the low factor loading. Factor loading of 0.50 is used for selection of items in the factor based on the recommendation of Stevens [43]. Subsequently, reliability analysis is performed on these variables. The alpha coefficients are 0.751, 0.655, and 0.623 for Factor 1, 2, and 3, respectively. The variables derived from the analysis are named legitimating use, intuitive use and distorted use, respectively. Legitimating use is defined as the use of export information to

justify decisions already made on the basis of cost, good relationship, and instinct [45]. Intuitive use is the use of information with intuition or making guesses and distorted use is the conscious modification and non-use of export information [45].

Organizational culture

The measurement of organizational culture is adopted from Deshpande, Farley and Webster's [12] study. The measure has 16 items capturing the four elements of organizational culture, which are clan, adhocracy, hierarchy and market. Each organizational culture construct consists of four items representing four organizational dimensions; 1) kind of organization, 2) leadership, 3) cohesiveness, and 4) the importance placed by the organization. The respondents are asked to rate their level of agreement or disagreement with the items in terms of how similar the description fits their organizations. A five-point scale, ranging from 1 (strongly disagree) to 5 (strongly agree), is used to measure the variables.

Data Collection

Data for this study is collected via a self-administered mail survey among export managers within the Malaysian exporting organizations. The database of exporting firms is acquired from the Malaysia External Development Corporation (MATRADE). The questionnaire is mailed with a self-addressed reply envelope and a letter to the designated contact person in the database with a request that they forwarded it, if necessary, to the export managers of the organization or the person in charge of making the exporting decisions. An internet-based random number generator is used to generate 2,500 numbers and company names are then extracted from the MATRADE database A total of 137 completed questionnaires are returned with 131 usable responses. The unusable responses are due to too many missing items and one inappropriate respondent being the personal assistant of the General Manager. This is following the recommendations that low missing data that is less than 10% is less likely to produce biased results, regardless of the methods used to treat the missing data [3,36]. 121 unopened envelopes are returned by the postal service due to change of address or termination of operation. The usable response rate represents a 5.5% response rate. Local researchers in the Southeast Asian countries have informally indicated that businesses in this region generally distrust mail surveys and are too busy to entertain academic research which is seen as competitive intelligence, thus resulting in low response rate [19]. Analyses done on the usable data are descriptive analysis and correlation.

Sample

The highest number of organizations in this study has less than 51 employees (43.1%), the next highest is having 51-150 employees (27.7%) and the third highest with 151-200 employees (17.7%). In terms age of company, 37.7% of the companies have been in operations for 10-19 years, 28.5% have been in operations for 20-49 years, and 20.8% in 5-9 years. The highest number of companies in this study comes from the food industry (14.8%), 10.2% are in the electrical and electronics parts and components industry and also the furniture and parts industry. The organizations' profile is presented in Table 2.

Table 2: Organizations' Profile

		*n**	percent
Size	Less than 51	56	43.1
	51-150	36	27.7
	151-250	23	17.7
	251-500	8	6.2
	501-1000	5	3.8
	More than 1000	2	1.5
Age of company	Less than 5 years	15	11.5
	5-9 years	27	20.8
	10-19 years	49	37.7
	20-49 years	37	28.5
	50 years or more	2	1.5

Table 3: Information use

Type of Use	Mean	SD
Instrumental/Conceptual Use We actively seek out information for specific decisions.	4.05	.680
Our confidence in making export decisions is increased as a result of information.	3.89	.856
We store information so that it can be used by others at a later date.	3.81	.795
Without information, the decisions we make would be very different.	3.76	.858
Information is translated into significant practical action in this company.	3.70	.772
Decisions based on information are more accurate than wholly intuitive ones.	3.67	.827
Information is often used specifically to make a particular export decision.	3.66	.810
The majority of information acquired by the company is used.	3.62	.728
The same piece of information is often used for more than one decision.	3.61	.750
Export decision would not be taken without detailed information	3.56	.887
Information often has relevance to our decisions.	3.55	.888
Our uncertainty associated with export activity is greatly reduced by information.	3.45	.896
Aggregate mean:	**3.69**	**.431**
Symbolic Use		
Information frequently supports decisions made for other reasons.	3.56	.728
Information is sometimes taken into account to justify the cost of having acquired it.	3.52	.925
Instinct/intuition is often combined with information when making decisions.	3.52	.844
Information is often gathered to maintain good relationship with information suppliers.	3.23	1.064
Information is often collected to justify a decision already made.	3.06	.959
Information is sometimes manipulated in order to justify company decisions made on the basis of instinct.	2.95	.905
If information is difficult to obtain, guesses are made instead.	2.76	1.087
Key executives often distort information in passing it on.	2.80	.845
Information is often not considered in the making of decisions for which it was originally requested.	2.57	.823
Aggregate mean:	**3.11**	**.485**

RESULT AND DISCUSSION

Patterns of information use and organizational culture

In order to identify the patterns of information use and organizational culture among the exporters in the study, means are calculated for all items under each constructs. Table 3 presents the mean and standard deviation (SD) for information use while Table 4 presents the organizational culture.

From Table 3, on average the respondents in this study agree that most of the information collected by their companies are used instrumentally/conceptually which is using the information for its intended purpose. The results show that the item with the highest mean in the instrumental/conceptual use dimension is "We actively seek out information for specific purpose" with a mean of 4.05. This implies that the type of information that the exporting companies needed is specific and tailored to certain targets and purpose. As such, any export assistance extended to the companies by government agencies, for example, should first identify what is needed by the companies before dispensing any 'one-size-fits-all' kind of assistance. In addition, the value of information to the companies is that it increases their confidence in making decisions, is vital towards decision making, and increases the accuracy of the decisions. This implies that information will add value if they are problem-solving oriented. It is important, therefore, to know the types of problems faced by exporters so that the information is packaged accordingly. The aggregate mean for symbolic use of 3.11 indicates a lower usage compared to instrumental/conceptual use. Even though information may be used to support decisions made for other reasons, for example, exporters use information for decision making purposes to a higher degree. Nevertheless, the exporters do take into account the cost of acquiring the information. Certain information acquisition process is expensive, such as conducting in-house research or commissioning a research agency to gather information. As such, the information is used mainly because of its cost rather than its usefulness. Information may also be used together with intuition especially when a fast decision is required, and used to maintain good relationship with the supplier of the information.

For organizational culture in Table 4, in terms of the kind of organization (see all items no.1), the mean for market culture is the highest (mean = 3.56). The lowest mean is for hierarchy culture (mean = 3.32). For leadership practices (see all items no.2), adhocracy culture has the highest mean (mean = 3.95), with the lowest mean being for market culture (mean = 3.30). As for cohesiveness (see all items no. 3), the highest mean is for market culture (mean = 3.84), with the lowest for hierarchy culture (mean = 3.56). In terms of emphasizing what is important in the organization (see all items no. 4), hierarchy culture has the highest mean (mean = 4.06), while the lowest is for clan culture (mean = 3.78). Overall, the predominant culture among the companies in the study is adhocracy culture, followed by hierarchy, market and clan culture, although there is not much difference in the means.

Table 4: Organizational culture

	CLAN CULTURE	MEAN	SD
1	My organization is a very personal place. It is like an extended family. People seem to share a lot of themselves.	3.47	1.033
2	The head of my organization is generally considered to be a mentor, sage or a father or mother figure.	3.52	.917
3	The glue that holds my organization together is loyalty and tradition. Commitment to this firm runs high.	3.79	.811
4	My organization emphasizes human resources. High cohesion and morale in the firm are important.	3.78	.874
	Clan Culture Aggregate Mean	**3.64**	**.610**
	ADHOCRACY CULTURE	**MEAN**	**SD**
1	My organization is a very dynamic and entrepreneurial place. People are willing to take risks.	3.45	.905
2	The head of my organization is generally considered to be an entrepreneur, an innovator, or a risk taker.	3.95	.879
3	The glue that holds my organization together is a commitment to innovation and development. There is an emphasis on being first.	3.65	.944
4	My organization emphasizes growth and acquisition of new resources. Readiness to meet new challenges is important.	4.04	.782
	Adhocracy culture aggregate mean	**3.77**	**.703**
	HIERARCHY CULTURE	**MEAN**	**SD**
1	My organization is a very formalized and structured place. Established procedures generally govern what people do.	3.32	.939
2	The head of my organization is generally considered to be a coordinator, an organizer, or an administrator.	3.82	.840
3	The glue that holds my organization together is formal rules and policies. Maintaining a smooth-running institution is important here.	3.56	.807
4	My organization emphasizes permanence and stability. Efficient, smooth operations are important.	4.06	.668
	Hierarchy culture aggregate mean	**3.69**	**.593**
	MARKET CULTURE	**MEAN**	**SD**
1	My organization is very production oriented. A major concern is with getting the job done, without much personal involvement.	3.56	.912
2	The head of my organization is generally considered to be a producer, a technician, or a hard-driver.	3.30	.954
3	The glue that holds my organization together is the emphasis on tasks and goal accomplishment. A production orientation is commonly shared.	3.84	.677
4	My organization emphasizes competitive actions and achievement. Measurable goals are important.	3.97	.670
	Market culture aggregate mean	**3.67**	**.561**

The results imply that more than one culture may exist within an organization, but there may be one predominant culture that mainly determines the way that the organizations do things. In the case of exporters, the dominant culture determines how the organization would tackle internationalization. Adhocracy culture is characterized by entrepreneurial leadership, emphasizing growth, innovation, and risk taking and considered to have an external orientation and informal structure. An adaptable and externally oriented culture such as adhocracy culture has the greatest potential to become successful exporters [14]. Hierarchy culture is more bureaucratic, characterised by a formalized, structured place, held together by formal rules and policies. It may appear that this culture may not be conducive to be successful exporters. However, it was found that in stable industries, firms can compete effectively by adhering to orders and rules [16,27]. Market culture is characterized by its emphasis on competitive advantage, which is necessary for international ventures. However, clan culture focuses on internal maintenance such as employee satisfaction, morale, and cohesiveness. Because of the greater emphasis on internal orientation and less on financial goals, they have lower potential to become successful exporters [14].

Table 5: Correlation among Information Use and Organizational Culture (n=131)

Pearson correlation	Instrumental/ Conceptual use	Legitimating use	Intuitive use	Distorted use
Clan	.239**	.241*	-.022	-.004
Hierarchy	.168	.114	.048	.072
Adhocracy	.360**	.243**	-.033	-.014
Market	.260**	.290**	.010	.072

** Correlation is significant at 0.01 level (2-tailed)
* Correlation is significant at 0.05 level (2-tailed)

The relationship between information use and organizational culture

Pearson correlation is used to test the relationship between information use and organizational culture. The result is presented in Table 5.

Five out of sixteen correlations are statistically significant at below 0.30 level, with one correlation above 0.35. Instrumental/conceptual and legitimating uses are significantly correlated with three dimensions of culture (i.e. clan, adhocracy, and market) except with hierarchy culture. Instrumental/conceptual use is significantly correlated with clan, adhocracy, and market culture at 0.01 significance level. This result is somewhat similar to the study by Moorman [30] which found significant relationship between conceptual use of information and hierarchy culture, and between instrumental use and clan culture. On the other hand, legitimating use is significantly correlated with adhocracy and market culture at 0.01 level, but significantly correlated with clan culture at 0.05 level. Hierarchy culture is found to have no significant correlation with any of the information use dimensions.

Instrumental and conceptual uses refer to rational and straightforward utilization of information in making decisions [5]. Legitimating use, a dimension of symbolic use, pertains to the employment of information to justify decisions already made, justify the cost of

acquiring the information and for maintaining good relations with information providers. Instrumental/conceptual and legitimating uses are found to have significant association with three dimensions of culture which are clan, adhocracy, and market culture. Internally focused culture such as the clan culture would use information positively to increase their confidence, get acceptance among members of the organization, and also for economic purposes. The legitimate use of information by clan culture indicates that the managers within this culture are confident enough to use information in a symbolic way because they have the support and trust of their own people to make any decision necessary for the improvement of the organization's performance. Adhocracy culture which is more externally focused would have the support of an entrepreneurial leadership and use information for the company's strategic and economic performance. Another externally focused culture is the market culture which may use information to maintain growth and market competitiveness.

On the other hand, intuitive use and distorted use are found to have no relationship with organizational culture. Although companies may behave differently when looking for and processing information [44], companies in this study may not agree to use information that may be detrimental to their well-being. Such use, if any at all, seems to be non-discriminating among cultures. In addition, hierarchy culture is found to have no significant correlation with any of the information use dimensions. This finding provide further support for previous studies that found hierarchy culture to have the lowest levels for all pattern of information processing [e.g., 44].

CONCLUSION

The four types of cultures are not mutually exclusive within an organization, rather they coexist, with one may be more dominant than the others [25]. For exporters, the dominant culture may determine how the organization approaches its international ventures and also its commitment towards exporting.

Past studies in the area of organizational culture and information processing have focused on the formal-informal continuum of the competing values model. This study extends the body of knowledge by looking at the competing values model through the internal-external continuum, providing empirical evidence of a relationship between externally oriented cultures (i.e. adhocracy and market culture) with instrumental/conceptual use and legitimating use of information.

However, there is no evidence of intuitive and distortive use based on culture. The organizations know well enough the negative implications of using information in that manner to avoid them. One interesting finding is that hierarchical culture is not related to any of the acquisition and use variables. Being more bureaucratic, formal, and structured, organizations with this culture may not be too adventurous in obtaining information. Hierarchy culture is found to maintain a high degree of formality in planning [44].

DETERMINING THE IMPACT OF LOGISTICS FACTORS ON THE BUSINESS SUCCESS OF THE ELECTRICAL AND ELECTRONICS INDUSTRY IN THAILAND BASED ON DIFFERENT SIZES OF THE FIRMS

ABSTRACT

An empirical analysis of internal and external logistics factors to the business performance of the firms of the Electrical and Electronics Industry in Thailand is presented. This study used data collected from the high level logistics executives in the Electrical and Electronics Industry. The analysis was divided into two scenarios based on the firm's capital investment (less than or higher than 100 million baht). Questionnaires were used as a tool to collect data and Structural Equation Modeling (SEM) was used to analyze relationships among these factors. This study attempted to examine a structural model of internal and external logistics factors on firm's business performance. Seven hypothesized relationships were tested on five factors which consisted of human resource management, logistics infrastructure, internal operational activities, external operational activities and business performance. The outcomes can recommend important logistics factors to the firms in each scenario so they can focus more on these factors with their limited resources and budgets.

Keywords: Electrical and Electronic Industry, Internal and External Logistics Factors, Structural Equation Modeling, Performance Evaluation, Supply Chain Performance.

1. INTRODUCTION

Fierce competition in today's global markets, the introduction of products with shorter life cycles, and the heightened expectations of customers have forced business enterprises to invest in, and focus attention on, their supply chains. This, together with continuing advances in communications and transportation technologies (e.g., mobile communication, internet, and overnight delivery), has motivated the continuous evolution of the supply chain to manage it effectively. In a typical supply chain, raw materials are procured and items are produced at one or more factories, then shipped to warehouses for intermediate storage, and subsequently shipped to retailers or customers. Consequently, to reduce cost and improve service levels, effective supply chain strategies must take into account the interactions at the various levels in the supply chain.

This study investigates internal and external logistics factors in the supply chain of the Electrical and Electronics Industry in Thailand. This is to evaluate their impact on the firms' business performance based on their different sizes of investment. Questionnaires are used as a tool to collect data from the firms and Structure Equation Modeling (SEM) is employed as a tool to analyze the proposed relationship among these factors.

2. THEORECTICAL FRAMEWORK AND HYPOTHESES

There are three groups of main factors in the questionnaire, which are tested to find their impacts towards the firm's competitive capabilities and business performance. As seen in Figure 1, the first group is related to the external logistics factors while the second group evaluates the internal logistics factors. Finally, the last group evaluates the firm's business performance.

Internal Logistics Factors: These factors include Human Resource Management (HRM) and Internal Operational Activities of the firms (IO). These activities represent the firms' internal operations relating to manpower, human resource planning, and employee recruitment, as well as the day to day internal operations management of the firms.
External Logistics Factors: These factors include the fundamental Logistic Infrastructure (LI) and External Operational Activities of the firms (EO). Both factors are mainly linked to activities beyond the firms' internal operations. They represent fundamental logistic infrastructure, transportation and supplier linkages.

Business Performance: This includes the firm's operating performance such as return on investment, profits as a percentage of sales, net income before taxes, and present value of the firm. These performances are considered to be the main criteria for evaluating the business performance of the firms.

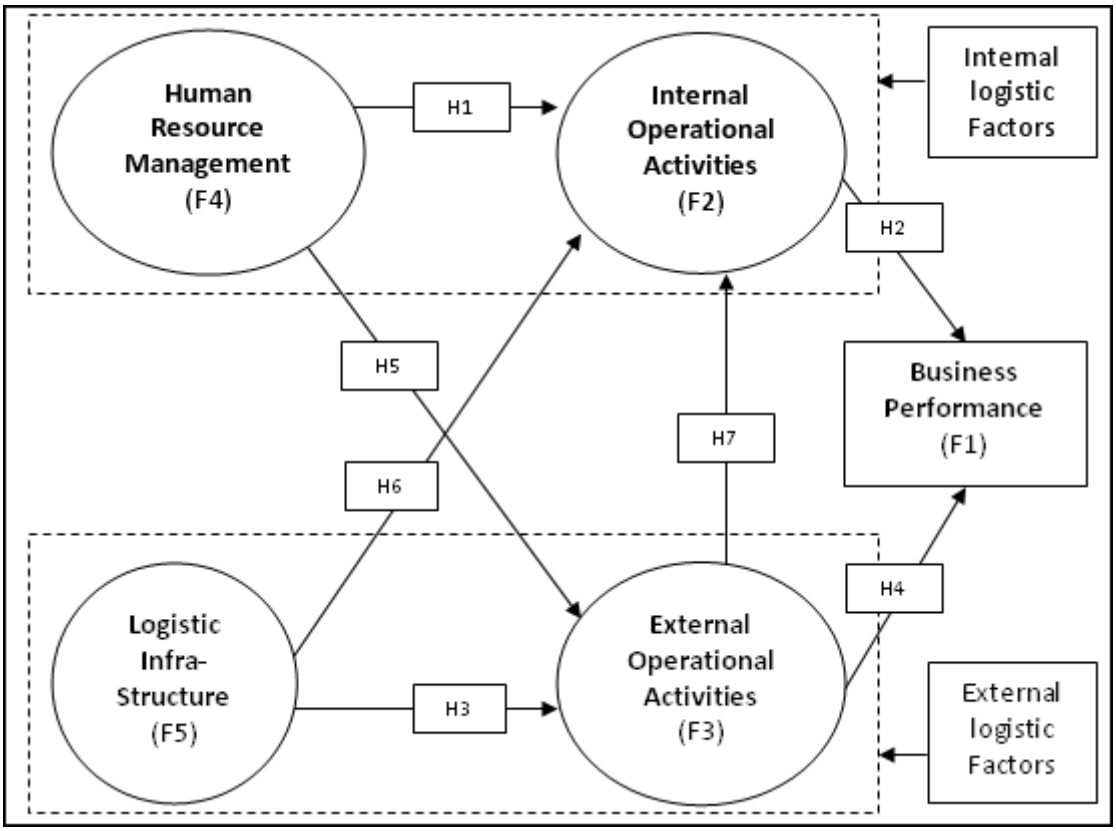

Figure 1: Research hypothesis

2.1 Relationships of External Operational Activities (EO) in relation to Internal Operational Activities (IO)

Hypotheses 1 and 5 propose that strategic Human Resource Management (HRM) has a positive impact on Internal Operational Activities (IO) and External Operational Activities (EO). As a result, the following hypotheses are proposed:
H1: Human Resource Management (HRM) has a positive impact on Internal Operational Activities (IO).
H5: Human Resource Management (HRM) has a positive impact on External Operational Activities (EO).

2.2 Relationships of Logistic Infrastructure (LI) in relation to External Operational Activities (EO) and Internal Operational Activities (IO)

Hypotheses 3 and 6 propose that the Logistic Infrastructure (LI) has a positive impact on External Operational Activities (EO) and Internal Operational Activities (IO). As a result, the following hypotheses are proposed:
H3: Logistic Infrastructure (LI) has a positive impact on External Operational Activities (EO).
H6: Logistic Infrastructure (LI) has a positive impact on Internal Operational Activities (IO).

2.3 Relationships of External Operational Activities (EO) in relation to Internal Operational Activities (IO)

Hypothesis 7 suggests that positive relationships between the External Operational Activities (EO) have an impact on Internal Operational Activities (IO). As a result, the following hypothesis is proposed:
H7: External Operational Activities (EO) has a positive impact on Internal Operational Activities (IO).

2.4 Relationships of Internal Operational Activities (IO) and External Operational Activities (EO) in relation to Business Performance (BP)

Hypotheses 2 and 4 support that positive relationship between the Internal Operational Activities (IO) and External Operational Activities (EO) have an impact on Business Performance (BP). Therefore, the following hypotheses are proposed:
H2: Internal Operational Activities (IO) has a positive impact on Business Performance (BP).
H4: External Operational Activities (EO) has a positive impact on Business Performance (BP).

3. RESEARCH METHODOLOGY

A survey was undertaken to gather data for testing the research hypotheses. The surveys include multiple scale items for each of the factors. The respondents responded from a variety of firms in the Electrical and Electronics Industry that are listed by Electrical and Electronics Institution. From the 1,100 surveys in the target samples, 336 responses were received. Thirty three surveys were excluded from the analysis because of incomplete information. Thus, the response rate was about 30.54%. The questionnaire's questions were pre-tested by a few respondents from an Electronic Manufacturing firm, Delta Electronics (Thailand) Plc. This is

to ensure readability, eliminate ambiguity and make sure that close-ended questions have a complete array of possible responses and so on. The analysis was also separated into two scenarios based on the firm's capital investment. Small-size firms are the group of firms that has their capital investments less than 100 million baht while large-size firms are the group of firms that has their investments at least 100 million baht. This is to find the impact of logistics factors based on the different sizes of the firms towards their business performance. From the 303 surveys, 117 samples are classified as the large-size firms and 186 samples are the small-size firms. The responses samples were comprised of high ranking plant or production managers as well as logistics managers. The responses were recorded using a 5-point Likert-type scale (1 = strongly disagree to 5 = strongly agree) for each group of factors.

The study uses Structural Equation Modeling (SEM) with SAS to analyze the research hypotheses. SEM is performed by using a two-step procedure. First the measurement model is developed. Then, it is followed by development of the structural model (Anderson and Gerbing, 1988). The structural model differs from the measurement model because it includes causal paths based on hypothesize relationships between specific factors in the model.

4. RESULTS

Confirmatory Factor analysis (CFA) was used to validate measures of constructs for developing the measurement. CFA is a more effective method for assessing unidimensionality than exploratory factor analysis, coefficient alpha, and item-to-total correlation. The purpose is to ensure unidimensionality of the multiple-item constructs or low item-to-constructs and to eliminate unreliable items (Bollen, 1989). Items that loaded on multiple constructs were deleted from the model prior to testing. The measures underlying the constructs are given in Table 1. The measurement model was analyzed using the SAS program and CALIS procedure. An adequate fit was achieved for the measurement model.

For the large-size firms' scenario, the chi-square to *df* freedom ratio = 1.39, the Bentler's Comparative Fit Index (CFI) = 0.9222, Bentler and Bonett's Non-normed Fit Index (NNFI) = 0.9076, all of the *t*-statistics for the indicator variables were greater than 2.576, significant at $p<0.01$, and no standard errors were near zero. The confirmatory factor analysis resulted in the elimination of several individual items (V6, V7, V12, V15, V19, V22, and V26) because of low factor loadings or high residuals. This result was not surprising because many of the survey items had been developed specifically for the study, and other items had been adapted from other literature streams.

For the small-size firms' scenario, the chi-square to *df* freedom ratio = 1.45, the Bentler's Comparative Fit Index (CFI) = 0.9326, Bentler and Bonett's Non-normed Fit Index (NNFI) = 0.9232, all of the *t*-statistics for the indicator variables were greater than 2.576, significant at $p<0.01$, and no standard errors were near zero. Similarly, the confirmatory factor analysis also resulted in the elimination of a few individual items (V9, V10 and V11).

Table 1: Measures underlying the constructs

Construct and measurement items
Business Performance (BP)
V1: Market share of the firms V2: Return on investment V3: Profits as a percentage of sales V4: Increasing the capacity of production recently V5: The present value of the firm
Internal Operational Activities (IO)
V6: The firm is currently using effective production planning ,and inventory management software, such as MRP, ERP, SAP, etc. V7: Demand forecasting of the firms is quite accurate and has a high potential to be used for its production planning. V8: The firm has managed its inventory control system effectively so that its level of inventory is suitably set and managed. V9: The firm has an ability to respond to the customer's order quickly and promptly. V10: The firm can always produce its product with high quality and conform to the required standard.
External Operational Activities (EO)
V11: The firm always exchanges important information such as production and inventory level with key suppliers. V12: The firm has never experienced late order delivery to customers in recent time. V13: The firm can manage its transportation vehicles or outsource firms to deliver its products promptly. V14: The firm has suitable transportation methods to deliver its products effectively. V15: The firm has an effective system to find the right materials from the right suppliers.
Human Resource Management (HRM)
V16: The firm can recruit new employees to fill its requirement perfectly. V17: The firm always provides good and effective training programs for its employees. V18: The firm always provides good return and appropriate welfare for its employees. V19: The firm has maintained and kept good employees with the firm for a long period of time. V20: The firm has an opened mind to receive recommendation from employees and respond to them. V21: Every department in the firm is willing to participate and mutually join activities to strengthen their relationships.
Logistic Infrastructure (IL)
V22: Road network coverage is sufficient and appropriate. V23: Multimode transportation such as land, water or air can be done to reduce the transportation cost. V24: Ports for importing and exporting materials and products are sufficient and can offer good and quick service. V25: Information technology network is reliable and provides good coverage throughout the country. V26: Import and export tax systems for collecting and redemption are effective and well facilitated. V27: Electrical and water infrastructures are reliable and can provide good coverage throughout the country.

Table 2: Measurement model for large-size firms

Individual items, their respective factors and coefficient alpha for each factor. (All scales were 5-point Likert scales where 1 = Strongly disagree - 5 = Strongly agree)	Unstandardized coefficient	Standard error	*t*-value	Standardized coefficient
Business Performance (BP) (α = 0.7919)				
V1: Market share of the firms	0.5084	0.0679	7.4826	0.6836
V2: Return on investment	0.7017	0.0654	10.7367	0.8784
V3: Profits as a percentage of sales	0.6886	0.0673	10.2375	0.8519
V4: Increasing the capacity of production recently	0.6183	0.0806	7.6744	0.6967
V5: The present value of the firm	0.6100	0.0747	8.1649	0.7292
Internal Operational Activities (IO) (α = 0.7335)				
V8: The firm has managed its inventory control system effectively so that its level of inventory is suitably set and managed.	0.6100	0.0747	8.1649	0.6223
V9: The firm has an ability to respond to the customer's order quickly and promptly.	0.6851	0.0752	9.1052	0.8014
V10: The firm can always produce its product with high quality and conform to the required standard.	0.5225	0.0646	8.0865	0.7334
External Operational Activities (EO) (α = 0.7126)				
V11: The firm always exchanges important information such as production and inventory level with key suppliers.	0.4804	0.0817	5.8810	0.5629
V13: The firm can manage its transportation vehicles or outsource firms to deliver its product promptly.	0.6804	0.0673	10.1097	0.8468
V14: The firm has suitable transportation methods to deliver its products effectively.	0.6561	0.0574	11.4369	0.9187
Human Resource Management (HRM) (α = 0.7684)				
V16: The firm can recruit new employees to fill its requirement perfectly.	0.4924	0.0847	5.8133	0.5876
V17: The firm always provides good and effective training programs for its employees.	0.5709	0.0780	7.3194	0.7088
V18: The firm always provides a good return and appropriate welfare for its employees.	0.4347	0.0830	5.2373	0.5379

V20: The firm has an open mind to receive recommendations from employees and respond to them.	0.5221	0.0844	6.1891	0.6189
V21: Every department in the firm is willing to participate and mutually join activities for strengthening their relationships.	0.4717	0.0929	5.0750	0.5235
Logistic Infrastructure (IL) (α = 0.7607)				
V23: Multimode transportation such as land, water or air can be done to reduce the transportation cost.	0.6687	0.1038	6.4428	0.6583
V24: Ports for importing and exporting materials and products are sufficient and can offer good and quick service.	0.6410	0.0841	7.6215	0.7643
V25: Information technology network is reliable and provides good coverage throughout the country.	0.5189	0.0915	5.6719	0.5895
V27: Electrical and water infrastructures are stable, reliable and can provide good coverage throughout the country.	0.2781	0.1023	2.7173	0.3012
Note that V6, V7, V12, V15, V19, V22, V26 were eliminated				

Table 3: Measurement model for small-size firms

Individual items, their respective factors and coefficient alpha for each factor. (All scales were 5-point Likert scales where 1 = Strongly disagree - 5 = Strongly agree)	Unstandardized coefficient	Standard error	*t*-value	Standardized coefficient
Business Performance (BP) (α = 0.8853)				
V1: Market share of the firms	0.6281	0.0581	10.8138	0.7493
V2: Return on investment	0.6466	0.0473	13.6713	0.8773
V3: Profits as a percentage of sales	0.7024	0.0580	12.1141	0.8106
V4: Increasing the capacity of production recently	0.7092	0.0638	11.1092	0.7637
V5: The present value of the firm	0.6308	0.0657	9.5987	0.6867
Internal Operational Activities (IO) (α = 0.7689)				
V6: The firm is currently using effective production planning ,and inventory management software, such as MRP, ERP, SAP, etc.	0.6308	0.0657	9.5987	0.5598
V7: Demand Forecasting of the firms is quite accurate and has a high potential to be used for its production planning.	0.7265	0.0637	11.4051	0.8184
V8: The firm has managed its inventory control system effectively so that its level of inventory is suitably set and managed.	0.6483	0.0601	10.7920	0.7831
External Operational Activities (EO) (α = 0.8597)				
V12: The firm has never experienced late order delivery to customers in recent time.	0.5041	0.0579	8.7089	0.6365
V13: The firm can manage its transportation vehicles or outsource firms to deliver its product promptly.	0.6770	0.0513	13.2044	0.8606
V14: The firm has suitable transportation methods to deliver its products effectively.	0.6828	0.0483	14.1384	0.8998
V15: The firm has an effective system to find the right materials from the right suppliers.	0.5242	0.0536	9.7739	0.6956
Human Resource Management (HRM) (α = 0.8655)				
V16: The firm can recruit new employees to fill its requirement perfectly.	0.4001	0.0700	5.7138	0.4533
V17: The firm always provides good and effective training programs for its employees.	0.6221	0.0635	9.7930	0.7071
V18: The firm always provides a good return and appropriate welfare for its employees.	0.5617	0.0710	7.9102	0.5986

V19: The firm has maintained and kept good employees with the firm for a long period of time.	0.6171	0.0646	9.5456	0.6963
V20: The firm has an open mind to receive recommendations from employees and respond to them.	0.6745	0.0618	10.9107	0.7650
V21: Every department in the firm is willing to participate and mutually join activities for strengthening their relationships.	0.7641	0.0666	11.4696	0.7925
Logistic Infrastructure (IL) (α = 0.7786)				
V22: Road network coverage is sufficient and appropriate.	0.5909	0.0746	7.9236	0.6248
V23: Multimode transportation such as land, water or air can be done to reduce the transportation cost.	0.6603	0.0808	8.1684	0.6406
V24: Ports for importing and exporting materials and products are sufficient and can offer good and quick service.	0.6372	0.0705	9.0418	0.6955
V25: Information technology network is reliable and provides good coverage throughout the country.	0.5150	0.0739	6.9647	0.5609
V26: Import and export tax systems for collecting and redemption are effective and well facilitated.	0.5650	0.0785	7.2006	0.5769
V27: Electrical and water infrastructures are stable, reliable and can provide good coverage throughout the country.	0.5238	0.0779	6.7242	0.5443
Note that V9, V10, V11 were eliminated				

Table 2 and 3 provides unstandardized coefficients, standard errors, and *t*-values for each individual item for the large and small-size firms consecutively. These numbers provide information about the local fit, that is, how well each individual item is related to its respective factor. Each of the coefficients is large and significant at the $p<0.01$ level. They also provide coefficient alphas for each factor after the measure purification process. The coefficient alphas are ranged from 0.7126 to 0.7919 (for large-size firms' scenario) and 0.8853 to 0.7689 (for small-size firms' scenario). De Vellis (2003) noted that alpha levels below 0.6 are unacceptable. Goodness of fit is determined by comparing the structural model (full maintained model) to alternative models. One tests alternative models by sequentially deleting or adding paths. The measures of goodness-of-fit are shown in Table 4 and Table 5. After deleting 3 paths representing Hypothesis 3, 4 and 6 (for the large-size firms' scenario) and deleting 1 path representing Hypothesis 4 (for the small-size firms' scenario), the results of the test of the overall fit of the model can be shown in Figure 2 and 3 and are provided below. The chi-square statistic is significant. Other goodness-of-fit indices indicate an acceptable fit of the structural model to the data, especially given the exploratory nature of the study. Bentler's Comparative Fit indices (CFI) and Bentler and Bonett's Non-normed Index (NNFI) are above the desired 0.90 level (Byrne, 2006; Hair *et al*., 1995) and thus indicate good fit. The ratio of chi-square to degrees of freedom is 1.42 and 1.48 respectively, which is below the recommended 3.0 threshold (Hartwick and Barki, 1994; Hair *et al*., 1995), which also indicates a good fit. The adjusted goodness of fit index is above the desired 0.80 threshold (Hartwick and Barki, 1994; Wheaton *et al*., 1977; Segars and Grover, 1993), although below the conservative 0.90 thershold recommended by Bagozzi and Yi (1988).

Table 4: Measures of goodness of fit for the structural model for large-size firms

Model	χ^2	*df*	χ^2/*df* ratio*	CFI**	NNFI***
Null model	1007.3	190	-	-	-
Uncorrelated factors	392.2136	170	-	0.7281	0.6961
Full maintained model	224.1593	162	1.38	0.9239	0.9108
H 6 path deleted	224.2866	163	1.37	0.9250	0.9126
H 3 path deleted	227.5769	164	1.38	0.9222	0.9099
H 4 path deleted	234.8728	165	1.42	0.9145	0.9016
Measurement model	223.5983	160	1.39	0.9222	0.9076

* χ^2/*df* ratio < 3 (Hartwick and Barki, 1994; Hair *et al*., 1995) ** CFI > 0.9 indicates a good fit of the data to the model (Bentler and Bonet, 1980) *** NNFI > 0.8 indicates an acceptable fit (Wheaton *et al*.,1977; Segars and Grover, 1993; Bagozzi and Yi, 1988)

Table 5: Measures of goodness of fit for the structural model for small-size firms

Model	χ^2	*df*	χ^2/*df* ratio*	CFI**	NNFI***
Null model	1890.4	276	-	-	-
Uncorrelated factors	508.0703	250	-	0.8435	0.8272
Full maintained model	359.9145	244	1.47	0.9282	0.9188
H 4 path deleted	362.2389	245	1.47	0.9274	0.9182
Measurement model	353.0948	242	1.45	0.9326	0.9232

* χ^2/*df* ratio < 3 (Hartwick and Barki, 1994; Hair *et al*., 1995) ** CFI > 0.9 indicates a good fit of the data to the model (Bentler and Bonet, 1980) *** NNFI > 0.8 indicates an acceptable fit (Wheaton *et al*.,1977; Segars and Grover, 1993; Bagozzi and Yi, 1988)

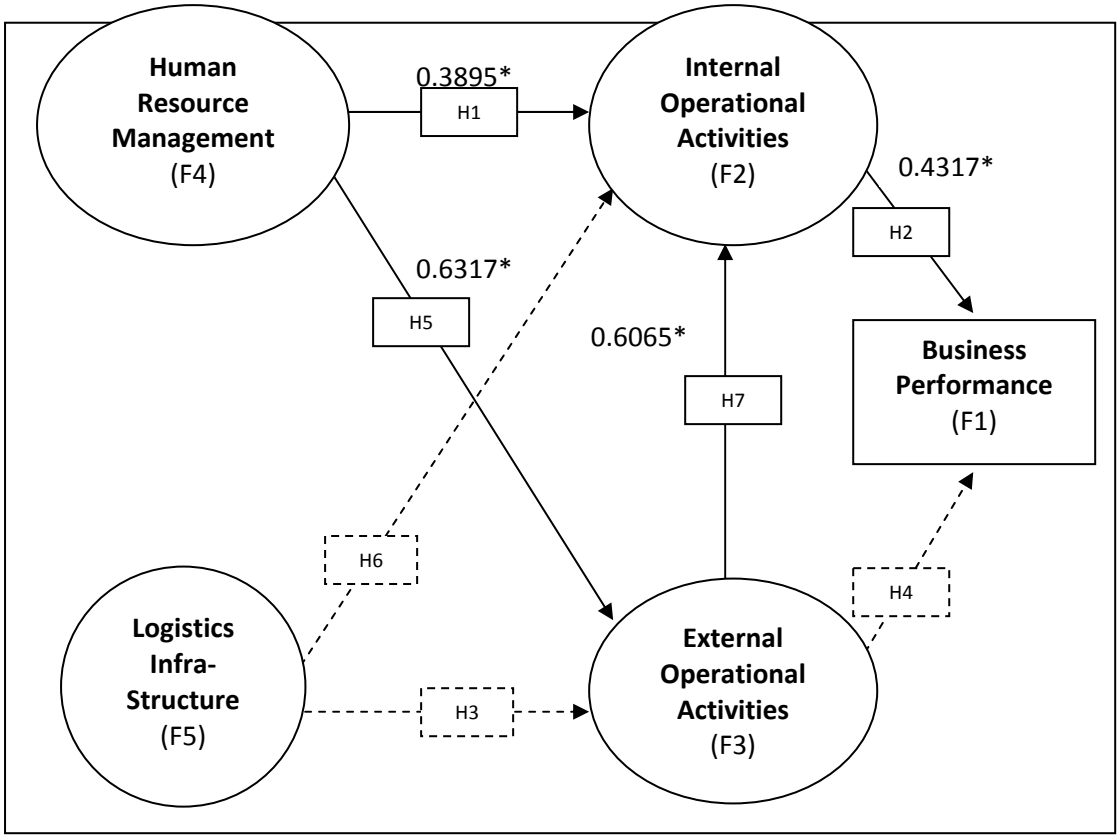

Figure 2: Structural model for large-size firms

----▶ Denotes non-significant paths ——▶ Denotes significant paths

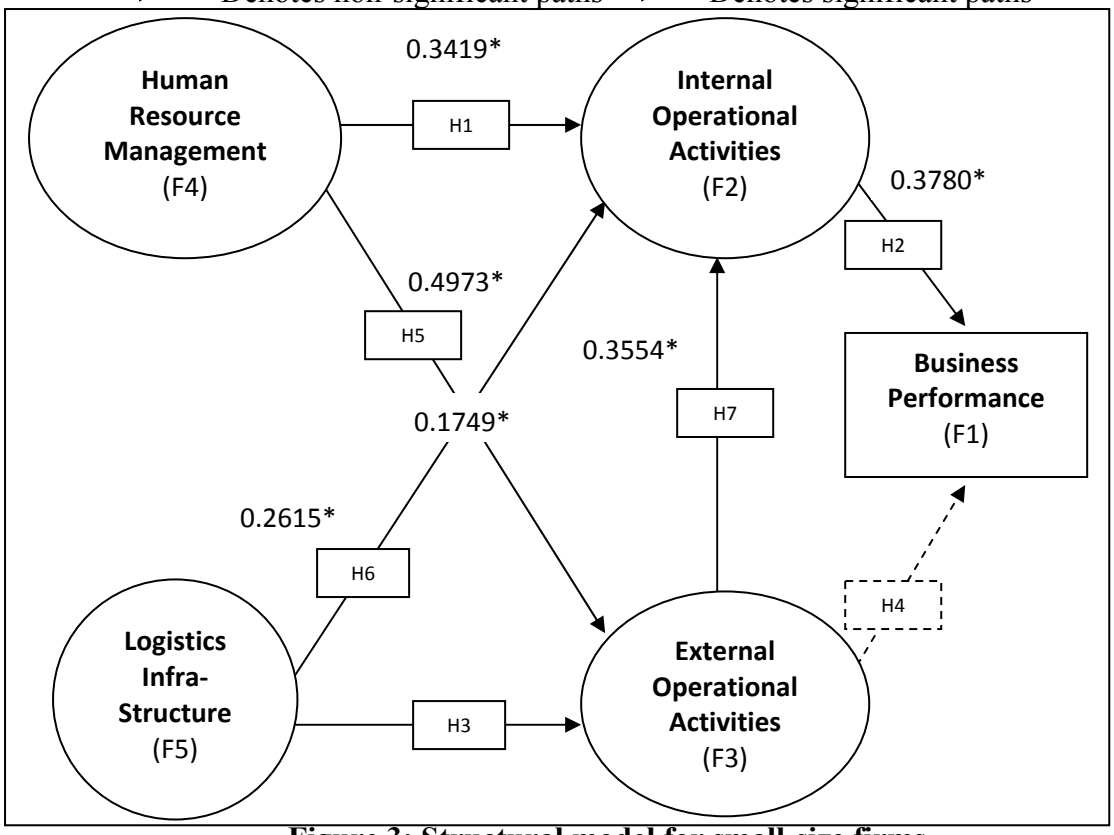

Figure 3: Structural model for small-size firms

These results are indicative of an acceptable fit of the model to the data, especially given that many of the measures used in this study were either developed for the study, or adapted from other studies. The R^2 values for the three structural equations, which represent the variance explained by the endogenous factors of BP, IO, and EO, are 0.19, 0.82, and 0.40, respectively (for the large-size firms' scenario) and 0.14, 0.56, 0.32, respectively (for the small-size firms' scenario).

5. DISCUSSION AND MANAGERIAL IMPLICATIONS

5.1 Large-size firms

5.1.1 Significant paths

Four paths tested positive and significant ($p<0.01$). These paths consist of H1 representing the path from HRM to IO; H2, testing the effect of the IO factor on factor of BP; H5, representing the path from HRM to EO, and Finally H7, representing the path from EO to IO

5.1.1.1 The effects of Human Resource Management (HRM), on both Internal Operational Activities (IO) and External Operational Activities (EO), were positive (H1 and H5)
The paths from HRM to both IO and EO were positive and significant ($p<0.01$). HRM refers to the personnel related practices and policies an organization needs to develop its current employees. Developing the human resources of a firm has shown to be a key to improving both internal and external operational functions. The business in this industry that has made training, education, and development of HRM a priority have seen it pay off through more efficient operations. Bridle (2010) reported the strategic role of HRM that could help to ensure organizational success by warning managers against abdicating responsibility for leading their people. HRM can help an organization to succeed, provided that all employees understand their role, work together and take responsibility for their contribution. As a result, an improvement in HRM is critical for building fundamental supports to all operational activities.

5.1.1.2 The effects of External Operational Activities (EO), on Internal Operational Activities (IO) towards Business Performance (BP), were positive (H2 and H7)
The path from EO to IO was positive and significant ($p<0.01$). This supports the fact that external operational activities have shown to contribute to the success of firms' internal management. As the firms try to improve their internal operations, their external operational activities must be in a good shape to support the internal activities. One setback would impede the effectiveness of another. External operations refer to all logistic activities relating to the flows of goods outside the company boundary, and usually involve transportation or freight management in various transportation modes. Gimenez and Ventura (2005) also reported that the internal and external operations integration could influence each other. The integration in the logistics-marketing interface does not lead to reductions in costs, stock-outs and lead-times, while the integration achieved in the logistics-production interface does improve these performance measures.

As the path from IO to BP was positive and significant ($p<0.01$), this provides an empirical evidence of IO that can help firms to achieve business success. As, it is imperative for the

firms to excel in their internal operations on which the efficient and effective flow of goods and information in supply chains depend, this becomes the direct impact on the firms' business performance. Law and Pujawan (2009) reported that the internal operation including various factors within a firm such as production planning, human factors, and the system scheduling, could affect the firms' system performance in terms of stability, cost, service level and a better internal operation would eventually lead to a better operational performance.

5.1.2 Non-significant paths

There are 3 paths which were not significant and are recommended to be dropped during the Wald test. These paths included H3, representing the path from LI factor to EO and H4, testing the effect of the EO on BP and finally H6, representing the path from LI factor to IO.

The propose hypotheses H3 and H6 were rejected because LI has shown no direct influence on both EO and IO. This may be due to the fact that the large-size firms do not regard much of the effect of LI**.** The large-size firms with their better financial abilities could manage and place themselves in a better logistics location where electrical, water and transportation infrastructure have been established more completely. From our collected surveys, 77 firms (65.8% from the total of 117 large-size firms) are located in the main towns or industrial estates whereas 40 firms (34.2%) are located outside the main towns. As a result, the implication of the logistics infrastructure on their normal operations may not be as much when compared to the small-size firms who have limited accessibility and financial abilities. Referring the rejection of the proposed hypothesis H4, where EO has shown no impact on BP, it seems that an improvement in external operational activities without improving on its internal management would lead to little impact on the firms' performance. Therefore, emphasizing on building good infrastructure and external operational activities without strengthening its own HRM and internal management does not significantly help the business performance of the firm. Hence, competitive advantage for many manufacturing firms now lies in their ability to effectively implement superior manufacturing, continual improvement of reliability of existing production processes, and developing a continual stream of quality products.

5.2 Small-size firms

5.2.1 Significant path

In general, overall results for the small-size firms' scenario are also quite similar to the large-size firms' scenario. However, there are two different significant paths in this scenario which are H3, representing the path from LI to EO and H6, representing the path from LI to IO that are now significant and need further investigation.

5.2.1.1 The effects of Logistics Infrastructure (LI), on both Internal Operational Activities (IO) and External Operational Activities (EO) were positive (H3 and H6)

The paths from LI to IO and EO were both positive and significant ($p<0.01$). Internal operational activities refer to all flows of goods, people and information, within the firm boundary. It is responsible for input of product, storage of raw materials, internal transportation, and storage of partly finished and finished products, preparation of orders and

return of packaging to suppliers while the external operational activities refer to the exchange of information and material transportation outside the firms. Again from our collected surveys, only 56 firms (30% from the total of 186 small-size firms) are located in the main towns or industrial estates where the basic logistics infrastructures are sufficient and more completed whereas up to 130 firms (70%) are located in the rural areas outside the main towns. With weaker financial ability of the small-size firms, their internal and external operations still need to rely very much on the logistics infrastructure. This finding is different to the case of the large-size firms in which they could depend more on themselves. Vastag *et al.* (1994) reviewed current manufacturing trends with a new type of logistical infrastructures supporting agility and quick response to global markets. They showed how these new logistical infrastructures were being put in place and created logistical environment to improve manufacturing competitiveness. They must be the linkages within the organization and throughout the entire organizational network.

5.2.2 Non-significant paths

There is only one path which was not significant and is recommended to be dropped during the Wald test for the small-size firms' scenario. This path represented the proposed hypothesis H4, where EO has proven to show no impact on BP. This is similar to the case of the large-size firms, which can be concluded that an improvement in external activities without improving on its internal management would not eventually improve the business performance of the firms.

6. CONCLUSION

The research outcomes indicate that there are relationships among internal logistics factors, external logistics factors as well as the firm's business performance. The results show some supports for some of the hypotheses which have been formulated in our theoretical framework. For the large-size firms, it shows that the logistic infrastructure does not have any impact on the internal and external operation activities as well as those external operational activities do not have a direct impact on business performance. On the other hand, for the small-size firms, it shows an impact of logistics infrastructure on the internal operational activities.

Human resource management shows its significant impact on both internal operational and external operational activities for both scenarios and it is the key factor for successful integration between external and internal logistics as well as the business performance. The firms must be able to develop their human resources by using an appropriate strategy for attracting quality workforces involving good human resource planning and effective employee recruitment and developing them through a proper training and development, and a fair performance appraisal to maintain quality workforces with the firms.

External operational activities have been shown to contribute to the effectiveness of the firm's internal management for all firms' sizes. Even though, the external operational activities do not have a direct impact on the firm's business performance, they can indirectly impact via improving the internal operations management. As a result, without a good and sound support from the external operational activities (such as sufficient and reliable

transportation vehicles or good logistics methods to deliver products to the customers) the firms would not be able to manage their internal logistics and operations effectively. This would eventually impede the success of their business performances.

Comparing between the results of the firms in both groups, two links are different, which are H3 and H6, where the logistics infrastructure does not show the impact on both internal operational activities and external operational activities of the large-size firms but show this impact for the small-size firms. Although, the Logistics infrastructure is important for the firms' operations management, the result from the large-size firms reported no significant impact. This is due to the fact that they are more ready to facilitate themselves and have already put themselves in the place and the position where they can rely more on themselves while the small firms are more valuable and sensitive to the good or bad condition of these infrastructures.

ABSTRACT

According to the most recently Global Competitiveness Report, it ranked the economic competitiveness 133 nominated countries worldwide during 2009-2010, indicating two key factors that have been taken into consideration for economic growth, including higher education and training which has produced well-educated workers as key for efficiency-driven economics. One of the most important factors for long-term economic development is innovation which is only factor that brings forth better standard of living. A consequence of crucial key for innovation-driven economics results from the emergence of Research University. Therefore, the classification becomes important tool to determine which higher educational institute has been classified as Research University. Meanwhile, to determine if Research University is qualified, it can be achieved by using educational quality assurance; for instances, accreditation, ranking and rating, educational performance, and so on. In addition, the National Qualifications Framework (NQF) contributes the confidence in the graduated's quality and qualification standard. So, the purpose of this paper was to point out the link of the role of higher educational classification and standardization enhancing the global competitiveness under scope of three questions. Firstly, "Is it alright saying that enhancing the university to Research University boosts the economic competitiveness?" Secondly, "how do you know which university is a Research University?" And lastly, what ensures the quality of the university that has been classified as Research University?

Keywords: The Global Competitiveness Report, Classification and Ranking, Higher Education, Research University, National Qualifications Framework

INTRODUCTION

Many countries are becoming aware of the urgent leveraging the economic competitiveness to keep pace with the current of globalization. The report for the national competitiveness assessment, or so-called "The Global Competition Report" proposed by the World Economic Forum, until now has been widely accepted for over three decades as ranking tool for global competitiveness (Schwab, 2009). It is cited that the Global Competition Report reflects the country's overall economic environment, and makes us acknowledge the existing competition in each country under the indicator of the economic prosperity, and enables individual countries understand what advantages and disadvantages in competition of the respective country are they. Consequently, the Global Competition Report becomes a crucial instrument

for policymakers and business leaders worldwide to formulate the appropriate policy and institutional reform and eventually lead to global competitiveness enhancement.

In addition, the paper demonstrated two important factors for competitiveness enhancement; firstly, higher education and training, which is a crucial key for efficiency-driven economics. Many literatures showed that higher education and training is important for countries to add the value chain beyond simple production process and products. In particular, the current economics have leveraged the competitiveness in manpower. Many industries need for well-trained workers who are potential adapt themselves to the ever-changing environment. Secondly, the most important factor is an innovation. It is a key for driving the economics and it is considered as the single factor for better standard of living in long run.

The evolution of Globalisation and the evolution of the knowledge-based economy have led to changes dramatically. In many countries, the higher education has to adapt itself in term of character and function to meet the society's complex demand and expectation (Burbules and Torres, 2000; Mok and Welch, 2003). The need for enhancing the university into Research University and World-Class University has been something challenging desirable. Since the universities have been eager to become the quality Research University as a key economic driver, three questions raised; 1) "Is it alright saying that enhancing the university to Research University boosts the economic competitiveness?", 2) "how do you know which university is a Research University?", and lastly 3) what ensures the quality of the university that has been classified as Research University? So, this paper was aim to demonstrate three major purposes. Firstly, there were relationship between the quality of higher education, innovation, and competitiveness enhancement. Secondly, classification became a crucial tool to determine which university has been characterized of Research University. Lastly, higher education standardization was a tool reflecting which of Research University was qualified.

QUESTION 1: IS IT ALRIGHT SAYING THAT ENHANCING THE UNIVERSITY TO RESEARCH UNIVERSITY BOOSTS THE ECONOMIC COMPETITIVENESS?

Recently, the World Economic Forum has completed presenting the ranking for economic competitiveness at international level. The latest volume of the report year 2009-2010 described the objective of the national competitiveness assessment that furthers the people to the high level of prosperity. This depends on how country employs the resources and how productively it has been. The Global Competitiveness Index (GCI) was used to evaluate the competition capacity. It included twelve pillars which were divided into three different areas; basic requirement (pillar 1-4), efficiency enhancer (pillar 5-10), and innovation and sophisticated factor (pillar 11-12).

At the latest ranking for competitiveness, there included 133 countries. Each country was selected among five regions; Europe, Latin America and the Caribbean, Asia and Pacific, Middle East and North Africa, and sub-Saharan Africa. The information used for ranking included 2 major parts; quantitative and qualitative data. Quantitative data was derived from the international organizations such as the International Monetary Fund (IMF), the World Bank, and other United Nations agencies, and so on. The qualitative data was derived from the exclusive opinion survey which consisted of more than 13,000 samples from 133 countries. Of overall samples, 12,614 samples (95% responds per country) returned the

completely filled-out questionnaires. The most items met the GCI structure and 7-point scale was used (1 = mostly severe, 7= mostly positive) (Schwab, 2009).

The ranking results have shown that Top 10 countries with highest score of competitiveness were Switzerland (5.60), the United States (5.59), Singapore (5.55), Sweden (5.51), Denmark (5.46), Finland (5.43), Germany (5.37), Japan (5.37), Canada (5.33) and Netherland (5.32). When compared to the Global Competitiveness Report 2008-2009, it revealed that Top 10 countries were the same countries, only rank was changed (see Table 1). In addition, the report confirmed that the innovation factor was mostly important competitiveness in twelve pillars as appeared in the Top 10 countries with highest overall GCI. The Top 10 countries were in the development stage of innovation-driven economics. To bring for the innovation development, it is necessary for countries to be supported in different ways, especially the pillar 5; higher education and training.

Table 1 The Overall GCI 2009-2010 ranking, 5th pillar and12th pillar 2009-2010, and Overall GCI 2008-2009 comparisons

Country/Economy	Overall GCI 2008-2009	Overall GCI 2009-2010		5th pillar Higher education and training index 2009-2010		12th pillar Innovation index 2009-2010	
	Rank	Rank	Score	Rank	Score	Rank	Score
Switzerland	2	1	5.60	6	5.60	2	5.56

Source: Schwab (2009)

To respond the question if quality of higher education, innovation, and interrelation competitiveness are associated or not, and how much. This paper examined relationship the pillar 5 as a factor reflecting the higher educational quality, the pillar 12 reflecting the innovation, and the overall GCI reflecting the competitiveness. The higher educational quality and innovation were highlighted as revealed by the advantages of Top 10 countries in related indexes. The Pearson's Correlation was used to test the relationship while advantages comparison was based on the Global Competitiveness Report 2009-2010. The results have shown as follow;

1.1 Index tendency comparison for pillar 5, 12, and overall GCI, and determining the relationship among three indexes.

Table 1 showed the directional tendency comparison for overall GCI and the pillar 5 (education and training), and the pillar 12 (innovation), it indicated the same direction with overall GCI for pillar 5 and 12. Eight of Top ten countries with high overall GCI reported high index for pillar 5 (5.49-5.97), except for only two of Top ten countries; German and Japan whose scores were ranked 22 and 23 respectively. However, German and Japan showed scores higher than average score (mean = 4.08) was 5.06 and 5.07 respectively. The Figure 1a implied the relationship between overall GCI and the 5th pillar scores, the very strong linear relationship was found and significantly positive correlation among them (Pearson's Correlation Coefficient; 0.957; P<0.01) (Hinkle, 1998). Next, among Top 10 countries with high overall GCI, eight of them showed high innovation (12th pillar) scores ranged 5.04-5.77, except for Canada and Netherland whose scores were ranked 12 and 13 respectively. However, both Canada and Netherland showed high innovation scores of 4.80 and 4.79 respectively which were scores higher than average score (mean =3.37) obviously (see Table 1). The Figure 1d signified the relationship between overall GCI and the 12th pillar, it found positive strong linear relationship (Pearson's Correlation Coefficient; 0.880; P<0.01). Similarly, The Figure 1g showed high relationship between scores of the pillar 5th and 12th it found positive strong linear relationship (Pearson's Correlation Coefficient; 0.894; P<0.01) (Hinkle, 1998).

1.2 Advantages and Disadvantages Analysis of Variables/Relationship Analysis of Variables.

According to the Global Competitiveness Report 2009-2010, the advantages and disadvantages analysis was performed based comparing overall GCI raking and individual variables for top ten countries. If individual variables ranged from 1 to 10, indicating the advantageous variables, in turn, if less than 10 (11, 12, 13… 133), it indicated disadvantageous variables. Therefore, in order to point out that higher education and innovation were two factors enhancing the competitiveness, four variables were analyzed, including quality of educational system (section 5.03), quality of Math and Sciences education (section. 5.04), quality of scientific research institutions (section 12.02), and university-industry collaboration in R&D (section 12.04). This revealed the quality of higher education, innovation, and competitiveness relationship. On the other words, the higher educational institutions emphasized the quality of educational system, particularly in Math and Sciences. Enhancing the university into Research University by concentrating the R&D and industrial collaboration was an important mechanism for economic development. Table 2 showed the advantages and disadvantages comparison for four variables, it indicated that the Top ten countries had advantages on such four variables, just a few had disadvantages. However, the countries with disadvantageous variables still had higher scores than mean. Most importantly, it was obvious that eight of Top ten countries had advantages on university-industry collaboration in R&D (section 12.04), reflecting the emphasis of R&D by institutes, and the industrial collaboration was conductive to increase the national competition potential. In addition, the Figure 1b scores on overall GCI and: quality of educational system (section 5.03), the Figure 1c scores on overall GCI and quality of Math and Sciences education (section 5.04), the Figure 1e scores on overall GCI and quality of quality of

scientific research institutions (section 12.02), the Figure 1f scores on overall GCI and university-industry collaboration in R&D (section 12.04), found the strong linear relationship for overall pairs of relationship with positive coefficient value (Hinkle, 1998).

In conclusion, the relationship test showed the interrelation among quality of higher education, innovation, and competitiveness. This also reflected the quality of higher education and innovation that lead to enhance the competitiveness, consistently with Yusuf and Nabeshima (2007), saying that tertiary education institutions have played a vital role on local and regional economics. World Bank (2002) added that "within the tertiary educational system, the Research University also plays important role in training professionals, high-level specialists, scientists, and researchers, consistently with the economic demand and bringing forth new knowledge components contributing the national innovation system.

QUESTION 2: HOW DO YOU KNOW WHICH UNIVERSITY IS A RESEARCH UNIVERSITY?

Over the past 30 years, the educational reform policy has been transformed into practice in all educational systems (Carnoy, 1999). The phenomenon has been expanded significantly, especially in promoting the university to the National Research University. In many countries, the government has formulated its policy and triggered the concerned agencies to put the policy into practice seriously and urgently. As realized by government that the Research University is fundamental to leverage the competitiveness and sustainability, consistently with literatures citing that human capital is important to investment on knowledge and skill that leads to an improved productivity and key thrusting the promising economics in the future (Bils and Klenow, 2000; Hanushek and Kimko, 2000; Krueger and Lindahl, 2000; Cohen and Soto, 2001).

In several countries, the government policy has stimulated the higher education to become a Research University. One important issue included diversity and complex which such a situation causes an important issues inevitably ; namely, under the diversity and complex, how do the Educational Higher Commission recognise which university is classified as the Research University. Therefore, the classification was becoming an important tool to identify which university is qualified as a Research University. This tool was very useful to stakeholders (student, higher educational institution, business and industry, researchers and policymakers) as it provided useful information about the differences of the educational intuition groups broadly (McCormick and Zhao, 2005). As we have seen, the classification is a crucial tool to the Higher Education Commission as it enables them to understand the characteristics of educational groups (e.g. Research University, Master's University, Baccalaureate Colleges, and others) as importantly fundamental information to design the development guidelines that suits the individual educational institute and lead to enhance the higher educational standardization and economic competitiveness at international level. Moreover, McCormick (2008) added "classification is more likely to be used to identify the similarity than ordering the institutes. This could be a reason why classification has not reflected the quality of the higher education, but simply used to identify the higher educational institute criteria or parameters which have been developed in agreement with the background of the objectives of classification. The question's sample background that lead to create the classification instrument (see Table 3).

Advantageously, higher education classification has been popular worldwide, especially the Carnegie Classification of Institutions of Higher Education[1], a well-established classified system, has been famous in the United States universities and colleges. Over the past 30 years, it was first developed in 1973 by classifying the educational institutes into five major groups; doctoral-granting institutions, comprehensive universities and colleges, liberal art colleges, 2-year colleges, and institutes and professional school, and other specialized institutions, respectively. As a proxy for research activity, the doctoral-granting institution was divided into four subcategories; Research I, Research II, Doctoral I, and Doctoral II. The higher educational institute's role on research has been highly valued. In the United States higher educational system, research activity varies from institute to institute, which attract considerable attention in developing the higher educational institutes into Research University (McCormick, 2008).

Table 3: Examples of classification bases

Background	Classification bases
What do you offer?	**Degrees or disciplines offered/awarded**
What do you produce?	**Student profile such as enrolment –Institute of Higher Education, Mode of delivery such as part time, full time and distance learning**
What do you teach?	**Instructional program – Classification of Instructional program (CIP)**
Why do you exist?	**Purpose of establishment (*e.g.*, land grant, research, innovation, doctoral universities *etc*)**
Who are you?	**Sources of funding (*e.g.*, public, private, religious, etc.*)*, size (*e.g.*, large, medium, small, *etc*), variety (*e.g.*, comprehensive or specialized fields, etc.)**
Where do you setting?	**Geographical location (*e.g.*, urban, rural, community, *etc*.)**
How do you admit students?	**Admission method (*e.g.*, competitive or open admission, *etc*.)**

Source: Adapted from Phusavat and Chansa-ngavej (2007)

Later, the Carnegie Classification of Institutions of Higher Education was revised for many times since, 1976, 1987, 1994, 2000, and latest 2005-2006 while core classification remained the same. The notable points of changes included 1) variation on label used, definition, and technical part, 2) the Research University appeared grew up by 25% as resulted from the 1994 classification (Evangelauf, 1994). Following 1994, 3) the Roman numbers were omitted for Research University I & II, Doctoral University I & II, aiming to avoid latent mistakes pertaining to difference in the institute quality. In addition, 4) the position of the institute was analyzed in 1976, 1987, and 1994, and summarized the indicator of prestige which is a key driver to move the institutional direction and decision-making on its policy (Aldersley, 1995). Apparently, the higher educational institutes have attempted to upward and move toward the reputed Research University. In 2000, 5) the Research University I was integrated into the Doctoral University I while Research University II was integrated into the Doctoral University II. More recently, during 2005-2006, there occurred a great change in classification; the classification system was overhauled comprehensively. The overall pictures of change included; firstly, changing from single classification into a set of multiple parallel classifications under three major questions; “What is taught?”, “Who are students?”, and “What is the setting?” With these questions, the five following categories were included; undergraduate instructional program, graduate instructional program, enrollment profile, undergraduate profile, and size and setting in addition to update of the existing original classification. Secondly, the web-based tool was developed where users are able to combine the classification schemes and generate subset in which they are interested. Lastly, the elective classification or so-called “community engagement” was developed subject to the voluntary participation of the institutes. In this case, data was obtained from institutions directly, opposite to empirical data of previous time. Broadly speaking, the “elective classification” facilities the institutional classification in viewpoint of mission and action, which were grouped into three followings; 1) Curricular Engagement, 2) Outreach & Partnership and 3) Curriculum Engagement & Outreach & Partnership (McCormick and Zhao, 2005).

In addition, the Carnegie Classification of Institutions of Higher Education becomes an exemplar tool for classification development by researchers in many countries. For examples, the Japanese Classification composed of five major groups; Research University, Doctorate-granting University I, Doctorate-granting University II, Master's Degree-granting University, and Colleges (Amano and Chen, 2004). Similarly, the Chinese Classification included five major groups, Research University, Doctorate University, Master' University, Baccalaureate College, and Associated Colleges (Liu and Liu, 2005). Thailand Classification contains five areas in classifying the university position; including university characteristics, teaching, research, student body, and management (Phusavat, 2008). European Classification composes of five main categories with 14 dimensions; education (4 dimensions: degree level, subject mix, orientation of programmes, and involvement in lifelong learning), research and innovation (2 dimensions: research intensiveness and innovation intensiveness), international orientation (2 dimensions: teaching and research), size and setting (3 dimensions: mode of delivery, public/private character and legal status) and community engagement (2 dimensions: cultural engagement and regional engagement) (Bartelse and van Vught, 2009).

Most obviously, the higher education classification by researchers or institutes over countries required that the Research University has always been classified. In addition, the common indicators as proxy for research activities are used.

- Number of Research staffs
- Number of peer reviewed publications per FTE academic staff
- Aggregate level of federal funding
- Receive amount of government research funding in fifty rank of first priority
- Number of doctoral degrees award annually
- Number of doctoral degrees more than the average number of doctoral degrees from universities focuses on doctoral degrees
- Ratio between doctoral and baccalaureate degrees

Source: Amano and Chen (2004), McCormick and Zhao (2005), Liu and Liu (2005), Liu (2007), Phusavat (2008) and Bartelse and van Vught (2009)

In brief, the classification was an important tool determining which university is quailed as Research University. It provided the policymakers to design the appropriate direction for higher educational development.

QUESTION 3: WHAT ENSURES THE QUALITY OF THE UNIVERSITY AS A RESEARCH UNIVERSITY?

In 1990s, it is known as the "decade of quality" which term "quality" became commonly used in the industries, commerce, and government sector. In context of higher education, the quality is widely used and played important role for higher educational system in many countries. Though the universities have been classified as Research University, for examples, the Ivy League has been classified as Research University in the United States, G13 (Group of Thirteen) in Canada, the Russell Group in the Unite Kingdom, the League of European Research University (LERU) in Europe continent, G08 (Group of Eight) in Australia, China's Research Universities I in the mainland China, and other research universities worldwide.

Most people perceived these universities as a leading research university with important components, for examples, top-quality academic staffs and students, adequate funding for R&D, facilities for academic works, and other qualities. Nonetheless, the universities have been questioned about the quality among the stakeholders (students, instructors, institutional executives, policymaker, industrial operators, and so on). One most frequently asked question was "how do they ensure the quality of university as a Research University?"
The literature survey revealed that the quality assurance in higher education by means of evaluation can ensure of its quality. Bogue (1998) proposed the evaluation approaches. Firstly, the peer reviews evaluation (e.g. educational institutes per se, external professionals, or external body). This approaches included the educational accreditation, and University Ranking/Rating. Next, the Total Quality Management (TQM) has been employed for educational evaluation. Thirdly, the assessment of outcomes is a way of quality assurance that emphasized the accomplishment of the curriculum. Fourthly, it included the accountability indicator and performance indicators, etc. Barnett (1987) and Church (1988) added that quality assurance for higher educational evaluation should be characterized of comprehensive viewpoint in respect with input, processes, and outcomes. However, that the quality of the Research University has been emphasized results in the global competitiveness. The instruments have been widely used and most institutes perceive as appropriate for quality assessment of the Research University included (1) ranking as quality measure that could be used to compare the quality of research activity at national and international level (Salmi and Saroyan, 2007), and (2) "NQF" is an instrument for quality assurance corresponding the need of the industrial stakeholders, and could be used to compare the qualified graduated at national and international level (Coles, 2006; Tuck, 2007). Therefore, to point out that those two instruments mentioned are conductive to higher educational quality standard, this paper included the detailed information about the tool to ensure of the quality of the Research University below;

3.1 Ranking systems in higher education

The phenomenon of the ranking university or higher educational institutions has grown rapidly worldwide. The national ranking has emerged since 1980 s while the international ranking has happened recently (Högskoleverket, 2009). Bowden (2000) and McCormick (2008) stated that "ranking" is a rating tool based on the criteria set up. The process of ranking consisted of sequences ordered as follows; collecting data, selecting category and quality of the variables, standardizing and weighting the indicators from selected variables, and last step; calculation and comparison (Hogskoleverket, 2009). In addition, the literature such as Usher and Savino (2006) and Cunningham (2008) contained criticism about biases of ranking systems. However, the ranking systems have been commonly used domestically and internationally, and be used for continuous improvement and development for weaken areas. The ranking system provides many advantages. It provides a mechanism to indicate which university should be classified as a leading Research University, especially in research activities. It also composes of ranking system providing the student, government, HE leaders, employers, and policymakers with useful information supporting the decision-making. For examples, the students make good use of information to support their decision in choosing the educational institutes. The government applies the information to formulate the educational policy and budgeting. The HE leaders apply the information to enhance the management. The employers use the information for recruitment purpose. The policymaker

uses the information for policy planning. Next, the ranking system is a tool facilitating the quality improvement. For examples, it is potential to protect the students and stakeholders from low quality provision, and encouraging the institutes to move toward the number one leader, accelerating the academic community to improve the quality, and influence the competition and productivity. Finally, the ranking system brings about the transparency and serves as an effective instrument for public accountability (Usher and Savino, 2007; Salmi and Saroyan, 2007). With various advantages of the ranking system, the institutes worldwide, especially the Research University, make an effort to improve the quality based on the criteria set forth and eager to become a World-Class university. The International Ranking System that has been interested included the Shanghai Jiao Tong University Global Ranking (SJTU), and the Times Higher Education QS World Universities Ranking (THE-QS)

3.1.1 Shanghai Jiao Tong University Global Ranking (SJTU)

The International Ranking System was initiated in 2003 by the Shanghai Jiao Tong University Global Ranking (SJTU)[2]. Its primary aim was to develop the Academic Ranking of World Universities (ARWU). Liu (2006) cited that the ARWU was put on the internet in 2003. There were more than 2,000,000 visitors accessing into the site, averaging 2,000 visitors daily. Liu and Cheng (2005) added that over 2,000 educational institutes were taking into account, and over 1,000 institutes had been ranked. However, only 500 institutes were presented on the internet. International Ranking System by SJTU occurs every year with the intent to focus the quality of research only. The Jiao Tong Group said it is hardly possible to rank other qualities like teaching and learning for reasons that there are great differences among universities and the much more differences at national level. In addition, there included the technical problems in collecting data at international level. In addition, they did not desire to use the subjective measures of opinion from informative sources of the universities. They needed for the non-subjective measurable indicator and comparison could be done at international level, which data could be checked. Consequently, the International Ranking System by SJTU employed four criteria with several research performance indicators, including 1) alumni and staff wining the Nobel Prize and Fields Medals, 2) highly cited researchers, 3) publicized paper in Nature and Sciences, articles in Science Citation Index-expanded (SCIE), and Social Science Citation Index (SSCI), 4) academic performance with respect to the size of an institution. The weight for each indicator was detailed in Table 4. In general, the International Ranking System by SJTU was criticized in two broad areas. Firstly, it only focused research while ranking could not cover all areas of higher education quality. Secondly, certain quality indicators, especially in the scientific prizes index which was extremely criticized due to 1) the variation was very low, quite simply there were very few Nobel and field awarded, 2) only Nobel Prize winners from a given institutions said about the quality of the institution. As a result, this was considered to be a far too superficial attribute which could bee manipulated by the Nobel Prize winners who have not actually participated in the institutional activities (Marginson and van der Wende, 2006) The International Ranking System by SJTU was also criticized considerably in relation to the bibliometrically based citation indicator for it caused the bias. The indicators matched with the Medical and Natural Sciences, but not some disciplines like Humanities and Social Sciences. The indicators had the limitation in term of the preference of the use of English as major language as they were familiar with presentation in English (Usher and Savino, 2006;

Cunningham, 2008). Thus, the work results other than English were inclined to be less presented (Marginson, 2007).

3.1.2 Times Higher Education QS World Universities Ranking (THE-QS)

Times Higher Education QS World Universities Ranking (THE-QS)[3] was first proposed in 2004 with the aim to compare the achievement of universities which are attempting to enter into the world-class university. To contemplate and be regarded as the world-class university, THE-QS described four pillars; research quality, teaching quality, student employability, and international outlook, all these have brought forth six indicators derived from various sources such as the Higher Educational Statistics Agency (HESA), the Higher Educational Funding Council, the Quality Assurance Agency, the Office for Standard in Education and Individual University Survey (Stella and Woodhouse, 2006). The research quality was measured by two indicators; academic "peer review", and number of research citation per head of academic faculty. Teaching quality was measured in term of student-teacher ratio. The student employability and the international outlook were measured by two indicators; international teacher and researcher ratio, and the proportion of the international students. (Weight for each indicator detailed in Table 4). However, the THE-QS Ranking was criticized in the following areas; 1) academic peer review which was used to measure the quality of research, as it was so subjective, it is weighted by 40%, 2) data derived from questionnaires surveyed with the academics and employers was not transparent, reflecting the reputation, but not quality, 3) Internationalization was criticized in term of the difficulty on international comparison. The indicators were likely to prefer the university using English (Anglo-Saxon universities), and 4) citation indicator was criticized in term of biases like the SJTU Ranking.

Table 4 Comparison of the methodologies for International ranking systems

	SJTU		THE-QS	
Universities analyzed	**1000+**		**500+**	
Universities ranked	**500**		**200**	
Criteria	**Indicator**	**Weight**	**Indicator**	**Weight**
Quality of education	**Alumni of institution winning Nobel Prize and Fields medals**	**10%**	**Staff-student ratio (proxy for 'teaching quality')**	**20%**
Internationalization	**-**	**-**	**International students**	**5%**
			International staff	**5%**
Research Output	**Papers indexed in Nature and Science***	**20%**	**-**	**-**
	Papers indexed in SCIE & SSCI	**20%**		
Prestige	**Staff of an institution winning Nobel Prize and Fields medals**	**20%**	**Academics Peer review**	**40%**
			Reputation: employers	**10%**
Impact	**Highly Cited researchers in 21 broad subject categories**	**20%**	**Research citation per head of academic faculty**	**20%**
Per capita performance	**Per capita academic performance of an institution**	**10%**	**-**	**-**
Total		**100%**		**100%**

Source: SJTU (2009) and THE-QS (2009)
*For institutions specialized in humanities and social sciences such as London School of Economics, N&S in not considered, and the weight of N&S is relocated to other indicators

In summary, the Ranking system is a tool reflecting the quality of the university. It was developed many times at national and international level under the ranking criteria. However, it has been widely criticized in term of biases, and leading to continuous development. The literature review on ranking system revealed the following common indicators that have been used by most universities; citation, publications, research awards and patents, and research budget (see Table 5).

Table 5 Indicators used in ranking of research activities

Type	Common of Indicators
Citation	**Bibliometrics (counting of publications and citations)**
	Highly cited publications
	Citations in engineering publications
	Citations in social science oriented indices
Publications	**Publications in science-oriented indices**
	Publications in Science and Nature
	Publications in social science oriented indices
	Publications in other indices
Research awards and patents issued	**National research awards**
	International research awards
	Number of patents issued
Research Budgets	**Financial indicators of research**
	Total amount of research expenditure
	Total number of research-based grants and projects
	Public-source grants
	Number of research-based chairs per institution.
	Research-based/affiliated research institutions or centers for studies

Source: Bowden (2000), Dill and Soo (2004), van Dyke (2005) and Williams and van Dyke (2005)

3.2 National Qualifications Framework (NQF)

Many countries worldwide are now aware of the national qualification framework (NQF) and the NQF implementation status which could be divided into three generations; first generation framework (the late-1980 – the mid-1990s) consisting of Australia, England, Wales, Northern Ireland, New Zealand, Scotland, and South Africa. Second-generation (the late-1990s to the early-2000s) consisting of Ireland and Mexico, etc. Third generation has been currently under consideration consisting of Albania and Brazil, etc. (DEEWR, 2008). The NQF has been applied worldwide due to the global economic growth where competition is stiff and severe, the opening of free trade, the movement of the international students, and migrant workers. These circumstances result that educational institutes worldwide demand for the academic accreditation as quality assurance of students, and international comparison can be done. At the same time, the industry stakeholders over countries call for the well-educated and multi-skillful employees whose qualification meet the company's need. Such qualities included flexibility, well-adaptation, and able to work overseas. The industry stakeholders also need for comparison the workers' qualification in countries as information supporting the recruitment process.

To bring forth the efficiency and fairness, the countries have to assign the qualification or skill possessed by students or the graduated that can be acceptable in accordance with the criteria for admission or job applications. The NQF has defined the qualifications framework as a classifier for qualification set in accordance with the level of learning outcomes achieved. The NQF varies in detail from country to country, for examples scope of framework, levels, learning measurement, teaching unit, responsible agencies for development and control, etc. However, all qualification frameworks have been established under the common objectives; quality improvement, accessibility, linkages, public and labor market recognition of qualification in local and international level (Coles, 2006; Tuck, 2007). So, to distinct the NQF attributes, the Australia Qualifications Framework (AQF) was used for comparison with the Thailand Qualification Framework (TQF).The AQF was regarded as the first-generation framework which was implemented since 1990 while the TQF is currently under the implementation process. Both Australia and Thailand are members of the APEC. Table 6 showed the comparison features of qualification framework in four different areas; scope of frameworks, level of qualification, domains of learning, and control unit.

Table 6 Features of national qualification framework in Australia and Thailand

Features	Australia	Thailand
Scope of frameworks	**AQF covers post-compulsory education in Australia, schools, vocational education and training, and higher education sector.**	**TQF covers higher education only.**
A number of levels	**Level is not specified in the framework.**	**Six levels: diploma, bachelor degree, graduate diploma, master degree, advanced graduate diploma and doctor degree.**
Domains of learning	**Implicit but descriptors for each qualification refer e.g. to knowledge, skill, performance and responsibility.**	**Five elements: ethics and morals, knowledge, cognitive skills, interpersonal skills and responsibility, and numerical, communication technology skills.**
Control unit	**Managed by AQF Council under legal with state and national legislation**	**Managed by Commission on Higher Education under legal**

Source: Burke (2009)

In addition, the literature review, for examples, Coles (2006, 2008), Raffe et al. (2008) and Young (2008) proposed four ways on how to achieve the implementation of NQF. Firstly, it is needed to demonstrate that the NQF is a developed tool to secure the stakeholders' confidence. Secondly, it has to indicate the national education and training as requirement limits to attract the international innovation directly. And lastly, it should avoid the over-engineering qualification system and NQF, specifically in low-economic countries.

An appropriate implementation of the NQF, especially in along with the contribution of effective system of quality assurance, the benefits result, for examples, the NQF is conductive to development on worker's skill, facilitate the education and labor market mobility, improve individuals' access to education and training at higher and different level.

Conclusively, the national qualification framework (NQF) is a tool for university quality enhancement which it produces the qualified graduated that meet the current market need and contribute the assurance of graduated's quality and accreditation standard.

CONCLUSION

A way to increase the competitiveness for university quality in any country is to move the university development into the National Research University and World-Class University. The powerful Research Universities are potential to produce the well-educated workers and innovation which both factors are vital keys to boost the competiveness. The "Classification" is an effective tool to identify which university is qualified and should be classified as Research University. Meanwhile, the "Ranking" is a tool determining the quality of the Research University which research activities are emphasized. Another important one is "NQF" which is an efficient tool to frame the quality assurance for graduated and production of the well-qualified workers consistently with the economic demand (see Figure 2).

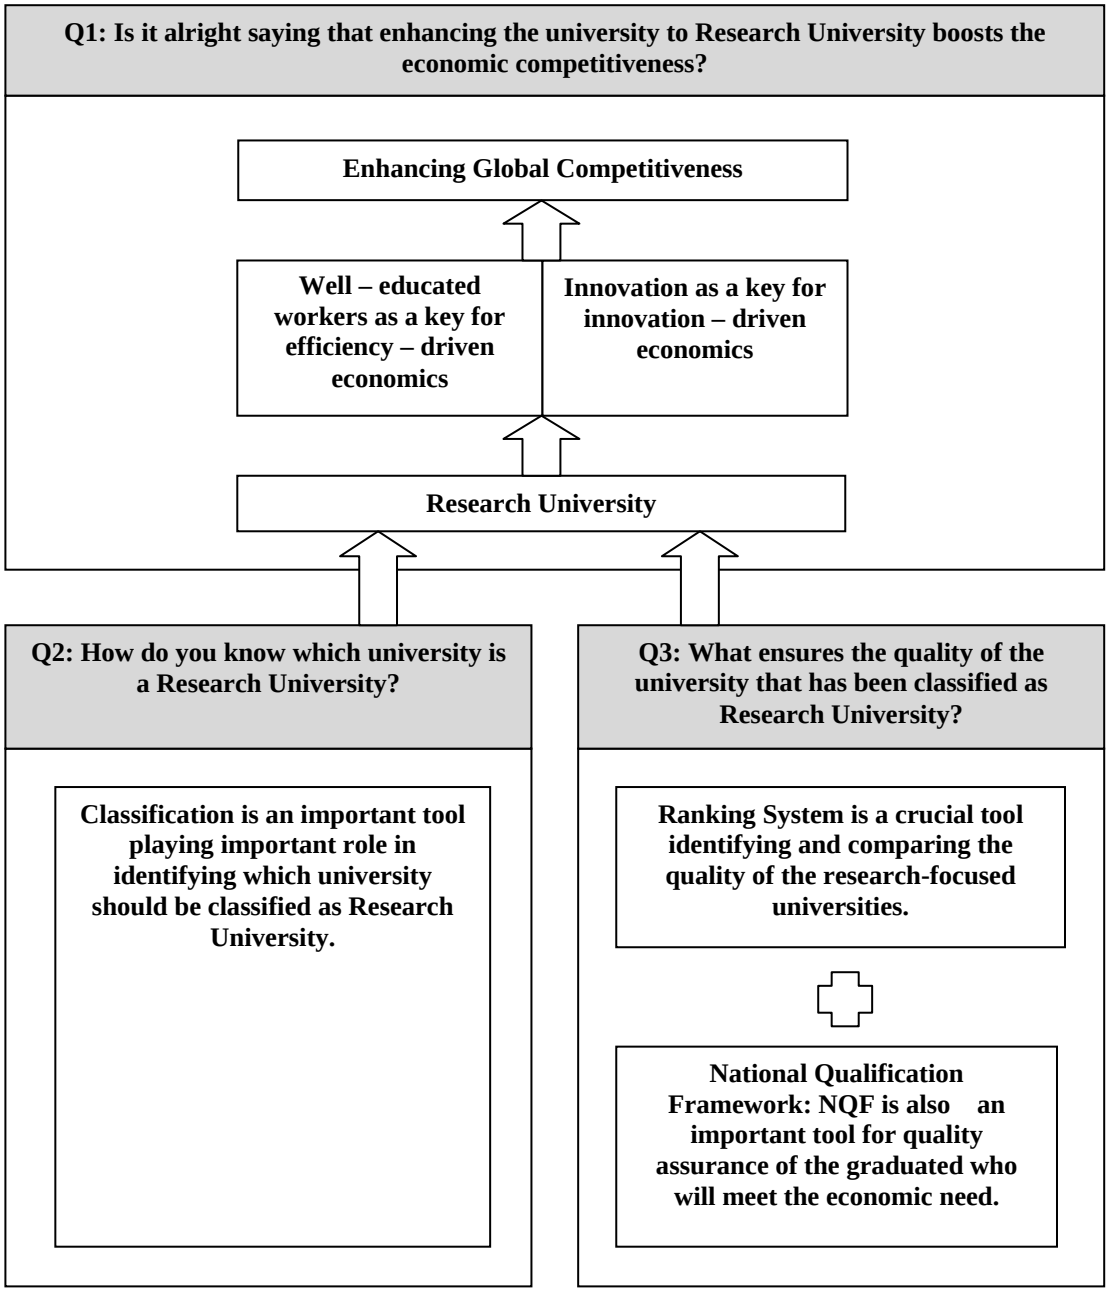

Figure 2 The Relationship of higher educational classification and standardization enhancing global competitiveness under scope of three questions

FUTURE STUDIES

The instruments derived from the vast literature review have been combined to develop the "Classification" and "Ranking" corresponding to Thailand educational system that meets the policy on leveraging the competition capacity.

EXPORT MULTIPLIERS AND THE DEFENCE SECTOR SUPPLY IN RETURN EXPORT MANAGEMENT

Dr. Štefan Bojnec, University of Primorska, Slovenia
stefan.bojnec@fm-kp.si

ABSTRACT

The statistical 60 sectors symmetric input-output matrix and the in-depth unique evidence of the Slovenian defence industry enterprises focusing on the defence industry supply in return export activities are analyzed using the input-output modelling approach. The input-output modelling approach using the 60 sectors symmetric input-output matrix is used to estimate direct, indirect, and total effects of the exports from the fore-ward defence industry supply in return activities on the Slovenian economy during the years 2004-2008. The indirect effects are three-to-four times greater than the direct effects. The empirical results confirm that the defence system of supply in return activities can be in a greater extent used for implementation of the economic development objectives in building up and development of the industrial technological base and for a niche approach in setting up, maintaining and catching up of the high-technological base activities of the domestic suppliers and sub-suppliers with largely high technological exports of particularly civilian goods and services.

Keywords: supply chain management, defence sector, supply in return, input-output modeling, export multiplier, Slovenia

INTRODUCTION

The analysis of the fore-ward supply defence industry market chain linkages is a rare in literature. Previous analyses have indicated the presence of economic relations between the defence technological and industrial base activities with the rest of the economy (e.g. Kolar 2007, Bojnec and Fošner 2009). These inter-sector, multiplicative economic effects are potential factor for economic growth in the economy as a whole (e.g. Davis 2008). However, so far there is almost no study to investigate the size of this multiplicative effect and its spread over the different sectors in the economy.

The developed technological and industrial base activities provide competitive market opportunities for medium-high and high-technological intensive industries, which can create supply-side synergies and demand-side multiplicative effects on the other economic activities by providing basis for their international competitiveness (e.g. Gandolfi 2007). Moreover, state defence budgets that are allocated toward development of the defence technological and industrial base activities as well as for defence supply chain management of industrial and service activities generate demands for direct and indirect supply chains from different economic activities and thus through these causalities cause synergies that generates economic growth. From macro-economic and inter-sector point of views (e.g. Chenery and Srinivasan 1989), the impacts of the defence sector is through aggregate direct and indirect

demands for products of different economic activities for the defence sector and through aggregate supply of different kind of the defence industry enterprises. Both effects can generate positive effects for economic growth.

The direct and indirect linkages of the defence technological and industrial base activities in the economy might have important role on overall economic performances, production, supply and supply in return management, middlemen, and trader activities, and thus for competitiveness of the economy. These defence sector activities might provide a special opportunity for a greater role of small- and medium-sized enterprises, which in several developed countries are the most dynamic element in a job creation and the most recently, they are one of the key organizational structures in research and development activities, inventions and innovations and their disseminations and implementations into different industrial and service activities. There is, however, very limited research on the role and importance of the defence technological and industrial base activities in the economies, particularly in production, supply and supply in return activities, middlemen and trader activities by using matrix theory (e.g. Lam et al. 2008; Iwankowicz 2008) and input-output methodological approach (e.g. ten Raa 2006). Our specific focus is on the size and spread of the export multiplier pertained to the defence sector export supply in return activities with Slovenia. It is selected as a case study due to the available information on both the 60 sectors symmetric input-output table and particularly due to the available enterprise-level evidence on the exports that is linked to the defence sector export supply in return activities.

The first contribution of this paper is the analyses of the direct and total multiplicative linkages of the defence industrial and technological base sector activities in the supply in return export activities on the rest of the economy. More specifically, we analyse the impact of the country's defence industry supply in return export flows, which are directly and indirectly spead from the defence industrial and technological base supply in return export activities to different sectors of the economy, which are directly and indirectly linked to these activities. We underline that not only direct producers and direct suppliers links are important, but also different other links with suppliers in return, midleman and traders activities. The defence technological and industrial base activities are not linked only to the pure defence sector, but are linked significantly with the rest of the economy that are transmited from the export flows. This implies policies that are less purely defence sector policies, but market driven with the rest of the economy in an open and global international trade environment with goods, services and their outsourcings (e.g. Heather 2002, Allen 2005).

The second significant contribution of this paper is the calculated size and the spread across diffferent sectors of the export multiplier for the defence sector supply in return export activities. To do this, we combine two data sets: first, the statistical 60 sectors symmetric input-output matrix, which was used for the calculation of direct coefficients and multipliers from the inverse statistical 60 sectors symmetric input-ouput matrix. Second, the enterprise-level data on the supply in return export activities. On these bases we estimated direct, indirect and total multiplicative effects, which are caused and linked by the size of the export multiplier for the defence sector supply in return export activities.

The third contribution is the unique defence industry data management. The commercialization and marketization of the defence technological and industrial base sector activities might be still limited as several those activities are of a secure nature. This migh be one of the reasons that not many researches so far has been conducted and not many evidence is available to be analyzed and compared. The advantage of our research is to combine both publicly available data on the statistical symmetric input-output table and the unique in-depth defence sector enterprise data set, which has been obtained by both the conducted in-depth surveys in the Slovenian defence sector enterprises that are engaged in different business activities with the defence technological and industrial base activities, and from Ministry of Defence.

The rest of the paper is structured as follows. In the next section we explain the methodology on application of the input-output industry data management focusing on the defence industry sector to provide an analytical data management tool with managerial implications. We also present the data used on the statistical input-output table and on the unique survey evidence on the linkages of the defence technological and industrial base activities with the rest of the economy and with the supply in return export flows (e.g. Kenen and Lubitz 1971). The focus is on the export multiplier. The section after then describes the empirical results on the direct fore-ward linkages on the basis of the unique in-depth empirical evidence obtained from the surveys in the Slovenian defence sector industry enterprises. The special focus is on the export multiplier in the defence industry supply in return export activities. After this, we provide managerial and policy implications for the defence industry supply in return export management and for data management systems in the defence sector with issues for future research, whereas the final section derives main conclusions.

METHODOLOGY AND DATA USED

The application of input-output modelling in the industry cross-sector data management is used focusing on the defence industry sector supply in return export activities. The input-output modelling provides a base for the data management in the cross-sector back-ward and fore-ward industry linkages. To analyse the linkages of the defence technological and industrial base supply in return export activities with the rest of the economy, we apply matrix theory, which is a base for an input-output modeling in the data management. The compailed statistic symmeteric input-ouput matrix is a starting point of our analysis of the direct, indirect and total fore-ward supply-side cross-sector linkages, which are pertained to the defence technological and industrial base supply in return export activities. We employ the statistical 60 sectors symmetric input-output matrix of the Slovenian economy in the combination of the enterprise-level data on the defence industry supply in return export activities. In this way, we analys the cross-sectoral flows between the defence techological and industrial base supply in return export activities with the different parts of the economy, which are directly and indirectly engaged in the conduction of these supply in return export activities.

The input-ouput modelling is an appropriate methodological tool to measure economic relations between different economic activities. This methodological approach with the use of the input-output matrix of inter-sectoral and inter-country economic flows can show the structure of direct fore-ward supply-side linkages of the defence sector activities with the rest

of the economy and with the international trade flows. Our special focus is on the defence industry fore-ward supply in return export activities. They are causing subcontracting, middelmen, traders and similar activities within the national economy and in international trade.

The relation between production and consumption in the economy can be analysed by use of the statistical input-output table. The symmetric 60 sectors input-output table is based on tables of supply and consumption in the economy. The symmetric input-output table presents process of domestic production and transactions of products and services in the economy at the level of products or adjusted at the branch level (SORS 2008). At the aggregate economy level, symmetric input-output table is a matrix with row and columns at the level of product/branch with the sum by row or columns, which gives the total value of production. The input-output model assumes that inputs are associated with outputs with linear production function with fixed coefficient at least on short-term.

The input-output modelling is based on linear algebra (Iwankowicz 2008, Lam, Chan, Ip and Lau 2008). The column *j* in the input-output table shows how much in production of the sector *j* (X_j) are spent inputs from all other sectors *i* in the economy for the intermediary consumption (X_{ij}) and what is the structure of the value-added (for wages, different other incomes, and business surplus) in the sector *j*. The X_j depends and causes on X_{ij} through technical coefficients, A_{ij}:

$$X_j = A_{ij} X_{ij} + Y_j ,$$

where Y_j is final supplies or final consumption.

Technical coefficient, a_{ij}, indicates how much of inputs of the sector *i* is needed for a unit of production of the sector *j*:

$$a_{ij} = \frac{X_{ij}}{X_j} .$$

The indicator of total (direct and indirect) intermediary reproduction links between the symmetric 60 sectors in input-output matrix (*i*=*j*=60) is the matrix multiplier of the individual sector, which we can obtain by resolving structural form of the symmetric input-output model:

$X_j = A_{ij} X_j + Y_j$

$X_j - A_{ij} X_j = Y_j$ and, taking care to ensure conformability, we can write:

$I_{ij} X_j - A_{ij} X_j = Y_j$, where I_{ij} is a unit matrix (n,n) and

$(I_{ij} - A_{ij}) X_j = Y_j$, where $(I_{ij} - A_{ij}) X_j$ is non conformable. After pre-multiply both side by the inverse $(I_{ij} - A_{ij})^{-1}$, we obtain:

$(I_{ij} - A_{ij})^{-1} (I_{ij} - A_{ij}) X_j = (I_{ij} - A_{ij})^{-1} Y_j$, which follows:

$X_j = (I_{ij} - A_{ij})^{-1} Y_j$, since $(I_{ij} - A_{ij})^{-1} (I_{ij} - A_{ij}) = I_{ij}$.

where X_j is vector-column for production, Y_j is vector-column of final supplies or final consumption, A_{ij} is matrix of technical coefficients for total production for the 60 symmetric sectors in the input-output system, I_{ij} is a unit matrix and $(I_{ij} - A_{ij})^{-1}$ is the inverse matrix or matrix of sectors multipliers (r_{ij}) (Leontief 1966)

Our special interest in to estimate the export coefficients and export multiplier by investigation the sector's *j* fore-ward export sells or delivery structures. This is presented in the rows of the symmetric 60 sectors input-output matrix. The row *j* in the symmetric input-output table shows how the final supplies or final consumption of the sector *j* (Y_j) is used in the intermediary consumption of the all sectors in the economy (X_{ij}) and in the final household consumption C_j, gross investments I_j, government consumption G_j, and exports E_j: $Y_j = X_{ij} + C_j + I_j + G_j + E_j$.

The direct export coefficient of sector *j* e_j shows the exports of the sector *j* in the unit of final consumption in the sector *j*:

$$e_j = \frac{E_j}{Y_j},$$

where E_j is the value of exports of sector *j*. The export multiplier $\hat{e}_j$ for the sector *j* is:

$$\hat{e}_j = \sum_{j=1}^{n} e_i r_{ij}, \text{ where } \hat{e} = e\,(I - A)^{-1}, \hat{e} = (\hat{e}_1\ \hat{e}_2\ \ldots\ \hat{e}_{60}).$$

The export multiplier $\hat{e}_j$ for sector *j* shows total (direct and indirect) effect of exports of sector *j* on the economy as a whole.

To estimate the export multiplier for the defence sector supply in return export activities for the period 2004-2008, we use the 60 sectors symmetric input-output matrix for 2005 valued at basic prices, which are compiled every five years (SORS, 2008) and the enterprise data on the supply in return export activities by the years 2005-2008. The symmetric input-output matrix is based on tables of supply and consumption in the economy. The input-output matrix presents process of domestic production and transactions of products and services at the level of products or adjusted at the branch level. At the aggregate economy level, input-output table is a matrix with rows and columns at the level of product/branch with the sum by rows or columns gives the final value of production or gross domestic product. The input-output model assumes linear production function with fixed coefficient at least on short-term. The input-output table total economy flows are distinguished separately by domestic flows and international export/import flows. The classification used for industries is Statistical Classification of Economic Activities in the European Community (NACE Revision 1 or Slovenian version of the Standard Classification of Activities) and for products is the Classification of Products by Activity. Our special focus are the Slovenian enterprises and their role in the defence supply in return export chain management of the defence technological and industrial base activities.

EMPIRICAL RESULTS

The input-output analysis, particularly on measuring direct and indirect multiplicative effects can provide wider application opportunities of these methodological approaches in the industry data management. In the Slovenian statistical 60 sectors symmetric input-output matrix, the defence sector belongs to the public administration and defence services; compulsory social security services. Bojnec and Fošner (2009) on the basis of the empirical results obtained from the 30 sectors symmetric input-output table for domestic output at basic prices for Slovenia in 2005 confirmed that in the domestic matrix as well as for the total sell

matrix, the final consumption expenditure by government are the most important. The export flows in the export part of symmetric input-output table are less concentrated, but still there are three market outlets, which are the most important: first, intermediary consumption in transport, storage and communication services; second, final consumption expenditure by households; and third, intermediary consumption within public administration and defence services; compulsory social security services.

We first present our unique in-depth enterprise survey evidence for the defence industrial and technological base activities. We analyse the structures of the defence sector production supply, supply in return and subcontracting activities, middlemen and trader activities of the defence technological and industrial base activities to define the enterprise level starting point for the defence supply in return export multiplier. The defence technological and industrial base activities are analysed for their direct linkages by the frequency of the distribution of the defence sector enterprises. The analysed defence sector activities are separated between domestic and international or external flows. The in-depth survey data evidence is obtained by personal interviews in the Slovenian defence industry enterprises with a pre-prepared written questionnaire. The surveys were conducted in the Slovenian enterprises, which are on the list of the Slovenian Ministry of Defence that they are engaged in the defence industry and technological base activities. From the list of around 100 enterprises, we have successfully conducted the surveys in the 64 Slovenian enterprises, which are engaged in the business activities with the defence technological and industrial base activities in Slovenia. The surveys were conducted in November and December 2007. The questions in the written questionnaire were divided into six thematic subjects. In this paper, we focus on the data evidence that is obtained on the three of them: the main evidence on the enterprise profile, on the importance of the defence technological and industrial base activities in the enterprises, and the in-depth evidence on the defence production-supply chain activities, supply in return and subcontracting activities, and middlemen and trader activities.

According to the size of the enterprises by the number of employees and by the revenues, in the sample are included: 48.4 per cent small enterprises, 26.6 per cent medium-sized enterprises, and 25.0 per cent large enterprises. This implies that most of the enterprises in the Slovenian defence technological and industrial base activities are the small- and medium-sized enterprises.

By the NACE production activity classification, most of the enterprises in the sample operated in the service activities (70.9 per cent), then 15.0 per cent in production activities, and 14.1 per cent in manufacturing activities. Most of the Slovenian enterprises in the defence technological and industrial base activities are engaged in advices, maintenance, information and information technologies, logistics, education, research, providing infrastructure and other services in the Slovenian army.

Table 1. Frequency Distribution of the Enterprises with Their Market Outlets for the Needs of the Defence Industrial and Technological Base Activities (in per cent)

Frequency distribution of enterprises (%) for primary production	National Slovenian market	EU-26	The rest of the world markets
0%	31.7	65.1	66.7
1-49%	28.6	22.2	17.4
50-99%	17.5	12.7	15.9
100%	22.2	0.0	0.0
Total (%)	100.0	100.0	100.0
for supply in return or subcontracting activities

Source: Own survey results.

The frequency distribution of the defence industry enterprises in Slovenia by the structure of their market outlets for the needs of the defence industrial and technological base activities is presented by the three different geographically segmented markets: the national Slovenian market, the markets of the other enlarged EU-26, and the other markets in the rest of the world (Table 1). For several defence industry enterprises in our sample, the national Slovenian market is not important for primary production supply chain management, which is related to the defence industrial and technological base activities. On the other hand, the significant proportion of the enterprises is selling all its primary production of the defence industrial and technological base activities on the national Slovenian market. The other defence industry enterprises are marketing the different degree of primary production of the defence industrial and technological base activities on the national Slovenian market. The results indicate that around 40 per cent of the defence industry enterprises in our sample sell at least 50 per cent of their primary production of the defence industrial and technological base activities on the national Slovenian market, whereas the remaining around 60 per cent of the enterprises in the sample sell less than 50 per cent of their primary production for the needs of the defence industrial and technological base activities on the domestic Slovenian market. On average, a bit more than 40 per cent of primary production for the needs of the defence industrial and technological base activities is supplied on the domestic Slovenian market. However, this varies by the enterprises substantially as the standard deviation is 41.9 per cent.

When considering the enlarged EU market, the domestic Slovenian market is prevailing for around two-thirds of the enterprises in the sample that are engaged only in the defence business activities on the domestic Slovenian market. The relative frequency of the

distribution of the enterprises for the supply of primary production for the needs of the defence industrial and technological base activities with the EU-26 markets clearly indicate that around two-thirds of the enterprises are not engaged in these EU business activities. Moreover, the relative frequency of the distribution of the enterprises in the sample that are not engaged in the supply of primary production for the needs of the defence industrial and technological base activities with the other markets in the rest of the world is even a bit higher.

The share of the enterprises that are not engaged in the supply in return or subcontracting activities for the needs of the defence industrial and technological base activities on the domestic Slovenian market is relatively high, but it is even much higher for similar activities towards the EU-26 markets (more than three-quarters) and even more at the other markets in the rest of the world. The relatively high share of the Slovenian defence sector enterprises is also identified for the supply in return or subcontracting activities that are exclusively specialized for the domestic Slovenian markets, but none to the EU-26 markets and only one to the markets in the rest of the world. These results indicate that the Slovenian defence sector enterprises are not very frequently engaged in the supply in return or subcontracting activities as there are only few enterprises in Slovenia that specialize in the defence supply in return or subcontracting activities on the domestic Slovenian market, much less for similar activities in the EU-26 markets, and a very rare for the other markets in the rest of the world.

The distribution of the enterprises in the defence chains as the middlemen (traders) on the national on the Slovenian market is more symmetric than on the EU-26 markets and on the rest of the world markets. A large share of enterprises is not engaged into the defence chains as middlemen (traders) neither on the domestic Slovenian market nor on the enlarged EU-26 markets nor on the markets in the rest of the world. On the other hand, there are less than one-third of enterprises, which are fully specialized and engaged in the defence chains as the middlemen (traders) on the domestic Slovenian market, but less so for the enlarged EU-26 markets and none of them is fully engaged on the rest of the world markets. The results indicate that more than 40 per cent of the enterprises are more than 50 per cent engaged in the defence chains as the middlemen (traders) on the domestic Slovenian market. On average, the enterprises in the sample are 38 per cent engaged in the defence chains as the middlemen (traders) on the domestic Slovenian market, with a large variability by the enterprises as confirmed by the standard deviation of more than 45 percentage points. This implies rather a bi-polar distribution of the Slovenian defence industry enterprises in these activities. Moreover, much more asymmetric is found the distribution of the enterprises with a higher concentration at lower average value (9.6 per cent and relatively lower variability as the standard deviation is a bit more than 25 percentage points) for the engagement in the defence chains as the middlemen (traders) on the enlarged EU-26 markets. The average value for the engagement of the enterprises in the markets in the rest of the world is a bit lower (8 per cent and lower is also variability as suggested by the standard deviation of a bit more than 22 percentage points). This implies that the Slovenian defence industry enterprises in these business activities are more similar regarding the engagement in the defence chains as the middlemen (traders) in the enlarged EU-26 markets and in the other markets in the rest of the world.

Table 2. Distribution of Enterprises with Market Outlets for Middlemen (Trade) Activities for the Defence Chains (in per cent)

Enterprise frequency (%)	Purchasing from abroad		Participation in supply in return for	
	EU-26	The rest of the world markets	EU-26	The rest of the world markets
0%	49.2	66.7	77.8	85.7
1-49%	15.9	14.2	11.0	12.7
50-99%	19.0	17.5	8.0	0.0
100%	15.9	1.6	3.2	1.6
Total (%)	100.0	100.0	100.0	100.0

Source: Own survey results.

We further investigate the Slovenian enterprise middlemen (traders) activities in the defence marketing chains regarding the purchasing activities abroad and the participation of the enterprises in the supply in return. As can be clearly seen from Table 2, the large share of the Slovenian defence sector enterprises in the sample is not engaged in the supply in return activities for the EU-26 markets and in the supply in return activities for the other markets in the rest of the world. The relatively high share of the enterprises in the sample is also not engaged in the purchasing activities from abroad. These results clearly confirmed that a majority of the Slovenian enterprises that are engaged in the defence industrial and technological base middlemen (traders) activities are not oriented on international markets.

However, 15.9 per cent of the enterprises specialized exclusively (hundred per cent) for the purchases in the EU-26 markets. On the average the enterprise in the sample on the EU-26 markets conducted a bit more than 33 per cent of all purchases. Furthermore, there is only one, a single enterprise, which specialized exclusively for purchases on the other markets in the rest of the world. On the average the enterprise in the sample in these markets conducted a bit more than 17 per cent of all purchases. Finally, the two enterprises are specialized exclusively in the supply in return for the EU-26 markets. On average the enterprise conducted around 11 per cent of the supply in return activities on the EU-26 markets and around 4 percent of the supply in return activities on the other markets in the rest of the world. In the latter case, there is also the single enterprise that specialized exclusively for the supply in return activities for the other markets in the rest of the world. These results suggest that the enterprises in the defence middlemen (traders) activities are adjusting towards business opportunities in these markets, which are still more seen on the domestic Slovenian rather than in the international markets. This is a challenging issue for the Slovenian enterprises upon the Slovenian membership in the enlarged EU and in the North Atlantic Treaty Organization (NATO).

So far there is no study to investigate the export multiplier concerning the defence sector export supply in return activities. To do this, we have estimated direct export coefficients e_j and production multipliers r_{ij} to obtain the export multipliers $\hat{e}_j$ by the 60 sectors of the symmetric input-output matrix for Slovenia. On the basis of the calculated sectoral multipliers and direct defence export supply in return activities of the Slovenian enterprises, we have calculated direct, indirect, and total effects of the defence export supply in return activities on the Slovenian economy. We have found that the defence supply in return export multiplier is equal 3.69 (Table 3). This implies that, if these activities are properly conducted

and managed, they can have an important impact on the other, non defence sectors activities. In this way, they can significantly contribute to the exports of the defence and civilian products and services, and thus contributing to growth, employment and economic development in the rest of the economy. This requires advanced organizational and supply chain management arrangements.

Table 3. Export multipliers by sectors and the export multiplier for the defence supply in return export activities

60 input-output sectors engaged in supply in return export activities	export multipliers
Other mining and quarrying products	1.91
Textiles	5.64

MANAGERIAL AND POLICY IMPLICATIONS

Globalization and internationalization of supply chain management has taken different forms. In the defence sector, it has taken a special form of barter trade supply in return organization, where military imports can be covered by supply in return export activities of defence and civilian products. While in general, the competition for capital and similar equipment sales and supports has intensified globally, for example in Europe, there have been achieved notable sales successes for aircraft, locomotives and ships (Quayle 1999). These activities have also been pertained to the defence technological and industrial base activities in the economy with different suppliers and sub-suppliers arrangements and a joint project management within and between the countries. The important reason for such cooperation arrangements are in use of economies of scale, which are necessary for greater and complex capital equipments and their considerable investment costs. In additional to high-

technological requirements, this requires extensive management procedures for production of capital equipments and support strategies on project management performance and dealing with subcontractors to gain and remain successful in the global market competition.

The concept of vertical and horizontal enterprise integration into supply chain and supply-chain management often requires contractual and other arrangement about managing coordinated information, flows of products and services, plant operations, and logistics. The crucial premise is synchronization and coordination within and between various autonomous supply-chain members to increase economies of scale, reduce fixed and other operational costs and provide flexibility and agility in responding to consumer demand shifts. Chandra and Kumar (2001) illustrated a supply-chain model based on a collaborative system approach utilizing the example of the textile industry. The appropriate structure, compliance with defined qualitative and quantitative requirements, proper control and incentive mechanisms, alignment of interdependent decision-making processes and implementation principles of optimization to synchronize the supply chain are critical success factors in improvement in the overall performance of each participating member and the supply chain management as a whole. The concepts of vertical and horizontal enterprise integration into the defence industry supply chain and supply-chain management are still underdeveloped in the Slovenian economy. The Slovenian defence industry enterprises demands an institution to monitor and support the Slovenian defence industry and associated business sectors (Bojnec, 2009). The contractor risk in the Slovenian defence industry is currently practiced by the involved enterprises. Unlike to some developed countries, such as in the United States of America, in Slovenia is not developed a legislative requirement of “Buy Slovenia First” to ensure the sustainability of the defence industry supply chains.

In addition to enterprise resource planning to streamline and integrate operation processes and information flows within a company, for the barter supply in return defence industry activities is a crucial collaborative system implementation in production, inventory, procurement, suppliers and logistics companies inside and outside a certain country in response to the need for resource optimization and the global competition and logistics management and worldwide market distribution. An interesting question regarding western exporting manufacturers was raised by Li (2002): should they use independent resident distributors or employee sales force when they enter emerging markets? This is also a challenging issue in the Slovenian supply in return export management, but theories provide mixed and contradict answers. Different channel structures and channel management are associated with advantages and disadvantages, and hence the choices of channel structure depend on market entry stages and market conditions. For a relatively small countries such as Slovenia (two million of population), where economies of scale for most of products can be achieved on wider export markets, the defence industry export supply in return can provide opportunities for exports, growth and economic development for engaged enterprises, activities, and regions.

The input-output modelling is found as an important analytical tool in the industry data management for investigation of the back-ward and the fore-ward linkages between the economy sectors, which is illustrated in the case of the Slovenian defence industry supply in return export activities. These are the challenging research and policy issues in the changing world, industrial management and data systems. During the last two decades since the fall of

the Berlin's wall in Europe, the role and importance of the defence technological and industrial base activities has changed. The greater focus has been directed towards the defence technological and industrial base activities with a greater reliance on quality, invention, and innovation. A key question in managerial economics is economic efficiency (e.g. Heather, 2002; Allen, 2005). The small- and medium-sized business sector enterprises have been a constituent part in these processes of a greater openness, commercialization, and marketization of the defence technological and industrial base activities. However, in a spite of the increasing participation of the small- and medium-sized enterprises in the defence technological and industrial base production supply chain management, supply and supply in return chain management, and middlemen (traders) activities, these markets are still an issue of a special concern, but with the increasing role of the economic efficiency criteria in their marketing and supply in return export activities. This also holds for Slovenia as a small open economy, which is the member of the enlarged EU and NATO as well as in cooperaton with the other countries in Europe and in the rest of the world. The extensive overseas participations by Slovenian armed forces have contributed to goodwill and credibility from other countries, but so far this has to a lesser extent been utilised in the defence industry supply in return export management activities as an issue for future research.

CONCLUSIONS

This paper presents unique empirical results of the defence industrial and technological base supply-chain activity structures and marketing flows. The Slovenian defence technological and industrial base enterprises are strongly linked with the domestic Slovenian markets in primary production, supply in return and subcontracting activities, and in the defence chains as middleman and trader activities. The distribution of the enterprises in these activities is rather bi-polar. On one hand, several of these enterprises are not linked with the other similar domestic enterprises, but on the other hand, there are also several enterprises that are wholly (hundred percent) linked with the other similar domestic enterprises or with the domestic market. The remaining smaller number of enterprises is by a different degree linked with the domestic Slovenian markets. The share of the enterprises that are not engaged in the business activities with the enlarged EU markets or with the other markets in the rest of the world is much higher. This implies that the Slovenian enterprises in the defence industrial and technological base activities are much more oriented on the domestic Slovenian markets than into the international trade and international competition. Their enterprise activities in primary production, supply in return or subcontracting activities, in middleman and trader activities are rather strongly associated between themselves on the domestic Slovenian market, which has been shown by rather a similar distribution of enterprises in these different activities on the three different geographically segmented market outlets (domestic Slovenian, enlarged EU, and the rest of the world markets).

The input-output modelling approach is used to study export supply chain management in the defence technological and industrial base activities. Our focus has been on those enterprises and activities, which are engaged into the defence industry supply in returns export activities. It has been found that the size of the export multiplier provides a significant multiplicative effects from the defence industry supply in return export activities on the rest, particularly on the civilian activities in the Slovenian economy. A greater attention should be given to products and services in activities and services in higher productive value-added activities in

middle-high and high-technological intensive activities to achieve greater positive synergies and multiplicative effects for the rest of the economy. The defence technological and industrial base supply in return export activities are found as an important factor for strengthening of export supply-side management, internationalization of the enterprises and the economy to increase international competitiveness.

ABSTRACT

The purpose of this paper is to identify challenges in collaborative product development in the high-tech enterprises. The research approach is a multiple case study realized in Finland and Thailand. There are twenty-three challenges that have found to be critical for effective collaborative product development. These include negotiation strategies, mutual trust, generating new ideas and rapid pace of new product introduction. In addition to the theoretical study, the practical definition of challenges is made by the experts in the high-tech enterprises.

Keywords: Challenges, Collaborative Product Development, High-Tech Company

INTRODUCTION

The amount of partnerships in research and development has grown significantly during the past decades, especially in the high-tech industries. Globalization and current economical situation are increasing the competitive forces in all fields of industry and the pace of new product development has reached new levels. Technologies, products and services are more complicated than before. Therefore companies are facing increasing challenges in keeping up with the pace of development and new innovations systems. The enterprises are introduced to the challenges of more modern collaborative product development that combines agile methods of new product development to more complex partner and supplier co-operation interfaces (Schwaber, 2004). Improving firm's innovation performance has become an important concern of today. This is the reason, why firms are continuously improving their innovation processes, combining internal R&D and external knowledge acquisition activities (Cassiman and Veugelers, 2006). Firms must be able to draw on a variety of internal and

external technologies in order to introduce new products and services to the market at the right time. Thus, the acquisition of external information and technology becomes a vital factor and strategic variable for organization's success. (Kurokawa, 1997; Rigby and Zook, 2002; Squicciarini and Loikkanen, 2008). Therefore acquiring product development know-how by means of collaborating is occurring to be much more challenging than what we are traditionally used to. These are the reasons, why this is an important topic to study.
The aim of this research is to investigate the challenges hidden in the collaborative product development process and to better understand the relationship between a high tech company who is a buyer of the knowledge for its new product development (NPD) process and with a supplier of the needed knowledge. The focus of the study is in knowledge transfer process during or in sourcing process of product development process. This research not only contributes to a better understanding about the modern product development process, but also gives the insight of what the most important aspects of the collaborative R&D of special know-how are in high-tech field of business. In order to meet the objectives of this study, the following research questions need to be answered:

RQ1: What are the challenges of collaborative product development according to literature?
RQ2: How these challenges are defined in high-tech product development?

This study addresses the research questions in a qualitative approach both through literature as well as analysis of high-tech enterprise interviews. The first research question will be answered on according to literature review, and then the second research question is based on qualitative interviews.

RESEARCH PROCESS

This study bases its theoretical foundation on buyer-supplier relationship and product development (Figure 1). Selected theories are applied to an extent as required for the purpose of understanding the challenges of collaborative product development.

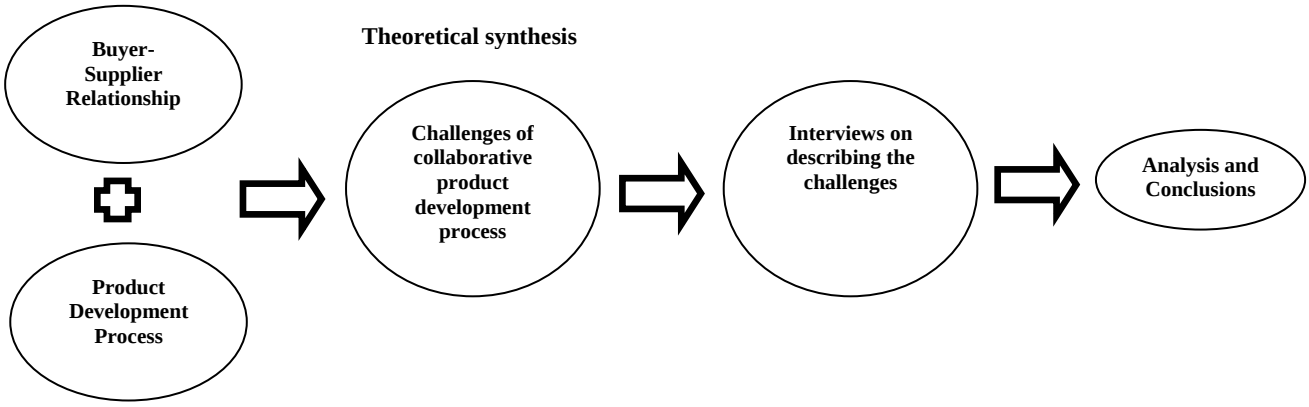

Fig. 1 Research process

The research process had two phases. The first phase is literature survey built up in order to define the challenges of product development related purchasing, contracting activities and

collaborative R&D as seen in previous studies. The second phase is an empirical investigation of high-tech case companies. The empirical study was conducted to better understand the main challenges of collaborative product development by exploring the common definition of the challenges in practical way. The study consisted of 7 interviews with people who are expert in collaborative product development. Each interview session was based on the same questionnaire. The interviews were allowed the interviewees to explain and clarify the challenges. All the interviewed companies are the high tech enterprise and have long traditions of continuous R&D and NPD process, 4 companies are operating in Finland and one in Thailand. Most of them are a large-size high-tech enterprise.
The participants interviewed were selected carefully on the basic of their professional background and expertise. Selected participants hold responsible positions in the interviewed companies. The experience and the current interests ensured the high motivation among the participants and up-to-date knowledge with respect to the discussed topics. The total work experience of those interviewed was typically between 10 and 20 years.

Table 1: Brief characteristic of the interviewed companies

Company	Number of interviews	The job title of respondents	Company size	Type of products	Area
Company A	2	1) Director of Sales and Marketing Development 2) Director of Technological Assets	Mid-sized	Software and services	Finland
Company B	1	Head of R&D	Large	Consumer electrics, converging internet and communications	Finland
Company C	1	Collaboration Manager	Large	Telecommunications equipment and services	Finland
Company D	1	Software Project Manager	Large	Network protocol analyzers and simulators	Finland
Company E	2	1) Senior Manager of Design Engineering Department 2) Specialist of Design Engineering	Large	Electrical products	Thailand

COLLABORATIVE PRODUCT DEVELOPMENT PROCESS

Buyer-supplier relationship

In recent years, there are many scholars concentrate on the relationship between buyer and supplier. Gules and Burgess (1996) has emphasized, the buyer and supplier relationships are often characterized by reference to two major types: adversarial and collaborative (Lamming, 1986; Lyon, Krachenberg and Henk, 1990; Imrie and Morris, 1992).
The traditional relationship or adversarial relationship is referred to as the antagonistic model, which has the characteristics of tough negotiation, focus on price, short-term contracts and multiple sourcing (Matthyssens and Van den Bulte, 1994). The competition for suppliers was defined by the buyer. The buyer would ask many suppliers to bid for business and use the enquiry and post-bid negotiation process to reduce the piece price. The supplier with the

lowest bid would be awarded the contract. This type of relationship sees the buyer-supplier relationships in terms of both parties completing with each other for profit margin. In this atmosphere, the sharing and transfer of data and information were very limited and this relation tended to discourage innovation in the supplier. Therefore with the ineffectiveness of such relationship and also the globalization of markets combined with a restructuring of many firms that a focus towards costs, quality, flexibility and technology, a new relationship between buyer-supplier has emerged by moving towards a more collaborative approach: partnership relationship (Macbeth and Ferguson, 1994; Herbig and O'Hara, 1995).

Partnership relationship requires trust and commitment for long-term cooperation along with a willingness to share risks (Humphreys et al., 2001). Buyer and supplier achieve lower costs through working together to lower both buyer's and seller's operating costs (Wilson, 1995). In the partnership model, suppliers become involved in the new product development process very much earlier than before. Lamming (1993) showed the results of involvement of suppliers in development of a new vehicle gives the Japanese a major advantage and also he assert that earlier involvement, a key aspects of participation in new product development, is a feature of the collaborative relationships. Many manufacturers now recognize that their ability to become world-class competitors is based to a great level on their ability to establish high levels of trust and cooperation with their suppliers since they believe that their supplier are able to help them achieve a stronger competitive position (Humphreys et al., 2001). Many researchers (e.g., Ellram, 1990; Lamming, 1986; Wilson, 1995) studied the key success factors for the collaborative relationships. The common key success factors that affect the relationships between partners are commitment, trust, cooperation, shared knowledge/technology and social bonds.

Product Development

Organizations face bigger challenges to stay competitive and are forced to exploit knowledge from the environment in order to sustain growth. (Cooper, 2001; Squicciarini and Loikkanen, 2008; Audretsch DB, 2008) Product development process - the most strategically sensitive business function - is accelerating in global environment. Characteristics that make product development challenging for the project team are trade-offs, dynamic nature of environment, used level of details, pressure of time, required investments, creation, satisfaction of customer needs, team spirit and diversity. Dimension used to assess the performance of product development effort are: product quality, product cost, development time, development cost and development capability (Ulrich and Eppinger, 2008; Cooper 2001). Speaking of modern product development, firms are seeking new ways to grow and diversify through technological innovation and development (Kurokawa, 1997). However, globalization, rapid pace technological change and increasing amount of information flows has made the modern product development more versatile and complex, than traditional product development processes let us perceive. Today even the largest innovation-active organizations cannot rely only on the internal sourcing – they also require knowledge from beyond their boundaries when developing new products and technologies. Therefore increasing amount of innovations employed within a firm is not induced by firm's own product development process, let alone product development process is no longer merely an in house operation (Kurokawa, 1997; Rigby and Zook, 2002).

Innovative activity is essential for economic growth and development, therefore greater openness to knowledge sharing and trade increases the local technological development (Squicciarini and Loikkanen, 2008). Firms are experimenting in their innovation process, combining internal knowledge and external knowledge-acquisition activities (Cassiman and Veugelers, 2006). One challenge of modern product development is how organizations manage shared knowledge and internal and external information flows effectively. Many innovations in modern society are acquired through a variety of means, such as licensing, R&D contracts, collaborative product development projects, minority investments, joint ventures, or mergers (Kurokawa, 1997). Due to a rapid pace of modern society, technological change, and globalization, firms must be able to draw on a variety of internal and external technologies in order to introduce new products and services into to the market at the right time. Thus, the acquisition of external information and technology becomes a vital factor and strategic variable for organization's survival (Kurokawa, 1997; Rigby and Zook, 2002; Squicciarini and Loikkanen, 2008).

According to social network theory and the knowledge-based view of the firm, collaboration enhances competitive advantage through enabling efficient resource exchange and combination (Galunic and Rodan, 1998; Nahapiet and Ghoshal, 1998). In addition prior research has empirically demonstrated that inter-firm cooperation tends to increase the innovativeness (Mowery et al., 1996; Dutta and Weiss, 1997; Stuart, 2000). In the context of innovativeness, there is also evidence on that customers and suppliers are a particularly important source of innovation. Successful integration of suppliers in product development can result in improved quality, reduced product development duration, cost reductions, and improved access to needed technologies, markets etc. (Ragartz et al., 1997; Mikkola and Skjoett-Larsen, 2003; Handfield et al., 1999) Extensive supplier involvement in product design can cut the complexity of the project, which in turn creates a faster and more productive product-development process. Such involvement can also alert the project team of potential problems early on, at a stage where they are faster to eliminate (Brown and Eisenhardt, 1995). According to Ragartz et al. (2002) supplier involvement gravity may range in from simple consultation or information gathering to outsourcing design of components or systems entirely. Also supplier involvement schedule varies according to the purpose and need. Early involvement of suppliers is necessary when the product development process in question involves high complexity and uncertainty. In addition timing of supplier integration is relative when supplier holds critical items of technologies with regards to the development process (Ragartz et al., 2002; Handfield et al., 1999; Monczka et al., 2000).

Collaborative product development project can be successful only if the partners are able to enhance learning, re-evaluating and readjusting the initial conditions of their partnership (Doz, 1996). Conflicting pressures of simultaneous competition and cooperation may bring tensions in inter-firm collaboration. Therefore, combination of collaboration and competition are one the challenges product development projects face more or less in every organization. Moreover, the role of trust in creativity-oriented joint developments is very important. Bidault and Castello (2009) suggested that the role of trust has a positive effect on establishing the collaborative development, but has mixed effects on the innovativeness of the joint development as well as Simons and Peterson (2000) explored that mutual trust is conductive to an increase of joint creativity. Björkman and Lindell (1991) found that two-thirds of the sample ventures had the primary mission of leading the new product development to diversification into new product markets. Other expected benefits of entering

collaborative R&D are cross-fertilization of ideas, improvement of competitive position, R&D cost reduced, larger project / increased funds, early access to new technologies, better chance of project completion, access to larger potential market, risks reduced, etc. Also Tidd et al. (1997) suggest that there is usually more than one reason for an alliance and these reasons can be classified as strategic, in terms of opportunities for gaining market leadership and general learning or tactical, in terms of reducing cost, time and risk. However, some investigations into joint development observed that collaborative development often fail because it lacks coordination of activities and management. This suggests that consideration should be given to both contractual and procedural coordination mechanisms in collaborative relationships (Sobrero and Roberts, 2002). One aspect of the contracting in product development is the fact that results lead in a legal relationship, where partnership and mutual interest has to be created and clarified in order to avoid risking the collaboration (Fleming, 2003; Smith and Eppinger, 1997). Also contracting collaborative product development should create value to both parties i.e. should create a win-win situation for partners (Emden et al., 2006).

CHALLENGES FOR COLLABORATIVE PRODUCT DEVELOPMENT PROCESS

Theoretical synthesis

The challenges in collaborative product development have been summarized in Table2. This synthesis highlights the key findings from the review of literatures. The findings are classified into seven perspectives named: contract management, information management, collaboration management, resource management, NPD management, technology management, and globalization management. The goal of this summary was to list all the challenges faced by high-tech companies in collaborative product development.

Table 2: Challenges of collaborative product development (Cassiman and Veugelers, 2006; Cooper 2001; Fleming, 2003; Kurokawa, 1997; Lamming, 1993; Leavy 1994; Ragartz et al., 2002; Rigby and Zook, 2002; Simons and Peterson, 2000; Sobrero and Roberts, 2002; Squcciarini and Loikkanen, 2008; Ulrich and Eppinger 2008; Wilson 1995)

Category	Challenges
Contract Management	1. Negotiation strategies 2. Managing the win-win situation (combination of competition and collaboration) 3. Degree of supplier integration
Information management	4. Understanding the dynamics of information between network partners 5. Managing the transferred and shared information between network Partners 6. Managing communication between partners
Collaboration management	7. Mutual trust 8. Mutual goal 9. Lack of commitment 10.Understanding the role of competence flow between supplier- buyer 11. Increase communication and coordination costs 12. Managing the cross-functional interface
Resource management	13. Pressures of the continuous quality improvement and cost reduction
NPD management	14. Generating new ideas 15. Rapid pace of new product introduction 16. Finding the superior product 17. Finding the best partner candidate for R&D 18. Increased expectations of quality and reliability
Technology Management	19. The features of technology (technological change, complexity, and uncertainty) 20. Increase special know how of some technology 21. Finding the best technological solution
Globalization management	22. Need for cultural understanding 23. Increased competitive forces

Practical definitions

The practical definitions of all challenges have been summarized in Table3. This summary focuses on the key findings from the empirical study. The goal of this summary was to explore the common practical definition of challenges.

Table 3: Practical Definitions of Challenges in High-Tech Company Environment

Challenges	Practical definition	Comment
Contract Management		
1. Negotiation strategies	The economics of scale, the size of the company and the amount of the sales are the key factors in negotiation situation. The company can get the total price cheaper but it is good to gain profit for the company's providers as well.	Reviewing the literature, negotiation strategy is the specific technique (e.g., win-lose, win-win) that the parties use during the negotiation process. Negotiation strategy takes two parties to carve some outcomes based on mutual interests. A good negotiator is one who produces a win-win situation between both parties. However, companies try to win a bit more.
2. Managing the win-win situation (combination of competition and collaboration)	The company tries to have reasonable cost and offers long term contracts in order to give stability and creates the visibility and openness to the processes.	The aim of win-win negotiation is to find a solution that is acceptable to both parties, and leaves all involved feeling that they've won in some way. The negotiation itself is a careful exploration of company position and the partner's position, with the goal of finding a mutually acceptable compromise that gives both parties as much of what they want as possible.
3. Degree of supplier integration	There are many degree of supplier integration depending on the case and the partner. Sometimes just in-licensing and sometimes it is more integrated collaboration. The important thing is to define what the right level of details is for each part in the project in order to carry out the work and earn the share of the results.	According to the literature review, supplier involvement gravity may range in from simple consultation or information gathering to outsourcing design of components or systems entirely. The interaction degree of supplier involvement in product development process depends on several factors; project's size, scope and complexity, technological uncertainty and so on (Kamath and Liker, 1994; Ragartz et al., 2002).
Information management		
4. Understanding the dynamics of information between network partners	The company has to all the time validate and verify the information by frequent meeting and ordinary project work or using the constant information changing management.	Frequent communication and interaction have been considered a crucial way in efficient understanding and management of information flow between partners.
5. Managing the transferred and shared information between network partners	The information is shared by documents, a specific tool, and/or meeting. The crucial things are all the information is tried to be shared all the time and the level of trust and openness between partners has to be very high.	The transfer and sharing information between partners is somehow controversial. For the transferred and shared information between network partners, the company has to achieve the trust and openness, however the company has to be careful on what is shared and transferred.
6. Managing communication between partners	The communication is managed through many ways that are meeting, teleconference, emails, reports, working together, and unofficial face-to-face discussions.	In order to achieve the benefits of collaboration, effective communications between partners are essential. According to Cormican and O'Sullivan (2004), face to face interaction is the

Challenges	Practical definition	Comment
		most effective form of communication. The frequency of personal contacts is found to be positively related to project success (Heinz et al. 2006).
Collaboration management		
7. Mutual trust	The mutual trust is crucial for the success of the project however the level of trust usually depends on the personal level. The company tries to achieve mutual trust through team building, openly discussions and social activities. Moreover, the basic challenges of achieve mutual trust is to find the balance how to be fare enough to the partners and how to take into account business in the first place.	Most of researchers claimed that the role of mutual trust has a positive effect on establishing the joint development as well as it is conductive to an increase of joint creativity but some argued that mutual trust is not continuously positive because it seems peak at a certain value of trust.
8. Mutual goal	The important thing to achieve mutual goal is to sustain the win-win situation in order to balance between how to achieve fair prices without compromising too much of the company benefit and to keep the production costs and development costs low enough.	The existence of common goals between the suppliers is emphasized. The mutual goal is project completed on time and safely, without rework and extra coasts. To achieve the mutual goal, it is required to have a strong mutual trust among the parties to success both parties' interests (Gray & Larson 2006).
9. Lack of commitment	The ways to ensure the commitment are usually written in the agreement. However if there is a lack of commitment, the company has to mange this issue on a company level or change the partner.	Cullen et al. (2000) claimed that commitment is to give extra effort to make the work and a willingness to go beyond contractual obligations. The more committed partners will balance short-term problems with long-term goal achievement.
10. Understanding the role of competence flow between supplier-buyer	Company has to know what the partners can do and what their competencies area by defining the company competencies and the competencies the company need from the partners in order to take the partners to fill out the gaps in the company's resources and competence area.	Reviewing the literature, effective supplier starts with the selection of the most appropriate suppliers, using criteria such as providing high quality parts, aggressive pricing and reliable delivery. The competence supplier can take costs out of the supply chain.
11. Increased communication and coordination costs	The communication and coordination costs totally based on the virtual meeting and using free tools (e.g. Skype) in day-to-day communication but they are not remarkable costs for the company.	According to Lyons et al. (1990), they presented that the one of the disadvantages of collaborative between partners is increased communication and coordination costs. However, in the real operating, that costs are not significant costs for the company.
12. Manage the cross-functional interface	Company is becoming more flexible in operation and cross-functional. The partners work through project interface and company has to consider the maturity and the life cycle of the technology and adjust the functions and the stakeholders.	A cross-functional team is a group of people with different functional expertise working toward a common goal. The management of cross-functional interface relates to coordinating and synergizing the activities of multidisciplinary for achieving the mutual goal. To manage cross-functional interface is concerned

Challenges	Practical definition	Comment
		with building a better system for achieving such cross-functional goals as product innovation, quality, cost, and delivery.
Resource management		
13. Pressures of the continuous quality improvement and cost reduction	It is based on contracts and projects plan. However, it is not always easy to get enough resources or competence from the supplier or the partner because the capabilities do not fit.	The on-going improvements in product and process can enhance quality and reliability of product leading to the lower costs.
NPD management		
14. Generating new ideas	There are plenty of sources for ideas but the crucial issue is how to put the ideas into the practice. The ideas are not only generated on the base of market, customer needs or partners but also on follow-up new and future technologies, and find out what is happening around the world.	Generating new product ideas is a must for any companies. New products are what keep established business profitable and sustainable. Reviewing the literature, there are a number of ways to generate new product ideas, for example observe what's around and what's been done before, think creativity and do a technical and market research.
15. Rapid pace of new product introduction	Monitoring, evaluating and collecting new ideas all the time.	From the literature review, there are five phases to rapid pace of new product introduction (NPI): 1) analyze the resources and competences, 2) formation of partnership, 3) sharing knowledge, 4) evaluation and 5) conclusion (Farrukh et al, 2003).
16. Finding the superior product	Research activities and evaluation to measure which product should be superior product.	The superior product is the one of the fifteen critical factors that makes the difference between winning and losing (Cooper, 2001). A differentiated product delivers unique benefits and superior value to the customer. However, superior, unique, and benefit are defined from the customer's standpoint not in the eyes of the R&D, technical or design department.
17. Find the best partner candidate for R&D	Define what the company needs and expectations are and do a deep analysis of the competences and economical status of the partner candidate.	Ball (2005) presented that selection decisions of the partner/supplier are determined based on factors such as a supplier's new product development capabilities and capacity to share information; and ability for a supplier's component to differentiate the final product.
18. Increased expectations of quality and reliability	Focus on quality improvement in order to have a good process and high-level of process to develop the main process and the products and use key performance indicators for monitoring.	Reliability is defined as how long the device continues to meet the customers' expectations whereas quality is defined as meeting the customer's expectations and ensuring that the parts work when assembled in the final product. It can be said that reliability is quality over time. The increased expectations of quality and reliability from customers leads the

Challenges	Practical definition	Comment
		company recognize about the quality polity which is to consistently meet customer expectations by continual improvement of quality.
Technology Management		
19. The features of technology (technological change, complexity, and uncertainty)	Check the changes on the customers, markets, and competitors as fast as possible in order to able to change the on-going development work and define the features and contents and also develop processes to support specification work for allowing changes in short time.	The observation that the technology change continuously- incrementally and radically is now commonly accepted. It is complex and often unpredictable therefore it enables companies to develop process and monitor the change continuously as well as link together effectively collaborations to the partners for mutual advantage.
20. Increase special know how of some technology	The company must has system for handling information about technologies and the company must make a decision on which market, customer, and technology area the company focus.	
21. Finding the best technological solution	Evaluate and analysis tools, follow-up new and future technologies, and the requirements of the customers together with a good vision of the future.	The companies have to find the best technological solution for their need not a technological solution that will work.
Globalization management		
22. Need for cultural understanding	Learn more about different organizational cultures and what the working philosophy in different places is.	Culture is as significant and complex as it is difficult to understand and use in thoughtful way. Cultural learning help company understand generally act the way partners do and recognize that the role expectations and other social variable such as ethnicity and place of residence affect the way partners speak and behave.
23. Increased competitive forces	Focus on strategy and vision and try to increase expand markets with quality and competitive price and need to have flexible products that have all the needed features and that support the evolution of technologies. However sometimes there are some big changes the company has to re-shape the strategy or change the business model.	Every company has to deal with the same challenges in the field later or sooner therefore it is not only one company has to deal with the competitive forces. However, if the company has to re-shape the strategy or business model, there are some crucial things that should be considered “Is something that changes the user behaviors” or Is this something that makes the user experience better.

Table 2 presents the key points of the challenges taken out from the literature review and Table 3 elaborates the practical definition of these challenges from high-tech enterprises view point. These definitions were somewhat similar to the earlier literature but some were different.

According to the findings, there are 19 challenges which the practical definition are similar to the earlier literature such as managing the win-win situation, degree of supplier integration, understanding the dynamics of information between network partners, managing the transferred and shared information between network partners, managing communication

between partners and mutual goal. In the other hand, there are 4 challenges which the practical definition differs from the earlier literature definition:

- Negotiation strategies: the practical definition of negotiation strategies is quite the same as in the earlier literature in terms of its focuses on finding a mutually acceptable compromise that gives a win-win situation for both parties. In practical way however, the companies try to win a bit more than their partners.

- Mutual trust: in the practical meaning, the mutual trust is very significant for the success of project and lead to increasing the creativity. Some researchers (Bidault and Castello, 2009) argued that through the mutual trust has a positive effect on the collaborative project, it is not continuously positive, because the positive effect seems to peak at a certain value of trust.

- Increased communication and coordination costs challenge: the earlier literature claimed that this factor is the one of the disadvantage of collaborative product development but in a practical way, it is not a critical factor for the joint development.

- Rapid pace of new product introduction: the practical definition is mentioned in terms of idea management in order to success the rapid pace of new product introduction but not mentioned on the resources and competences analysis, formation of partnerships and sharing knowledge between partners as presented by the earlier literature.

CONCLUSIONS

This research has addressed the challenges faced by the high-tech companies in collaborative product development. The study deals with the main concern on the improvement of collaborative product development in the high-tech enterprises. This concern is very crucial considering the globalization and current economical situation which are increasing the competitive forces in high-tech company environment. The challenges that affect collaborative product development were identified by the literature which focused on answering to the first research question. The practical definition of those challenges was analyzed by the case company which concentrated on answering to the second research question. The 23 challenges in the 7 main categories are found from the literature concerning collaborative product development. The number of challenges and the number of types of challenges indicate that there are very many categories and challenges for collaborative product development.

By focusing on the categories and challenges, the majority of categories and challenges are somehow relative to the co-operation and nobody denies that the co-operation is very important and difficult issue which companies have to manage. Moreover the increase of the importance of communication, commitment, information sharing, collaboration is certainly really much more difficult than usual collaboration in buyer and supplier relationships, therefore knowing and understanding these challenges should help ensure that companies are able to deal with the increasing challenges in order to keep up with the pace of development and new innovation systems and prepare to solve many of the problems these companies are facing.

The results from the case companies that explain how the high-tech companies define challenges answered to the second research question. There are some challenges which are defined different to the earlier literature such as negotiation strategies, mutual trust, and increased communication and coordination costs therefore there are the important contributions coming out from the practical definition that helps to better understand the relationship between a high-tech company who is a buyer of the knowledge for its NPD process and with a supplier of the needed knowledge. Furthermore, the practical different in practical definition and theoretical review indicate that there is more develop practices in the future to be more success in collaborative product development. Therefore, the outcome of this research was new knowledge about the challenges of the collaborative product development both in theory and in practice.

A DOUBLE SCREENING PROCEDURE FOR MELAMINE INSPECTION

Hsien-Tang Tsai, National Sun Yat-sen University, Kaohsiung, TAIWAN, htt@mail.nsysu.edu.tw

Shih-hsiung Lo, National Sun Yat-sen University, Kaohsiung, TAIWAN, lo2330@gmail.com

ABSTRACT

According to a report from the Chinese Ministry of Health, 294,000 infants have been affected by melamine-contaminated infant formula by the end of November 2008. After one year, however, melamine-contaminated foods are still entering market in Mainland. The Melamine found in contaminated milk products from Mainland had drawn worldwide attention. Screening model was first developed to solve the employee selection problem, and then was widely used in the area of quality management, credit scoring, medical problems, etc. The aim of this article is to propose an efficient procedure for melamine inspection by using the well-known screening model, in which with some melamine inspection methods appropriately arranged into the scheme of a double screening procedure we can lower down the probability of misjudgment, inspection cost, inspect error and improve inspection efficiency etc. The proposed double screening procedure could meet the needs of both consumer and company, as well as could be integrated into a preventive food safety management model for melamine.

Key words: Melamine, Screening Model, Food Safety Management, Inspect error

INTRODUCTION

According to Review of "WHO Expert consultation to the toxicological aspects of melamine and cyanuric acid" (WHO, 2008), 294,000 infants have been found to be affected by the melamine-contaminated infant formula as of the end of November 2008. The report went on to add that more than 50,000 infants have been hospitalized, and six deaths have been confirmed. World Health Organization and international food safety and health authorities strictly banned foods melamine contamination in 2009 (Freeonline library, 2009). However, Melamine-laced milk products have been found on sale in China, more than one year after the melamine scandal over contaminated dairy goods (Bangkok Post, 2010). Authorities in the southwestern province of Guizhou found that products made by three food companies contained illegally high levels of the toxic substance (Bangkok Post, 2010).

Melamine adulteration in Mainland had drawn worldwide attention (WHO, 2008b). Food safety and health authorities all around the world have been working to identify public health threshold levels for melamine (FDA, New Zealand Food Safety Authority, 2008). In the meeting organized by WHO at the end of 2008, international experts have established a tolerable daily intake (TDI) for melamine at a level of 0.2 mg/kg bodyweight. (i.e., for every kg a person weighs they can safely consume 0.2 mg every day; for a 50 kg child this is 10

mg; for a 70 kg adult the safe amount is 14 mg). The TDI is applicable to the whole population including infants. The TDI determines the level of melamine in food that will present negligible risks to public health(WHO, 2008b). The US Food and Drug Administration (FDA) has published an interim safety/risk assessment on melamine and structural analogues and has established for melamine a tolerable daily intake (TDI) of 0.63 mg per kg of body weight per day(WHO, 2008a). The European Food Safety Authority (EFSA) has published a provisional statement and recommended to apply a TDI of 0.5 mg per kg of body weight per day as tolerable intake value for the total of melamine and its analogues (ammeline, ammelide, cyanuric acid) (WHO, 2008a).

The TDI is an estimate of the maximum amount of an agent to which an individual can be exposed on a daily basis over the course of a lifetime without an appreciable health risk. Based on this figure, the US FDA set the legal limit of melamine and melamine-related compounds in food products other than infant formula below 2.5 parts per million (ppm) do not raise concerns. The US FDA announced a 1 ppm standard for safe levels of melamine in infant formula. The Hong Kong Food and Health Bureau (FHB) set the legal limit of melamine at 1mg/kg for milk, any food intended to be consumed principally by children under the age of 36 months and any food intended to be consumed principally by pregnant or lactating women; and 2.5mg/kg for other food(WHO, 2008c).

Taiwan suspended imports of all mainland Chinese milk products, and recall all the problem foods on Sep 22, 2008(Bloomberg, 2008). Sep 25, 2008 the DOH raised the legal standards for melamine in foods from zero ppm to 2.5ppm. DOH minister Lin Fang-yu resigned the next day under heavy criticism(Taiwan News, 2008). On Sep 27, Premier Liu Chao-shiuan and Lin's successor Yeh Ching-chuan both said that the authorities would use a "zero detection" method to replace the 2.5ppm standard(Taipei Times, 2008).

Milk powder, creamer, dairy products and vegetable protein concentrates were all banned from importing from Mainland on Sep 21, 2008. DOH lifted the import restrictions of dairy products and vegetable protein in June 2009, but remained inspection in batches and melamine should not be detected positive. Two groups of plant protein powder imported from Mainland were found to have melamine on Nov 19, 2009. According to Mainland Affairs Council's Report, Melamine adulteration in Mainland created panic among consumers and enormous losses for business operators in Taiwan (Mainland Affairs Council, 2008). In order to ease people's worries about tainted food, Taiwan's DOH needs to set up a food safety system to safeguard the people's health and welfare. The system should include setting food safety standards, establishing testing programs to ensure that those standards are met, conducting tests on milk and dairy products in the market; maintaining close liaison with the trade, overseas and Mainland authorities; monitoring any relevant findings and studies on melamine in food conducted locally or in overseas jurisdiction.

Considering the lower limits of detection, the DOH should go for the best available technology - the GC/MS or LC-MS/MS and not the HPLC. However, if people use extremely expensive testing methods, it would raise the price of products to a level that nobody could afford. How to utilize all kinds of resources to inspect thousands of dairy products efficiently is a critical issue. Therefore, it is an urgent problem to set up a reasonable inspection process which satisfies the needs of consumers, business operators and food manufacturers. The aim

of this article is to propose an efficient inspection procedure for melamine by using screening model which is well-known in solving quality problems.

LITERATURE REVIEW

1. Melamine and a Melamine-related Compound

Melamine (CAS No. 108-78-1), (Chemical Name: 1,3,5-Triazine-2,4,6-triamine**)**.

Melamine is used in the production of melamine resins, typically by reaction with formaldehyde. It has many industrial uses, including in the production of laminates, glues, adhesives, moulding compounds, coatings and flame retardants. Melamine was also found as a metabolite of the pesticide cyromazine in plants, goats, hens and rats. Melamine is also used in some fertilizers.

Outside the current food safety incident consumer exposure to melamine is considered to be low. Besides low levels of residues as consequence of cyromazine metabolism it may occur through the extraction of melamine from compression moulds by acidic foods, such as lemon or orange juice or curdled milk, at high temperature. Taking into account these sources the estimated oral uptake of melamine is around 0.007 mg melamine/kg body weight/day.

There are no approved uses for the direct addition of melamine to food (e.g. in the United States and Europe). Adulteration occurs, in part because commonly used methods for protein analysis cannot distinguish between nitrogen from protein sources and nitrogen from non-protein sources. This results in incorrectly high protein measurements for products containing non-protein nitrogen sources like melamine and provides an economic incentive for their (illegal) addition.

2. Methods for the Analysis of Melamine

There are several inspection methods available for the analysis of melamine and its analogues in food and feed, such as ELISA, HPLC, GC/MS, LC-MS/MS (WHO/HSE-FOS, 2008a, 2008b), they serve for different product inspections and have various detection and quantification limits, respectively.

2.1 ELISA is an enzyme-linked immunosorbent assay (ELISA) that determines a quantitative level of melamine and is intended for use in milk, milk powder, wheat gluten and pet food. Melamine is extracted from a sample by vortex or sonication, and the extract pipetted into the antibody-coated microwell. The quantity of melamine is determined via a colour reaction, and a microplate (or strip-) reader is required to measure the optical density. Test kits (i.e. coated microplates and reagents) are commercially available; they can prove very useful as screening tool. However care has to be taken with respect to sample preparation in order to avoid interferences. Also currently available test have reported detection limits that may not be sufficiently sensitive. Validated for various food matrices and sample preparation methods adapted to achieve lower detection and quantification limits are currently under development.

2.2 HPLC-UV can provide quantitative information (usually using UV at 240 nm). Samples are extracted with acetonitrile/water mix and analyzed by ion-pair HPLC. However, analyses of complex samples like candy and cookies will give a lot of interfering compounds that also will absorb UV at 240 nm. Therefore, development of an LC-UV requires intensive validation by a mass spectrometric based technique for each food matrix and may also require a selective sample preparation procedure. Often positive samples are validated by a second analysis. However, this is normally used to eliminate false positives, whereas false negatives will not be discovered. From the point of food safety it is more important to find the false negatives (thus samples that do contain melamine above the limit even though analyses show they are below).

2.3 GC-MS/MS is with LC-MS/MS amongst the most reliable methods for low level quantification of melamine in a variety of different sample matrices. It will deliver high sensitivity and selectivity for a broad range of different products. This approach is less sensible to matrix effect compared to LC-MS/MS. Samples are generally extracted with an acetonitrile/water mixture. The extract may then be cleaned up by liquid/liquid extraction followed when necessary by solid phase extraction SPE followed by a derivatization step. Isotope dilution approaches using isotopically labelled internal standards may provide more reliable quantification, but is not mandatory.

2.4 HPLC-MS/MS is with GC-MS/MS amongst the most reliable methods for low level quantification of melamine in a variety of different sample matrices. It will deliver high sensitivity and selectivity for a broad range of different products. Samples may be extracted with an acetonitrile/water mixture. The extract may then be cleaned up by liquid/liquid extraction followed when necessary by solid phase extraction SPE. Isotope dilution approach is strongly recommended to provide reliable quantification.

For HPLC-MS/MS, melamine is analyzed in the positive electrospray ionization mode; analogues are analyzed in the negative ionization mode. The different polarities required necessitate the use of polarity switching during one HPLC-MS/MS run and, thus, adequate analyze chromatographic separation or two different HPLC-MS/MS runs. Trimethylsilyl derivatives are produced for GC-MS/MS analysis of melamine and analogues. Analysis is performed in the electron impact ionization mode.

Table 1. Analytical techniques used for analysis of melamine and analogues in food and feed

Analytical technique	Selectivity	Sensitivity	Cost	Purpose	Remarks
ELISA	Low	Low	Low	Screening	Currently for detecting melamine only
HPLC-UV/DAD	Low	Low	Medium	Screening and confirmation	Preferred for screening of melamine and analogues; however, validation is required for confirmation
GC-MS /MS	High	High	Very high	Screening and confirmation at trace levels	Confirmatory method for melamine and analogues
LC-MS /MS	High	High	Very high	Screening and confirmation at trace levels	Confirmatory method for melamine and analogues

Note: DAD, diode array detection; ELISA, enzyme-linked immunosorbent assay; HPLC, high-performance liquid chromatography; LC, liquid chromatography; MS, mass spectrometry; MS/MS, tandem mass spectrometry; UV, ultraviolet.

3. Screening Model

Screening model was first developed to solve the employee selection problem (Taylor and Russell, 1939), and then was widely used in the area of quality management (Owen, McIntire, and Seymour, 1975; Tang, 1987; Moskowitz, Plante, and Tsai, 1991), credit scoring (Tsai and Yeh, 1999; Tsai, Thomas and Yeh, 2005), medical problems (Moskowitz, Plante, and Tsai, 1993) etc. Screening models with single-stage, double-stage, and multi-stage consider the inspection process, inspection error, inspection costs, selection rate, in order to achieve the best inspection determine baseline for optimizing the misclassification error, total costs, etc.

A double screening procedure was first established by Moskowitz and Tsai (1988). The scheme of a double screening procedure is as follow: two inspection stations are considered, a product is inspected at the first station by using an inspection method which is relatively easy to use, low cost, but may be less precise or accurate, and results in one decision out of accept, rejection, or undecided. The second station, by using a better but more expensive inspection method, is applied to those undecided products, and results in one decision out of accept or rejection.

The scheme of a double screening procedure can be stated in more details as follows: Suppose there are two screening variables X_1 and X_2 that can be used jointly to predict a performance variable Y which cannot be measured directly. Also assume that Y has a one-sided lower specification $-K_\gamma$. Thus, an item with a Y value above $-K_\gamma$ is conforming; Otherwise, it is nonconforming. Hence the individual nonconforming probability (INP) for an item with $X_1= x_1$ and $X_2=x_2$ is defined as INP=Prob $[Y<-K_\gamma|X_1= x_1, X_2=x_2]$. Note that if an item is accepted, then its INP can be interpreted as the individual misclassification probability (IME).

Furthermore, an average outgoing quality (AOQ) is defined as the proportion of nonconforming items among selected items, or as derived in Tsai and Moskowitz (1986), the average INP for those accepted items. A selection ratio (β) is defined as the proportion of selected (accepted) items. We also define emaxa and eminr to be the maximum INP for those accepted items and the minimum INP for those rejected items, respectively. Therefore, the INP for every accepted item is no more than emaxa at both inspection stations. Thus the overall AOQ will also be less than or equal to emaxa.

METHOD

Double Screening Procedure for Melamine Inspection

There are several inspection methods available for the screening and quantification of melamine in food such as ELISA, HPLC, GC/MS, LC-MS/MS (WHO/HSE-FOS, 2008a, 2008b), they are able to detect very low concentrations of melamine and its analogues in food products and have various inspection costs, inspection errors, detection limits, false positive and false-negative factors, easiness to use, respectively. In order to set up a double screening procedure for melamine inspection, two commonly used methods HPLC and LC-MS/MS are

adopted as first stage and second stage inspection methods, their detection limits are 2.5ppm and 0.05 ppm; inspection costs are R_1=NT1,500 and R_2=NT4,000, respectively.

Let Y denote the true value of melamine contained in food, since its measurement scale is based on ppm (10^{-6}), it is reasonable to assume that Y has a lognormal distribution, i.e., Z=lnY has a normal distribution. If Z=lnY~N(μ_z=0, σ_z^2=1.5), and the mean and variance of Y are $\mu_y = \exp(\mu_z + \sigma_z^2/2)$=3.08, $\sigma_y^2 = \exp(2\mu_z + \sigma_z^2)[\exp(\sigma_z^2) - 1]$=8.97, respectively. The measurement error model used in Moskowitz et al. (1993) is adopted here to develop our proposed double screening procedure for melamine inspection. Let's consider the following measurement error models: X_1=Z+e_1; X_2=Z+e_2, where
Y: the true value of melamine;
Z=lnY: the logarithm of true melamine value (Y) with lognormal distribution N(μ_z, σ_z^2);
e_1: the measurement error of HPLC with N̂(, σ_1^2);
X_1: the exponential value of observed melamine by HPLC with N(μ_z, σ_z^2 + σ_1^2);
e_2: the measurement error of LC-MS/MS N̂(, σ_2^2);
X_2: the exponential value of observed melamine by LC-MS/MS with N(μ_z, σ_z^2 + σ_2^2);
σ_1: the detection limit of HPLC, say ln(2.5ppm);
σ_2: the detection limit of LC-MS/MS, say ln(0.05ppm);
R_1: the inspection cost for HPLC;
R_2: the inspection cost for LC-MS/MS.
Assume that the true value of melamine (Y or Z) is independent of measurement error (e_i), then X_1 and Z has a bivariate normal distribution, and their correlation can be derived as $r(X_1, Y) = \frac{\mathrm{Cov}(X_1, Y)}{\sqrt{\mathrm{Var}(X_1)\mathrm{Var}(Y)}} = \frac{\mathrm{Var}(Y)}{\sqrt{[\mathrm{Var}(Y) + \mathrm{Var}(e_1)]\mathrm{Var}(Y)}} = (1 + \frac{\sigma_1^2}{\sigma_y^2})^{-1/2}$, similarly, X_2 and Z also has a bivariate normal distribution with the correlation $r(X_2, Y) = (1 + \sigma_2^2/\sigma_y^2)^{-1/2}$.

The scheme of a double screening procedure for melamine inspection is shown as in Figure 1. There are two inspection stages such that HPLC is arranged in the first stage and its exponential value of observed melamine is denoted by X_1, and LC-MS/MS is in the second stage and its exponential value of observed melamine is denoted by X_2; The decision rules for two stages are based on the principle of no positive reading for any inspection method, say, the product is rejected at the first stage if $X_1 > \sigma_1$, otherwise it goes to the second stage for inspection by LC-MS/MS; the product is rejected if $X_2 > \sigma_2$, otherwise it is accepted, where σ_1=ln(2.5ppm) and σ_2=ln(0.05ppm) are detection limits for HPLC and LC-MS/MS respectively.

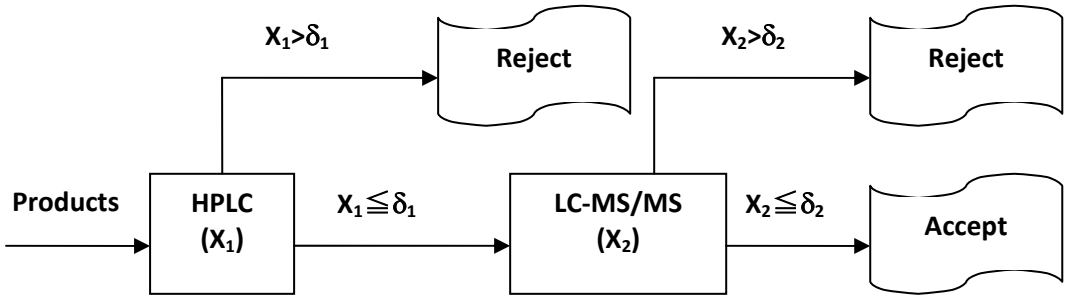

Figure 1: A Double Screening Procedure for Melamine Inspection.

A single screening procedure can be modified in Figure 1 such as the product is rejected if $X_1>\delta_1$, otherwise it is accepted. The average outgoing quality after single screening procedure (or the probability of misjudgment) is defined as the probability of Z exceeds the detection limit δ_1 for those accepted product such as $AOQ_1 = P[Z > \delta_2 \mid X_1 \le \delta_1]$, where the acceptance rate is $S_1 = P[X_1 \le \delta_1]$ The maximum individual misclassification error (max IME) occurs at $X_1=\delta_1$ such as $e\max_1 = P[Z > \delta_2 \mid X_1 = \delta_1]$. Similarly, the average outgoing quality after double screening procedure is defined as the probability of Y exceeds the detection limit δ_2 for those accepted product such as $AOQ_2 = P[Z > \delta_2 \mid X_1 \le \delta_1, X_2 \le \delta_2]$, where the acceptance rate is $S_2 = P[X_1 \le \delta_1, X_2 \le \delta_2]$. Similarly, The maximum individual misclassification error (max IME) occurs at $X_2=\delta_2$ such as $e\max_2 = P[Z > \delta_2 \mid X_2 = \delta_2]$Moreover, the expected per-item inspection cost for double screening procedure is defined as $R = R_1 + R_2 S_1$.

NUMERICAL EXAMPLES

In this section, three numerical examples are provided to show the corresponding results of the proposed double screening procedure for melamine inspection. The distributions of Z=lnY are assumed to be normal distributions with N(-0.5, 1.5^2), N(0, 1.5^2), N(0.5, 1.5^2) for comparison between three examples, all computations are based on the simulation data. The first example has more probability on the left tail (small amount of melamine) while the third example has more probability on the right tail (large amount of melamine). Since HPLC has less precision than LC-MS/MS, it is assumed the inspection errors have variances such as σ_1^2 $=1>\delta_2^2=0.2$. Clearly, AOQ1's are increasing while AOQ2's are decreasing from example 1 to example 3; and AOQ2 are much less than AOQ1 which verifies the efficiency of a double screening procedure than that of a single screening procedure. The third example has smaller expected per-item inspection cost since it rejects more items at the first stage, which demonstrates the efficiency of a double screening procedure than that of a single screening procedure.

Table 2. Three numerical examples of double screening procedure for melamine inspection.

Parameter	Example 1	Example 2	Example 3
$Z=\ln Y \sim N(\mu_z, \sigma_z^2)$	$N(-0.5, 1.5^2)$	$N(0, 1.5^2)$	$N(0.5, 1.5^2)$
$P[Z>\delta_2=0.05]$	0.96	0.98	0.98
$P[Z>\delta_1=2.5]$	0.17	0.28	0.40
$e_1 \sim \tilde{N}(0,\sigma_1^2)$	N(0, 1)	N(0, 1)	N(0, 1)
$e_2 \sim \tilde{N}(0,\sigma_2^2)$	N(0, 0.2)	N(0, 0.2)	N(0, 0.2)
$r(X_1, Y)$	0.829	0.838	0.838
$r(X_2, Y)$	0.991	0.99	0.992
$r(X_1, X_2)$	0.821	0.831	0.835
$S_1=P[X_1 \leqq \delta_1]$	0.79	0.7	0.6
$S_2=P[X_1 \leqq \delta_1, X_2 \leqq \delta_2]$	0.05	0.03	0.02
$AOQ_1 = P[Z > 0 \mid X_1 \leq \delta_1]$	0.946	0.968	0.972
$AOQ_2 = P[Z > \delta_2 \mid X_1 \leq \delta_1, X_2 \leq \delta_2]$	0.255	0.192	0.167
R (NT dollar)	1500+4000*0.79 =4700	1500+4000*0.7 =4300	1500+4000*0.6 =3900

CONCLUSION

The Melamine found in contaminated milk products from Mainland had drawn worldwide attention. In this article an efficient procedure for melamine inspection was proposed by using the well-known screening model, in which two commonly used inspection methods for melamine are appropriately arranged into the scheme of a double screening procedure and the decision rules are based on no positive reading. Since all inspection methods involve some degree of measurement error, a measurement error model was adopted to evaluate the probability of misjudgment and the expected per-item inspection cost. The results show that a double screening procedure is better than a single screening procedure in terms of probability of misjudgment and the expected per-item inspection cost. Besides, the inspection error of a method is a key factor to the probability of misjudgment, therefore, the future research might consider to increase the number of measurement of a certain method to reduce the variance of its error.

ABSTRACT

This paper investigates the role of assembly operations and product structure in Cellular Manufacturing System (CMS) design. With respect to the common definition of CMS, the cell formation problem (CFP) is identifying of part families and machine cells so that every part type ideally can be produced only in an individual cell. A new definition of CFP can be presented when the assembly details are considered. Therefore, the main purpose of this research is to show the importance of integrating assembly operations and product structure with the machining operations to forming manufacturing cells. Finally, some different examples from the literature are considered and the related results are compared to validate the proposed issue.

Keywords: Group Technology, Cellular Manufacturing System, Cell Formation, Assembly Operations, Product Structure

I. INTRODUCTION

The traditional manufacturing systems including Flow shop and Job shop (i.e. process layouts) is selected when there are a few product types with large annual product demand and or many product types with low annual demand in manufacturing environment, respectively. However, today's industrial environments are met with enormous changes in product configuration and demand, severe competition, increase in variety and reduction in product life cycle. In the other hand, manufacturers tend to improve quality of their products while reducing the cost and delivery time in order to gain competitive advantages in contrast to rivals. Therefore, the companies have been compelled to use more effective strategies and approaches in procurement, production, and distribution.

Group Technology (GT) is a management philosophy in manufacturing that has been applied due to its positive effects in batch production as a successful alternative in order that overcoming disadvantages of current systems in response to above-mentioned requirements. The purpose of GT is to determine and divide the parts into families by taking advantage of their similarities and the processes required to produce them. These similarities may be based on shape, on production process or both. Parts that share similar shapes or processing requirements (or both) are grouped into families.

Cellular Manufacturing System (CMS) is one of the most applications of GT for designing of the manufacturing system that produces the families of similar parts within cells each of which is a cluster of dissimilar machines. From standpoint of the organization related to CMS which is known as Cellular Layout, this layout is a combination of two above mentioned systems; process layout (i.e. job shop) and product layout (i.e. flow shop).

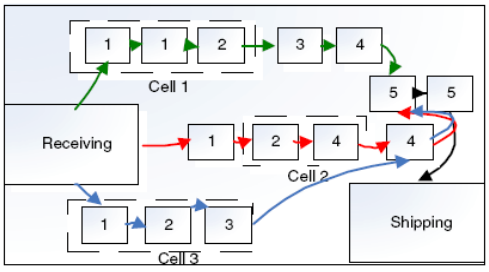

Fig. 1: Cellular Manufacturing System [1]

With respect to the common definition of CMS, the *Cell Formation Problem* (CFP) is how to group similar parts in *Part Families* (PFs) and their associated machines in *Machine Cells* (MCs) so that every part type ideally can be produced only in an individual cell.

II. LITERATURE REVIEW AND CONTEXT DESCRIPTION

So far, many studies have been carried out on CMS design, each of which has taken account of different objectives, constraints and production parameters. Pertaining to this subject, Tavakkoli-Moghaddam et al. [2] have developed a nonlinear integer model of CFP in dynamic condition and solved by using some traditional metaheuristic methods such as

Genetic Algorithm (GA), Simulated Annealing (SA) and Tabu Search (TS). Caux et al. [3] has been addressed the problem of manufacturing cell formation to minimize the inter-cell traffic with alternative process plans and machine capacity constraints. Their method permits to solve simultaneously the cell formation problem and the part-routing assignment problem whereas other methods are based on two heuristics or algorithms: one of the two problems is then solved from the solutions of the second one. Hu and Yasuda [4] have considered cell formation problem with alternative processing routes that the number of manufacturing cells is not known in advance. Defersha and Chen [5] have proposed a mathematical programming model following an integrated approach for cell configuration and lot sizing in a dynamic manufacturing environment. The model development also considers the impact of lot sizes on product quality. Solution of the mathematical model is to minimize both production and quality related costs.

In a comparative manner, the researches in literature on CMS could be considered at two sections which are described in the following of this paper.

2.1. CMS with just machining operations

Regarding to the common definition of CMS design, as previously mentioned, the issue of cell formation has been addressed when converting from job shop to the CMS. In this case, a number of researchers have compared job shop to cellular manufacturing and have generally concluded that the benefits derived from CMS are the reductions in set-up time, increased throughput, higher productivity, more efficient materials handling, reduced raw material, reduction of work-in-process (WIP) inventories, shorter lead times as well as the improvement of quality and better worker satisfaction ([6]- [19]).

However, several studies have mentioned that the implementation of CM does not always lead to performance improvements and there is likely to be some difference between the advantages predicted by various models and the advantages obtained in practice. For example, Flynn and Jacobs, 1987 [6]; Morris and Tersine, 1990 [9]; Kannan and Ghosh, 1996 [16]; Shambu and Suresh, 2000 [19] have reported that CM performs better than job shop only when set-up times are high and demand is stable. In the other hand, Flynn and Jacobs, 1987 [6], Wemmerlov and Hyer, 1989 [8] and Suresh ,1992 [20] state that a well organized and operated job shop produces better flow times and less work-in-process inventories than cellular manufacturing. Johnson and Wemmerlov, 1996 [21] conducted a meta-analysis of 31 model-based studies that compared the performance of functional and cellular layouts under a variety of operating conditions. Shafer and Charnes, 1997 [22] and Johnson and Wemmerlov, 1998 [23] also used modeling in their comparative studies of functional versus cellular layouts.

2.2. CMS with both machining and assembly operations

2.2.1. The role of assembly in manufacturing

In the realistic manufacturing environments, such as electronics and automobile

manufacturing companies, many of products are composed from at least two components. It is maybe because of increased market demand for customization; shorter product life cycles and short product delivery lead times, by which the downstream manufacturers can quickly assemble and deliver small batches of customized products. For example, a plant can package the knocked-down parts or subassemblies and they are shipped to other automobile assembly plants usually in foreign countries and assembled there.

In this situation, the assembly operations are required to be performed in a specific order for making the final products. In other words, a group of parts constitute a subassembly and a group of subassemblies constitute a higher level subassembly and so on. The order of assembly operations can be represented as an in-tree structure (as shown in Fig. 2).

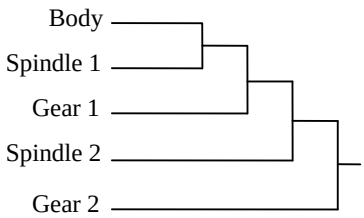

Fig. 2: An example of assembly tree [24]

There are two types of assembly features classified according to the operation flow of component parts. One type is the well-known serial assembly line where a main sub-assembly is transferred from machine to machine by material handling devices and assembled with smaller components. This type can be considered similarly to the flow shop system in whole production environment. The other type is called ‘‘fixed assembly’’ where components are first machined in their own fabrication machines in the pre-assembly stage and then pulled together to be assembled into a final product at a main assembly station. For example, In a fire engine assembly plant, the body and chassis which are the components of a fire engine are produced independently in two different departments and then brought into the assembly station, whereas the engine is purchased from outside. When the body and chassis are completed and the engine is received, they are fed to an assembly line where the fire engine is assembled [25].

2.2.2. Assembly Cells

There are a few number of studies proceeding to CMS when assembly operations exist in the manufacturing environment. Herein, the *Group Assembly* (GA) can be considered as a part of GT based on Burbidge’s [26] concept of Assembly Groups. The *Cellular Assembly* (CA) also is known as an application of GA and a part of CMS. In this case, some researchers (e.g. Levin, 1994 [27]; Feare, 1995 [28]; Bukchin et al. 1997 [29]) have discussed the problems with assembly lines and performance improvements resulting from the conversion of them to Assembly Cells. Assembly cells are formed by creating teams of workers with each team responsible for a specific set of assembly tasks. Workers in the cellular systems are capable of helping their co-workers in the same cell. Such a team approach to product assembly is considerably different from the conventional assembly line approach where a

serial, production system with each worker having individual responsibility for a specific task is usually the norm [30]. The application of assembly cells have been reported in some European companies such as Phillips, Olivetti and Volvo [26], and especially adopting it in Sony highlights the advantages of such cellular layouts over traditional assembly line layouts [31]. McGraw [32] also has described a scenario at Compaq where the cells show an improvement in productivity and quality by as much as 25%.

It must be mentioned that the performance improvement resulting from conversion of an assembly line to assembly cells and the factors which influence these improvements are different than the tradeoffs to be investigated when a functional layout is converted to cells. Therefore, some studies have discussed them to provide the guidelines for best selection. In the research by Gravel et al., 2000 [33], an interactive tool is presented to design manufacturing cells for an assembly shop. The method is based on an analysis of operation sequences and durations and allows machine-sharing among cells and with the non-cellular portion of the shop. They have sought to look at the internal structure of products in order to design one or more cells containing just a few machines that could be used to make portions of more than one product. They have showed that a cellular configuration is not always desirable, and discuss the conditions where this is so. Sengupta and Jacobs, 1998 [34] have stated that the cellular systems outperform an unpaced assembly line when teamwork is efficient and task time variances and setup times are high. In contrast, the assembly line outperforms the cells when task time variances and setup times are low and/or when teamwork in the cells causes an increase in assembly task time. In addition, their next working paper in 2004 [30] has tried to answer to the question that if assembly cells are superior to assembly lines, why have these systems not been adopted more extensively in practice? Thus, they examines two configurations of assembly cells, and compares their performance with that of a conventional assembly line in a controlled environment to understand the effects of the different factors in order to see which type of system is really superior to the other. Johnson, 2005 [35] added to the literature in this area by examining the planned (proposed) conversion of a multi-model assembly line to a set of parallel assembly cells in a real plant. The actual assembly line and the proposed assembly cells are described and the reasons for the expected performance improvements in cycle time and batch throughput time are analyzed using simulation based modeling. These results are used to generate insights about environments where conversions from assembly lines to assembly cells are likely to generate improvements in these metrics and the factors to consider when contemplating such conversions.

2.2.3. Focusing concept

In the other hand, regarding to the problems associated with the application of GT, the Focusing Technology (FT) philosophy has been proposed in which the parts that belong to a product (or a product line) are grouped into a part-family and this family is processed in a focused cell. Focused Cellular Manufacturing (FCM) is the application of the FT concept where components are grouped by end-items (or finished products) and form a group of machines or processes of functionally dissimilar types physically placed together and dedicated to the production (and to the assembly) of all parts of a finished product. In fact, the FT is the means for achieving Skinner's recommendations. Skinner, 1974 [36] suggested

that factories can be more focused. He explained that this should be done by grouping various products and resources into several manufacturing units with each unit focusing on a limited, concise, and manageable set of products, technologies, volume and markets. Skinner states that if it is not possible to focus the whole factory, one should adopt the 'plant within a plant' (PWP) notion. PWP is achieved by dividing the existing facility into organizationally and physically separated sections. As truly mentioned by Wemmerlov and Hyer, 1987 [37], FT concept is not a 'pure' group technology, and similarly FCM is not classified as cellular manufacturing since it does not attempt to take advantage of process similarities in order to reduce set-up times. FCM also is not classified as a flow shop since there are no machines dedicated to individual operations and the machines utilized are not arranged in a series [38].

Similarly to before sections, there is a need to develop a set of guidelines which help manufacturers for best selection. Therefore Al-Mubarak et al. 2003a [38] compared a well designed and operated JS layout to FCM layout. They have conducted experiments assuming that the firm being modeled has specialized resources and expertise by either similarity in process or by product line and concluded that FCM had shorter assemble waiting times whereas the job shop had better balance among machine utilizations. Al-Mubarak et al. 2003b [39] provided a comparison of FCM to CM, and concluded that products were completed in less time and average WIP inventory levels were less in FCM, and CM had less set-up time when batch sizes were small and set-up times were large. In the research by Canel et al. 2005 [40], three manufacturing systems: focused cellular manufacturing (FCM), cellular manufacturing (CM), and the traditional job shop (JS) have been compared and evaluated. All three systems are modeled using the same shop characteristics. The objective of their study is to provide a set of recommendations to assist manufacturing managers in how to organize production in their manufacturing shops. These recommendations should help managers in designing their production cells based on either traditional JS concept or GT concept or FT concept. The manufacturer's choice of a JS, GT or FT concept as a basis for designing production cells is an important strategic decision. A choice of one when the other is more appropriate might result in a very expensive mistake that would adversely affect the competitive position sought by a company.

III. INCORPORATING THE ASSEMBLY DETAILS IN MODELING THE CMS DESGIN PROBLEM

All of the aforementioned researches in the literature on CMS design with both machining and assembly operations didn't have consider assembly details integrating with machining operations in modeling the manufacturing cells formation. However, as mentioned by Vakaharia and Kaku [41], and Albino and Garavelli [42], one of the claimed disadvantages of CM is that end-item markets may grow at different rates, resulting in load imbalances. This is because the common studies of CMS design assume that each part is a final product and don't consider the structure of end-items whereas the individual parts gained by only machining operations differ from items which they are assembled. In the other hand, a family in CMS is typically composed of parts that belong to different finished products.

However, at the first time Panchalavarapu and Chankong [43] considered assembly aspects to model the CFP and presented a new definition of this problem as "identifying

machine cells, part families and a combination of subassemblies so that once the part families are completely processed within a cell, they are also assembled within the cell. The managers of individual cells are now responsible for producing finished subassemblies instead of part families…. The goal of the cellular system design should be to minimize overall material flow resulting in the system due to processing and assembly of parts". For this purpose, they proposed a mathematical model to determine assignment of parts, machines, and subassemblies to manufacturing cells. Their proposed model employs a similarity between part, machine, and subassembly using the part-machine incidence matrix derived from the part routing information, and part-subassembly incidence matrix derived from the product structure. They have analyzed a case study to evaluate the implications of the proposed model. As indicated in Fig. 3, the number of exceptional elements (EEs) due to assembly is significantly higher compared to the integrated model. In the other hand, Fig. 5 indicates clearly the total number of EEs is significantly higher for all the alternative designs evaluated with GT considerations alone without regard to assembly considerations. The results of the case study indicate that a cellular system design with a mix of GT and integration efficiency should increase the productivity of the system compared to a design which emphasizes on GT considerations.

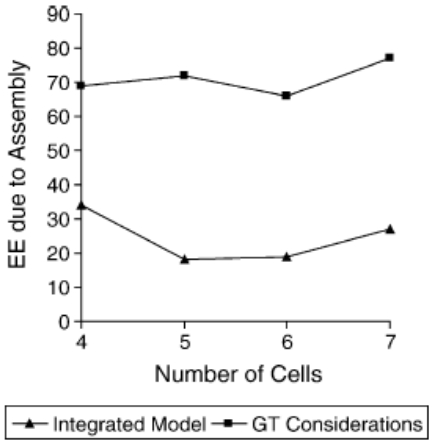

Fig. 3. EE due to assembly for various configurations [43]

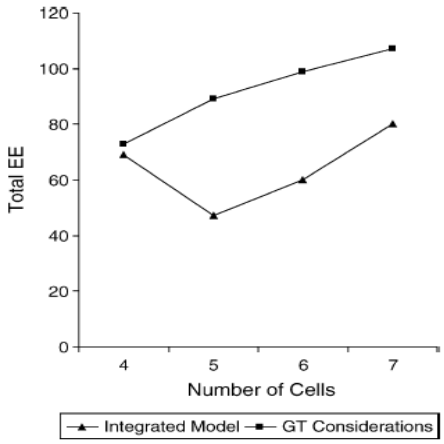

Fig. 4. Total EE for various configurations [43]

It is important that in contrast to what is mentioned by Canel et al. [40], the using of assembly cells and or focused cells for a few end-items would not be always more practical than installing the many required cells for a CM layout. If Similarly to the study by Panchalavarapu and Chankong [43], the whole makeable items are divided into two types: *individual parts* (which contain only the machining consecutive operations and their role is always child) and *assembly items* (such as final product which are composed from a number of components and don't have machining operations), an area can be considered for assembly operations, and all of the individual parts after completion are transferred into assembly area to make the subassemblies and final product. Thus, the planning and controlling process of manufacturing system (without considering movement cost) is done easier. However, if the assembly items contain the machining consecutive operations, separating the assembly area from other machine cells is not justifiable. It must be noticed that the production volume of

lower level components is related to the demand of final product and so the production volume of higher level components. As a result, the place of assembly operations and the role of parent/child relationships influence on material handling, planning, and controlling; thus they must be integrated with machining operations for designing CMS. Therefore, integrating assembly details with machining operations in modeling the cellular manufacturing design will obtain a variety of benefits such as reduction of work-in-process inventories between production of parts and assembly of the finished product, increase of output of the manufacturing system, easier production management, and etc.

According to the above issues and also in order that rectifying the drawbacks of previous researches in the literature, Aryanezhad and Aliabadi [44] developed a nonlinear model to integrate the assembly operations and product structure to the CFP. The proposed model dedicates machining and assembly operations to manufacturing cells so that minimizing the intercellular movements resulting due to both them. For solving aforementioned model, a linearization method is applied and then the computational results from solving different examples on literature for each situation (with and without assembly consideration) are compared and analyzed together. The obtained analytical outcomes show the importance of integrating assembly details in CMS design:

TABLE I
COMPARISON OF COMPUTATIONAL RESULTS OF INTERCELLULAR MOVEMENTS IN TWO SITUATIONS [44]

Problem #	without integrating assembly details		with assembly consideration	
	due to processing	due to assembly	due to processing	due to assembly
1	0	7	0	7
2	51	8	51	4
3	165	15	165	7
4	325	12	325	9
5	0	8	2	4
6	2226	20	2226	20
7	520	32	520	29
8	3724	22	3724	22

As indicated in above table, the number of intercellular movements resulting due to the processing is identical for both situations. It is because of considering the demand of final product and accordingly the production volume of its components which are bigger than the counts of each given child in child/parent relationships. But in all the test problems, the number of intercellular movements resulting in situation with assembly consideration is equal or less than the other situation.

IV. CONCLUSIONS

This paper investigates the incorporating of assembly operations and product structure in CMS design for forming manufacturing cells. It have been shown that the assembly operations and product structure should be integrated with machining operations in CMS design to obtain a variety of benefits such as reduction of work-in-process inventories between production of parts and assembly of the finished product, increase of output of the manufacturing system, easier production management, and so on. For this purpose, some different examples from the literature are considered and the related results are compared.

Abstract—In recent years, vehicle communications technologies and wireless networking technology are continuous development, when we use wireless communications to exchange information data, traffic will be more secure and convenient than that of the past.We describe the problem that characterizes the privacy of VANETs and proposes a new anonymous key mechanism with a system architecture based on bilinear paring and elliptic curve cryptography which adapts to VANETs. We will make a comparison of this research with other papers to illustrate the advantages of our idea. We have also a computation list to study the required operations. We can believe that the idea will be more secure and efficient to the past published papers.

Keywords: VANETs; security; privacy; identity-based; cryptosystem; bilinear pairing

INTRODUCTION

Telematics is a combination of Telecommunication and information, primarily application vehicle ad hoc network, rapidly developed in recent years and has become the focus of considerable attention as one of the market. Telematics is based on Dedicated Short Range Communication (DSRC)-based, use to build vehicles to vehicles and vehicles to roadside [1, 19]. The international there are many organizations in the development of standards set Telematics. Among them, the United States Vehicle Infrastructure Integration (VII) program based on IEEE 802.11p and IEEE 1609 Wireless Access in the Vehicular Environment (WAVE) / DSRC technology, the most attention [20].

In addition to the network layer below set telematics standard protocol, Society of Automotive Engineers (SAE) has also set up a DSRC Technical Committee, the purpose for the development of the DSRC communications developed on the basis V-2-V and V-2-I application layer protocol of the technical specifications [3].

VANET and MANET characteristics of high homogeneity, VANET is decentralized, with the formation of self-organization and multi-hop transmission capacity of the nodes in mobile network environment.

[*] Correspondence: changher@mail.cgu.edu.tw

Telematics related applications primarily through wireless communication technologies to reach, therefore, the wireless communication of information on the security issues will also be hidden on Telematics, for example, applications of Telematics always regard to information of position system as reference of a routing transfer protocol or generate personal privacy issues [3]. When the traffic information, emergency messages and traffic accident messages happened, it is a major influence to that message. If a malicious attack by spreading false information or tamper information, that attacker can affect the timeliness of incident handling. As the Telematics related industries have not fully developed, security mechanism was not perfect, it is necessary to design a mechanism to protect the transmission of packet content, to establish a messaging security and privacy protection [2].

In 2007, Li and Hwang [5] proposed under the framework of V-2-V and V-2-I, using blind signature technology to protected personal privacy. Papadimitratos and Buttya [15] proposed using Cross-Certification to vehicle registered mechanism. In 2008, M.Raya and J.Freudiger [10] several scholars proposed to send each other messages, using anonymous key pairs to protect personal privacy. [5, 15, 10] This research using crossing research certification and anonymous key pairs to the use for ITS so this give me a lot of idea to comprise this draft. They do not provide protocols. So, we proposed an identity-based encryption, Communication between the parties to anonymously send messages, and achieve to access that mutual authentication mechanism. The method can prevent a malicious attacker to message interception and tampering, and privacy protection.

RELATE WORKS

Identity-based cryptosystem

In order to simplify the traditional public-key cryptography key management issues problem. In 1984, Shamir [4] proposed Identity-Based Cryptosystem (IBC) concept. The characteristic is that sender can just use receiver's identity like e-mail, IP address, or number to encrypt the message, the private key generated by a key generation center (KGC) is to issue. In 2001, Boneh and Franklin [6] proposed bilinear pairings of ellipse curves as a mathematical tool, designed the first practical IBC system. In 2002, Paterson [8] proposed Identity-Based Signature scheme that was based on the bilinear pairings property of ellipse curve.

On the elliptic curve cryptography, Weil pairing feature has many applications, such as IBC schemes, digital signature schemes and Key Distribution are available to achieve the weil pairing. Weil pairing mainly is an algebra non-degenerate bilinear pairings of the basis. So, we will start with some brief non-degenerate bilinear pairing features.

VANETs security application requirement analysis

In 2004, Jeremy Blum and Azim Eskandarian [18] describe security architecture for vehicular communications intended mainly to counter the so-called "intelligent collisions" (meaning that they are intentionally caused) by using an infrastructure of digital signatures. But this is only one type of attacks and building the security architecture requires awareness of as many potential threats as possible.

In 2005, Dotzer [7] on the possible applications for the VANETs gave a rough description, mainly based on safety features to distinguish between the message, be divided into "security service", like traffic information, emergency incidents and response, traffic accidents and other related information, and "non-security services", like entertainment-related, multimedia file transfers with the special needs of the user's personal. Plobl et al [14] to use messages transmitted on the model of the VANETs application for classification, mainly divided into three categories: 1. Telematics message and Warnings, refers to the drivers, by "taking the initiative to pass a regular way" or "passive even-triggered approach" to convey relevant information, to inform other drivers traffic and road accidents. 2. From the police cars, ambulances or fire engines, and other special vehicle used in emergency disaster relief, the issue of the Alarm signals. 3. Addition value-added services, like vehicle guidance service, internet access services and other related applications.

In 2004, Hubaux et al [16] describe the certified identity that a vehicle provides via a wireless link an *electronic license plate*. The protocols that use such license plates can be designed in different ways. An event data recorder (EDR), inspired by the "black boxes" found on airplanes (EDR record all major data from the vehicle for crash reconstruction).

VANETs security privacy requirement analysis

Raya ea al [13, 12] VANETs security threats on the divided into three categories: may lead to disasters and life threat "Attacks on safety-related application", may lead to financial fraud and wireless communications confidential information on stolen "Attacks on payment-based application". At the same time, the road safety message in accordance with their privacy and timeliness are divided into three categories: traffic information (such as traffic flow and traffic jam conditions), a general safety message (such as driving and collision avoidance of information) and attribution of responsibility message (such as traffic accident-relation information, available to law enforcement agencies for reference).

In 2005, Raya and Hubaux [12] describe vehicular networks will be the largest real-life instance of self-organized ad hoc networks. Its size will be in millions of nodes, distributed among different authorities and services providers.

In 2008, Klaus plob1 and Hannes Federrath [17] propose a security infrastructure that uses asymmetric as well as symmetric cryptography and tamper resistant hardware.

After a once-only initialization it employs asymmetric cryptography within a public key infrastructure for messages influencing road safety. But the generation scheme of certificate and anonymous key pairs cannot be described explicitly and apply the process of registration, cannot prevent inside attack. The components of the scheme include tamper-proof devices (TPD_s), digital signatures, public key infrastructure (PKI), tamper resistant hardware (TRH) and anonymous key pairs. However, there are still some key management issues, such as anonymous key pairs update problem.

VANETs security protection architecture

Zhou et al [9] proposed construction of a specific threshold value of the distributed PKI encryption technology distributed architecture. Most of nodes need to cooperate and send the certificate in this protocol, then VANETs high-speed characteristics, and can not guarantee that a certain number of participants. Zarki et al [11] proposed a highway on the VANET infrastructure, suppose the most vehicles will be equipped with GPS devices in future, be able to provide the correct location, in the communication between vehicles will be widespread use of short-range ad hoc network technology.

In wireless network environment, Zariki [11] proposed public key digital signatures are not particularly useful without a certification infrastructure. There are some recent and promising results in cryptography that obviate the need to public key certificates. So we will use IBE system [6] is an elegant method of obtaining public key cryptography without any certificates: in it, an entity's public key is derived from a unique identity string, e.g., an email address or X.500 distinguished name.

SECURE ANONYMOUS KEY MECHANISM

In the proposed mechanism, there are four sub mechanisms: the system initiation mechanism, the electronic plate generating mechanism, the anonymous key pair generating mechanism, the application finish mechanism for VANETs. Table 3.1 shows the mechanism symbols.

- System security requirements:

1. The communication mechanism can achieve data confidentiality, data integrity, non-repudiation, and authentication.
2. The anonymous key pairs can used to secure communication in VANETs.
3. The secure anonymous broadcast mechanism can avoid that attacker tampering and intercept of message content.

Table 3.1 shows the mechanism symbols.

Symbol	Definition
ELP	A vehicle electronic license plate.
G_1	An additive group of prime order q.
G_2	A multiplicative group of the same order q.
$\hat{e}$	Weil pairing function can make $G_1 \times G_1 \to G_2$.
H_1, H_2, H_3, H_4	Hash functions.
K	Secret key of the KGC, $K \in Z_q^*$.
P	Generator of G_1.
PU_K	Public key of the KGC, $PU_K = K \cdot P$.
PU_M, PR_M	Key pairs of the MVO.
PU_K, PR_K	Key pairs of the KGC.
PU_P, PR_P	Key pairs of the Vehicle manufacture
LA	License plate application.
RID	Any one of the applicant's real identities.
RIN	A number to record which real identity is the $HMAC$ key.
AC	Area code of the MVO.
$m_1 \sim m_7$	Temporally combination messages.
$E_1 \sim E_6$	Temporally ciphertexts.
$HMAC()$	A hash-based MAC function.
$EMAC$	HMAC value of the ELP

System initiation mechanism

Figure1. Shows the system members and illustrates the system initiation steps. The KGC is a trusted third party. The LEA such as polices can trace the real identity that corresponds to the anonymity legally. The motor vehicle office (MVO) is a local vehicle management authority that is subordinate to monitor transportation. The private services provider (SP) which belongs to personal enterprise can provide application services in VANETs. The electronic board is a public place that drivers can get the necessary parameters or information from it.

The system initiation steps as follows: Step1. The KGC chooses private key K and generates public key PU_K. Step2. The KGC generates public keys (identities) for members. Step3. The members choose their secret key by themselves, and then generate their private keys. Step4. The KGC and system members put public system parameters with related information on the electronic board. Step5. The KGC makes a signature for whole information on the electronic board. The public system parameter include $\{G_1, G_2, \hat{e}, P, PU_K, PU_M, PU_L, PU_P, S_M \cdot P, S_L \cdot P, S_P \cdot P, H_1, H_2, H_3, H_4\}$. Figure 3.2 shows the system members and illustrates the system initiation steps. First, we describe these members. The KGC is a trusted third party. It is mainly used to generate public key and private key. The LEA such as police, it can trace the real identity from anonymity drivers. The MVO such as supervision station, it can generate electronic plate. The vehicle manufacture (VM) which belongs to personal enterprise, it can

provide drivers of vehicles certificate. The electronic board is a public place that drivers can get the necessary parameters or information.

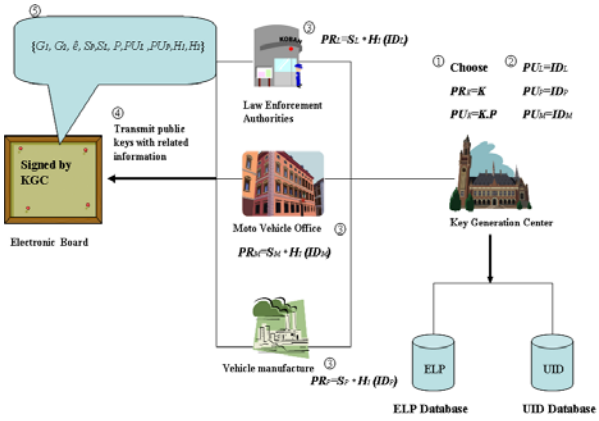

Figure 3.2 System initiation mechanisms

Now we describe the system initiation steps as follows：

1. The KGC chooses private key *K* and generates public key PU_k.
2. The KGC generates public key for numbers.
3. The members choose that their secret key and generates private keys.
4. The KGC and system members put public system parameters with related information on the electronic board.
5. The KGC makes a signature for whole information on the electronic board.
   The public system parameters include {*G1, G2, ê, SP, SL, P, PUL, PUP, PUM,* H_1*, and* H_2*}*.

Anonymous key pair application mechanism

Figure 3.3 illustrates from the vehicle manufacturers to produce electronic plates. Now we describe the steps in this phase as follows:

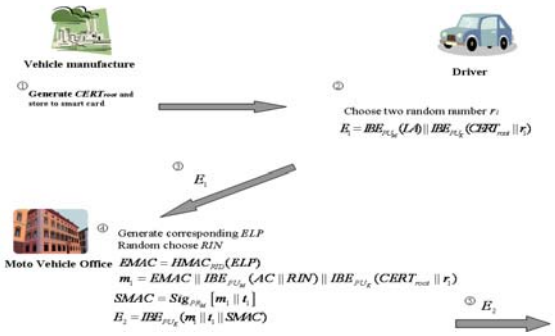

Figure 3.3 electronic plate generate

Step 1：The vehicle manufacture for each car generate ownership certificate ($CERT_{root}$) and stored in smart card. The ownership certificate record the driver information about of the vehicle purchase, for example, purchase car date, vehicle provider proves of car, the driver's signature and vehicle plate. Provide KGC generate anonymous authentication key pair and stored in smart card. Figure 3-7 ownership certificate format content.

Step 2：After the drivers get the car, and then check the $CERT_{root}$ and will their own license plates and title transfer to the MVO produces electronic number plates. Before sends the application (*LA*), driver chooses one random number (*r1*). The random number *r1* is a secret key that only knew by the KGC and the applicant, because the applicant encrypts *r1* with the public key of the KGC (IBE_{puk} ($CERT_{root}$ ||*r1*)).

Step 3：The applicant send a ciphertext (*E1*) to the MVO.

Step 4：The MVO decrypts *E1*= IDE_{PUm} *(LA||t1)* with its private key (*PRM*), and it verify driver's license plate and generates a unique electronic plate (*ELP*), then transfer to KGC generate anonymous key pair. First, the MVO uses any one of the driver's real identities as an encryption key of *HMAC* function to blind the *ELP* (*EMAC* = $HMAC_{RID}$ *(ELP)*). This operation is to make sure that the KGC cannot know the correct *ELP*, but the KGC can have a material to generate anonymous key pairs. The MVO use RIN record driver's identity, and use AC to record drivers license in which area electronic applications. Table 3-2 shows an example of *RIN*. The MVO encrypts them with its public key *PUm* (IBE_{pum} *(AC || RIN))*, RIN and AC are used in anonymity trace mechanisms. And then send to database of KGC to storage.

Step 5：The applicant sent a ciphertext (*E2*) to the KGC.

Anonymous key generate

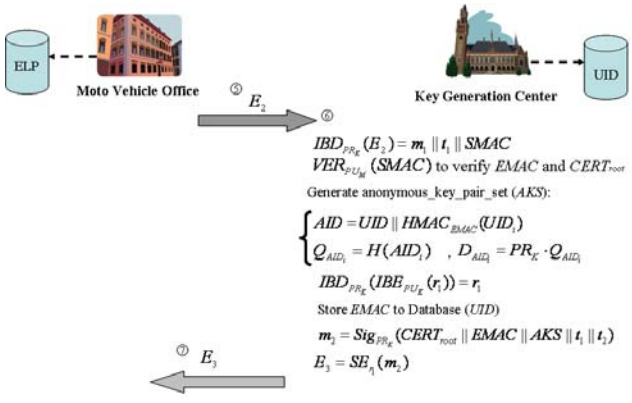

Figure 3.4 generate anonymous key pair phase

Figure 3.4 illustrates the KGC will generate anonymous key pair for driver. Now we describe the steps in this phase as follows:

Step 6：After the KGC decrypt ciphertext *E2*, verify electronic plate and $CERT_{root}$ then to generate an anonymous key pair for driver. The KGC choose a set of driver identities (*UID*) from database and the KGC lets *EMAC* to *HMAC* to be the *EMAC* key. The anonymous identity (*AID*) is *AID = UID || HMACEMAC* (UID_i), so the KGC can generate a set anonymous key pair (*AKS*) by using the scheme. Before transfer message *m2*, the KGC makes a signature for $(Sig_{PRk}\ (CERT_{root}\ ||AKS\ ||\ t1\ ||\ t2))$ with timestamps. Before transmits the ciphertext *E3*, the KGC encrypts it with the secret key *r1*.

Step 7：The ciphertext (*E3*) sent to the driver.

Application fish

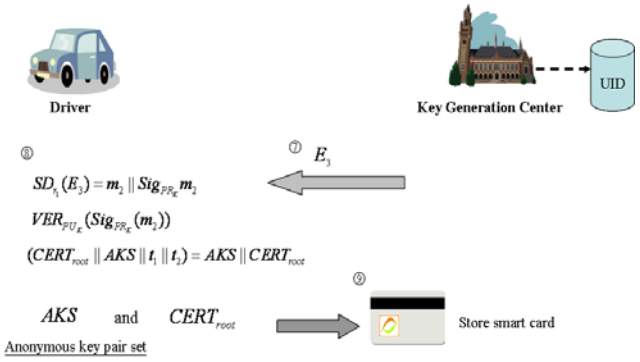

Figure 3.5 application finish phase

Figure 3.5 illustrates anonymous key pair application finish. Now we describe the steps in this phase as follows:

Step 8： the driver decrypts ciphertext for SD_{r1} $(E3) = m2 \| Sig_{PRk}\ m2$, and verifies the message *m2* by checking the signature $(SigPRk\ (CERT_{root}\ ||AKS\ ||\ t1\ ||\ t2))$, then the driver get the *AKS*, *CERTroot*.

Step 9：The driver can put the *AKS* and $CERT_{root}$ store into a smart card.

SECURITY ANALYSIS

We will analyze some security properties of our scheme in order to provide us with a proof of security. We analyze security of the communication with anonymous key management.

Lemma 1 Anonymity

Proof: Driver can random choose an anonymous key pair from the AKS to make a signature for message before message transmit every time.

Lemma 2 Anonymity enforceability

Proof: The AKS are generated by KGC. The generation such as *EMAC*, *RID*, PR_k, and $CERT_{root}$ are provided secretly. Even someone must use unique $CERT_{root}$ to generate the *AKS* by the KGC. It is illegality can be verified by $CERT_{root}$ and public parameters.

Lemma 3 Authentication

Proof: Before the MVO, the KGC, and the Vehicle manufacture transmit messages each other, sender must make a signature for messages by using *Sig ()* function with private key. Receptor make a verified for messages by using *Ver ( )* function with public key. This is in order to achieve the authentication of the information.

Lemma 4 Confidentiality

Proof: Before the MVO, the KGC, and the Vehicle manufacture transmit messages each other, ender must make encrypt for messages by using *IBE ( )* function with public key. Receptor make a verified for messages by using *IDE ( )* function with private key. This is in order to achieve the confidentiality of the information.

Lemma 5 Insider attack avoid

Proof: The vehicle ownership is managed by vehicle manufacture, real identities are managed by the MVO, and anonymities key pair is managed by the KGC. The MVO blind the ELP to generate *EMAC* by *EMAC( )*, and the KGC can not know the ELP content. After the KGC verify the vehicle ownership certificate, then to generate anonymous key pair. So the MVO can not know the anonymous key pair content. The KGC use $CERT_{root}$ to get the applicant's vehicle ownership information. But it can not know the applicant identities content by $CERT_{root}$. So the insider attacker can not match applicant real identities with anonymities.

Lemma 6 Replay attack avoid

Proof: In the proposed scheme, before the message transfer, we use timestamps to prevent replay attack. The system can use timestamps to check the transmission time of the message.

Lemma 7 Non-repudiation

Proof: Before the broadcast message, must be signatures to messages to prove that the sender is legitimate anonymous identity. So it can ensure non-repudiation of messages.

The table 2 shows the security comparison other approaches. From this comparison, we find out that the proposed scheme is better than other schemes. The symbol O means the security requirement is approached and the symbol × means the not.

Paper Property	Our scheme	Plobil et al. [17]
Authentication	O	O
Confidentiality	O	O
Non-repudiation	O	O
Anonymity	O	O
Inside attack avoid	O	×
Anonymity unforgeability	O	O
Dynamic anonymity	O	×
Non-certificate	O	×

Table 4.1 security comparison

CONCLUSION

Vehicular ad hoc networking is a promising wireless communication technology for improving highway safety and information services. In this paper, we introduced the identity-based cryptosystem for the anonymous key pair of vehicle safety application message. The proposed mechanism is a public-key type with the elliptic curve cryptosystem. It is a well-known fact that the public-key cryptography concept solves the anonymous key distribution and storage problems.

Our scheme can be applied to vehicle ad hoc network, so that the users can protect their privacy more easily and reduce the bandwidth of storage space. We believe that our study can provide a guideline for the design of a more secure and practical VANETs.

MARKET REACTION TO THE RATING REPORTS WITH MIXED OR CONSISTENT FOLLOW-UPS: A PRICE AND TRADING BEHAVIOR ANALYSIS

Chuang-Min Chao, National Taipei University of Technology, Taiwan

Fu-Cheng Fang, National Taipei University of Technology, Taiwan
pipi50524@hotmail.com

ABSTRACT

The purpose of this study is to investigate the trading behavior and stock returns of foreign institutional investors and individual investors in Taiwan stock market around the rating report announcement of foreign institutions. This study develops with the method of event study. Specifically, this study focuses on the effect under different frequencies of rating reports, such as single recommendation, consistent recommendations and mixed recommendations.

Keywords: Abnormal Trading Volume, Abnormal Returns, Trading behavior, Event study

INTRODUCTION

Traditional financial theory often refers to the stock market as an efficient market. By this, it means that the stock price already reflects all the information of the market. However, a growing literature provides empirical evidence that markets are measurable subject and are important mispricing. For instance, Black (1986) points out the concept of noise trade which indicates that investors are easy to misinterpret the irrelevant information as trading signals in the market. However, if investors are naive and aggressive in their trading (e.g., the noise trader) that they may earn higher rewards (DeLong et al., 1990, 1991; Hirshleifer and Lou, 2001; Kyle and Wang, 1997).

On the other hand, several studies provide evidence that investors are too credulous in the sense that they do not pay fully attention to the incentives of interested parties, such as firms, brokers, analysts, or other investors, who tend to manipulate available information. As a result, stock market prices do not seem to discount fully for the forecast bias which made by the analyst (Lin, 2000). Empirical evidence suggests that after analysts recommend or revise their forecast to the stock favorably, there are positive abnormal returns (Chan, et al., 1996; Lin, 2000; Barber et al., 2001; Stickel, 1995; Womack, 1996; Michaely and Womack, 1999; Krische and Lee, 2000). Womack(1996) argues that there is a strong underperformance after analysts' recommendations of downgrade and selling but the weak superior performance only exist after new recommendations of buying. Asquith, Mikhail and Au(2005) indicate that the effect of the analysts' recommendations on the abnormal returns is most significant within the 5-day event. Chao and Lu(2008) and Chao and Chen(2009) argue that the abnormal

trading volume may be an alternative measurement to the study of market information on investors' behavior. Therefore, they investigate the trading behavior of institutional and individual investors around the day of stock information announced. They find that the recommendations by foreign institutions have a significant effect on the abnormal trading volume for both institutional and individual investors. However, the trading behavior of the institutional and individual investors is negatively correlated.

The purpose of this study is to investigate the security returns and trading behavior of individual investors and foreign institutional investors around the stock recommendations by foreign institutions. The given recommendations of the same stock may be re-enforced or challenged by subsequent ratings from other institutions, this study is going to distinguish our sample into those who got consistent ratings and those who got mixed rating results during the sample event period. Base on these this study will to omit the period of October, 2008 to December, 2008.distinguishes, this study is going to examine whether the intense attention will affect the market outcomes as well as the trading behavior of the individual investors.

RESEARCH DESIGN

The data

The data used in this study is observed during the period from January, 2008 to December, 2009. This study omits the period of October, 2008 to December, 2008 due to the fact that Taiwan government narrowed the limit up and limit down of the stock market during that period. Therefore, the sample in this study are those companies whose stocks are listed in the TSEC Taiwan 50 Index which contains the Top 50 highest trading volume stocks in Taiwan stock market. Next, this study focuses on the rating report announcement of foreign institutions. This study adopt the rating report announcements from 16 different foreign institutions, these foreign institutions publicly offer rating report announcement on cnYES.com. All the data of trading volumes and stock returns are obtained from the TEJ data bank.

Typical rating report announcement

According to classification of rating report announcement in I\B\E\S, rating report announcement are classified into 3 types which contain 5 grades in this study. Table 1 provides a description of the composition of the classification.

TABLE 1 TYPES OF RATING REPORTS

Type	Good news		Neutral news	Bad news	
Grade	Strong buy	Buy	Hold	Sell	Strong Sell

Asquith(2005), he reported that the change of rating announcement are more important than single rating announcement. Therefore, in this study, the rating report announcements are classified into three categories according to the frequency and consistency of the rating announcements. Table 2 provides a description of the composition of the second time classification.

TABLE 2 CATEGORIES OF RATING ANNOUNCEMENTS

Name	Definition
Single	1.Only one good news in a period.
	2.Only one neutral news in a period.
	3.Only one bad news in a period.
Consistent	1.Good news: More than one foreign institutions report good news to the same company within a certain period
	2.Bad news: More than one foreign institutions report bad news to the same company within a certain period
Mixed	More than one foreign institutions report good and bad news to the same company within a certain period
*The "period" indicates one week before and after the announced date in this study.	

Event study

The event study method is used while the market model is used to estimate the expected value of the price and trading volume. The abnormal return and abnormal trading volume are therefore calculated and used to examine whether the mixed or consistent follow-up rating reports by other institutions which will affect the abnormal returns and the abnormal trading behavior of the investors in a different way.

The abnormal return is the difference between actual and predicted stock returns during a specific time period around the announce day. The actual return for stock i on day t is given by

$$R_{i,t} = \alpha_i + \beta_i \times R_{m,t} + \varepsilon_{i,t}$$

Where $R_{m,t}$ is the return on a market portfolio (market index) for day t .The parameter estimates α_i and β_i are obtained by using all available data for trading days -70 to -11 relative to the event date and $\varepsilon_{i,t}$ is a stochastic error terms.

The abnormal returns are computed as follows:

$$AR_{i,E} = R_{i,E} - (\hat{a}_i + \hat{B}_i \times R_{m,E})$$

Where $(\hat{a}_i + \hat{B}_i \times R_{m,E})$ is the predicted stock return base on 60 day estimated period, and $R_{i,E}$ is the actual return of stock i in event-time period E.

Finally, the average abnormal returns are computed as follows:

$$AAR_E = \frac{\sum_{i=1}^{n} AR_{i,E}}{n}$$

Where n is the number of all sample companies

If the market is efficient, security prices should reflect all potential changes in the event outcomes. That is, if the required rate of return on a stock around the event day is identical to that of any other random trading day, one should not be able to make excess returns by trading around all of these event days.

The second stage uses Harris(1986) proposed that to adopt volume ratio to compute the abnormal trading volume. The actual trading volume ratio for stock i in event-time period E is given by

$$EV_{I,E} = \frac{V_{i,E}}{V_{m,E}}$$

Where $V_{i,E}$ and $V_{m,E}$ are the trading volume of stock i and the total TSEC in event-time period E.

The expected trading volume ratio for stock i in event-time period E is given by

$$NV_i = \frac{V_i}{V_m}$$

Where V_i and V_m are the average trading volume of stock i and the total TSEC in the trading days -70 to -11 relative to the event-time.

The abnormal trading volume ratio is computed as follows:

$$AVR_{i,E} = \frac{EV_{I,E}}{NV_i} - 1$$

Finally, the average abnormal volume ratio is computed as follows:

$$AAVR_E = \frac{\sum_{i=1}^{n} VR_{i,E}}{n}$$

Where n is the number of all sample companies

EMPIRICAL RESULTS

Table 3 and Figure 1 show the market reactions from days -10 to +10. For those companies with only single good news reports, there is a significant effect on their abnormal returns on day -5 and-4 , and a significant positive effect on the event date, but turns to be a negative effect four days after the good news announcement date. It appears that the foreign institutions offer the single good news announcement which causes significant increase in the abnormal return on the event date, but a significant reverse effect will emerge on the following days.

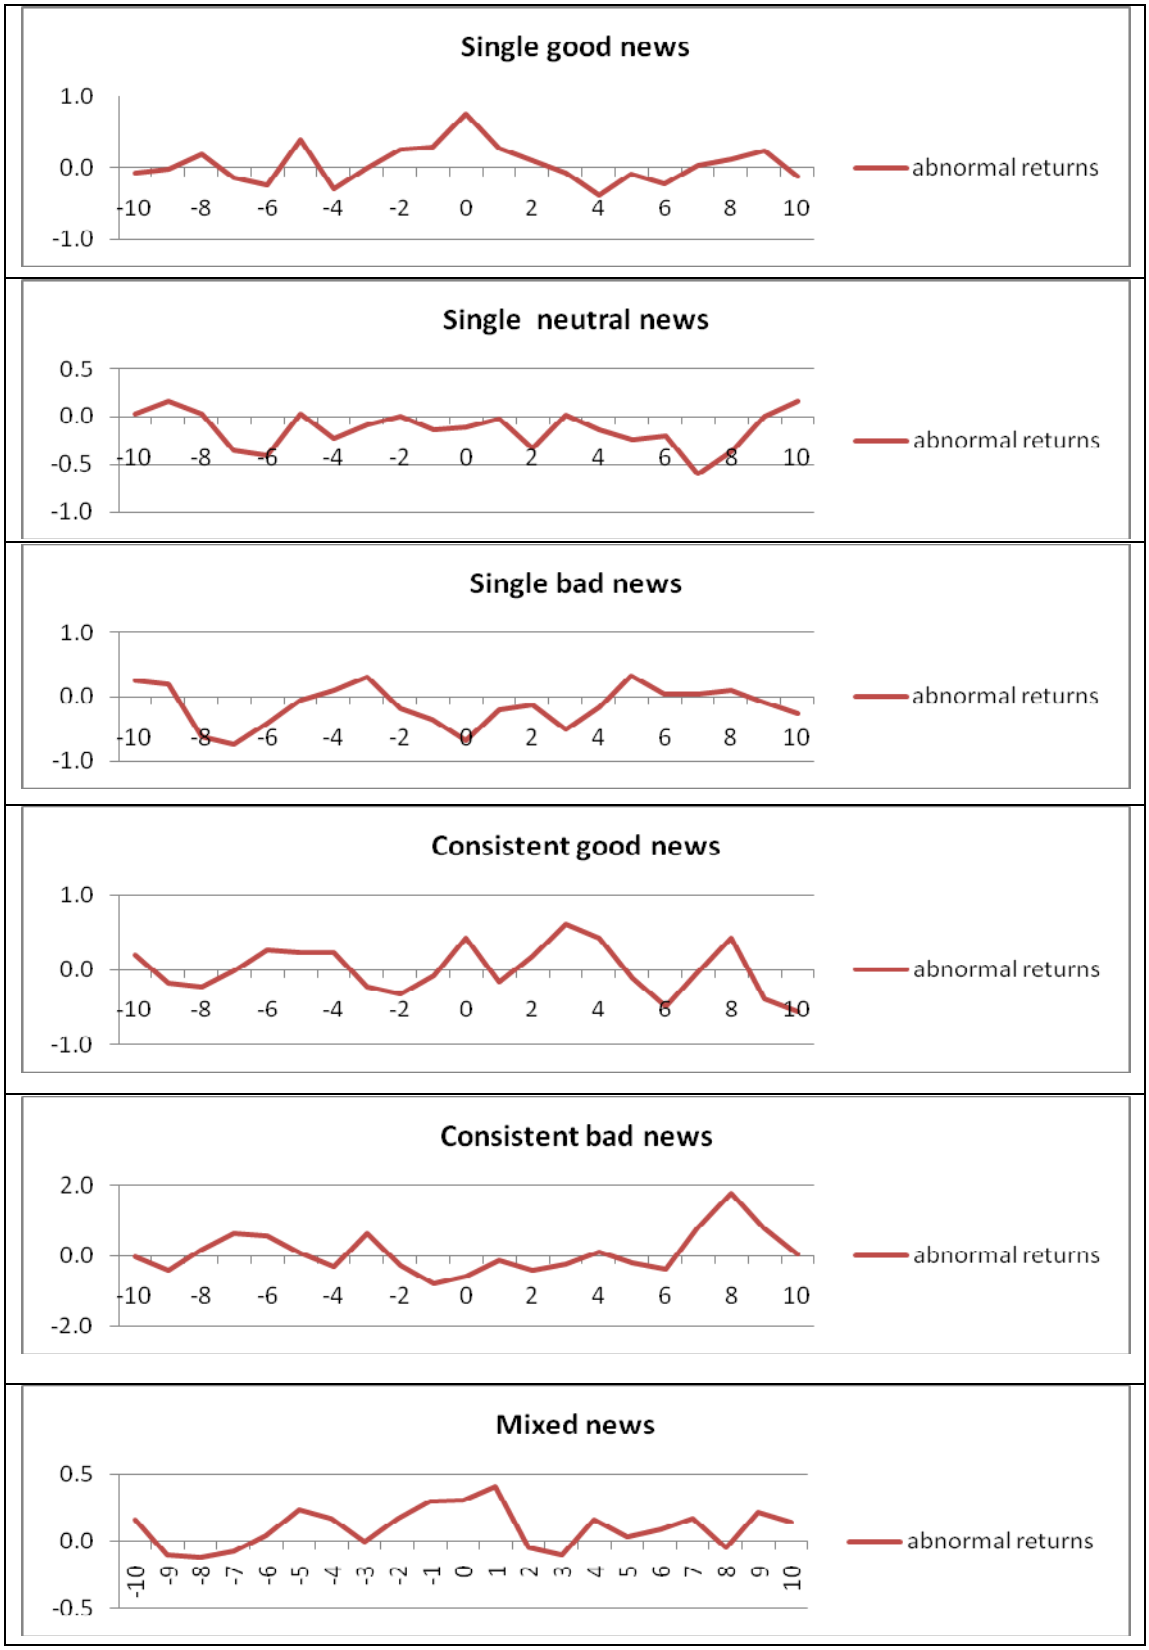
For those companies with a single bad news, there is a significant negative effect on their abnormal returns on the event date, the 7th and 8th days before the event date and the 3rd day after the event date. The result implies information leakages before the announcement of the rating report.

FIGURE 1 Market Reactions to the Rating Report by Foreign Institution



As to those companies with the consistent good news, there is a significant positive effect on their abnormal returns on the event date, the 3th day. On the other side, for those companies with the consistent bad news, here is a significant positive effect on their abnormal returns on the event date, the 8th day. It seems that the consistent good news is more authentic than the consistent bad news. As for the mixed news, we find out a significant increase on the day 1. As the whole, the period of all mixed news was offered of event has no specific trend in abnormal return.

Table 4 shows the effect of the consistent good news announcement on the trading behavior of the individual investors as well as that of the foreign institutional investors.

TABLE 4 Investor reactions to the consistent good news was offered of event

10	0.572	0.382	-0.736	-2.923***	-0.551

The total trading volume has a significant increase on the even date, the 1st and the 4th day after the event. But the total trading volume decreases at the 6th and 7th day. The decrease in the total trading volume may be due to the fact that when most people have the same

predictions due to consistent news announcement, the trading activity will be limited. And this is Consistent with the result of Bamber and Cheon(1995).

For the foreign institutional investors, according to Table 4, we find out a significant decrease in the abnormal buying volume on the day -2 and a significant increase in the abnormal buying volume on the day -6, 4, 5. At the same time, there is no significant effect on the abnormal selling behavior. Therefore, it appears that the trading behavior of foreign institutional investors is consistent with the ratings report.

9	1.640	1.086	0.762	0.853	1.475
10	1.668*	1.233	1.416	0.674	1.359

On the other hand, under a consistent good news, the individual investors have a significant increase in the abnormal selling volume on the day 4 and decrease in the abnormal selling

volume on the day -6, -7, -8, -9, -10. It implies that the consistent good news affect the individual investors' selling behavior more than their buying behavior.

Table 5 shows the results of the mixed news announcements. The total abnormal trading volume has a significant increase around the (-1, 4) event window, and similar results are observed on the buying and selling behaviors of both the individual and institutional investors. This is another evidence consistent with Bamber and Cheon(1995). When market is full of mixed information, investors tend to have different interpretations of the market, and therefore will perform differently on the stock market. This leads to the increase in both the buying volume and selling volume of the stocks.

CONCLUSION

This paper investigates the stock returns and trading behavior of individual investors and foreign institutional investors around the stock recommendations by foreign institutions. The samples in this study are those companies whose stocks are listed in the TSEC Taiwan 50 Index.

On the security abnormal return, there are significant increases on the day 0 by the event of the single good news was offered and the significant decrease on the day 0,3 by event of the single bad news was offered which seems that a single news is indeed provide influence to security return, but it is temporarily. About the consistent and mixed news, they also provide influence to security return, and it is temporarily, too. These are consistent with the result of Bauman, Datta and Iskandar-Datta(1995).

Abnormal trading volume suggests that rating report announcements are informative to investors. This study examines the information which contained in rating report announcements and we extend the previous research in this area by employing six different kinds of rating report announcements which allows us to assess the relative informativeness of the individual investor and foreign institutions investor across different classes of rating report announcements.

By the event of consistent good news was offered, for foreign institutions investor, there is a significant variation in abnormal buying volume, but there is an insignificant variation in abnormal selling volume. Contrarily, for individual investor, there is an insignificant variation in abnormal buying volume, but there is a significant decrease in abnormal selling volume. It indicates that the foreign institutions investors' different form individual investors' reaction to the consistent good news was offered. In the end, no matter what kind of investors and buying or selling side, every situation cause significant increase in the abnormal trading volume by the event of the mixed news was offered.

These results can help researchers and investors to understand the information which effect on the individual investors' trading behavior and the stock price. For investors, understanding the different trading behavior helps them to make better decisions when receiving information.

ABSTRACT

The purpose of this study is to examine how stock price changes around the common recommendations in presses of Economic Daily News and United Evening News. By using event-study methodology, the impact of common recommendations in presses on recommended stocks is examined. The result indicated that stocks price was reflected in statistically significant positive abnormal return relevant with presses common recommendations in announcement day and before announcement day. Post-announcement day, stocks returns in statistically are significantly negative relevant with presses common recommendations. Empirical evidence proof that presses common recommendations is a lagging indicator.

Keywords: Market Model, Press Common Recommendations, Abnormal Return,

INTRODUCTION

Stock returns are always the most important issues for security investors. Therefore, investors are sensitive to the disclosure of information in the stock market. Investors will make use of available means to collect information that may have an impact to stock price. Feasible tools including television news, newspapers, financial magazines and other mass media are often used to collect information.

In usual, corporate investors have better stock analysis expertise and information access channels then general public. Therefore, the profitability of their investments are considered to be better than the general public. In view of this, the general public likes to search professional advices from institutional investors.

The purpose of this study was to examine whether the recommendations of stocks listed on the newspaper the share price after recommendation. Whether there is a positive growth, or investors can profit through stock trading are examined. Employing Scholes-Williams model of Event study method, stock price variation is utilized as an indicator to measure the

difference of stock price between pre-recommendations and past-recommendations in Taiwan.

This paper is organized as follows. Section 2 presents the related literature. Section 3 describes the data and preliminary analysis. The Scholes-Williams modeling that measures the financial return is also introduced. Section 4 presents empirical evidence. Finally, section 5 discusses the results and presents conclusions.

LITERATURE REVIEW

The market efficiency is the relevant information can be fully reflected in securities prices. And the new information must be immediately reflected in stock prices. In an efficient market, stock price and real value are almost the same. According to *Fama(1970)* the efficiency of the market is divided into three types:

1. *Weak form of the efficiency market hypothesis:* Stock price already reflects all past information. Investors can not earn excess returns by the historical information in the market. Technical analysis in the weak form of market efficiency can not help investors find the price of the stock.

2. *Semi-strong form of the efficiency market hypothesis:* The current stock price fully reflects all public information, such as financial statements, notices and dividends, stock splits, new issues of the declarations, etc., investors can not use this information to develop a set of rules and achieve excess return. If this hypothesis is true, then fundamental analysis is invalid.

3. *Strong form of the efficiency market hypothesis:* All available relevant information were complete responded in the price, including the open and the inside information. Even if the investors who possess inside information can not gain excess return.

Investors always expect that from the existing information can lead to obtain excess return with hope accompanying by low cost. Naturally, general media like financial magazines, papers, TV or radio programs are information channels to collect. Therefore, it is an interest issue for scholars and researchers to investigate the object of whether investors can profit to earn excess return by the decisions based on the recommendation on newspapers.

The analyst result of Wang, Lin and Liu () and Chen, Chen and Liu (2006) are consistent with our study about investors whether can obtain the excess return after the information expose. Investors only can earn excess return at event day if they are able to purchase the stock. Xu and Liu (2008) indicate that after the announcement of stock recommendation of analyst, there is little positive abnormal returns. It lasts only one day of the announcement day.

The empirical evidence of Chang and Chan (2007) suggests that financial analysts' downward stock recommendation revisions provide superior information to investors than do upward stock recommendation revisions. Yang, Chou, Doong and Lin (2007) point out that the analyst characteristics are proposed to be important factors to explain the variations of the

accuracy of EPS forecast. Zarowin (1989) presented the analysis results that fail to support the assumption of overreaction to earnings announcement. It is similar to the result of Lin, Lee and Tsao (2007) that the overreaction effect does not exist in Taiwan stock market. Yang (2003) found that when the annual increasing dividend announcement was revealed, security investors can not obtain abnormal return by inside trading. It also supports that the security market is efficient. On the contrary, after the decreasing dividend announcements, security investors can obtain abnormal return by inside trading. It proves that the security market is not efficient. The empirical evidence of Werner, Bondt and Thaler (1985) is consistent with the overreaction hypothesis.

Chang, Chen and Lai (2008) indicate that there is a positive influence of International Strategic Alliances experience on firm performance. Shelor, Aanderson and Cross (1991) has found the information conveyed in the earthquake is very important to the market. The stock returns are statistically significantly negative.

DATA AND METHODOLOGY

This section describes the source of data and the reasoning of data selection, and explains the model to measure the abnormal return. The Event Study and the Market model are applied to calculate the abnormal return.

Description of the sample

This study investigated the information content of the newspaper columns. The data are collected from the weekend issues of *Economic Daily News* and *United Evening News* during the period January 1, 2007 to August 16, 2009. There are 238 stock samples totally.

The first step of Event study is to confirm the event and event that may affect shortly or last for a period of time. In this study, event days were the first trading day after each of common recommendations, and event periods were taken from five trading days before and after the event. Related financial data were obtained from the prospectuses of Taiwanese listed companies on TSEC and OTC, and the **TEJ database** of the Taiwan Stock Exchange Corporation.

Empirical model

Event study is modern in the financial area which is one of the widely used research design. The purpose of the event study method is for a particular event, whether if the event cause the abnormal stock returns or excess returns. Expected patterns are as follows: market model, mean adjusted return model and market adjust return model. We make used of the most commonly used-the market model for the study of empirical method.

The abnormal return defined as: at a specific time point, the differences between actual return and expected return of specific securities,

$$AR_{it} = R_{it} - E(R_{it}) \qquad (1)$$

where AR_{it} present the abnormal return of security *i* at time *t*, R_{it} is the actual return of security *i* at *t*, and $E(R_{it})$ is the expect return of security *i* at *t*. In this paper, Scholes-Williams model of Event study method is employed to exam whether abnormal existed after the common recommendations. Assuming that rate of return of individual securities confirm to the following pattern, the

$$R_{it} = \alpha_i + \beta_i R_{mt} + \varepsilon_{it} \qquad (2)$$

model parameters α and β were obtained from the estimation period. β_i stands for regression coefficient, or risk factor, behalf securities returns the market index sensitivity. Definition of securities in time for the expected rate of return:

$$E(R_{it}) = \hat{\alpha}_i + \hat{\beta}_i R_{mi} \qquad (3)$$

Scholes and Williams pointed out that the general least squares estimate of $\hat{\beta}_i$ estimates will produce errors. This makes relatively frequent stock trading, risk factor to be underestimated; trade too often, a risk factor is overvalued. In such thin trading or non-synchronous trading, recommend using the following formula to adjust the risk factor:

$$\hat{\beta}_i^* = \frac{\hat{\beta}_t^- + \hat{\beta}_t + \hat{\beta}_t^+}{1 + 2\hat{\rho}_m} \qquad (4)$$

$\hat{\beta}_t$ was the rate of return during the same period of least squares estimates; $\hat{\beta}_t^-$ was pre-market stock returns and the return of the least squares estimate; $\hat{\beta}_t^+$ compared to stock returns and post-market returns of least squares estimates. $\hat{\rho}_m$ was the market rate of return of the first order autocorrelation coefficient. Least squares model estimates the value of the intercept:

$$\hat{\alpha}_t^* = \overline{R}_i - \hat{\beta}_i^* \overline{R}_m \qquad (5)$$

$\overline{R}_i$ stand for average rate of return of security estimate period, $\overline{R}_m$ stand for average rate of market return.

THE EMPIRICAL RESULTS

In this section we discussion the empirical results for the information effect the period of before and after information exposed by whether statistically significant. Table 1 & 2 shows analyzed through Scholes-Williams model and it's displayed by generalization.

Table 1 presents the result of abnormal return (AR) and Table 2 presents the result of cumulative abnormal return (CAR). Both were tested statistics by Traditional T-test for common recommendations on event window around announcement. We observed only before announcement day (t= -5~0) has the statistically significant positive in both Table 1

and 2 , but from days 1 to days 3 turns to significant negative in table 1. Although cumulatively t-test still remain significant, but continued to decrease. When over the days -5 to 0 abnormal return turns into negative. That is when investors obtain the message from the column of presses and follow the instruction to buy the stock been recommendations, only can lose their funds. Previous literature has point out that the reason caused this situation might be the information has been exposed in some form of way before days 0, the effect of information has been reflected already.

Fig. 1 and Fig. 2 exhibit the abnormal return and cumulative abnormal return for upgrades and downgrades of recommendations.

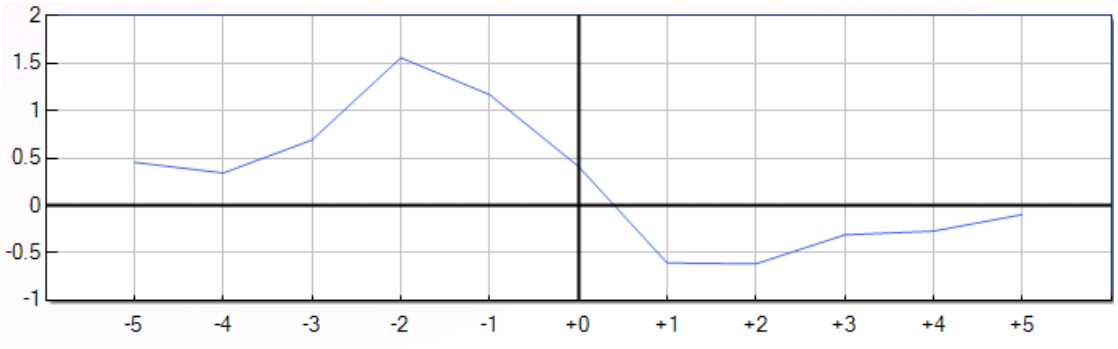

Fig.1 Abnormal returns about the recommendation of analysts in the newspapers.

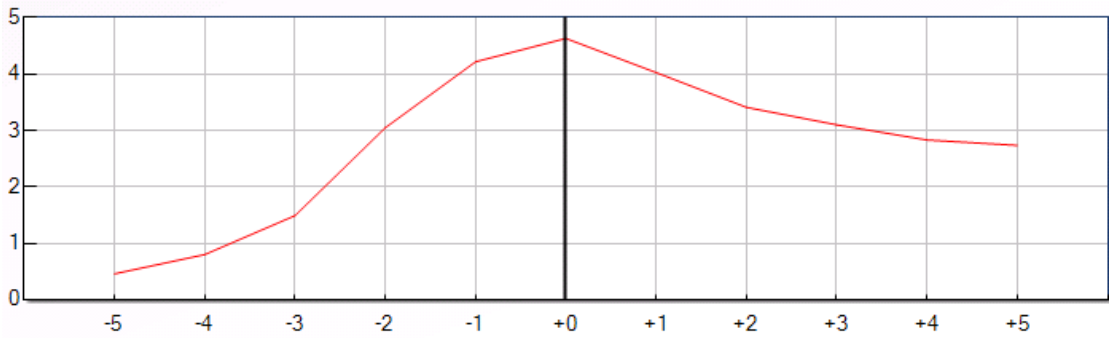

Fig. 2 Cumulative abnormal return about the recommendation of analysts in the newspapers.

CONCLUSIONS

The purpose of this study was to examine how the stock price changes before and after the information exposes, and whether the generally investors are able to profit excess return from the weekly publication. We used the common recommendations of press column of *Economic Daily News* and *United Evening News* as data base, from the period of January 1, 2007 to August 16, 2009.

The result shows that the ability of generally investors gets the information to profit is limited because of the message effects usually occurred only one day after the incident. Stock price has better performance before the information revealed. In other words, investors can only purchase stocks that were just recommended to earn excess return in event day. Otherwise, they could lose because of the message they received. This study provides an important message to investors

that appositive abnormal return exist only in day -5 to day 0, and then abnormal return will be vanish in the days after the announcement. Investors who face the source of such information and might adopt the information should be more cautious.

Our study provided evident that the Taiwan stock market seems a *semi-strong efficiency market*. The reason is that investors can not obtain excess return by presses or newspapers of public information source. Information has already been reflected before announcement of recommendations.

ABSTRACT

A number of studies have investigated the causes and effects of stock market crashes. These studies mainly focus on the factors leading to a crash and on the volatility and co-movements of stock market indexes during and after the crash. However, how a stock market crash affects individual stocks and if stocks with different financial characteristics are affected differently in a stock market crash is an issue that has not received sufficient attention. In this paper, we study this issue by using data for Taiwan stock market around the Bearish-Bullish Turning Points that have taken place during the August 1997–February , 2009 period with a large sample of Taiwan firms. We use the multivariate regression analysis and consider certain company-specific characteristics, such as the China-concept factors, board of directors, and the percentage of shares owned by foreign institutions to study the determinants of stock returns around the Bearish-Bullish Turning Points.

Keydword: stock return, China concept factor, Company-specific idiosyncratic risk

1. INTRODUCTION

Stock market returns have long been a popular research topic in finance. In the traditional capital asset pricing model (CAPM) of Sharpe (1964), Lintner (1965) and Mossin (1966), stock returns are explained by their market risks (i.e., beta). The three-factor asset-pricing model of Fama and French (1992,1993) challenged the empirical validity of the Sharpe–Lintner–Mossin single-factor capital asset pricing model (CAPM). In their three-factor asset pricing model, in addition to beta, Fama and French (1992, 1993) use size and market-to-book ratio as determinants of asset returns. They find that smaller firms and firms with a low market-to-book ratio consistently provide relatively higher returns compared with larger firms and firms with a higher market-to-book ratio.

This study focuses on the relationship between the Taiwan stock market returns around the bearish-bullish turning points and the systemic risk and corporate characteristics, such as the China-concept factors, board of directors, and the percentage of shares owned by foreign

institutions. The data used in this study is observed from 1997 to 2009. The sample companies in this study are the stocks listed in the Taiwan Stock Exchange.

The purposes of this study are as follows. First, following Wang et al. (2009), this study is going to apply three-factor CAPM, i.e., the systematic risk (β), the size premium and the value premium, to explore how these variables affect the Taiwan stock market returns during the bearish-bullish and bullish-bearish turning points. Unlike previous studies, this study collects data around the turning points of bear-to-bull or bull-to-bear markets.

Secondly, in addition to controlling the systematic risk variables, this paper controls factors of corporate characteristics. Traditionally, the CAPM relies on systematic risks and it assumes that company-specific idiosyncratic risk can be diversified away. However, Xu and Malkiel (2003) show that idiosyncratic volatility is a significant determinant of earnings growth and equity returns. They suggest that company-specific idiosyncratic risk factors can become significant determinants of capital asset prices. Therefore, in this study, certain company-specific characteristics, such as the China-concept factors, board of directors, and the percentage of shares owned by foreign institutions, are included in the regression model to investigate whether these corporate characteristics play a significant role in determining stock returns around the bearish-bullish turning points.

2. SAMPLE CHARACTERISTICS

Our sample for each bearish-bullish turning points consists of the stocks listed in the Taiwan Stock Exchange. We obtain the stock returns and other explanatory variables data from the Taiwan Economic Journal (TEJ). We identify bearish and bullish points using the approach of Pagan and Sossounov (2003).The Pagan and Sossounov (2003) adaptation of the Bry-Boschan (BB) algorithm can be summarized as follows:
1. Identify the bullish and bearish by using a window of 8 months.
2. Enforce alternation of phases by deleting the lower of adjacent bullish and the higher of adjacent bullish.
3. Eliminate phases less than 4 months unless changes exceed 20%.
4. Eliminate cycles less than 16 months.

The Taiwan stock market bearish and bullish period from 1997 to 2009 are presented below(Table 2.1):

Table 2. 1 Classification of bearish-bullish.

Bearish	Bullish
1997 / 7 ~1999 / 1	1999/1~2000/5
2000/5~2001/9	2001/9~2002/5
2002/5~2003/4	2003/4~2004/11
2004/11~2005/10	2005/10~2007/10
2007/10~2008/1	2009/1~2009/9
2008/5~2009/1	

Table2.2 shows the study period used in this article, which is one month after the turning point.

Table 2.2 The study period used in this article a month after the turning point.

Bearish	Bullish
1997/8	1999/2
2000/6	2001/10
2002/6	2003/5
2004/12	2005/11
2007/11	2009/2
2008/6	

This stock return in this study is the one-month return after the bearish-bullish or bullish-bearish turning points. And the number of companies listed in Taiwan Stock Exchange from 1997 to 2009 is listed in table 2.3.

Table 2.3 Number of listed companies

year	Number of listed companies
1997	404
1998	437
1999	462
2000	531
2001	584
2002	638
2003	669
2004	697
2005	691
2006	688
2007	698
2008	718
2009	730

3. METHODOLOGY

The purpose of this study is to examine the relationship between the Taiwan stock market returns around the bearish-bullish turning points and the systemic risk and the corporate characteristics, such as the financial ratios, corporate governance variables, and China-concept factors. The regression model used in this study and the related variables are as follows:

$$RET_{t+1} = \beta_0 + \beta_1 Beta_{t+1} + \beta_2 MVBV_{t+1} + \beta_3 Size_{t+1} + \beta_4 ROE_{t+1} + \beta_5 TD_{t+1} + \beta_6 Share_{t+1} + \beta_7 RP_{t+1} + \beta_8 ED_{t+1} + \beta_9 CEO_{t+1} + \beta_{10} FH_{t+1} + \beta_{11} CCF_{t+1}$$

BETA: the CAPM beta of the stock
SIZE: the logarithm of the firm's market capitalization

MVBV: market value/book value ratio pre share.

TD: Debt ratio

ROE：Return of equity.

SHARE: The percent of the firm's stock owned by the managers

CEO Chair-Duality(CEO): A dummy variable equal to 1 if the CEO is also the chairman of the board.

ED：Earnings distribution ratio
Formula = (direct distribution of surplus power + Σ ownership rates between the control chain).

Ratio of pledged shares of insider ownership (RP)

FH: Foreign shareholding ratio

CCF: China concept factor

In this study, the variables are as follows:

(1)BETA

In the capital asset pricing model (CAPM), an asset's risk consists of company-specific idiosyncratic risk, which can be eliminated through diversification, and market risk, which cannot be diversified away. Market risk, measured by BETA, is the contribution of an asset to the riskness of a well-diversified portfolio. Since it cannot be eliminated by diversification, investors must be compensated by receiving a risk premium for bearing it. BETA measures the volatility of the returns on the asset relative to the returns on the market portfolio. We use BETA as an explanatory variable in the regressions to determine if stock returns are affected by BETA for each bearish-bullish turning points. BETA is computed using the market index model with historical monthly returns. Wang, Meric, Liu and Meric(2009) find the higher betas incur greater losses in stock market crashes. So this study wants to explore how BETA variables affect the Taiwan stock market returns during the bearish-bullish and bullish-bearish turning points.

(2) SIZE & MVBV

In their three-factor asset pricing model, in addition to BETA, Fama and French (1992, 1993) use SIZE and market-to-book ratio(MVBV) as determinants of asset returns. They find that smaller firms and firms with a low market-to-book ratio consistently provide relatively higher returns compared with larger firms and firms with a high market-to-book ratio. Miyajima and Yafeh (2007) find firm size and market-to-book ratio to be among the most important determinants of firm performance during the 1995–2000 Japanese banking crisis. Jiang and

Lee (2007) also find book-to-market ratio to be an important determinant of future profitability and excess stock returns. Therefore, in our regressions, in addition to BETA, we also use SIZE and MVBV as explanatory variables to study if these variables influence stock returns in stock market crashes. We define SIZE as the logarithm of the firm's market capitalization. MVBV is computed as the market value of the firm's equity divided by its book value. To explore how these variables affect the Taiwan stock market returns during the bearish-bullish and bullish-bearish turning points.

(3) TD & ROE

The CAPM relies on systematic risk and it assumes that company-specific idiosyncratic risk can be diversified away. However, Xu and Malkiel (2003) and others show that idiosyncratic volatility is a significant determinant of earnings growth and equity returns(ROE). These studies suggest that company-specific idiosyncratic risk factors can become significant determinants of capital asset prices during unexpected stock market events that cause sudden changes in volatility. Therefore, we add some stock- and company-specific financial characteristics as explanatory variables in the regressions to investigate if these characteristics play a significant role in determining stock returns during the bearish-bullish and bullish-bearish turning points.

One of the firm characteristics we use as an explanatory variable in the regressions is the total debt/total assets ratio (TDTA). Miyajima and Yafeh (2007) find financial leverage to be one of the most important determinants of firm performance during the 1995–2000 Japanese banking crisis. The Hamada (1969) equation specifies the effect of financial leverage on beta. The leveraged beta only captures the volatility risk contribution of financial leverage. However, the debt ratio can have an added importance during the bearish-bullish and bullish-bearish turning points.

(4) SHARE (manager ownership)

Jensen and Meckling (1976) emphasized the importance of the agency costs of equity arising from the separation of ownership and control of firms whereby managers tend to maximize their own utility rather than the value of the firm, and develop more formally the classical owner-manager agency problem. They advocate that managerial share-ownership may reduce managerial incentives to consume perquisites ,expropriate shareholders' wealth or to engage in other sub-optimal activities and thus helps in aligning the interests of managers and shareholders which in turn lowers agency costs. We consider both the effects of manager ownership and stock return during the bearish-bullish and bullish-bearish turning points. We measure ownership (SHARE) by the percentage of shares held by manager shareholding.

(5) CEO Chair-Duality (CEO)

It has long been argued that when the board chairperson is also the CEO (unity), the motivation of the board to monitor and oversee the management is compromised due to a lack of independence and conflicts of interest. The CEO also holding the board chairmanship reduces the board's ability to ensure that the management pursues value-increasing activities. This issue was considered sufficiently important for the Cadbury Report (1992) to

recommend that listed companies separate the roles of CEO and board chair (duality). However, proponents of CEO unity argue that the combining of the two positions provides a strong and unambiguous leadership that is capable of making decisions that are in the best interests of the firm (Brickley et al. 1997), and that separating the positions could lead to the incomplete transfer of company information between the two officeholders and confusion over who is in charge of running the firm. CEO unity appears to be even more important during during the bearish-bullish and bullish-bearish turning points, which requires rapid and decisive recommendations by corporate boards to cope with the new dangers and opportunities. So We consider both the effects of CEO Chair-Duality and stock return.

(6) Earnings distribution ratio (Cash-control right ratio) ED

The ownership of publicly traded companies is largely concentrated in the hands of families in Taiwan. The controlling shareholders face strong incentives to monitor managers and maximize profits when they retain substantial cash flow rights in addition to control. These incentives, emphasized by Jensen and Meckling (1976) and Shleifer and Vishny (1986), also restrain the diversion of corporate resources by the controlling shareholders, and enhance the value of minority shares. So we use TEJ date to consider both the effects of Cash-control right ratio and stock return during the bearish-bullish and bullish-bearish turning points.

(7) Ratio of pledged shares of directors ownership (RP)

Directors of public companies are obliged to report to the Securities and Futures Commission (SFC) the percentage of their shareholdings that are pledged for loans and credits. These data matter since pledging for loans effectively reduces the personal funds required for shareholding. In other words, the degree of personal leverage expands and then the over-investments to the stock market of the largest shareholder also undertake the risk of the companies to a certain degree. So we use TEJ date to consider both the effects of Ratio of pledged shares of directors ownership and stock return during the bearish-bullish and bullish-bearish turning points.

(8) Foreign shareholding ratio(FH)

Foreign institutional investors have gained a significant role in Taiwan stock markets, In this paper, we address these issues in the context of foreign institutional shareholding in Taiwan stock markets. So we use TEJ date to consider both the effects of Foreign shareholding ratio and stock return during the bearish-bullish and bullish-bearish turning points.

(9) CCF: China concept factor

China has the closest relationship with Taiwan owing to long history of political relation and economic collaboration. Since the economic reform by Deng in 1990s, China has allured hundreds of billion dollars of funds from all over the world. Since a great percentage of Taiwanese firms have made real investments in China, we call these firms “China-concept” firms. If these firms are listed firms in Taiwan stock markets, then, their stocks are called “China-concept” stocks. So we use TEJ date to consider both the effects of China concept factor and stock return during the bearish-bullish and bullish-bearish turning points.

4. REGRESSION RESULTS

The regression results for the bearish-bullish events are presented in Table 4.1 and

Table 4.1 the bearish-bullish turning points

Mode		Not standardized coefficient		Standardized coefficient	t	Significant

** Indicates that the variable is significant at the 5% level.
*** Indicates that the variable is significant at the 1% level.

BETA is statistically significant at the 1% level during the bearish-bullish regression and bullish-bearish turning points regression. The sign of the coefficient is positive in bearish-bullish regression implying that stocks with higher betas incur greater profit in stock market bearish-bullish turning points. The sign of the coefficient is negative in bullish-bearish turning points regression implying that stocks with higher betas incur greater losses in stock market bullish-bearish turning points.

MVBV is statistically significant at the 1% level during the bearish-bullish regression and bullish-bearish turning points regression. The sign of the coefficient is positive in the bearish-bullish regression and bullish-bearish regression implying that stocks with higher MVBV(market-to-book ratio) incur profit in stock market.

The SIZE variable is statistically significant at the 5% level during the bearish-bullish regression, the sign of the coefficient is positive in bearish-bullish regression implying that stocks with higher betas incur greater profit in stock market bearish-bullish turning points. Size variable is not statistically significant in bullish-bearish turning points regression. TD(total debt ratio) is statistically significant at the 1% level during the bearish-bullish regression and bullish-bearish turning points regression. The sign of the coefficient is negative in bearish-bullish regression implying that stocks with high TD incur greater losses in stock market bearish-bullish turning points. The sign of the coefficient is positive in

bullish-bearish turning points regression implying that stocks with higher TD incur greater profit in stock market bullish-bearish turning points.

ROE (Return of equity.)variable is not as important in bearish - bullish turning points regression. ROE is statistically significant at the1% level during the bullish - bearish regression. The sign of the coefficient is negative in the bullish - bearish regression and implying that stocks with higher ROE incur loss in stock market.

Share(The percent of the firm's stock owned by the managers) is statistically significant at the 1% level during the bearish-bullish regression. The sign of the coefficient is positive in bearish-bullish regression implying that stocks with higher Share incur greater profit in stock market bearish-bullish turning points.

RP(Ratio of pledged shares of insider ownership) is statistically significant at the 1% level during the bearish-bullish regression. The sign of the coefficient is negative in bearish-bullish regression implying that stocks with higher RP incur greater profit in stock market bearish-bullish turning points. RP variable is not as important in bullish - bearish turning points regression.

CEO(CEO Chair-Duality) is statistically significant at the 5% level during the bearish-bullish regression. The sign of the coefficient is positive in bearish-bullish regression implying that stocks with CEO Chair-Duality incur greater profit in stock market bearish-bullish turning points.CEO variable is not as important in bullish - bearish turning points regression.

FH(Foreign shareholding ratio) variable is not as important during the bearish-bullish regression and bullish-bearish turning points regression.

CCF(China concept factor) is statistically significant at the 10% level during the bearish-bullish regression. The sign of the coefficient is negative in bearish-bullish regression implying that stocks with China concept factor incur greater loss in stock market. CCF variable is not as important in bullish - bearish turning points regression.

5. CONCLUSIONS

This study focuses on the relationship between the Taiwan stock market returns around the bearish-bullish turning points and the systemic risk and corporate characteristics, such as the financial ratios, corporate governance, and the China-concept factors. The data used in this study is observed from 1997 to 2009. The sample companies in this study are the stocks listed in the Taiwan Stock Exchange.

We find that stocks with higher betas, higher MVBV, ,larger Size, high Share, CEO Chair-Duality, low TD, low RP, low ED and not China concept factor tend to increase stock returns during the bearish-bullish turning points. On the other hand, we also find higher betas, low MVBV, higher ROE, low TD, and low ED tend to decrease stock returns during the bullish - bearish turning points.

ABSTRACT

Previous studies argue that the CAPM based on the efficient market theory cannot explain the empirical results of certain asset-pricing anomalies. Moreover, many studies suggest that investor sentiments could shift the valuation away from the fundamental values by behavioral factors. In order to incorporate those anomalies and investor sentiments, this study uses the investor sentiment conditional information asset-pricing framework of Ho and Hung (2009) to discuss the effects during the bullish and bearish period in Taiwan Stock Exchange. Through our research result, we find that conditional CAPM seems to be more significant in bullish than in bearish. The z_{t-1} *in all specification are significant, and this is consistent with the model of Avramov and Chordia(2006). And these* β*s seem to be more significant in bullish than in bearish. We thought it is because the news on the newspaper are tend to be optimistic, so when the stock market is in the bullish, the sentiment effect will be more significant.*

1. INTRODUCTION

The capital asset pricing model (CAPM) of Sharpe (1964) and Lintner (1965) has long been a basic tenet of finance. The CAPM theoretically contends that systematic risk is measured by the exposure to the market portfolio, and investors would like to require stock return by the systematic risk from CAPM. In early tests of the Sharpe (1964)–Lintner (1965) mean-variance capital asset pricing model (MV CAPM), Black et al. (1972), Blume and Friend (1973) and Fama and MacBeth (1973), among others, find the estimated relationship between average excess return and beta is too flat and the intercept is positive. This led to a consensus that the Sharpe–Lintner riskfree rate version of the CAPM should be rejected and replaced by Black's (1972) zero-beta version. More recently, Fama and French (1992) find that beta alone does not explain the cross-section of expected returns.

In addition, certain studies argue that the CAPM based on the efficient market theory cannot explain the empirical results of the significant relationship between the stock returns and the firm size (Banz, 1981), value(e.g.,Chan et al., 1991), momentum (Jegadeesh and Titman, 1993)and liquidity(Pastor and Stambaugh, 2003). Consequently, these effects have been named as the asset-pricing anomalies. Besides, many studies suggest that investor sentiments could shift the valuation away from the fundamental values by behavioral factors(DeLong

and Shleifer, 1991; Shiller, 2000; Brown and Cliff, 2005), such as representativeness, conservatism(Barberis, Shleifer and Vishny, 1998) and overconfidence(Danie, Hirshleifer and Subrahmanyam, 2001).

Fisher and Statman (2000) find that the sentiments of both small and large investors are reliable contrarian indicators for future S&P500 index returns and that high consumer confidence is generally followed by low returns. Brown and Cliff (2004) document a relationship between institutional investors' sentiments and the returns on large size stocks. Charoenrook (2005) shows that changes in consumer sentiment are positively related to contemporaneously excess market returns. Some recent studies suggest that investor's sentiment has a negative relationship with stock returns in the long-run (e.g., Baker and Wurgler, 2006, 2007; Brown and Cliff, 2004), especially for those stocks whose valuations are highly subjective and difficult to arbitrage.

In order to incorporate those anomalies and investor sentiments, this study use the investor sentiment conditional information asset-pricing framework of Ho and Hung (2009) to discuss the effects during the bullish and bearish period in Taiwan Stock Exchange. Engle, Lilien and Robins(1987) use time-series method, and extent it to be conditional CAPM. They given the price of risk of market were fixed, and use excess return and conditional model, let the size and value effect to be more predictable. To illustrate time-varying betas, many studies have considered macroeconomic variables such as the term premium, default spread, or consumption-wealth ratio as conditioning variables (e.g., Shanken, 1990; Ferson and Harvey, 1991; Braun Nelson and Sunier, 1995; Ferson and Schadt, 1996; Jagannathan and Wang, 1996; and Lettau and Ludvigson, 2001).

As to the sentiment measures, two types of measures are widely used in the literature, namely, the direct and indirect measures(Brown and Cliff, 2004; Baker and Wurgler, 2006, 2007; Ho and Hung, 2009). This study is going to construct a direct measure of investor's sentiment by recording the frequency of discussions of stocks on some financial-related websites. Recently the Internet has become a very important tool for investors to get market information. Many studies use website data mining to develop sentiment measure and analysis (Das and Chen, 2007; Miao, Li and Dai, 2009; Li and Wu, 2009), but few studies use the frequency of investors' discussion on certain stocks as a sentiment measure. If certain stocks are mentioned more frequently on the website, it likely that the investors are paying more attention on those stocks, or, in other words, the investor's sentiment is relatively high.

The purpose of this study is to examine whether the conditional asset pricing model can explain the conditional expected returns. We run cross-sectional regressions of the estimated risk-adjusted returns on firm size, book-to-market ratio, liquidity and momentum effects. In addition, this study constructs a direct sentiment measure based on the frequency of discussions on the website. Finally, this model will be examined during the bullish and bearish period of the Taiwan Stock Exchange. . Huang (2006) argues that investors' sentiment could be different during the bullish and bearing periods. Following Pagan and Sossounov(2003), this study distinguishes the bullish and bearish periods and analyzes whether the results will be change when the investment atmosphere is different.

We first exam whether conditional models completely explain conditional expected returns and also use fixed effects estimation method to deal with the alpha Next, we evaluate the relative performance of various specifications of conditional asset-pricing models in respect of how well they capture the size, value, liquidity, and momentum effects. We use the two-pass regression framework of Ho and Hung (2009) we regress monthly individual stock returns on the risk factors of asset pricing models in which factor loadings may vary with conditioning variables. Especially, we set the sentiment to be a firm characteristic variable in our framework, and test it in two phases that the bullish and bearish periods. In the second-pass, we run cross-sectional regressions of the estimated risk-adjusted returns - the sums of the pricing error and the residual from the first-pass regressions - on firm characteristics of size, book-to-market ratio and variables representing the liquidity and momentum effects. The null hypothesis of exact pricing is that the conditional pricing models specified in the first-pass regressions successfully capture the anomalies on both period, and thus, the size, value, liquidity, and momentum effects do not explain the cross-section of risk-adjusted stock returns in the second-pass regressions.

This paper contributes to the literature in the following areas. First, we extend frequency of discussions on the website to be a deirct sentiment variable and using it to be a firm's characteristic, and then loading this factor in conditional CAPM. Most literature use macroeconomic sentiment variables to discuss the relationship between stock return and sentiment, such like Association of Individual Investor(AAII), ML(Merrill Lynch) or Consumer Confidence Index (CCI) (Schmeling, 2009, Lemmon and Portniaguina, 2006, Brown and Cliff ,2005, Ho and Hung, 2009),but few study use microeconomic sentiment variables to discuss it, so this study try to figure out whether stocks will influence by its own sentiment variable. It seem like when the news post in the media more frequency and investors will discuss more often (Sehgal and Song, 2007). If certain stocks are mentioned more frequently on the website or newspaper, it likely that the investors are paying more attention on those stocks, or, in other words, the investor's sentiment is relatively high.

Second, many study suggests that the betas will be different in bullish and bearish (Huang, 2006), so we use the simple framework of Pagan and Sossounov(2003) to distinguishes the bullish and bearish periods and analyzes whether the results will be change when the investment atmosphere is different, especially in Taiwan.

The rest of the paper proceeds as follows. The next section describes the two-pass methodology for examining various specifications of the asset-pricing models. Section 3 details the sentiment indices and the stock trading data used in the analyses. Section 4 examines whether conditional models completely explain conditional expected returns and presents the results of models in capturing the asset-pricing anomalies. Section 5 concludes.

2. METHODOLOGY

2.1. The two-pass framework

We assume that returns are generated by a conditional version of a K-factor model

$$R_{jt} = E_{t-1}(R_{jt}) + \sum_{k=1}^{K} \beta_{jkt-1} f_{kt} + e_{jt} \quad \text{.....(1)}$$

where $E_{t-1}$is the conditional expectations operator, $R_{jt}$is the return on security j at time t; f_{kt} is the unanticipated (with respect to information available at $t-1$) time t return on the k th factor, and β_{jkt-1} is the conditional beta corresponding to the k th factor. $E_{t-1}(R_{jt})$ is modeled using the exact pricing specification

$$E_{t-1}(R_{jt}) - R_{Ft} = \sum_{k=1}^{K} \lambda_{kt-1}\beta_{jkt-1} \quad \text{.....(2)}$$

where R_{Ft} is the risk-free rate and $\lambda_{kt}$is the risk premium for factor k at time t. The estimated risk-adjusted return on each security for month t is then calculated as

$$R_{jt}^{*} \equiv R_{jt} - R_{Ft} - \sum_{k=1}^{K} \hat{\beta}_{jkt-1}F_{kt} \quad \text{.....(3)}$$

where $F_{kt} \equiv f_{kt} + \lambda_{kt-1}$ is the sum of the factor innovation and its corresponding risk premium and $\hat{\beta}_{jkt}$ is the conditional beta estimated by a first-pass time-series regression over the entire sample period as per the specification given below. Our risk adjustment procedure imposes the assumptions that the conditional zero-beta return equals the conditional. The two-pass conditional framework can be summarized in a generic form as

$$R_{jt}^{*} \equiv R_{jt} - \left[R_{Ft} + \beta(\theta; S_{t-1}, z_{t-1}, X_{jt-1})'F_t\right] = c_{0t} + c_t Z_{jt-1} + e_{jt} \quad \text{.....(4)}$$

where $R_{jt}^{*}$is the estimated risk-adjusted return on stock j for time t and is equal to the sum of the intercept and the residual obtained from a first-pass time-series regression. θ denotes the parameters that capture the dependence of β on investor sentiment (S_{t-1}), default spread (z_{t-1}), and firm characteristics (X_{jt-1}). Ft is the vector of risk factors specified in the asset-pricing model. The vector of the conditional beta is estimated by the first-pass time-series regression over the entire sample period. $Z_{jt-1}$is the vector of the asset-pricing anomalies – the size, value, liquidity, and momentum effects – that we intend to capture. c_t is the vector of characteristics rewards.

Eq.(4) is a cross-sectional regression by which we run, in each month, the estimated risk-adjusted returns of individual stocks on the variables of size, B/M, liquidity, and prior returns. We test the null that the second-pass cross-sectional slopes on the asset-pricing anomalies are zero and statistically insignificant, that is $\hat{c}_t = (Z_{t-1}Z_{t-1})^{-1}Z_{t-1}R_{jt}^{*} = 0$, The adjusted R squared in the second-pass regression serves as an indicator for comparing the relative overall performance of the conditional specifications of the asset-pricing model.

To further illustrate the conditional models, we use the single-factor CAPM as an example to describe the empirical specifications. We set the sentiment to be a firm characteristic variable, so we modify the framework of Ho and Hung(2009) in the first-pass regression for stock returns. To describe the beta modeling in the time series regressions, let us focus on the one factor CAPM, and we assume that there is a single macroeconomic predictor z_{t-1}. The

beta of the excess market return, β_{jt-1}, can be expressed as a function of investor sentiment (S_{t-1}), default spread (z_{t-1}), and firm characteristics ($SIZE_{jt-1}$ and $(B/M)_{jt-1}$) as

$$\beta_{jt-1} = \beta_{j1} + \beta_{j2} z_{t-1} + (\beta_{j3} + \beta_{j4} z_{t-1}) S_{t-1} + (\beta_{j5} + \beta_{j6} z_{t-1}) SIZE_{jt-1} + (\beta_{j7} + \beta_{j8} z_{t-1})(B/M)_{jt-1} \quad (5)$$

where $SIZE_{jt-1}$ and $(B/M)_{jt-1}$ are the market capitalization and the book-tomarket ratio at time $t-1$. In the empirical examinations, beta is modeled under four specifications. In the first, the unconditional one, all βs except for β_{j1} are restricted to be zero. The next three are conditional versions:
(i)$\beta_{j2} = \beta_{j4} = \beta_{j6} = \beta_{j8} = 0(ii)\beta_{j3} = \beta_{j4} = \beta_{j5} = \beta_{j6} = \beta_{j7} = \beta_{j8} = 0$(iii)all βs are allowed to depart from zero. To illustrate, the first pass time series regression for the very last specification is

$$r_{jt} = \alpha_i + \beta_{j1} r_{mt} + \beta_{j2} z_{t-1} r_{mt} + \beta_{j3} S_{t-1} r_{mt} + \beta_{j4} z_{t-1} S_{t-1} r_{mt} + \beta_{j5} SIZE_{jt-1} r_{mt} + \beta_{j6} z_{t-1} SIZE_{jt-1} r_{mt} + \beta_{j7} BM_{jt-1} r_{mt} + \beta_{j8} z_{t-1} BM_{jt-1} r_{mt} + u_{it} \quad (6)$$

wherer_{jt}=$R_{jt} - R_{Ft}$ and r_{mt} is excess return on the value-weighted market index. Note that the firm characteristics size, book-to-market ratio, sentiment and the macroeconomic predictor are all lagged one period as compared to the excess market and individual stock returns. R^*_{jt} in Equation (4), the dependent variable in the cross-section regression, is given by $R^*_{jt} = \alpha_i + u_{it}$. The time series regression (6) is run over the entire sample.

The asset pricing models we have considered in second-pass is the Fama-French (1993) three-factor model augmented by the Pastor-Stambaugh (2003) liquidity factor and the winners-minus-losers portfolio (WML) which proxies for the momentum factor. The equation is below.

$$r_{jt} = \alpha_i + \beta_{jm} r_{mt} + \beta_{jSMB} SMB_t + \beta_{jHML} HML_t + \beta_{jPS} PS_t + \beta_{jWML} WML_t + u_{jt}$$

u_{jt} is the error term. *SMB* denotes the monthly return difference between the average return on the three small size portfolios minus the average return on the three big size portfolios. *HML* denotes the monthly return difference between the average return on the two value portfolios minus the average return on the two growth portfolios. *PS* is the Pastor-Stambaugh (2003) liquidity factor constructed by the difference between the value-weighted return on the high liquidity sensitive portfolios and the value-weighted return on the low liquidity sensitive portfolios. *WML* is the momentum factor that represents the difference between the returns on the winner and the loser portfolios of the momentum strategies depicted by Jegadeesh and Titman (1993).

3. DATA

3.1. Sentiment Index

We calculate the monthly frequencies of stock-related news for each individual stock as our sentiment index. If the news of certain stock show up more frequently during a certain period, we assume that the sentiment for that stock will be relatively high. The index is constructed as follows:

$$\text{Sentiment Index}_i = \text{Ln (monthly frequencies of stock-related news)}_i$$

for each individual stock i.

3.2. Trading data

Data are collected from TEJ for the period from Mar 2000 to Feb 2010. We use the monthly report data for those listed companies whose stocks are listed in the TSEC Taiwan middle 100 Index. Some studies suggest that smaller or hard-to- arbitrage stocks will be more difficult to evaluate, and therefore are more likely to be influenced by sentiments (e.g., Baker and Wurgler, 2006, 2007; Brown and Cliff, 2004). Consequently, we choose Taiwan middle 100 stocks as our sample companies.

We use the TAIEX value-weighted returns as a proxy for the market returns. Our monthly variables are the levels of S (sentiment index), SIZE and B/M (the natural logarithms of a firm's market capitalization and the book-to-market ratio, respectively) TURNOVER (the ratio of trading volume to the number of shares outstanding), RET2-3, RET4-6 and RET7-12 (the cumulative returns over the past second through the past third, the past fourth through the past sixth and the past seventh through the past twelfth months, respectively) and default spread (z, the return difference between capital loan rate and government bonds of ten year period).

3.3 bearish-bullish period

We identify bearish and bullish periods using the approach of Pagan and Sossounov (2003). The Pagan and Sossounov (2003) adaptation of the Bry-Boschan (BB) algorithm can be summarized as follows:

1. Identify the bullish and bearish by using a window of 8 months.
2. Enforce alternation of phases by deleting the lower of adjacent bullish and the higher of adjacent bullish.
3. Eliminate phases less than 4 months unless changes exceed 20%.
4. Eliminate cycles less than 16 months.

The Taiwan stock market bearish and bullish period from 1997 to 2009 are presented below (Table 3.3.1):

Table 3.3.1 Classification of bearish-bullish.

Bearish	Bullish
1997 / 7 ~1999 / 1	1999/1~2000/5
2000/5~2001/9	2001/9~2002/5
2002/5~2003/4	2003/4~2004/11
2004/11~2005/10	2005/10~2007/10
2007/10~2008/1	2009/1~2009/9
2008/5~2009/1	

Table 3.3.2 shows the sample period used in this study, which is one month after the bearish-bullish turning point.

Table 3.3.2 Sample Period in this Study

Bearish	Bullish
1997/8	1999/2
2000/6	2001/10
2002/6	2003/5
2004/12	2005/11
2007/11	2009/2
2008/6	

4. EMPIRICAL RESULTS

First, we regress the first pass time-series regression for estimating the βs so that we can calculate the $R_{jt}^{*} = \alpha_i + u_{it}$ for second-pass cross-section regression. And we have three specifications need to test in Bullish and Bearish. See Table 1-2.

$(i)\beta_{j2} = \beta_{j4} = \beta_{j6} = \beta_{j8} = 0\ (ii)\beta_{j3} = \beta_{j4} = \beta_{j5} = \beta_{j6} = \beta_{j7} = \beta_{j8} = 0\ (iii)$all βs

All the R^2 seem to increase when we add our variable. The z_{t-1}in all specification are significant, and this is consist with the model of Avramov and Chordia(2006). Next we will work on the second-pass regression yet, which will be finished shortly.We can then calculate the $R_{jt}^{*} = \alpha_i + \mathcal{U}_{it}$ for the second-pass cross-section regression, after estimating these βs.

5. CONCLUSIONS

This study uses the investor sentiment conditional information asset-pricing framework of Ho and Hung (2009) to discuss the effects during the bullish and bearish period in Taiwan Stock Exchange. The z_{t-1}in all specification are significant, and this is consist with the model of Avramov and Chordia(2006). And these βs seem to be more significant in bullish than bearish. We thought it is because the news on the newspaper are tend to be optimistic, so when the stock market is in the bullish, the sentiment effect will be more significant.

AN ANALYSIS OF DEMAND FOR LIFE INSURANCE – PROFITABILITY REGIONS. AN EMPIRICAL STUDY

Adam Sliwinski*, Warsaw School of Economics, Poland

* - Reader, Warsaw School of Economics at General Insurance Department, Finance and Management College. He also holds the position of economist at the Postal Mutual Insurance Company. He has published two books on insurance and insurance risk analysis. He was Postdoctoral Fellow at the School of Slavonic and East European Studies (University College London), funded by the Foreign and Commonwealth Office and the Foundation for Polish Science and as such, was an Honorary Research Assistant at SSEES, University College London. He also completed visiting position at Cass Business School, City University London.

ABSTRACT

The aim of the paper is to demonstrate the effect of the regional death risk differentiation method upon the financial management and effectiveness of life insurance. Such an aim involves answering the question of whether the application of regional death risk differentiation in the process of financial management can improve effectiveness of life insurance companies or rate of return of life insurance contract?

The above issue is explored on the basis of empirical research undertaken by the author. The research followed the pattern of premium differentiation for the main categories of assurance by special so called profitability regions. The study is based on the demographic data which refers to territory of Poland. First, the profitability regions are created. Regions are comprise by all Polish voivodeship (preliminary regions). The final stage is an approach to proof that the regional differentiation of an insurance rate has an improving effect on overall profitability of an life insurance contract. That is checked by implementation of an approached provided by D. Moffet[1] who calculated effective rate of return on life insurance.

JEL classification: G32, C1
Keywords: life insurance, spatial risk analysis, pricing of life insurance

1. INTRODUCTION

Insurance companies are complex economic institutions of a specific structure, distribution and financial system. Financial management of insurance, like other companies are part of the general economic phenomena associated with the accumulation and redistribution of funds.

The specific nature of "insurance product", especially life insurance, its long-term nature, heterogeneous and intangible nature distinguish economies of insurance from other economic

[1] D. Moffet, *An analysis of the Demand for Life Insurance: Mathematical Foundation*, The Journal of Risk and Insurance, Vol.46, No 2 (Jun 1979) pp.87-98

institutions.

Some of the most important metrics for the assessment of the insurance company is financial result (profit). "The financial result mirrors the relevance of the strategy for the insurance company, as portfolio management and accuracy of calculation of costs of risk. ". The costs reflect the level of insurance premiums.

In the fierce competition and the risk of losing the trust of customers, insurance, especially life insurers must constantly look for new factors of competitiveness. One of the key areas to create competitive advantage is the modification of the offer of life insurance products. One of the main factor which determines the sale of life insurance is the price. Previous research conducted by the author shows that the price determines the demand for life insurance in Poland [2]. It is interesting that in the first period after the transformation of the nineties the relationship between price and demand for life insurance were added. Demand has grown with the increase in prices. Life insurance was a luxury good. Having a long-term policy was seen as a social advancement. After several years of market development, this relationship was reversed. The lower the price the higher the demand for life insurance. Life insurance companies using this tendency should optimize the level of contributions due to different criteria. Optimization should provide long-term financial solvency of insurer. The paper contains a proposal for spatial risk diversification in the long-term insurance. The condition of spatial differentiation is a significant variation in the level of risk of death occurring in different regions. The paper aims to present the results of studies on death risk analysis in Polish regions. The result is division of the Polish territory, in a number of so-called profitability regions. In the future, life insurance companies could differentiate the level of insurance premiums by the risk of death in those regions. The study is based on the demographic data which refers to territory of Poland. First, the profitability regions are created. Regions are comprise by all Polish voivodeship (preliminary regions). Preliminary regions are merge together by comparison of the main characteristic of death probability distribution. The cluster analysis is applied into the merging process. The final stage of the paper is an approach to prove that the regional differentiation of an insurance premiums has an improving effect on overall effectiveness of an life insurance contract. The approach provided by D. Moffet[3] is implemented to verify it.

2. LITERATURE REVIEW

The decent justification for such a research is luck of the previous study on the spatial death risk differentiation and its application into the process of life insurance pricing. After the in-depth literature analysis only two papers were found on the similar. First is the study provided by B.Babel, S. Eckel, R Schmidt and V Schmidt[4]. The stated authors have studied

[2] A.Sliwinski, T.Michalski., M.Rószkiewicz, *Determinants of the consumption of life insurance in Poland,* Journal of Wroclaw Economic University, Wroclaw 2010 (forthcoming)

[3] D. Moffet, *An analysis of the Demand for Life Insurance: Mathematical Foundation*, The Journal of Risk and Insurance, Vol.46, No 2 (Jun 1979) pp.87-98

[4] B. Babel, S. Eckel, R Schmidt and V Schmidt, *Mortality maps based on spatial extrapolation*, working paper of University of ULM, available at: http://www.mathematik.uniulm.de/stochastik/personal/eckel/Publications/MortalityMaps20060131.pdf

the difference between mortality rate according to Germans regions. They created the mortality maps for East, West and South Germany for the various age groups. After the mortality analysis the authors discussed the possible consequences of observed differences for the risk based pricing of life insurance. They concluded that the regional differences of mortality in South, East and West Germany have implication on the premium of life insurance contract or pension plans.

Second paper is the paper written by D.Moffet[5]. In the paper the problem of life insurance effectiveness determination by the way of death risk calculation is described. The author touched the problem of effective rate of return on life insurance contract form the perspective of policyholder. As an example he used whole life insurance policy issued to a male, age 22, at a annual premium of 101USD. In his model which is briefly described later in the text the rate of return is influenced by the choice of the survival probability. Consequently the rate is sensitive to the probability of survival. Thus there is a question if in terms of created regions in Poland the differences in probability of survival influence significantly the effective rate of return. If yes, that would be one of the justification for risk based pricing of life insurance contracts in Poland. The biggest the effective rates the better for the client and in hence the overall demand for life insurance polices improve.

3. METHODOLOGY AND DATA

The paper consist two main parts. In the first part the regions are merged into so- called profitability regions. That part consist the demographic analysis. To provide the study the demographic data are used. The database covers 16 Polish provinces (regions) and includes information about the population of regions in the years 1999 to 2003. For regions obtained the following data:

1. size of the population by individual age (from 0 to 100 years), separately for men and women;
2. number of deaths from regions (deaths in older and younger deaths by individual age from 0 to 100 years),
3. number of births in different regions.

Table 1 presents the summary of established regions taken together with their coding used by Polish Central Statistical Office.

[5] D.Moffet, *An Analysis of the demand for life Insurance: Mathematical Foundations,*The Journal of Risk and Insurance, Vol.46, No.2 Jun.1979.pp87-89

Source: Polish Central Statistical Office.

In the first stage there is an estimation of the frequency of deaths for the people aged from 5 to 84 years. The calculations were made separately for all studied regions. Age restriction stems from the fact that in the age ranges from 0 to 4 years we have a heterogeneous distribution of empirical probabilities of death. Thus in this age range processes, extinctions processes are difficult to theoretical modeling. The probabilities of death over the age of 84 years are extrapolated on the assumption of exponential function. In the presented studies frequency of death is used to characterized different regions. Narrowing the age range will not affect the importance of the achieved results and their interpretation from the perspective of optimizing the level of premiums for life insurance. The largest group of life insurance customers are people in so-called production aged. The general conditions of insurance companies offer life insurance limit access to the upper age 65-70 years depending on the type of product and system of premium payment. Age of admission to life insurance contracts more than 65 years usually refers to the situation of one-instalment of total premium, and it is associated with the unit – linked life insurance products. Analysis of risk of death in the accepted age range, and the separation regions on the basis of a similar level of probability will correspond to the needs of life insurance companies.

Then after the calculation of frequency of death by individual ages and separately for the regions other variables were chosen to compare the regions by probability of death distribution. The comparison let to merged the regions in so-called profitability regions.

In order to identify the profitability regions cluster analysis were used. Cluster analysis was made separately for two moments in time. The first group was made for the implementation of features evaluated on the basis of data from the years 1998/1999. Then the analysis was repeated using the characteristics of the estimated value based on data from the years 2002/2003. This approach allowed the analysis of the changes that have occurred in the 5

years period. Segmentation was based on the Ward algorithm for 16 regions with 5 variables. Used variables are:
1. the average age of people living in the region (Var1),
2. frequency of deaths in middle-aged people living in the region (Var 2),
3. parameter B of Gompertz function (Var 3)
4. parameter h of Gompertz function (Var 4),
5. participation of men in the average age in the total number of people in average age residing in the region (Var 5).

The result of the first part of the research are clusters which includes the regions that could be characterized by similar probability of death distribution. The results could be used by life insurance company to implement risk based pricing of life insurance contracts. The company could value the premiums separately for achieved profitability regions.

In the second part of the paper Moffet's approach is implemented to check if the risk based strategy influences the effective rate of return of life insurance contract.

4. THE CHARACTERISTIC OF CHOSEN VARIABLES

4.1 Average age of the region's population

Average age is a variable chosen for the test. This variable was chosen because the distribution of the probability of death determines the level of that probability for a person at a given age. Average age were counted as a weighted average, where weights are the number of people living in the age of the region. Table 2 presents the results of calculations of average age in the different regions in the analyzed periods.

Table 2. The average age of population living in the region between 1999 and 2003.

No	Regions	Code	Average age		Difference	Change [%]
			1999	2003		
1.	Dolnoslaskie	D02	36	38	2	5,6%
2.	Kujawsko-Pomorskie	C04	35	36	1	2,9%
3.	Lubelskie	L06	36	37	1	2,8%
4.	Lubuskie	F08	35	36	1	2,9%
5.	Ludzkie	E10	38	39	1	2,6%
6.	Malopolskie	K12	35	39	4	11,4%
7.	Mazowieckie	W14	37	38	1	2,7%
8.	Opolskie	O16	36	37	1	2,8%
9.	Podkarpackie	R18	34	36	2	5,9%
10.	Podlaskie	B20	36	37	1	2,8%
11.	Pomorskie	G22	35	36	1	2,9%
12.	Slaskie	S24	36	38	2	5,6%
13.	Swietokrzyskie	T26	36	38	2	5,6%
14.	Warminsko-Mazurskie	N28	34	36	2	5,9%
15.	Wielkopolskie	P30	35	36	1	2,9%
16.	Zachodniopomorskie	Z32	35	37	2	5,7%

Source: Calculation done by the author based on data published by Polish Central Statistical Office.

In the period considered the average age increased in all regions analyzed. The largest increase, equal to 11.4% took place in the region of K12 (Malopolskie). In nine regions, the average age has increased more than 2%, but not more than 3%. The other six regions, the average age increased by more than 5%. The lowest average age change occurred in the region of W14 - Mazowieckie region. This may be due to the arrival of younger people in connection with the dynamically developing economy of the region, labor market and in total better prospects for the future.

4.3 Frequency of death

Second variable includes information about the number of people living and the dead at a given age. It is an estimator of the probability of death. The adopted frequency of death taking into consideration information on the number of people who died in average age. This information is important for life insurance. The risk of death is the primary factor determining the level of insurance premiums. For the study the frequency of death counted on the basis of empirical data is used. Frequency comparisons were made for people in average age in the regions separately for two moments in time. Taking into account the characteristics of the distribution of probability of death is known that the level of the probability increases with age. For life insurance companies is important to have an information about the direction and strength of changes in the frequency of deaths of people at any given age. Table 3 presents estimates of the frequency of deaths of people in average age, and changes in a given period of time for different regions.

Table 3. The frequency of death in average aged of population living in the regions between 1999 and 2003.

No	region	Code	Frequency of death		Difference	Change[%]
			1999	2003

5.	Ludzkie	E10	0,00298	0,00291	-0,00007	-2,3%
6.	Malopolskie	K12	0,00188	0,00231	0,00043	22,7%
7.	Mazowieckie	W14	0,00357	0,00092	-0,00265	-74,2%
8.	Opolskie	O16	0,00107	0,00139	0,00032	30,0%
9.	Podkarpackie	R18	0,00130	0,00138	0,00008	6,2%
10.	Podlaskie	B20	0,00135	0,00208	0,00073	54,1%
11.	Pomorskie	G22	0,00127	0,00158	0,00031	24,5%
12.	Slaskie	S24	0,00144	0,00202	0,00059	40,8%
13.	Swietokrzyskie	T26	0,00159	0,00094	-0,00065	-40,8%
14.	Warminsko-Mazurskie	N28	0,00114	0,00164	0,00050	44,4%
15.	Wielkopolskie	P30	0,00174	0,00155	-0,00019	-10,8%
16.	Zachodniopomorskie	Z32	0,00273	0,00187	-0,00086	-31,4%

Source: Calculation done by the author based on data published by Polish Central Statistical Office.

Analyzing the results shown in the table 3 it is visible that the level of death rates behaved differently depending on the region. In eight regions, there is a fall in the frequency of deaths in average age. The highest decrease was observed in the region W14 - Mazowieckie. In other regions, the frequency of death of people in average age increases. The highest increase was recorded in the region of B20 - Podlaskie.

4.4 Parameters of Gompertz law of mortality

Gompertz law of mortality[6] is based on the assumption of exponential distribution of probabilities of death. The law is based on the hypothesis of the so-called the human life force. Gompertz understood human life force as an inverse of the force of mortality (1 / μx (t)). He accepted that the loss of life force is proportional to the size of this force at any given time and the period in which the loss occurred. At the end he received the following formula:

$$\mu_x = Be^{hx} = Bc^x, \qquad (1)$$

where *B* and *h* are constant over the range of age considered. The parameter *B* determines the level of force of mortality of infants. However, the higher the value of the parameter *h* the force of mortality for the population is changing slower. Calculation of parameters may give rise to calculate force of mortality for separate Polish regions. Table 4 contains the estimates of Gompertz parameters of the exponential function (B, h) for all investigated regions separately. The analysis was based on demographic data from 1999 and 2003. This approach allows the assessment of changes in the force of mortality in regions within the period of 5 years. Estimates were based on the smoothed distributions of the probabilities of death in different regions. In order to smooth the empirical probabilities of death by individual ages moving average was used according to the Polish Central Statistical Office's methodology[7].

[6] The full description of Gompertz law of mortality could be found for example at: A. Neil, *Life contingencies*, Heinemann, London 1983, pp.27

[7] The methodology could be found at: *Life Table of Poland 2007*, GUS, Warsaw 2008, pp.34

Analyzing the above parameters of Gompertz function is visible that they differ in the regional section. For example, the parameter *B* for the region marked with the symbol Z32 is *0.0003* for the parameter *h* equal to *0.0793*. For the region D02 *B = 0.0002*, *h = 0.0817*. In 1993, the coefficient *B* takes three values equal to: *0.0001*, *0.0002* and *0.0003*. According to this parameter, all analyzed regions can be divided into three groups corresponding to three different values of the parameter. In 2003, you can not see the value of *0.0003*.

4.5 Population structure

The share of middle-aged men in the total number of persons of the same age living in different regions were used due to the fact that the probability of death for men in that age is higher than the probability of death of women in the same age. This trend is visible by analyze the life expectancy tables on Polish territory. Table 5 compares the probability of death of selected age group of men and women. The probabilities are estimated based on data from the year 2006 for whole territory of Poland.

Table 5. Comparison of probabilities of death for men and women in Poland.

Age	Probability of death		Difference (1-2)
	Men (1)	Women (2)	
15	0,00329	0,00122	0,00207
20	0,00537	0,00130	0,00407
25	0,00593	0,00147	0,00446

Increased participation of men in total region population, due to higher probability of death would have negative impact from the perspective of life insurance company. Table 6 contains the estimated share of men in the population of polish regions.

Table 6. The share of middle-aged men in the total number of people living in the region at this age in the years 1999 and 2003.

Source: Author.

The share of middle-aged men in the total number of persons in this age of regions varies around 50%. Comparing the shares in two periods, could be seen that the share has changed slightly. In the nine regions male participation has decreased, but increased in seven. The highest growth was recorded in the region G22 - Pomorskie. The decrease occurred in the region A16 - Opolskie.

5. SPATIAL ANALYSIS OF RISK OF DEATH AND THE SO-CALLED PROFITABILITY REGIONS

Cluster analysis was made separately for the two moments in time. The first grouping was made for the implementation of variables evaluated on the basis of data from the years 1998/1999. Then the analysis was repeated using the estimated value characteristics based on data from the years 2002/2003. This approach allowed the analysis of the changes that have occurred in the period of 5 years. Segmentation was based on the Ward's algorithm for 16 regions with 5 above described variables. Before cluster analysis all variables were standardized. Standardized values of variables for the years 1999 and 2003 are summarized in Tables 7 and 8.

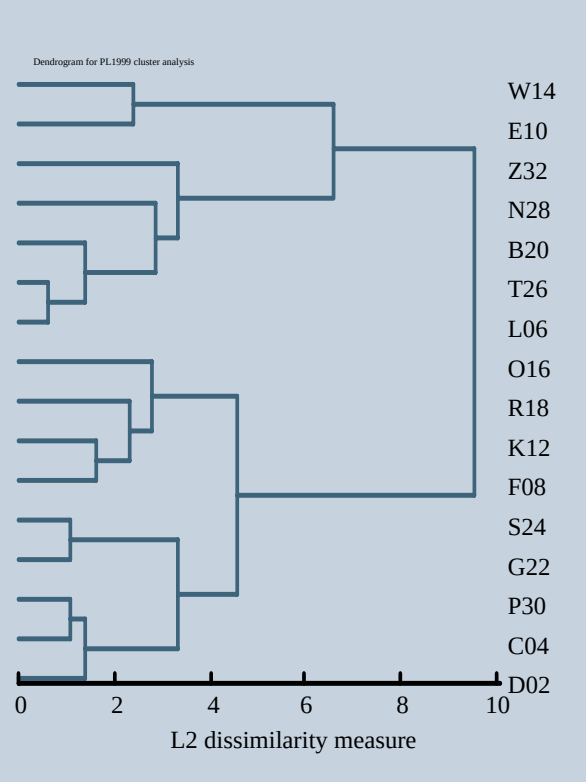

Figure. 1. Clusters for the regions – 1999. Source: Author.

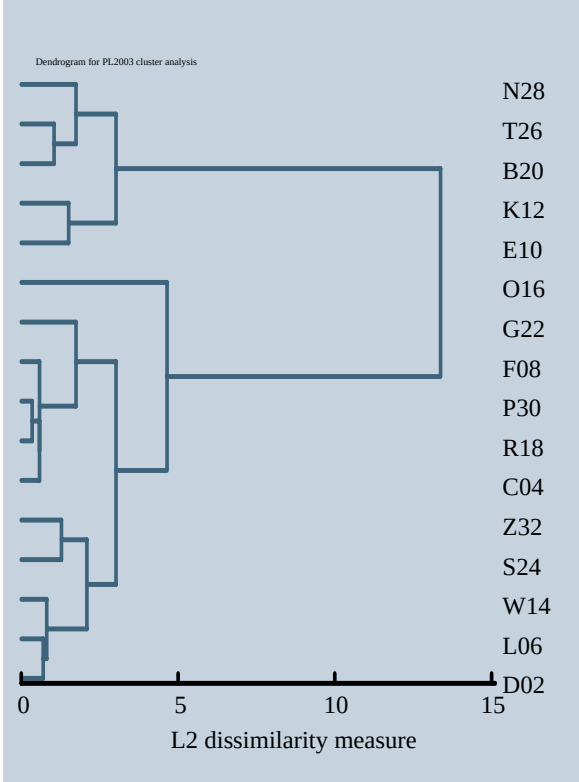

Figure. 2. Clusters for the regions – 2003. Source: Author.

There has been a change in the similarity of the regions due to the value of the analyzed variables within the period of 5 years. Presented clusters differ. The allocation of regional groups (clusters) has changed in the period under review. For example, at the level of similarity measure equal to 6 in 1999 is subdivided into three clusters. With the same similarity measure in 2003, the regions can be grouped into two clusters. Extracted at a fixed level of similarity measurement areas (clusters) and regions belonging to them are summarized in Table 9. The extracted regions could be characterized by different risk of death. Therefore life insurance companies might implement the proposed approached to risk based pricing strategy. However before the implementation the influence has to be proved. If there is an influence on overall profitability of life insurance contract the regions could be so-called profitability regions. To show the possible effect of regional risk differentiation on the life insurance contract effectiveness Moffet approach is used. The results are shown and described in the next section of the paper.

6. EFFECTIVE RATE OF RETURN OF LIFE INSURANCE CONTRACT

The characteristic of distribution of probability of death was used as a general factor of merging regions. However Moffet proved that the effective rate of return on life insurance seen to be related to the consumer's subjective probability of survival. There is an obvious relation between probability of death (q) and the probability of survival (p) where q=1-p. Moffed in his research introduced new approach to the topic of life insurance based on matrix analysis. The life insurance contract[8] in the year t^{th} could be written as the following vector:

$$[P+V_{t-1},Q,V_t], \quad (2)$$

where:
P- premium,
Q – face amount,
V_t – cash value available at the end ot the t^{th} year.

[8] D.Moffet, *An analysis of the Demand for Life Insurance: Mathematical Foundations*, The Journal of Risk and Insurance, Vol. 46, No.2 pp.96

Application of the *principal of equivalence*[9] yields the following expressions for the effective rate of return r_t:

$$r_t = \left[\frac{(1-p_t)Q + p_t V_t}{P + V_t} - 1\right](100), \qquad (3)$$

where:
p_t – policyholder survival probability in the year *t*. Using the above formula Moffet calculated the rate of return on an example of the $10.000 whole life insurance policy issued for a male age 22, at an annual premium of $101. The rate of return is sensitive to the probability of survival. The same example is used to show the influence of the probability of survival calculated separately for polish received clusters. The results are shown in table 10.

Table 10. Rate of return for received clusters – 2003.

t	V_t	p_t	r_t (%)	Cluster I		Cluster II		Difference
				p_t	r_t(%)	p_t	r_t (%)

Source: D. Moffet. op.cit. pp.97 and own calculation for cluster I and cluster II.
In general the differences are not so significant however the rate of return varies by received clusters. The smaller probability of survival the higher rate of return. It could be seen that the rates are higher in terms of cluster I.

[9] The paradigm of traditional life insurance is the so-called principle of equivalence, which is based on the notion of risk diversification in a large portfolio under the assumption that the future development of interest rates and other relevant economic and demographic conditions are known.

7. CONCLUSIONS

The Polish life insurance industry has grown rapidly during the transition period. The changes concern almost all life insurance aspects, especially the level of competition. The number of companies raised more then eight times in comparison to 1991 when new reforms were implemented. Life insurance companies should constantly improve their competitiveness to attract more costumers. The negative influence of financial crisis and the final lost of trust to life insurance companies also caused the need for new strategies of life insurers. One of the new approach to the costumers could be risk based pricing. Currently life insurers differentiate premiums by sex. The results described in the paper proved that the premiums could also be differentiated by regions. However, first the demographic study is needed. There is no need to calculate premiums separately for each regions of particular country owe to the level of risk of death which is similar for some regions. Therefore, before the premium calculation the regions could be merged in to so-called profitability regions. Seems that cluster analysis is really useful to do that merging. However the variables chosen for the study are always disputable and the final result of merging depends on the kind of variables used to compare the regions. The main intention of the author of the paper was to show the possible direction for life insurers in terms of risk based pricing. The study shows that the similarity of probability of death distribution allows to create two clusters (profitability regions). Implementation of that approach also has an influence on the rate of return on life insurance. Hence the results of the study should be in a scope of interest of life insurers. There is also no legal limitations. According to polish insurance law insurance companies are obliged to collect statistical and actuarial data which then might be use to calculate insurance premiums and eventually to the process of premium differentiation. Only the differentiation of the premium by pregnancy and maternity is formally prohibited.

ABSTRACT

For many years in Taiwan's local government, especially on the level of township street light maintenance keeps at the traditional manual operation manner. It has significant difference to the underlying goal of electronic government (e-government) general policy and cannot effectively approach public sector service-oriented task. The existing study, however, seldom discussed on the computerised civil convenience-oriented service systems of the townships which involve in some research fields i.e. enterprise, government, and social community. The authors of this article were taking the experience and knowledge about participate the electronic civil administration system to combine with the literature, the analysis and integration on the questionnaire to the resident in the townships. The conclusion above wishes to offer the academician and government decision makers the reference on promoting electronic civil administration and the follow-up study.

Keywords: Electronic government (e-government), Electronic civil administration, Township office management, Outsourcing of public-sector services.

INTRODUCTION

In the past years, the experience of civilians waiting for public services often time-consuming that even much slower than taking public obligations. Insufficient transparency, inefficiency and ineffectiveness often were blamed on the whole service procedure. Despite the concept of electronic governance (E-governance) is becoming an important role in the existing governance (Kieran and McDonagh, 2006), many of previous literatures were emphasis the quality of website design and connectivity (Reichheld et al., 2000a, 2000b.), influence of democratization (Lowndes and Sullivan, 2004), and local welfares (Granberg, 2008). Later, Deliotte and Capgemini (2008) proposed that two sub-dimensions of E-governance effectiveness were conducted to ease administrative load and inhabitants' satisfaction respectively. Above these studies, however, were only focused on European countries E-governance development instead of aimed at specific administrative work. In addition, previous works were more concerned about the level of E-governance policy-making (RDEC, 2003), a conceptual framework (Kumar et al, 2007), and nation's information communication and technology (ICT) infrastructure construction (Colesca and Loliana, 2009). Fewer described that the level of local government carrying out E-governance administrative

measures in addition to Keiran and McDonagh (2006)'s study on a county authority undertaken public service modernisation in E-governance.

This article is aiming at the town level E-governance based a specific case of the electronic street lights maintenance system (ELMS) implementation. A failed street lamp may cause public safety and traffic accident problem in the region. Without doubt, quick response under fault condition of failed street lamp is worth to make effort administrative work. This study is surveying numerous representative townships where have using ELMS experience through residents' perspective on this specific E-governance administrative that revealing some implications as the reference to the subsequent study.

METHODOLOGY

Sampling

The survey areas covered 3 townships where are employs ELMS more than 4 years in Taiwan. In an attempt to explore impact of using e-service in ELMS, the survey respondents are town resident. Every questionnaire items on Likert 5-point scale and the options description is depend on dimensions. The survey period is from 2009/12/1 to 2010/1/31, and 390 questionnaires were issued. For precisely measuring, prior to this survey, has excluded invalid questionnaires as well as interviewee who are not willing to answer. Thus, 280 valid responses (approximately 72%) were conducted with *face to face* interview.

Variable selection

In order to measure the value of services in town's using ELMS, this article classifying *service content* dimensions which developed by Ruiz et al. (2007) as follows: service quality, service equity, confidence benefits, perceived sacrifice, service value, customer satisfaction and repurchase intensions. Part of the dimensions in the study that can be interesting derived from the last 'repurchase intensions' that may certain interpret the support extent of town residents for incumbent town managements.

RESULT

Table 1 shows the perspective of town resident opinions on service content after towns ELMS using. The study KMO value is 0.76 and the Barlett test is significant revealed ($p<0.001$). In the dimension of *service quality*, the interviewees are general satisfaction with ELMS implementation (35%) and what is more 'extremely satisfied' with ELMS having 18.9%. In the section of *service equity*, 42.3% comments agreed that they are being treated fairly whilst meet the trouble about street lamp failed since ELMS operation. The general comment on *confidence benefits* is occupied 57.8% as recognize town residents have a strong confidence in ELMS service. Whilst asked about town residents whether they have experiencing be trade-off to get the new-style service, 63.6% comments considered that they have not *perceive sacrifice* on ELMS. 37.5% regard ELMS as 'worthy' as even 30.7% as 'absolutely worthy' on the dimension of *service value* perception. In the section of *customer satisfaction*, most of interviewee is extremely satisfied with ELMS (45.7%). Interestingly, whilst asked about *repurchase intentions* interpreted as 'reconsider incumbent management'

or their political organization in the next town election, despite more than half expressed they will support it, however, not significant enough compare to other dimensions.

Table 1. Questionnaire result after towns implementation of ELMS

Sample items	Frequency	Percentage(%)
Service quality		
Satisfied	98	35
Extremely satisfied	53	18.9
Service equity		
Upgraded	120	42.3
Confidence benefits		
Have it	162	57.8
Perceive sacrifice		
Not much	178	63.6
Service value		
Worthy	105	37.5
Extremely worthy	86	30.7
Customer satifaction		
Extremely satisfied	128	45.7
Satisfied	88	31.4
Repurchase intentions		
Will re-buy	98	33.2
Absolutely will re-buy	62	22.1

IMPLICATIONS

Accretion 'electronic' concept of existing civil services

Taiwan has been started E-Government Program since 1997. The initial stage of the program is strengthening ICT network infrastructure environment (Wu, et al, 2002). The major goal of E-Government program is to establish 'competent' and 'competitive' government (RDEC, 2003). After over 10 years with ICT infrastructure development, Taiwan, as well as Sweden, was ranked 9th among the 34 countries and region on the World e-Government Ranking survey by Institute of E-Government at Waseda University, Japan, in 2008 (Obi, 2008).

The sector of township level, in practical terms is frequently limited to budget unequal distribution. The township level formulating fiscal policy regularly under the factions (*paixi*) pressures especially wrestling in the town council. Faction in the town level is mostly maintains good relationships with the ruling party due to interacting the interests instead of royalty (Rigger, 1999). In addition to the civil service recruited through public competitive examinations, more township employees employed by faction supports included managements of town office. Hence, compared to the superior level, town level policy implementation is must be more closely local needs that are also performed faction demands. The subjective and objective conditions of electronic services is just right to fit the township management are paying attention on administrations *as can be seen* (fig.1).

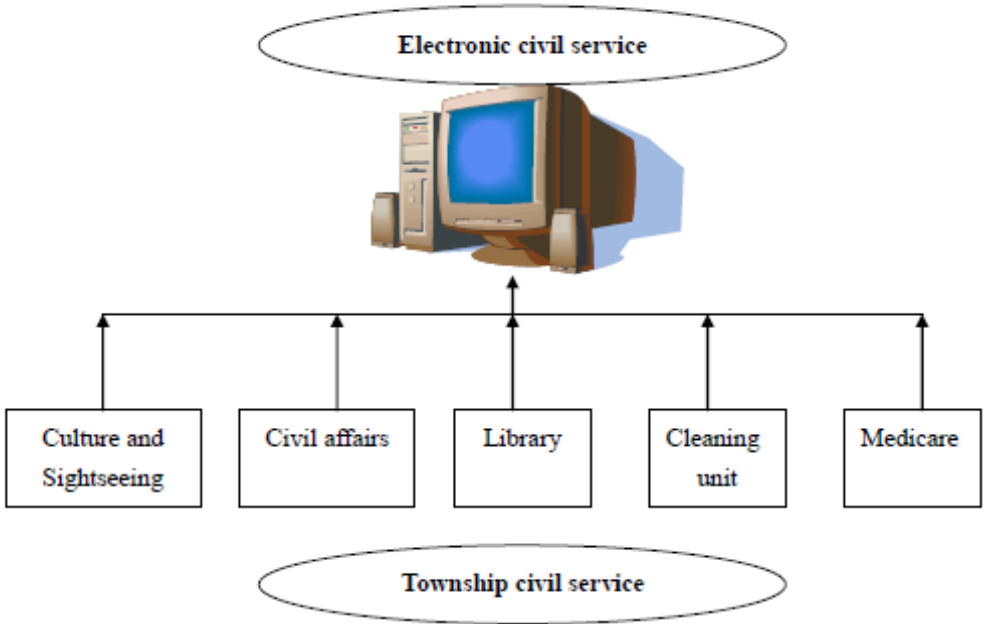

Figure 1. Accretion 'electronic' concept of existing civil services

Therefore, the quality of street lightening is spontaneously become a prime issue of public concern. Under the traditional manual operation of repairing failed street lamp had to take about a week. On the other hand, while the electronic street lights maintenance system started operations that is shortened from a week to 3 days. Consequently, on this survey, service value, service quality, confidence benefits and customer satisfaction have positive significant so as to repurchase intensions has also significant effect. Once town residents are satisfying the public convenience-oriented services, town managements is also improving its support degrees. Due to voter intention is susceptible to various cause, township governance needs attract their attention with the help of the exhaustive approach to covered administrations.

User satisfaction with contemporary governance

Upon the period of the martial law ruled, due to lack of checks and balances system, Taiwanese people were only simply accepted the public services instead of response its contents effectively. Rising awareness of the public services quality after democratic trend makes the ruling management could not disregard the voices from the rank-and-file. Needless to say that township governance is no exception to the trend. The representative assembly of the commission voted by town residents is responsible to supervise the township management and administrative procedure. The public opinion, furthermore, is turning into a functional approach to direct supervision of the government administration as figure 2 shows.

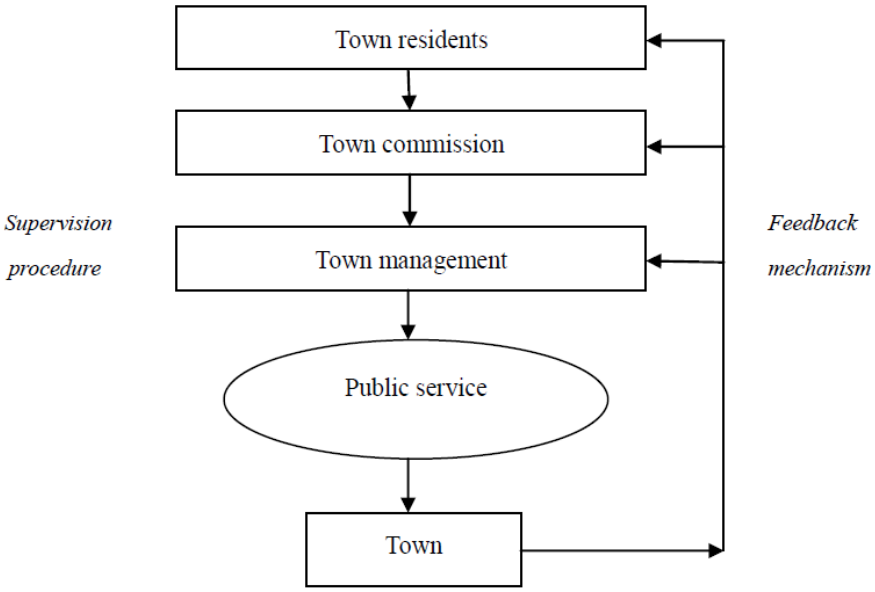

Figure 2. Supervision procedure and feedback mechanism of public services in the township governance

After the electronic street lights maintenance system implementation, besides it has shorten the repairing period, the fruitful result is provided an initiative service the user may check the failed street lights lamp repairing process online instead of queue wait to be processed. No doubt that strengthens confidence benefits of the town residents' mind. It also coincidence with '*Increased user value and satisfaction*' proposed by Codagnon and Boccardelli (2006) in eGep Measurement Framework Analytical Model.

CONCLUSION

This article is having outlined the positive impact of ELMS in the town level governance. As a part of the public services, the *quality* issue determines resident satisfaction in to some degree. The stakeholders, including town resident and its management, both are improving the merit in E-governance implementations. Due to the subject limitation, this study is only focuses on the effect of town office introduces street lights maintenance system. In addition, other kind of public services affection in terms of electronic assistance can be discussion subsequently in the future.

ABSTRACT

The growing of the internet brings a challenge to banking. In order to maintain its competitive edge, banks develop internet banking services. And in order to build a successful internet banking services, banks need to know how to attract customers whom continuously use their service. The purpose of this study intends to develop a research model based on the commitment-trust theory to explore the factors influencing the customers' loyalty of internet banking. The results of this study indicate that shared values, communication and system security have a positive impact on the trust of customers; relationship benefit, customers' authorization, and customer trust have a positive impact on relationship commitment. Trust and relationship commitment from customers have a positive impact on the retention of customer in using of internet banking; customer retention and customer satisfaction have a positive impact on customer royalty. The future work of this study will conduct a survey research to collect the data from internet banking customers and use SEM statistical technique to validate the reliability and validity of the measurement and validate the research model and hypotheses.

Key words: Internet Banking, Relationship Commitment, Customers Royalty.

INTRODUCTION

The popularity of the Internet has introduced a new access of promoting products and services provided to corporations, yet it also brings a challenge to them. For banks which have highly adapted information technology to their banking system, the impact can be enormous. In order to maintain their competitive edge and follow the trend, more and more banks now develop Internet banking services. Since the cost of internet access is low and most web interfaces and features are easy to imitate, most banks provide similar internet

banking services. As a result, there are more options for customers to choose from. If they are not satisfied with an internet banking service, they can always find a substitute easily.

The report " A survey of Internet banking service usage in Taiwan" conducted by 104.com indicates that the population of internet users above the age of 18 who has experienced internet banking service in 2008 was 72.7 % of the whole population. Compared with 53% in 2007, it has increased nearly 20 per cent. And the percentage of internet users who experienced internet banking service within the last 6 months is 61.1%. From the information above, we can understand that along with the massive development of internet, internet banking is also developing in a fast and massive way. However, banks only retain 60% of the population of internet banking users. Therefore, how to be niche in order to attract more customers and to retain them in using the service has became a challenge for most banks.

The Commitment-Trust Theory (Morgan and Hunt, 1994) indicates that during the process of relationship exchange, commitment and trust are the key success factors. This study use Commitment-Trust Theory to discuss the impact on customer retention using a banking service from commitment and trust perspective. Furthermore, relationship quality is formed by trust, satisfaction, and commitment (Dwyer et all., 1987; Grove et all., 1998., Wulf et all., 2001). The relationship between customers and banks can be measured by the three aspects above.

Michael (2002) considers quality, customers' satisfaction and loyalty as a series of reason-result relations. They are considered as one unit to be managed and evaluated. And service quality, customers' satisfaction, and customers' loyalty are a part of customer relationship management. Through customer relationship management, corporations can handle customers' information efficiently in order to establish a longer two way relationship with customers. Hence, increase the loyalty of customers to corporations. The result of a sustainable customer loyalty can be great, chronic and profitable. The longer the loyalty from a customer, the more profits a corporation can gain from it.

Through customer relationship management, a corporation is able to establish a longer relationship with customers. Therefore, our research adopts part of customer management relationship into our study. Hopefully we are able to result a better explanation of the factors which influenced customers' retention in the use of internet banking service.

From all the perspectives above, our research focuses on issues of the percentage of users which continue using internet banking services and factors which are able to influence the retention and loyalty of customers using internet banking. We are going to find out whether customers can be committed to establish a relationship with a bank due to the features of internet banking services provided. After that, testify the degree of relationship commitment to the influence of customers' retention in using internet banking services. On the other hand, from the perspective of customer relationship management (CRM), we are going to find out whether the service provided by internet banking is able to satisfy its customers. Also, this study tries to find out whether customer satisfaction has something to do with customers' retention in using internet banking services. We hope the outcome of this research can be part of the references of the future of internet banking service development in Taiwan.

Here are the purposes of this research:

(1) From a relationship commitment point of view to explore customer retention in the use of internet banking services and have a further discussion of the influences which affect customer loyalty to it, and establish a research model.
(2) From different perspectives of CRM exploring factors which affect customers' loyalty to internet banking services.

THEORETICAL BACKGROUND

Relationship Commitment

According to the definition of commitment given by scholars, it is an interaction dominated by obligations. These obligations may be mutual, or self-imposed, or explicitly stated, or may not. Distinction is often made between commitments as a member of an organization (Dweyer et al., 1987; Moorman at al., 1993). Other scholars, however, considered commitment as an interaction in a partnership as a continuing desire to maintain a valued relationship (Morgan and Hunt, 1994; Mactintosh and Lockshin, 1997). Wulf et al (2001) indicates that this continuing desire to maintain a valued relationship keeps consumers willing to retain a certain consumer-retailer relationship. Morgan and Hunt (1994), moreover, raised Commitment-Trust theory. They believe that the key successful factors of relationship marketing are relationship commitment and trust. Since trust and commitment enable both consumers and retailers to (1) work harder to maintain a valued relationship; (2) focus on a long term benefit instead of a short term advantage; and (3) have mutual trust between each other that would avoid opportunistic behavior by either of the parties. Therefore, one party considers the there is a lower possibility of another party taking a new action. It is the model of Key Mediating Variable (KMV) which acquires that commitment and trust enables the success of relationship marketing.

Trust leads to commitment, and commitment leads to a greater possibility of customer retention which increases the possibility of relationship retention (Garbarino and Johnson, 1999). Therefore, our research indexes Trust and Commitment to measure customer retention using an internet banking service.

As we all understand, commitment is the key feature of continuing a good relationship. It can also be considered as a positive feedback from customers retaining cooperation with a firm. Customers gradually form a psychological attachment to certain websites is seen as a relationship commitment. It only exists when customers are willing to continue the relationship with these websites (Gruen et al., 2000). Relationship commitment can be used as a method to discuss the impact after customers started to build up a relationship with internet banking services, thus, to measure customer retention using internet banking services. Followed by the discussion of Vatanasombut et al (2008), our research employs relationship benefit, shared values and communication as external factors to discuss whether these factors can influence customers' commitment to continue using internet banking services and trust of internet banking services.

The study of Trust has been discussed and explored in various fields, including: Psychology, Sociology, Economics, and Marketing. Trust is often considered as a key factor of

establishing a successful relationship (Berry, 1995; Dwyer et al, 1987; Moorman et al, 1993; Morgan and Hunt, 1994). Moorman et al (1993) defined trust as a will of retaining a relationship with a trustworthy partner due to a partner's professionalism, reliability and will. Morgan and Hunt (1994), on the other hand, defined trust based on the recognition of honesty and reliance to a partner. We simply organized the related literature reviews of trust as below: Trust is when a party believes in another party's commitment and thinks he is trustworthy. Even in an unpredictable condition, the party still believes another party is able to finish his commitment with honesty and a positive will (Grazioli and Jarvenpaa, 2000). For example, a trust in a customer means he has faith in a supplier (Crosby et al, 1990; Gefen, 2000). Aside from this, Trust comes when a company believes under certain conditions a customer shows the ability of reliance, security and faith (Grandison and Sloman, 2000). Gefen (2000) in his research discovered in many cases that the trust of customers comes from the interaction between suppliers. If a supplier's action is expected by customers and a supplier achieve these expectations. It increases the trust from customers to suppliers, even though suppliers are not able to guarantee they are going to act the same way in the future.

There are three constructs of Trust: Ability, Benevolence, and Integrity (McKnight and Chervany, 2002; Mayer et al, 1995). McKnight and Chervany (2002) added predictability as another construct aside from the three. However, Mayer et al (1995) advocated predictability should be excluded from the constructs of trust. He thinks that if the cooperated party is given a high predictability, this party might ignore others needs and only focus on his own benefits. As a result, the party is not trustworthy.

Our research adopts the view from Mayer at al (1995), emphasis that when customers are doing commercial activity with suppliers, if they have uncertainties toward suppliers, it can leads to a negative impact on retention the commercial activity (Gefen 2000).Uncertainties appear when customers eager to understand supplier's actions but they are not able to do it because suppliers are seen as a individual, its actions cannot be control. This influences customers' retention. If suppliers are not able to reduce the condition, the commercial activities between the two parties cannot last. Establishing trust between the two is the only efficient way of doing commercial activities (Gefen, 2000; Hart and Saunders, 1997).

Dealing issues related to Trust has become more important on internet banking services than traditional banking (Ratnasingham, 1998). Since internet banking considered as a risky and unsecured trading environment, users find it difficult establishing trust without contractual or guarantee protection (Grazioli and Jarvenpaa, 2000; Crosby et al, 1990). In addition, the leak of personal information could happen when a web without proper internet security. As a result, opportunists are able to access the information. This also adds the risk for internet banking service, since most of the trades done on the web. Moreover, when users are doing trading on the web, they are not able to see a physical trading, so they are not able to observe another party's behavior to determine if he is trust-worthy or not. This is also a factor of uncertainty (Clarke, 1997). We can put this way- trust is a key factor determines the growth of internet banking service.

Customer Relationship Management (CRM)

According to Kalakota and Robinson (1999), Customer Relationship Management (CRM) is a series of actions developed under strategies of Integrated Sales and Marketing, and service tactics. Under the integration of corporations with procedures and technology, to find the real needs from customers while require the internal of corporations to improve their services to contribute to customer satisfaction and loyalty to corporations.
The concept of customer satisfaction was proposed by Cardozo (1965), indicated that the increase of customer satisfaction leads to more consume behaviors; Howard and Sheth (1969) was the first scholars adapted consumer satisfaction to consumer theory. They considered customer satisfaction as a mental condition outcome when a customer thinks what he pays and what he receives is cohesive and reasonable. Oliver (1981) believed that customer satisfaction is a reaction comes from the surprise after consumer purchasing goods. Churchill and Carol (1982), on the other hand, considered customer satisfaction as an outcome from purchasing and using products. It comes from the comparison of expectations and the real results from consumers.

Fornell (1992) mentioned consumer satisfaction is an evaluative feeling comes from customers' comparison with their expectation before purchasing and the result after purchasing. Before the purchasing, customers might have an assumption that they would be satisfied and content with the products or services; however, they might actually feel dissatisfied with the products or services. Kotler and Scheff (1996) regarded consumer satisfaction as a function represents the difference between a customer's expectation and the real result he receives; Reichheld and Sasser (1990) believed customer satisfaction increases customer loyalty. It could also increase the purchasing retention from customers. Kotler and Scheff (1996) also believe customers with higher customer satisfaction are easy to develop an emotional attachment to a certain corporation, enables the corporation gains more customer loyalty.

Michael (2002) considered customer satisfaction, customer loyalty, and quality are a series of cause and effect. They depend on each other. So, they have to be evaluated and managed as a unit. Not only saving the cost, customer loyalty is able to create a long term and continuous profits to a corporation. In other words, establish a company with higher customer loyalty benefits the company with an accumulative and positive return (Griffin, 1995).

Trust can be divided to the trust before trading and the trust after trading (Singh and Sirdeshmukh, 2000). The trust before trading can influence the customer satisfaction after trading. Customer satisfaction accumulates from the past trading experiences. As a result, its accumulative degree of trust can also influence customer satisfaction towards corporations.
From the past researches, there were various views toward the definition for customer retention and fields it covered. Some researches believed customer retention is the outcome of attitude. For instance, Jones et al (2000) redefined customer retention as a repurchase intention in their customer retention research. Other researches considered customer retention is simply an outcome of behavior, which means a repetitive purchasing behavior to suppliers (Hennig-Thurau and Klee, 1997). For example, Bolton (1998) redefined customer retention as a continual relationship between customers and corporations in his study of Customer Satisfaction to Mobile Phone corporations. There are other researches believed customer

retention contains two standpoints: Behavior and Attitude. Gerpott, Rams, and Schindler (2001) defined customer retention as an activity retains the trading between customers and suppliers. It can be carried out by two approaches. (1) A continuous contractual relation between customers and suppliers or repurchasing. (2) The idea of giving up a continuous contractual relation or reconsidering purchasing in the future.
Our research adopts the view that customer retention includes Behavior and Attitude. After integrating the literature reviews above, we defined customer retention as customer retention in using internet banking services and the remaining degree of customer retention in using internet banking services.

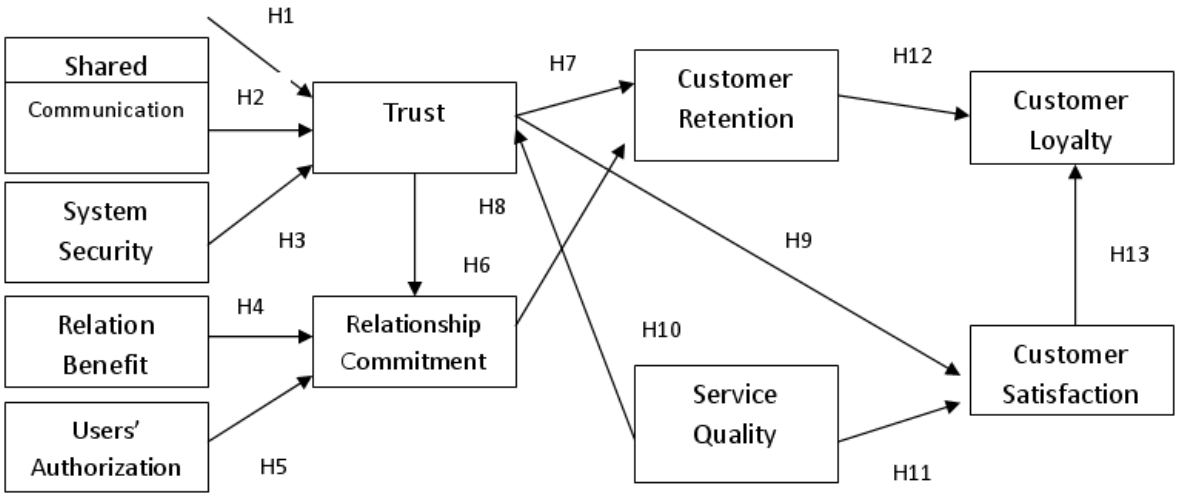
RESEARCH MODEL AND HYPOTHESES DEVELOPED

Research Model Developed

This study mainly explored the factors which influence customer retention and customer loyalty after customers using internet banking services. The research models can be divided to two parts: First, discussing whether shared values, communication, system security, and service quality are able to influence customers' trust. We are also going to discuss whether relationship commitment can be influence by trust, relation benefit, and users' authorization. In addition, we are going to discuss if relationship commitment is able to affect customer retention, and if customer retention can influence customer loyalty.

Second, discussing whether trust, service quality are able to influence customer satisfaction. After that, we are going to discuss whether trust and relationship commitment can influence customer retention, and customer retention can influence customer loyalty. The models of our research are shown as figure 1.

figure 1 Research Model of Internet Banking Customers' Loyalty



Research Hypotheses Developed

(1). Shared Values

Morgan and Hunt (1994) considered the higher the share values is, more positive effect it can bring to the trust between two parties. Hart et al (1986) also discovered that Shared Values is a key factor that brings trust to customers. Sitkin and Roth (1993) believed Shared Values is a sign of trust. Since each individual has different values, each individual might have different of views. If individuals are not able to share their values, they are not able to trust each other. They distrust each other. Based on the inference above, we propose the hypotheses as follows.

> H1: The Shared Values from internet banking services to customers has a positive effect on customers' trust to internet banking services.

(2). Communication

Communication increases the reliability, instant, and accuracy of information sharing. It is also a key factor of trust (Morgan and Hunt, 1994). Communication solves argument and adjusts the expectation and values between both parties so that it creates trust between both parties (Etgar 1979). In E-commerce, customers develop trust toward corporation when corporations give instantly feedback to their problems, provide a secured trading environment, and provide new products information to them, or give them notice before the system has to be repaired. Based on the inference above, we raise our hypothesis:

> H2: A good communication between internet banking services and customers has a positive effect on customers' trust to internet banking services.

(3). System security

Kini and Choobineh (1998) defined trust in E-commerce as an ability which believes in the capability, reliance, and safety of a higher risky environment. They pointed out system security is a key factor which affects trust in E-commerce. System security in internet banking services usually refers to a system wins customers' trust when it is able to protect and secure customers' personal information during on line trading. Based on the inference above, we propose our hypothesis:

> H3: The system security of internet banking services has a positive effect on customers' trust to internet banking services.

(4). Relationship Benefit

Vatanasombut et al (2008) indicated when products meet customers' need, it can reach to an expected profit. Relationship benefit only happens when customers think the products are valuable to them and it is synchronized. For instance, Web ATM mechanism provides services such as free transmission, instantly checking personal banking account's details and orders, even apply for any loans. Corporations which able to provide higher relationship benefit are more likely to develop relationship commitment with customers. Based on the inference above, we raise our hypothesis:

H4: Relationship benefit provided by internet banking services to customers has a positive effect on developing relationship commitment with customers.

(5). User Authorization

Vatanasombut et al (2008) believed User Authorization as banking authorizes customers more conveniences to control trading with banks. This comes from service satisfaction's aspect which is very different from marketing's point of view. Internet banking services provide customers doing trading anytime, anywhere. Even for people who are the first time users, they can pick it up easily. Kappelman and Guynes (1995) had testified user authorization. During the internet banking system was updating, the bank authorized its staff with a little right. It actually increased staff's recognition of control user authorization has been considered as a kind of perceptual control. It is also considered as a key factor in relationship commitment in Key Mediating Variable. Based on the inference above, the study proposes the hypothesis.

H5: If internet banking services is able to authorize to customers, it has a positive influence on establishing relationship commitment between internet banking and customers.

(6). Trust

Trust is very important in relationship of cooperation. Partners all do their best to contribute to their commitment to each other (Wang and Head, 2007). But one party which is more devoted is easy to get hurt by another party's action (Mayer et al, 1995). Vatanacombut et al (2008) believed, customers have to trust corporations before they commit to the relationship to them in E-commerce. Customers have to carry with a certain degree of risk after they make a commitment. Based on the inference above, our research raised our hypothesis:

H6: Trust from customers to internet banking services has a positive effect on establishing relationship commitment between internet banking and customers.

Trust takes a crucial part in internet. A complete trust is one of the successful factors in E-commerce (Coutu, 1998). Customers want to completely control their own trading based on securities. Under trust and commitment, when customers commit to corporations, it means they agree on the relationship and they value the relationship. In addition, customers believe the services their partner provides are cohesive, reliable, and helpful (Vatanacombut et al, 2008; Gefen, 2000). Based on the inference above, we raise our hypothesis:

H7: Trust from customers to internet banking services has a positive effect on customer retention to internet banking services.

Trust can be divided to before trading and after trading, the trust before trading affects customer satisfaction after trading (Singh and Sirdeshmukh, 2000). Customer satisfaction accumulates from the pasting trading experiences. Its accumulative degree of trust can also affect customer satisfaction to corporations (Zeithaml et al, 1996). Based on the inference above, we raise our hypothesis:

H9: Trust from customers to internet banking services has a positive effect on customer satisfaction to internet banking services.

(7). Relationship Commitment

According to the description of Key Mediating Variable, relationship commitment means customers value a relationship and try their best to retain the relationship. Since related banking regulations and policies state it is illegal to spread customers' information to a third party, and banks have to put the regulations in public, it helps in increasing trust from customers so they are more willing to commit to this relationship (Vatanacombut et al, 2008). Base on the inference above, we raise our hypothesis:

H8: Relationship commitment established from customers to internet banking has a positive effect on customer retention to internet banking services.

(8). Service Quality

Trust comes from the benevolence and integrity of the party which customers trade with. Customers evaluate clues from both explicit and implicit sides then gradually they increase their trust to corporations. As a result, when customers receive good services, they increase their trust to the service provider (Anderson et al, 1994). Based on the inference above, we raise following hypothesis:

H10: Service quality provided by internet banking services has a positive influence on the trust from customers to internet banking services.

Service quality refers to the service levels outcome from the interaction between service providers and their customers (Parasuraman et al, 1991). Anderson et al (1994), raised the relation of cause and effect from service quality to customer satisfaction, they considered service quality as one of the factors which affects customer satisfaction. Based on the inference above, we raise the following hypothesis:

H11: Service quality provided by internet banking service has a positive influence on customer satisfaction to internet banking services.

(9). Customer Retention

Customer retention is a very crucial link in customer relationship management. It refers to a broadly recognized, widely-implemented strategy for managing and nurturing a company's interactions with customers. But corporations mostly miss out the importance of customer retention when introducing customer relationship management. They rarely to evaluate, understand, and discuss if customer retention is possibly able to bring them any benefit (Smith, 1999). So we infer customer loyalty is influenced by customer retention. Based on the inference above, we raise the hypothesis:

H12: Customer retention in using internet banking services has a positive effect on customer loyalty to internet banking services.

(10). *Customer Satisfaction*
According to the aspect of demand, consumers' service demand forces them to purchase. If the purchased service meets the consumers' demand, they are satisfied with the service outcome (O'Reilly and Chatman, 1986; Burke and Stets, 1999). Satisfaction is considered as an evaluation of emotion. Emotion can possibly causes dependence to a service when customers are satisfied with the service (Hunt, 1977). This emotion forms the commitment to service providers. This commitment transforms to the behavior of repurchasing or loyalty. Base on the inference above, we raise the hypothesis:

> H13: Customer satisfaction to internet banking services has a positive effect on the loyalty to internet banking services.

RESEARCH DESIGN

Operational Definition of Constructs

According to all the references, we operate on those variables and workout a scale which is related to variable measurement research. After choosing appropriate questions, we rephrase them and put the questions to our questionnaire. We adopt Likert Scale (1 = strongly disagree, 5= strongly agree) to collect the result. The operational definition of all the constructs is shown as Table 1.

Instrument Design

The content of questionnaire is amended from the previous research literatures. In order to validate the content validity, we conducted a pilot test to invite two professors in information management and two senior manager of banking to revise the instruments. The constructs and number of measurement items and referred literature is shown as Table 2.

Sampling and Data Analysis Methods

The sampling frame for this study will come from internet banking users in Taiwan. They all have the experience of using internet banking services. The survey will be carried out by sending it out by the internet to our subjects. For example, posting the questionnaire on BBS or sending the questionnaire by emails.

This study will use Partial Least Squares (PLS) to validate the instrument reliability and validity, and verify the hypothesis in the research model. PLS is a structural equation modeling approach similar to LISREL, where the covariance structure derived from observed data is used to simultaneously fit measurement equations and structural equations specified in the model. Such covariance-based approaches are appropriate for areas with strong a priori theory, where theory testing and refinement are the research goals, as was the case in this study.

Table 1 Operational Definition of the Constructs

Measured Variables	Operational Definition	References
Shared Values	The understanding of customers' behaviors, objects, views of banks, and customers' understanding of banks' policies.	Morgan and Hunt, 1994
Communication	When customers are using internet banking services, they expect themselves to have good information sharing with banks.	Morgan an Hunt, 1994
Relationship Benefit	When customers are using internet banking services, they expect themselves to believe the benefit the banks can provide in their relationship.	Morgan and Hunt, 1994
System Security	When customers are using internet banking services or when they are doing online trading, they believe the system security can provide the secure they need.	Kini and Choobineh, 1998; Morgan and Hunt, 1994
User Authorization	When customers are using internet banking services, subjectively they believe the banks authorize them with more users' right.	Morgan and Hunt, 1994; Hartline and Ferrell,1996; Harrison et al, 1997
Trust	The degree of customers subjectively believes the products, services, and information provided by internet banking are reliable.	Doney and Cannon, 1997
Relationship Commitment	When customers are using internet banking services, subjectively they are willing to commit to their banks.	Morgan and Hunt, 1994
Service Quality	The feeling followed after customers browsing the web, interacting with the service system, and the services it provided.	Zeithmal et al, 1996
Customer satisfaction	The evaluation after comparing the expectation before using the services and the actual result after using the services.	Engal and Blackwell, 1994
Customer Retention	When customers retain using the internet banking system or retain using certain internet banking webs.	Kotler, J and Scheff, 1996
Customer Loyalty	The degree of customers repetitively using certain internet banking services, and the degree of trading with certain internet banking services.	Sirgy and Samli, 1985; Dick and Basu, 1994

CONCLUSION

Internet development has totally changed consumer habits. Credit cards, physical currency, and traditional brick-and-mortar banks can no longer satisfy consumers. As a result, the financial industry started to provide internet banking services, mobile banking services and an internet ATM in order to satisfy consumers. It is crucial for the financial industry to learn how to deal with the impact the internet has brought to it. It is important to learn how to use its hardware and software resources in order to build up an internet service. However, more important is to learn how to attract and inquire consumers to use it. On the other hand, the financial service industry has to improve its operating model and affiliate with the same industry or different industries in order to confront the dramatic change of the business environment and the enormous new market opportunities the internet has brought while maintaining its competitive edge at the same time. Also, going deeper to understand consumers' needs and promoting consumer's loyalty are important for the financial service industry on the issue of profit and a long lasting business.

The purpose of this study intends to develop a research model based on the commitment-trust theory and customer relationship management theory to explore the factors influencing the customers' loyalty of internet banking. The results of this study indicate that shared values, communication and system security have a positive impact on the trust of customers; relationship benefit, customers' authorization, and customer trust have a positive impact on

relationship commitment. Trust and relationship commitment from customers have a positive impact on the retention of customer in using of internet banking; customer retention and customer satisfaction have a positive impact on customer royalty. The future work of this study will conduct a survey research to collect the data from internet banking customers and use SEM statistical technique to validate the reliability and validity of the measurement and validate the research model and hypotheses.

ABSTRACT

The strategic role of Information and Communication Technology (ICT) is evident in the enterprises. Also Small and Medium Enterprises (SMEs) adopt ICT tools to improve their processes and products/services. Due to scarcity of resources and ICT competences of SMEs, they need the support of ICT suppliers in the ICT adoption process. As a consequence, ICT suppliers can play an important role. On the other hand, the ICT sales channel is nowadays characterized by strong dynamism. Nevertheless, little attention has been paid by literature to the business models of these operators. The goal of the paper is to provide, through 53 case studies, a detailed picture of the ICT sales channel in the European market.

Keywords: Information and Communication Technology, ICT, SMEs, strategy, ICT sales channel.

INTRODUCTION

Nowadays Small and Medium Enterprises (SMEs) are recognizing the important role that ICT can have supporting business processes but also company products and services.
ICT innovation rate is very high, ICT tools are ever more pervasive and they can create or support the companies' competitive advantages (McFarlan, 1984; Porter and Millar, 1985). This fact is true in enterprises in general but it is relevant and critic for SMEs, that do not have competences and resources to invest much in ICT and to guide the whole process of new technologies adoption (Fuller, 1996).

For these motivations ICT suppliers can play an important role for SMEs, as enablers of ICT adoption but also as generators of business innovation (Wroe, 1989; Geisler, 1992). Nevertheless, in practice, in many cases this important potential role is not completely exploited yet (Fuller, 1996).

ICT suppliers, which operate in the ICT sales and distribution channel, providing hardware, software and ICT services with enterprises, are facing a period of important changes in strategies and business models.

It is relevant for SMEs to choose the right ICT partner, with all the right characteristics and competences (Montazemi, 1988): an actor that can offer the best fitting technologies and support them in the process of adoption. Nowadays there are not models or guidelines to choose the most adapt suppliers. In literature, contributes about ICT suppliers models classification are absent.

In this context, the goals of the paper are:

- to propose a *classification framework* to analyze the *strategic positioning* (Porter, 1985) and the competences of the ICT suppliers. This framework – defined on the basis of an empirical analysis on the European market - can be useful to:
  - top management of the ICT suppliers, as a means to define strategic actions more effectively;
  - ICT vendors that sell ICT suppliers to market their products and services especially to SMEs, in recruiting and selecting the most suitable sales channel partners;
  - companies ICT decision makers (for example Chief Technology Officers, Chief Information Officers), to help understand the competences and the commercial offer of the different ICT suppliers and to select the most effective external partner for the company;
- to identify the main strategic trends in the European market.

The research uses the case study methodology to analyze 53 ICT suppliers operating in the European market. Work was carried out between January 2006 and December 2007.

THEORETICAL BACKGROUND

ICT was seen in the past mainly as a cost centre and a service – useful but not core – in support of enterprise activities. Despite the increase in ICT spending, companies that manage to extract significant business value from their ICT investments were few. In the last ten years, ICT has become an important element in enterprises processes, in the products/services distributed to the market, a lever enabling strategic and organizational projects of change and the re-definition of business models and thus a potential source of uniqueness and competitive advantage for companies (Venkatraman, 1997; Andal Ancion, Cartwright and Yip, 2003). ICT managers (called Chief Information Officers in large enterprises) are today more and more involved in strategic activities aimed at innovating products/services, enterprises processes and business models (Loebbecke and Jelassi, 1999; Sambamurthy, Bharadwaj and Grover, 2003). Researchers have began to study ICT contribute to business, in terms of value generation.

A direct linkage between ICT and firm performance was established by Powell and Dent-Micallef (1997). Bharadwaj (2000) found that high ICT-capable firms (those that invest heavily in ICT) outperform competitors that do not invest to the same extent (also see, Sambamurthy, Bharadwaj and Grover, 2003). These results suggest ICT offers firms a

competitive competency, which aids firms in differentiating themselves in the marketplace, such as through innovation.

However, since prior studies focused on the population of large and often diversified companies, questions remain as to whether these results are generalizable to SMEs (Dibrell, Davis and Craig, 2008). Supposedly, the more flexible managerial capabilities of SMEs dictate the extent of success of ICT adoption and the resulting positive effects on financial performance (Khazanchi, 2005). In this event, smaller firms should be able to more effectively utilize ICT, to exploit newer technologies than their larger, less agile competitors (Xiang and Lan, 2001; Bonk, 1996). Principally, the arguments have been that Information Technology (IT) is a resource which small firms can utilize to behave like bigger firms (McFarlan, 1984; Porter and Millar, 1985). Recognition of strategic IT utilization issues faced by SMEs is perhaps more important than those facing big businesses since SMEs drive the economies of many nations (Kyobe, 2004).

Actually, many small and medium enterprises (SMEs) try to adopt ICT to support their business. Due to their limited resources, SMEs ICT adoption is different from larger business (Fink, 1998; Thong, 1999; Welsh and White, 1981; Kyobe, 2004; Pollard and Hayne, 1998). An incorrect ICT investment decision can have devastating effect for SMEs. Therefore, they need to be very careful in their ICT investment decision-making. According to this perspective, researchers concentrated, in the past years, on ICT adoption process for SMEs. Existing literature that documents some of the drivers and barriers of ICT adoption within SMEs is very rich (Drew, 2003; Dutta and Evrard, 1999; Thong, 1999; Thong and Yap, 1996; Utomo and Dodgson, 2001; Walczuch, Braven and Lundgren, 2000; Kyobe, 2004). The drivers and barriers may come from two different sources, those from within the internal SMEs and those from outside SMEs (Sarosa and Zowghi, 2003). Knol and Stroeken (2001) underlined an important internal barrier: the lack of awareness of entrepreneurs regarding IT effects. SMEs face specific problems in the formulation of their innovation strategies due to their deficiencies arising from their limited resources and range of technological competencies (Kyobe, 2004; Tidd, Bessant and Pavitt, 1997). They have smaller budgets for IT investments than their larger counterparts (Raymond, 1985), so financial limitations have traditionally prevented SMEs from making investments in large and complex IT applications. In addition, smaller companies are historically managed and operated by personnel with rich product and domain expertise but limited IT skills (Auger and Gallaugher, 1997; Fuller, 1996). Together, these findings along with other prior researches on levels of IT knowledge in SMEs suggest that collaborative efforts with external suppliers of IT opportunities may be a good investment (Ray and Ray, 2006; Wroe, 1989; Geisler, 1992).

A much cited source for SMEs assistance in ICT adoption process is independent and impartial consultants and ICT suppliers (Fuller, 1996; Chau, 1995; Fink, 1998; Utomo and Dodgson, 2001). They could provide expertise regarding ICT value and use for SMEs.

If we focus on ICT suppliers figure, in literature it is evident that ICT providers can be a source of important ICT capabilities for enterprises, of different size. They are a lever to support enterprises innovation and change processes, through technologies innovation (McGray and Clark, 1999). They offer specialized ICT competences that increase enterprise dynamic capabilities (Lacity, Willcocks and Feeny, 1996). According to the Continuous

Innovation theory (Boer and Gertsen, 2003), this requires the ability to combine exploitation and exploration capabilities. Exploration capabilities can be enabled by ICT suppliers' experiences. Especially when a firm's internal IT (Information Technologies) capabilities are lacking, external IT capabilities represent a very effective tool to pursue organizational goals (Massey and Walker, 1999; Thong, Yap and Raman, 1996).

An important part of literature is focused on advices that can help enterprises to choose the best ICT supplier and to manage correctly the relation (for example Feeny and Willcocks, 1998; Dail and West, 2005). These contributes offer operative suggestions but they do not guide the client in the recognition of the best fitting supplier, in terms of strategy, competences and so on. This is a problem that, especially for SMEs, has to be helped in the search and selection process.

We can say that considering the important role of ICT suppliers, especially in SMEs context, the attention in literature has been focused more on the "client's perspective", analyzing the determinants of the process of suppliers selection and the benefits related to stronger relationships. A few contributes examine ICT vendors' perspectives (motivations, strategies, business models, products offered). (Hussey and Jenster, 2003; Morabito, Pace and Previtali, 2005; Rayala, 2007). The existing academic and managerial literature dealing with ICT suppliers can be classified into two main categories:

- *qualitative contributions* (Patrakosola and Olsonb, 2007; Cheng, Sheen and Lou, 2006; Curry and Kenney, 1999; Kenney and Curry, 2001; Kumar, 2006), focusing on the analysis of ICT suppliers business models, their competences, the main internal activities, and their organization;
- *quantitative contributions*, especially provided by research centers, (like Forrester Research, Reed Research Group; National Electronic Distributors Association; Isuppli Corp.; National Electronic Distribution Association; Avnet, Inacom; Kompass) focusing on the size of the ICT market targeted by the ICT suppliers, which is the focus of our the empirical analysis.

As far as the first category is concerned, the analyses have indicated a lack of contributions going beyond a "traditional classification" of the ICT suppliers business models. In fact, the majority of academic and professional contributions indicate only three kinds of players in the ICT sales and distribution channel: (i) hardware resellers that sell hardware products (for example personal computers, servers, storage systems) of well known brands (for example HP, IBM, Acer, Fujitsu Siemens); (ii) software houses that sell self-developed software applications (for example Enterprise Resource Planning systems, Customer Relationship Management applications, Business Intelligence applications, CAD, and Product Lifecycle Management systems); (iii) system integrators that customize and integrate for the company-users software applications provided by software vendors (for example Microsoft, SAP, Oracle).

As far as the second category is concerned, quantitative data and figures dealing with the size of the ICT market targeted by ICT suppliers are provided mainly by research companies.

Our research goal is to know better ICT suppliers nature, classifying their business models, understanding how they are evolving, and studying their specific competences. This is

relevant to support enterprises, especially SMEs, in choosing the best ICT suppliers. On the other hand, our research results can be useful also for ICT suppliers' management to understand how to organize their structures and competences to serve a particular area of the market.

METHODOLOGY

The present research is based on case studies, defined by Yin (2003) as "empirical inquiries that investigate a contemporary phenomenon within its real-life context, especially when the boundaries between phenomenon and context are not clearly evident".
Since the objectives of the present research are to propose a classification framework to analyze the strategic positioning and competences of ICT suppliers and to identify the main strategic trends acting in the European market, this methodology seems to be the appropriate for two reasons. First, case studies provide both qualitative and quantitative results by the combination of several data collection methods (for example interviews, questionnaires, archives) (Eisenhardt, 1989). Second, the case study methodology is very suitable for description (Kidder, 1982).
When using a case study methodology, at least two different choices have to be made; first, the number of case studies to carry out (one or more than one) and second, the type of case study (explanatory, descriptive or exploratory). In the present case, multiple exploratory case studies seem to be most appropriate, since:

- we seek to describe a phenomenon which is poorly analyzed by the literature;
- despite their complexity, multiple case studies are valuable when the data is inappropriate for statistical analysis, unavailable or too expensive to collect (Andersen, 1997).

To describe the analysis conducted, we have identified the following main phases:

- research design;
- case studies implementation;
- analysis of data and interpretation of case studies evidence;
- assessment of research quality.

Research design

As suggested by Yin (2003), we first identified the study questions. In accordance with the research objectives, these questions are:

- What is the strategic positioning, that is the products/services offered and target market (Porter, 1985), of the various companies acting in the ICT sales and distribution channel?
- What are the most relevant competences related to the different strategic positioning?
- What are the main strategic trends affecting the European ICT suppliers?

As attention has to be paid to different subunits in the company, we employed the embedded (that is multiple unit of analysis) case studies which include the following roles of analysis:

- member of the strategic direction of the ICT supplier (for example Chief Executive Officer, managing director);
- manager of the sales/marketing area;
- manager of the technical area.

Case studies implementation

The concept of population is crucial, because the population defines the set of entities from which the research sample is to be drawn (Yin, 2003). A total of 53 semi-standardized interviews were carried out among European ICT suppliers. On the one hand, we leveraged a formally structured schedule comprising the following sections:

- general company information (that is turnover in the last years and trends, number of employees, location);
- commercial offer (that is ICT products and services offered, turnover distribution among the different kind of products and services);
- internal organization and competences (that is organizational units, number of employees in each organizational unit, competences of the employees);
- market scope (that is target industries, size of target enterprises, geographical target market, customer concentration);
- competitive landscape (that is main competitors, competitive positioning, competitive advantages);
- external trends (that is main economical, technological, legal, institutional trends affecting company business);
- strategic goals for the future.

On the other hand, due to the lack of information on this specific issue (as mentioned above, literature on ICT suppliers is scarce), we did not know all the necessary questions in advance and so developed, adapted and generated questions that fitted with the main research aims. In this way, we had the advantages of both standardized and non-standardized interviews.
We did not select the cases randomly, because, as noted by Pettigrew (1988), only a limited number of cases can usually be studied and it therefore makes sense to choose extreme situations and polar types in which the process of interest is "transparently observable". These were selected, then, because they conformed to the main requirements of the study, while representing both similarities and differences considered important for the data analysis.

In order to find the most interesting European ICT suppliers, three main sources of information were considered:

- the Politecnico di Milano, School of Management's ICT suppliers database containing approx. 200 entries;
- the databases of ICT sales partners provided by the main ICT vendors in Europe (that is HP, IBM, Acer, EMC2, Microsoft, SAP, Oracle);
- commercial database (that is Kompass).

The selection of the ICT suppliers to be analyzed was based on the following criteria:

- total turnover in 2006 above €4 million;
- number of references collected from 1,000 SMEs analyzed within the Politecnico di Milano, School of Management's Observatory dealing with the "ICT in SMEs"[1];

- a wide coverage of all the possible business models (in the selection phase the ICT suppliers' business models were only analyzed through secondary sources, such as Web sites and company documentation);
- availability to participate in the research project.

With these criteria, 53 European ICT suppliers were selected (see Table 1).

ICT operator	*Turnover 2006 (€ millions)*	*Employees*	*ICT operator*	*Turnover 2006 (€ millions)*	*Employees*
Company 1	400,00	2800	**Company 28**	12,00	140
Company 2	122,00	464	**Company 29**	11,00	70
Company 3	120,00	2500	**Company 30**	11,00	130
Company 4	100,00	1000	**Company 31**	11,00	60
Company 5	82,00	920	**Company 32**	10,80	114
Company 6	60,65	500	**Company 33**	10,00	25
Company 7	60,00	200	**Company 34**	9,70	88
Company 8	60,00	NA	**Company 35**	9,00	75
Company 9	56,00	400	**Company 36**	8,50	70
Company 10	55,00	22	**Company 37**	8,50	90
Company 11	52,10	730	**Company 38**	8,12	60

Company 24	15,00	50	**Company 51**	4,60	44
Company 25	14,75	55	**Company 52**	4,40	32
Company 26	12,59	NA	**Company 53**	4,28	15
Company 27	12,50	23			

Table 1. The Selected ICT Suppliers

Before the interviews, a pilot test was performed with practitioners. As a result, the wording of some of the questions was changed so as to make them easier to understand. All the interviews were conducted in the same way in order to have comparable results (we offered each subject the same stimulus), and were successful, as all the questions were answered by the respondents. The interviews were conducted by telephone, lasted on average one hour and were tape-recorded and transcribed. Afterwards, the transcription was approved by the interviewees.

Analysis of data and interpretation of the case studies evidence

The responses from interviewees were summarized, interpreted and tabulated from the transcripts according to the themes of the research questions. More in detail, data were encoded in two files: the central database (a simple Excel table) and a Word document containing the complete summary of the interviews. If any information remained unclear and/or we felt more data were needed, informants were contacted later with additional questions. The data analysis was conducted following two complementary approaches, and both a within-case and a cross-case analysis were carried out. The first approach seeks to generate insight (Gersick, 1988; Pettigrew, 1988), while the second enables intra-case comparisons, highlighting similarities and differences between responses.

Assessment of research quality

The validity and reliability of case studies rest heavily on the correctness of the information provided by the interviewees and can be assured by using multiple sources or looking at data in multiple ways (Eisenhardt, 1989; Yin, 2003). We have exploited multiple sources of evidence (that is interviews, questionnaires, archives). Reports were reviewed by interviewees and a protocol was written.

THE ICT SUPPLIERS CLASSIFICATION FRAMEWORK

The aim of this section is to present a classification framework of the strategic positioning of the ICT suppliers based on the results of the empirical analysis.

The classification framework uses the following traditional strategic variables (Porter, 1985):

- the *market scope* refers to the dimension (that is number of employees) of the companies in the target market. According to the European Union classification (European Commission Recommendation 2003/361/EC, 6 May 2003), four main categories were identified: micro enterprises (that is 1-9 employees) or consumers, small enterprises (that is 10-49 employees), medium enterprises (that is 50-249 employees) or large enterprises (more than 250 employees);
- the *portfolio scope* refers to the ICT products and services offered by the ICT suppliers. Five main categories were identified:
    - hardware and software infrastructure (that is network systems, desktop computers, laptops, servers, storage systems, printers, operating systems, office automation software);
    - advanced IT services (that is planning, design and implementation of complex ICT infrastructures such as Voice Over IP systems, high-end servers, storage systems);
    - management software (that is Enterprise Resource Management systems, Customer Relationship Management applications, Business Intelligence applications);
    - system integration services (that is customization and integration of software applications developed by third parties);

- business consulting (that is consultancy services focused on business process re-engineering/re-organization before the launch and adoption of critical ICT applications).

Given the two classification variables, nine different possible strategic positioning were identified (see Figure 1) which are described in the following sections.

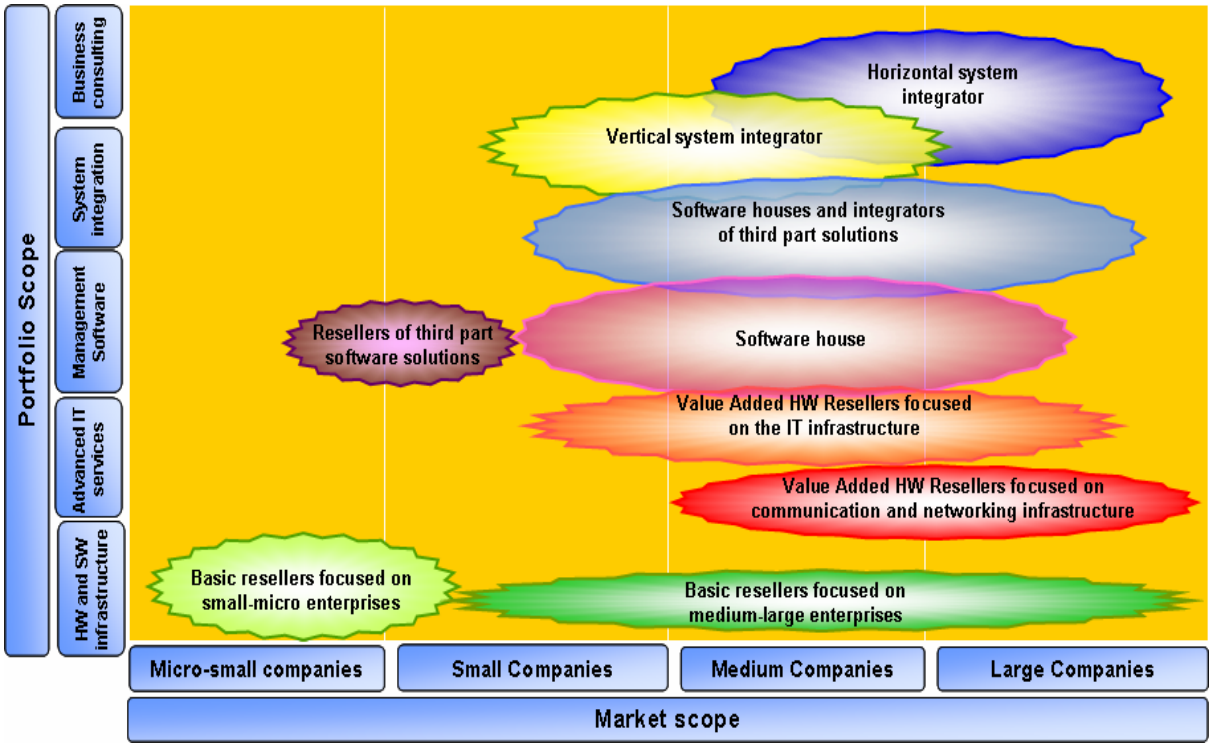

Figure 1. The Strategic Positioning of the ICT Suppliers

Basic resellers

These companies offer simple ICT products (for example LANs, desktop computers, laptops, notebooks, printers, and mono-processor servers) to micro/small enterprises or, in some cases, even to the consumers. In addition, they often supply basic software applications (for example office automation applications, operating systems, simple security systems) and basic ICT services (for example set-up and maintenance of small local networks, personal computers, mono-processor servers).

Basic resellers can be classified into two main categories in function of the target market:

- *basic resellers focused on micro enterprises*; these are small resellers which mainly target micro or small enterprises in the same geographical area (for example an industrial district). Sometimes these resellers target consumers through their consumer stores.

An example of a basic reseller is *Company 53*, an HP sales partner, which reached a total turnover of €4.3 million in 2006. *C53* markets mainly basic hardware products (that is personal computers, entry level servers, storage systems) that account for 80 percent of the

total turnover, and basic ICT services (that is configuration and installation of the marketed hardware products) representing the remaining 20 percent of the total turnover. The market comprises a large number of companies operating in manufacturing industry.

- *basic resellers focused on medium-large enterprises*, also called "corporate resellers": these are larger resellers which target their products and services to medium/large enterprises or public sector authorities.

An example is *Company 12*, an IBM sales partner, which reached a total turnover of more than €50 million in 2006. *C12* markets mainly basic hardware products (approx. 60 percent of the total turnover) basic software applications, such as office automation applications, DBMS (Database Management System) and information systems. (approx. 30 percent of the total turnover), and basic IT services (approx. 10 percent of the total turnover). The market mainly comprises companies with more than 250 employees operating in various industries, as well as local public sector authorities.

Value Added Hardware Resellers

Value added hardware resellers offer complex hardware products (for example high-level servers, storage systems, complex communication technologies) and advanced ICT services (that is design, planning, maintenance of complex ICT infrastructures), besides the supply of basic hardware and software products. They target their products and services mainly to medium and large enterprises requiring such advanced products and services, and also focus on small enterprises for the supply of basic hardware and software products.

The empirical analysis shows that these players can be classified into two categories in function of their products and services portfolio:

- *Value added hardware resellers focused on the IT infrastructure;* these players supply hardware and high-level implementation, installation and maintenance of complex IT infrastructures (that is multi-processor servers, storage systems and complex security systems).

An example is Company 19, an HP and Cisco sales partner, which reached a total turnover of more than €25 million in 2006. More than 40 percent of the total turnover refers to advanced IT services focused on the design, installation, implementation, and maintenance of complex IT infrastructures (that is servers and storage systems) for a number of large customers in the financial and manufacturing industries.

- *Value added hardware resellers focused on communication and networking infrastructure*, such as complex networking systems and Voice Over IP systems.

An example is Company 31 that offers Cisco, Citrix, and HP networking products. C31 started as a cable company and now specializes in the design and installation of complex networking infrastructures. A number of support services are also provided (for example always-on remote assistance and maintenance). In 2006 the total turnover reached more than €11 million, 35 percent from networking products and 65 percent from services.

Resellers of third party software solutions

These players offer simple software applications (that is software to manage accounting, production and warehouses) developed by software vendors (for example Teamsystem, Zucchetti and Adonix-Formula) that are easy to install at the customer's site. The target market is represented by micro/small enterprises and professionals (for example lawyers and accountants).

An example is *Company 51*, part of a larger group (a leading software house in the development of ERP, Enterprise Resource Planning, applications for SMEs and professionals), which is focused on reselling ERP, Business Intelligence and office automation applications to micro and small businesses, and in providing some installation and support services. The total turnover reached €4.6 million in 2006.

Software houses

These players develop and customize management software applications for companies in various industries. Several types of software application are developed: Web applications (for example corporate Web sites, eCommerce Web sites, Intranet applications and Extranet applications), ERP systems, CRM applications, Business Intelligence applications, Mobile&Wireless applications. The target market is medium or large enterprises. To larger companies, the software houses usually also supply complex industry-specific software applications (for example applications for the financial, banking or telecommunication industries).

There are several cases of software houses operating in the European market. Some of these offer software applications to companies operating in various industries, for example Company 9 (recently acquired by another player) which supplies ERP solutions to SMEs and professionals, and Company 15, which offers an ERP solution to the companies operating in the manufacturing industry. Others focus on more specific markets or on specific kinds of application, for example Company 25, belonging to an important group, which provides software applications to hospitals to support all medical activities, and Company 28 that supplies Mobile applications for Sales Force support (that is Sales Force Automation applications) to companies in the grocery industry.

Software houses and integrators of third party solutions

These players, besides offering self-developed software applications, supply integration and customization of management software applications developed by well-known software vendors (for example Microsoft, SAP and IBM).

An example is Company 21, a software house with a turnover of more than €20 million in 2006, which several years ago developed an ERP application targeted at the manufacturing industry (mainly Wood&Furniture, Mechanical, and Food industries). In 2005, C21 started to offer the Microsoft Navision application (now called Dynamics) in order to enlarge its product and services portfolio, and to broaden its marketing target by trying to focus on new industries, exploiting Microsoft brand awareness.

Vertical system integrators

The core business of these players is the integration of a specific (and unique) software applications developed by a software vendor. This extreme focalization results in a close partnership with the software vendor that has developed the software application. Sometimes, vertical system integrators develop industry-specific "vertical" software applications based on the standard release of the software which are subsequently promoted by the software vendor. The target market is mainly medium-size companies, often in industries for which the system integrator has developed the "vertical" software applications.

An example is Company 49, a small player (turnover of €5 million) that offers integration and customization services of an ERP solution developed by a software house. The development and customization are sometimes carried out in a joint team made of C49 and the developers. In particular, C49 has developed a vertical solution for the eyeglasses industry.

Horizontal system integrators

These players are focused on the integration and customization of various software applications developed by third party software vendors, while remaining independent from the latter (for this reason they are called "horizontal"). The target market is large enterprises.

An example is Company 17, a system integrator backed by some investment trusts. Following various acquisitions of other vertical system integrators in the last 10 years, C17 offers a broad range of integration services focused on various kinds of application: ERP systems (that is SAP, MS Dynamics), CAD (Computer Aided Design), PLM (Product Lifecycle Management) systems, software applications for the banking and telecom industries.

Their market is mainly large companies and public sector authorities, even if the strategic goal for the future is to focus on medium-size enterprise as well, offering integration services for ERP systems.

The empirical analysis shows that several ICT suppliers have a hybrid competitive positioning. For instance, some software houses or system integrators supplying large volumes of hardware products also assume the role of Value added hardware resellers.

THE ICT SUPPLIERS COMPETENCES

For each competitive positioning, the most important internal competences were analyzed. From the empirical analysis and the literature review, six main types of competence were highlighted (see Figure 2):

- *logistics,* that is competences concerning supply and management/integration with suppliers, warehousing, dispatching and shipping of merchandise, as well as pre-sales and customer care services*;*
- *basic ICT infrastructure services,* that is the ability to supply basic IT services dealing with the configuration, installation, and maintenance of simple ICT infrastructures*;*

- *advanced ICT infrastructure services*, that is competences concerning the design, planning, and implementation of complex ICT infrastructures*;*
- *software (SW) development*, that is competences focused on requirement analyses, design, implementation, integration and testing of applications developed in programming languages (for example Java, Cobol, C++ and Visual Basic)*;*
- *system integration*, that is competences in the customization and implementation of software applications (for example ERP systems, CRM applications, Business Intelligence applications) developed by software vendors (for example SAP, Microsoft and IBM);
- *business consulting*, that is competences focused on organization analysis and business process reengineering.
-

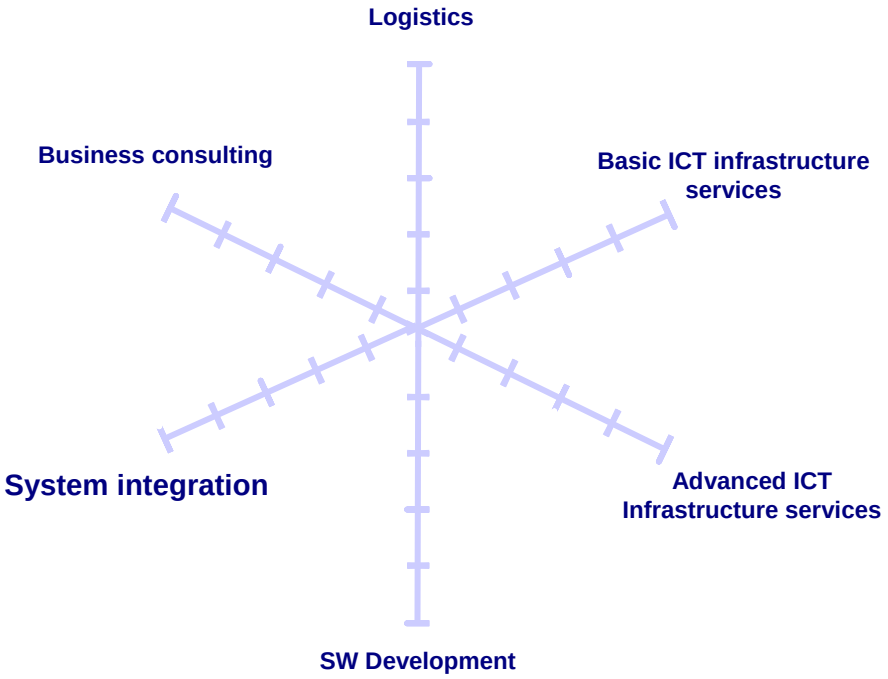

Figure 2. The Competences Mapping Scheme

On the basis of the results of the empirical analysis, the most common competence profile for each competitive positioning has been defined as in Figure 3.

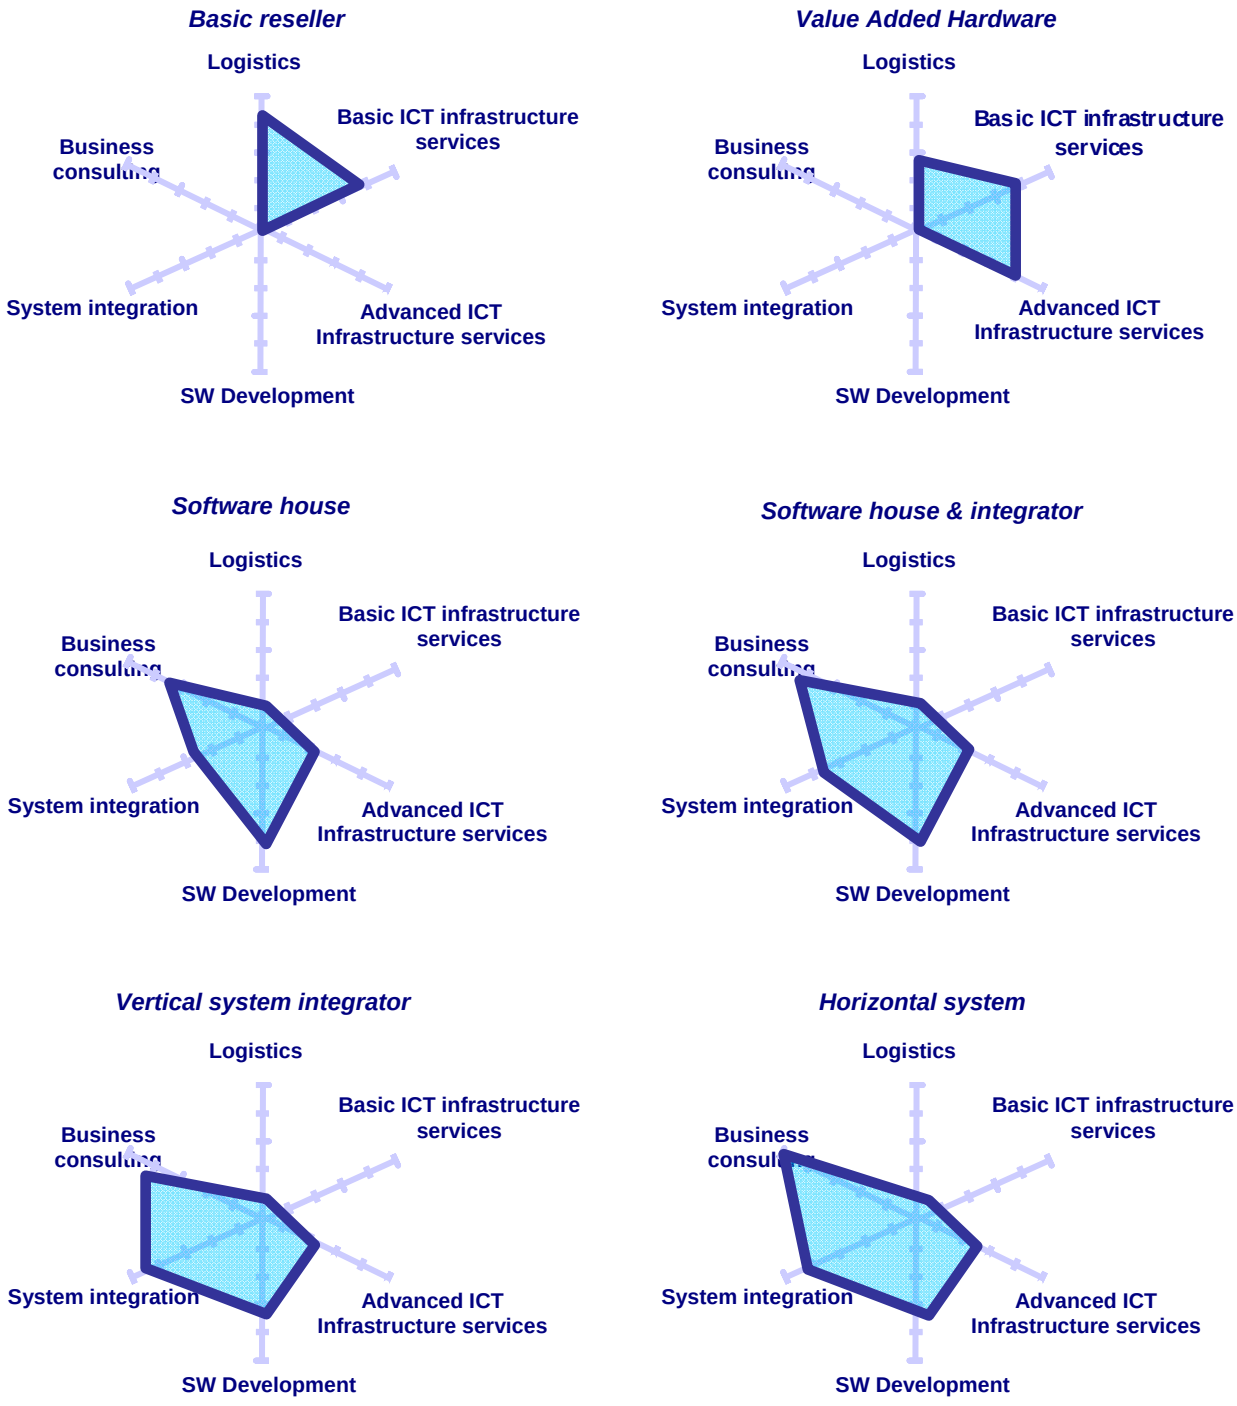

Figure 3. The ICT Suppliers Competences Profiles

Besides these competences, all the ICT suppliers need commercial and marketing skills, nature of which depends on the target market addressed (that is small, medium or large enterprises). More precisely, a supplier which targets a substantial number of micro or small enterprises needs marketing skills in analysis and segmentation, direct and tele-marketing

activities, and tele-sales. The need to reach many, geographically disparate small companies have encouraged some software houses to develop their own sales channel made up of small software resellers. These software houses have developed skills in sales-channel management, for example recruiting and selection of the resellers and training capabilities. On the other hand, a supplier focused on medium or large enterprises will need sales-technical and relationship-based skills, besides the competences related to the market analysis and segmentation.

THE MAIN STRATEGIC TRENDS IN THE EUROPEAN MARKET

The empirical analysis reveals a number of strategic trends in the European market, showing that the ICT sales and distribution channel is in a change and development phase.
The most important strategic trends, which are described in the following section, are:

- the evolution of the portfolio and market scope of some basic resellers;
- the attempt by some software houses to expand their offer through the integration of third party software applications;
- the internationalization of some software houses;
- the acquisition by software houses of some basic or value added Hardware resellers;
- the attempt by some system integrators to enlarge their target market.

The evolution of the portfolio and target market scope of some basic resellers

Basic resellers (both those focused on SMEs and large enterprises) are facing a high level of competition.
In particular, the competition for basic resellers focused on small and micro enterprises comes from three main categories of player:

- big electronic retailers (for example Mediamarket) which have started to sell to micro and small companies arriving from the consumer market;
- hardware vendors (for example Dell) which sell hardware solutions via telephone or the Internet and focus mainly on micro and small enterprises;
- some players from other nearby industries (for example telecommunications) that have started to supply basic hardware and software solutions to micro enterprises and professionals, in order to integrate and complete their core commercial offer.

For basic resellers focused on medium-large enterprises, the main competitive pressure comes from large hardware and software vendors that have started to supply products and services directly to medium/large enterprises.

Moreover, the economic margins on basic Hardware products have been decreasing significantly over the last years. The high level of competition in this market has determined two main strategic trends:

- the attempt of several basic resellers to expand and enrich their commercial proposition by offering value-added infrastructural services (that is design, planning, maintenance of complex IT infrastructures) or even management software applications. The evolution towards the Value Added Hardware Reseller model can provide greater profitability, even if this is not easy, since it requires the development of specific competences that are not common for a basic reseller. The second type of portfolio evolution (towards the

supply of management software applications) requires an even greater change in competences, and for this reason, it has often been achieved through mergers and acquisitions. An example is *Company 31*, which started as a cable installation company and then expanded its activities to include a Network Operation Center, help desk always on, and new outsourcing and remote access services.

- the attempt of some players focused on large enterprises to enlarge their target market towards medium companies. In this case, too, change is not easy, since it requires the development of marketing and commercial skills and resources in order to target a very large number of prospects effectively and efficiently.

The attempt by some software houses to expand their offer through the integration of third party software applications

In parallel with their self-developed applications, a number of software houses have started to offer integration and customization services for software, especially ERP systems, developed by well-known vendors (for example Microsoft, SAP and Oracle). The aim of this strategy is to offer a more complete commercial range to customers, leveraging software-development competences and the brand of large international vendors.

The commitment of these players in proposing the new ERP system may vary:

- in some cases, the goal of the software house is to enlarge its product and services portfolio without investing too much in the new ERP system, as its own, self-developed ERP application is considered the real "core offer";
- in other cases, the software house exploits the new ERP system to enlarge the target market. This is true for a number of software houses focused on specific industries that have started to offer the new ERP system to different, previously not targeted industries;
- in other cases again, the software house invests significantly in the new ERP with a view to replacing its self-developed application in the future.

An example is Company 31, which has started to sell and integrate Dynamics, the ERP system developed by Microsoft.

The internationalization of some software houses

Several software houses focusing on specific niche markets and offering vertical software applications (for example financial software and Mobility applications[2]) are trying to expand their geographical market by leveraging specific and vertical competences. An example is Company 25 which offers a software application developed ad hoc for hospitals. The company has successfully started to target Germany and is also trying to enter the South American market.

The acquisition by software houses of some basic or value added Hardware resellers

In recent years, a number of software houses have acquired basic or value added hardware resellers. The goal of these acquisitions is twofold:

- to integrate the product and services portfolio;

- to acquire the hardware reseller's customers and subsequently propose software applications.

The attempt by some system integrators to enlarge their target market

There is a growing interest among almost all the analyzed horizontal system integrators operating in Europe in enlarging their market by trying also to serve medium-size enterprises. This evolution presents a number of difficulties deriving from the different commercial and delivery model required for a market comprising mainly medium-size enterprises.

The creation of "ecosystems"

Various ICT suppliers with different business models and competences are trying to develop networks and partnerships (or ecosystems) in order to offer "end-to-end" solutions to company users. In many cases, ecosystems have been created through mergers and acquisitions, and in recent years, there have been a significant number of such moves in the ICT market. For example, a company, which operates in the networking industry, acquired two software houses, in order to enlarge its products and services portfolio. Moreover, a Group acquired a software house which develops an ERP system, in order to enter a new market.

CONCLUSIONS

The empirical analysis shows that several business models can be pointed out in the ICT sales and distribution channel, going beyond the traditional classifications. For each business model different competencies are required in order to create competitive advantages.

Moreover, several strategic trends and evolutions are affecting these companies in Europe, highlighting that many players are trying to develop sustainable business models in the competitive landscape. The results of the analysis can be useful to the:

- ICT suppliers, as a means to define strategic actions more effectively;
- ICT vendors that exploit ICT suppliers to market their products and services especially to SMEs, in recruiting and selecting the most suitable sales channel partners;
- corporate ICT decision makers (for example Chief Technology Officers, Chief Information Officers), to help understand the competences and the commercial offer of the different ICT suppliers and to select the most effective external partner for the company.

Notes

[1] In 2005 and 2006, the Observatory dealing with ICT in SMEs analyzed approx 1,000 SMEs and indicated their ICT suppliers (that is hardware suppliers, software suppliers and system integration services suppliers).

[2] For instance: Sales Force Automation, Field Force Automation, Warehouse management and Fleet management.

DEVELOPMENT OF A THEORETICAL FRAMEWORK AND MANAGEMENT INFORMATION SYSTEM FOR PRISON MANAGEMENT

Sastry KS Musti, University of West Indies, Trinidad and Tobago
mks_sastry@hotmail.com

ABSTRACT

Management of law and order, crime control and legal system are most challenging activities for democratically elected governments in any country. As law enforcement activities become more stringent, the prison population increases. Prisons and behavioral correction facilities engage wide range of humans from hardcore criminals to upright police officers either for detention or for monitoring purposes. These humans have different cultural, psychological, financial backgrounds and yet are expected to coexist. The judicial processes should be effective enough in bringing the matters to a logical end; however that will be possible with full cooperation from all corners. In a nutshell, there are too many roles, processes and activities involved in the overall governance related to prisons making the overall administration a complex task. To avoid fraud, corruption, undesirable incarnations and incidents of delayed justice, an effective MIS for overall prison administration is desirable. Such IT tools not only provide transparency but also tend to improve overall law and order and increased trust in governance.

There have been many attempts by various organizations, authors across the globe to model various activities related prisons through appropriate modeling. Some have developed information systems for specific aspects such as patterns of crimes, prison facilities and correctional centers. However, there is no standard framework that has been reported on data modeling and designing a comprehensive MIS for prison management as part of e-governance.

This paper examines the present legal, administrative and management processes in overall governance and administration of correctional facilities and prisons. A brief review of legal, administrative and management processes related to prisons and correctional centers as reported from different countries will also be presented. Based on the information, a theoretical framework with specific objectives will be suggested. Keeping in view of these objectives, data models and an overall information system will be designed with regard to specific objectives of reducing fraud and corruption.

Keywords: MIS, E-Governance, Prison Management Systems

IMRPOVEMENT OF THE CUSTOMER FOCUS – THEORETICAL MODEL OF THE CUSTOMER PERCEIVED VALUE

Harri Karkkila, Plusbox Oy, Finland
harri.karkkila@plusbox.fi

Pekka Kess, University of Oulu, Finland
pekka.kess@oulu.fi

ABSTRACT

A high level of customer perceived value is the key to customer loyalty and to the profitability of customers and companies. It is not enough to meet the customer's needs in order to win customer loyalty. Instead the aim for companies should be to try to delight customers. Customers are delighted when they feel that the product or service not only fulfils their needs and expectations, but also gives them unexpected additional value. The aim of this research was to generate a theory for consumer perceived value which could be useful for managements trying to develop superior value so as to improve their customer loyalty. The pre-purchase consumer value was examined applying Grounded Theory methodology and by synthesizing the existing research results. The resulting theory from this synthesis consists of three main stages namely, gaining, sacrifice and purchase factors. The gaining stage has three sub-elements: substance, reputation and interaction. All these have the same four sub-categories: emotional, social, functional and economical elements. The novelty of this research Is in its treatment of customer perceived value firstly, from the perspectives of the companies – based on three functionally different factors: substance, reputation and interaction – and secondly from the perspective of the customers based on the identified subjective outcomes (i.e. emotional, social, functional and economic factors).

Keywords: consumer perceived value, customer focus, grounded theory, pre-purchase, reputation, sacrifice, substance

INTRODUCTION

The target of the companies is to succeed in a sustainable way. The customer perceived value is one of the most reliable ways to realise it. One of the basic presumptions in economics is that the enterprises strive to maximize their profits (Eskola 1996). In practice there are five possibilities; increasing the amount of customers, increasing the average purchase of the customers, increasing the purchasing times of customers, directing the customers' purchases to more profitable products and improving the productivity and profit earning capacity of enterprises.

The most effective way both in gaining new customers and keeping them and improving the enterprise profitability is to increase the customer loyalty (Reicheld 1996). Loyalty customers are more profitable. The increasing of customer loyalty is possible if the customers experience the products and services offered by the enterprise – or the benefits caused by them – better than other alternatives possibly often.

When striving to customer loyalty the enterprises should offer such products and services that the customer perceived value increases and creates loyalty. Based on this Blomqvis et al (1993) define the loyalty customer as follows: "The customer, who in time trusts in, that one enterprise is able to fulfil fully or greatest part of those of his needs concerning the products or services belonging in the enterprise's offerings." This means that the customer is loyalty to the enterprise and purchases the products or services of competitors only in exceptional case.

The customer's experience about the quality of the service and the bonds between customer and the enterprise form the customer perceived value in other words the ratio between the benefits customer has gained and the sacrifices the customer has fall into. Further the customer experienced value defines the relationship's level and solidity, in other word loyalty (Blomqvist et all 1993).

CONSUMER PERCEIVED VALUE

The consumer's buying behaviour has been examined widely and the customer's experienced value has been commonly accepted as the basis of the choice of purchase (preference). As Drucker (2002) states "The customers are willing to pay only about it what they find use of and what brings them value". What can we understand with the concept 'value'?
The concept "value" can be divided into direct value which means that the benefit is gained direct from the product or service, into instrumental value which means that you gain something you find valuable or useful by using the product or service or with help of it, and thirdly to exchange value which often coordinated with money (Nevanlinna & Relander 2006).

Woodal has found in his research that the concept value is used in very many meanings which depart from others in perspective and even contents. The concept value in business can be seen in three principle different meanings which depart from each others in perspective (Woodal 2003);

- Value added, which is a very enterprise centric point of view, with which is calculated the value added in it's products and services during the enterprise's own processes like innovations, processing, labour, energy etc (Porter 1985). Korkman states that the value is developed when using a product or service – not when producing it. The consumption is then in principle the source of the value, not the production (Korkman 2007).
- Customer lifetime value (VLC) is the value which the customer yields to the enterprise during the relationship's lifetime in other words the enterprise's own point of view about the value of the customer for the enterprise it self (Woodal 2003).
- Value for the customer or VC (Woodal 2003), consumer perceived value, (Sweeneya & Soutarb 2001)

According to Woodal (2003): "Value for the customer (VC) is any demand-side, personal perception of advantage arising out of a customer's association with an organisation's offering, and can occur as reduction in sacrifice; presence of benefit (perceived as either attributes or outcomes); the resultant of any weighed combination of sacrifice and benefit

(determined and expressed either rationally or intuitively); or an aggregation, over time, of any or all of these."

THE OBJECTIVES OF THE STUDY

The customer perceived value can be only found through observation of the customer's reality. As Drucker (2002) says "The customer's reality is so often different from the producer's." The enterprises usually know the customer's world of ideas and his or her desired value only partly or badly. The problem is that there is a lack of a tool or a thinking model, which suits in enterprise's functions but in the same time operates customer oriented.

The target in this study is to generate a theory and way of thinking to describe customer perceived value so that it would help the enterprises' management to understand their customer deeper and on the other hand could be a useful tool in developing value for the customers.

The target is to find a theory which describes the consumers' pre-purchase decision factors, which would have use in practice in enterprises and institutions quality management, R&D operations, marketing and in planning of other functions in the way that the managers could think alike consumers - customer centric – and that way offer to the consumers such benefits they were ready and willing to pay for.

In practice this means the description of value ratio and its factors which is the basis of consumer's decisions, in other words a clear consumer's decision taxonomy. So the target of this study is to define the factors which influence on the experience of consumers about a good purchase.

THE RESEARCH QUESTION

To understand the consumer's choices we have to be able to describe the consumer's decision processes. In this study the main interest is to build a theory or model to describe the consumer's decision factors and their respective relations in a way that helps the enterprise management in practice to understand their customer's choices better than today. The research question has been articulated as follows: Which are the factors of consumer's pre-purchase decisions?

THE RESEARCH METHODOLOGY

The research was carried out as a literary research. The research was based on the following theories:

1. Theories of Customer Perceived Value
    a. Porter (Porter 1985, 1996)
    b. Kotler (Kotler, 1990, 1999)
    c. McCarthy's 4P marketingmix (McCarthy 1960)
    d. Parasuraman, Zeithaml ja Berry (Parasuranam et all 1990)
    e. Fredericks, Salter (Fredericks & Salter 1995)
    f. Holbrook (Hollbrook 1999)

   g. Woodruff (Woodruff & Fisher 1996).
   h. Woodall's Model (Woodall 2003).
   i. Fishbein (Fishbein (1963)
   j. Zeithaml (Zeithaml 1988)
   k. Sweeneya and Soutarb (Sweeneya & Soutarb, 2001)
2. Multiattribute Value Theory (Liesiö, 2006)
3. Theories of Consumer's Choice (Friedman 1988)
4. Andreasen's Model of Consumer's Choice
5. Nicosia's Model of Consumer's Choice Behaviour concerning new Products
   a. Howard-Sheth's Model of Consumer's Choice
   b. Engel-Kollat-Blackwell Model
   c. Bettmanin Model
   d. Vroom's theory of motivation (Vroom 1964)
6. Other Perspectives to Consumer Perceived Value
   a. Concepts "´Quality" and "Value"
   b. Consumer's Satisfaction and Perceived Value
   c. Kano's model (Kano 1984)
7. Social Psychology and Consumer's Choice
8. Temporal Positioning

The used theories can be divided in three groups based on their scope:

1. the theories to describe the decision behaviour of the consumers
2. the theories defining the consumer experienced value
3. the theories to describe the value-ratio experienced by the consumers

The models and theories introduced above however contain the main part of constructions, categories and concepts of which the theory of consumer perceived value-ratio in pre-purchase situation has been generated.

The second group is formed of the theories defining the consumer experienced value. The meaning of the consumer experienced value in developing competition advantages is very remarkable, but it is not only the value to solve the consumer's choices – the sacrifices have as great meaning in the decision making. The theories of value have however the decisive role in generating the theory about the value-ratio.

The third perspective is that the consumer compares the value experienced to the sacrifices experienced. This is called in this research 'The Consumer Perceived Value-ratio'. The value-ratio is studied temporally in the situation of pre-purchase where the experiences are subjective expectations.

This research has been carried out according the principle introduced by Strauss and Gorbin (Strauss & Gorbinin 1988): "Although we are not generating the data we generate a theory out of the data. If we do it right, we let the data talk with those concepts which come out of it clearly understandable and representatively. Our theory, yet incomplete, yield common language (concepts) with help of which the others can get ideas and solve problems – already a small amount of understanding can do the difference."

Grounded Theory is a methodology developed by Glaser and Strauss (and later also Gorbin) mainly for sociological research and theory generating. The main principle is that we let the data itself to create the theory: searching in the data events and incidents (coding), conceptualising them, categorising them to classes, defining the central relations between concepts and classes, finding the key-category and based on it formulating an opinion for the theory (hypothesis, proposition) (Glaser & Strauss 1967, Strauss et Gorbinin 1988, Glaser 1992, Pandit 1996).

”The value of the Grounded Theory is not only that with help of it can be developed a theory but that the theory is grounded on data” (Strauss & Gorbin 1988) The Grounded Theory has eight stages (Strauss & Gorbin 1988):

1. Open coding
2. Axial coding:
3. Selective coding:
4. Theoretical saturation:
5. Defining the central core-category
6. Theoretical sampling:
7. Writing
8. Evaluation

RESULTS

The target of this research was to understand the consumer’s choices. The main interest was to build a theory or model to describe the consumer’s decision factors and their respective relations in a way that helps the enterprise management in practice to understand their customer’s choices better than today. The research question was;
“Which are the factors of consumer’s pre-purchase decisions?”

In the chosen data could be found a lot of different factors. It almost looked like every researcher should present his or her own factors. This can also be explained with different viewpoints. There were many suitable ways to categorize the concepts, and the proposed way is the summary of the found alternatives.

The first of main factors is the ‘Gaining’ divided in three components; substance, reputation and interaction. These factors describe the consumers’ experienced gaining. This concept is the customer perceived value.

The second of the main factors is ‘Sacrifice’ describing all the bother, trouble and costs consumer experiences to sacrifice.

In addition to these two earlier mentioned there are a lot of other agents which have influence in consumers’ decisions but do not belong in earlier mentioned factors. These are called in this research ‘Purchasing Factors’.

In the chosen data came out another classification for the customer perceived value. This classification divided all factors in four categories (Sweeneya & Soutarb 2001); emotional, social, functional and economical. The material, on which the research is grounded, supports

the proposition that all the mentioned main categories of the factors of consumer's pre-purchase decisions and their components could be divided in these four subcategories as shown in the figure 1.

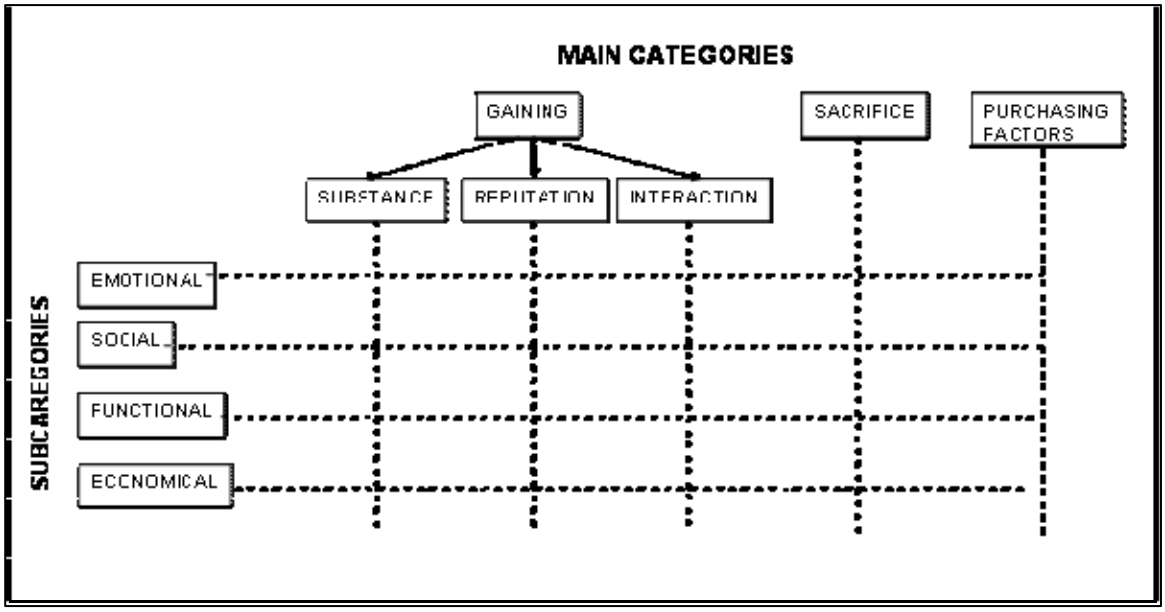

Figure 1. The matrix of categories and subcategories of consumer perceived value.

The factors affecting on the consumer's choice decision are consumer's own experiences about the value factors and thus totally customer centric. By using the Woodruff's value hierarchy (Woodruff et Fisher 1996) one can lead from the consumer's experiences product's and service's attributes for production and manufacturing. According the hierarchy the product's and service's attributes produce consequences which lead to consumer experienced benefits.

In the proposed model the customer perceived value is divided in three factors which all are clearly directable to different functions and operations in enterprises. This means they are easier to use for everyday work in marketing, development and strategies.

Substance is an outcome of products and services and their properties. So it only concerns the offering of enterprises. It answers the question WHAT. Reputation concerns the company's and its products image. It answers the question WHO. Interaction means the way to get the product or service or information about it. It answers the question HOW.

Some of the factors add the consumer's perceived value but others reduce it. Some factors have influence in the others meaning and importance.

LUXURY IN THE INFORMATION AND COMMUNICATION TECHNOLOGY PRODUCTS

Dr. Weichen Teng, Chinese Culture University, Taiwan
wcdeng@sce.pccu.edu.tw
Dr. Tientien Liao, Chinese Culture University, Taiwan
ttliao@sce.pccu.edu.tw

Abstract

As the retail market for information and communications technology (ICT) has become very competitive, managers and marketers face the challenge of how to motivate consumers to pay more to purchase ICT products. This study shows that from the consumer's perspective, high-priced ICT products can be divided into at least two segments—a luxury product and a high-end product. Consumers whose shopping styles are perfection-seeking, novelty-seeking, and prestige-seeking tend to prefer a luxury product. Consumers whose shopping styles are innovation-seeking and perfection-seeking tend to prefer a high-end product. This study aims to develop an integrated conceptual framework for examining consumers' preferences for high-priced ICT products and help ICT firms to position their products.

Keywords: Shopping style, High-priced product, High-end product, Premium product, Consumer behavior

INTRODUCTION

Innovations in technology are causing three separate industries--computers, communications, and consumer electronics--to converge into one integrated industry of information and communication technology (ICT). Many software and hardware companies are expanding their product lines strategically to include such consumer electronics or telecommunication devices as music players, digital cameras, personal digital assistants, smartphones and e-book readers. Traditional manufacturers of consumer electronics are also developing new products in order to enter the ICT market.

With various players offering many innovative products, the retail market for ICT goods has become very competitive. To increase their market share and revenue, many ICT companies engage in price wars, a strategy that hurts their profits. ICT firms therefore face the challenge of motivating customers to pay more to purchase their products. To attract those customers who are willing to pay a premium price, some firms are turning to the luxury market. Acer, for example, a personal computer manufacturer, has been working with the luxury carmaker Enzo Ferrari to launch the Acer Ferrari series of laptop computers.

A second alternative to escape price wars has been to develop a high-end product that the consumer is willing to pay a premium price. ICT firms engaging such a strategy aggressively deploy the newest advances in technology to provide the ultimate high-end products possible to customers. Hypersonic, a personal computer manufacturer offering top-notch laptop

computers (US$3,450 as of 9/23, 2009 on amazon.com, listing the three most expensive) providing cutting-edge technology to astute and selective gamers, is one such company.

As a premium market emerges in the ICT sector and ICT companies increasingly see launching expensive products as a way to increase their profit margin, managers and marketers of computers and consumer electronics need to develop a thorough understanding of consumers' purchasing behavior in relation to high-priced ICT products. A successful marketing positioning strategy can help customers to perceive sufficient value in a premium good to compensate for the high price charged (Tynan, Mckechnie and Chhuon, 2009).

Previous studies have examined the concept of luxury in the context of the retail markets (e.g., Vigneron and Johnson, 2004; Wiedmann, Hennigs, and Siebels, 2009), few have investigated the concept as it applies to the ICT market. In the ICT sector, we propose that high-priced ICT products can be divided into at least two segments: luxury products that are stylish and design-oriented, and high-end products that are innovative and technology-oriented. Different customers might expect different features from luxury and high-end products.

This study aims to discuss luxury and high-end products in the ICT sector and to examine factors that drive customers to purchase those products. The theoretical discussion and empirical findings deepen understanding of these factors in the following ways: (1) by providing a broader perspective for looking at the luxury ICT market; (2) by developing an understanding of consumers' shopping styles in relation to luxury and high-end ICT products; and (3) by making strategic recommendations for enhancing the development of luxury or high-end ICT products.

CONCEPTUAL FRAMEWORK AND HYPOTHESES

The luxury ICT market

The luxury market is a significant segment of today's retail markets. Although luxury consumer demand in the West appears to be waning due to the credit crunch, property crash and a slowing world economy, the appetite for luxury brands is growing elsewhere in the emerging economies of China, India, and Asia (Tynan, Mchechnie and Chhuon, 2009). In the past, luxury goods such as the finest jewelry, sports car, or yachts, were the preserve of the privileged few, but now, the concept of luxury has a broader application in the marketing field and indicates premium products in most categories, such as clothing, food, or travel. Luxury has become as luxurification of the commonplace (Berry, 1994), and has become more affordable for many middle-market consumers (Silverstein and Fiske, 2001). Luxury is increasingly about experience and authenticity, and the old values of tradition and nobility have become less important (Yeoman and McMahon-Beattie, 2006).

Silverstein and Fiske (2001) suggest that a confluence of business factors and social forces fuels the rise of luxury consumption. On the business side, manufacturers now have the capacity to produce more goods than consumers demand; therefore, they have to differentiate their products from those of competitors and believe that the luxury market is an attractive segment for making profits. At the same time, owing to the rise in disposable income for the

middle classes, consumers have started to trade up; middle-income earners are willing to pay premium prices for products and services that possess higher levels of quality, taste, and aspiration than other goods in the same category (Yeoman and Mcmathon-Beattie, 2006). At least until the very recent global financial crisis, some consumers purchase goods and service which meet not only their physical needs but also their emotional needs (Silverstein and Fiske, 2001). This need convergence of manufacturer and consumers has resulted in a rise in consumption of luxury products.

The luxury market has been expanding most significantly in several Asian countries (Nueno and Quelch, 1998). For instance, TNS (2008) estimates that by 2014, China will become the largest luxury goods consumer market in the world, accounting for a 23 percent share in the global market. Because of this trend, luxury brands that

feature high prices, prestigious names, and international markets play an increasingly important role in profit generation for many international corporations.

The luxury market in the ICT sector is also booming; the market for mobile phone handsets is such an example. As the market for mobile phone handsets has matured and as technology has become less of a differentiating factor, mobile phone makers are starting to target the luxury market. Increasing numbers of mobile phone makers and designer brands enter independently or jointly the luxury mobile phone market. Vertu is one such example. A wholly owned subsidiary of the mobile phone manufacturer Nokia, Vertu declares itself the world's first luxury mobile phone maker and prices its first devices at a staggering US$21,240 (Wired, 2002). Another example is that of the mobile phone manufacturer LG collaborating with the fashion brand Prada to launch luxury phones. ABI Research (2008) forecasts that revenues from luxury- branded handsets will increase to more than $43 billion by 2013.

In many categories of goods, such as that of fashion clothing and accessories, consumers might view most high-priced products as luxury ones, a concept related to prestigious names, stylish designs, and precious materials. However, in high-tech industries such as the ICT sector, some innovative products are high-priced but lack stylish designs and are made without precious materials. It is innovation and technology that make the product high-end; therefore, not all high-priced ICT products are viewed by customers as luxury ones, as they would be in the fashion or accessories sectors. Thus, when ICT firms intend to develop high-priced products, the luxury product is not the only positioning segment they think about in the high-priced market.

In addition, a high-priced product does not simply mean a special product item; it represents a meaningful strategic approach to increase brand equity. Such a strategy, however, has not always met with great success, so manufacturers face the challenge of how to position and develop their products effectively. A technology player's ability to identify the nature and expected behavior of buyers in the niche consumer segment and to understand and respond to their needs will be crucial for the successful development of high-priced products. Thus, to gain a deeper understanding of what motivates target customers to pay premium prices is important to ICT marketing managers.

Overty and Lee (2006) indicate that consumer choice is the result of multiple dimensions of consumption value, and preference is to influence future consumer outcomes, including intentions, willingness to buy and word-of-mouth, they demonstrate that the multiple value dimensions contribute to preference and future intentions. Based on the framework, we assume that there are at least two reasons for customers' choice of high-priced ICT products, one is the preference for luxury, and the other is the preference for high-end performance. The makers of luxury products usually increase product value through the use of stylish designs, precious materials, or prestigious brand names, whereas high-end ICT products usually embed the most innovative and state-of-the-art specifications within utilitarian features. **Hypothesis 1. The constructs of consumers' preference for luxury products and preference for high-end products are different in the ICT sector.**

Consumers' preferences for luxury ICT products

Over the past few years, many ICT manufacturers have worked to upgrade the quality of their products as well as their brand images. With luxury goods in demand, some ICT firms are trying to create luxury lines with unique products so that they can attract customers with the products' design or special-edition features. Although luxury ICT products have so far represented only a small fraction of overall market sales, the consumer's increasing desire for differentiation combined with the profitability of such products is boosting the presence of these products in the market.

Arghavan and Zaichkowsky (2000) propose that psychological benefits are the main factor distinguishing luxury products from non-luxury products. Vigneron and Johnson (2004) define luxury brands as goods of which the simple use or display brings the owner esteem, apart from any functional utility. Nueno and Quelch (1998) define luxury brands as those whose ratio of functionality to price is low, while the ratio of intangible and situational utility to price is high.

We apply the definition of luxury brands by Nueno and Quelch to its understanding of luxury ICT products and assume that one reason an individual may be willing to pay a relatively high price for a particular ICT product is simply that it is a luxury product. **Hypothesis 2. The more a customer prefers a luxury ICT product, the more she/he is willing to pay a high price for this product.**

Consumers' preferences for high-end ICT products

In contrast, some manufacturers in the high-tech market focus less on enhancing products' luxury features and instead focus more on developing incremental innovations and state-of-the-art specifications in their high-end models in order to upgrade the quality, performance, or usability of their products. When ICT firms launch these innovative ICT products, they position these products as high-end models and price them at a premium, as they attempt to recoup their development costs, but firms may lower the price over time; the smartphone is one such product. The pricing strategy for a high-end product is different from that for a luxury product, for which the price level must be maintained to retain prestige value.

Differing from radically innovative products that focus on breakthrough technologies, a high-end product offers not only new technologies but also a guarantee of the product's quality. Consumers do not look at all innovative products as high-end ones if there is a perceived risk in terms of the product's quality. Some consumers will not purchase a new technology until a high-end model with a good quality guarantee has been launched; they are then willing to pay a relatively high price to buy that innovative product.

We define the preference for high-end ICT products as a customer's intention to choose a product with innovative and top-quality specifications when she/he purchases an ICT good and proposes the hypothesis. **Hypothesis 3. The more a customer prefers a high-end ICT product, the more she/he is willing to pay a high price for this product.**

Consumers' shopping styles

Researchers have long discussed the importance of knowing why people choose a particular product during a selection process. Walsh, Hennig-Thurau, Wayne-Mitchell, and Wiedmann (2001) suggest that psychographic segmentation can effectively identify product preferences. Because the purpose of this study is to investigate the factors involved in consumers' preferences for luxury or high-end ICT products, we use psychographic segmentation for this purpose.

Consumers' decision-making styles (in short, shopping styles), like lifestyles, have been a prominent area of interest in consumer behavior studies using psychographic segmentation. Sproles and Kendall (1986) define the shopping style as a mental orientation characterizing a consumer's approach to making choices and state that one or more specific shopping-style dimensions may influence consumer choices. Tai (2005) suggests that an understanding of shopping styles is important to marketing because they determine consumer behavior and are relatively stable over time; therefore, they are relevant for market segmentation and useful for this study.

Sproles and Kendall (1986) develop a Consumer Styles Inventory (CSI) by dividing its scale into eight central decision-making dimensions that influence consumers' shopping styles: perfectionism/high quality consciousness, brand consciousness, novelty-fashion consciousness, recreational value, price-value consciousness, impulsiveness, confusion from too many choices, and brand loyalty. We have adapted and modified some of these dimensions and several others in order to gain further insight into consumer shopping styles in the context of high-priced ICT products.

Perfection seeking, novelty seeking, and prestige seeking are drivers of luxury ICT products

Among the eight consumer shopping styles in the CSI, perfectionism/ high quality consciousness may be the most important reason consumers purchase luxury ICT products. Sproles and Kendall (1986) identify the perfectionist consciousness as a shopping decision style that characterizes the segment of consumers who are extremely concerned about product quality and inclined to buy luxury brands mainly because of their perceived excellence in

quality and performance. We adapt the definition of perfectionism/high quality consciousness to the perfection-seeking style and examine it in this study.

In a large-scale study, Gentry, Putrevu, Shultz, and Commuri (2001) find that consumers do not necessarily buy luxury brands just for the caché of their conspicuous brand names, but more often because of the superior quality reflected in that name. The literature on luxury consumption emphasizes the importance of leadership in quality to ensure the perception of luxury (e.g., Quelch, 1987; Garfein, 1989; Roux, 1995). **Hypothesis 4. The customer's perfection-seeking shopping style has a significantly positive effect on his/her preference for a luxury ICT product.**

The novelty-seeking shopping style might be another reason a customer purchasing a luxury ICT product. Novelty seeking is the desire to seek out the new and different (Hirschman, 1980). In the CSI, novelty seeking is not limited to technological innovations. Sproles and Kendall (1986) broaden the scope of novelty to the concept of fashion and indicate that consumers who are conscious of novelty and fashion will find seeking out new products pleasurable, will be likely to shop less carefully and more impulsively, and will be less sensitive to price. Thus, we consider that the novelty seeking will influence the preference for luxury good. **Hypothesis 5. The customer's novelty-seeking shopping style has a significantly positive effect on his/her preference for a luxury ICT product.**

According to the marketing literature on factors driving the purchase of luxury goods, the prestige-seeking shopping style might be another driver influencing the purchase of luxury ICT products. Some studies have used the concept of prestige to discuss luxury consumption. Chao and Schor (1998) reveal that luxury brands can convey status and prestige. Vigneron and Johnson (2004) conclude that prestige brands have five perceived values: they are conspicuous, unique, social, hedonic, and high quality. Prestige consumption is similar to status consumption, but it is conceptually distinct from conspicuous consumption because it is not merely the purchase of prestigious products to display wealth and prosperity. It is also different from materialism, which involves the acquisition of goods for their own sake (Eastman and Flynn, 1999; O'Cass and McEwen, 2004).

Based on the above discussion, we define the prestige-seeking shopping style as belonging to the segment of customers who are concerned about the conspicuousness, uniqueness, social nature, hedonicity and quality values when they purchase an ICT good. We assume the effect of prestige-seeking tendencies on luxury preference. **Hypothesis 6. The customer's prestige-seeking shopping style has a significantly positive effect on his/her preference for a luxury ICT product.**

Perfection seeking and innovation seeking are drivers of high-end ICT products

On the other hand, if some brands not perceived of by consumers as luxury brands plan to develop premium models of ICT goods, they can embed their high-priced products with innovative specifications and convince consumers that those products will also offer high quality. The consumer's perfection-seeking style may drive him/her to choose a high-end product. **Hypothesis 7. The customer's perfection-seeking shopping style has a significantly positive effect on his/her preference for a high-end ICT product.**

The innovation-seeking shopping style may also be an important factor influencing the preference for high-end products. As discussed above, manufacturers usually embed innovative specifications in their high-end products so that they can charge higher prices. The innovation-seeking style belongs to the segment of customers who are very concerned about innovations in the product. The innovation-seeking style is different from the novelty-seeking style because the innovation-seeking style focuses more on the product's technological features. Several studies have demonstrated that novelty seeking is an antecedent to innovation-seeking (e.g., Hirschman, 1980; Roehrich, 2004); therefore, we assume that the novelty-seeking style will influence the innovation-seeking style. **Hypothesis 8. The customer's innovation-seeking shopping style has a significantly positive effect on his/her preference for a high-end ICT product; Hypothesis 9. The customer's novelty-seeking shopping style has a significantly positive effect on his/her innovation-seeking shopping style.**

On the basis of the above analysis, we hypothesize the integrated framework of choice of high-priced ICT products as follows (see Figure 1).

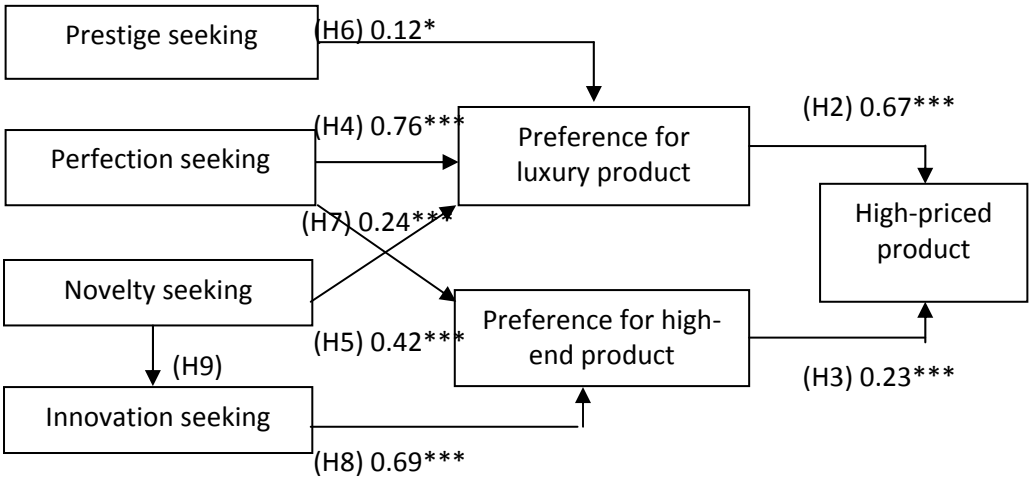

Figure 1. Research model and Results of SEM analysis

RESEARCH METHODOLOGY

Instrument development

An empirical study was administered to test the model. To generate the questionnaire, multiple-item scales were developed on the basis of previous studies to measure the relevant constructs. The corresponding items of each construct are described in Table 1. All of the items were initially tested using five graduate students who are experienced ICT goods consumers; they were asked to list items that correspond to the measured constructs. The most frequently mentioned items were included in the instrument. To reduce the possible ambiguity of the items in the questionnaire, a small-scale pilot study was conducted. All questionnaire items were based on a 5-point Likert scale anchored between "strongly agree" and "strongly disagree," and the results led to several changes in the wording of the questionnaire.

Sample collection

The survey was conducted between July and September of 2008. Six hundred questionnaires were distributed to the participants of open enrollment courses or evening classes at a university in Taipei, none of whom were traditional students. Most of the participants worked during the day and studied at night or on weekends. Although the sample is clearly not representative of the population at large, such a sample is often selected by researchers for luxury studies (e.g. Kapferer, 1998; Eastman, Goldsmith, and Flynn, 1999). In addition, young professionals with higher education levels are also often selected by researchers to form the samples for technology adoption studies (e.g. Shim, Ahn, and Shim, 2006; Shim, Park, and Shim, 2008). Another survey shows that the majority of Chinese consumers of luxury products are aged between 20 and 40 years; they are considerably younger than those in the U.S. and Europe, although younger does not mean richer. This segment is willing to spend a greater portion of their income on luxury goods than those in the U.S. and Europe are willing to (Debam and Svinos, 2008). Because this study intends to help ICT firms motivate customers to pay more, and middle class consumers have embraced luxury brands in Chinese society, the sample group is considered effective for this study.

For each question, respondents were asked to circle the response that best described their level of agreement with the statement. Three hundred and forty-five complete questionnaires were collected, yielding a valid response rate of 58%. Of those respondents, 56% were female, 44% were male, and the majority (73%) had monthly incomes greater than the 2007 minimum monthly wage in Taiwan. The profiles of the valid respondents are shown in Table 2.

Table 1 Constructs and corresponding items

Constructs	Items
Willingness to pay for high priced products	1. When shopping for an ICT product, the product I choose is usually in the higher price range. 2. When shopping for an ICT product, I will choose a high priced one.
Preference for luxury ICT products	1. When shopping for an ICT product, I will choose a luxury brand. 2. When shopping for an ICT product, I will choose the finest one. 3. When shopping for an ICT product, I will choose a premium one.
Preference for high-end ICT products	1. When shopping for an ICT product, I will choose one with high-end specifications. 2. When shopping for an ICT product, I will choose one with high performance. 3. When shopping for an ICT product, I will choose one with high-end accessories.
Prestige seeking	1. When shopping for an ICT product, I will choose one that represents my personal image. 2. When shopping for an ICT product, I will choose one that demonstrates my lifestyle and taste. 3. When shopping for an ICT product, I will choose one that associates with my social status.
Perfection seeking	1. When shopping for an ICT product, I will choose one that is well made. 2. When shopping for an ICT product, I will choose one with high quality.
Novelty seeking	1. When shopping for an ICT product, I will choose the one with the latest style. 2. When shopping for an ICT product, I will choose the newest model in the market.
Innovation seeking	1. When shopping for an ICT product, I will choose an innovative one. 2. When shopping for an ICT product, I will choose one that has latest-generation technology.

Scale validity and reliability

According to measurement development theory, a well-accepted instrument can be determined by (1) construct reliabilities, (2) the convergent validities of measures associated with individual constructs, and (3) the discriminant validity between constructs (Hulland, 1999). Thus, evaluations of the psychometric properties of the measurement model in terms of reliability, convergent validity, and discriminant validity were conducted.

Internal consistency was evaluated using Cronbach's alpha test. Table 3 lists the means and internal consistency of each of the constructs. In general, a measurement with internal consistency exceeding 0.70 is considered reliable (Nunnally and Berstein, 1994). As shown in Table 3, the internal consistency values of all the constructs in the model exceed or equal this recommended threshold.

Table 2 Descriptive statistics of the respondents' characteristics

Measure	Items	Frequency	Percent	Remark
Gender	Male	150	43.5	
	Female	195	56.5	
Age	Under 25	53	15.4	
	25-29	105	30.4	
	30-34	78	22.6	
	35-39	51	14.8	
	40 and up	58	16.8	
Monthly income (NT$)	Under 20,000	92	26.7	
	20,001-35,000	102	29.6	
	35,001-50,000	85	24.6	
	50,001-65,000	38	11.0	
	65,001-Up	28	8.1	
Occupational category	Executives	11	3.2	Taiwan's minimum monthly wage was NT$17,280 (US$533) and average monthly income was NT$44,414 (US$1,383) in 2007.
	Manager	34	9.9	
	Professional	97	28.1	
	Staff or sales	42	12.2	
	Self-employed	4	1.2	
	Freelance	12	3.5	
	Unemployed	48	13.9	
	Housewife	4	1.2	
	Student	47	13.6	
	Others	46	13.3	
Total		345	100	

Convergent validity is the extent to which varying approaches to construct measurement yield the same results (Campbell and Fiske, 1959). Convergent validity was evaluated for the measurement scales using two criteria suggested by Fornell and Larcker (1986): (1) all indicator factor loadings should be significant and exceed 0.70, and (2) average variance extracted (AVE) by each construct should exceed the variance due to measurement error for that construct.

Table 3 Construct Means and Internal Consistencies

Construct	Number of items	Mean	Cronbach Alpha
Willingness to pay for high priced ICT products	2	2.83	.81
Preference for luxury ICT products	3	2.54	.90
Preference for high-end ICT products	3	3.18	.90
Prestige seeking	3	3.37	.85
Perfection seeking	2	3.29	.70
Novelty seeking	2	2.98	.87
Innovation seeking	2	3.28	.82

Note: All constructs are measured on a five-point scale with the anchors 5=strongly agree, 4=agree, 3=neutral, 2=disagree, 1=strongly disagree

The results, illustrated in Table 4, indicate that all loadings are significant (t-value >1.96) and, except for three items, are larger than 0.7. Additionally, the average variance extracted values fall between 0.53 and 0.78, exceeding the minimum value of 0.5 for good internal consistency as suggested by Fornell and Larcker (1986). Thus, the evidence reveals satisfactory convergent validity.

Table 4 Significant levels of items loading (Completely Standardized Solution)

Loading	Item 1	Item2	Item3
Willingness to pay for high-priced ICT products	0.81 16.88	0.85 17.99	
Preference for luxury ICT products	0.91 21.52	0.85 19.37	0.85 19.21
Preference for high-end ICT products	0.90 20.76	0.87 19.91	0.82 18.23
Prestige seeking	0.86 18.67	0.90 19.85	0.70 14.22
Perfection seeking	0.69 13.15	0.77 14.66	
Novelty seeking	0.91 20.74	0.84 18.46	
Innovation seeking	0.87 18.82	0.83 17.92	

Discriminant validity assesses the extent to which a concept and its indicators differ from another concept and its indicators (Bagozzi, Yi and Phillips, 1991). To assess the discriminant validity of the proposed constructs, the AVE method was used. Fornell and Larcker recommend that the square root of the average variance extracted from a construct should exceed the square correlation between itself and any other construct. Table 5 shows that AVEs are greater than 0.52, which is the highest possible squared correlation between construct pairs. Thus, the evidence reveals satisfactory discriminant validity.

Table 5 Average variance extracted and discriminant validity

Construct	PreS	PerS	NS	IS
Prestige seeking (PreS)	0.62			
Perfection seeking (PerS)	0.31	0.53		
Novelty seeking (NS)	0.11	0.28	0.78	
Innovation seeking (IS)	0.13	0.31	0.52	0.72

Note: Diagonal elements represent the average variance extracted (AVE), while off diagonal elements represent the correlation squares among constructs. For discriminant validity, the AVE should be larger than correlations.

DATA ANALYSIS AND RESULTS

Analysis of the measurement model

A confirmation factor analysis (CFA) with LISREL 8.5 (Jöreskog, 2000) was conducted to assess the fitness of the measurement model. The purpose of testing the measurement model is to determine whether the measures possess satisfactory psychometric properties (Lou, Lou, and Strong, 2000). To assess a measurement model's overall goodness of fit, researchers follow a common practice of reporting a goodness-of-fit index (GFI) (Bentler and Bonett, 1980), an adjusted goodness-of-fit index (AGFI) (Bentler, 1980), a comparative-fit index (CFI) (Bentler, 1988), a normed-fit index (NFI) (Bentler and Bonett, 1980), a standardized root mean square residual (SRMR) (Bentler and Yuan, 1999), and a root mean square error of approximation (RMSEA) (Browne and Cudeck, 1993). A good fit to the model is suggested by GFI, CFI, and NFI values higher than 0.90; an AGFI value higher than 0.8; a RMSEA value below 0.05; and an SRMR value lower than 0.08. Hair, Anderson, Tatham and Black (1998) suggest that a RMSEA value lower than 0.08 is an acceptable value for fair fit. The overall results of this study suggest that the measurement model provides a satisfactory fit to the data (see Table 6). A similar set of fit indices was used to examine the structural model (see Table 6) and shows acceptable fit values with GFI at 0.91, AGFI at 0.87, NFI at 0.93, NNFI at 0.94, CFI at 0.95, SRMR at 0.064, and RMSEA at 0.070. The overall results suggest that the structural model also provides a satisfactory fit.

Table 6 Fit indices for measurement and structural models

Goodness-of-fit measure	Recommended value	Hypothesized model		
		Measurement	Structural	Fit evaluation
GFI	>0.90	0.92	0.91	Good/Good
AGFI	>0.80	0.88	0.87	Good/Good
NFI	>0.90	0.94	0.93	Good/Good
NNFI	>0.90	0.95	0.94	Good/Good
CFI	>0.90	0.96	0.95	Good/Good
SRMR	<0.08	0.055	0.064	Good/Good
RMSEA	<0.05	0.068	0.070	Fair/Fair

Hypotheses testing

Although the discriminant validity among the constructs in this study demonstrates to a satisfactory degree, we have also used a factor analysis to test the discriminant validity in order to explore the difference between preferences for luxury products and those for high-end products. A principal component analysis with oblique rotation by SPSS 10.0 was performed; the result shows that two factors are extracted (see Table 7) and supports the hypothesis that the preference for luxury products and the preference for high-end products are different (H1).

Table 7 Principal component analysis with oblimin rotations.

Scale items	Factor 1 (Preference for high-end ICT products)	Factor 2 (Preference for luxury ICT products)
Item 1	**.951**	3.720E-02
Item 2	**.952**	4.928E-02
Item 3	**.776**	-.172
Item 4	.205	**-.768**
Item 5	-3.267E-02	**-.962**
Item 6	-5.901E-02	**-.947**

Note: Rotation converged in 8 iterations.

We proceeded to examine the proposed hypotheses by performing a path analysis. Figure 1 shows the standardized path coefficients between constructs as well as square multiple correlation (SMC) values for each dependent variable. According to Bollen (1989), the SMC value is the percentage of explained variance and is equivalent to R^2 in linear regression.

As expected, we find that the preferences for luxury and high-end products have significantly positive effects on the willingness to pay for a high-priced ICT product; H2 and H3 are supported. As for the drivers of preference for luxury products, the shopping styles of perfection seeking, novelty seeking and prestige seeking have significantly positive effects on the preference for luxury products; H4, H5, H6 are supported. Moreover, the perfection-seeking and innovation-seeking shopping styles have significantly positive effects on the preference for high-end goods; H7 and H8 are supported. In addition, the novelty-seeking style has a positive effect on innovation seeking, H9 is supported. The model explains 67% of the variance in the construct of high-priced ICT products, 76% of the variance in the construct of luxury products, and 68% of the variance in the construct of high-end products. Figure 1 shows the standardized path coefficients between constructs as well as the SMC values for each dependent variable.

DISCUSSION

The results of the above data indicate that consumer' perspectives of high-priced ICT products can be divided into at least two segments: a preference for luxury products, and a preference for high-end products. For the customers who prefer a luxury product, the values of novelty, prestige, and quality are determinants of a luxury ICT product; in contrast, for

those consumers who prefer a high-end product, the values of innovation and quality are determinants of a high-end ICT product.

If an ICT firm plans to develop luxury products, it has to demonstrate leadership and a long-term commitment to quality; otherwise, consumers might reject the brand and its products. In addition, because consumers expect luxury products to offer novelty value, ICT firms need to focus their efforts on developing new product designs for luxury products. This finding might explain why luxury ICT products are usually developed with stylish designs; they offer customers novelty value. Furthermore, making customers feel that they are gaining prestige when they own and use the products is another driver for customer choice of a luxury ICT good.

In addition to luxury products, some customers are willing to pay a relatively high price for high-end ICT products because of their innovations and quality. As with luxury products, high-end products have to offer quality to their target customers, but those target customers of high-end products are concerned more with innovation value than with prestige value. When marketing to customers who tend to prefer high-end products, an emphasis on the new technology will capture the target consumers' attention and arouse their desire to purchase a high-end product.

In contrast to those innovative products that attract innovators with radical innovations whose performance reliability or quality may have not been proved, high-end technology products with the innovations must pay attention to guaranteeing the product's quality in terms of performance, reliability, and usability. Some customers will often wait for high-end products to be launched before trying new technologies.

LIMITATIONS AND IMPLICATIONS

Certain limitations are inherent in this study. The first limitation is that the sample is composed of adult students of only a local university, so there may be a sampling bias. Although several previous empirical studies of luxury have also used university students as subjects to investigate consumer behavior (e.g., Vigneron and Johnson, 2004), a large scale of sampling is usually suggested. Bakewell and Mitchell (2006) indicate that male and female decision-making styles vary. Thus, the second limitation is that certain demographic variables--such as sex, age, or income level--may be moderate variables in the model but are not considered in this study, further extended research or cross-validation studies should be conducted. Additionally, the findings are the result of a survey in a specific country, so they might be limited to the local cultural context. The study asks respondents about their perception or shopping preference with regard to ICT products in general instead of a particular category, such as personal computers or mobile phones. This implies that consumers will have similar preferences on their purchases of different ICT goods; the implicit assumption should be tested in further research.

Despite these limitations, we show that from the consumer's perspective, quality and novelty are the very basic values of high-priced ICT products what can be divided into at least two segments--luxury products and high-end products--and each type has different drivers of consumption. The consumers whose shopping styles encompass perfection, novelty and

prestige seeking prefer luxury ICT products. This finding may explain why some luxury ICT products offer only simple and basic functions but place a lot of emphasis on quality commitment, stylish design, and brand image; they do this because these attributes satisfy the target customers of luxury ICT products more than technological attributes do. On the other hand, high-end product seekers are more technology and performance features oriented.

However, luxury products and high-end products might not be the only two segments in the high-priced ICT market; some high-priced ICT products could be positioned between the luxury and high-end concepts. Some premium products, like digital home theater systems belong to this positioning. These premium ICT products might not be as fashion-oriented as luxury products are and do not have as great a need to offer multiple innovative functions as some high-end products do, but they do have to adopt the latest innovations on the critical functions to offer the best quality and craftsmanship value to target customers.

We integrate consumers' needs and shopping styles to establish a multi-dimensional model for both academics and practitioners who want to better understand consumers' behavior in terms of why they are willing to pay a high price for a particular ICT good. These findings may also serve as a basis to successfully create, market, and monitor luxury brands or high-end products. The main contribution of this paper is the integrated conceptual framework for examining consumers' preferences for high-priced ICT products, which may be useful to researchers and marketers who wish to develop marketing strategies to improve their products' value for different segments of consumers.

ABSTRACT

Objective *– This study attempts to gain knowledge about consumer attitude towards organic clothing and organic clothing stores (retailers) and to see whether there is any potential this might have for young entrepreneurs. Here we have tried to evaluate the current state of consumer awareness and knowledge in Malaysia.* ***Design/methodology/approach*** *- The survey was conducted using mall-intercept personal survey whereby potential respondents were approached and were requested to fill up the likert-based questionnaire. The questionnaire was designed especially to elicit consumers' buying pattern and their views on organic clothes. Consumers were asked open frame questions on their agreements and disagreements. Reliability tests were conducted to check the internal consistency of measurement items and the Cronbach's alpha was calculated to show that there was high correlation between the items. Pearson correlation tests were also used to examine the individual relationships between the independent variables and the dependent variable (intention to buy organic clothes), and subsequently Multiple Linear regression (MLR) tests using stepwise regression method were conducted to find which determinants could explain the intention to purchase organic clothes. This is just a basic research done regarding consumer's attitude and awareness towards organic clothing and how it enhances the growing market for Small and Medium Enterprises. The local eco-entrepreneurs also find taking up a social responsibility to create awareness and encourage consumers to buy eco-friendly products.* ***Findings –*** *The data obtained from the survey were analyzed using Demographic Analysis of respondents, Chi-Square, ANOVA and Correlation Analysis to examine possible results that brings to the understanding of consumer knowledge, belief, perceptions and willingness to purchase and wear organic clothes.* ***Research Limitations*** *– the sample was restricted to a single geographic area in Malaysia and further the number of respondents may not portray the population responses with regard to organic clothes consumption.* ***Practical implications*** *– As Malaysians become more concerned about environment, the green consumer category will continue to grow. It is important for businesses to recognize this phenomenon and capitalize on the emerging market for environment friendly goods and services. Green Entrepreneur promotes the welfare of local people, hence he can be re-designated as Social Entrepreneur*

Keywords: green consumers, consumer power, environment, SME's, social entrepreneurship, Malaysia, business idea, eco tourism, organic clothing.

1. INTRODUCTION

We spend a lot of money on clothes, often driven by the desire for something fresh, new and trendy. We want to look young, attractive, and successful. Clothes are now becoming increasingly disposable. The EPA estimated in 2003 that there was 10 million tons of clothing and other textile waste thrown away. Clothes that come home in bags, get worn a few times, and then a shoved to the back of the closet and forgotten. To address this problem, some entrepreneurs are rethinking the clothes they are making and looking for ways to waste less, recycling existing clothes to give them a new life.

Wearing something green is a new fashion statement. Organic cotton is a major improvement over conventionally grown cotton, reusing clothing we already have is even greener. In the U.S. events are held where people bring their old clothes, swap them, or modify them at sewing stations with help from skilled workers. The old worn-out dresses are trimmed, cut, re-sewed, re-mend, and re-fashioned. This concept is spreading throughout the globe now.

Many people have drawers and closets full of old T-shirts that they don't wear but also don't want to throw away. Businesses are finding creative new ways to recycle such T-shirts to make a quilt, hand-bags and purses. Opportunities for recycled clothing are tremendous now. There are huge lot of old discarded clothes which can be re-invented at a green clothing business unit. This unit can be a Small and Medium Enterprise (SME) set up by a focused entrepreneur. This is how he can become a *Green Entrepreneur* in the clothing business.

Why do consumers go 'Green'? And what empowers consumers to select Green/organic Clothing items? Consumers' all over the world are facing a lot of changes in their consumption pattern in the last two decades. Demand towards products is driven by convenience and habit which in turn is hard to change. But consumers have scanty knowledge of the link between their consumption choices and growing market for local businesses as well as environmental consequences. Malaysia which is passing through the intermediary stage of development is facing with tremendous challenge in ensuring sustainable business development and environmental consciousness. The increase of the environmental consciousness has had a thoughtful effect on consumer behaviour, with the green product market expanding at a remarkable rate (Bhaskaran et al 2006). Therefore in the last few decades there has been an increase in production and consumption of organically produced products in the US and it has filtered in the Asian countries as well. Organically produced products are seen to have less impact on the environment.

Common beliefs and attitudes of the consumers and their awareness on environmental issues (Government awareness programmes) is basically the main reason. The western countries market has also done a broad generalization regarding demographic characteristics of green customers which has an impact on their buying behaviour. But an empirical study done here is ideal to evaluate the reasons on the whole. Every entrepreneur and marketer knows that material goods and services serve multiple purposes to consumers. Purpose is to satisfy basic needs such as subsistence and protection. In the last two decades consumers have become more environment and health conscious. The trend has led to more independent businesses and entrepreneurial ventures focused towards green consumers. In clothing products, the

environmental friendly clothing is termed as "Organic" clothing and is considered healthy (Chinnici et. al, 2002).

The product information is more important to a green consumer rather than a catchy advertising campaign. Even the hospitality industry with ecotourism falls under this banner. Green consumers lead to eco-friendly businesses and thereafter create and develop a new community of social entrepreneurs. Hence we find a paradigm shift from eco-entrepreneurs to social-entrepreneurs

In December 2000, the National Organic Standards Board of the U.S. Department of Agriculture (USDA) established a national standard for the term "organic". Organic Clothing is defined by how Clothing should be produced without the use of sewer-sludge fertilizers, most synthetic fertilizers and pesticides, genetic engineering (bio-technology), growth hormones, irradiation and antibiotics to plants. A variety of agricultural products can be produced organically, including fresh farm produce, grains, meat, dairy, eggs, and processed clothing products. "Organic does not mean "natural". There is no legal definition as to what constitutes "natural" Clothing. However, the Clothing industry uses the term "natural" to indicate that a Clothing has been minimally processed and is preservative-free. Natural clothing can include organic clothing, but not all natural clothing are organic in nature. Americans have become increasingly concerned about environment. Studies have shown that almost 62% to 77% Americans have joined the environmental movement from 2004-2006 (Can be seen in the Sierra Club membership). More people are making their homes energy efficient, driving more fuel efficient cars, focusing more on recycling, and buying products that are healthier and less harmful to society and the environment. This has given boost to independent businesses and state owned businesses dealing in environment friendly products. Local businesses focusing on green products have emerged as a growing business sector.

Significance of 'Green' in Clothing business:-

- ***Eco Fabrics / Organic Clothing***

For the last few years humans have realized the disastrous effects of plastic bags on the planet. Plastic bags have been stuffed in our lands via landfills, in our animals – plastic bags and plastic pieces were found in the stomach of several cows in India and have even managed to form an island – there is a large mass of discarded plastic waste floating in the Pacific Ocean too.

A lot has been done in an effort to get rid of plastic bags and bottles. Many corporate organizations and governments have attempted to them. But at the end of the day it boils down to the individual, not regulations, that will solve this problem (or any other for that matter, but that's another topic for another day!) As an individual we have the sole right to choose. And our decisions can make the difference to the planet, one bag at a time.

So what's the alternative? What constitutes an "eco bag and eco clothing"? It is made up of Eco fabric. Eco fabrics have always been around in the form of cloth and other sustainable materials that were used in ancient times. Fortunately a number of hip, fashionable and earth-

friendly people have come on strong to save their planet and oceans without compromising on the cool factor. They patronize eco friendly products and propagate the same.

Organic clothing is made of all-natural, non-synthetic materials and is a part of the organic agriculture movement. This movement emphasizes farming and processing that work with nature and help minimize air, soil and water pollution. Organic clothing materials come from plants that have not been radiated genetically modified or treated with synthetic or chemical pesticides. Organic Clothing fabric may be processed in any of the following ways:-

1. Natural and Sustainable Fabric like Organic Cotton, Organic Wool, Organic Silk, Hemp
2. Recyclable or renewable material like Bamboo, soy and Tencel, wood pulp product
3. "POP," fabric made from recycled plastic soda bottles

- ***Eco Fashion***

Eco-Clothing and Eco-Fashion is devoted to the future of clothing and textile design. It showcases and supports designs which do not only contemplate cut, form, and drape, but also the garment's social and environmental impact, from the cultivation of its fibers to its use and disposal. Globally Labour Laws and Environment Protections Laws have to be adhered to in dealing with Eco-Fashion and all Eco-products. Recycled products are also used in Eco-fashion i.e. re-invent clothes to reduce waste.

In today's fashion era, designers all over the world are making a marked statement with Eco-fashion or Green fashion, making clothes that best suit the environment. These 100% organic fabrics are grown without pesticides or herbicides made from synthetic products. Not only this, these 100% organic fabrics are treated without chemical dyes or bleaches. Today clothing made from organic fiber's such as organic cotton, hemp, soy silk, or bamboo are largely in fashion and widely used. For example Eco fabric is made with hemp plant? Hemp plant is produced without any insecticide and this plant requires very little water to grow. The plant also doesn't require any artificial fertilizers or synthetic herbs to grow quickly and densely. Not only this, the long and sturdy fibers of the plant make it last much longer and durable in nature.

The organic hemp plant has another characteristic too. It absorbs equal amounts of CO2 during its growing phase that will be released later when the plant is burnt for fuel or other purposes, and does not contribute to the green effect. However, due to organic properties of this plant, it is possible to substitute hemp for other material, thus reducing the effect of water pollution to a large extent. A non-combustible and non-toxic product in nature, hemp if cultivated in large quantities helps in conservation of natural resources.

- ***Green washing***

It means the fibers must be grown at certified organic farms, and they can't be blended with synthetics or dyed or bleached with chemicals.)

- ***Organic Dry Cleaning***

It's likely that our drycleaners use PERC, a petroleum-based solvent that is a known carcinogen. Drycleaners sometimes use DF-2000, a hydrocarbon solvent that is harmful to the environment. If one has intends to look for a clothing care process that makes less of an ecological impact, they can try green cleaning which is CO2-based, or opt for steam cleaning their clothing. Wet cleaning, a water-based process, is PERC-free but is not safe for all fabrics.

2. OBJECTIVES of THE STUDY

This study attempted to gain knowledge about consumer attitude towards organic Clothing products consumption and to see whether there is any potential this might have for changing their behaviour. The rationale for carrying out this study is that consideration for the environment could come only from well informed citizens who are aware of, and fully committed to their rights to a quality health and environment. Here we have tried to evaluate the current state of consumer awareness and knowledge in Malaysia.

The specific objectives of the study are –:

1. To gain knowledge on the local consumers awareness and attitude towards organic Clothing – consumers are among those who :-
    i. Have made their purchases along with organic clothing products.
    ii. Consumers who never purchased any organic products
    iii. Those who have been dedicated Green Consumers i.e. organic clothing buyers and consumers for a long time.
2. Investigate the reasons which may influence the intention of buying organic Clothing products.
3. Analyse how Green consumers “promote” Green Markets i.e. environment friendly product markets.
4. How “Green consumers” lead to the birth of “Green Entrepreneurs” who finally show signs of building a “Social Entrepreneur’s” profile.

3. LITERATURE REVIEW

As early as 1965, consumer’s attitude towards pesticide use in farms was explored (Bearler and Willitis, 1968; Sachs et al., 1987). Methods used to explore these topics have been varied, included mail and phone surveys. According to the research, there are number of reasons that consumer choose to purchase organic Clothing products, as well as some barriers. Reasons of buying would be grouped according to general and commodity-specific concerns (Yiridoe et al. 2005). Examples of concern include food safety, human health, environmental impact, whereas commodity attributes included taste , freshness and packaging (Yiridoe et al., 2005). Surveys have identified additional positive attributes that consumer associate with organic food products which include improved taste (Davies, 1995), they are better for environment (Lea and Worsley, 2005).

Empirical evidence shows that consumer’s difficulty in locating environmentally directed products is partly due to lack of information (Brown and Wahlers 1998). Research related to consumer attitudes and preferences for organic products shows that these products are

perceived as healthier than conventional alternatives (Chinnici et al., 2002; Harper and Makatouni, 2002). Consumers do not always buy sustainable products as consequences of environmental concern or to benefit the community or due to personal beliefs but mainly to give priority to health, to be part of the social group, to distinguish from others and to accomplish the need to try out new technologies (Vermier and Verbeke, 2004).

To the best of our knowledge very limited research has been done pertaining to consumer attitudes towards organic product in Malaysia, and what effect it will have on the up-coming businesses and the transformation of environmental friendly businesses to finally show concern for the society at large. Hence there is an advent of Social Entrepreneurs. Love for nature and environment will lead to care for the society as well. We also see the consumer's knowledge on government action towards healthy and organic products is on a very limited scale. The results could be used by the government, budding entrepreneurs and NGO's (Non Governmental Organisations) to tap a business opportunity, plan marketing strategies, design proper sales channel and target it to these group of consumers. With awareness creation by the government sector this group of consumers will increase.

Over the last few decades many researchers in Malaysia have studied the SME's in Malaysia in different fields of interest. For example micro-credit (Sudin and Bala, 1994; Moha Asri, 1997, Rosman *et al*. 2004) , franchise (Abu Bakar and Rohaizat, 2003), business strategy (Mohd Rafi and Syed Ihsan, 2002), human resources management (Wyer and Mason, 1998; Hooi, 2006), and information technology (Moha Asri, 2002; Foong, 1999). The environment 'green' business related researches have been done in a qualitative way (Mohd.Rafi, 2010) and few researches on Green consumers and Organic Food (Naila Aaijaz, Mohd. Dahlan, and Ghazali, 2009). But no specific research related to Organic Clothing and Eco-fashion has been done which sites this as a huge SME opportunity for young entrepreneurs.

4. RESEARCH DESIGN (RESEARCH METHODOLOGY)

The survey was conducted using mall-intercept personal survey. Potential respondents were approached while they were shopping in supermarkets located in 3 different locations within Kota Bharu. The supermarkets were Mydin (Kubang Kerian), Billion, KB Mall and Tesco. Prior to data collection, the availability of organic clothing within these locations was confirmed. The respondents were requested to fill up the questionnaire and to return it back immediately to the researcher. As a result, a total of 104 questionnaires were collected. The questionnaire was designed especially to elicit consumers' buying pattern and their views on organic products. Consumers were asked open frame questions on their agreements and disagreements. We used Likert Scale (1 = almost always,, 2=to a considerable degree, 3=occasionally, 4=seldom and 5=never). This is just a basic research done regarding consumer's attitude and awareness towards organic clothing and how it enhances the growing market for Small and Medium Enterprises. The local eco-entrepreneurs also find taking up a social responsibility to create awareness and encourage consumers to buy eco-friendly products. The following statistical tests were applied to analyse the data collected :-

i. Reliability tests were conducted to check the internal consistency of measurement items.

ii. Cronbach's alpha was calculated. It's a tool to observe reliability of scales. Cronbach's alpha determines the internal consistency or average correlation of items in a survey instrument to gauge its reliability.
iii. Pearson correlation tests were used to examine the individual relationships between the independent variables and the dependent variable (intention to buy organic products).
iv. Multiple Linear regression (MLR) tests using stepwise regression method were subsequently conducted to find which determinants could explain the perception and intention to purchase organic Clothing products

Finally we arrive at the The Green Consumer Information Paradox, which supports the contention that perceptions towards organic products depict the strongest relationship with the buyer's intention to buy organic clothing followed by the buyer's belief that by using organic product he is contributing to preserving the environment. The researchers here contend that this environment friendly attitude of consumers will give rise to eco-entrepreneurs and subsequently will culminate into evolution and rise of social entrepreneurs. Hence the following hypothesis:-

Hypothesis formulation :-

1st Hypothesis

H0 : Customers having environmental perception intend to buy Green Clothing.

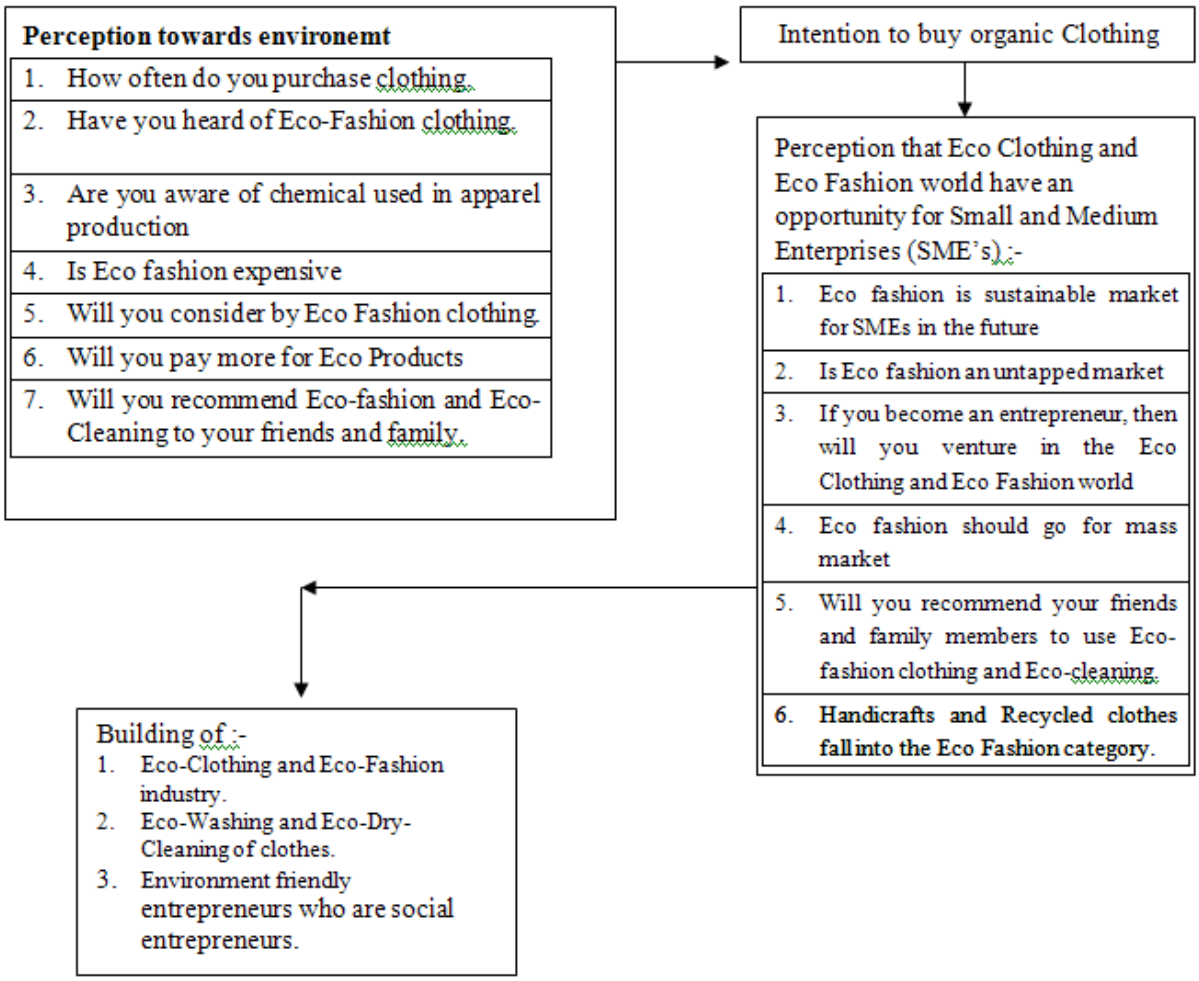
H1: Customers having environmental perception do not intend to buy Green Clothing

2nd Hypothesis

H0: Customers having environmental perception have an inclination to become green SME entrepreneurs.

H2: Customers having environmental perception do not have an inclination to become green SME entrepreneurs.

Conceptual Framework and Hypothesis formulation
FIGURE – 1



5. RESEARCH ANALYSIS and FINDINGS

Reliability Test Analysis (Scale Alpha) / Cronbach's alpha

The Reliability Test results as seen in Table 1 below reveals that the reliability are satisfactory as Cronbach's alpha exceed 0.70 (Nunnally, 1978). Cronbach's alpha measures how well a set of items (or variables) measures a single uni-dimensional latent construct. When data have a multi-dimensional structure, Cronbach's alpha will usually be low. Technically speaking, Cronbach's alpha is not a statistical test - it is a coefficient of reliability (or consistency). Cronbach's alpha can be written as a function of the number of test items AND the average inter-correlation among the items. Below, for conceptual purposes, we show the formula for the standardized Cronbach's alpha:

$$\alpha = \frac{N \cdot \bar{c}}{\bar{v} + (N-1) \cdot \bar{c}}$$

Here N is equal to the number of items, c-bar is the average inter-item covariance among the items and v-bar equals the average variance. One can see from this formula that if you

increase the number of items, you increase Cronbach's alpha. Additionally, if the average inter-item correlation is low, alpha will be low. As the average inter-item correlation increases, Cronbach's alpha increases as well. This makes sense intuitively - if the inter-item correlations are high, then there is evidence that the items are measuring the same underlying construct. This is really what is meant when someone says they have "high" or "good" reliability. They are referring to how well their items measure a single uni-dimensional latent construct. Thus, if we have multi-dimensional data, Cronbach's alpha will generally be low for all items. In this case, we run a factor analysis to see which items load highest on which dimensions, and then take the alpha of each subset of items separately.

Table – 4.1 (a) : Standardised Confirmatory factor loadings (Perception and Entrepreneurial inclination towards Green Clothing and Eco Fashion)

	Construct	Items	Cronbach Alpha
	Perception towards Environment	7 items	
1.	How often do you purchase clothing.		-.321
2.	Have you heard of Eco-Fashion clothing.		.346
3.	Are you aware of chemical used in apparel production		.428
4.	Is Eco fashion expensive		.334
5.	Will you consider by Eco Fashion clothing.		.833
6.	Will you pay more for Eco Products		.673
7.	Will you recommend Eco-fashion and Eco-Cleaning to your friends and family.		.682
	Entrepreneurial Inclination	6 items	
1.	Eco fashion is sustainable market for SMEs in the future		.752
2	Is Eco fashion an untapped market		.685
3.	If you intend to become an entrepreneur, then will you venture in the Eco Clothing and Eco Fashion world		.746
4.	Eco fashion should go for mass market		.708
5.	Will you recommend your friends and family members to use Eco-fashion clothing and Eco-cleaning.		.752
6.	Handicrafts and Recycled clothes fall into the Eco Fashion category.		.298

Note : All factor loadings are significant at p=0.01

Table – 4.1 (b) (i) Reliability Statistics (Perception of Organic (Green) Clothing.

Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.690	.687	7

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Squared Multiple Correlation	Cronbach's Alpha if Item Deleted
How often do you purchase clothing	16.955	17.521	-.321	.532	.777
Are you aware of chemical used on apparel production	16.705	12.119	.428	.376	.648
Will you consider buying Eco-Fashion clothing	17.345	11.624	.833	.839	.570
Will you pay more for Eco products	17.220	11.188	.673	.779	.582
Is Eco fashion expensive	17.405	12.785	.334	.633	.674
Have you heard of Eco fashion	16.395	10.914	.346	.561	.695
Will you recommend Eco Fashion and Eco-Cleaning to your friends and family	17.405	11.398	.682	.744	.584

Interpretation of Reliability Analysis of Perception of Organic (Green) Clothing

Cronbach's Alpha can take values between 0 and 1. The closer to 1, the more reliable the scale of our variable. Table 4.1 (b) (i) reveals reliability are satisfactory as Cronbach's alpha exceeds 0.69. When we examine the Corrected Item – Total Correlation we find that "How often do you purchase clothing" variable has the lowest value (-0.321) and Cronbach's alpha for the overall scale of our variable is 0.690. If we delete this item, the Cronbach's Alpha 'if Item deleted column' shows that the overall reliability will increase to 0.777. Judging from this, deletion of this item will definitely increase our reliability much higher, hence we decided to delete it and retain rest of our items**. We can see that all the items are around 0.7. In general most researchers agree that 0.7 is acceptable so the scale of our "Perception of Green Clothing" is acceptable.**

Table – 4.1 (b) (ii) Reliability Statistics - Entrepreneurial inclination

Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.848	.851	6

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Squared Multiple Correlation	Cronbach's Alpha if Item Deleted
Should Eco-fashion go for mass market	12.890	13.495	.708	.836	.811
Handicrafts and Recycled clothes fall into the eco-fashion category	12.890	15.656	.298	.246	.881
Is Eco_fashion an untapped market	12.705	13.506	.685	.826	.814
Eco Fashion is a sustainable market for SME in the future	12.580	13.280	.666	.537	.817
Will you recommend Eco Fashion and Eco-Cleaning to your friends and family	12.705	13.174	.752	.763	.802
If you intend becoming entrepreneur, will you venture in the Eco-Fashion or Eco-Cleaning	12.255	11.196	.746	.749	.802

Cronbach's Alpha can take values between 0 and 1. The closer to 1 the more reliable the scale of our variable. Table 4.1 (b) (ii) reveals reliability are satisfactory as Cronbach's alpha exceed 0.80. When we examine the Corrected Item – Total Correlation we find that "Handicrafts and Recycled clothes fall into the Eco Fashion category." This variable has the lowest value (0.298). Cronbach's alpha for the overall scale of our variable is 0.848. If we delete this item, the Cronbach's Alpha if Item deleted column shows that the overall reliability will increase only slightly to 0.881. Judging from this, deletion of this item would not increase our reliability much, hence we decided to retain all our items. We can see that all the items are around 0.7. **We can see that all the items are around 0.7. In general most researchers agree that 0.7 is acceptable so the scale of our "Entrepreneurial Inclination towards Eco Clothing" is acceptable.**

Data Analysis

The data obtained from the survey were analyzed using Chi-Square, ANOVA and correlation analysis to examine possible results that brings to the understanding of consumer knowledge, belief, perceptions and willingness to purchase and consume organic Clothing. All statistical analyses were using SPSS package version 16.0.

Analysis of Findings

Demographic Analysis of the Respondents

Two hundred respondents participated in the survey. Majority were male 69 %

Refer Table 4.3.1 (a) and the majority of the respondent's (31.5%) age ranged from 25-30 years. The sample was predominantly Malaysian nationals (87%) with ethnic races - Malays (62%), Chinese (12.5%), Indians (12.5%) and Others (26%). Most respondents (37.5 %) were married and (19%%) were married with kids. 44% respondents had experienced some chronic skin illness themselves and 56% respondents' family members had suffered from some chronic skin illness earlier. Table 4.3.1 (a) demonstrates the summary of sample demographics.

Table 4.3.1 (a) Demographic Profile of Respondents (n=200)

Items	Number	Percentage (%)
Gender		
Male	138	69%
Female	62	31%
Nationality		
Malaysians	174	87%
Non-Malaysians	26	13%
Ethnicity		
Malay	124	62%
Chinese	25	12.5 %
Indians	25	12.5%
Others	26	13%
Age		
18-24	50	25%
25-30	63	31.5%
31-40	37	18.5%
41-50	37	18.5%
51 and above	13	6.5%
Marital Status		
Single	62	31%
Engaged	25	12.5%
Married	75	37.5%
Married with Kids	38	19%
Level of Education		
Diploma	28	26.9 %
Bachelor	39	27.9 %
Master	26	25 %
PhD	12	11.5 %
Others	05	4.8 %
Occupation of respondents		
Administration	15	7.5%
Academics	54	27%
Sales & Marketing	19	9.5%
Accounts	6	3%

Medical Doctor	27	13.5%
Engineer	12	6%
IT/Technical job	17	8.5%
Student	35	17.5%
School Teachers	15	7.5%
Family Income per month		
RM 2000 under	76	38%
RM 2000-5000	49	24.5%
RM 5000-8000	12	6%
RM 8000-12000	50	25%
RM 12000-15000	6	3%
RM 15000 and above	7	3.5%
Respondent suffered from any skin illness		
Always	0	0%
To a considerable degree	24	12%

Seldom	25	12.5
Never	103	51.5%
Family suffered from any chronic skin illness		
Always	0	0%
To a considerable degree	12	6%
Occasionally	37	18.5%
Seldom	63	31.5%
Never	88	44%

(b) Buying Pattern of Organic Products

The respondents were asked to indicate their Apparel buying behaviour related to organic clothing. Category 1, 2 and 3 are those who never bought (non users) any of organic products and they made up to almost 87% of the sample. That is only 13% had bought and used Organic clothing in the past. It somehow signified that the sample captured unequal number of organic product users and non users. Table 4.3.1 (b).

Table 4.3.1 (b) Respondent's category of Organic Clothing Buyer

Category	Organic Clothing Buyer	Frequencies	Percentage
1.	I have not bought organic clothing in the past and I am not thinking about buying organic clothing now.	38	19 %
2	I have not bought organic clothing in the past and I am thinking about buying in the near future.	112	56 %
3	I have not bought organic clothing in the past and I am definitely planning to buy organic clothing in the future.	24	12 %
4	I used to buy organic clothing, but I no longer buy them, I might start buying them again in the future.	12	6 %
5	I buy organic clothing on most, not all trips to the market place	14	7 %

(c) Pearson's R Test of Correlation

Pearson correlation tests were used to examine the individual relationships between the independent variables

(i) Relationships between Perception variables of Green Clothing and intention to buy Organic products :-

The above table of correlation shows that there is significant relation existing between intend to buy eco clothing and all other independent variables as 'r' is ranging from 0.336 to 0.774, p=.000 i.e. p> 0.05). Therefore all variables have a positive correlation and are associated with 'intention to buy Eco-clothing'. So we should not reject our 1st null hypothesis i.e. customers having environmental perception will buy eco-clothing. The tests indicate that 2 independent variables 'Will you pay more for eco-products', and 'Will you recommend Eco-Clothing and Eco-Cleaning to your family and friends'are significantly related to intention to buy organic products. However the strength of the relationship varies from weak to strong. Table 4.3.1 (c)(i) shows the summary results.

(ii) Relationships between independent variables and Inclination to become entrepreneur in the Eco Clothing and Eco fashion world.

The above table of correlation shows that there is significant relation existing between intend to buy eco clothing and all other independent variables as 'r' is ranging from 0.354 to 0.812, p=.000 i.e. p> 0.05). Therefore all variables have a positive correlation and are associated with 'inclination to become entrepreneurs in Eco Clothing SMEs'. So we should not reject our 2nd null hypothesis i.e. customers having environmental perception will buy eco-clothing. The tests indicate that 2 independent variables 'Eco-Fashion is a sustainable market for SMEs in the future, and Will you recommend Eco-Clothing and Eco-Cleaning to your family and friends' are significantly related to inclination to become entrepreneur in the eco-Clothing and eco-fashion world. However the strength of the relationship varies from weak to strong. Table 4.3.1 (c)(ii) shows the summary results.

Table 4.3.1 (c)

(i) Relationships between the Independent variables and Intention to buy Organic Products

(ii) Relationships between independent variables and Inclination to become Entrepreneur in the Eco Clothing and Eco fashion world.

(i)	Relationships between Perception variables of Green Clothing and intention to buy Organic products		
	Dependent Variable

4.	Will you recommend your friends and family members to use Eco-fashion clothing and Eco-cleaning.	**.812**	**.000**
5.	Handicrafts and Recycled clothes fall into the Eco Fashion category.	**.354**	**.000**

***Correlation is significant at the 0.01 level (1-tailed)**

*** p value is significant at <.05**

(d) Multiple Linear Regression Tests

Multiple Linear regression (MLR) tests using stepwise regression method were subsequently conducted to find which determinants could explain the intention to purchase organic clothing products. The advantage of step-wise regression is that it will take the significant variable first and keep the other variables in reserve and next another significant variable will be included. By this iteration method, the R^2 values will be given stepwise so that one can observe the contribution of each independent variable to the model.

(i) Intention to purchase organic clothing products

Table 4.3.1 (d) (i) Variance explained by factors - purchase intention of organic Clothing (Summary)

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.915[a]	.838	.834	.2911

a. Predictors: (Constant), Will you recommend Eco Fashion and Eco-Cleaning to your friends and family, Are you aware of chemical used on apparel production, Is Eco fashion expensive, Have you heard of Eco fashion, Will you pay more for Eco products

b. Dependent Variable: Will you consider buying Eco-Fashion clothing

Table 4.3.1 (e) (i) : Factors predicting purchase intention of organic Clothing products ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	84.846	5	16.969	200.314	.000[a]
	Residual	16.434	194	.085		
	Total	101.280	199			

a. Predictors: (Constant), Will you recommend Eco Fashion and Eco-Cleaning to your friends and family, Are you aware of chemical used on apparel production, Is Eco fashion expensive, Have you heard of Eco fashion, Will you pay more for Eco products

b. Dependent Variable: Will you consider buying Eco-Fashion clothing

Table 4.3.1 (f) (i) : Factors predicting purchase intention of organic Clothing products (Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.137	.090		1.532	.127
	Have you heard of Eco fashion	.053	.019	.106	2.826	.005
	Are you aware of chemical used on apparel production	.117	.023	.167	5.039	.000
	Is Eco fashion expensive	.167	.027	.235	6.262	.000
	Will you pay more for Eco products	.390	.036	.504	10.842	.000
	Will you recommend Eco Fashion and Eco-Cleaning to your friends and family	.158	.039	.194	4.092	.000

a. Dependent Variable: Will you consider buying Eco-Fashion clothing

(a) dependent variable : Intend to purchase organic Clothing.

Interpretation of MLR (Multiple Linear Regression) in Test (i).

In the first iteration, perception '*Have you heard of Eco Fashion*' is the first independent variable which enters the model and it produces a R^2 of 19% as shown in Table 4.3.1 (f)(i). In the second iteration – '*Will you recommend Eco Fashion and Eco Cleaning to family and friends*' enters the model which adds to the R^2 by 39%. The R^2 improves by 20% because of this variable.

The dominant factors in purchase intention towards organic clothing products are given in the Table 4.3.1 (f). Here "t" value is important for interpretation. In the first iteration, the "t" value was 2.826 and significant. This "t" value is the error level present in the model which takes purchase intention of organic clothing as dependent variable and perception towards organic clothing '*heard about Eco fashion*' as the independent variable. In the second iteration when perception towards organic clothing factor is added to consumers '*aware on chemical use on apparel*' on organic clothing being environment friendly, the 't' value for increases up to 5.039 and the 'Is *Eco fashion expensive'* option shows a 't' value of 6.262. This 't' value decrease (or error level decrease) is not only because of addition of organic clothing as environment friendly factor but also because of the interaction or the joint contribution of perception towards organic clothing factor and consumers awareness on organic Clothing being environment friendly factor. Similarly the 't' value further increases in the fourth iteration where it is 10.842 (increased) for perception factor, then it decreases in the fifth (last) iteration to 4.086 for '*Will you recommend to family and friends*' on environment friendly factor. Hence the first and last factors are less significant. These imply

that the contribution of the model improves further. The result suggest that an individual who is also an organic Clothing buyer perceived that factors that influences him to buy organic Clothing products are his perception '*Will you pay more for eco product*', perceived that it is environment friendly '*Aware of chemical use*' and customer is aware that '*Eco products are expensive*' also.

(ii) Inclination to become an entrepreneur in the Eco-clothing and Eco-Fashion world.

Table 4.3.1 (d)(ii) Variance explained -factors in purchase intention of organic Clothing - Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.866[a]	.749	.743	.6140

a. Predictors: (Constant), Will you recommend Eco Fashion and Eco-Cleaning to your friends and family, Handicrafts and Recycled clothes fall into the eco-fashion category, Eco Fashion is a sustainable market for SME in the future, Is Eco_fashion an untapped market, Should Eco-fashion go for mass market

b. Dependent Variable: If you intend becoming entrepreneur, will you venture in the Eco-Fashion or Eco-Cleaning

Table 4.3.1 (e)(ii) : Factors predicting purchase intention of organic Clothing products ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	218.363	5	43.673	115.844	.000[a]
	Residual	73.137	194	.377		
	Total	291.500	199			

a. Predictors: (Constant), Will you recommend Eco Fashion and Eco-Cleaning to your friends and family, Handicrafts and Recycled clothes fall into the eco-fashion category, Eco Fashion is a sustainable market for SME in the future, Is Eco_fashion an untapped market, Should Eco-fashion go for mass market

Table 4.3.1 (f) (ii): Factors predicting inclination to become an entrepreneur in Eco-clothing and Eco-fashion world - Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.466	.170		-2.743	.007
	Eco Fashion is a sustainable market for SME in the future	.359	.063	.278	5.683	.000
	Is Eco_fashion an untapped market	-.111	.118	-.081	-.941	.348
	Should Eco-fashion go for mass market	-.092	.125	-.065	-.739	.461
	Handicrafts and Recycled clothes fall into the eco-fashion category	.145	.053	.111	2.737	.007
	Will you recommend Eco Fashion and Eco-Cleaning to your friends and family	1.052	.069	.759	15.259	.000

a. Dependent Variable: If you intend becoming entrepreneur, will you venture in the Eco-Fashion or Eco-Cleaning

Interpretation of MLR (Multiple Linear Regression) in Test (ii).

In the first iteration, inclination '*Eco Fashion is a sustainable market for SME in the future*' is the first independent variable which enters the model and it produces a R^2 of 63% as shown in Table 4.3.1 (f)(ii). In the second iteration – '*Is Eco-fashion an untapped market' enters the model and* adds to the R^2 by 118%. The R^2 improves by 55% because of this variable.

The dominant factors in inclination to become entrepreneur in Eco-clothing and Eco-fashion are given in the Table 4.3.1 (f)(ii). Here "t" value is important for interpretation. In the first iteration, the "t" value was 5.683 and significant. This "t" value is the error level present in the model which takes '*inclination to become entrepreneur in Eco-clothing and Eco-fashion world*' as dependent variable and '*Eco fashion is a sustainable SME market in the future*' as the independent variable. In the second iteration when '*inclination to become entrepreneur in Eco-clothing and Eco-fashion world*' factor is added to consumers '*Is Eco-fashion an untapped market'* , the 't' value for the 2nd iteration decreases to -.941 and the 'Should *Eco-fashion go for mass market'* option shows a 't' value further decrease to -.739. This 't' value decrease (or error level decrease) is not only because of addition of '*Eco-fashion should go for mass market*' but also because of the interaction or the joint contribution of '*Is Eco-fashion an untapped market'and 'Eco-fashion go for mass market'*. Similarly the 't' value further increases in the fourth iteration where it is 2.737 (increased) for inclination factor, then it increases further in the fifth (last) interation i.e. 15.259 for '*Will you recommend to family and friends*' on inclination factor. Hence the second and third factors are less significant. These imply that the contribution of the model improves further. The result

suggest that an individual who is also an organic clothing buyer will have an inclination to recommend to family and friends and finds Ec-fashion being a sustainable SME market in the future and will be inclined to become an entrepreneur in the Eco-fashion world.
Discussion and Inference of The Green Consumer Information Paradox

Result indicated that perceptions towards organic products depict the strongest relationship with buyer's intention to buy organic products followed by the buyers belief that by consuming organic product he is contributing to preserving the environment. Yiridoe et al. (2005) has admitted that some of the general concerns with regard to consumer's perception towards organic product include safety, environmental impact, human health, taste, nutritional value and visual appeal. The other factors i.e. belief that a product is safer and availability of product information also support the intention to buy organic products. However, other factors i.e. awareness about availability of product (location) were found to be insignificantly related to the intention to use the product. Studies have shown that most significant factors affecting nature is not the official government policy but public awareness or public concern for environment. It can be argued here, that, consumers who are increasingly concerned and realized the essentials of environmental issues are considered as "Green Consumers"; those consumers who make their buying decisions at least partly on the basis of personal environmental criteria.

6. RECOMMENDATIONS

(a) Manufacturing for, and Marketing to the Green Consumers – reverse side of the coin.

In the 20th and 21st century, the entrepreneur or person who invests and runs his own business for Green Consumers can be termed as Eco-Entrepreneur. That is the entrepreneur who is environment friendly. In other words, he is an organic products' farm owner who delivers the highest standard in product integrity to his customers. Understanding consumer behaviour is critical to any entrepreneur. Hence the inference of this study is highly useful to an eco-entrepreneur or a prospective eco-products entrepreneur. For the Green Entrepreneur the stakes are high. Taking the research study inference i.e. The Green Consumer Information Paradox he can plan all environmental campaigns – from building public awareness to driving organic product sales. To be successful in this market it is important to tie the product's environmental attributes to the lifestyles of the target customers.

(b) Eco-Tourism
As Malaysians become more concerned about environment, the green consumer category will continue to grow. It is important for businesses to recognize this phenomenon and capitalize on the emerging market for environmentally friendly goods and services. Eco-tourism is becoming very popular in Malaysia. It is also a service which is environment friendly. Customers interested in eco-tourism want to enjoy nature's offerings and are ready to pay more to preserve and protect the environment.

(c) Paradigm Shift from Eco-entrepreneurship to Social Entrepreneurship
Despite the exciting opportunities of the green consumer market, eco-entrepreneurs must not neglect the traditional consumer values:-
1. Price Factor – Few will pay extra for greener (organic) environment friendly products.

2. Quality factor – many may not like green products – less effective.
3. Convenience – only minimal inconvenience will be tolerated by consumers of green products.
4. Availability – very few customers will go out of the way to purchase green products.

Finally we can say that Green Entrepreneur promotes the welfare of local people, hence he can be re-designated as Social Entrepreneur. Many researches can be done to study the impact of Green Consumer on the growth of Green Entrepreneurs and finally Social Entrepreneurs.

7. LIMITATION and FUTURE RESEARCH

The limitations of this study is that the sample was restricted to a single geographic area in Malaysia. Further the number of respondents may not portray the population responses with regard to organic-clothing consumption. Therefore additional studies will be necessary to better discriminate between consumer groups to determine which segments are most appropriate to market and to promote organic clothing as a way of building sustainable consumption pattern for the future. Since consumers' perception towards organic Clothing product has a strong correlation with the intention of buying organic clothing, therefore it is wise to further investigate the details of how consumer perceived the organic clothing. This will help marketers with better selling point when promoting these products to the public at large. Many awareness creation activities should be held and showed among the younger generation consumers in their early age. It should be done before they reach the stage where their consumption pattern becomes their habit, and determines their future identity and self values.

ENVIRONMENTAL MANAGEMENT OF AN INDUSTRIAL SECTOR: THE CASE OF ITALIAN DRINKING WATER SUPPLY

Giovanni Lagioia, University of Bari Aldo Moro, Italy
g.lagioia@dgm.uniba.it

Grazia Calabrò, University of Messina, Italy,
grazia.calabro@unime.it

Vera Amicarelli, University of Bari Aldo Moro, Italy
v.amicarelli@dgm.uniba.it

ABSTRACT

The drinking waters industry is recording a growth rate three times superior compared with other beverage compartments, becoming a dominant market and moving conspicuous business. The growing interest towards this sector is the result of changing in eating habits and lifestyles that encourage the consumption of health and well being products. As a consequence, spring waters have become large consumption beverage, because of consumers consider them healthier than tap water, and they have caused the enlargement of packaging waste. The analysis of environmental issues of life cycle of a product, from cradle to grave illustrates the massive negative effects of this sector on the environment and social organization. The objective of this note, which is the first part of a wider research still in progress, is to analyze the most important considerations that have promoted the huge increase of consumption of bottled drinkable water reducing tap water utilization. Subsequently, applying the international methodology Material Flow Analysis (MFA), the authors investigate the sustainability of bottled and tap water sector from cradle to the consumption phase. The preliminary results allow proposing different industrial strategies, in particular as regard waste management.

Keywords: water system, bottled water, tap water, environmental management system, waste management.

INTRODUCTION

Due to massive promotional efforts, bottled water compartment marks a sharp consumption increase about three times more than other beverages and it makes up the largest portion of the beverage industry with huge turnover. Bottled water consumption is definitely higher than beer and sweet soft drinks consumption. According to Global Drinks, in 2008 worldwide bottled water consumption accounted for 218 billion litres. Even though the majority of bottled water market is made up by Europe and United States of America with the highest per capita consumption, Asian and African markets are growing and will become soon target of future competition strategies. In Europe, Italy shows the highest per capita consumption, about 200 liters/year (L/y), with a 2008 turnover equal to 2,300 million Euros although a negative market trend (- 2%) compared to 2007. Worldwide, Arab Emirates holds the consumption record with approximately 300 L/y.

In 2008, Italian market operates with 189 sources and counts 321 brands [2]. Dominant corporations with very large market share; besides high advertising budget brand leader companies drive domestic industry, several regional ones successfully entered local market often with private label [2]. Thus, there is the possibility of choosing among a wide array of products whose peculiarities and differences are not well perceived by the consumer who is often perplexed and confused.

Eating habits and lifestyles changing that incentive the health and well-being products consumption causes bottled water growing interest, as many advertising companies promote in their campaigns [3]. Moreover food safety worry, increased after some public health jeopardizing events, makes the consumers suspicious towards tap water quality and safer to bottled water. Therefore, if in the past bottled water use was motivated by its therapeutic utility, currently it is a widely used beverage. Italian regulation allows several "water product" sales: mineral water, potable water, table water and spring water [6]. This is a serious problem; because often consumers consider these terms synonymous and ignoring the differences (chemical-physical ones) among them simply associate bottling to safety. In this paper with the expression *bottled water* we refer to mineral, table and spring water while, *tap water* indicates water distributed by public water system (for example Apulia water system).

To choose bottled instead of tap water also reflects consumer's lack of confidence towards ground water pollution or contamination during capitation and transportation. These elements are at the base of several bottled water-advertising campaigns, which make the direct capitation one of the principal factors to ensure water safety and purity. Obviously it does not mean that, in an absolute sense, bottled water is free from potential contamination and polluting agents because by law, drinking water, is constantly checked and analyzed in order to guarantee high safety standard [1-3-4].

A serious problem linked to the bottled water consumption exponential growth is the amount of packaging waste increases [9-10]. The wrong packaging waste management does not match waste policies efforts to minimize environment impacts. Based on total bottled water consumption (281 billion L) and an average weight of PET bottle of 30-35 g we estimate that, on a yearly basis, 5-7 million of tons (Mt) of plastic packaging waste are produced. They are very often sent to landfills or treated into incinerator plants with a huge resources loss and significant environmental impacts.

Glass or PET (Polyethylene Terephthalate) mono-use bottles represent a sort of quality and hygiene warranty for consumers, and in the same time, they are a strategic innovation and marketing tool for producers. Not by a chance, competition among bottled water companies is mainly played on packaging and design. Environmental evaluation linked to different phases of water life cycle, from natural sources to consumer tables, shows real negative environmental and social impacts of this industrial sector.

OBJECTIVE

The goal of this study is to analyze the sustainability of industrial sector of drinkable water focusing on the issues of waste generation (mainly plastic and glass bottles) and natural resources consumption and to propose different industrial strategies. This note presents the

findings of different studies carried out in the sectors of bottled water and tap water for describing the material basis of two sectors and making comparison of the results. After the introduction, the note presents the methodology of the research describing the main results of the investigation in the sector of bottled and tap water and summarizing the main findings of this investigation in the conclusion paragraph.

MATERIALS AND METHODS

The first step of analysis is the study of the changes happened into eating habits and lifestyles, which make possible the exponential growth of bottled water market. Subsequently, it has been focused one of the main problem of drinkable water system that is the disposal of the related packaging (plastic bottle). For scrutinizing the performance of drinkable water systems, the diagram flows of bottled water and tap water have been studied. The result of this first phase of Material Flow Analysis (MFA) was a summary picture of different phases for capturing, processing (for instance filling or potable treatments) and delivering water to family. Hence, a collection of data regarding the material and energy consumption has been carried out. In order to gather information, a review study of company reports, interviews with managers and visits to administrative individuals have been conducted. The data gathered has been compared with data from national and international literature. The analysis of energy, water, and waste flows and their external effects has allowed making a representation of their environmental performance.

In the final step of our analysis we discussed critical points of these chains and we focused on waste management issues and strategies to reduce environmental burdens.

BOTTLED AND TAP WATER MATERIAL FLOW ANALYSIS

As mentioned above, we carried out the MFA of two systems of drinkable water: bottled and tap. In both studies, the MFA analysis regards one cubic meter (m^3) of water, and electricity consumption figures are converted into primary energy value MJ (million of Joules) based on conversion factor of 9 MJ/kWh.

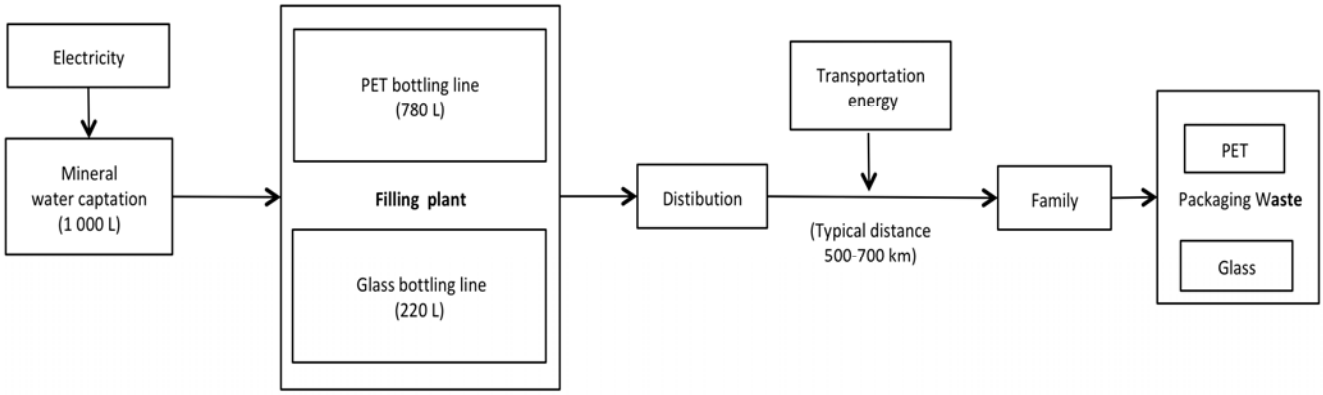
The analysis boundaries are all phases between natural sources (catchment) and family (consumers) as figures 1 and 2 show.

Bottled water case study

As concerning bottled water compartment, the analysis starts from water catchment by natural source directly bottled into a filling plant (Figure 1). At this step of our research we have not gathered enough data to estimate the typical distance between natural water sources and filling plants and considering that the sources are very often close to plants, the authors do not included energy input related to this point. We underline that, according to European Economic Community (EEC) and Italian laws “natural mineral water” utilization (catchment) must occur near to the spring itself and the same water must be bottled pure as it is not performing any drinking treatment (otherwise it cannot be defined “natural mineral water”) [6-7]. No chemical-physical treatments are made before bottling because they are directly complies with low parameters included into Italian drinking water dispositions. According to

the law it is allowed carbon dioxide adding. Water extraction and possible stocking must occur with methods and materials able to avoid surrounding environments contamination. Water is usually withdrawn, based also upon source features, by lifting pump systems whose energy input is lower than 2 kWh/m^3 of water. The next phase is diversifies according to bottle raw materials: PET and glass.

Figure 1 – Diagram Flows of one cubic meter of bottled water (PET and glass bottles).
Source: personal elaboration by the authors



The substantial difference between these two is bottle production phase. In the first case, bottling plant involves bottles production from PET performs, filling, capping and labelling. If glass bottled is employed, the process starts with bottles usually washing and sterilizing before following the same steps of PET bottles. Filling plant also includes secondary and tertiary packaging that is blisters assembly and palletizing. Finished and packed product subsequent distribution is basically performed by trucks, with 15 t loading capacity and 4 km/L fuel consumption and crossing distances are very different. Sometimes it is distributed non-over its regional boarders (250-300 km), often is spread all over the country (800-1,000 km). For bottled water compartment, logistic plays a primary role due to very high freight costs (economically and environmentally), to medium customers brand fidelity level and to competition often based only on purchasing price. In this analysis we considered that the typical distance from filling plant and urban distribution platform ranges from 500 km to 700 km.

Bottled water PET bottles.

As already said, a PET filling plant produces itself PET bottles. The line includes blowers to give PET preforms different capacity and shapes. When PET pre-forms are delivered to filling water plant site they are ready to be placed into the blowers or they are first sterilized with ozone also to strengthening bottle structure. So made bottles are filled, capped and labelled. They are then sent to secondary packaging to be grouped and assembled in LDPE film handled blister. These blisters are then placed on wooden pallets (tertiary packaging), which allow easy stocking, loading and unloading operations. Material and energy consumption related to all phases are gathered from literature and companies and calculation have been made considering that in Italy 78% of bottled water is in PET bottles and the remaining quota in glass ones (22%). Leader PET bottle size is the 1.5 L one, used for

approximately 74% of whole volume bottled in PET, followed by 2 L (about 16%) and by 0.5 L (6%). Other sizes like 0.2-0.33-0.75 L have a marginal importance (4%) even if, due to outdoor bottled water consumption increase, a rising is previewed. For this reason, they have not been considered in this analysis. We have not included ozone treatment and subsequent washing because it is assumed that PET pre-forms are made for direct use. Pallets wood weight is also not counted because pallets are used to moving packed bottles only and generally reused several times. In order to provide the market a set of 780 L (split into 520-570 bottles) total material input is equal to 25-33 kg. The total energy used for bottled water capitation, bottling and packaging is equal to 190-205 MJ (equal to 0.26 MJ/L).

Bottled water GLASS bottles.

In glass bottling line too it is possible to receive glass bottles already sanitized (certified) and proceed directly to the filling phase. Otherwise, these bottles can be treated using ozone or other detergents. The bottles out of the sanitation section are filled, capped and labelled. Then, they are grouped in PE crate or in cardboard blister with or without handles (secondary packaging). Crates or cardboard blisters are then placed on a wooden pallet (tertiary packaging) useful for stocking, loading and unloading operations.

Material and energy consumption related to all phases of this line has been obtained considering that in Italy 22% of bottled water is bottled in glass bottles. Most diffused glass bottle size is the 1 L one and, also in this case, other sizes, above all 0.33-0.75 L, have a marginal importance and they have not been considered in this analysis. Figure 1 also refers to 220 glass bottles of which total material input is 105-121 kg, excluding pallets wood because they are only used to moving packed bottles. Distribution phase follows the same assumptions made for PET system. The total energy used for 220 L of bottled water capitation, bottling and packaging is equal to 55-60 MJ (equal to 0.27 MJ/L).

Distribution.

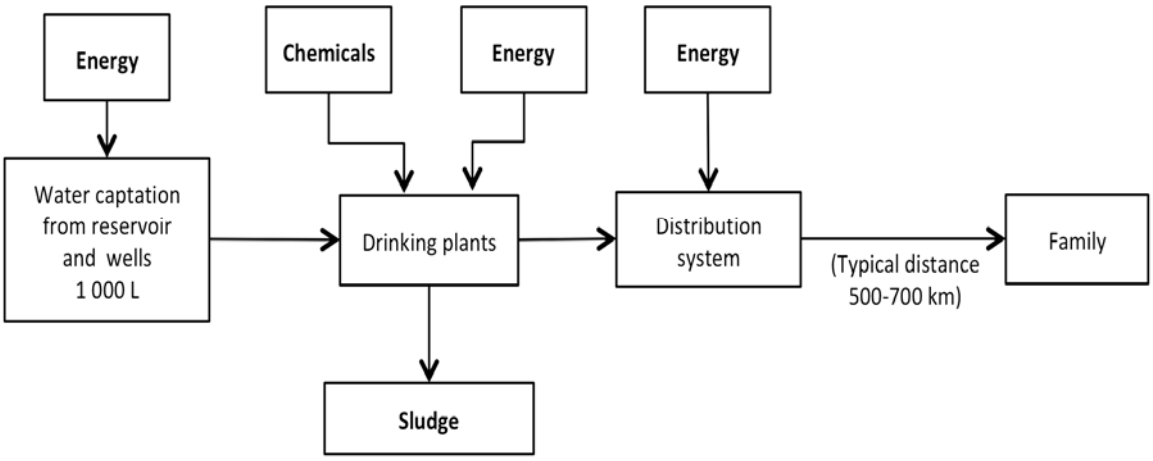
Common assumptions for PET and glass bottles are based, as already mentioned, on a typical distance (500-700 km), which is considered significant. This is the distance from a filling plant and its distribution chain. Trucks with 15 t loading capacity and 4 km/L fuel consumption compose transportation system. To transport 1 m^3 of bottled water 290-435 MJ of energy are required of which 205-315 MJ (80%) related to 780 L of PET bottles and 85-120 MJ to 220 L of glass ones.

Tap water case study.

Tap water. Water for human consumption, supplied by different aqueducts, is mainly used for household. It is well known that water is the best natural solvent; this is the reason why very often natural water are not “pure” or contaminant free. Many substances may be diluted in water; often they are not harmful but yet healthy, sometimes even in microscopic percentage they may be seriously toxic for human being. To define water *drinkable* it has to be colorless, odorless, impurities and contaminants free and with a good taste. Good taste is experienced by our senses while microorganisms and health toxic polluters are evaluated by lab tests according to national and EEC regulations [6-7]. When tap water parameters do not comply

with required standards, it will be treated in water drinking plants through specific chemical-physical processes unlikely bottled water. That being stated, it is possible to identify a sort of "production cycle" also for tap water including water catchment, chemical-physical treatments (upon quality evaluation) and subsequently distribution and consumption (figure 2).

Figure 2 – Diagram Flows of one cubic meter of tap water



Source: personal elaboration by the authors.

Natural water catchment means to collect surface and underground water, conveying it to natural or artificial basins where it will be quality controlled, and a) pumped right into distribution pipeline (unusual); b) diluted or mixed with other water in order to match required standards; c) pumped to water drinking plants. Subsequently, water eligible for human consumption will be pumped into pipelines of different length in order to reach consumption sites. In a drinking plant input water is pre sanitized, several times filtered and again sanitized. So treated water is drinkable and it is directly pumped into distribution pipelines or water storage basins. This water has been treated with chlorine dioxide and sodium hypochlorite as disinfecting agents, quartz gravel and vegetal active carbon as filtering agents. Required quantity of agents is 0.5-1.3 kg/m^3 of water. Usually water drinking plants also have a sludge treatment unit (0.3-0.7 kg/m^3), main process byproduct, where they are dried and then sent to appropriate landfills. Electric energy is used for lifting pumping system and for water chemical–physical treatments. The last ones account to about 10% of the whole amount of energy used up to final pipeline input.

Distribution

As well as for bottled water, also for tap water distribution is the hardest phase to determine in terms of material and mainly energy costs. Difficulty arises from numerous variables affecting energy cost calculation. For instance orography and supplied areas extension have a direct influence on presence/absence of lifting pumping systems. It is well known that in aqueduct water circulate because of water fall and/or pumping systems depending on what just mentioned. Based on available data, we estimate that to lift 1000 L of water for a height

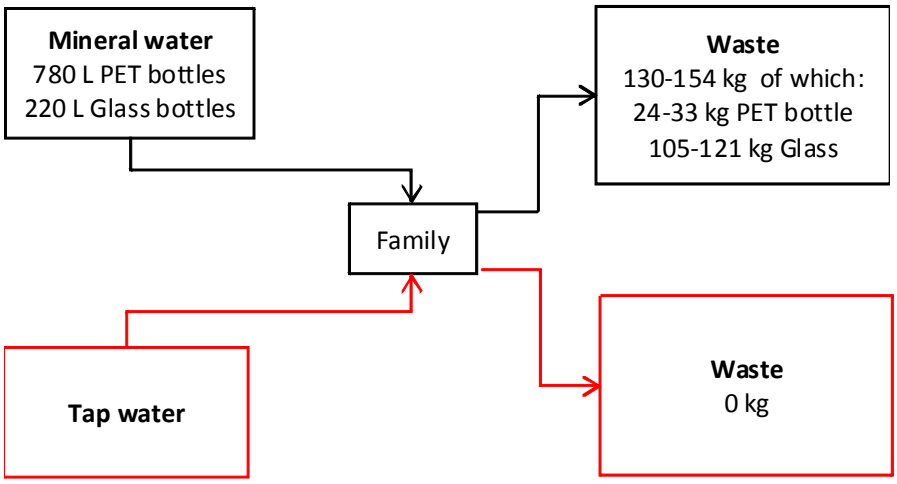
of one meter 0.007-0.01 kWh (kWh/m^3·m) is necessary. In this preliminary phase of the present study we have considered that tap water distribution system is included in a distance (drinking plant-family) of 500-700 km and the maximum height to surpass is 150 m. So that, to make 1000 L of water available to families, we calculate that 1.1-1.6 kWh are needed.

CONCLUSION

Material basis of economic sector provide a tool capable to assess sustainability of the economic activity itself. On this basis it is possible to evaluate related environmental impacts and critical points. Assuming that drinking water is a not substitute good showing a demand always higher, it is necessary to find the right sustainable supply mix between bottled and tap water. Data show that bottled water sector requires a material input extremely higher (130-154 kg/m^3) than tap water (0.5-1.3 kg/m^3). The amount of energy for the whole bottled water (PET and glass) life cycle estimated is 530-700 MJ/m^3 and in the case of PET bottles it is almost equally split between bottling and distribution phases. Tap water energy input is equal to 15-20 MJ/m^3. Similar studies show the same result [5].

The most critical point of bottled water compartment is waste generation (figure 3), basically all the involved packaging. Tap water instead does not need packaging therefore its biggest impact is indirect because it depends on production of electricity necessary to deliver drinking water to families. Tap water distribution systems energy consumption is proportional to supplied area size and orography, in vast and mountainous regions it requires more energy. Data also show that basically people drink bottled water according to reasons very different from the ones should motivate such a choice. It is a matter of fact that bottled water is preferred for organoleptic reasons and often because it is a new life styles symbol [3]. Heavy competition among current numerous brands could be negative for consumers, because they do not evaluate main quality standard when selecting a products, considering instead other secondary aspects that might be dangerous. So that, it is necessary to incentivize consumers to make much more conscious chooses to select products more environmental friendly.

Figure 3 - Solid Waste family production related to bottle or tap water consumption



Source: personal elaboration by the authors.

To make possible conscious consumer chooses it is necessary to reorganize a relevant industrial sector of international economic system, bottled water one, towards solutions more sustainable like:

- Promoting the implementation of new packaging strategy, re-design them using biopolymers and/or making bottles lighter. This means to have, at the end of the packaging life, a different quantity and quality of waste to treat;
- Providing for the creation of an efficient system for packaging recycling. Reorganizing and improving the infrastructural logistics to facilitate the effective recycling rate, which is potential, elevated. A European Directive dated 2008 allows the use of regenerate plastic material into food sector [8]. Its application is not diffused in all the European member states; in Italy for instance it is still not possible. The aim of this directive is to encourage the growth of a new market for this secondary raw material;
- Encouraging bottled waters short chain to reduce transportation costs and related environmental impacts and to make possible the social and economic local development due to the presence of water sources.

As concerning tap water the main critics point is energy costs. First of all it is necessary to increase the efficiency of lifting pumping systems to reduce the energy input during all the phases of tap water chain. Furthermore, it is also necessary to reorganize the energy mix used to produce electricity enlarging renewable energy sources role. No less important is the loss of water during distribution phase. There is, often, a big difference between water entered in water pipeline and water arriving to families. This means that better is the efficiency of the whole tap water system bigger will be its contribution to the environmental in terms of natural resources (water) and energy.

ABSTRACT

Branding is one of the most imperative assets of an organization. Recently, research findings recognize political party identification as brands. Though the literature of brand personality has been focusing on commercial brands, only a paucity of studies consider the arena of political branding. On the other hand, market segmentation plays a significant role in the entire field of marketing. Who (i.e., demographic segmentation), what (i.e., image and status), and why (i.e., personal values) refer to three bases of identifying market segments. In order to advance the knowledge of political branding in the marketing discipline, an empirical study on the relationships among psychographics, brand personality, political party identification, voting behavior, and voting intention is conducted. The purposes of this study are as follows: (1) to understand the relations among psychographics, party identification, voting behavior, and voting intention, (2) to identify the connection between brand personality and party identification, (3) to investigate the correlations among party identification, voting behavior, and voting intention. Statistical analysis methods include AHP, factor analysis, and logistic regression.

REGIONAL DIFFUSION FOR TIED PRODUCTS IN GREEN CONSCIOUS CONSUMERS

Yenming J. CHEN, National Kaohsiung First University of Sci. & Tech, Taiwan
yjjchen@ccms.nkfust.edu.tw

ABSTRACT

We demonstrate that independent aftermarket replacement component remanufacturers are able to help competing manufacturers establish their market share with our suggested decisions. We model the market, in capturing its behavior fluctuation, as an agent-based modeling and appeal to evolutionary game theory in the light of innovative diffusion process with network externality and green consciousness social imitation, in microscopic and dynamic emergent perspectives. We show that both market share and long term profitability of a tied product firm, with inferior market share, indeed can be raised significantly by applying our suggested price-protection-distribution decisions at specific timing.

Keywords: consumer choice, social imitation, technology adoption, replicator dynamics, network externality, agent-based modelling

1. INTRODUCTION

Some tied product manufacturers enjoyed extraordinary high profit margin from the associated replacement components as the existence of monopoly created by their product designs and corresponding intellectual property laws. It is socially beneficial, however, for environmental consciousness, to reuse these replacement components, instead of shredding back to raw materials.

In current situation, original manufacturers oppose any compatible replacement components sold in the market since third party remanufactured products cannibalize their anticipated high profit. On the other hand, direct and indirect demand externality has proved to be able to increase the market share for a market with multiple competitors. Despite of the anticipated monumental profit in a monopolist case, having full reward with singleton market share can not be foreseen since strong competition occurs between existing primary product manufacturers [?,?,?,?].

Given the premise of profit maximization during the new product diffusion along the time and spatial regions, we are dealing with a joint pricing and product protection decision problem in this paper and several questions are raised. Should the original manufacturers accept the existence of remanufacturing? If it does, how to control the profit cannibalization at specific time and region in order to gain the maximal market share and long term profit?
We tackle the problem of optimal price-protection-distribution decisions by carefully establishing the relation between market share and consumer behavior, typically, a consumer choice model, from the perspective of each individual consumer in a green segment social network. In particular, we incorporate the factor of green consciousness social imitation in

the consumer choice model, and attempt to construct a framework of competition in the system product market. We model the market, in capturing its behavior fluctuation, as an agent based modeling and appeal to evolutionary game theory in the light of innovative diffusion process with network externality and social imitation, in microscopic and emergent perspectives.

In this paper, we demonstrate the optimal price-protection-distribution decisions for each original tied product manufacturers to maximize their profits in a competitive market of interacting, in both spatial and temporal dimensions. With the help of our proposed model we show that a tied product firm with inferior market share can invert its position if a carefully designed mix of decision is followed at the right timing and an agglomerative clustering of product distribution is arranged at the initial launch phase. In this case, both market share and long term profit indeed can be raised significantly. We finally give suggestions and managerial implications for tied product firms in setting effective operations providing customers in green segment grow to dominance.

2. OPTIMAL MODELING AND DESIGN

There are three decision variables in our model,

- Pricing (p_i): the retail price in US dollars of the original replacement component from firm i. Prices are set based on market strength and the prices of competitors [?].
- Protection (β_i): the tolerance of firm i for remanufacturing. $0 \le \alpha_i \le 1$. $\beta_i = 0$ represents the highest level of tolerance; $\beta_i = 1$ represents no tolerance at all. Optimum tolerance level can increase the spread of information about a product through the market and to gain market share, thereby preventing major losses in profitability [?].
- Initial Distribution Scattering (α): it refers to the initial distribution of green conscious users.

Define the tied product usage $\{ij\} = \{i : i = 1,\ldots,n\} \times \{j : j = 1,\ldots,m\}$ of each consumer as the outer product set of the product used and the operation employed. Each consumer continues to use a piece of replacement component for a period of time, e.g. a certain product life cycle (PLC). Within a replacement component's life cycle, consumers continue to use the same replacement component. Once the component has been used for longer than its PLC, consumers must once again make purchase decision.
The persuasion stage: when a replacement component exceeds its PLC, the consumer does not immediately make a purchase decision. Rather, they will consider and observe for a while, considering the replacement component they have been using and what other nearby consumers are currently doing, i.e., performing social imitation. Once the consumer makes a decision on what replacement component they will use next time, the persuasion stage is concluded.

The implementation stage: consumers' choice of new exploitation strategies depend on computed conditional probability of product firms' marketing strategies, which comprises product utility and choices of other consumers nearby.

We first attempts to construct a model of tied product market using spatial simulation and evolutionary game theory. The model incorporates operational mix and consumer behavior in an market. We attempts to find each firm's optimal operational mix for maximizing its own profit under the assumption that other firms are able to response to the best operation. Each tied product firm creates a mix involving pricing, protection, and distribution, to maximize profits in a market of interacting consumers. The marketing strategies of each firm also interact, so each must consider the reactions of other firms before any operation decision.

Different combinations of decisions affect the utility that consumers attain by choosing to obtain product j from tied product firm i. This therefore affects the choices that consumers make purchasing in obtaining tied product. In the market, a tied product firm's market share and profitability is decided by the number of consumers choosing operation j for its tied product. Of the exploitation strategies available, retail purchase benefits both a firm's profitability and its market share.

The effects of social imitation are limited to the total numbers of people using the four exploitation strategies who are laterally adjacent to a consumer k. Each consumer k makes the decision on which operation to use as in Eq.1, which shows the probability that the consumer will change their decision to j for a product i [?].

$$\Pr_j = \frac{\exp(\lambda f_{ij} b_{ij})}{\sum_{j=1}^{3} \exp(\lambda f_{ij} b_{ij})} \tag{1}$$

Where λ is a sensitivity parameter. b_{ij} represents the impact of social imitation, that is the total number of neighbors local to k using operation j. $\Pr_j$ is the probability that a consumer k will change their decision to j for a product i. Based on the maximal expected value of utility, Eq.2 therefore determines the final decision of a consumer k for choosing original replacement component, remanufactured replacement component, or not using any product.

$$j^* = \arg\max_{j=1,..,3} \{E_t \Pr_j^k(t)\} \tag{2}$$

Where j^* represents the best choice of operation for a consumer k in terms of her or his maximized utility. With the aforementioned two-stage diffusion process, it will affect other consumer exploitation strategies made thereafter. A tied product firm's market share and income at time t are determined by the number of people using their tied product and purchasing their tied product, respectively.

In an market, a tied product firm i strives, directly, to maximize its profit through its pricing for original replacement component. From the retail, income must be subtracted the fixed costs of development, multiplied by the number of users of retail versions and δ^t. δ is the discount factor. In this model, the discount factor is fixed. The profit functional also includes the cost of IPR (Intellectual Property Right) protection ($\theta\beta^2$)[?]. This is the cost of deterring

remanufactured replacement components in the market, and is the inverse of the degree of tolerance. The cost is low when the firm adopts a relaxed, tolerant strategy, whereas the cost is high when the firm does not tolerate remanufacturing. We are seeking a proper level of price and protection to maximize the profit for each firm i as Eq.3.

$$\max_{p_i,\beta_i} \delta^t (p_i - \theta\beta^2) x_{i1} \tag{3}$$

Where δ is the discount factor, $0 < \delta < 1$.
p_i is the price of original replacement components for firm i.
x_{i1} is the total number of consumers using firm i's product at ESS.
θ is the cost of IPR protection.
Each consumer in the market derives a different subjective degree of satisfaction from a particular tied product because of the decision they follow [?]. Consumers' considerations include both the intrinsic utility of the tied product and network effects. $f_{ij} > 0$ represents the utility that a consumer obtains by purchasing tied product from firm i using operation j. $X_{ij}(t)$ represents the number of consumers at time t using tied product from firm i obtained via operation j.Motivated from [?] we have derived the utility functions as Eq.4 to Eq.6.

$$f_{i1}(x_{i1}(t),t) = I_{i1} + W_i^{(1)} x_{i1}(t) - W_i^{(2)} x_{i3}(t) - W_i^{(3)} \log(x_{i4}(t)) - W_i^{(4)} p_i \tag{4}$$

Eq.4 shows the utility obtained by a consumer k on purchasing original replacement components from firm i. It involves the sum of the intrinsic utility, network externalities and price of the tied product. In addition, when most consumers in the market make a different choice, the intrinsic utility obtained by a consumer purchasing original replacement components from firm i becomes lower. High levels of remanufacturing also reduce the utility of purchasing the original replacement components.

$$f_{i3}(x_{i3}(t),t) = I_{i3} + W_i^{(7)} x_{i1}(t) + W_i^{(8)} x_{i3}(t) + W_i^{(9)} p_{i1} - \beta_i C p_{i1} \tag{5}$$

Eq.5 shows the utility obtained by a consumer k on using remanufactured replacement components from firm i. It is the sum of the intrinsic utility and network externalities of the tied product plus any incentive applied by the government agencies. As the number of consumers using the tied product increases, and as the price of original replacement components rises, the utility of remanufactured replacement components also goes up.

$$f_{i4}(x_{i4}(t),t) = V x_{i4}(t) + \frac{W_i^{(9)}}{x_{i1}(t) + W_i^{(10)}} \tag{6}$$

Eq.6 shows the utility obtained by a consumer k by not purchasing any tied product or making other choices. As the number of consumers using original replacement components rises, the utility of making another choice decreases.

However, in the modern market, tied product firms rarely reveal the results of market share surveys in the publicity. Consumers therefore have no way to accurately gauge x_{ij} – the number of consumers using tied product from firm i – when gaining their utilities. In this paper, the replicator dynamics Eq.7 is used to estimate the numbers of consumers using one particular tied product (x_{ij}), the way the market is evolving, and the state of the market in the future. In this equation, as part of evolutionary games, if the fitness function of a product brings higher than average utility to consumers, then the proportion of consumers using the product will gradually increase; if the utility is lower than average, the proportion will decrease. The speed of these market changes will depend on the size of the gap between the fitness function and the average. When the proportions of consumers using x_{1j} to x_{nj} reaches an evolutionarily stable state (ESS), then there will be no further changes [?]. The estimate of consumers concerning numbers of consumers using each tied product can, in turn, be entered into Eq.4–6 and all corresponding utilities are able to calculated thereafter. Note that the fitness function in replicator dynamics Eq.7 is similar to the utility functions in Eq.4–6 but x_{ij} , the population density, is used instead.

$$\frac{\dot{x}_{ij}(t)}{x_{ij}(t)} = f_{ij}(x_{ij}(t),t) - \bar{f} \quad j = 1,\ldots,4 \tag{7}$$

Where $\bar{f} =$ average fitness and x_{ij} represents the proportion of consumers in the entire market purchasing firm i's tied product through operation j, as guessed by the consumer. $\dot{x}_{ij}$ represents the proportion changing over time of consumers in the entire market purchasing firm i's tied product through operation j, as guessed by the consumer and changes over time. As all players learn through replicator dynamics, if an equilibrium state is reached, this state is called an evolutionarily stable strategy (ESS). An ESS is equivalent to a Nash equilibrium in a rational game [?].

3. NUMERICAL ANALYSIS AND DISCUSSION

To find the optimal decision, our model has been validated on an numerical basis. The parameters $W_i^{(r)}$, I_{ij} used in this numerical analysis are chosen by the maximization problem Equ.8. The characteristics of tied product products and consumer judgments of their relative quality, compatibility and complexity are then devised, with the values of $W_i^{(r)}$, I_{ij} .

$$\max_{W_i^r, I_{ij}} \sum_{t=0}^{\infty} \delta^t (p_i - \theta\beta_i^2) X_{Buy_{(i,t)}} \tag{8}$$

Subject to
ESS exist,
Eigenvalues of Jacobian Matrix
in Replicator Equation ≤ 0

The model is also used to test the effects of different distributions of early adopters and compare different results. By observing the evolution trend with time (changes in numbers of users over time) and the spatial distribution patterns (entropy difference).

In a tied product market with homogeneous competition, consumers make choices based on their subjective awareness and preferences. In the fitness functions in Eq.4–6, all parameters other than x_{ij} are seen as externally determined. Their values are set according to market conditions, and when an ESS emerged, this paper find the solution to the optimization. Thus the optimal values of $W_i^{(r)}$, I_{ij}, for maximizing profitability are found.

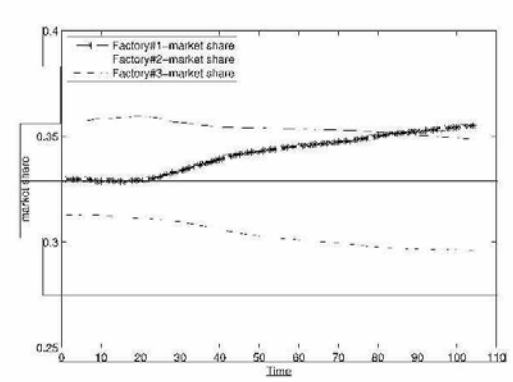
The optimal values of $W_i^{(r)}$, I_{ij}, are used to set the initial parameters, with each product available on the market and consumers' judgments of their quality, compatibility and complexity. The experiments show that x_{11}, x_{12}, x_{21}, x_{22}, x_{31}, x_{32} could coexist when the pricing (p_i) is between 55 and 64; and protection policy between 0.15 and 0.85. Adjusting the initial values, operational mix and parameters lead to different ESS's.

During the introductory phase the three firms employ a lower pricing for their original replacement components ($p_1 = p_2 = p_3 = 54$). They increase the utility of the original replacement components to attract consumers in order to gain market share. The network effects for firm 1 in this period are stronger than those for firms 2 and 3: $W_1^{(1)} > W_2^{(1)} > W_3^{(1)}$. Thus firm 1 achieves a large increase in a proportion of customers buying its original replacement components through a suitable mix of low prices, high quality OEM tied product and an appropriate IPR protection. This means that in the introductory phase, firm 1 is able to achieve a higher market share than other firms and higher profits.

During the growth phase the three firms all use high prices ($p1 = p2 = p3 = 61$) to improve profitability. For firm 1, the increase in price reduces the utility of the original replacement components for consumers, which also reduces the utility of using remanufactured version of the firm 1's product. This means that the rise in the fraction of the market using original replacement components from firm 1. The number of people using remanufactured replacement components from firm 1 also gradually declined. This means that firm 1's market share rises slowly in this phase (see Figure 1).

During the mature phase, the three firms use midrange prices to attract consumers ($p_1 = p_2 = p_3 = 57$). After the end of the PLC, firm 1's market share is above 35%, and at this point the firm implements a strict anti-reproduce policy, which couples with the price and results to a diminish of the utility of using remanufactured replacement components from firm 1. The utility of the original versions goes up, so at this point the numbers of people using remanufactured replacement components from firm 1 falls.

In terms of market share, firm 1's network functions are stronger that the other firms, so there network effects are $W_1^{(1)} > W_2^{(1)} > W_3^{(1)}$. Firm 1 is thus able to attract more consumers, and its market share rises continually.



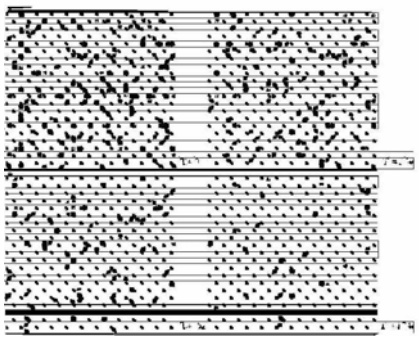


Figure 1. Market share Figure **2. Market evolution (scattered distribution)**

In addition to the operational issues, we also concern with whether the distribution of early adopters within the market affects the diffusion of the product. We carry out several experiments, and find that early adopters in a scattered distribution leads to different diffusion pattern than early adopters in a clustered distribution. In this paper, distribution refers to the clustering of users due to green segment social imitation. Figures 2 show the distribution of users of tied product from firm 1 (black dots) over time (t=now). Over 104 cycles (1 cycle=1 week), each consumer makes purchase decisions, and the differences in patterning are apparent.

In the consumer's decision process, the impact of social imitation and network externalities is large. When early adopters fall in clustered distributions, their interconnectedness is higher, so the speed of spatial diffusion is faster. This allows firm 1's original replacement components to swiftly gain market share. Finally, the firm is able to achieve strong interlinking throughout the market and a decisive market advantage.
These figures show that when early adopters of tied product from firm 1 are clustered, firm 1 's original replacement components diffuses quickly through the market. When the early adopters are scattered, the diffusion retards. The distribution of early adopters is an extremely important factor in the speed of a product's diffusion through the market.

4. CONCLUSIONS

The contribution of this paper is on the right decision of price, protection, and distribution for tied product firms, taking consideration of both social imitation and network externalities, and basing on consumer purchasing behavior. In previous works, there is no way to quantitate network externality appropriately. Consumers have been unable to accurately determine market shares. This paper attempts to find consumers' estimation about the market size by the help of evolutionary game theory.

A firm at stable market leader stage need to concentrate on regular marketing device. If a firm at a startup position, an aggressive tool or deterrence for competitors can be applied. Reproduction and remanufacturing tolerance can be considered to employ temporally before market share getting bigger and stronger.

ABSTRACT

Shipping industry globally is a significant air polluter. The fuels used in shipping industry nowadays have high exhaust gas emission. Therefore alternative energy sources are needed. Though there is possibilities to use less polluting fuels, costs of those are high. Therefore price competitive alternative fuels are needed. Liquefied natural gas could be one alternative towards more environmental friendly engines and production.

The main goal of the research was to investigate if there is genuine interest towards the use of liquefied natural gas as a fuel and what where the critical issues in the use and operation of it. The aim was to find out these and then find solutions to make it more interesting and make possible customers more risk acceptant towards new technologies. As the new product innovation already exists and is functional, the main issues seem to be the predictability of future logistics and prices.

The research is a mixture of empirical and theoretical study and the approach is mainly action-oriented, as the aim is to get a comprehensive understanding of the topic. The theoretical part of the study concentrates on new product development and to innovations progress to a successful market product. Important thing is to sense and respond to customers' needs and then develop the critical areas. The empirical data was collected with questionnaires that were sent to experts in the field of shipping industry and possible customers. The results of the study revealed a direction of development and areas that needed improvement.

Keywords: New product development, Technological development, Innovation, Decision-making, Critical factor –index

INTRODUCTION

The importance of sustainable development and more environmental products and production is getting more and more important these days. Therefore companies search and develop new innovations to create new business opportunities in these fields. The shipping industry is also facing the same demands as other industries. The fact that shipping industry is a significant air polluter requires actions.

In example the sulphur oxide (SO2) emission in Europe's seas were 3.3 million tonnes and 250,000 tonnes of nitrogen oxide (NOx) in year 2000. The problem is same all-around the world and without legislation the level of exhaust gas emission can be expected to rise. Therefore the International Maritime Organization (IMO) and the European Union (EU) have made legislations about sea pollution. The following figures represent the emissions of SO2 and NOx from 2000-2020. The figures reveal how the emissions would grow without legislation and what are then the aims and possible results of implementation of legislation on European soil. (11)

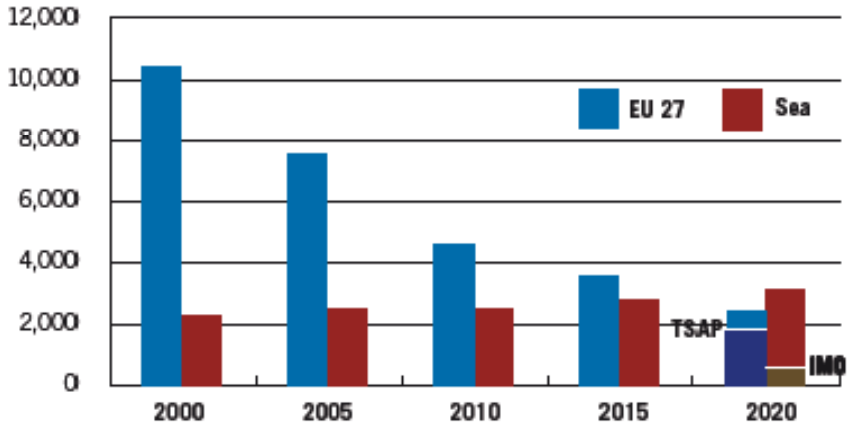

Figure 1. Emissions of SO2 in 2000-2020. (11)

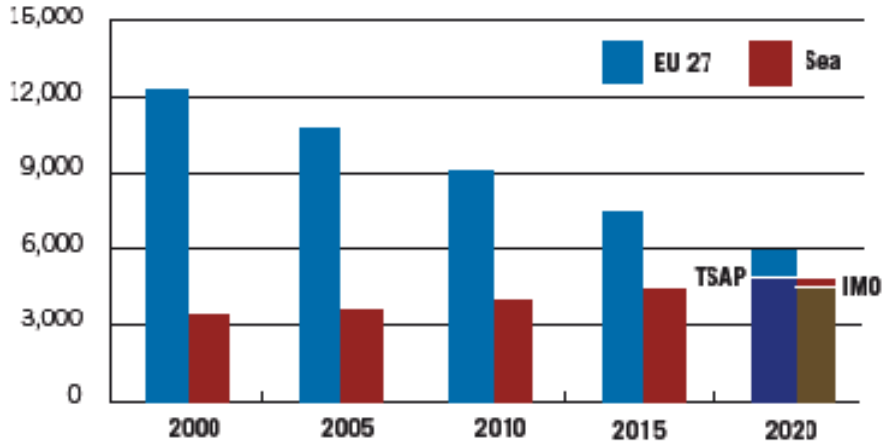

Figure 2. Emissions of NOx in 2000-2020. (11)

In the figures the abbreviation EU 27 means "emissions from land-based sources in all EU-countries (incl. domestic shipping)", Sea means "emission from international shipping in European sea areas," TSAP means "target in line with the EU Thematic Strategy on Air Pollution from September 2005" and finally the abbreviation IMO means "expected outcome from implementing the preliminary IMO-agreement from April 2008" (11).

The legislations of the IMO and EU are demanding and in order for the shipping industry to answer those demands, they have to take actions. Innovation of new technologies to use alternative fuels is needed. However these tighter legislations come to action quite soon and it is important to already start using alternative fuels or other equipment to clean the exhaust gas emissions. There already exists other alternatives as Light Fuel Oils, but the prices of these are not very competitive. (11)

Liquefied natural gas (LNG) is one alternative that would fulfill the legislations and be more environmental friendly fuel. LNG is natural gas that is cooled down to the temperature of -162°C. During this process also the volume reduces about 600 times, making it possible to use it as a fuel in ships. Though the technological possibilities for this exists in forms of engines, the use of it requires modifications in the ships, as the tanks and engine rooms are different in comparison to oil. However with good designing the use of liquefied natural gas could be reality in also already exiting ships and not only in new-built ships. (10: 47.)

Environmental legislation of sea pollution

In Europe there are two main organizations to set legislation against sea pollution and these are the IMO and the EU. The IMO sets international standards to regulate shipping industry. The Marine Environment Protection Committee (MEPC) is a part of the organization that sets legislation to prevent pollution from ships. The MARPOL (marine pollution) convention is an environmental convention in which the emission legislations concerning ship pollution are decided. (6,7,8)

Legislation for the Prevention of Air Pollution from Ships was adapted to MARPOL 73/78. This regulation sets limits for SOx and NOx exhaust gas emissions nowadays and in the future. With this legislation the allowed emission levels will reduce gradually with a certain timeline to be fulfilled. Violations against the legislations of MARPOL 73/78 are considered to be punishable under the law of the Party or the flag State. (7,8)

The legislation set in the MARPOL's convention also involves an opportunity to create specific SO2 emissions control areas (SECA). On these areas the exhaust gas emissions are even tighter than elsewhere. In Europe the Baltic Sea was the first one to become SECA in 2006 and after that also the North Sea joined in year 2007. The following figures will represent the timeline to reduce SO2 exhaust gas emissions globally and in SECAs. Figure 4 represent the limitation for NOx emissions, which are explained in the so called three-tier structure. (11)

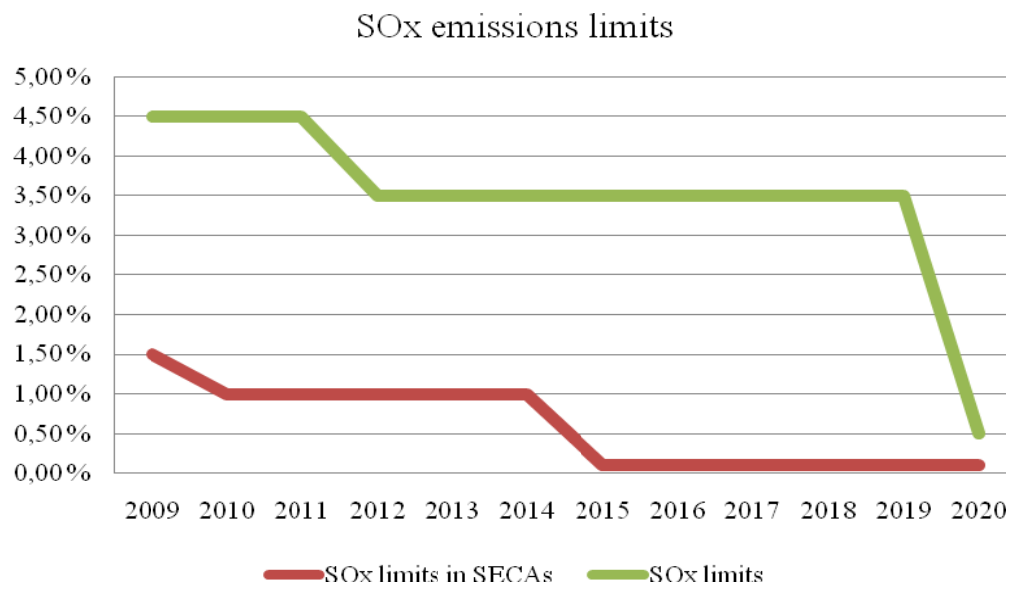

Figure 3. SOx emission limits. (8)

The SO2 limitations have to decrease significantly on SECAs as well as globally. The timeline for global exhaust gas emission reduction however is longer. The fact however is, that with LNG these figures could be achieved. The limitation for NOx emissions set by the IMO depends much on the construction year of the ship. The limitation is tighter for new-built ships then for already existing ships.

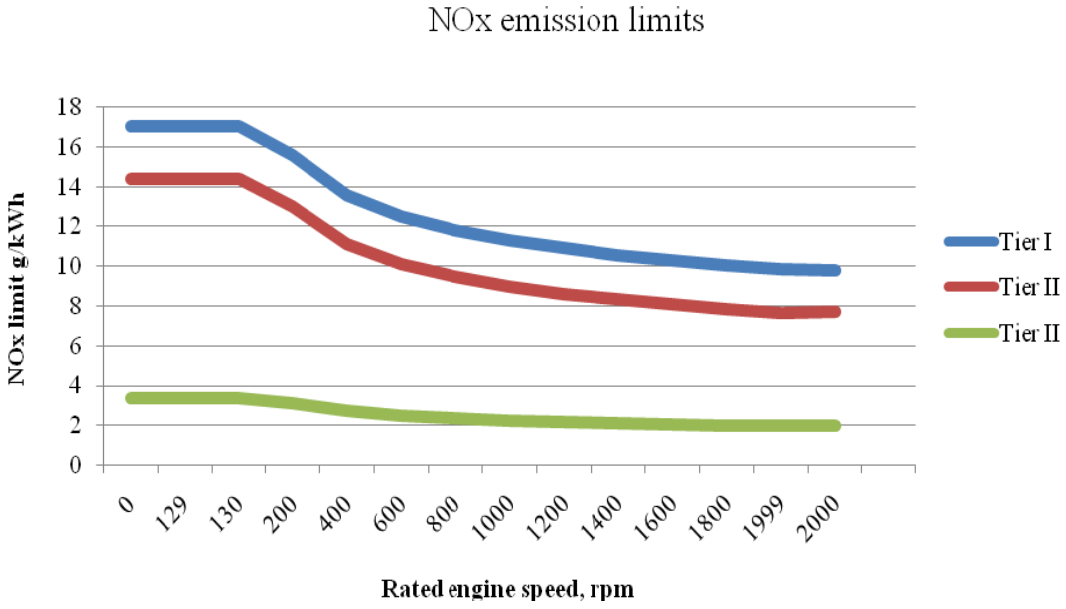

Figure 4. NOx emission limits. (15: 16–17.)

As for already existing engines installed on a ship constructed on 1st of January 1990 until 1st of January 2000 the NOx limitation is 17.0 g/kWh. Ship built after this date belongs to the three-tier structure. The Tier I regulation applies to diesel engines that are installed to ships that are constructed "on or after 1st of January 2000 and prior to 1st of January 2011". (15: 16.) The NOx emission limit for this is 17.0 g/kW. (15: 16.)

Tier II applies on diesel engines installed on ships that are constructed on or after 1st of January 2011. The allowed exhaust gas emission level of NOx will be reduced to 14.4 g/kWh. Tier III is a regulation that applies to engines that are installed on ships that are constructed on or after 1st of January 2016. Then the NOx emission limit will be reduced to 3.4 g/kWh. However this applies only if the ship operates at SECA. Outside SECAs the limits of Tier II apply. (15: 17.)

The above legislations are set by the IMO, but on Europe also the EU has set legislation against sea pollution. EU has set directives such as the EU's directive 1999/32/EC that concerns the reduction of sulphur content of certain liquid fuels and the directive 2005/33/EC that concerns sulphur content of fuels amending the previous directive 1999/32/EC. With these directives the aim is to control the sulphur amount in fuels used and sold on European soil as well as to decrease the amount of SO2 exhaust gas emissions. The following table represent when a certain EU's stated limitation comes to force. (4,5)

Date	**Limitation:**
1.7.2000	To make every possible step to stop usage of gasoil with content of SOx more than 0,2%
1.1.2003	To make every possible step to stop usage of HFO that contain more than 1,0 % of SOx
11.8.2006	SOx content of marine fuels in ships in the Baltic Sea is limited to 1,5%
11.8.2006	SOx content of marine fuels in passenger vessels that have regular route on the area of EU is limited to 1,5%
11.8.2006	SOx content of marine gas oils that is sold in EU to 0,1%
11.8.2007	SOx content of marine fuels in ships in the North Sea and English Channel is limited to 1,5%
1.1.2008	To make every possible step to stop usage of gasoil with content of SOx more than 0,1%
1.1.2010	SOx content of ships on inland waterways and at berths is limited to 0,1%
1.1.2010	SOx content of marine diesel oils that is sold in EU to 1,5%

Table 1. EU's limitations for SOx emissions. (4,5)

These legislations set by the IMO and the EU is the main reason to look and start using more environmental friendly alternative fuels. LNG could be one alternative as the technology to use it exists. The main problem however with the use of it seems to be price and logistics. There is not much information about the price, but it is expected to be on acceptable level.

About logistics, there however is some knowledge since as LNG is cooled down natural gas the pipeline infrastructure of natural gas provides possibilities to import LNG to terminals in

harbors. Also the fact that LNG -terminals and small hubs are planned to be built in harbor provide opportunities for shipping industry. In Europe there are many locations, where terminals and hubs are planned and though nowadays many hubs or terminals do not exist, the future looks promising.

The purpose of the research

The meaning of this research was to find out the critical factors that influence customers risk acceptance and willingness to use more environmental fuels. The main idea was to find out if there is genuine interest, as the topic of environmental fuels is on everybody's mind, there are still few that are willing to take the first step. Finding out the critical factors will help to develop right areas and also increase the interest and information needed in right places.

The research was focused on the area of Europe and in more specific to the SECA areas in European soil. The study is focused on this area, since the emissions legislation is tighter there and the need for more environmental fuels already exists in that area. Though the legislation is going to get tighter on other areas as well, they still have time to think their actions. A research and usage of alternative fuels on SECAs will probably give answers for shipping industry in all other places as well.

In order to find solutions and answers for the research questions and for the decision making process of whether this is actually a technology worth improving and developing an empirical data was collected with questionnaires sent to experts in the field of this technology, possible customers as well as for possible suppliers of liquefied natural gas. Since the research is done in different groups the comparison of results is also important, as it will reveal do these groups see things the same way or where there is lack of knowledge or interruption in the information sharing. The approach in this research is mainly action-oriented, as the aim is to create a comprehensive description and understanding of the subject. (9: 256.)

RESEARCH STRATEGY AND THEORETICAL FRAMEWORK

The meaning of the research was to find critical factors in making liquefied natural gas a successful marketable product. The research was made with questionnaires among different experts in the field of shipping industry. As the interesting thing is, how to make shipping industry more interested in this alternative fuel and also aware of the possibilities that new technologies provide to them.

The theoretical framework used in this research is based on a new product development from innovation and decision-making to market opportunities. The theory provides a path for new product to enter market successfully. Though the market is in need of alternative energy sources as the chief economist Dr Fatih Birol from the International Energy Agency (IEA) has stated, the use of new fuels and the introduction of those to the market demands research and risk acceptance from shipping industry. The main reason for need of alternative fuels is, as Dr Fatih Birol has said: "One day we will run out of oil, it is not today or tomorrow, but one day we will run out of oil and we have to leave oil before oil leaves us, and we have to prepare ourselves for that day." (2)

The market is therefore in general need of new innovations and ways to reduce exhaust gas emissions. In fact the shipping industry is already able to get engines that run on liquefied natural gas as a result of product innovations. As previously the strategy in companies was to make and sell, it is moving towards sense and respond. Nowadays it is more important to know what the customers want in order for a product to succeed in the market. However in many cases the customers do not really know what they want. Therefore innovations are usually combinations of both technology push –model and market pull –model. The innovation of using liquefied natural gas as a fuel could be seen as an interactive model of innovation. (1, 16)

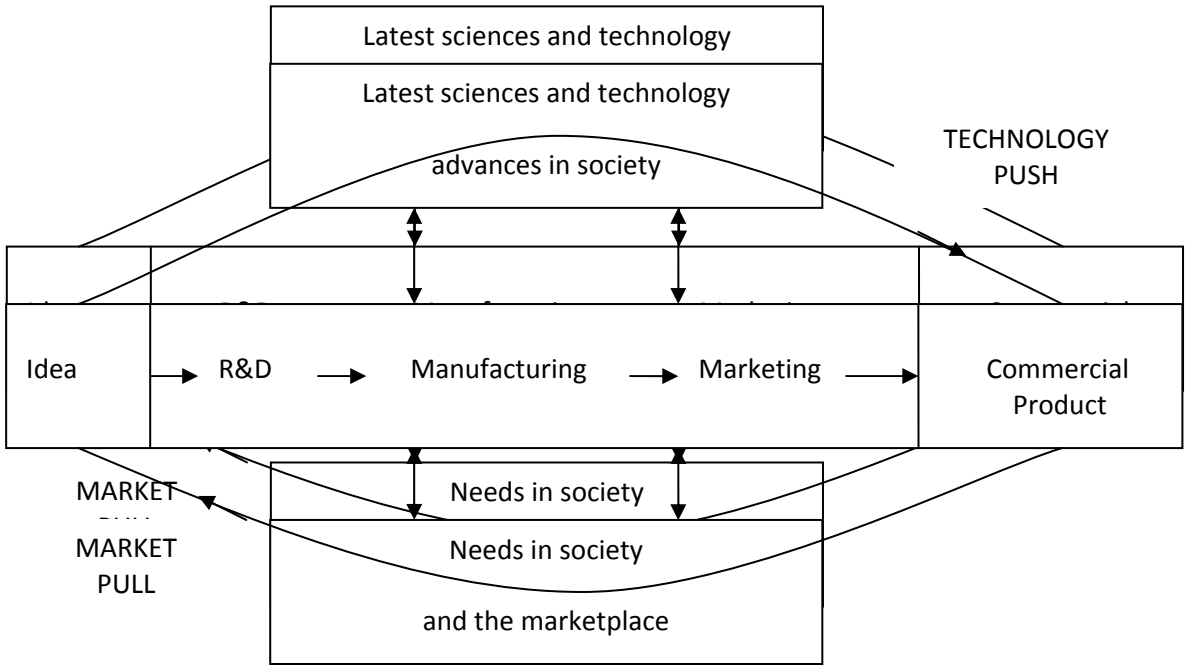

Figure 5. Interactive model of innovation. (16)

In new innovations critical is the success of those on the market. New products success on the market is not obvious and it requires effort. The following figure represents the factors that influence a new product success on the market. The success of an innovation depends on many things, but the importance of these factors differs between sectors. The coordination and balance of all factors is the key to a successful innovation. There are not any straightforward advices in which way the product will succeed in a 100 percentage certainty. The success is always a factor of many things, but the things listed below and shown in the figure will be beneficial and give an advantage. (14: 36.)

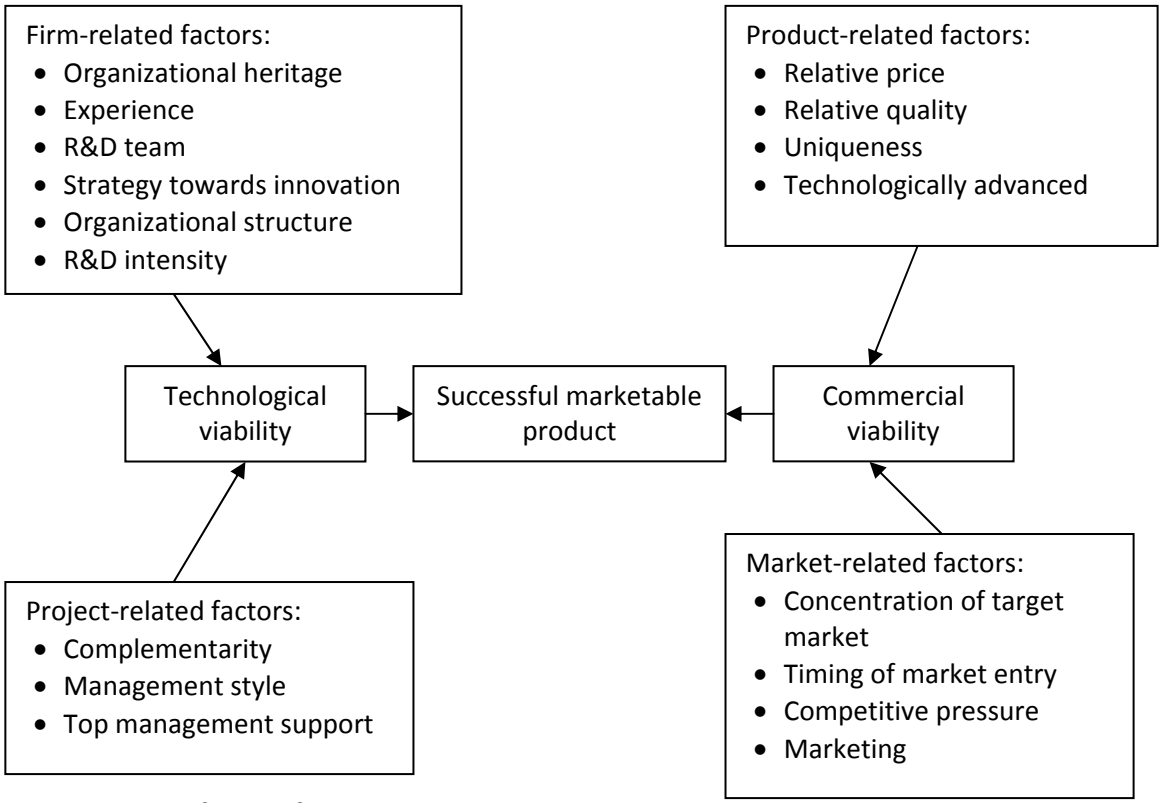

Figure 6. Critical factors for innovation success. (16: 82.)

Roy Rothwell (1996) has also investigated what affects the success of innovations. There are several things that influence the success of a new product and many of those can be achieved with good planning and communication. He has found out that there exist project execution factors and corporate level factors that influence the success:

1. "Good internal and external communication
2. Treating innovation as a corporate wide task
3. Careful planning and project control
4. Efficiency in development work and high quality production
5. Strong market orientation
6. Provide good technical service for customers
7. Effective product champions and technological gatekeepers
8. Development of human capital
9. Cross project synergies and inter-project learning
10. Commitment and support for innovation from top management
11. Long-term corporate strategy with associated technology strategy
12. Long-term commitment to major projects
13. Corporate flexibility and responsiveness to change
14. Acceptance of risk by top management
15. Innovation-accepting, entrepreneurship-accommodating culture"

(14: 36.)

As entering the market the effort of the companies to take into account the factors affecting the success of product on the market are important, but also the time of entry is important. This is where the product life cycle is a good tool. Every product on the market has a certain cycle and usually older product will gradually decrease in profits. This also means that companies have to the entire time make new product available on the market. Innovation is a way for the company to stay competitive on the market. (17: 124.)

The product life cycle tool has five stages: introduction, growth, maturity, saturation and decline. The change of product to different stages is due to customers' needs, technological development and competition. This tool makes it easier to observe the situation of already existing products and the need for new ones. (17: 126–127.)

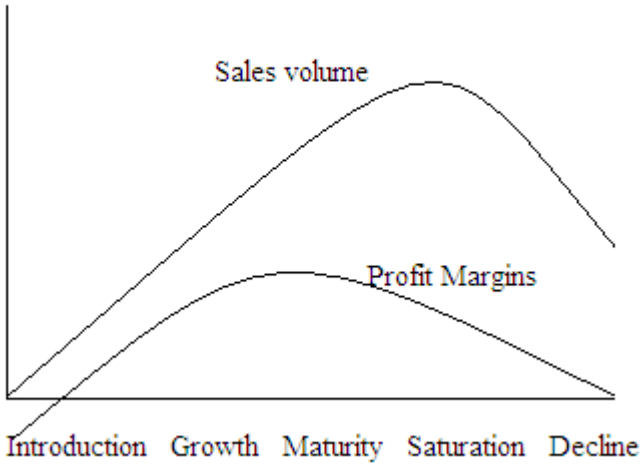

Figure 7. Product life cycle. (17: 126.)

In all the stages that have been introduced already involve a decision-making process in them. The decision-making processes in new product development and in market entry are important. In every stage of from discovery to the launch is important to stop and discuss and analyze. The stage-gate™-model is a useful tool in this, since it manages a new product to market efficiently. In this model there are different gate points or decision-making points. In these points resources are allocated, the decision of going on are decided and i.e. the project is scored to a certain criteria it should meet in the next gate. (3: 358.)

In every way different decision-making tools and models are useful and beneficial as it opens up discussions. With communication and discussion it is possible to end poor projects in the beginning and also in general have a more in-depth analysis of the product. Communication is in many cases key to successful product as it allows different sectors in companies to share their knowhow and therefore the decisions are usually of high quality. (3)

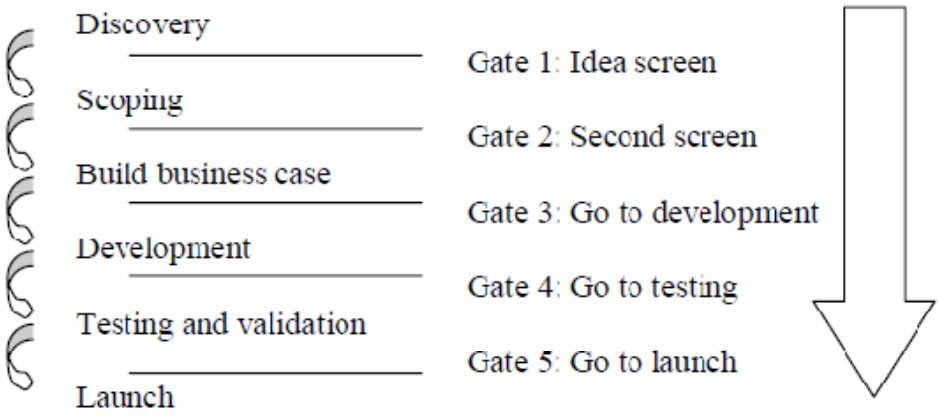

Figure 8. Stage-gate™-model. (3: 356.)

The most important thing in making new products and innovation interesting and successful on the market is all about the communication and background work. The product has to be something that customers want and therefore sensing and responding to customers' needs is essential. In background work technical studies, assessments and also market studies are relevant and important. When the decision making is based on the right and comprehensive information and understanding, the product is more likely to succeed.

In this case the situation on the market was sensed with questionnaires. The analysis of the results had both qualitative and quantitative features. The first part of the questionnaire contained open questions which were then analyzed qualitative and the second part of the questionnaire contained critical factor index (CFI) –questions, which were analyzed quantitatively according to that method.

CFI is a way to find out what are the critical factors in a certain field of study and that gives companies the possibility to develop right areas. The CFI questions contained 10 different attributes that it measured. In these questionnaires they were asked of their expectation, experiences and direction of development of the attributes. (13: 3.)

	Scale: 1 = low, 10 = high		Direction of development in 2016 compared to 2009		
Attribute	Expectation (1-10)	Experiences (1-10)	Worse	Same	Better
Attribute 1					
Attribute 2					
Attribute 3					

Figure 9. Model of the CFI questionnaire. (13: 3.)

In the preliminary analysis the standard deviations and averages are calculated. These figures are then later on used in the further analysis. (13: 3.)The first method is the gap analysis,

which compares expectations and experiences. It will help to identify whish experiences are more insignificant in comparison to expectations and in that way it reveals development areas. Then the importance index of attributes is calculated in order to find what the respondent see most important. This is calculated for every attribute so that the average of expectation is divided with 10. The direction of development index is calculated after this and it will reveal how the respondent think the development is going to proceed. If the direction of development is going to be positive the value is below 1 and if the direction of development is expected to be negative the value is above 1. (12: 318-319.)

All the formulas used in the further analysis reveal some areas of development, but the actual CFI –formula involves all the figures gotten in the above analyses and in that way it will give comprehensive results. The smaller the value of the attribute in the CFI is the more critical it is. (12: 319.)

$$CFI = \frac{\text{SD of expectation} \times \text{SD of experience}}{\text{Importance index} \times \text{Gap index} \times \text{Direction of development index}}$$

(12: 319.)

RESULTS AND ANALYSIS

The response rate of the questionnaires remained quite low being 39 %. Though the response rate was low, the results gotten from different research groups supported each other and gave an answer about the direction of the development. Possible customers and experts in the field of this technology seemed to have quite similar view of the LNG market and the results of analysis show a certain direction of development, even though the research target groups in total were quite small and response rates low. They have same ideas on the matter that LNG is more suitable for new-built ships than for already existing ship market and the reasons for this were quite similar, mainly the space problem and the costs of modifications.

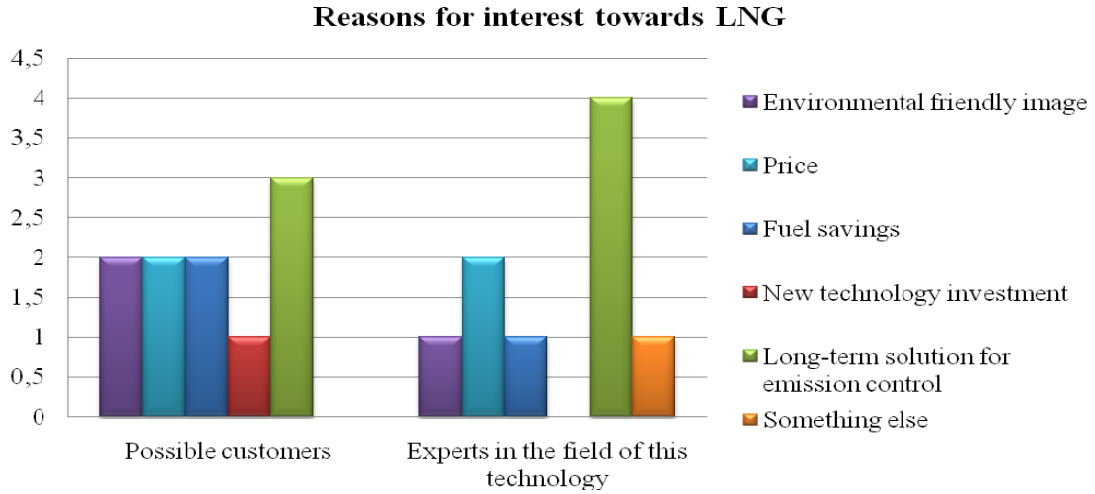

Figure 10. Reasons for interest towards LNG.

The reasons why possible customers would see LNG as an interesting choice are quite the same from both their and experts points of views. The main reason for interest towards LNG

is the ability to have a long-term solution for emission control. The second reason that these both groups see as a reason is the price. Also suppliers of LNG see the environmental and economical benefits of LNG as good reason for its use. Possible customers saw also the possible fuel savings and the ability to give more environmentally friendly image as important reasons. However, the main reason is the fact that with the use of LNG they are able to fulfill the emission legislation in long-term.

In many ways the results of these groups coincide and both groups see the same problems with the use of it. As the results gotten from the analysis of possible customers' questionnaire revealed that they would need education in the matters concerning the use of LNG, experts in the field of this technology acknowledged this too.

Experts and possible customers also had same opinion on the fact that the use of LNG is most efficient and realistic on new-built ships. The main reasons for this were that the rebuild of already existing ships was seen too expensive and difficult. There should be more experience and information of the costs for this to be more realistic. The following figure will show how the answers distributed in these questions.

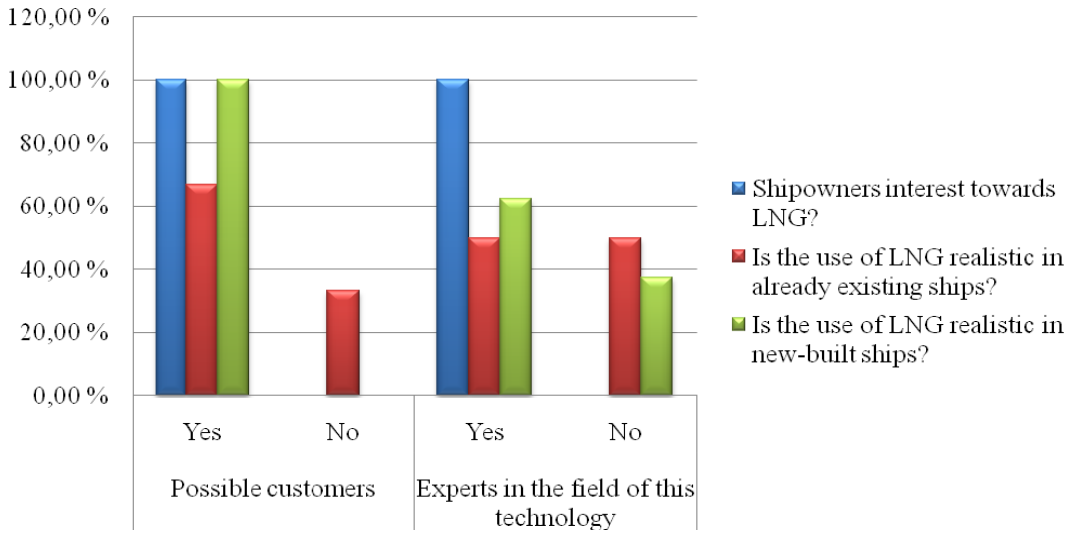

Figure 11. Compared results of possible customers and experts.

In general possible customers have positive opinion on the use of LNG and are very interested in its use. However they do not see the use of this realistic for already existing ship. If the response rate would have been bigger, I believe that this would show even more clearly. In general all the groups are interested of LNG, but more information of infrastructure and costs are needed, for possible customers to dare to take the risk.

The qualitative analysis results of different groups resulted in quite similar views and they saw price and the missing infrastructure at the time biggest obstacles. The CFI analysis supported the results gotten with the qualitative analysis and also the results of different groups had similarities, even though the respondents look the problem from different perspectives.

Both of these groups had 10 different attributes in the CFI-questionnaire that concerned different perspectives in the use of LNG. These attributes concerned the logistics, information sharing, quality, price of LNG and competitive fuels as well as the future.

Nr.	*Attribute for possible customers*	*Attribute for expert in the field of this technology*
1	logistics	logistics
2	information sharing	information sharing
3	information sharing	information sharing
4	quality of technology	quality of technology
5	quality of technology	logistics
6	price	price
7	price	price
8	price	price
9	future	future
10	future	future

Table 2. CFI attributes.

The analysis of these attributes revealed the following results. Some attributes that were asked from the possible customers are empty, since the respondents did not feel that they had enough knowledge to answer those and they were uncertain of those. This already reveals that the subject is new and customers do not have information and knowledge about this.

Possible customers				
Attribute	Development index	Gap index	Importance index	CFI
1	0,99	1,02	0,1	0,00
2	0,99	1,10	0,35	1,25
3	0,99	1,10	0,5	2,09
5	0,33	1,20	0,5	3,37
9	0,99	1,00	0,6	2,69

Table 3. CFI analysis of attributes asked from possible customers.

Experts in the field of this technology				
Attribute	Development index	Gap index	Importance index	CFI
1	0,99	1,13	0,48	9,96
2	0,99	1,03	0,68	3,24
3	0,99	1,08	0,65	6,18
4	0,25	1,07	0,73	4,29
5	0,99	1,15	0,53	7,87
6	0,75	1,08	0,53	1,76
7	0,99	1,00	0,53	17,57
8	0,99	1,00	0,53	21,36
9	0,99	1,05	0,70	2,76
10	0,99	1,10	0,43	11,64

Table 4. CFI analysis of attributes asked from the experts in the field of this technology.

The following figure represents the results of CFI-analysis. It reveals the most critical areas for development and is the most comprehensive method to measure what are the essential things I comparison to other indexes. The smaller the CFI value of the attribute is the more critical it is. (Ranta et al. 2007: 319.)

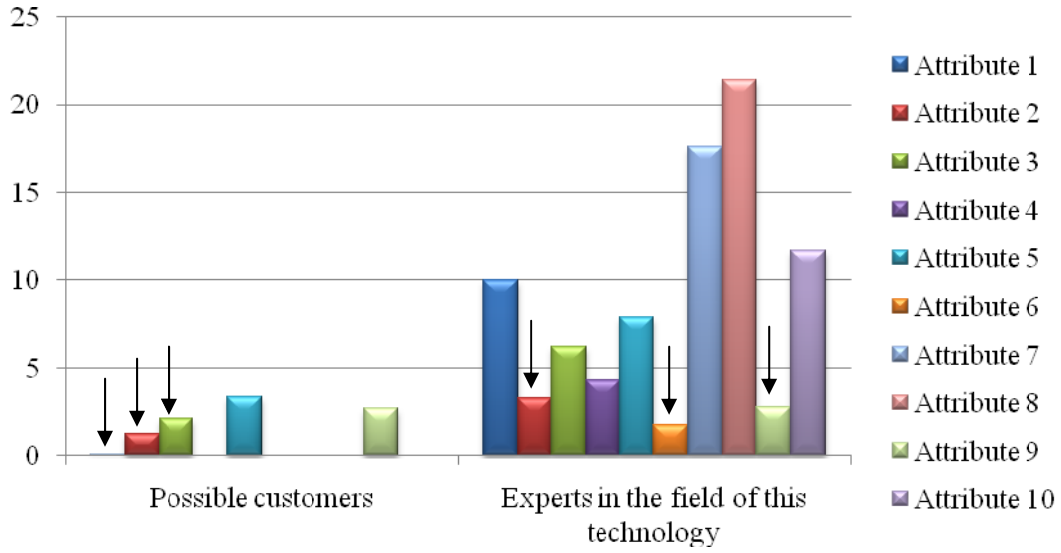

Figure 12. Critical factors.

The critical factors for possible customers were attributes 1, 2 and 3 which concerned logistics and information and knowledge sharing. The critical factors on experts' opinion were attribute 2, 6 and 9 which concerned the information sharing ability, price and future. As these groups look this matter from different perspectives the results do coincide quite well. Both see the information sharing critical, as well as logistics. However on experts' point of view also price and future will reveal more. Though I believe that with good knowledge

sharing those issues can be overcome. Awareness of new technologies will increase the interest towards them as well as the risk acceptance.

TEST OF APPLICABILITY AND EVALUATION OF RESULTS

The use of LNG seems to be very interesting alternative as seen from the perspective of all the results gotten. However there are still many problems with it. The logistics is a major problem for possible customers, since even though there is LNG -terminals being build; there is not much information about those at the moment. It also seems that the possible suppliers are not that willing to answer the questions as the market is still under development. The future will reveal more of these.

Possible customer and experts seem to have quite similar view of the market as they see it very potential for new build, but in many cases too expensive for already existing ships. That also means that in order to promote retrofit market it would need experience of these conversions and their costs and benefits in opposite to new build ships.

The actions of possible suppliers will be important in the future as the buildup of an infrastructure will be critical. The information that suppliers and experts possess should be distributed for possible customers. Awareness of these plans and possibilities makes the use of LNG more realistic for possible customers also.

One critical thing that the results revealed was the fact that education of both customers and experts is needed. The main issue to develop is the competence of experts informing possible customers about LNG. That is the group that will then also affect the education of customers, but if they have uncertainty of this, it is obvious that also the customer remains uncertain. As Roy Rothwell (1996) has stated, the things that affect the innovation success are “good internal and external communication” and “development of human capital” (Rothwell 1996: 36). These are also the areas that need development so that experts are able to professionally promote this technology for possible customers.

CONCLUSION

The response rate and size of research target groups remained quite low and that of course decreases the reliability of this study. Still the answers gotten will show future direction of this industry and the use of LNG. The results revealed that in many cases people do not know enough of LNG or do not want to reveal their plans yet, since the market is developing.

There seems to be very wide interest towards alternative and more environmental fuel. Still a development in many areas is needed to make it more realistic. At the moment the market for LNG is limited, due to lack of knowledge. The future, however, seems very positive and I believe that the market will increase. The increase in knowledge and in the development of infrastructure will create operational possibilities for customers.

The study also revealed areas for development that can be critical in making LNG more interesting alternative on the market. The main matter in this was the fact that in many cases the experts thought that they had information related to sales, but still there were many areas

in the use of LNG that they were uncertain of. As the information sharing for possible customers is a critical factor, it is important that experts have enough competence in these matters. Therefore a better information sharing internally and education could also have a positive impact on the external information sharing and in that way it would be possible to attract customers' genuine interest. It is important that customers feel that the experts are truly professionals, that way the promotion of LNG is easier. I also believe that as the year 2016 when the emission legislation tightens, comes closer and closer also the interest towards LNG ships will increase significantly.

AN INVESTIGATION OF THE ENVIRONMENTAL BELIEFS AND ATTITUDES OF MANAGERS IN POLAND AND UKRAINE

Agnieszka Leszczynska
Maria Sklodowska Curie University, Poland
leszczynski1@poczta.wp.pl

ABSTRACT

Empirical work on the acceptance of environmental impacts and responsibilities on the part of enterprises in developing countries is still relatively rare. There is also little research on the beliefs and attitudes of managers towards the issue of environmental protection. At the same time, a high ecological awareness is one of the most important motivators which induce organizations to undertake pro-ecological activities. This research helps fill the knowledge gap by providing information on the beliefs and attitudes of managers towards the environment. The purpose of the present study is to conduct an investigation of managers in two European countries: Poland and Ukraine. Results indicate that in practice managers did not go beyond the basic common sense of cutting their water & energy costs. This points to a lack of clear and adequate knowledge on relationships: environment – organization, and a tendency to be politically correct in relation to environmental issues.

Keywords: environmental belief, attitude, environmental management

INTRODUCTION

The underpinnings for environmental beliefs and attitudes lie in the means-ends theory of Rokeach (1973) which posits that motives can be explained by the underlying consequences and personal values. In the area of environmentally concerned behaviour, the operative personal values would include, for example, cleaner resources while the negative consequence would be environmental degradation.

The second stream is theory of planned behaviour which explains that individuals and groups strive to order their beliefs in a consistent framework (Ajzen 1985, 1888) cognizant of a specific mode of conduct or end-state of existence that is personally or socially preferable. In the light of that theory environmental beliefs and attitudes would pertain to the cognizance of the personally and socially preferable end-state of maintaining the integrity of the physical and natural environment through behaviours. Attitudes towards such behaviours are driven by beliefs about these behaviors and evaluation of the potential outcomes of the behaviors.
The importance of environmental beliefs and attitudes lies in a three-fold association. For many purposes, including the political arena, it is important to consider public awareness and opinion pertaining to environmental issues. It allows a country, among other things, to assume an appropriate ecological policy, to introduce instruments stimulating desired social behaviours. At the individual level, environmental beliefs comprise a key psychological determinant of behaviour. These include conserving behaviour, supporting intent, searching

for information. From the point of view of organization management, environmental beliefs and attitudes constitute one of the main factors affecting behaviours of organizations (Tilley, 1999; Worthington and Patton, 2005). Many organizations have engaged in environmental management initiatives in order to improve their environmental performance and have found other benefits to the process, such as financial savings and reduced risk of liability. Environmental beliefs and attitudes are carried forward into the realm of managerial decision-making.

Several analyses of attitudes towards various dimensions of the environment can be found in the literature (D'Souza, 2007; Boman and Mattsson, 2008, Gonzalez-Benito, 2010). These studies concern a general level of ecological awareness of a given country's public (Kasim, 2009; Tomicevic, 2010). The present paper focuses not on a general level of ecological awareness of the public but on managers' environmental beliefs and attitudes. Issues concerning the ecological awareness of a selected group (population) are sporadically presented in the literature. Limited research to date has been undertaken with respect to managerial attitudes towards environmental issues (Cummings, 2008). Therefore, the paper presents results of a study of managers' environmental beliefs and attitudes in two countries (Poland and Ukraine). The research seeks to explore whether managers possess knowledge pertaining to environmental issues; whether they possess the understanding of the relations between an organization and the environment; whether they think that being green is practical.

The reply to the questions posed enables one not only to determine managers' current attitudes towards environmental issues. Considering that the level of managers' ecological awareness and their attitudes are primary factors determining an organization's environmental strategy (Vithessouthi, 2009), the determination of environmental beliefs and attitudes of managers appears to be of key importance in the understanding of an organization's attitude in this sphere. Understanding how managers interpret environmental issues facing their firm is an important step in attempting to understand the development of pro-environmental organization behaviour as it is the attitudes and behaviours of managers that shape corporate behaviour.

THE CURRENT STATE OF KNOWLEDGE

Interest in environmental attitudes began in the early 1970s (Bord and O'Connor, 1997) led Dunlap and Van Liere (1978) to the publication of a new environmental paradigm (NEP), which sought to measure the degree of pro-environmental orientation through a series of 12 environmental items/statements. Hitherto conducted studies to a large extent concern factors that affect an environmental attitude. Some usual variables considered are age and gender as well as other socio-demographic and socio-economic factors (Whitehead, 1991; Engel and Pötschke, 1998; Witzke and Urfei, 2001; Dupont, 2004; Israel and Levinson, 2004; Hidano et al., 2005).

Limited research to date has been undertaken with respect to managerial attitudes towards environmental issues within the countries in question, although attitudes have been solicited in Japan (Pierce et al., 1987), Canada (Edgell and Nowell, 1989), Sweden (Widegreen, 1998; Gooch, 1995), Turkey (Furman, 1998) and the Caribbean (Rauwald and Moore, 2002), China

(Lee at al., 2005). On an international platform, Rojsek (2001) identified that at least in one developing country (Slovenia), significant differences regarding obstacles perceived by managers to environmental management were based on a firm size and age, whereas Branzei et al. (2002) attributed differences in environmental performance among Canada, China and Japan to a knowledge of environmental management. Studies conducted in China show that companies pay less attention to corporate environmental reporting and disclosure compared with some of their western counterparts, and only report when they are forced to do so (Peiyuan, 2005). This is confirmed by the latest studies according to which Australian respondents were more cautious of supporting a forthright view on environmental issues, whilst Chinese respondents favoured a more centralized approach to decision making regarding the environment (Cummings, 2008).

In Poland, studies of ecological awareness, referring to the general public, were conducted by the Centre for Public Opinion Research (CBOS 1996, 1997, 2000) and by other researchers (Wojnarowska, 2009). Taking into account the level of managers' ecological awareness Leszczynska (2009) showed that there is a gap between their attitudes towards the environment and actions undertaken in this area. There is no evidence which would enable a comparison of the level of awareness of Polish managers with the level of those from other countries. To our knowledge, studies regarding environmental beliefs and attitudes of managers in Ukraine are also lacking. Admittedly, there have been studies concerning a general attitude of the public to ecological issues in this country, however they referred to the whole society (Grodeland, 1996; Public, 2003). Studies focusing on the managers' group have not so far been published.

STUDY METHOD

The research process involved:

- literature review,
- semi-structured interviews with industry representatives to establish research focus and propositions. Results of discussions cross-checked with interviews prior to designing part I of the questionnaire,
- piloting the questionnaire, revision,
- sending the questionnaire by mail to sample organizations with a cover letter,
- input and analysis of survey data.

The studies were conducted in 2009. 200 managers in public and private corporations nationwide were selected in Ukraine. In Poland the population of managers was 250. The survey was directed to middle executives, with the exception of employees of environmental protection departments on the assumption that they are characterized by a higher level of ecological awareness and knowledge. Questionnaires were mailed to selected organizations. Organizations were chosen in a random way, based on information available in statistical bases.

The samples were selected predominantly from organizations within the manufacturing and natural resources industries, including chemicals, machinery, food, mining. All these industries have a direct involvement with the natural environment, and therefore were chosen specifically for this study. The study instrument was a survey which consisted of two parts.

The questions used in Ukraine were translated from Polish into Russian. The questionnaire was based on an assumption that environmental beliefs and attitudes are determined by knowledge, values, attitudes, a desire to act (Zsoka, 2008).

The first part of the questionnaire pertained to ecological awareness understood as a conglomerate of knowledge, values and attitudes. This part contained 15 closed dichotomous questions or disjunctive cafeteria-style checklists. The questions used were formulated based on Public Opinion Research Center in Poland (CBOS 1996, 1997, 2000) questionnaires. Therefore the instrument was verified in previous studies conducted by this institution in the years 1996-2009. The studies were of a quantitative character; the percentage of responses given to individual questions was assessed. Questions regarded the respondents' opinions concerning environmental threats, the environmental state in the vicinity of an organization, responsibility for the state of the environment, a knowledge of ecological organizations and eco-labels, etc. The second part of the survey referred to beliefs and opinions pertaining to ecological issues. The scope of the questions included in this part was quoted in Tab.2. In this part, which involved 18 questions, a 5-point rating scale suggested by L.S. Cumming (2008) was used. Responses were given in an interval response scale, on a 1–5 rating scale for a particular question, where 1-strongly unfavourable to the concept and 5-strongly favourable to the concept. This part was verified in pilot studies conducted in Australia.

RESULTS

The total response rate was 31 (15%) for Ukrainian respondents and 216 (86%) for Polish ones. Cumulative results from the individual questionnaires were obtained directly from the SPSS statistical software. The survey yielded varied statistical results. The Wilks' Lambda reveals significant differences between the two countries with regard to environmental attitudes (value=0,781; F=4,49). Significant differences were obtained for all environmental questions.

Assessing the level of ecological knowledge of Polish respondents it ought to be emphasized that less than a half of them (44%) possess the knowledge of which institution to inform in case of a threat to the environment. The respondents pointed to a fire brigade (35%), police (17%), emergency management headquarters (12%). Only 4% would contact public administration units responsible for the state of the environment. Taking into account marking products (labelling), every fourth respondent is able to recognize ecological labels. Whereas 45% of the questioned managers, 33% of all-Polish ones and 10% of local ones, can "pride themselves on" the knowledge of international ecological organizations.

Ukrainian managers are able to mention only international ecological organizations. The interviewees in this country report possible environmental threats to police (33%), a fire brigade (30%). Only 4 respondents (out of the whole population) were able to indicate examples of eco-labels. The above results point to a definitely lower level of ecological knowledge of Ukrainian managers. It may result from their lack of interest in these problems and also from a delay with which ecological ideas are promoted. One may suppose that in Ukraine eco-labelling is not popularized, and organizations' ecological activities are not propagated, for example, by the media. Despite the fact that results obtained by Polish managers are better, they cannot be fully positively assessed. A 25% knowledge index of

labels among managers in a country functioning in the European market is certainly insufficient.

Assessing a general state of the environment, a significant part of the respondents in both the countries studied is to a significant extent worried about the state of the environment (>40%). They consider the ozone layer and the greenhouse effect to be the greatest threats (Fig.1).

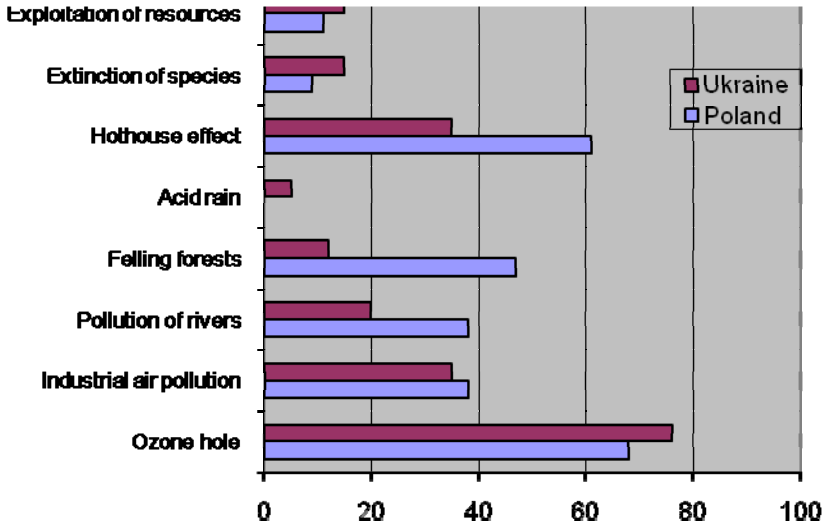

Figure 1. Environmental threats (in %[1])

Referring to local problems related to the environmental state in the vicinity of an organization, managers point to the existence of 2 or 3 threats (65%). In Ukraine 10% and in Poland 4% of the respondents do not perceive any threats. The greatest problem according to the respondents is air pollution and littering the area (Fig.2). Apart from that, essential differences among the countries are discernable. Problems which appear in Ukraine are caused by negligence on the part of authorities and by industry. In Poland the existent state is to a lesser degree caused by lack of interest of authorities in ecological issues. The interviewees in this country to a greater extent concentrated on antropogenic burdens on the environment i.e. air pollution, water pollution.

[1] The sum of responses does not need to be 100% due to a possibility of a choice of several answers.

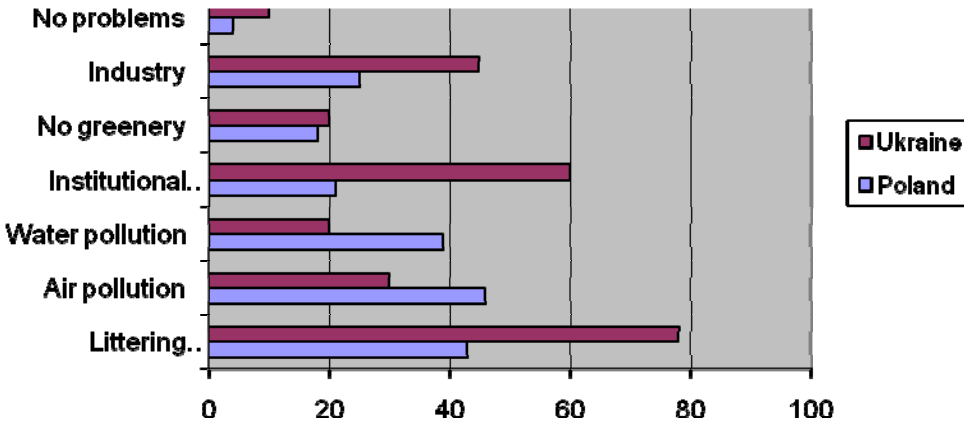

Figure 2. Ecological problems in the vicinity of an organization (in%)

In the opinion of 53% of the respondents, environment protection in Poland (compared to 2004) is functioning better (or definitely better 6%). The opposite answer was given by 15%, so by three times fewer, of the respondents. As to Ukraine, a general state of the environment over the last 5 years has not changed (52%). Managers notice neither a deterioration of the environmental state nor its improvement. These results may prove that authorities take certain actions aimed at restoring environmental components to a socially desirable state, and these actions neutralize the current negative impact. On the other hand, they may be indicative of a passive attitude of managers who are not concerned about those changes in the environment which do not directly affect their business activities.

The studies conducted show that in the opinion of the managers in both the countries an improvement of the state of the environment is dependent on their activities. However, there are differences as to factors regarded as having an influence on an improvement of the environmental state (Fig.3). The state of finances is perceived as a significant factor (though to a different extent), whereas responsibility of business clubs is considered to be of little importance. Due to the fact that Poland developed an ecological policy and that competences regarding environment formation were transferred to local self-governing bodies (along with a necessity of working out a regional development strategy) the activities of the government and of local authorities are also perceived there as having a significant impact on the environment.

From the standpoint of values recognized naturo-centric attitudes are more and more common. Managers indicate that nature preservation is one of the most highly appreciated values, in contrast to modernization of life and advance. Contrary to expectations, such an attitude is mainly typical of Ukrainian managers (50%), and to a lesser extent of Polish ones (38%).

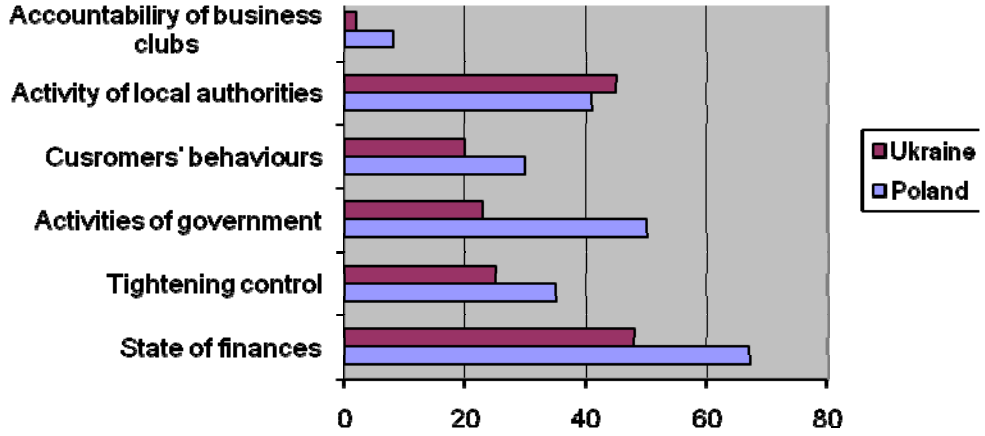

Figure 3. Factors affecting improvement of the state of the environment

As indicated in Table 1, there is a discrepancy between the current practices of the respondents and their overwhelmingly positive responses on the practicality of environmentally friendly measures described above. Except for saving water and electricity, the majority did not take measures against poor water quality, wastewater pollution or solid waste. This discrepancy reflects the tendency to have a "politically correct" stand on environmental issues, without any concrete effort to explore or address the issues further. The findings also indicate that organizations do not go beyond the basic common sense of cutting their water and energy costs. This is understandable considering the additional costs required to install facilities necessary to recycle waste water.

Table.1. Response on existing environmental practice

Is your organization taking any measures at present in relation to:	Poland		Ukraine	
	Yes	No	Yes	No
Water quantity	100%	-	95%	5%
Water quality	28%	72%	17%	83%
Electricity	100%	-	100%	-
Wastewater pollution	47%	53%	48%	52%
Generation of solid waste	23%	76%	35%	65%

The second part of the questionnaire, based on an ordinal scale (1-5), focused on convictions and beliefs. The results obtained were compiled in Table 2.
In the opinion of Polish respondents, employees whose tasks have a significant impact on the environment ought to participate in ecological training (3.8). The managers interviewed believe that:

- trade sanctions should be imposed on countries not complying with international ecological agreements (4.2),
- environment pollution in one country can have direct effects (financial or social) in other ones (4.7),
- national and local organizations should be subject to analogous requirements of compliance with environmental protection as international organizations in a given country (4.1).

Table 2. Results of study of ecological convictions (means, t-Test)

Question	Poland	Ukraine	Mean value	t-value	Sig.
1. Mandatory ecological education	3.8	3.8	3.8	-6.12	0.05
2. Environmental teams in manufacturing enterprises	3.8	2.6	3.2	-5.50	0.00
3. Ecological taxes	2.7	3.5	3.1	-5.42	0.04
4. Limitation of use of subsidies	3.3	3.3	3.3	-7.12	0.00
5. Sanctions for polluting countries	4.2	3.4	3.8	-6.80	0.00
6. Subjecting international problems to domestic policy	3.2	3.4	3.3	-5.66	0.23
7. Applications of ecological standards	3.3	3.7	3.5	-4.73	0.01
8. Financial profits from ISO	3.3	1.6	2.45	-3.90	0.08
9. Governmental control of environmental regulations	3.6	4.1	3.85	-5.18	0.00
10. International effects of pollution	4.7	4.0	4.35	-5.24	0.00
11. Taking into account opinion of the public	1.9	2.5	2.2	-6.09	0.05
12. Compromise with stakeholders	3.3	3.5	3.4	-6.78	0.05
13. Managers' accountability for environmental management	2.0	2.3	2.15	-7.05	0.00
14. Statistical data accumulated by manufacturing organization	2.8	4.3	3.55	-5.55	0.00
15. Considering interests of other groups	3.3	3.3	3.3	-4.89	0.06
16. Publishing a separate environmental report	3.7	4.2	3.95	-3.09	0.00
17. Verification of environmental performance by auditors	3.5	3.7	3.6	-7.15	0.00
18. Identical requirements for all organizations	4.1	4.0	4.05	-6.62	0.08

With reference to ecological standards and norms, in the opinion of Polish respondents, if there are no appropriate national standards, organizations should apply international ones (3.3). Central control over environmental norms and regulations should be maintained by governmental bodies (3.6). The respondents assumed a more conservative attitude towards considering the public's opinion in environmental decision-taking (1.9). A negative assessment was also made with reference to laying all accountability for implementation of environmental management in an organization only on managerial staff (2.0). At the same time, in the opinion of Polish people manufacturing enterprises and those whose area of activity is the environment protection sector should publish annual environmental reports which need to undergo independent verification (3.5). According to the respondents it is necessary for all manufacturing enterprises to accumulate and make available statistical information concerning the level of pollution (2.8).

Ukrainian respondents were the most prominent in expressing a desire to have trade sanctions imposed (3.4), and to have local companies exposed to the same degree of environmental compliance as foreign companies (4.0). On the questions of negative construct, they were however of the opinion that international environmental concerns should be subordinate to national concerns (3.4) and that the national government should maintain central control over the environmental regulations (4.1). This reflects a more nationalistic and centralized perspective on environmental accountability.

Ukrainian respondents do not perceive any benefits resulting from implementation of ISO14000. It is probably due to a very low popularity of environmental management schemes in Ukraine, which are implemented only by international organizations. Moreover, the interviewees do not perceive a need of forming environmental committees in organizations (2.6); they have a negative perception of their own accountability for implementing environmental management (2.3).

CONCLUSION

The findings of this study indicate that, in summary, managers are generally positive about the relevance of environmental issues in their operations and their role in them. However, their generally positive environmental beliefs and attitudes cannot be taken as indicative of their actual business practices. A discrepancy between a belief and attitude and actual practice can be explained by factors like capital availability, information availability, time availability as well as a socio-demographic background. From the standpoint of environment protection organization in an enterprise, Polish managers have a higher awareness of needs in this area. They are to a greater extent supportive of conducting ecological education, forming ecological teams, of an independent verification of environmental performance. In the opinion of the respondents from this country ecological problems ought to be solved on a national forum; it is also necessary to introduce sanctions for polluting countries. In Ukraine, there is a dominant position that international ecological problems need to be subjected to a national policy (in contrast to more developed countries where respondents were in favour of a global approach). Only in a situation when proper national solutions are not available, is a possibility of applying solutions created abroad taken into account (i.e. standards).

Environmental beliefs and attitudes of managers are weaker in Ukraine than in Poland. Managers in this country perceive their role in implementing tasks regarding environmental protection in a more passive way. They are to a lesser degree responsible for:

- considering the opinion of the public in taking environmental decisions,
- compromise with stakeholders,
- taking on responsibility for environmental protection in an organization.

This results, on the one hand, from a lesser openness of an organization to its surroundings (e.g. overlooking the impact of customers), on the other one, from a fear of taking on responsibility due to lack of proper knowledge. Key factors which determine an attitude towards the environment are: a level of knowledge, access to information. The studies conducted show that the level of knowledge of managers in less developed countries is lower. Therefore, it seems appropriate that they acquire knowledge concerning environmental protection and related fields. Such ecological education should be based mainly on self-study and involve examining specialist articles, monitoring results, study results. There is a need for the dissemination of environmental knowledge in business education, as well as through networking with media. Improved levels of environmental beliefs and attitudes would also inculcate a shared environmental value orientation in business students in the two countries.
As far as economic instruments of environment protection are concerned, the managers have an identical (i.e. negative) approach to the issue of reduction of subsidies. Subsidies are treated as additional sources of financing. Investments, including ecological ones, are not introduced without an additional external financial support. However, there are differences with respect to ecological taxes. Managers in Poland are to a greater extent of a negative opinion on taxes because they lower an organization's financial performance. Fees for use/pollution of the environment are also much higher in this country.

The results obtained point to Ukraine's significant backwardness which results from the attitudes and negligence on the part of local administration. The main problem is a lack of civil movement and governmental pressure, and the experience and resources to address their negative environmental impacts. In Poland, for example, environmental regulations are complex, contradictory and vague. Ukraine's strong desire to achieve economic development also contributed to a generally low consideration for environmental management. High priority for economic development at the expense of the environment was coupled with a lack of strong civil pressure. Only the recent years have brought the introduction of environmental protection regulations based on legal solutions used in more developed countries. However, the adjustment of the legislation on environmental protection to the requirements of, for example, the European Union requires a long period of time. It has to be accompanied by a transition of decision and control powers to local bodies. Therefore, apart from appropriate legislation, it is necessary to simplify the administrative process by shortening proceedings or by informal negotiations which will replace procedures and administrative decisions with a system of agreements of directly concerned parties.

Since regulation is one of the key driving forces of the adoption of environmental practices, it is recommended that the government should be more aggressive in implementing laws and regulations that are applicable to organizations. Information and advice on environmental programmes that are affordable and suitable should also be easily accessible so as to further

promote their take up of environmental practices. Such information and advice should convince managers that environmental practices contribute towards long-term financial benefits and demonstrate their social responsibility.

In the light of the results obtained a country's socio-economic development affects an attitude towards the environment. This concerns especially positive changes in the sphere of economic, social, political activities. More developed countries (Poland) are characterized by a higher level of ecological awareness, and vice versa. Therefore, the findings of the study confirm a need to raise ecological awareness in less developed areas.

The current research is not free from limitations. Firstly, compared to the Polish sample, the Ukrainian one comprised a marginal proportion. To that extent, results may not be strictly comparable between the two countries. Secondly, the literature points to the role of a collectivist orientation, a cultural value in the formation of environmental beliefs and attitudes. In the present study the author did not include culture as a study variable. The assumption made was that the countries, as neighbouring ones, are party characterised by convergent cultural values. The study was also limited (as far as its scope is concerned) to selected determinants, indicative of environmental beliefs. There is a need for a deeper study of causative factors responsible for the making of environmental beliefs and attitudes, such as a collectivist orientation, and the role of environmental education in institutions.

DEVELOPING AN ECONOMIC COST MODEL FOR A SUPPLY CHAIN

Pitchasinee Wajcharapornjinda, Thammasat University

Navee Chiadamrong, Thammasat University
navee@siit.tu.ac.th

ABSTRACT

Supply chain management (SCM) has become the most powerful tool for any business because it aims to provide the win-win situation for all members by maximizing the profit of the whole chain. However, some benefits from joining the chain are difficult to quantify into monetary term. If these benefits and big savings of supply chain coordination cannot be detected, it would result in the productivity paradox and failure to justify the benefits of building trust and coordination in the supply chain. The proposed classification of supply chain cost expands the cost concept breaking overhead costs according to their cost center and introduces the opportunity cost to estimate the neglected cost of non-value added activities. With this proposed classification, a company would be able to quantify the hidden benefits and their savings as well as other logistics costs if they choose to join and coordinate in the chain in which these savings would be ignored and overlooked by the traditional costing methods.

Keywords: Supply Chain Costs, Opportunity Costs, Cost Model, Activity-based Costing

1. INTRODUCTION

A supply chain is a set of channel members, which are suppliers, manufacturer, distributors, wholesalers, retailers, and end customers, transact to each other to satisfy customer requirements within the promised time at the minimized cost. Activities in a supply chain include flows of information and materials, technology, resources, and funds as well as coordination and collaboration with all members.

Council of Supply Chain Professional (2005) defined the term "Supply Chain Management" as planning and management of all activities involved in sourcing and procurement, conversion, and all logistics management activities. In essence, supply chain management integrates supply and demand management within and across companies. Recently supply chain management concept has evolved beyond a mere cost-reducing business function into a core competency and source of competitive advantage for many companies because of its impact on customer service – the output of the entire logistics function. In a highly competitive marketplace where products, prices, and quality are easily imitated, superior customer service can be the key element that ranks one company above another (Lambert *et al.*, 1998; Ferguson, 2000).

One of the problems to become a coordinating chain is that the mutual benefit cannot be realized to all coordinated members due to the fact that the traditional costing method can reveal and express only visible costs. Marx (2009) explained that the problem is in the

underlying methodology of the traditional costing systems. They adhere to the assumption that products cause cost. Each time a unit of product is manufactured, it is assumed that cost is incurred. This assumption makes sense for certain direct costs, but it does not work for activities that are not performed directly on the product units. The problem with this approach is that for most overhead activities, the proportions of the activity actually consumed by a specific product, does not universally correspond with a single cost driver. This holds true for most modern companies where products are produced by a combination of manpower and technology. The traditional cost accounting model employs a volume-based driver, such as direct labour hours or machine hours for the assignment of all manufacturing overhead costs. The conventional cost accounting model ends up with a cost of goods sold based on absorption costing and includes only product costs as defined in financial accounting. Fundamentally, traditional costing systems try to assign cost directly to products, rather than to activities first and then from the activities to product units. The typical cost report gives information on what is spent, but not why it is spent. When overhead costs are cut in order to reduce total costs it is the symptoms that are treated and not the cause. In many cases, the cutting of overheads is more likely to lead to a reduction in the quality of the products than to the long term reduction of the cost.

Lin *et al.* (2001) stated that tradition cost accounting systems have become extremely inadequate new concepts and advanced systems since they continue to allocate these escalating overhead costs on a volume-driven basis such as labor hours or machine hours which no longer predict the true consumption of resources in manufacturing and design. Su and Lei (2008) reported that the traditional costing systems were limited to analyzing production costs and less effective when considering the complex processes of the supply chain. As a result, many savings in new technology and useful concepts may not be quantified and overlooked.

In our paper, we use the process costing system together with Activity-based Costing to evaluate costs in a supply chain. In the process costing method, the costs are accumulated according to processes or departments and assigned to a large number of nearly identical products. It can provide information to analyze product and customer profitability and to make pricing, product-mix, and process improvement decisions. Then, Porter (1985) said activities consume resources and product consumes activities in which this is the fundamental assumption of Activity-based Costing system (ABC). Thus, in ABC, a cost is incurred at the point where the activity takes place. ABC allocates overhead costs using cause-and-effect criteria with multiple cost drivers. For ABC system, overhead costs can be more accurately allocated to products based on resource consumption during the activities.

2. LITERATURE REVIEW

Lalonde and Pohlen (1996) proposed a Supply Chain Costing, which employed many techniques embedded in Direct Product Profitability (DPP), Activity-based Costing (ABC), Total Cost of Ownership (TCO), and Efficient Consumer Response (ECR). To evaluate the supply chain cost, major activities were firstly identified and placed in a flow diagram. Secondly, the activities are broken down into the specific activities and put them in a flowchart. Thirdly, the resources required for each activity were identified, and their costs were traced to the activities. Next, the activity costs were traced to supply chain output or

cost object. Finally, the cost drivers for specific activities were analyzed by determining the causal effect between the demand for specific logistics services and costs spanning for the entire supply chain. Their analysis could help companies to evaluate how different channel structures drive costs and contribute to overall profitability.

Wu (2005) sparked the idea of cost architecture as a concept for how to evaluate supply chain costs. In the proposed cost architecture, costs are organized into hierarchy levels of increasing complexity, and the total supply chain cost was formulated as the sum of quantifiable costs, more complex quantifiable costs, and not directly quantifiable costs. Focusing on SCOR model, supply chain management costs are defined as measure of all costs associated with managing supply chain including costs associated with acquiring and delivering materials, planning and order management, but none of the expenditures associated with R&D or sales and marketing.

3. CLASSIFICATION OF SUPPLY CHAIN MEMBERS AND THEIR ASSOCIATED COSTS

Members in a supply chain may perform four main roles as manufacturer, warehouse, distributor, and retailer. The manufacturers order raw materials from their suppliers and convert them into finished products. Then, the external hiring warehouses or storage points are hired to keep the products for a period of time. They hold the products in the intermediate chain and distribute them to distributors or retailers as well as receive the incomes from their holding service. Next, the distributors buy a number of products from different manufacturers and make the profit from their sales to retailers. Finally, the retailers purchase the products from the manufacturers or distributors and sell them to their end customers.

A company who traditionally classifies its costs into direct material, direct labor, and factory overhead costs will not be able to quantify its true and aggregate costs when many costs are invisible by their nature. If these savings are overlooked or cannot be quantified, the benefits of becoming a supply chain will be underestimated and the project may be justified unsatisfactory. In our proposed supply chain cost model, costs in a supply chain are classified into both visible costs and invisible costs. These invisible costs are referred to the hidden opportunity costs. It is defined as the value of the next best alternative forgone as the result of making a decision. Although the opportunity costs are not shown in any financial statement, it is an important part of a company's decision making processes. The opportunity costs may not be easily seen and understood, but they may cost a company by a large amount if the company does not have ability to quantify them. Moreover, inability to quantify these hidden opportunity costs causes all supply chain members to be unable to realize the importance of the cooperation, which could be led to big loss or huge saving, within the chain. Figure 1 shows the proposed supply chain costs of all supply chain members. It explains the costs that may be incurred in each stage of a supply chain.

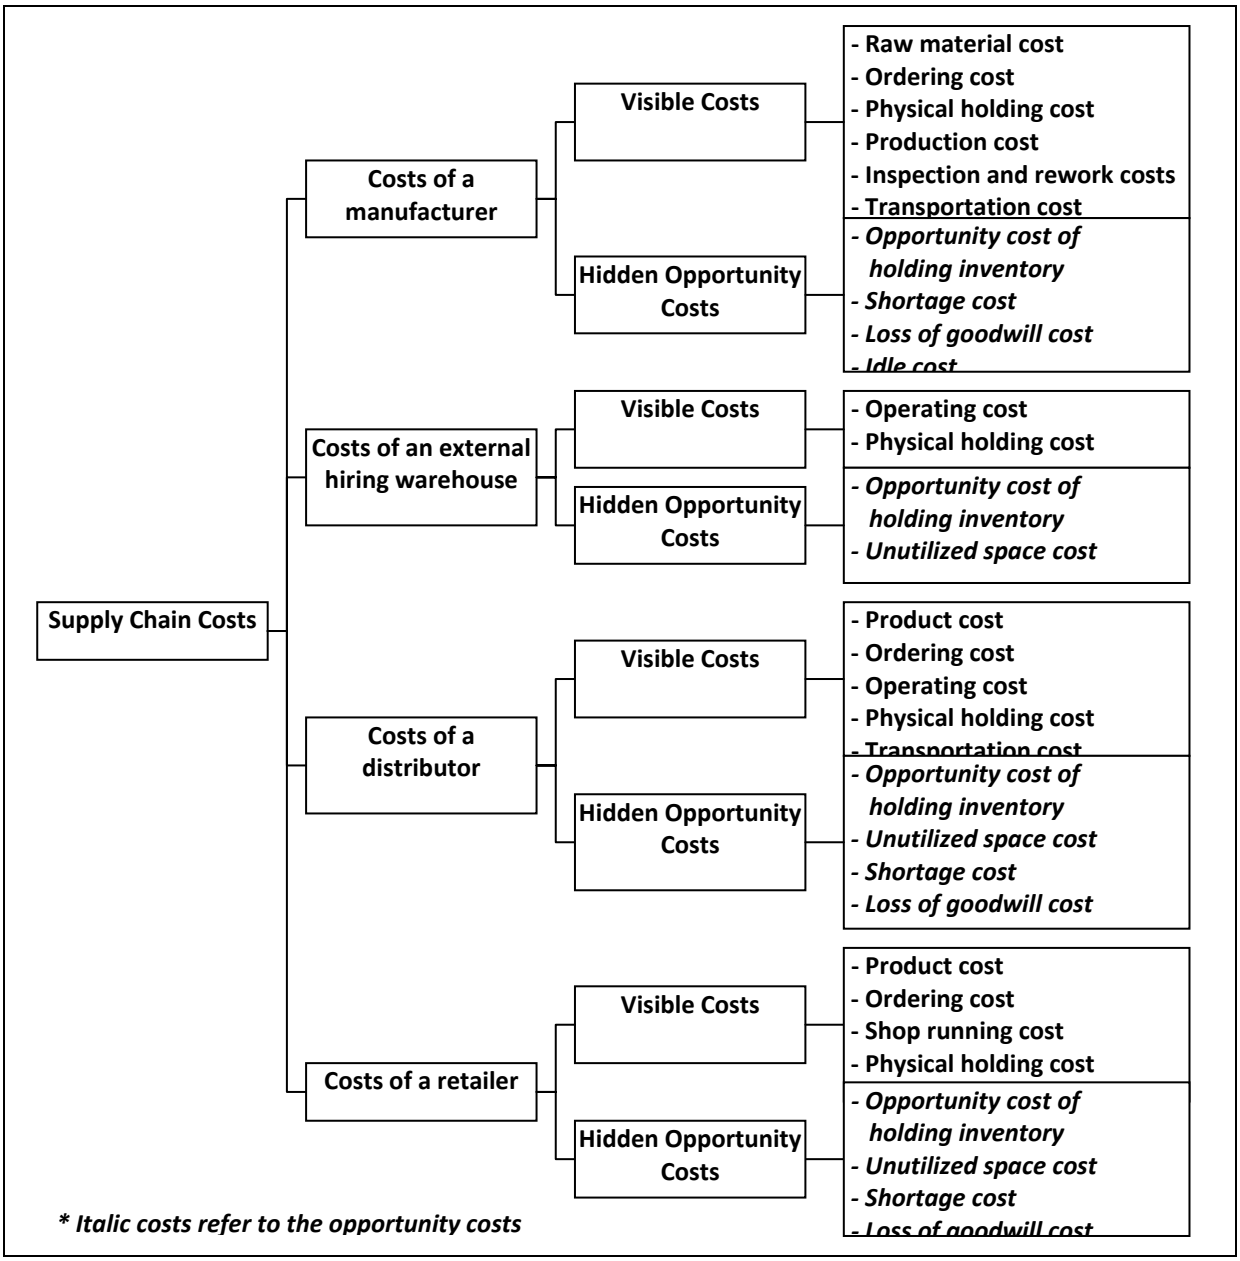

Figure 1: Proposed classification of supply chain costs

4. PROPOSED SUPPLY CHAIN COST MODEL

4.1. Manufacturer

A manufacturer is a stage in supply chain that produces products through a number of processes involving raw materials, components, or assemblies, usually on a large scale with different operations. Manufacturers may be commonly used interchangeably with producers.

Total cost of a manufacturer

= ***Raw material cost + Production cost + Warehouse and inventory cost + Transportation cost + Quality cost + Other expenses***

4.1.1. *Raw material cost* includes both direct and indirect costs of raw materials used to produce a product. Since one or more than one type of materials are transformed into a product, total material cost of a product is the sum of units of each direct material multiplied by its unit cost and the cost of indirect materials.

$$MTMC = \sum_{j=1}^{J}\sum_{i=1}^{I}\left(MDM_{ij} \times MDMC_{ij}\right) + \sum_{j=1}^{J} MIMC_j$$

where $MTMC$ = Total raw material cost of a manufacturer
MDM_{ij} = Quantity of direct material *i* of product *j*
$MDMC_{ij}$ = Unit cost of direct material *i* of product *j*
$MIMC_j$ = Indirect material cost of product *j*
for *i* = *1*, …, *I* (*i* is different types of direct materials.)
for *j* = *1*, …, *J* (*j* is different types of products.)

4.1.2. *Production cost* is manufacturing costs associated with converting raw materials into components and finished products. This cost includes the costs of direct and indirect labors, machining, machine setting-up, and inbound part handling. Total production cost can be formulated as:

Total production cost of a manufacturer
= Ordering cost + Machining cost + Set-up cost + Idle cost + Labor cost

1. *Ordering cost / Order preparation cost* is incurred each time an inventory replenishment order is placed. This includes costs associated with order processing, inventory allocation, ordering from internal or external suppliers, shipment scheduling, order status reporting, and shipment initiation.

$$MTOC = \sum_{s=1}^{S}\left(MO_s \times MOC_s\right)$$

where $MTOC$ = Total ordering cost of a manufacturer
MO_s = Number of placed orders from the supplier *s*
MOC_s = Ordering cost per order for the supplier *s*
for *s* = *1*, …, *S* (*s* is different types of suppliers.)

2. *Machining cost* includes utility costs, which could be driven by actual machine hours. Some examples of these costs are costs of electricity and fuel for running manufacturing equipment.

$$\sum_{j=1}^{J}\sum_{a=1}^{A}\left[\left(MMC_{aj}\right] \times MMH_{aj}\right)$$

where MMC_{aj} = Machining operation cost of machine type *a*, which is used to produce the product *j*
MMH_{aj} = Total operating time of machine type *a*, which is used to produce the product *j*
for *a* = *1*, …, *A* (*a* is different types of machines.)

3. *Set-up cost* is the costs incurred each time different batches are produced. It consists of engineering costs of setting up the production runs or machines.

$$\sum_{a=1}^{A} [(MSC]_a \times MST_a)$$

where MSC_a = Set-up cost for each time the machine *a* is set up
MST_a = Number of set-ups of the machine *a*

4. *Idle cost* is the cost associated with the under-utilization of manufacturing equipment. It shows inefficiency of the company planning in utilizing available resources.

$$MTIdC = \sum_{a-1}^{A} \left(\alpha_{M_a}^{I} \times Eff_a \times MIdT_a\right)$$

where $MTIdC$ = Total idle cost of a manufacturer
$\alpha_{M_a}^{I}$ = Opportunity loss cost of machine idle of the machine type *a* per unit time
Eff_a = Efficiency of the machine *a*
$MIdT_a$ = Total idle time of the machine *a*

5. *Labor cost* is a wage or salary, usually financial, received by workers, who produce products or works in a factory.

$$\sum_{j=1}^{J} [(MWDL]_j \times MH_j) + \sum_{b=1}^{B} (MWIL_b \times MNIL_b)$$

where $MWDL_j$ = Wage per unit time per person of direct labors, who produce the product *j*
MH_j = Number of working hours of direct labors, who produce the product *j*
$MWIL_b$ = Salary per unit time per person of indirect labors, who work in the department *b*
$MNIL_b$ = Number of indirect labors, who work in the department *b*
for *b* = *1*, …, *B* (*b* is different types of departments.)

4.1.3. *Warehouse and inventory cost* is the costs associated with warehousing and holding inventory in warehouses. Total warehouse and inventory cost of a manufacturer can be formulated as:

Total warehouse and inventory cost of a manufacturer
= ***Physical holding cost + Opportunity cost of holding inventory + Shortage cost***

1. *Physical holding cost* is the operating cost associated to the physical holding of inventory when the materials are held. This physical holding cost of holding different types of products can be charged according to their consumed spaces.

$$\sum_{j=1}^{J} [(MHOC]_j \times MSS_j \times MT_j)$$

where $MHOC_j$ = Physical holding cost per unit of storage space of the product *j* per unit time

MSS_j = Storage space of the product *j*
MT_j = Period of inventory holding time of the product *j*

2. *Opportunity cost of holding inventory* can be calculated as the expense that is lost or foregone due to keeping that inventory as a capital tied up. It can be expressed as a bank's interest rate or a company's own cost of capital, multiplied by the value of that keeping inventory.

$$\sum_{j=1}^{J}\left(\alpha_{M_j}^{H} \times MUC_j \times MT_j\right)$$

where $\alpha_{M_j}^{H}$ = Holding opportunity cost per unit time
MUC_j = Unit cost of inventory of the product *j*
MT_j = Period of inventory holding time of the product *j*

In order to calculate the opportunity cost due to the capital tied up, the bank's interest rate or company's cost of capital could be used depending on the following cases. The first case is when the product is stored while there is no immediate demand, so the company needs to pay the opportunity cost of holding the inventory equal to the amount of money to acquire that inventory (i.e., bank's interest). The other case is when the product is stored while it could have been sold, so the opportunity cost of holding is a loss according to the company's required cost of capital for the sold products.

3. *Shortage cost* is the opportunity cost of not having the units in stock for sales e.g., lost profits, penalty costs, and loss of customer goodwill. This cost can be calculated as the shortage cost per unit multiplied by the number of shortage units.

$$MTSC = \sum_{j=1}^{J}\left(\alpha_{M_j}^{S} \times MQS_j\right)$$

where $MTSC$ = Total shortage cost of a manufacturer
$\alpha_{M_j}^{S}$ = Shortage opportunity cost of the product *j*
MQS_j = Quantity of shortage of the product *j*

4.1.4. *Transportation cost* is the cost of transporting materials from one place to another place. This transportation cost includes both transportation cost inside and outside a factory. Transportation cost of a manufacturer can be formulated as:

Total transportation cost of a manufacturer
= ***Inbound handling cost + Outbound transportation cost***

1. *Inbound handling cost* is the cost of handling raw materials, work-in-processes, and finished products inside the manufacturing plant by different types of transporters such as forklift trucks, conveyors, etc.

$$\sum_{i=1}^{I}\sum_{j=1}^{J}\sum_{k=1}^{K}\sum_{l=1}^{L}\left([MHdC]_{ijkl} \times MHdT_l\right)$$

where $MHdC_{ijkl}$ = Cost of handling the raw material *i*, work-in-process *k*, and the finished product *j* per period of the transporter type *l* (*l* can be forklift trucks, conveyors, etc.)
$MHdT_l$ = Handling time of the transporter type *l*
for *k* = *1, …, K* (*k* is different types of work-in-processes.)
for *l* = *1, …, L* (*l* is different types of transporters.)

2.2. *Outbound transportation cost* is the cost for shipment between two geographical locations and the related expenses from the manufacturer to distributors or the manufacturer to retailers or distributors to retailers. This cost also includes all outbound transportation costs for the returned products from distributors or retailers back to the manufacturer in which it will be considered as a part of quality costs in this study. Note that for the manufacturer that hires a distributor to distribute its products, the manufacturer must also pay the outbound transportation cost from the point-of-distributor to the retailers.

$$MTTC = \sum_{v=1}^{V}\sum_{y=1}^{Y}\sum_{x=1}^{X}\left(MT_{xyv} \times MTC_{xyv}\right)$$

where $MTTC$ = Total outbound transportation cost of a manufacturer
MT_{xyv} = Number of trips from the starting point *x* to the ending point *y* by the mode of transportation *v*
MTC_{xyv} = Transportation cost from the starting point *x* to the ending point *y* by the mode of transportation *v* per unit of distance the mode of transportation *v* per trip
for *x* = *1, …, X* (*x* can be the manufacturer, the distributor, or the retailer.)
y = *1, …, Y* (*y* can be the manufacturer, distributor, or the retailer.)
v = *1, …, 4* (*v* is the mode of transportation, which may include truck, train, ship, and airplane.)

4.1.5. *Quality cost* is the total cost of quality-related efforts and deficiencies. The quality cost is separated into three parts, which are cost of inspection, cost of rework, and cost of loss of goodwill.

$$MTQC = \sum_{j=1}^{J}\left(MInspC_j \times MN_j\right) + \sum_{j=1}^{J}\left(MRC_j \times MNR_j\right) + \sum_{j=1}^{J}\left(\alpha_{M_j}^{Q} \times MRT_j\right)$$

where $MTQc$ = Total quality cost of a manufacturer
$MInspC_j$ = Cost of inspection of the product *j* per unit
MN_j = Number of the product *j* being inspected
MRC_j = Cost of rework of the product *j* per unit
MNR_j = Number of the product *j* that must be reworked
$\alpha_{M_j}^{Q}$ = Opportunity cost of loss of goodwill per unit of product *j*
MRT_j = Number of units that the product *j* is returned as defectives

4.1.6. *Other expenses* are other expenses that are not previously mentioned.

4.2. External Hiring Warehouse

An external hiring warehouse is a stage in a supply chain that holds the products for some periods of time before delivering them to its distributors or retailers by the request of the manufacturer. In this instance, the manufacturer requests the external hiring warehouse to keep its stocks until they will be delivered to the distributor later and the manufacturer will be responsible for all outbound logistics costs as mentioned earlier.

Total cost of an external hiring warehouse
= ***Labor cost + Warehouse and inventory cost + Inbound handling cost + Other expenses***

4.2.1. *Labor cost* is wage or compensation, usually financial, received by workers in exchange for their laborers, who work in warehouses.

$$\sum_{j=1}^{J}(WWDL_j \times WNDL_j) + \sum_{b=1}^{B}(WWIL_b \times WNIL_b)$$

where $WWDL_j$ = Wage per unit time per person of direct labors, who respond to the product *j*
$WNDL_j$ = Number of direct labors, who respond to the product *j*
$WWIL_b$ = Salary per unit time per person of indirect labors, who work in the department *b*
$WNIL_b$ = Number of indirect labors, who work in the department *b*

4.2.2. *Warehouse and inventory cost* is the cost associated with warehousing and holding inventory in warehouse. Total warehouse and inventory cost of a manufacturer can be formulated as:

Total holding cost of an external warehouse
= ***Physical holding cost + Opportunity cost of holding inventory + Unutilized space cost***

1. *Physical holding cost* is the operating cost associated to holding inventory. Similar to the manufacturer, this physical holding cost of holding different types of products may be different depending to their sizes.

$$\sum_{j=1}^{J}[(WHOC]_j \times WSS_j \times WT_j)$$

where $WHOC_j$ = Holding operating cost per unit of storage space of the product *j* per unit
WSS_j = Storage space of the product *j*
WT_j = Period of inventory holding time of the product *j*

2. *Opportunity cost of holding inventory* is the cost that is lost due to holding one type of inventory but loss a chance to hold another type of inventory that may give a company a higher return.

$$\left[WCS \times WDS \times \Sigma_{j=1}^{J}\left(\alpha_{W_j}^{H} \times WOS_j\right)\right]/_{WN}$$

where WCS = Initial investment cost per unit of storage space

WDS = Percentage of depreciation cost per unit time
$\alpha_{W_j}^{H}$ = Opportunity cost per unit time
WOS_j = Number units of occupied space of product *j*
WN = Number of replications per unit time

Opportunity cost of holding inventory is an extra cost of capital of the company that is foregone due to holding the inventory that may give a lower return. So, it could be calculated from a lost profit from keeping lower profit return units.

3. *Unutilized space cost* is the opportunity cost incurred due to under-utilization of the storage spaces. It shows a company's inability to use space effectively.

$$\left[WCS \times WDS \times USF \times \sum_{c=1}^{C}\left(\alpha_{W_c}^{U} \times WUS_c\right)\right] / WN$$

where WCS = Initial investment cost per unit of storage space
WDS = Percentage of depreciation cost per unit time
USF = Unutilized space factor
$\alpha_{W_c}^{U}$ = Opportunity cost per unit time
WUS_c = Number units of unutilized space of area *c*
WN = Number of replications per unit time
for c = *1, …, C* (*c* is different storage areas.)

4.2.3. *Inbound handling cost* is the costs of handling finished products by different transporter types such as forklift truck, conveyor, etc. in the warehouses.

$$\sum_{j=1}^{J}\sum_{l=1}^{L}\left[\left(WHdC\right]_{jl} \times WHdT_l\right)$$

where $WHdC_{jl}$ = Cost of handling the product *j* per unit time of the transporter type *l* (*l* can be forklift truck, conveyor, etc.)
$WHdT_l$ = Handling time of the transporter type *l*

4.2.4. *Other expenses* are other expenses that are not previously mentioned.

4.3. Distributor

A distributor is a stage in supply chain that a company buys a number of finished products from different manufacturers and sells them to retailers.

Total cost of a distributor
= ***Product cost + Operating cost + Warehouse and inventory cost + Transportation cost + Quality cost + Other expenses***

4.3.1. *Product cost* is the total cost of a number of finished products purchased from different manufacturers.

$$DPC = \sum_{j-1}^{J}\left[\left(DUC\right]_j \times DU_j\right)$$

where DUC_j = Unit cost of the product *j*

DU_j = Number of units of the product *j*

4.3.2. *Operating cost* is the recurring expenses which are related to the operation of a distribution business, or to the operation of a device, component, and piece of equipment or facility. Total operating cost of a distributor can be formulated as:

Total operating cost of a distributor = Ordering cost + Labor cost

1. *Ordering cost* is the cost incurred each time an inventory replenishment order is placed. This includes costs associated with order processing, inventory allocation, ordering from different manufacturers, shipment scheduling, order status reporting, and shipment initiation.

$$DTOC = \sum_{m=1}^{M} (DO_m \times DOC_m)$$

where $DTOC$ = Total ordering cost of a distributor
DO_m = Number of placed orders from the manufacturer *m*
DOC_m = Ordering cost per order for the manufacturer *m*
for *m* = *1, …, M* (*m* is different manufacturers.)

2. *Labor cost* is wage or salary, usually financial, received by workers in exchange for their laborers in order to distribute the products to a number of retailers. The labor cost for a distributor includes wage or salary paid to its workers.

$$\sum_{j=1}^{J} (DWDL_j \times DNDL_j) + \sum_{b=1}^{B} (DWIL_b \times DNIL_b)$$

where $DWDL_j$ = Wage per unit time per person of direct labors, who respond to the product *j*
$DNDL_j$ = Number of direct labors, who respond to the product *j*
$DWIL_b$ = Salary per unit time per person of indirect labors, who work in the department *b*
$DNIL_b$ = Number of indirect labors, who work in the department *b*

4.3.3. *Warehouse and inventory cost* is the costs that may be incurred due to storing inventory. This cost includes physical holding cost and opportunity cost of holding inventor. Total holding cost of a distributor can be formulated as follows:

Total warehouse and inventory cost of a distributor
= Physical holding cost + Opportunity cost of holding inventory
+ Shortage cost + Unutilized space cost

1. *Physical holding cost* is the operating cost associated to holding inventory. Similar to the previous two members, this holding cost may be differentiated based on their sizes.

$$\sum_{j=1}^{J} [(DHOC]_j \times DSS_j \times DT_j)$$

where $DHOC_j$ = Holding operating cost per unit of storage space of the product *j*
DSS_j = Storage space of the product *j*
DT_j = Period of inventory holding time of the product *j*

2. *Opportunity cost of holding inventory* can be calculated as the expense that is lost or foregone due to keeping that inventory. Similar to the holding cost of the manufacturer, it can be expressed as a bank's interest rate or a company's own cost of capital, multiplied by the value of that keeping inventory.

$$\sum_{j=1}^{J}\left(\alpha_{D_j}^{H} \times DUC_j \times DT_j\right)$$

where $\alpha_{D_j}^{H}$ = Opportunity cost per unit time, which may be interest rate or cost of capital per unit time
DUC_j = Unit cost of inventory of the product *j*
DT_j = Period of inventory holding time of the product *j*

3. *Shortage cost* is the cost of not having the units in stock for sales e.g., lost profits, penalty costs, and loss of customer goodwill.

$$DTSC = \sum_{j=1}^{J}\left(\alpha_{D_j}^{S} \times DQS_j\right)$$

where $DTSC$ = Total shortage cost of a distributor
$\alpha_{D_j}^{S}$ = Shortage opportunity cost of the product *j*
DQS_j = Quantity of shortage of the product *j*

4. *Unutilized space cost* is the cost incurred due to under-utilization of storage spaces. It shows a company's inability to use space suitably.

$$DTUSC = USF \times \sum_{c=1}^{C}\left(\alpha_{D_c}^{U} \times DTUS_c \times DUST_c\right)$$

where $DTUSC$ = Total unutilized space cost of a distributor
USF = Unutilized space factor
$\alpha_{D_c}^{U}$ = Unutilized space cost of the storage or shelf area *c* per unit of unutilized space per unit time
$DTUS_c$ = Total unutilized space of the storage or shelf area *c*
$DUST_c$ = Total unutilized space time for the storage shelf area *c*
for *c* = *1, …, C* (*c* is different storage or shelf areas.)

4.2.2. *Transportation cost* is the cost of transporting materials from one place to another place. This transportation cost includes both transportation cost inside and outside a factory. Transportation cost of a manufacturer can be formulated as:

Total transportation cost of a distributor
= ***Inbound handling cost + Outbound transportation cost***

1. *Inbound handling cost* is the cost of handling products by different transporter types such as forklift trucks, conveyors, etc.

$$\sum_{j=1}^{J}\sum_{l=1}^{L}\left[\left(DHdC\right]_{jl} \times DHdT_l\right)$$

where $DHdC_{jl}$ = Cost of handling finished product *j* per unit time of the transporter type *l* (*l* can be forklift trucks, conveyors, etc.)
$DHdT_l$ = Handling time of the transporter type *l*

2. *Outbound transportation cost* is the cost for shipment between two geographical locations and the related expenses from point-of-distributor to retailers.

$$DTTC = \sum_{v-1}^{V} \sum_{r-1}^{R} (DT_{rv} \times DTC_{rv})$$

where $DTTC$ = Total outbound transportation cost of a distributor
DT_{rv} = Number of trips from the distributor to the retail *r* by the mode of transportation *v*
DTC_{rv} = Transportation cost from the distributor to the retailer *r* by the mode of transportation *v* per unit of distance
for *v* = *1*, …, *4* (*v* is the different modes of transportation, which may include trucks, trains, ships, and airplanes.)

4.3.5. *Quality cost* is the total cost of quality-related efforts and deficiencies. For distributor, since there is no production activity, only inspection cost and opportunity cost of loss of goodwill when the defective units are sold appear as the quality cost.

$$DTQC = \sum_{j-1}^{J} (DInspC_j \times DN_j) + \sum_{j-1}^{J} (\alpha_{D_j}^{Q} \times DRT_j)$$

where $DTQC$ = Total quality cost of a distributor
$DInspC_j$ = Inspection cost of the product *j*
DN_j = Number of units that the product *j* is inspected
$\alpha_{D_j}^{Q}$ = Opportunity cost of loss of goodwill
DRT_j = Number of units that the product *j* is returned

4.3.6. *Other expenses* are other expenses that are not previously mentioned.

4.4. Retailer

A retailer is a stage in supply chain that sells goods or merchandises from a fixed location such as a department store, boutique, or kiosk, in small or individual lots for direct consumption by the purchaser.

Total cost of a retailer
= ***Product cost + Operating cost + Warehouse and inventory cost + Quality cost + Other expenses***

4.4.1. *Product cost* is the total cost of purchased products from upstream members in the chain.

$$RPC = \sum_{j=1}^{J} (RUC_j \times RU_j)$$

where RUC_j = Unit cost of the product *j*

RU_j = Number of units of the product *j*

4.4.2. *Operating cost* is the recurring expenses which are related to the operation of a retail business, or to the operation of a device, component, and piece of equipment or facility. Total operating cost of a retailer can be formulated as:

Total operating cost of a retailer
= ***Ordering cost + Labor cost + Shop running cost***

1. *Ordering cost* is incurred each time an inventory replenishment order is placed. This cost may include the cost of ordering directly from manufacturers or distributors.

$$RTOC = \sum_{m=1}^{M} (RO_m \times ROC_m) + \sum_{d=1}^{D} (RO_d \times ROC_d)$$

where $RTOC$ = Total ordering cost of a retailer
RO_m = Number of placed orders from the manufacturer *m*
ROC_m = Ordering cost per order for the manufacturer *m*
RO_d = Number of placed orders from the distributor *d*
ROC_d = Ordering cost per order for the distributor *d*
for *d* = *1, …, D* (*d* is the different distributors.)
m = *1, …, M* (*m* is the different manufacturers.)

2. *Labor cost* is salary paid to workers during an accounting period on daily, weekly, or monthly basis, plus payroll, related taxes, and benefits (if any).

$$\sum_{b=1}^{B} (RW_b \times RNW_b)$$

where RW_b = Salary per worker, who works in the department *b*, per unit time
RNW_b = Number of workers, who work in the department *b*

3. *Shop running cost* is the day-to-day operating expenses which are related to the operation of a retail business such as utility cost for its operations management.

$$\sum_{j=1}^{J} (RU_j \times RSOC_j) \times ROpT$$

where RU_j = Average number of units of product *j* in the shop
$RSOC_j$ = Shop operating cost per unit of product *j* per unit time
$ROpT$ = Period of shop operating time

4.4.3. *Warehouse and inventory cost* is the cost of having an inventory in stock for a specified period of time. Total holding cost of a retailer can be formulated as:

Total holding cost of a retailer
= ***Physical holding cost + Opportunity cost of holding inventory***
+ Shortage cost + Unutilized cost

1. *Physical holding cost* is the operating cost associated to holding inventory. Similar to other members in the supply chain, this holding cost can be differentiated based on their sizes.

$$\sum_{j=1}^{J} [(RHOC]_j \times RSS_j \times RT_j)$$

where $RHOC_j$ = Holding operating cost per unit of storage space of the product *j*
RSS_j = Storage space of the product *j*
RT_j = Period of inventory holding time of the product *j*

2. *Opportunity cost of holding inventory* can be calculated as the expense that is lost or foregone due to keeping that inventory. Similar to the holding cost of the manufacturer and the distributor, it can be expressed as a bank's interest rate or a company's own cost of capital, multiplied by the value of that keeping inventory.

$$\sum_{j=1}^{J} \left(\alpha_{R_j}^{H} \times RUC_j \times RT_j\right)$$

where $\alpha_{R_j}^{H}$ = Opportunity cost per unit time, which may be interest rate or cost of capital per unit time
RUC_j = Unit cost of inventory of the product *j*
RT_j = Period of inventory holding time of the product *j*

3. *Shortage cost* is the opportunity cost of not having the units in stock for sales e.g., lost profits, penalty costs, and loss of customer goodwill.

$$RTSC = \sum_{j=1}^{J} \left(\alpha_{R_j}^{S} \times RQS_j\right)$$

where $RTSC$ = Total shortage cost of a retailer
$\alpha_{R_j}^{S}$ = Shortage opportunity cost of the product *j*
RQS_j = Quantity of shortage of the product *j*

4. *Unutilized space cost* is the opportunity cost incurred due to under-utilization of storage and shelf spaces. It shows a company's inability to use space effectively.

$$RTUSC = USF \times \sum_{c=1}^{C} \left(\alpha_{R_c}^{U} \times RTUS_c \times RUST_c\right)$$

where $RTUSC$ = Total unutilized space cost of a retailer
USF = Unutilized space factor
$\alpha_{R_c}^{U}$ = Unutilized space opportunity cost of the shelf area *c* per unit of unutilized space per unit time
$RTUS_c$ = Total unutilized space of the shelf area *c*
$RUST_c$ = Total unutilized space time for the shelf area *c*
for *c* = *1*, …, *C* (*c* is different shelf areas.)

4.4.4. *Quality cost* is the quality-related cost. For retailers, since there is no production activity, only inspection cost and opportunity cost of loss of goodwill, when the defective units are sold, appear as the quality cost.

$$RTQC = \sum_{j=1}^{J} \left(RInspC_j \times RN_j \right) + \sum_{j=1}^{J} \left(\alpha_{R_j}^{Q} \times RRT_j \right)$$

where $RTQC$ = Total quality cost of a retailer
$RInspC_j$ = Inspection cost of the product *j*
RN_j = Number of units that the product *j* is inspected
$\alpha_{R_j}^{Q}$ = Opportunity cost of loss of goodwill
RRT_j = Number of units that the product *j* is returned

4.4.5. *Other expenses* are other expenses that are not previously mentioned**.**

5. ILLUSTRATIVE EXAMPLE

An illustrative example is used to demonstrate our proposed cost classification. In the model, a customer arrives at a retail shop with the mean of the inter-arrival time of 10 minutes under the exponential distribution. Both distributor and retailer use the periodic review with order up to the target stock level (*T, OptS*) policy by making an order to the upstream members every week while the manufacturer orders its raw materials from the supplier according to the pre-determined interval. It takes 10 minutes with standard deviation of 5 minutes normally distributed to produce a product at the manufacturer. It is assumed that there is no delivery lead time and there is a 5% defect rate caused from the manufacturer's production even though there is an inspection for every batch of the production. After the manufacturer has produced the products, it transfers them to the external hiring warehouse, and the warehouse holds the products until receiving an order from the distributor. Then, the distributor will deliver the products to the retailer according to weekly orders. Suppliers and customers are considered to be external members in the chain as shown in Figure 2.

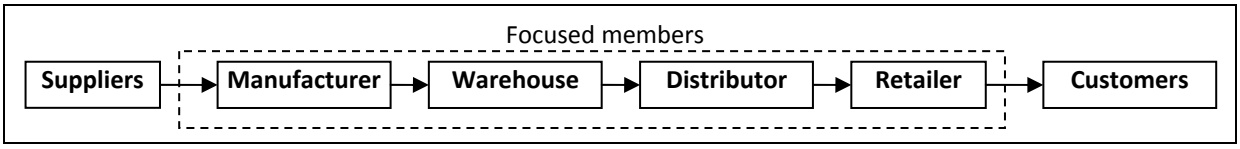

Figure 2: Illustrated supply chain

Arena 12.0 is used as a tool to simulate the behavior of the above system and OptQuest is used to optimize the target stock levels of the retailer and the distributor as well as the pre-determined interval time of raw materials' arrival at the manufacturer. This is to maximize the profit of the whole chain and to avoid any bias in the result due to poor parameters setting of the system. Twelve replications (one month per replication with the warm-up period is also one month) have been performed as a 95% confidence interval of part flow time has a width less than 5% of our point estimated for this value. The cost structure is shown in Table 1

Table 1: Cost structure

Cost items	Manufacturer	Warehouse	Distributor	Retailer
Raw material cost per unit (Baht)	120	-	500	1,000
Production and operation cost				
Ordering cost per order (Baht)	800	-	2,000	2,000
Machining cost per minute (Baht)	3	-	-	-
Set-up cost per set-up (Baht)	50	-	-	-
Idle cost per minute (Baht)	*0.1*	-	-	-
Direct labor per unit (Baht)	40	2.4	24	40
Indirect labor per unit (Baht)	10	2	10	-
Shop running cost per unit per minute (Baht)	-	-	-	0.05
Warehouse and inventory cost				
Physical holding cost per unit per minute (Baht)	0.003	0.003	0.005	0.015
Opportunity cost of holding inventory per unit	*0.01%*	*0.001%*	*0.002%*	*0.002%*
Shortage cost per unit (Baht)	*500*	-	*1,000*	*2,000*
Unutilized space cost per ft^2 per minute (Baht)	-	*0.01*	*0.01*	*1*
Transportation cost				
Inbound handling cost per unit (Baht)	1	4	4	-
Outbound transportation cost per unit (Baht)	50	-	50	-
Quality cost				
Inspection cost per unit (Baht)	10	-	3	3
Rework cost per unit (Baht)	3	-	-	-
Loss of goodwill per unit (Baht)	*750*	-	*1,500*	*2,500*
Transportation cost for rework per unit (Baht)	50	-	-	-

Table 2 shows the optimized system parameters including the bounds and their optimal values, and the results from the simulation can be summarized in Table 3.

Table 2: Optimized system parameters

	Lower bound	Upper bound	Optimized value
Distributor TSL (unit)	1,200	1,600	1,475
Retailer TSL (unit)	1,300	1,800	1,508
Inter-arrival time (min)	130	180	146.206645

Summary of profit and costs										
Total visible cost	2,284,787	79%	239,406	76%	3,821,567	77%	6,728,206	80%	13,073,967	79%
Total invisible cost	615,827	21%	74,505	24%	1,158,359	23%	1,666,682	20%	3,515,373	21%
Total revenue	2,974,250	-	345,302	-	5,903,080	-	11,835,340	-	21,057,972	-
Total profit	**73,635**	**-**	**31,391**	**-**	**923,154**	**-**	**3,440,452**	**-**	**4,468,632**	**-**

Please note that all italic costs in Table 1 and 3 are considered to be the invisible opportunity costs. As presented in Figure 3, the results under optimal setting of the system show that the invisible opportunity cost can contribute up to 21% of the total cost of the whole chain. This 21% will not be recorded in the accounting systems but it represents the amount of money that the company could save if the right strategy can be performed. In addition, if these costs are ignored or cannot be quantified, the benefits of becoming a supply chain will be underestimated and the company would not be able to realize its true costs. This could cause many wrong judgments and decisions when an important policy is needed to be made based on these notified costs.

Figure 3: Proportion of costs in a supply chain

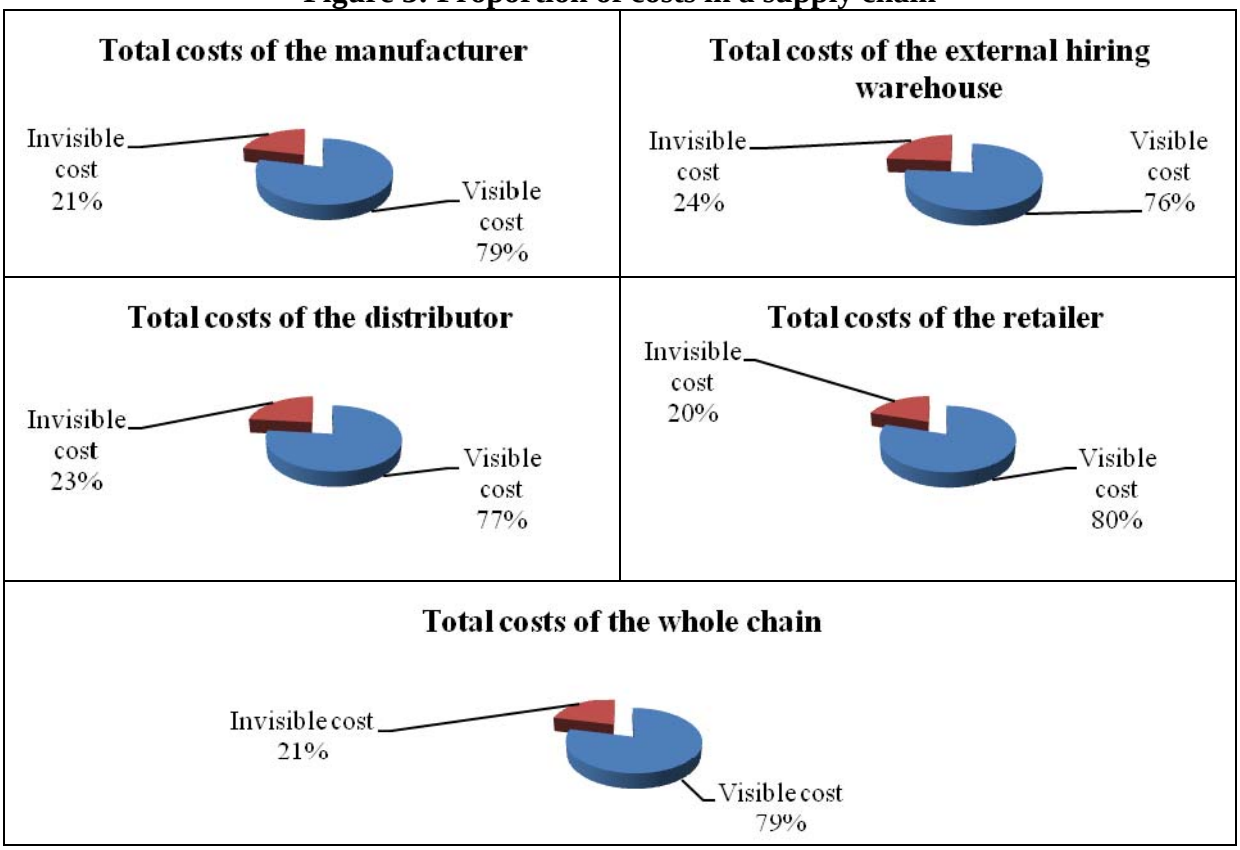

Figure 4 also summarizes the break-down of total costs to each group of costs (i.e. raw material, production and operation, warehouse and inventory, transportation and quality costs). Under our pre-determined cost structure, the raw material cost and the warehouse and inventory cost share the highest amount (expect for the external warehouse, which does not pay for the material cost since it only gives holding service). Raw material cost gets more expensive along the downstream members since each member needs to mark-up for their profits. It is also found that the majority of the warehouse and inventory cost as well as the quality cost are invisible by their nature. Without the proposed cost classification, these costs would be hidden and the company may not realize how big the amount is. However, this is the amount that they can save if the coordination among them can be better established.

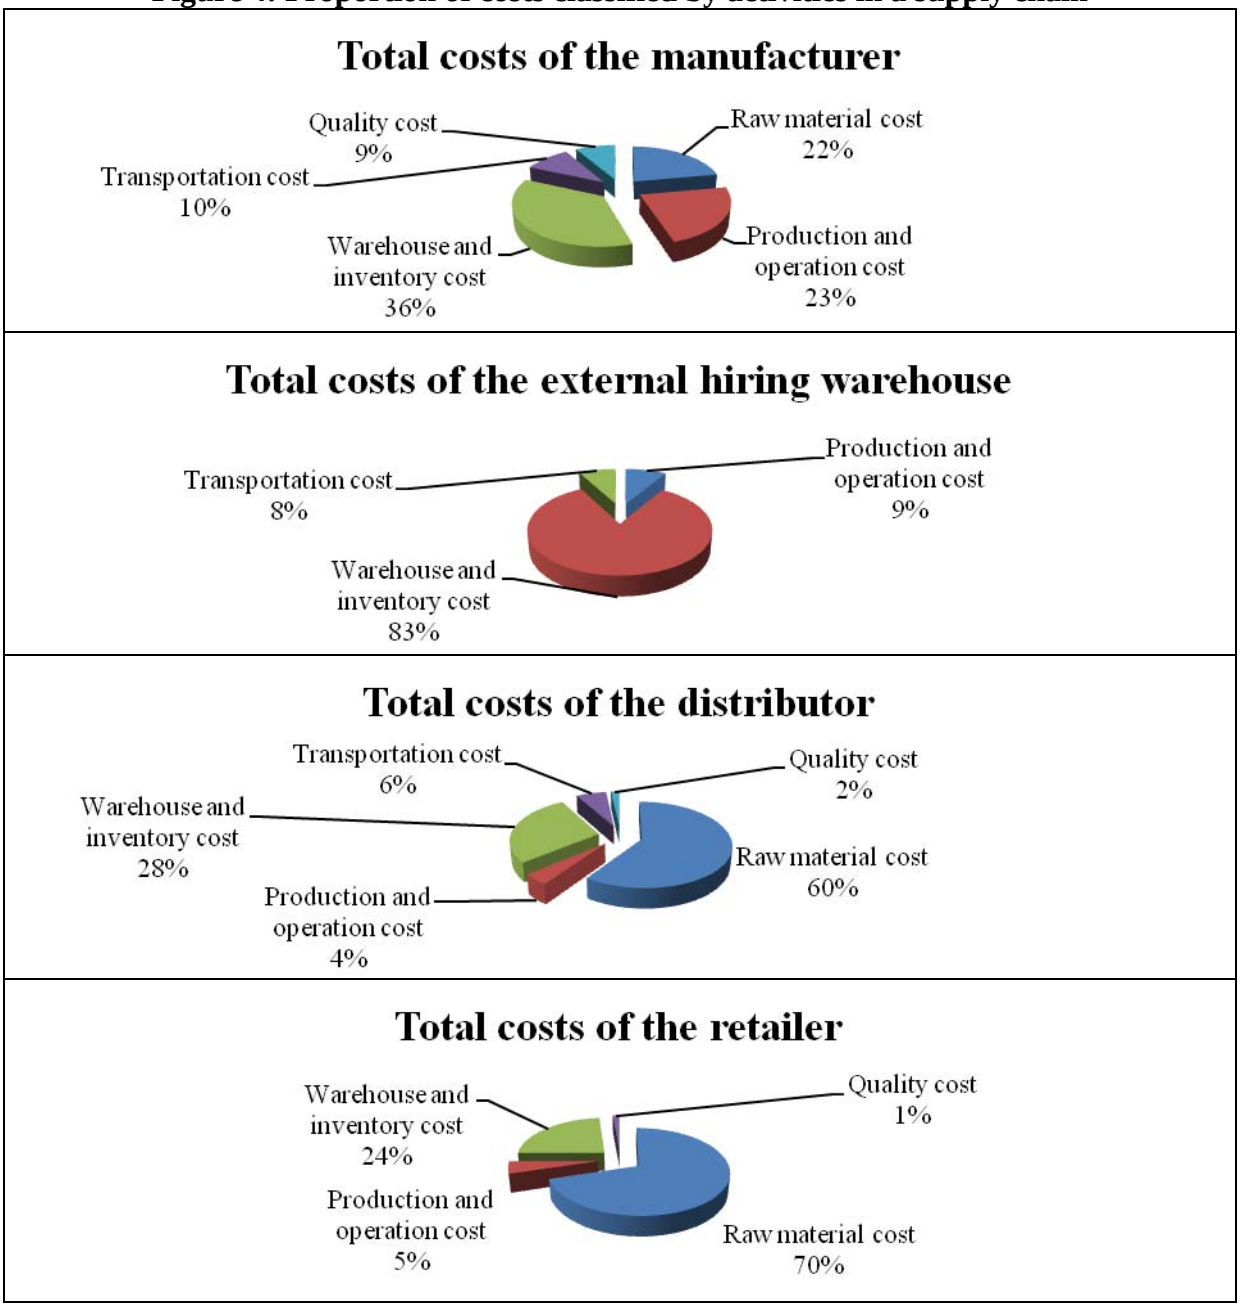
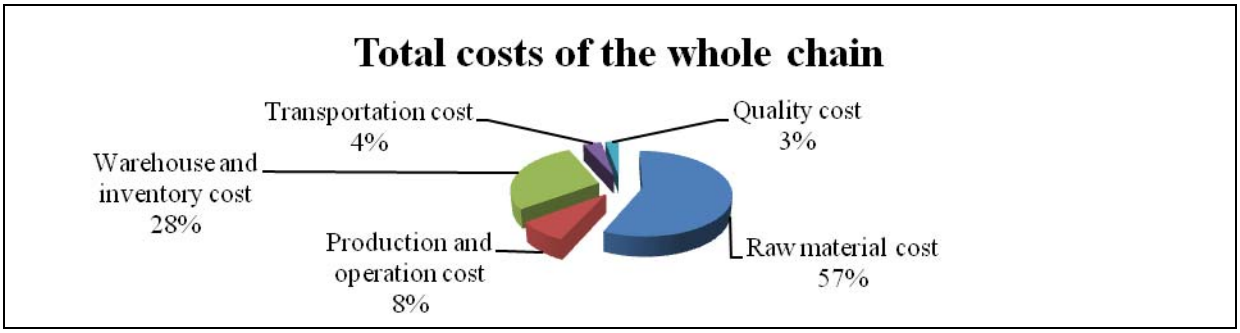
Even though, the result shows that the distributor and retailer share a high amount of the profit in relation to other members, their profit, in fact, could be lower since the study did not include the marketing and advertising costs in our proposed cost classification. These costs are essential for their retailing business and are quite expensive in its nature. However, this result is only based on one set of cost structure and may not be generalized to other cases. As the study just intended to show the distribution of these costs among the supply chain' members classified by visible and invisible criteria, the obtained results present the optimal cost of this chain based on one set of cost structure. Perhaps the sensitivity analysis of some significant costs may be required in order to gain more insights into the variability of their amount and their impact on the company's decision making.

Figure 4: Proportion of costs classified by activities in a supply chain





5. CONCLUSIONS

This paper proposes a classification of supply chain members and their associated costs, which account for the value of supply chain costs savings. An economic cost model is also developed to include two major cost elements. One presents the visible costs, which accounts for the costs which can be quantified into monetary term. Another is invisible cost, which considers for the hidden opportunity costs. This step involves a big risk because they are hidden intangible, non-structured, and entail considerable time for recognizable results. The proposed classification of supply chain cost expands the cost concept breaking overhead costs according to their cost center and introduces the opportunity cost to estimate the neglected cost of non-value added activities. This will present a more coverage cost structure that should be used to estimate the supply chain costs more thoroughly and more accurately. Since if these hidden costs could not be justified, the benefits of joining a chain may not be realized and each member would not be willing to take risk and join the chain. The study will also extend to justify the cost and benefit analysis to join the chain under different kinds of incentive schemes.

ABSTRACT

This paper proposes a general approach to the uncertain multiple attribute decision making problems where the attribute values in decision matrix is expressed in the form of interval linguistic variables. The interval linguistic variable is the most general expression of the attribute values, while the proposed approach deals with the most general uncertain situation for multiple attribute decision making problems. In the approach, by calculating the relative distance between the interval linguistic attribute values and their corresponding negative ideal alternative, the decision matrix with interval linguistic term elements is transferred into a single-point (definite numeric) one. According to the obtained single-point decision matrix, the maximum possible intervals for the overall values of alternatives can be calculated, based on which the ranking values of them can be figured out, together with superiority possibility between them. An example is used to illustrate the proposed approach in the end.

Keywords: Uncertain multiple attribute decision making; Interval linguistic variable; Ranking; Superiority possibility

INTRODUCTION

Multiple attribute decision making (MADM) refers to making preference decisions (e.g. evaluation, prioritization, selection) over the available alternatives that are characterised by multiple, usually conflicting, attributes (Hwang and Yoon, 1981). Due to its complexity, the MADM problem can be modelled either by subjective pairwise comparison matrices (Saaty, 1980) or a decision matrix (Hwang and Yoon, 1981). The analytic hierarchy process (i.e., AHP) is proposed by Saaty (1980) to solve MADM problems. In AHP, pairwise comparison between alternatives is used to find out priority weights (of alternatives) to rank them. In fuzzy decision making situations, linguistic or interval judgements are often used to express uncertain subjective pairwise comparisons between alternatives (Haines, 1998). Two major approaches have been used to process interval judgements. The first approach is based on simulation or assumption of distribution on the interval judgements (Haines, 1998). The second approach is based on mathematical programming (Arbel, 1989).

This paper deals with the MADM problems when the decision matrix includes the attribute values of interval linguistic variable. In the uncertain situation, the information available for the decision makers is fuzzy (Yoon, 1989). Interval number is usually one of the methods for handling uncertain decision information (Yoon, 1989; Bryson and Mobolurin, 1996). In

addition, interval linguistic variable is more flexible when modelling the uncertain MADM problems.

In the course of dealing with MADM problems with uncertain linguistic variables, 2-tuple methods are employed (Herrera and Martínez, 2000a, 2000b, 2001; Delgado et al., 2002), however, it requires that the linguistic variables be the same across the different attributes. But, for many cases, different attributes present different properties. It is desirable to employ different linguistic variables (derived from different sets of linguistic terms) (Herrera et al., 2005). Therefore the current research on MADM problems with uncertain linguistic variables should be improved and be extended to the more complex situation where different sets of linguistic terms would be used to evaluate the alternative against different attributes. In order to solve this kind of problems, this paper proposed a general approach, which is composed of the following steps: Step 1. Calculate the relative distance between the interval linguistic attribute values and their corresponding negative ideal alternative, the decision matrix with interval linguistic term elements is transferred into a single-point (definite numeric) one. Step 2. According to the obtained single-point decision matrix, calculate the maximum possible intervals for the overall values of alternatives; Step 3. Calculate the superiority possibility between the alternatives; Step 4. Figured out the ranking values of the alternatives; Step 5. Rank the alternatives with superiority possibility between them.

The research in this paper is organised as follows: Section 2 describe the complex MADM problems with interval linguistic variable as the attribute values. The general approach is proposed in section 3. In section 4, an example is used to illustrate the proposed approach. Conclusions are given in section 5.

PROBLEM DESCRIPTIONS

Definition 1. Let *R* be the real number domain. A bounded interval $[x^L, x^U]$ is called interval number and expressed as $\tilde{x}$, where $x^L, x^U \in R$, and $x^L < x^U$.

On evaluating the alternatives against the attributes, it is necessary to determine the linguistic term set for different attributes. Different attributes can employ different sets of linguistic terms. A linguistic term set, *e.g.*, *TERMSET*=$\{t_0, t_1, \ldots, t_g\}$, is of the following properties: its cardinality is odd and the linguistic term set *TERMSET* satisfies the following properties (Herrera and Martinez, 2000a; Herrera and Herrera-Viedma, 2000):

(1) It is ordered. If $i \geq j$, then $t_i \geq t_j$, here symbol "$\geq$" denotes "better or equal".

(2) There is the reciprocal operator "*Neg*". If $j=g-I$, then Neg(t_i)=t_j, where g+1 is the number of the elements in the linguistic term set *TERMSET*, and the maximum term is t_g.

(3) Min and Max operators. If $t_i \geq t_j$, then Max$\{t_i, t_j\}$=t_i and Min$\{t_i, t_j\}$=t_j. For example, linguistic term set *TERMSET* is composed of seven terms, i.e., *TERMSET* ={t_0=extremely bad, t_1=very bad, t_2=bad, t_3=fair, t_4=good, t_5=very good, t_6=extremely good}.

It is noticed that a linguistic term can be expressed in triangular or trapezoidal form. If a linguistic term t_i is expressed in the triangular form, then it could be represented as ($\alpha_i, \beta_i, \gamma_i$), while its membership function is defined as:

$$\mu_i(x)=\begin{cases}0 & x<\alpha_i \\ \dfrac{x-\alpha_i}{\gamma_i-\alpha_i} & \alpha_i \le x \le \gamma_i \\ \dfrac{x-\beta_i}{\gamma_i-\beta_i} & \gamma_i \le x \le \beta_i \\ 0 & x \ge \beta_i \end{cases} \quad (1)$$

If a linguistic term t_j is expressed in the trapezoidal form, then it could be represented as ($\alpha_j, \gamma_j, \delta_j, \beta_j$), while its membership function is defined as:

$$\mu_j(x)=\begin{cases}0 & x<\alpha_j \\ \dfrac{x-\alpha_j}{\gamma_j-\alpha_j} & \alpha_j \le x \le \gamma_j \\ 1 & \gamma_j \le x \le \delta_j \\ \dfrac{x-\beta_j}{\delta_j-\beta_j} & \delta_j \le x \le \beta_j \\ 0 & x > \beta_j \end{cases} \quad (2)$$

Definition 2. $term=[t_l, t_u]$ is called a uncertain interval linguistic variable, if t_l and t_u are both linguistic terms, and t_l and t_u are called the lower and upper limits respectively.

The following notations are used to represent the uncertain MADM problems when the attribute values are given in the form of interval numbers with linguistic variables.

• $S=\{S_1, S_2, \cdots, S_m\}$: a discrete set of m ($m \ge 2$) possible alternatives.

• $C=\{C_1, C_2, \cdots, C_n\}$: a set of n ($n \ge 2$) attributes. The attributes are assumed additively independent.

• $\overline{A}=[\overline{a}_{ij}]_{m\times n}$: the decision matrix in the form of interval linguistic variables, where, $\overline{a}_{ij}=[a_{ij}^L, a_{ij}^U]$ denotes the attribute values of alternative S_i with respect to attribute C_j, which is expressed in the form of intervals with linguistic variables, $i=1,\cdots,m$, $j=1,\cdots,n$. $\overline{a}_{ij}$ is the interval linguistic variable as stated in Definition 2, with a_{ij}^L and a_{ij}^U are linguistic terms.

•The weights of attributes are given in the form of interval, $w_j \in [w_j^L, w_j^U]$, where w_j^L and w_j^U are limit ends of the weight of attribute C_j , $j=1,\cdots,n$.

THE PROPOSED APPROACH

Normalize the decision matrix

Definition 3. Given two interval numbers $\widetilde{q}_i$ and $\widetilde{q}_j$ as stated in Definition 1, the distance between them is defined as:

$$d(\widetilde{q}_i, \widetilde{q}_j) = \frac{\sqrt{2}}{2}\sqrt{(q_i^L - q_j^L)^2 + (q_i^U - q_j^U)^2} \tag{3}$$

Obviously, $d(\widetilde{q}_i, \widetilde{q}_j) \geq 0$ holds.

Definition 4. Given two triangular linguistic terms $t_i = (\alpha_i, \beta_i, \gamma_i)$ and $t_j = (\alpha_j, \beta_j, \gamma_j)$, as defined in (1), the distance between them is defined as:

$$dis(t_i, t_j) = \sqrt{\frac{1}{3}[(\alpha_i - \alpha_j)^2 + (\gamma_i - \gamma_j)^2 + (\beta_i - \beta_j)^2]} \tag{4}$$

Definition 5. Given two trapezoidal linguistic terms $t_i = (\alpha_i, \gamma_i, \delta_i, \beta_i)$ and $t_j = (\alpha_j, \gamma_j, \delta_j, \beta_j)$, as defined in (2), the distance between them is defined as:

$$dis(t_i, t_j) = \sqrt{\frac{1}{4}[(\alpha_i - \alpha_j)^2 + (\gamma_i - \gamma_j)^2 + (\delta_i - \delta_j)^2 + (\beta_i - \beta_j)^2]} \tag{5}$$

Definition 6. The distance between two interval linguistic terms $Term^1 = [t_l^1, t_u^1]$ and $Term^2 = [t_l^2, t_u^2]$, as stated in Definition 2, is defined as:

$$d(Term^1, Term^2) = \frac{\sqrt{2}}{2}\sqrt{dis(t_l^1, t_l^2)^2 + dis(t_u^1, t_u^2)^2} \tag{6}$$

where $dis(t_l^1, t_l^2)$ and $dis(t_u^1, t_u^2)$ are defined in (4) (or (5)) respectively.

Definition 7. With respect to attribute C_j, the positive ideal attribute value is defined as:

$$ideal_j^+ = [ideal_j^{+L}, ideal_j^{+U}] \tag{7}$$

where,

$$ideal_j^{+L} = \max_{1 \leq i \leq m}\{a_{ij}^L\},\ j = 1,2,..., n. \tag{8a}$$

$$ideal_j^{+U} = \max_{1 \leq i \leq m}\{a_{ij}^U\},\ j = 1,2,..., n. \tag{8b}$$

Definition 8. With respect to attribute C_j, the negative ideal alternative (point) is defined as:

$$ideal_j^- = [ideal_j^{-L}, ideal_j^{-U}] \tag{9}$$

where,

$$ideal_j^{-L} = \min_{1\le i\le m}\{a_{ij}^L\},\ j = 1,2,...,n. \tag{10a}$$

$$ideal_j^{-U} = \min_{1\le i\le m}\{a_{ij}^U\},\ j = 1,2,...,n. \tag{10b}$$

Definition 9. With respect to attribute C_j, the relative distance between attribute value $\bar{a}_{ij} = [a_{ij}^L, a_{ij}^U]$ and the negative ideal attribute value $ideal_j^-$ is defined as:

$$b_{ij} = \frac{d(\bar{a}_{ij}, ideal_j^-)}{d(\bar{a}_{ij}, ideal_j^+) + d(\bar{a}_{ij}, ideal_j^-)}, \qquad i=1,\ldots,m,\ j=1,\ldots,n, \tag{11}$$

where $d(\bar{a}_{ij}, ideal_j^+)$ and $d(\bar{a}_{ij}, ideal_j^-)$ defined in (6).

By means of calculating the relative distance between the attribute value $\bar{a}_{ij}$ and the negative ideal alternative (point) $ideal_j^-$, the interval linguistic terms $\bar{a}_{ij}$ is transferred into a single-point (definite numeric) value. Thus, the decision matrix $\bar{A} = (\bar{a}_{ij})_{m\times n}$ with interval linguistic terms as its attribute values is transferred into a single-point one $B=(b_{ij})_{m\times n}$.

Calculate the maximum possible intervals for the overall values of alternatives

Based on the obtained single-point decision matrix $B=(b_{ij})_{m\times n}$ in (11), the maximum possible intervals for the overall value of alternative S_i, i.e., $O_i = [O_i^l, O_i^u]$, can be obtained:

$$O_i^l = \sum_{j=1}^{n} b_{ij} w_j^l, \quad i=1,\ldots, m. \tag{12a}$$

$$O_i^u = \sum_{j=1}^{n} b_{ij} w_j^u, \quad i=1,\ldots, m. \tag{12b}$$

where $w_j = [w_j^l, w_j^u]$ is the weights of attribute C_j, which is expressed in the form of interval, $j=1,\ldots, n$.

Calculate the superiority possibility between the alternatives

Suppose $O_i = [O_i^l, O_i^u]$ and $O_j = [O_j^l, O_j^u]$ are the maximum possible intervals for the overall value of alternative S_i and S_j, respectively, then the superiority possibility between the alternatives S_i and S_j is calculated as:

$$p(S_i \succ S_j) = \frac{\max(0, len(S_i) + len(S_j) - \max(O_j^u - O_i^l, 0))}{len(S_i) + len(S_j)} \quad (13)$$

where $len(S_i)$ and $len(S_j)$ are the length of the intervals $O_i = [O_i^l, O_i^u]$ and $O_j = [O_j^l, O_j^u]$ for the overall value of alternative S_i and S_j, respectively. Therefore, the superiority possibility matrix $P = (p_{ij})_{m \times m}$ between the alternatives can be set up, where its elements are defined in (13).

Calculate the ranking values of the alternatives

Based on the superiority possibility matrix $P = (p_{ij})_{m \times m}$ between the alternatives, the ranking value of alternative S_i can be calculated as:

$$\omega_i = \frac{1}{m(m-1)} (\sum_{j=1}^{m} p_{ij} + \frac{m}{2} - 1) \quad (14)$$

where p_{ij} is the element in the superiority possibility matrix $P = (p_{ij})_{m \times m}$ which is defined in (13), i, j=1,□, m.

Rank the alternatives with superiority possibility

The alternatives can be ranked according to the values of ω_i, i=1,□, m, together with the superiority possibility between them.

APPLICATION ILLUSTRATION

The example in (Herrera and Herrera-Viedma, 2000) is used for illustration. A venture investment company consider evaluating five projects (i.e., the alternatives S_i, i=1,2,…, 5) against four attributes. The alternatives are as follows: S_1 is a car company, S_2 is a food company, S_3 is a computer company, S_4 is an arms company, while S_5 is a TV company. Four attributes are employed to select the best alternative(s), the details are as follows: C_1 is the risk analysis, C_2 is the growth analysis, C_3 is the social-political impact analysis, C_4 is the environmental impact analysis. The linguistic term set which is used for evaluating the alternatives against the attributes is $TERM = \{t_1 = extremely\ poor, t_2 = very\ poor, t_3 = poor, t_4 = medium, t_5 = good, t_6 = very\ good, t_7 = extremely\ good\}$. The corresponding membership functions for the terms are as follows: t_1=(0, 0, 0.17), t_2=(0, 0.17, 0.33), t_3=(0.17, 0.33, 0.5), t_4=(0.33, 0.5, 0.67), t_5=(0.5, 0.67, 0.83), t_6=(0.67, 0.83, 1), t_7=(0.83, 1, 1).
Without loss of generality, the attributes are assumed all for the benefit, and the details in the decision matrix is:

$$\overline{A}=\begin{pmatrix}[t_2,t_3] & [t_3,t_4] & [t_1,t_2] & [t_1,t_2]\\ [t_1,t_2] & [t_4,t_5] & [t_3,t_4] & [t_2,t_3]\\ [t_2,t_4] & [t_1,t_3] & [t_4,t_5] & [t_3,t_7]\\ [t_2,t_3] & [t_1,t_2] & [t_2,t_3] & [t_2,t_3]\\ [t_3,t_4] & [t_4,t_6] & [t_1,t_4] & [t_3,t_4]\end{pmatrix}.$$

According to (3)-(11), the original decision matrix is transformed into a definite one as follows:

$$B=\begin{pmatrix}0.4771 & 0.5412 & 0 & 0\\ 0 & 0.7984 & 0.6510 & 0.2518\\ 0.6780 & 0.1986 & 1 & 1\\ 0.4771 & 0 & 0.3126 & 0.2518\\ 1 & 1 & 0.4096 & 0.4939\end{pmatrix}.$$

Furthermore, weights of attributes are given as follows: w_1=[0.1, 0.3], w_2=[0.2, 0.4], w_3=[0.3, 0.5], w_4=[0.2, *0.*3]. According to (12a) and (12b), the maximum possible intervals for the overall value of alternatives can be obtained as: O_1 =[0.1560, 0.3596], O_2 =[0.4053, 0.7204], O_3 =[0.6075, 1.0828], O_4 =[0.1919, 0.3750], O_5 =[0.5217, 1.0530], respectively. According to (13), the superiority possibility matrix $P=(p_{ij})_{m\times m}$ between the alternatives is obtained as:

$$P=\begin{pmatrix}0.5 & 0 & 0 & 0.4337 & 1\\ 1 & 0.5 & 0.1428 & 1 & 0.2348\\ 1 & 0.8572 & 0.5 & 1 & 0.5574\\ 0.5663 & 0 & 0 & 0.5 & 0\\ 1 & 0.7652 & 0.4436 & 1 & 0.5\end{pmatrix}.$$

Therefore, based on (14), the ranking value of alternative can be calculated as: ω_1 =0.1217, ω_2 =0.2189, ω_3 =0.2707, ω_4 =0.1283, ω_5 =0.2604. Thus, the alternative ranking together with the superiority possibilities between them is obtained as: $S_3 \underset{0.5574}{\succ} S_5 \underset{0.7552}{\succ} S_2 \underset{1}{\succ} S_4 \underset{0.5663}{\succ} S_1$.

CONCLUSIONS

With respect to the uncertain multiple attribute decision making problem with interval linguistic variables as the attribute values in the decision matrix, this paper develops a general approach, which is composed of the following four steps: (1). Normalize the decision matrix with interval linguistic variables by calculating the relative distance between the interval linguistic attribute values and their corresponding negative ideal alternative; (2). Based on the

single-point decision matrix obtained in step (1), calculate the maximum possible intervals for the overall values of alternatives; (3). Calculate the superiority possibility between the alternatives; (4). According to the results in (3), calculate the ranking values of the alternatives; (5). Obtain the alternative rankings with superiority possibility between them.
The proposed approach allows different linguistic term sets to be used to evaluate the alternatives against different attributes and is simpler than that in (Herrera, et al., 2005). The proposed approach is innovative and can be readily implemented into a computer-based information system. Thus, the new approach is of extensive applications. Furthermore, the future research will focus on the more complex situation where multiple decision makers take part in the decision process by using different linguistic term sets.

ABSTRACT

This research study represents one of the first attempts to measure the environmental impact of the cultural events (theatrical and festival) in order to evaluate the risks for formulating better policy. It is important to underline that this sector, which is not considered responsible in having a direct influence on the environment, has on the contrary a substantial ecological impact as other sectors, like services and commodity's manufacturing. In this paper the impact both of theatrical and festivals events in Apulia region, through the tool of the I-O (input/output) Ecological Footprint Analysis (EFA), has been carried out.

Keywords: theatrical sector, physical indicators, sustainability, environmental management system.

BACKGROUND

The creative and cultural industry impacts on the national economy as well as industries like tourism, film production and so on. Normally this industry is broken down in 7 sub-sectors: theatre, lyrics, musical, ballet, puppets, circus and others (mainly festivals).
According to EU figures, the creative and cultural sector contributes to 2.6% of European GDP and employs roughly 5.8 million employees. In Italy the cultural sector is worth 2.6% of Italian GDP, with around 40 billion euros. Furthermore it employs 550,000 workers. More difficult to measure but equally important, are the implications for other economic sectors and for the local development.

Nevertheless the financial crisis during the 2008-2009, in Italy, the cultural sector, (in this case all the 7 sub-sectors) has generated a turnover of 481.7 million of Euros of which only the sub-sector of the theatre accounts for 241.8 million of Euros (see table 1).

Table 1. Trend of theatrical industry in Italy during the 2008-2009.

Theatrical Industry (sub-categories)	Number of spectacles	Audience	Turnover (million of Euros)
Theatre	81 000	420 000	241.8
Lyrics	3 000	6 000	98.5
Musical	2 580	9 600	41.7
Ballet	6 350	146 000	32
Puppets	2 800	35 000	1.2
Circus	17 700	83 000	10.5
Others (mainly festivals)	39 000	2 100 000	56
Total	152 430	2 799 600	481.7

Source: [8].

These figures represent significant performance indicators if compared with the Sport and the Cinema, which, for the same period, have generated 190.6 and 354.4 million of Euros respectively. Always in Italy, in 2009, over 52,000 performances in theatres and roughly 17,000 festivals have been realized.

On regional level in Apulia, which is located at the South part of Italy, the cultural industry has reached roughly 9.5 million of Euros of which 6.5 million from theatrical activities, as showed in table 2.

In Apulia there are 80 theatres and 40 companies of players and actors with over 3,000 performances realized in one year. For the development of the theatrical sector in the Region, it was established as implementing body a network, one of the largest in Italy, formed by more than 56 partners including municipalities, provinces and the Apulia Region, named TPP (Theatre Public of Apulia). The TPP, in other words, is a Consortium for the promotion both of theatrical events and for the valorisation of the Regional cultural Institutions. TPP is responsible for the realization of cultural events and for the creation of Apulia festivals (folkloristic and internationals) with the aim to promote and to preserve the cultural heritage of the Region.

Table 2. Trend of theatrical industry in Apulia Region during the 2008-2009.

Theatrical Industry (sub-categories)	Number of spectacles	Audience	Turnover (million of Euros)
Theatre	3301	6170	6.5
Lyrics	78	N. A	0.5
Musical	72	N. A	0.6
Ballet	196	3 300	0.8
Puppets	202	150	0.8
Circus	1835	N. A	0.4
Others (mainly festivals)	181	5 159	0.5
Total	5 865	14 779	9.5

Source: [8].

In the last theatrical season 2007/08 the Public Theatre of Apulia has realized 182 shows, for a total of 819 replicas with roughly 209 thousands tickets sold.

The creative abilities express for the production of entertainments, festivals, conferences or concerts to international large-scale as well as theatrical and cultural events, contribute positively to keep and to preserve the worldwide-recognized brand “cradle of Culture”. Associated to this important aspect there is, as well, the ecological impacts on the environment such as resources consumption, wastes production, and not formalized attention in civil planning efforts.

Culture events, nowadays, are playing a crucial role in attracting visitors since that the culture gives to the consumer a reason to visit a particular location. In this scope, besides a long organizational tradition exists, new factors of management are being considered in order to pursue higher efficiency targets. Because of their nature, cultural events impact negatively on the environment. A gathering of thousands of people at a festival or a concert, and a simple performance of a play in theatre as well, naturally amplifies wastes generation as glass and plastic bottles, used paper plates, packaging, unwanted food and drink, waste water, cartons, plastic bags etc. These events can also negatively impact on the environment in other ways, increasing for example the traffic and the related carbon dioxide emissions. For instance, in a recent report published in 2008, the total emission from London theatres was calculated. It emerges that the carbon emissions account for roughly 50,000 tonnes a year- the equivalent of emissions from 9,000 households. This figure doesn’t include the travel audience estimated at approximately 35,000 tonnes of CO_2 per year. Furthermore, it has been estimated that if all theatres plan to switch on the lights half an hour before the performance, it should be possible to save more than € 110 million of Euros per year in energy costs and to reduce pollutants emissions [3].

From these data a question stand out: What entertainment industries should be doing to promote and achieve both sustainable theatre and environmental friendly cultural events performance?

Considering the great variety of events, there are innovative criteria and indicators that need to be implemented in the organization of cultural events in order to comply with sustainable development concept. This means that cultural event management requires new competencies and radical innovation aims at delivering tools for the professional sector of the arts production.

OBJECTIVE

The aim of this paper is both to propose suitable environmental indicators for managing cultural events in Apulia region and to calculate their environmental impacts, through the tool of the I-O (input/output) Ecological Footprint Analysis (EFA). The EFA in this paper is used in order to identify criticalities and to provide guidelines for ensuring environmental standards in theatre building and manufacturing. Important challenge for this paper is to compare the green policy, which concerns Apulia cultural events with the existing worldwide sustainable cultural management.

METHODOLOGY

As above cited, in order to plan a sustainable policy in the management of the cultural events innovative criteria and indicators were necessary to identify.

For this reason the choice of the Ecological Footprint Analysis (EFA) was done.

Nowadays several approaches are available to businesses in order to measure the environmental impact of their products or services. Methods reviewed are Life Cycle Analysis (LCA), Energy and Material Flow Analyses (EMFA) or Mass Balance Analysis (MBA) and Material Intensity per Unit Service (MIPS).

Ecological Footprint Analysis (EFA) is a system of accounting and expressing environmental impact, which draws on all these approaches.

The traditional definition of Ecological Footprint is "the area of productive land and water ecosystems required to produce the resources that the population consumes and assimilate the wastes that the population produces, wherever on Earth the land and water is located". Mathis Wackernagel and William Rees at the University of British Columbia coined this definition, in the 1990, and nowadays the Ecological Footprint tool is widely used by scientists, businesses, governments, agencies, and institutions working for monitoring sustainable development. During the years, different researchers and centres of research have implemented this methodology creating a database for integrating bio-productivity analysis with the embodied energy analysis in order to measure ecological value of commodities and services. In the 2003 *Global Footprint Network* was created with the aim to improve methodologies in the EFA. For measuring the Ecological Footprint a spreadsheet for the calculation was created (National Footprint Accounts) which provides all the primary conversion factors describing the area (ha) demand of economical activities. The Ecological Footprint conversion factor depends on each component involved in the human activities which are available for licence from *Global Footprint Network*. We underline that detailed factors are needed, because different inputs are necessary to manufacture products and these

may be calculated especially using the conversion factors for primary resources as provided by the National Footprint Accounts. One of the most important recent innovations in the field of EFA has been the use of physical input –output (I-O) analysis. With this new application it is possible to link macro-sectors decoupling it with micro-activities. The physical input–output (I-O) analysis become useful when there is a need to identify reporting tasks and routines. In this way it becomes possible to establish structured work procedure in green management of services, as well. The main constraint, for realising an I-O EFA in the specific sector of theatre industry, is the availability of detailed information about the material basis of the system. It is important, to develop a materials flow network by connecting all the phases of the system. For accomplished to this, the festival and theatrical sectors are schematized as an industry composed by different phases, measuring for each phase resource flows in units of weight [1, 2, 5, 9, 11].

The main constraint in assessing the EF required to carry out this type of analysis has been the availability and quality of data, which requires improving, cataloguing and quantifying the resources flows.

It is important to underline that this methodology has been used with significant results in the different services, mainly in the tourist sector, allowing to design construction effective measures for environmental policies and encouraging practices in reducing the use of materials that have a detrimental effect on environment.

In this research paper we focus on (I-O) EFA analysis. The choice of this methodology, rather than others, is due mainly to one important reason; with (I-O) EFA the advantage is to have a single number, an index coefficient (expressed as t/ha), with whom it is possible to make comparison with other Footprint studies. This study represents one of the first attempts to apply the I-O EFA at the sector of the cultural events.

DATA COLLECTION

In the first phase of the research studies, environmental data have been obtained through two different questionnaires surveys mailed to: a) the theatres in Apulia region, b) the Consortium TPP and c) the theatrical companies. Furthermore technical sheets of the spectacles have been scrutinized. In the technical sheets different information is contained about the general outline of spectacles, the equipment, the light design, the stage space. The questionnaires survey has been used to determine which information needs to be handled in order to prioritize and control the cultural events.

The requested topics are linked with the possible planning of waste minimization, recycling, sustainable transport modes etc. during the organization and the performance of the cultural events. The questionnaire survey has been implemented with interviews and personal discussion with artistic managers of Apulia theatres and festivals in the region.
In the second phase data acquired have been analyzed for calculating the Ecological Footprint related to the culture events (festivals and theatres).

CASE STUDY

The main aim of this paper is to propose suitable environmental indicators for managing cultural events in Apulia region, in order to encourage the audience to recognize the green cultural events in Apulia region. As mentioned, the ecological footprint is an accounting model of resource consumption and waste production, and is based on reliable data sources available at the relevant scale. For this reason an inventory of inputs and outputs has been constructed in order to make a qualitative and quantitative evaluation of those inputs and outputs, and to identify the most significant aspects of the system relative to the objectives of the study.

The issues have been differentiated according to both theatre and festivals.

Calculation of EF for Theatres

For theatres the main issues have been the following:

- ✓ Pre-production considerations;
- ✓ Materials selection and disposal/ recycling;
- ✓ Working with suppliers and partners;
- ✓ Lighting during the spectacle;
- ✓ Power Factor;
- ✓ Staff travelling;
- ✓ Modalities of travelling of participants;

Overall, data availability has exceeded initial expectations. However, it has been varied from component to component.

Data covered the period 2007-2008 and have been obtained thanks to analysing questionnaires sent to managers, scrutinizing the different technical sheets of theatrical companies and to the support of TTP. After, it has been constructed a matrix necessary for allocating all the data and for calculating the EF. The Theatres event have been divided on four phases: a) preparation, b) event, c) transport, d) food/drink (see table 3).

Ecological footprint has been measured by disaggregating the different materials and products, driven by data availability and the necessity to discount double counting between material and product consumption data.

The main constraint in this calculation has been the *lack of homogeneity* of the theatrical performances.

Each performance is different from the other, as well as, each theatre has its own characteristics not comparable between them. These aspects made difficult to have an average figure, which could characterize the EF. Furthermore, managers don't have high familiarity with the most of the data (such as energy and material consumptions, recycling and so on) because they consider unnecessary the benchmarking process from this point of view. For this reason we can only report the range between the "maximum" figure and the "minimum" figure of EF.

The EF ranges between 0.30 gha (global hectares) and 1.5 gha. The main reasons for the EF variability are the energy consumption and the objective differences between spectacles.

Calculation of EF for festivals

For Festivals the main issues to check have been the following:

- ✓ Pre-production considerations;
- ✓ Materials selection and disposal/ recycling;
- ✓ Lighting during the event;
- ✓ Modalities of travelling of participants;
- ✓

Data covered the period 2007-2008 and have been obtained mainly with the support of TPP and some managers of events. Furthermore, the different technical sheets of festivals organized in Apulia have been analysed, mainly during the summer season, in order to have average figure for each component necessary for measuring the EF. It was decided, as well, to split the festival in two categories: a) big festivals (15 days); b) small festivals (5 days). The Festival event has been disaggregated in 4 phases a) preparation, b) event, c) transport, d) food/drink and then it has been prepared a matrix as showed in table 4.

Table 4: Matrix for measuring the EF of Festivals.

Transport				
	bus	//		
	car	//		
	bicycle	NA		
	foot	NA		

The calculation of the EF for festivals has been possible thanks to the similar characteristics of the planning and typology of festivals.
For the big festivals the EF is equal to 4.3 gha per day.
For the small festivals the EF is equal to 1.4 gha per day.

Benchmarking these figures with data coming from other research studies, we can found that the EF for a 2-week holiday to Majorca and Cyprus is 0.37 gha and 0.93 gha per person, respectively [4, 6, 7, 10].

It is interesting to note that with this approach emissions are not quantified in physical terms, but it possible to identify the interventions which are necessary (such as optimizing energy consumption, virtuous behaviour, etc..) highlighting its potential benefits.

CONCLUSION

This research study represents one of the first attempts to measure the environmental impact of the cultural events (theatrical and festival) in order to evaluate risks and formulate better policy. It is important to underline that this sector, which is not considered responsible to in impacts directly on the environment, has on the contrary a substantial ecological footprint as other sectors, like services and commodity's manufacturing. The environmental issue is remarkable and we note the massive attempts of the International Community to improve decision-making process. In the last years, the new standard ISO 16001 (International Standard Organization) was passed in order to promote a better environmental management. The ISO 16001 Standard has the aim to stress the organization on the necessity to develop an energy management system. This should cause a decreasing of costs and of environmental issues as well as the implementation of a regular information system for benchmarking activities (to develop environmental policy, to establish objectives, etc). As emerges from this analysis, it is necessary to boost the management of companies in this direction because, mainly in service sector, the benchmarking process is considered not helpful

ABSTRACT

Due to the development and popularization of mobile devices and wireless telecommunication, everyone can save and retrieve the needed information and services anytime, anywhere with any device. However, the challenge is that the requirements from users are varied and uncertain. Context-Awareness is one of the solutions. It could capture the contextual information of users through many sensors, like GPS, RFID, Camera, Monitor, etc., and could understand the context thereafter, then provides appropriate services for users. This study is aimed at finding a well-defined context model that can demonstrate the correlation between human beings and the environment. This study employs ontology to describe the context and the context-aware engine takes into account the changes in context. As well, this study adopts case-based reasoning for the reasoning method. There are two advantages by adopting case-based reasoning, one is that it supports the reasoning of mobile contexts and the other one is that it can adjust itself and improve its precision after a number of uses. Comparing with the location-based context-aware system, the reasoning method employed by this study is better than that of the location-based context-aware system.

Keywords: Ontology, Context-Awareness, Case-based Reasoning

INTRODUCTION

As the development of wireless communication, mobile devices, and other relevant technologies, these services have become very popular nowadays. The concept of context-awareness therefore emerges. An intelligent context-aware system will detect users' context information, such as the location, the temperature, the time and any other physical information, by using sensors like GPS, cameras, video cameras, RFIDs or electronic thermometer, etc., and furnish users with required products or services based on the context. A most simple context-aware system can utilize the GPS module from mobile devices to locate the current position of a user and supply information related to the location. Other similar applications such as the mobile guide system that users can interact with the environment via such device which also supports navigation and search services, and

intelligent rooms and offices are all designed to reduce the burden of users. These services are provided to promote a tight connection between users and the environment.

There are two directions of the current development of context-awareness. On the one hand is the research and development of sensors for finer and more accurate detection in its subjects. On the other hand is to integrate existing sensors with context information to provide services. For instance, the Aura program of Carnegie Mellon University, (CMU), and the Oxygen program of MIT are both accomplishing the users' demand by detecting their context through mobile devices and sensors. Remarkable and progressive developments have been found in numerous researches regarding context-awareness. The current development of context-awareness focuses on "integrating existing sensors to do value-added services". How are the services value-added? This means context-awareness must be able to provide personalized services, and this is a crucial task. To do so, context-awareness could infer the personal service demand from the context information detected by sensors. The contexts that the system is required to know are depicted in Figure 1.

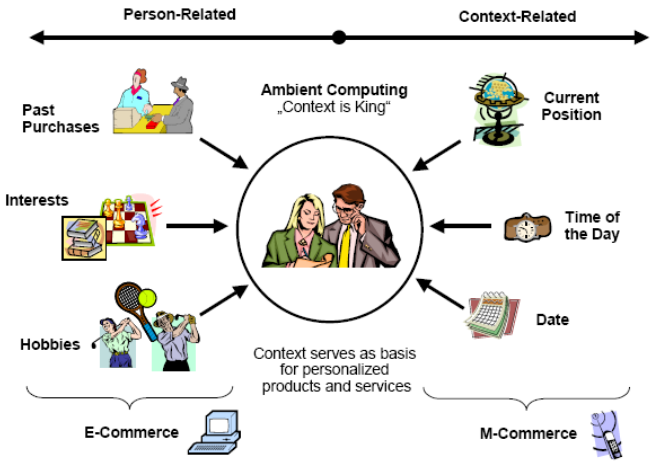

Figure 1. Personalized contexts in context-awareness environment (Koch, 2002)

Koch (2002) divided the information required for personalised context-aware environment into two: (1) those relevant to the users and (2) those relevant to the context. The information includes user's name, location, statistics and purchase history, or some dynamic information such as position, time, date, etc. All of them could assist personalization and called context factors in this research that could be combined to create different contexts.

A personalised context-aware service system must be able to display context models well and precisely. In service providing aspect, it needs an appropriate reasoning mechanism to support it. Therefore, this research wishes to achieve the following three targets:

(1) The context model would be built upon ontology and through which the interaction between human beings and the environment would be demonstrated adequately. Furthermore, the adoption of ontology could achieve the benefits of knowledge sharing and reusing. Other context-aware applications could benefit from this ontology.

(2) The use of Ontology Web Language Description Logic (OWL DL) to describe context ontology affords abundant of descriptive grammar, and in comparison to other ontology

descriptive languages, OWL DL supports interpretation of attribute constraints. In one word, the use of OWL DL could fully demonstrate the correlation between contexts.

(3) Considering the human contexts are circumstance and location related, the reasoning mechanism of context-awareness needs to be accurate, flexible and adaptable. Through its learning ability, it should be able to adapt the results according to the change of users. The research takes into account rule-based and case-based reasoning mechanism. In the context-aware system, the context is half/non-construction issue; besides, the case-based reasoning possesses learning ability, therefore the results of the reasoning mechanism would be adapted to best as it is used many times by users. Consequently, adopting case-based reasoning as the context-aware reasoning mechanism would be more appropriate.

LITERATURE REVIEW

Context-Awareness

The idea of context-awareness was first proposed by Schilit and Theimer (1994), who mentioned that due to the rising of distributed mobile computing, users were able to interact with other mobile devices or computers using their own mobile devices. Computing is no longer restricted to a specific location or a particular environment, it can extend to offices, conference rooms, houses, airports, bus stops, and on airplanes, etc. Besides, the mobility of mobile devices makes location information indispensable, because based on such information users can search for nearby devices as well as services. This is where the new challenge, context-awareness, comes in. The definition of context-awareness according to Dey (2001) is: “A system is context-aware if it uses context to provide relevant information and/or services to the users, where relevancy depends on the users’ tasks”. A context-aware system should be able to support the following 3 points: (1) providing information and/or services to a user, (2) automatic execution of a service for a user, and (3) tagging context to the original information which can be used for advanced search.

What does the “context” in context-awareness actually mean? The definition of context varied among many scholars. The one adopted by this research is that of Dey (2001), who combined the definition offered by past researches and came up with the following: “Any information that can be used to characterize the situation of an entity. An entity is a person, a place, or an object that is considered relevant to the interaction between a user and an application, including the user and applications themselves”.

Understanding the situation aids the design of a context-aware application. Terry (2001) mentioned that an effective context had to be sharable and managed by a context-aware system. In other words, the system must be able to understand the contexts before they are even being used. Schilit et al. (1994) thought context information could be divided into 3 categories:

(1) Computing context: this describes surrounding computable devices such as Internet connection, broadband Internet, communication costs and nearby resources including printers, monitors or workstations, etc.

(2) User context: this describes user’s preferences, location, surrounding company, current social circumstances, or present posture and behaviour of the user.

(3) Physical environment context: for example, lights could present information regarding the environment, such as lamplight, the amount of noise, traffic, and temperature, etc.

To fully represent the contexts, Chen and Kotz (2000) had included time context as the fourth one that contained information such as date, week, month, seasons, etc. The definitions of contexts as offered by individual scholars only intended to discover a contextual model that is more comprehensive. Such a model would describe all sorts of contexts, thus benefiting the reasoning of machines as well as its service provision

Ontology

Ontology was derived from philosophy, and according to Bunge (1977), "ontology is a philosophical discipline aimed at studying the nature of the real world". This viewpoint was later introduced to computer science to promote interoperability, information search and retrieval, natural language, artificial intelligence, and communication among agents, which went on to show its wide applicability. According to W3C, "ontology describes the knowledge of each domain". To put it simply, ontology could be used as the framework for domain knowledge and to analyze the relationship between individual ideas. Furthermore, Studer et al. (1998) adopted the definition from Gruber (1993) and Borst (1997) and stated, "an ontology is a formal, explicit specification of a shared conceptualization", which illustrates the four-layered meanings of ontology:

(1) Concept: ontology derives its concept from the real world.
(2) Explicitness: the application of the concept, which must be defined clearly with its constraints state. For instance, in the medical field, illnesses and symptoms are two varying concepts, their relationship is causal and the constraint of an illness is that it does not cause itself.
(3) Specification: ontology could be deciphered by computers.
(4) Sharing: the knowledge of ontology is collectively approved by a group, but not by an individual.

Chen et al. (2003) believed that ontology is an essential pre-requisite in the development of context-awareness, and they introduced the three reasons below:

(1) Ontology of a concept could achieve knowledge sharing in an open and dynamically distributed system.
(2) A well-defined ontology could provide semantics to facilitate the communication among agents so as to intelligently reason context.
(3) An explicit ontology allows interconnection and interoperation between devices and agents without the two having to operate together, thus accomplishing the ability of meaningful communication.

OWL is an abbreviation of Web Ontology Language and a descriptive language for ontology. It is developed by the Web Ontology Working Group from W3C, and is the most comprehensive descriptive language of ontology. It is designed for certain applications that handle the content of information rather than simply presenting the information. In brief, rather than human-readable, it is hoped that machine-readable can be achieved by using OWL. OWL consists of 3 sub-languages:

(1) OWL Lite: in comparison with OWL DL, OWL Lite is less complicated and supports users who only need a single category hierarchy and basic constraints.

(2) OWL DL: its name is derived from Description Logic (DL). This language supports users who require a large number of descriptions. It also ensures the completeness and decidability during computing, which means the conclusion must guarantee computability and the computing must be completed within the limited time, respectively. OWL DL comprises all the constraints of OWL.
(3) OWL Full: supports users who require a large number of descriptions, besides, RDF does not require computing guarantee, and OWL allows users to add pre-defined (RDF and OWL) words, therefore not one single reasoning software is able to fully support the reasoning features of OWL Full.

Case-based reasoning (CBR)

From a cognitive psychology perspective, human brains are like computers with a large memory. The moment human beings come across anything or an emergency, they search inside their brains for similar problems previously encountered. Those problems encountered before turn into experiences that would be used to solve the issue at hand, and once it has been solved, it would be stored in the brain as a part of the existing experiences.
Case-based reasoning (CBR) is identical in its problem-solving ability. It utilizes past cases, circumstances and solutions to solve the problems. Its feature lies in that it takes account of every past experience and case to deal with any unexpected situation. Due to each new experience the system becomes a step closer to the learning behaviour of human beings, which ensures later problem-solving accuracy.

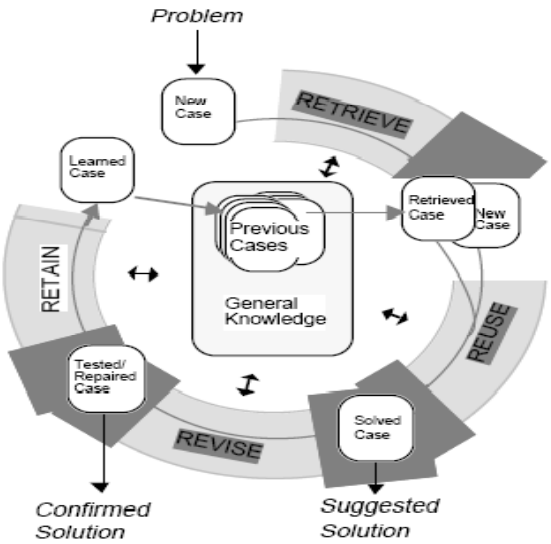

Figure 2. CBR cycle diagram (Aamodt and Plaza, 1994)

As shown in Figure 2, the steps involved in CBR consist of:
(1) Case retrieval: as soon as a case arises, the system will go into the case knowledge base and based on the similarity in computed result retrieve a similar case. The system will then provide the user with a solution based on the case description and result.
(2) Case reuse: when a new case which is not in the knowledge base arises, the expert system assesses whether it should be added to the case knowledge base.
(3) Case revision: although certain cases are not stored in the case knowledge base, due to its distinctness they will be revised.

(4) Case renewal: once the cases are tested or repaired by the expert system, they will be stored in the case knowledge base.

RESEARCH METHODOLOGY

This research is focused on context-aware service reasoning based on ontology. When users use mobile devices (mobile phone, PDA, notebook, etc.), the devices would furnish the system with context information, or the system could detect such information through sensors (such as GPS, RFID and monitor). Basing on the context, the system would work out the current or future information or service demanded from users.

Network Structure

The foundation of the system in this research is based on pervasive computing, so the mobile devices of users' (PDA, mobile phone, notebook…) could communicate with context-aware system via wireless network or Bluetooth. Another fundamental structure is built upon receiver module sensors such as GPS, RFID, thermometer, camera, monitor, etc as shown in Figure 3.

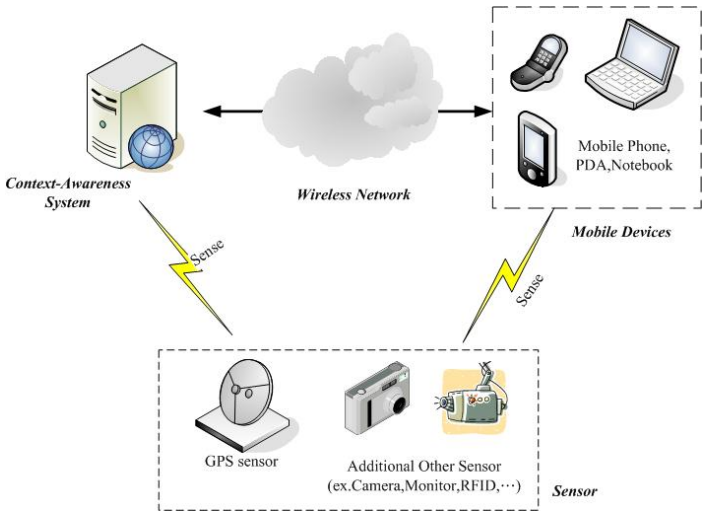

Figure 3. Network structure of context-aware system

The sensors could detect the context information of both users' and of the environment. For instance, the positioning function of GPS provides system users with information on current location, and based on such information the thermometer would connect to local weather report, or if the users are indoor, the temperature information would be obtained by connecting to an electronic thermometer in that room. Another example like RFID reader would detail resources closest to the users.

System Structure

Figure 4 illustrates the system structure of this research. The dotted squares represent modules and the arrows indicate information flow. This research is divided primarily into two parts: one is the context reasoning modules, and another is the case knowledge base of ontology and cases. Should the needs arise in the future for real connection to sensors, the

information providing modules sponsored by companies can be used to connect to the retrieving module of context information. The procedure of the system is as follows: (1) the Context Acquirement Engine receives context information detected by sensors as well as those provided by users, and subsequently forwards them to the Context Reasoning Engine; (2) the Context Reasoning Engine compares the context with existing cases stored in the case knowledge base, and search for similar or totally matching cases through similarity computing. Then find out the possible services required by users based on their corresponding service results. The Context Reasoning Engine would then forward the inferred service information to the Service Center, (3) the Service Center would furnish users with services based on this result, or act as a service medium for users; (4) finally, based on the feedback from users regarding service reasoning, the Case Adjustment/Addition Engine would revise the importance of the case or add it to the case knowledge base.

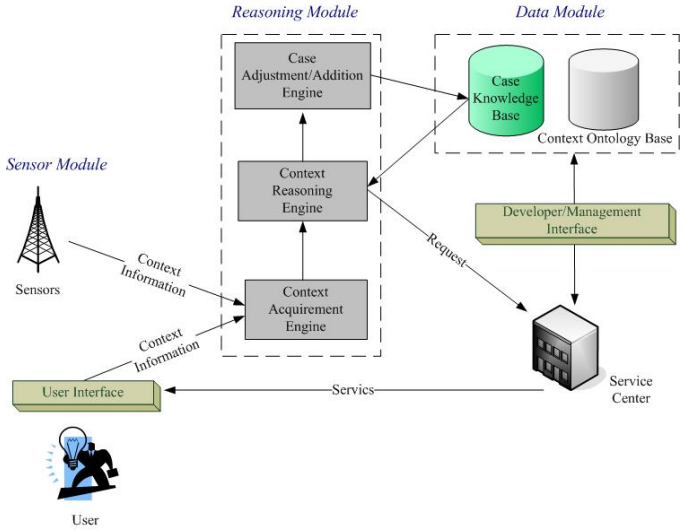

Figure 4. System structure

The illustration of the system components is as follows:

(1) User Interface: A medium between users and the system. Users use it to communicate and interact with the system. It consists of two primary functions: (a) to assist users to send context information and (b) to present users with services from the Service Center.

(2) Context Acquirement Engine: It saves and retrieves the communication protocol of each sensor and could automatically retrieve context information, be it user-provided or sensor-detected. The information would then be forwarded to the Context Reasoning Engine.

(3) Context Reasoning Engine: It stores all context factors from Context Acquirement Engine and compares their similarity with cases in the Case Knowledge Base.

(4) Case Adjustment/Addition Engine: This module adjusts the importance of cases according its number of uses. The formula employed is as above mentioned. This module is also responsible for the addition of new cases to Case Knowledge Base.

(5) Context Ontology Base: Context is very complicated. It can even be seen as the knowledge of interaction between human being and the environment, and cannot be described fully by the usual information structure. That is why this research adopts ontology to demonstrate the context.

(6) Case Knowledge Base: The case knowledge base saves and judges the required service case under each circumstance. The design concept of cases is based on the search of

correlation between contexts in contextual ontology. Each context would find out a corresponding service.

(7) Developer/Management Interface: This interface allows Service Center to add, delete, and modify both the Context Ontology Base and Case Knowledge Case. It also allows Service Center to transform and save the knowledge of ontology in the Case Knowledge Base.

SYSTEM ESTABLISHMENT AND VERIFICATION

In this section, we are focused on the establishment and verification of system which comprises primarily (1) the establishment of contextual ontology (determining the range and domain, defining the category and its hierarchy, case attributes as well as constraints on attributes, etc.); (2) Service Reasoning Engine based on ontology in practice; and (3) the experiment design and use of evaluation indicators to verify the service reasoning accuracy of the system. Only location-based service-providing mechanism is used as the comparison with the reasoning mechanism adopted by this research.

The establishment of ontology

As illustrated in Figure 5, the contextual ontology adopted by this research could be divided into 4 levels, nameed Top-level Ontology, Task Ontology, Domain Ontology, and Application Ontology. This division aids the ontology of maintenance, sharing, and re-using. Table 1 explains the different levels of ontology.

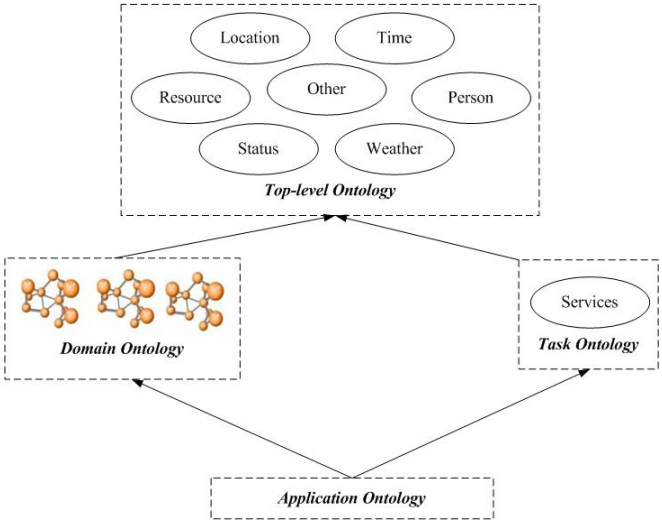

Figure 5. Ontology design of this study

Figure 6 illustrates the relationship of factors in the top-level. Each category depicts the context using item attributes and is established upon the ontology engineering proposed by Natalya (2001). This ontology engineering is orderly and mature, and furnishes the developer of ontology with a strict set of models to follow, so as to avoid unsuccessful and unsuitable establishment of ontology. Seven steps are involved in the ontology engineering: (1) to determine the domain and range of the ontology; (2) to consider whether or not to use existing ontology; (3) to list the words in this domain; (3) to define the categories and decide

the level among them; (5) to define domain attributes; (6) to define constraints and (7) to establish cases. Lastly, the consistency of a completed ontology is verified by Racer.

Table 1 Explanation of the ontology levels

Ontology Levels	Explanation
Top-Level Ontology	Context factors belong to this level: 1. Location: obtained through GPS module. 2. Time: divided into minutes, hours, days, months and years or seasons. It could also be defined by holidays. The setting of which should depend on the domain. 3. Resources: including all the surrounding resources, such as the Internet, facilities, application and information etc. 4. Status: describes user status including sitting, lying or moving, etc. It could also record the duration of the action. 5. Weather: describes the changes in weather and temperature. 6. Human beings: according to this research, the human context factor is determined by user identity. (For example: lecturer or students in institute of information management, and the latter could be divided into freshmen and current students). 7. Other: exceptions and future addition could be placed under this category.
Domain Ontology	The addition or choice of which is domain-based. For instance: medical study, tourism, entertainment, etc. (This research chooses school.)
Task Ontology	The establishment of ontology aimed to provide services to users, thus put the Services here.
Application Ontology	Describes incidents and the definition of which is based on Domain and Task Ontology.

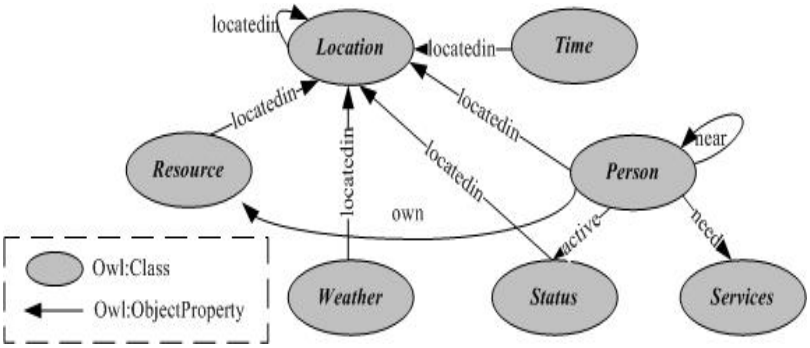

Figure 6. Context factors relationship in Top-level Ontology

Figure 7 illustrates the final ontology as established by this research using the Protégé plug-in, Jambalaya. Table 2 represents the algorithm of context-reasoning engine of this study.

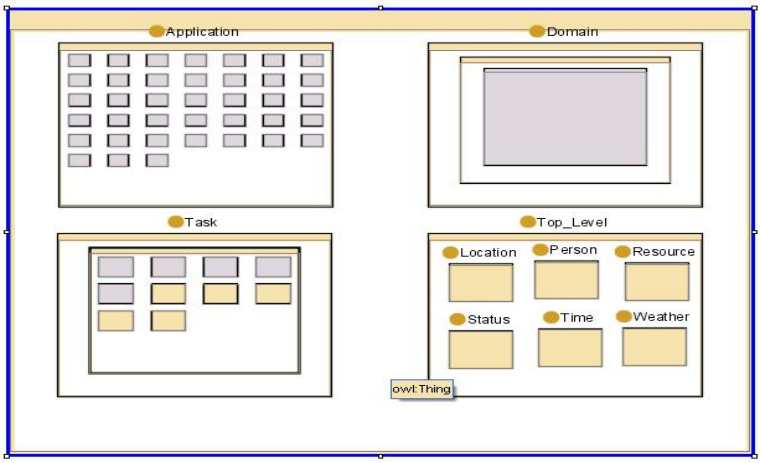

Figure 7. Ontology categories and cases correlation of this study

Table 2 Algorithm of reasoning engine in this study

Input	User's context information / new case
Output	Case's services

For all new case, C.
To read ontology m.read(OWL document's URI).
To catch all cases in ontology by mapping context factory's property, CRi (i=1..n, case number).
Compute similarity of C & CRi .

1.sim(C,CR)= $\frac{\sum_{i=1}^{n} P_i \times same(C_i, C_i^R)}{T(C, C^R)}$

2.Similarity(C, CRi) = $W_i \times sim(C, C^R)$,

If users feedback cases' weight, then $W_{default}^{t} = \frac{W_{default} \times t + W_{user}}{t+1}$

If users want to add this case that ontology doesn't have this case, then add this case in ontology.
Output the case's result that has the top score.
m.write(OWL document URI)

Experimental design

First of all, the target users need to install the domain-specific ontology (which in this research is school). Actually, the system could automatically detect user context, but the experiment is conducted under the assumption that the environment is equipped with sensors, which in the future would be connected to the database connectivity to complete the automation process. At this stage of the experiment, users must provide their context information. Figure 8 is the system operation procedure. The mobile device used here is a notebook and the main steps are: (1) installing the ontology for this particular domain; (2) choosing and confirming current context information; (3) based on the degree of similarity in the case, the system would report back with the top 4 services, and

the user could check interested services and give feedbacks; (4) then responding the importance of the case; (5) last, adding the case to Case Knowledge Base or not.

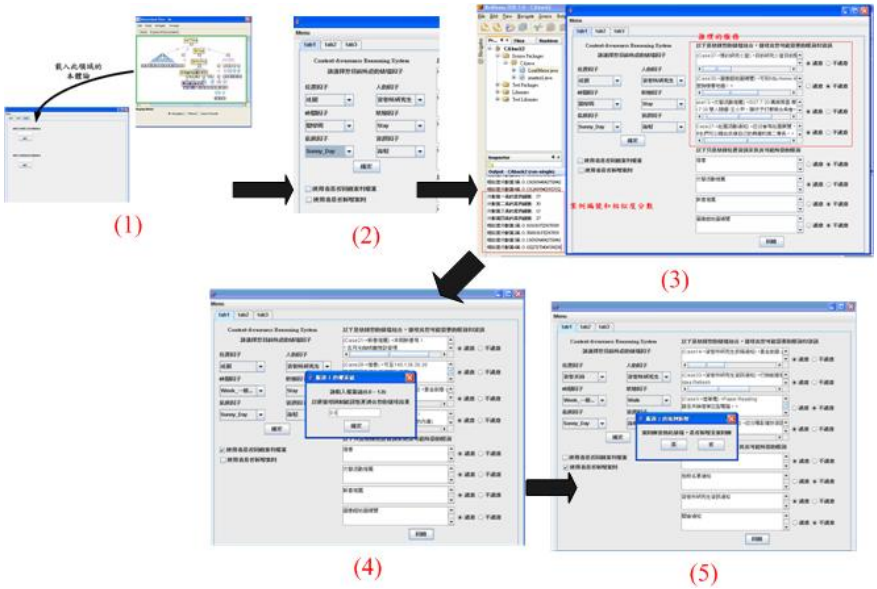

Figure 8. System operation procedure

This study consists of 3 experiments: the first one is students who have known the environment for more than a year. It focuses on the comparison of service-providing mechanisms, namely the reasoning engine adopted by this research, and that of the location-based. Users of this experiment do not report back the importance of cases nor do they add any. The ontology installed would be the default, and the importance of attributes and cases are set at default value. Experiment two tests users who are not familiar with the environment (freshmen in this research). An important goal of the context-aware system is to reduce the unfamiliarity and the search cost in this environment for users. That is why the test subjects are freshmen. Experiment two also compares its accuracy with location-based service-providing mechanism and users do not need to report back the importance or add cases. The ontology installed is also the default, and the importance of attributes and cases are not adjusted. Both Experiment three and one share the same subjects, but the former allows users to adjust case importance depending on the cases. The adjustment is intended to make the reasoning result of this system a better match to users' needs. Users in this experiment continuously use the system to test if the accuracy of the reasoning system could be improved in accordance with its number of uses. Unlike Experiment one and two, the ontology installed by Experiment three would write the importance and addition of cases into the ontology each time users report back or at the end of reasoning. Each user has a personal ontology. This study employs precision as the evaluation criteria. The formula is as below:

Precision = Count of services which users are interested in / Count of services reasoned by the system

Results of experiment

Results of experiment 1

Figure 9 illustrates the result of experiment 1. Axis Y indicates precision, and Axis X is the reasoning mechanism of this research and location-based service-providing mechanism. As demonstrated in the figure, the precision of the mechanism employed by this research is 0.658, and that employed by location-based service-provider is 0.441. Based on precision alone, the mechanism used in this research clearly is better. This is due to that general users (undergraduate and graduate students) are already familiar with the environment, and services provided based on user location would not be sufficient. Taking into consideration not only the location of users, the reasoning mechanism employed by this research provides services by comparing the similarity of context combination with other users, which comprises user identity, time, surrounding resources, weather, user status, information, etc. The use of ontology enables the conceptualization of correlation and logics of these contexts information.

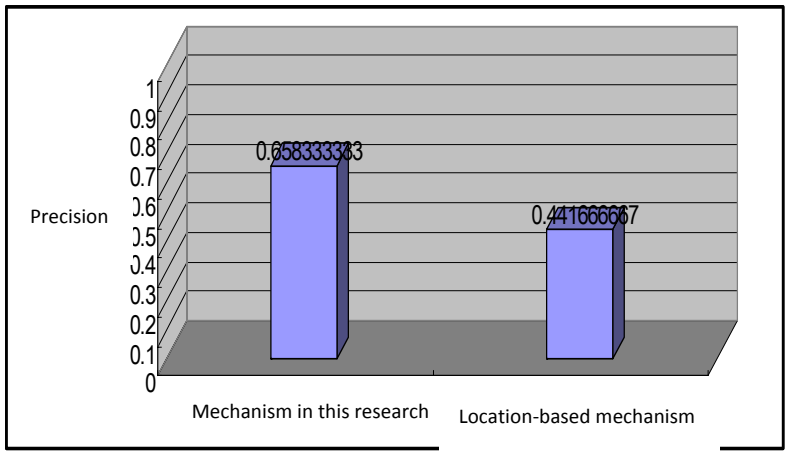

Figure 9. Result of experiment 1

Based on the location factor alone, the description of the context is not specific. For instance, if it is break time during a rainy day and the user is in the library, then the service needed by user would not be borrowing or returning books or the returning date of books. It is more likely to be weather forecast or university event searching, so the user could find out when the rain would stop or to simply pass the time. Such service could not be achieved by location-based mechanism.

Additionally, the location-based mechanism could not provide services at locations such as the laboratory. As a result it is only able to provide basic environmental information. However, the mechanism used by this research provides services in addition to information. The reason being although the service-providing unit is not immediately present, similar service requests had occurred in this environment, therefore the system could reason that user might need the service. Furthermore, services provided by this mechanism are diverse. Overall, based on experiment 1, the reasoning mechanism of this research is more precise than that of the location-based service-provider.

Results of experiment 2

As exhibited by Figure 10, the precision of reasoning mechanism used in this research is 0.821, and that of the location-based is 0.857. The two are very close and are higher compared to those of experiment 1. This is due to the fact that subjects are all freshmen who are unfamiliar with the environment and therefore it has lower evaluation threshold for service precision. As long as the system is able to provide services and information related to user location, the user could easily be satisfied.

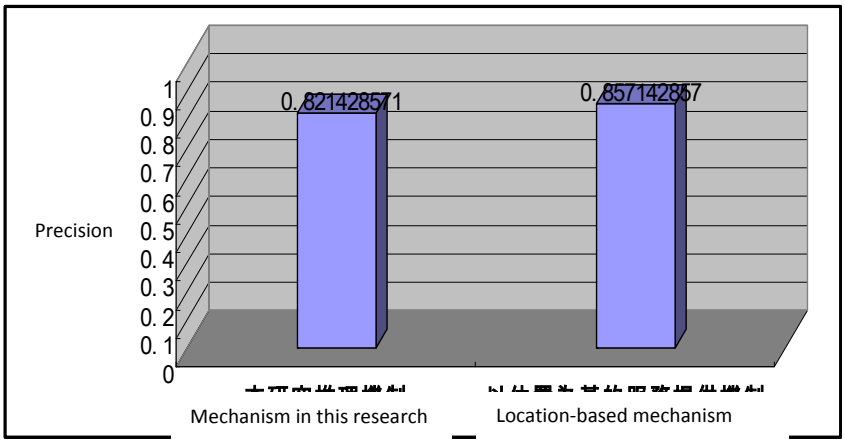

Figure 10. Result of experiment 2

Based on the value of precision, location-based service-providing mechanism is slightly above that employed by this research, which could be due to two possibilities: (1) users are not familiar with the environment and identify better with location context. Services provided by location-based mechanism have lower mobility, and as a result have greater precision. (2) The case designed by this research could not satisfy the needs of freshmen, and to rectify this, detailed interviews with them might be needed. The Service Center would expand the cases according to interview results. The reasoning mechanism used in this research provides services according to case similarity; the mobility of which might be too high for freshmen. In other words, certain services are not located in this environment. Had the users been those from experiment 1 it might have worked, but for the freshmen from experiment 2 such reasoning does not seem to work.

However, the reasoning mechanism of this research could adjust the importance of attributes. The importance of location would be placed on the highest when user identity is freshmen in order to match their context model. As they gradually get used to the environment, their service requests would become more mobile, and the re-adjustment of attribute importance would result in similar outcome as in experiment 1. The advantage of which would become obvious. Judging from the outcome of experiment 2, it is necessary for context-awareness to find out user identity beforehand. Simply by adopting a complicated algorithm to perform service reasoning would not necessarily satisfy certain users. Take the freshmen from experiment 2 for example, only a simple location-based context-aware service-providing mechanism can supply information relevant to the location, their needs would be satisfied and it might even be more effective. In other related literature, the context-aware devices are often used in tourism to provide information based on location. To tourists, the primary goal

of a context-aware system is not about providing highly accurate services, but rather services that could remove the barrier between users and the environment when they arrive at a new place. From the humane perspective, overly complicated information and reasoning mechanism would overload the tourists with information and cause stress, which would miss the purpose of sightseeing.

Results of experiment 3

Each User in this experiment has their own default ontology which comprises identical content and cases. The default attributes and case importance are also the same, and users could adjust the importance of the case provided by their ontology. Each time the system provides users with services, they could give feedback on the importance of the case, which the system would then re-write into the ontology. The value range of the case importance feedback is between 0.1~1, where 1.0 indicates the service is strongly needed by the user, and 0.1 presents the least and so on. Experiment 3 intends to test the ability for self-learning and adjustment of the system. The system becomes a personalized service reasoning system to users through the number of case uses. The procedure of the experiment is pretty much the same as the previous two, whereby users supply context information to the system and services would be provided according to similar cases. The difference lies in that each of the six users chooses three contexts to make up to 18. In addressing each of these contexts, the system continues to adjust the importance of cases, and each context would at least be used over 20 times.

As shown in Figure 11, the reasoning mechanism of this research follows the number of system uses to observe changes in precision. The location-based service reasoning mechanism which is not equipped with learning ability remains at 0.43 throughout. The mechanism employed by this study follows the number of uses and increases its accuracy to 0.694 after three uses. The precision advances to 0.764 after six uses and 0.764 after eighteen uses. After about twelve times of uses, the accuracy begins to dampen and the precision value is about 0.764. The final value for precision in comparison to that of the default system increases by 13.9%, and compared with location-based service-providing mechanism, there is a 33.4% difference in accuracy. It could be deduced that the accuracy of this mechanism could increase following the number of uses.

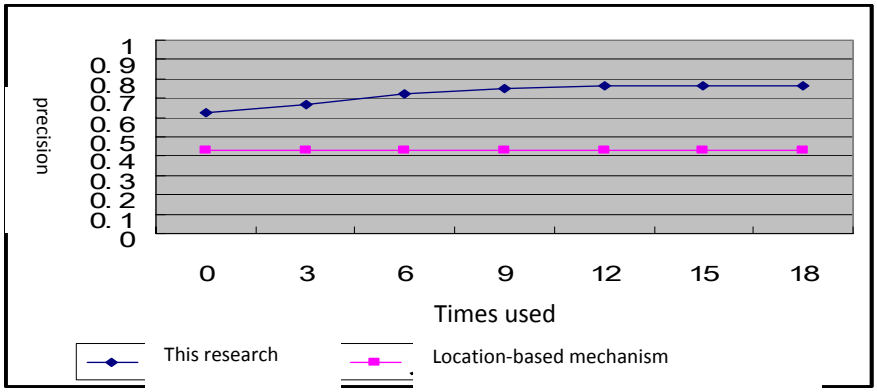

Figure 11. Result of experiment 3

It could be seen from Figure 12 that precision increase of the reasoning mechanism of this research is most prominent after 6 uses. After 3 uses the degree of precision increases by 6.667% and by 8.333% in comparison after 6 uses. The precision advances by 3.846% after 9 uses in comparison to 6. The elevation of precision begins to dampen after 12 times used, and after 15 and 18 times there is a limit in the increase of precision. There are 2 possibilities to this phenomenon. First, the case importance has been adjusted to its optimal, and any additional importance would result in the same services. Unless the user changes the need and interests, then the system would re-adjust accordingly. Second, the Case Knowledge Base is incomplete, and more cases need to be added by the Service Center to satisfy users' needs in services. Overall, after about 12 uses, the reasoning mechanism of this research could adjust itself to enable personalized service reasoning.

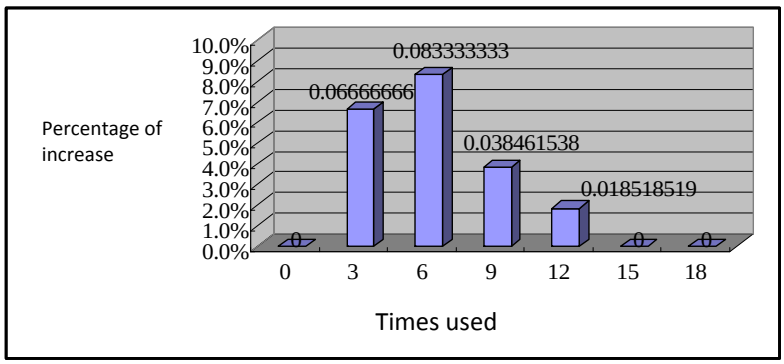

Figure 12. Percentage of increase in precision

CONCLUSION

How the context-aware system retrieves the context is no longer the most significant thing. What is more important is the process afterwards, which means how to provide the users with services. As Dey (2001) stated, context-awareness provides relevant products of services to users, but such relativity should be based on user's task. The task is what produces user's service needs. A common context-aware system simply provides the location information based on user's location, which cannot fully satisfy the task. This does not mean such a system is useless, because it is still suitable for some domains like tourism, and produces a good result even in comparison with the reasoning mechanism of this research. But from a personalized service perspective, it does not support in-depth reasoning.

Take the experiment results of this research as examples, the service reasoning mechanism adopted by this research is ontology-based. Ontology has the features of describing domain knowledge and fully expressing complex contexts and user tasks. What is more, the reasoning mechanism could regularize context information gathered by sensors using ontology. It could also filter and revise erroneous context information from the sensors, and transform basic information to advanced one. In short, it confers meaning to semantics and logics.

People exhibit non-structure and mobility in their need for services, therefore a context-aware system must, on the one hand, obtain more contexts concerning the users. That is to discover

more accurate services based on the combination of people, time, and location. The task on the other hand is how to find a more intelligent and flexible reasoning mechanism.

How does context-awareness obtain contexts for its reasoning? The simplest method for reasoning is rule-based reasoning, but the drawback is that it produces fixed results. Once user needs for service changes such reasoning will not meet the demand unless the service needs of users are certain and constant, which is very unlikely in reality. Even with the same situation, when certain context factors change (for example, the change in user interests), the service requirement will also change. As a result, the use of rule-based reasoning on context-awareness is plausible, but it is domain-dependent and the service for such domain is fixed and simple.

The context-aware reasoning mechanism must be able to follow the change in contexts and adjust its system model. The use of case-based reasoning as the reasoning engine for context-awareness can overcome the mobility of contexts. Results from experiment 1 show that case reasoning is more accurate than location-based service-providing mechanism. Experiment 3 further illustrates that one of its advantages of it is that following the number of case uses the mechanism would become personalized.

This research has constructed a context-aware reasoning mechanism by combining ontology and case reasoning. The experiment results from section 4 also indicate that the outcomes of such a context-aware reasoning mechanism are better than those of the location-based one. Based on the research results, two contributions are deduced and detailed below:
The context ontology design of this research emphasizes top-level ontology, where every category and attribute constraint is clearly defined. That means, the context ontology of this research is designed under the top-level structure, and any future context-aware application could draw from this research without the need of re-definition. By using this context ontology context information received from sensors could be filtered and integrated, as well as simple reasoning via the definition constraint. For example, it could be used to reason the context information is wrong or not, whether the relationship between context cases is inconsistent or receiving garbage information, etc. Furthermore, the use of ontology to design cases would be better than a common case reasoning design in terms of semantics and logics.
In regards to the context-aware reasoning mechanism, this research has referred to many other literatures and discovered that certain reasoning still adopts rule-based reasoning. However, rule-based reasoning is not in-depth and its result is absolute, which means it is impossible to produce other results. It's not enough in the context-aware environment, though in some situations it could be adopted. For instance, the intelligent offices will light up when a user steps in, but this is under the pretext that the applying domain must be apparent clear from the start, which will then of course be more effective than case reasoning.

By adopting case reasoning as the context-aware reasoning engine in this research, it could solve service reasoning under uncertain circumstances, because when a lot of context factors are involved, the uncertainty would become even greater. That is why simple rule-based reasoning cannot be employed. Additionally, case reasoning could revise reasoned services following changes in user service needs. The use of case reasoning could also solve the cold start problem in recommender systems, because the essence of case reasoning is the use of similarity in its calculation. Since there is no relevant context case of new users, the system

could still provide new users with services, because it could refer to similar cases of other users and their service needs.

LOYALTY-BASED CUSTOMER RELATIONSHIP MANAGEMENT

Chin Li Tseng, National Dong Hwa University, Taiwan
iRight@gmail.com

ABSTRACT

This study mainly presented an ontological foundation conceptual model for firms to implement CRM called loyalty-based customer relationship management (LBCRM). Over the last two decades the recognition of CRM is increasingly important and is invested in heavily within the firms in vary industries. However, the implementation performance of CRM are often far away from the expectations of the firm. Regardless of traditional or practice researches have shown the fact that attain to the goal and earn value from success CRM is a big task let along find the silver bullet from it to create a core business strategy of firm. Some works argued the reasons such as most researchers still exploring factors internal to the organization, most researches lacking both integrated and holistic view so that CRM yet done right. Therefore, this paper employed the customer perspective and integrated components link external and internal to the firms. In addition, comparing with the currently approaches this paper also presented a holistic lens and propositions are provided for future studies.

Keywords: Loyalty-Based CRM, CRM, stakeholder value management, ontology

INTRODUCTION

The customer relationship is considered as the highest priority in management in many companies (Becker, Greve, and Albert, 2009). However, firms pursue a broad spectrum of CRM initiatives, from after sales support, to product optimization, to cost reduction (Badgett and Connor, 2003) in one hand. On the other hand, due to the implementation performance of CRM are far away the expectations of firm (Budget, Ballou, and LaValle, 2004; Badgett and Connor, 2003; Wetsch, 2005), over 70% CRM appears to stay (Badgett et al, 2003).

Previous CRM researches concern more on micro process-based therefore lacking of a universal manner even it really provide deeper insight into achieving success with CRM strategy and implementation(e.g. Payne and Frow, 2005). A few researches more or less take CRM initiatives as one kind of particular organizational change and take it for granted so that focus on top-down management and overstate top-level support (Badgett et al., 2004). However this will bring a dramatically change within organization which cause an expected innovation initiatives toward termination unexpectedness due to lack of the support directly from the internal stakeholders.

Further, Studies have shown that a large number of CRM implementation either suddenly stopped or wait and see (Badgett et al. 2003), the reason is that our knowledge is so limited. It is reasonable to assume that if organizations keep investing heavily dollars on CRM implementations but the shareholder cannot participate in policy decision-line process and lack of obtaining timely and appropriate implementation of performance feedback and adjustment information, it is hard to support the development of CRM (Wetsch, 2005).This

may be the reason why although many companies know the importance of CRM still stop doing the initiatives (Badgett and Connor, 2003).

Thus, in this paper we suggest the conceptual framework of LBCRM employed the customer perspective and integrated components link external and internal to the firms. In addition, comparing with the currently approaches this paper also presented a holistic lens and propositions are provided for future studies. Furthermore, for LBCRM is an ontological foundation framework it fit application for firms including the actors and activities of given projects for keeping and earning the customer equality, satisfaction, and loyalty such as the industry of automobile, telecommunication, and bank especially.

INTROSPECTION AND REVIEW

Customer Relationship Management (CRM) is the outcome of ongoing evolution and integration of marketing thinking and newly available data, technologies and organizational approaches (Boulding, Staelin, Ehret, and Johnston, 2005), which were well received by the attention (Badgett, Ballou, and LaValle, 2004; Badgett and Connor, 2003) continuing to be a core business strategy and invested in heavily by corporations (Kim and Kim, 2009).

However, the implementation performance of CRM was not as expected, failure rate 70% (Wetsch, 2005), less than 15% companies worldwide done right, 85% of CRM implementation in companies of the U.S., Europe, and Asia, regardless of the size, not fully implemented successful(Badgett et al., 2004:1). Wetsch surveyed previous research found that the failure of CRM implementations were firms concerned too much on technological factors, such as database integration or factors internal to the organization such as system adoption or organizational culture (2005:29).

Recently works also pointed that the key Factors of CRM success were the steps associated with people (Badgett et al., 2004; Badgett and Connor, 2003). A few works notice that we must pay more attention on the impact of stakeholder to successful CRM (Badgett et al., 2004; Badgett et al.,, 2003; Becker et al., 2009; Payne, Ballantyne, and Christopher, 2005; Stephen, and Thomas, 2008).

Becker et al. among four industry studies in ten countries of Europe, the evidences of this study strongly supported my thinking to consider an exploration of CRM initiatives toward macro lenses, found that different process viewpoint in CRM initiative had no significant impact on business performance (2009: 207), which means that the process in CRM implementations may have its own meaning for the organization but it may not directly link to the business performance.

Furthermore, on the other hand, Reinartz, Krafft and Hoyer noted that previous studies have focused on CRM strategic components, such as the link between customer satisfaction and business performance, the link between customer loyalty and profitability, customer profitability heterogeneity, and customer loyalty programs, which needed to be broaden and focus on across firms strategic research which were less noticed (2004:293). Thus, CRM research need to be more integrated, holistic (Kim and Kim, 2009; Becker et al., 2009; Zineldin, 2006: 432), and exploring more systematically research topics.

Therefore, past works have shown the facts although recognizing the importance of CRM, relatively few firms and persons neither thinks CRM done right nor satisfy with the reports of performance improvement, the fact imply to have a clear objective to ensure future CRM initiative with practicality and usefulness is so key and must be, the fact also told us a holistic perspective is necessary to explore the people-related issues of CRM. On the basis above, it is necessary to adjustment our lenses while considering successful implementation of CRM. Keep all the investment of resources for CRM initiatives will have better outcome and enhance the stakeholder value management (SHVM).

EXPLORATION AND PROPOSITION

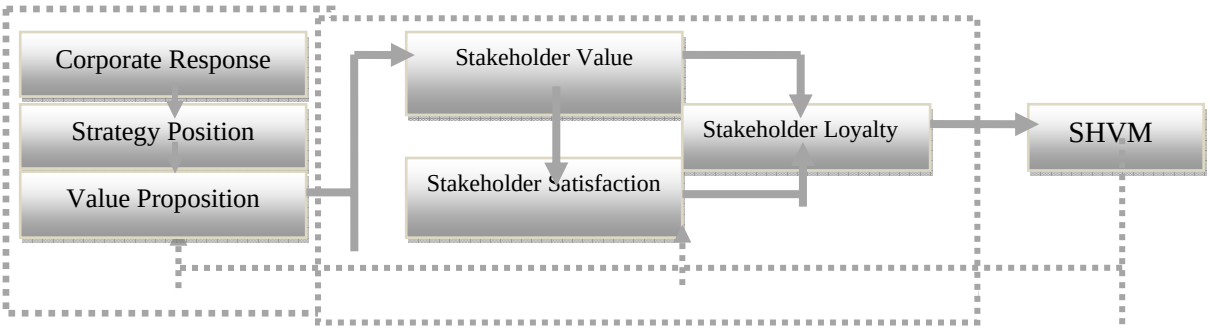
Loyalty based CRM is an ontological foundation for firms to implement their own CRM initiatives which offer a more powerful framework to meet those expectations I draw, derived from the given environment scanning and analyzing via the literatures review above. LBCRM intended to serve two purposes: Its prescriptive purpose is to guide the conceptualization and design of practical CRM initiatives which earn the loyalty from the stakeholder of the firms; its management innovation purpose is to emphasis on project-based management methodologically. Thus the use of the framework will not only lead to long-term systematic improvement for firms to earn the commitment and loyalty from its stakeholder but also lead firms' exploration and exploitation on the basis of the mechanisms of given projects such as the programs of co-creation of value, customer equality, satisfaction, and loyalty. The conceptual framework of LBCRM is shown as below.

Developing a Loyalty-Based CRM Model

Loyalty based CRM, Figure 1, it illustrates this integrated, methodical approach in a simple but post-hoc conceptual model, including mainly three blocks namely the co-creation of value between the firm and its stakeholder, the causal model of the antecedents and consequences relationships between stakeholder value, stakeholder satisfaction, and stakeholder loyalty, the SHVM which response to stakeholder with caring, feedback, and adjustment in a swift manner.

From Co-Creation of Value to Customer Value

The co-creation of value processes are illustrated in Figure 1. The corporate respond is to echo the stakeholders, the strategic position is how the firm selected a certain group of stakeholder from multi-stakeholder groups, and conduct a product, need, or channel-based positioning toward these certain stakeholder (Porter, 1996), and the value proposition is (Payne, Ballantyne, and Christopher, 2005: 868) to invite critical stakeholder involvement and provide the necessary products or services to the stakeholder individually. To ensure the stakeholder value will be created by co-creation of value flow above, I focus on three types of alignment across organizations: strategy, tactic, and culture.



Strategy Alignment

Strategy alignment is the premise of competitive advantage for firms (Porter, 1996). Reinartz, Krafft, and Hoyer argued that as firms become able to align their organizations and structure more effectively with their market goals, it is expected that they would be more successful in that market because they can adapt more readily to the needs of customers (2004: 296). Becker et al. (2009:207) also pointed out that I should pay attentions to the notions of multi-stakeholders of firm rather than caring the details of different processes of CRM initiatives. In fact, more and more studies have shown that strategy alignment is the critical factor for a successful strategy development process, and that emphasizing especially in the goals of the stakeholder (Badgett et al., 2004; Badgett and Connor, 2003). Thus:

Proposition$_1$: The wider the level of organizational strategy alignment with the goals of their stakeholder, the higher the positive link between successful CRM and relationship initiatives.

Tactic Alignment

Another required alignment for CRM success is tactic alignment (Huang and Liu, 2009). Since such internal tactical activities are based on the operation of parallel relationship, it is also known as so called horizon fit (Wright and Boswell, 2002). It is important for the various corporate functional units to achieve the same organizational strategy aligned projects in the same direction, because these divisions of labor in different sectors have different goals and must be effective integrated by human systems, prior research provide that various tactics alignment between activities will enhance organizational synergy (Way and Johnson, 2005). Hence forward:

Proposition$_2$: The deeper the level of internal tactic alignment with the goals of successful CRM, the higher the positive link between successful CRM and relationship initiatives.

Culture Alignment

The goal of culture alignment is mainly the organizational climate alignment. Prior researchers pointed out that the culture alignment of organization will help increase the level of collaboration across various corporate functional units (Way and Johnson, 2005). With the same organizational target, members in the organization should know that any kinds of competition internal are meaningless. If firms are able to understand their own subsections' difference, such as: organizational climate, subculture, and inertia. It will be possible to avoid the impact of the gap between various divisions

Therefore, since different subsections with their own inertias that may have different ways to achieve CRM goal. Top management team of firm can take this opportunity to integrate whole organizational climate and then create a favorable organizational climate to enhance successful CRM implementation (Badgett et al., 2004; Badgett and Connor, 2003). Present study suggests that culture alignment, will make the members we pursuit common goals with trust and share organizational performance with each other in the same atmosphere. Therefore:

Proposition$_3$: The wider the level of culture alignment with the goals of successful CRM, the higher the positive link between successful CRM and relationship initiatives.

From Customer Value to Customer Loyalty

Since a proper performance measurement framework is based on a causal model (Lebas, 1995; Kim and Kim, 2009). Prior studies have shown customer value has a positive effect link customer satisfaction (Heskett et al., 1994; Kamakura et al., 2005; Wetsch, 2005) and customer loyalty (Kim and Kim, 2009).Customers satisfaction has a positive effect on customer loyalty (Heskett et al., 1994; Kim and Kim, 2009). We considered the relationships between customer value, customer satisfaction, and customer loyalty for the performance measurement of the LBCRM in this study. We extend the traditional definition of the customer replaced it as stakeholder, see Figure1. And we argued five propositions for ensuring the success toward stakeholder value to stakeholder loyalty.

Stakeholder value and Stakeholder satisfaction

To enhance customer satisfaction, firms have to provide competitive products or services for their Stakeholders first. Many studies has shown that customer satisfaction must make their customers feel the services value they received are higher than other firms (Dabholkar, and Abston, 2008) In addition, both of the tangible and intangible value added are necessary to be considered for stakeholder value and then such of these services will directly bring stakeholder satisfaction (Bharadwaj and Roggeveen, 2008; Wetsch, 2005; Zineldin, 2006). As prior researches show that there is a positive relationship between customer value and customer satisfaction (Heskett et al., 1994; Kamakura et al., 2005; Wetsch, 2005). Hence forward:

Proposition$_4$: The greater the level of the stakeholder perceived value from firms, the higher the positive link between stakeholder satisfaction and successful CRM.

Many CRM initiativess of firms have been devoted to design the integration of marketing channels (Payne and Frow, 2005). Customers can feel the true satisfaction from the result of channel integration and single unit service center. Further, many firms have been able to grasp the opportunity for interpersonal contacts with their customers. Firms particularly concerned if customers experience the satisfaction with their appropriate services. For this reason, many firms draw up standard operation procedures for operation so as to enhance customer service delivery and to suggest specific solutions satisfaction with quality of the processes (Bharadwaj and Roggeveen, 2008; Zineldin, 2006). Thus:

Proposition$_5$: The greater the level of the stakeholder perceived quality of the processes from firms, the higher the positive link between stakeholder satisfaction and successful CRM.

As stated above, the product / service and process impact in raising customer satisfaction, the customers for the firm infrastructure (Jamal, and Adelowore, 2008; Zineldin, 2006) will also affect the customers to complete the process of consumption. The impression of firms is also related to customer satisfaction.

Customers receive and decode the firm's expressions easily from the firm's official web site, product catalog, an answer form call service center of firm, and even on the firm's advertisements which outside the external walls of building. Besides, even one mail seems to affect a customer via the wording and design quality that also lead customers deciding whether he or she will consume or not. These factors influence customers to repurchase

scenario as well as the notion which might discourage consumption of the original intent. On the other hand, according to similarity-attraction theory, human capital, organizational image, and day and night information of firm will constitute and express the meaning and service and it would also help to attract and enhance customer satisfaction if tempted. Therefore, present study suggests that:

Proposition$_6$: The greater the level of the stakeholder perceived quality of the resource expression from firms, the higher the positive link between stakeholder satisfaction and successful CRM.

Stakeholder Satisfaction and Stakeholder Loyalty

Currently organizational management strategy is to develop and enhance a long-term relationship and the ability that satisfy existing customers. They focus on customer satisfaction (CAST) and customer loyalty (Heskett et al., 1994; Zineldin, 2006).As mentioned above, the provision of competitive products or services to customers, firm convey high quality information and transaction process for timely and appropriate interpersonal interaction may also help improve customer satisfaction.

Unless the market and customers repurchase is recursive otherwise we can hardly say any relationship between buyer and seller has been established (Burt, 2000). To obtain customer loyalty, firms should consider how to make the customer satisfied with the present service and transfer customer satisfaction to customer loyalty (Oliver, 1999). This is the reasons why firms want to create and establish the relationships with their customers.

Wetsch (2005) pointed out that it is difficult to tell real from spurious loyalty when the marketing literature using behavioral data to analyze customer loyalty Firms perceived satisfied customers and strengthen the linkages and interaction with customers, known as a comprehensive feedback. Comprehensive feedback includes both active and passive cases. The latter, commonly referred to post sales service, is mainly in the provision of customer support services and the former is based on customer consumption records, initiated by the firms with social cognitive (Zineldin, 2006) feedback programs (e.g.: special recognition)for re-purchase proposal.

Firms apply to CRM seems special interested in the data mining technology, the initiative provide customers can contribute to re-purchase or complete the feedback and adjust the cross-selling of information (Heskett et al., 1994; Kamakura et al., 2005). While improving customers' care and the rate of customer value management are the main objectives.

However, without a good post sales service it is hardly to build customer loyalty (Kamakura et al., 2005).

Proper development of a comprehensive feedback and adjustment of CRM tactical activities is to help customers perceived the firms for their support. Thus, on the basis of the customers feelings will enhance the psychological attachment and create customer loyalty to the firms. Here forward:

Proposition$_7$: The greater the level of the stakeholder perceived corporate support from firms, the higher the positive link between stakeholder loyalty and successful CRM.

Proposition$_8$: The closer the level of the stakeholder perceived corporate value from firms, the higher the positive link between stakeholder loyalty and successful CRM.

Stakeholder Value Management

Payne, Ballantyne and Christopher cited Peck (2001) that research issues in stakeholder relationships has shifted emphasizing from a corporate responsibility for multiple stakeholders towards corporate responsiveness to these groups (2005:868). We employ the customer perspective (Kaplan and Norton, 1992) of CRM, Examining, positing, and developing the value of the stakeholder will make the organization resources allocation effective and value exchangeable to the stakeholder. In light of these considerations, we stressed not only on feedback and adjustment but also stakeholder involvement while echoing the opinions of stakeholder in time. Therefore we argued two propositions for the Stakeholder Value Management success.

Feedback and adjustment

Stakeholder value management is based on customer loyalty-based CRM. This study has proposed to conduct a comprehensive and stakeholder feedback and adjustment which can develop customer loyalty and help the individual customer lifetime value management. In fact, the customer value management also focuses on the basis of feedback and adjustment.

As mentioned before, since CRM processes in every action have a high level of context sensitivity the customer value management is clearly need for more long-term commitment to work. To grasp the sensitivity of these situations, we must continue caring out a search over time and thinking, the critical success factor is to maintain the value of the entire stakeholder network interaction management system and real-time feedback and adjustment. For example, in an attempt to provide customers with the desires of the firm product line of all possible pairs of products and services (Kamakura et al., 2005). Do all of these products or services fit customers' needs? Is the value of these products and prices competitiveness? Can firm afford to offer these services? Will it not be because of an impatient and self-defeating? How to ensure that each product or offer rewards of re-purchase service (Zineldin, 2006)?

Are acceptable for the customer? Any issues above will be very likely to result in loss of customers if getting serious flaws in the situation of the processes of CRM.

On the other hand, the culture alignment makes employee work under the same objectives and atmosphere. It is necessary to regularly inform the staff's attitude and behavior changes. For instance, the project staff, responsible for the tactical activities, whether the extent of their organizational identity change or not? How about the project of full feedback and adjustment? Do they recognize degree? Especially, how to deliver firm's value when we want to understand the front-line employees? To achieve customer loyalty and trust, we must firstly obtain the trust of employees: employee patronage, take the initiative to consumer products companies or services, willing to be the ratio of the level of internal customers for life (Dabholkar, and Abston, 2008; Wright and Boswell, 2002), the speed and the response that a staff deal with the customer complaint; if firms have any kind of competitive bonus scheme to employees that make good customer service. All these will affect the firm's success of stakeholder value management.

Proposition $_9$: The greater the level of the stakeholder perceived corporate support from firm, the higher the positive link between employee patronage and stakeholder value management development.

DISSCUSSION AND CONCLUSION

Present paper has presented a macro perspective and capture real circumstance of currently trend derived from previous researches, a holistic and measureable causality conceptual model combined stakeholder involvement from co-creation of value toward stakeholder loyalty are presented. Instead of merely focus on terminal customer I expand and extend the traditional definition of the customer and replaced it as stakeholders of focal firm. To such an extent that firms will keep up with the mainstream concepts and trends from the knowledge and practices of corporate strategy, which may makes a better alignment and a fully understanding between firms and their stakeholder.

Comparing the other approaches, LBCRM is more useful and meaningful while guiding an initiatives for CRM implementation since it based on firm's given projected-based manner so that the employees in focal firms will perceive more moderate change pressure during the period of the implementation and thus may willing to fit such an innovation evolution instead of shift gear for practices revolution within the organization, the level of the shareholder perceived corporate goal from firm will closer and higher the positive relationships between shareholder and stakeholder value management development which meet firms' expectations.

This paper has suggested the LBCRM model for CRM implementation based on ontological concepts. The model with its propositions presented in this paper currently has further developed for an empirical measurement (Tseng, 2010). However, the measurement validations remain an open issue and the relationships of components in LBCRM may be different in industries. The future finding will contribute to our knowledge while doing a loyalty-based customer relationship management and will serve its turn on stakeholder value management.

Finally, I suggest the LBCRM is a suitable guidance framework for firms which including the actors and activities of given projects for keeping and earning the customer equality, satisfaction, and loyalty such as the industry of automobile, telecommunication, and bank especially.

ABSTRACT

The study discusses the determinant effects of advertising content (informativeness/entertainment/irritation/credibility) on mobile advertising value, and consumer adoption intention regarding three mobile advertising type including permission advertising, incentive advertising and location-based advertising. The research applies the advertising content theory (AC theory), advertising value theory (AV theory), privacy theory and adoption intention (AI theory) to develop the conceptual framework and then discusses consumer attitudes and adoption behaviors concerning the mobile advertising applications.

Keywords: Advertising content, advertising value, privacy protection, adoption attitude

INTRODUCTION

The Internet-enabled mobile handset has rapidly achieved worldwide penetration owing to the very personal nature of the devices and their employment of sophisticated communication technology [32]. According to Gallen, the Asia-Pacific region leads the world in mobile marketing and advertising; accelerating growth will see nearly $7.7 billion (and more than $16 billion globally) spent in 2011 [15]. In 2009, Taiwan's Generation Mobile Communication users made up more than one million households, 11 times the number of users in 2006 [30]. Therefore, mobile marketing development has become increasingly important.

Academic studies indicate that while the cost of mobile advertising is higher than that for sending e-mail, early adopters easily book response rates five times higher than those for direct mail ([14]; [24]), hence, it is prudent for firms to carefully schedule mobile medium programs. Current mobile advertising is primarily concentrated on the effects of mobile content on mobile advertising value ([8]; [4]; [18]). What is lacking is an examination of mobile advertising value, privacy concerns and consumer adoption intention. Furthermore, most studies focus on the permission advertising ([16]; [3]; [40]), and are noticeably deficient in comparative analysis for both incentive and location-based advertising. To better understand consumer acceptance and attention regarding mobile ads and mobile marketing, it

is essential to investigate an integrative mobile advertising research subject. Zoller, Housen and Matthews (2001), in there study on mobile advertising types, proposed three types of mobile advertising: permission advertising, incentive advertising and location-based advertising [47]. Concerning mobile advertising content, Ducoffe (1996) proposed informativeness, entertainment, irritation and credibility, as factors to examine the effects of mobile advertising content on advertising value [8]. By adopting an integrated perspective that emphasizes the roles of mobile advertising content (AC theory) and value (AV theory), privacy theory and consumer adoption intention (AI theory), this paper addresses these key gaps. It develops empirical mobile advertising development strategy explanations for related mobile marketing products, while advancing service application research in the form of a linear regression method. Accordingly, this study examines a variety of effects that include: 1. the effects of three types of mobile advertising content on advertising value; 2. the effects of three types of mobile advertising value on consumer adoption intention; 3. the effects of consumer privacy concerns on the intentions of consumer adoption in regard to a variety of mobile advertisings.

The findings have the potential to offer significant implications for theory and practice. In addition, it may also give some insights into related academic research in the future. The study includes developing a questionnaire that builds from the following conceptual framework (See Figure 1). The rest of the paper is organized as follows. Section 2 gives a review of the literature in the areas of mobile advertising content, advertising value, consumers privacy concern and adoption intention. Section 3 introduces the methodology used in the research. Section 4 presents the background of data sources and analysis and gives the research findings of the study. Finally, section 5 provides the discussion and conclusion.

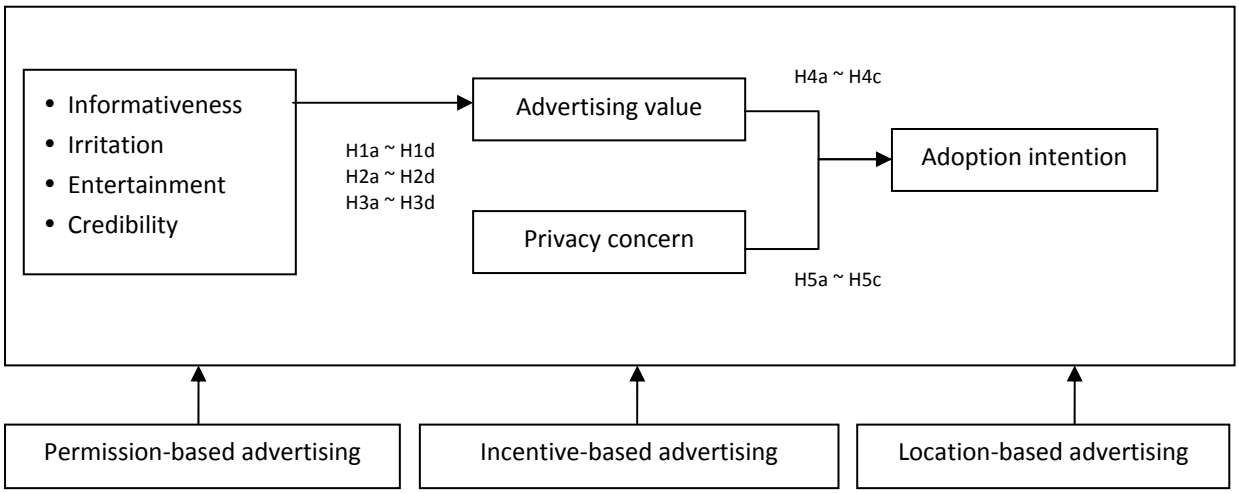

Figure 1 conceptual framework

LITERATURE REVIEW

Previously, a mobile advertising application in AV, AC and AD theory has not yet been explored. Therefore, this study aims to add to the limited literature on mobile advertising, mainly in Taiwanese context. This section outlines literature reviews of former scholars and defines a theory base for this study.

Mobile Advertising

Kotler and Armstrong (2000) defined advertising as any paid form of non-personal presentation and promotion of ideas, goods or services by an identified sponsor [25]. The Mobile Marketing Association (2008) defines mobile marketing as the use of a mobile medium as a communication and entertainment channel between a brand and an end-user [28]. Mobile devices will gradually become more functional: increasing numbers of people will purchase services and products as a result of mobile marketing promotion. According to scholars, mobile advertising contains the following important features: (1) It is Personalized: advertisers can provide for the needs of consumers; (2) It is immediate: advertisers can deliver an advertising limit time; and (3) Location-based services: providers see advertising as the cornerstone of their business plans [12].

Imhoff, Loftis and Geiger (2001) argued that personalization is "the ability of a company to recognize and treat its customers as individuals through personal messaging, targeted ads, or other personal transactions [21]." It is immediate: mobile advertising transcends time and space limitations, so advertisers can deliver their message to the customer at any time. Location-based services that connect to a distinct location are highly relevant for local advertising [6]. Consequently, the abovementioned features make mobile advertising the 'dream environment' for every marketer (Evelyne, 2007).

Thus, based on the characteristics of mobile advertising, Zoller et al. (2001) identified three types of mobile advertising: (1) Permission-based advertising in which consumers are willing to provide their personal information to firms and consent to receiving advertisements. According to consumer information, firms can then target their products or services to the individual consumer; (2) Incentive-based advertising which provide feedback venues for consumers while they agree to receive information on promotional or advertising activities; (3) Location-based advertising which sends regional advertising information to consumers located in specific regions [47].

In academia, scholars have studied various mobile advertising strategies to suggest and predict their application or promotion ([3]; [18]). Findings indicate that these three constructs (permission advertising, incentive-based advertising and located-based advertising) are valid for evaluating consumers' intentions to adopt mobile advertising information. For example, permission advertising was derived from the concept of permission-based marketing. Barwise and Strong (2002) found that consumers responded well to text adverts that grab their attention [3]. Incentive-based advertising refers to advertisers provide incentive for consumers to respond advertising content of receipt of reward. Finally, Varshney (2003) refers location-based advertising as messages can be sent to all users who are currently in a certain area or to certain users in all locations [45]. Transparent opt-in processes and an advanced level of customization are key success factors for location-based advertising [2]. Therefore, based on the above discussion about moblie advertising, we select permission advertising, incentive-based advertising and located-based advertising as our research targets.

Mobile Content and Mobile Advertising Value

In academia, Brackett and Carr (2001) referred to advertising content as comprising entertainment, informativeness, irritation and credibility [4]. Several scholars have indicated that mobile content includes: (1) informativeness: consensus exists with regard to the ability of advertising to inform consumers of product alternatives so that purchases yielding the greatest possible satisfaction can be made [8]; (2) entertainment: people's feeling of enjoyment which they associate with advertisements play the greatest role in accounting for their overall attitudes towards them [38]; (3) irritation: sponsored links are like any ad that causes irritation. They may depress an ad's value [26] and (4) credibility: has a direct relationship with both advertising value and attitudes toward advertising [4].

According to Ducoffe (1996), value potentially comes from expectations about the offering itself, from the experience that accompanies the exchange and from the residual feelings of having engaged in the behaviors necessary to achieve the exchange; i.e., value can reflect the worth of the element itself as well as the transaction [8]. The implication that each party to the exchange both gives and receives value differentiates the exchange from other forms of satisfaction based on need [20]. Advertising processing decisions are based on initial, spontaneous and categorical evaluations that combine to form an expected advertising value (EAV) assessment [9]. Consequently, attempts to achieve appropriate advertising values are not usually undertaken to copy extensive advertising, but rather only for brand names or appearance [34].

Scholars have indicated that informativeness, entertainment, irritation and credibility are four important factors to influence the effects of mobile advertising. For example, Varshney (2003) considered information a valuable incentive in mobile advertising because recipients react very positively to advertising transfer incentives. Entertainment is also a crucial factor for mobile advertising. In the findings of Fernandez (2000), informativeness is defined as being relevant to a purchase situation response to directional advertising in the Yellow Pages [13]. Wang et al., (2002) suggested that using advertising with more specific information that matches consumers and purchase situations are more likely to be made, resulting in a proactive response [46]. Haghirian, et al. (2005) extended the concept for measuring mobile advertising: the results indicated that entertainment, informativeness, irritation and credibility affect mobile advertising value, while exposure has no impact [18]. In entertainment, it is essential that the message is concise and funny, and captures consumers' attention immediately [22]. Brackett and Carr (2001) found that informativeness, entertainment and credibility affect advertising value positively, and that irritation has no impact [4]. Greyser (1973) suggested that public receptivity to advertising depends on goodwill that is eroded by the public dislike of advertising. Irritation can serve to distract, inhibiting counterarguments [17], therefore enhancing persuasion [1].

Hence, manufactures and service providers can create new mobile advertising and perform mobile marketing to encourage the development of new services and offer incentives for consumers [36]. Thus, this research chooses informativeness, entertainment, irritation and credibility to examine the effects of mobile advertising content on advertising value. Drawing from the above discussion concerning mobile advertising content and advertising value factors for three mobile advertising types, the following relationships were hypothesized:

H1a: The informativeness of permission-based advertising has a positive effect on its advertising value.
H1b: The entertainment of permission-based advertising has a positive effect on its advertising value.
H1c: The irritation of permission-based advertising has a positive effect on its advertising value.
H1d: The credibility of permission-based advertising has a positive effect on its advertising value.
H2a: The informativeness of Incentive-based advertising has a positive effect on its advertising value.
H2b: The entertainment of Incentive-based advertising has a positive effect on its advertising value.
H2c: The irritation of Incentive-based advertising has a positive effect on its advertising value.
H2d: The credibility of Incentive-based advertising has a positive effect on its advertising value.
H3a: The informativeness of Location-based advertising has a positive effect on its advertising value.
H3b: The entertainment of Location-based advertising has a positive effect on its advertising value.
H3c: The irritation of Location-based advertising has a positive effect on its advertising value.
H3d: The credibility of Location-based advertising has a positive effect on its advertising value.

Privacy concerns

Privacy is a complex concept; an acceptable use of private information in one situation may be deemed an unacceptable invasion of privacy in another [10]. Liu et al. (2004) Liu defined privacy as the right of an individual to be left alone and be able to control the release of his or her personal information [27]. Fareena and Adrew (2008) suggested that people have been concerned about the privacy of their personal information online since the advent of the Internet [11], and Hoffman, Novak and Peralta (1999) indicated that the Internet threatens consumer information privacy in new and extreme ways [19]. Therefore, in order to reduce privacy concerns, companies could offer consumers greater control over the acquisition and use of their personal information, in effect, forging a new trust in the marketer [44]. Scholars indicated that customers' privacy concerns arise from the feeling that their information is vulnerable and that they are not able to control their personal information [7]. For instance, the protection of location-privacy has become a key factor in the success of location-based services. As users consider their own physical location and movements to be extremely privacy-sensitive, the demand for solutions that protect such information in a variety of environments is great [5]. Hence, this study investigates the perceived privacy issues of consumers related to advertising value and adoption intention, in regards to a variety of mobile advertising strategies.

Adoption intention

In the academic world, Kim, Hock and Sumeet (2007) perceived that value reflects this concern for privacy by comparing benefits with sacrifices, thereby constituting an indicator of adoption intention [23]. Thaler (1985) stated that the prospect theory value function is defined in regard to single, one-dimensional outcomes [42]. A study by Urbany, Bearden, Kaicker and Smith-de Borrero (1997) concluded that a noticeably low or high price (relative to what was expected) affects purchase intentions in a manner beyond the ordinary allocated role of price [43]. A customer's privacy concerns can outweigh the benefits of using u-commerce services which, in turn, can influence their intentions to adopt u-commerce applications [39].

The Theory of planned behavior, an extension of the well-known Theory of Reasoned Action, is proposed as a model to predict consumer adoption intention [42]. In expectancy value models such as TAM, has been widely used in studies examining why consumers used or adopted new communication technologies ([23]; [37]).

Social norms theory can be used to develop interventions that focus on mobile advertising perceptions for the purpose of correcting misperceptions among students, thereby positively affecting adoption intentions [37]. Okazaki and Taylor's (2008) findings are of central importance to managers as he concluded that the factor most correlated with the willingness to adopt SMS advertising is the perceived ability to build a brand [33]. Therefore, the following hypotheses can be formulated.

H4a: The value of Permission-based advertising has a positive effect on consumer adoption intention.
H4b: The value of Incentive-based advertising has a positive effect on consumer adoption intention. H4c: The value of Location-based advertising has a positive effect on consumer adoption intention. H5a: Perceived privacy concerns regarding the privacy of permission - based advertising has a positive effect on consumer adoption intention.
H5b: Perceived privacy concerns regarding the privacy of incentive-based advertising has a positive effect on consumer adoption intention.
H5c: Perceived privacy concerns regarding the privacy of location-based advertising has a positive effect on consumer adoption intention.

RESEARCH METHOD

This study surveys consumer attitudes toward mobile advertising chosen from Taiwan market. In addition, the questionnaire items are designed and then modified to make them appropriate for assessing attitudes toward three types mobile advertising. Young consumers were chosen as survey targets. The data are collected over a period of one month (June, 2009). Research findings and suggestions are provided to examine the relationships among mobile advertising content (informativenness, irritation, entertainment, credibility) [8], advertising value [8], privacy concerns [27] and consumer adoption attitudes [35] for the three abovementioned types of mobile advertising [47]. Likert scales (1-5), which range from strongly disagree to strongly agree, were used for all questions in this study. Data analysis methods used in this research include factor analysis, reliability analysis, and a linear

regression method.

DATA ANALYSIS

Descriptive Statistic

The 360 respondents produced a total of 340 usable questionnaires resulting in a response rate of 94%. The respondents comprised 53.7% males and 46.3% females; 64% of the respondents ranged in age from 20 to 25, while 23% were between 26 and 30; 84% of respondents had a college degree.

Factor Analysis and Reliability Analysis

To verify the relationships among the factors, the study performs factor analysis and reliability analysis using SPSS statistical package. This entails a two stage process. Factor analysis is undertaken to identify underlying constructs from among sets of many interrelated items. The principal - component method is used for factor extraction, with factor interpretation carried out by Variamax rotation. Table 1 shows the factor analysis and reliability analysis for model factors. All factor loadings of variables exceed 0.5, while the α values of the item to total correlation exceed 0.7. The constructs with eigenvalues are greater than one. The mobile content of permission-based advertising, incentive-based advertising and location-based advertising resulted in similar factors, namely informativeness, entertainment, irritation and credibility.

Table 1 Factor and reliability analysis of model factors

	Permission-based advertising			Incentive-based advertising			Location-based advertising		
	eigenvalue / Cronbach's	Factor loading	α	eigenvalue / Cronbach's	Factor loading	α	eigenvalue / Cronbach's	Factor loading	α

Regression Analysis

One of the assumptions of regression analysis is that the residuals for consecutive observations are uncorrelated. If this is true, the expected value of the Durbin-Watson statistic is 2. Tables 2, 3 and 4 show that the values of the Durbin-Watson of the models are all near 2, which fit the requirement of the assumptions of regression analysis.

In Table 2, the results of regression Model 1 (F=48.321; ΔR^2=0.378) and Model 2 (F=63.060; ΔR^2=0.374) suggest that informativeness (β=0.161/0.160), entertainment (β=0.115/0.124) and credibility (β=0.522/0.522) have positive effects on advertising value in permission-based mobile advertising. Regression Models 3 and 4 show that significant results were obtained on the importance of AV and privacy concern theory; advertising value and privacy concerns are important to consumer adoption attitudes in permission-based mobile advertising. As well, advertising value and privacy concerns are effective at improving consumer attitude towards the adoption of permission-based advertising. In Model 5, while considering the factors of advertising value and privacy, advertising value appears to have a significant effect on consumer adoption attitude, while privacy was shown to have no impact on consumer adoption attitudes.

Table 2. Factors of permission-based advertising content on value and adoption attitude

		Advertising value		Adoption intention		
		Model 1	Model 2	Model 3	Model 4	Model 5
		Beta	Beta	Beta	Beta	Beta
Advertising content	informativeness	0.161**	0.160**			
	entertainment	0.115*	0.124*			
	irritation	-0.074				
	credibility	0.522***	0.522***			
Advertising value				0.363***		
privacy					0.186**	
Advertising value						0.338***
Privacy						0.090
R		0.621	0.617	0.363	0.186	0.373
ΔR^2		0.378	0.374	0.129	0.032	0.134
Durbin-Watson		1.935	1.942	1.949	1.978	2.031
F		48.321***	63.060***	1571.6494***	11.143***	25.033***

a. Dependent Variable: advertising value, adoption intention
b. Linear Regression through the Origin

In Table 3, the results of regression model 6 (F=30.680 , ΔR2=0.276) and model 7 (F=117.512 , ΔR^2=0.273) suggest that the credibility (β=0.508/0.524) have positive effects on the advertising value regarding incentive-based mobile advertising. In regression models 8 and 9, significant results are obtained on the importance of AV (β=0.312) and privacy concern (β=0.175): advertising value and privacy concern are important to consumer adoption attitudes in incentive-based mobile advertising. In Model 10, if considering advertising value and privacy, advertising value appears to have a significant effect on

consumer adoption attitudes, while privacy is shown to have no impact on consumer adoption attitude.

Finally, see Table 4, the results of regression model 11 (F=66.988 , ΔR^2=0.459) and model 12 (F=134.201 , ΔR^2=0.461) suggest that the entertainment (β=0.164/0.190) and credibility (β=0.609/0.607) have positive effects on the advertising value in location-based mobile advertising. In Models 13 and 14, significant results were obtained regarding the importance of AV (β=0.413) and privacy concerns (β=0.324): advertising value and privacy concerns are important to consumer adoption attitudes in incentive-based mobile advertising. In Model 15, while considering the factors of advertising value and privacy, advertising value and privacy both are shown to have significant effects on consumer adoption attitudes in regard to location-based advertising.

Regarding the effects of permission-based advertising content on advertising value, the results of linear regression analysis support *H1a*, *H1b*, *H1d* but do not support *H1c* regarding the effects of incentive-based advertising content on advertising value; the linear regression analysis supports *H2d*, *but does not support H2a*, *H2b*, *H2c*. For the effect of location-based advertising content on advertising value, the results of the linear regression analysis support *H3b* and *H3d*, *but do not support H3a*, *H3c*. Regarding the effects of advertising value and privacy concern on consumer adoption attitudes, the results support *H4a*, *H4b*, *H4c* and *H5a*. Advertising content that includes informativeness, entertainment and credibility, plays a variety of important roles in the three types of advertising value; advertising value and privacy concerns influence the consumer's attitude in regards to any adoption of mobile advertising information.

DISCUSSION AND CONCLUSION

This study explores mobile advertising service in the Taiwan market. Consumers are surveyed and statistical methods used to verify key factors of a firm's mobile advertising strategy. The contribution of this research is to incorporate advertising content [8], advertising value [8] and privacy [27] as well as consumers' adoption attitude [35] in order to construct a meta-dialogue for their relationships. Research findings provide support for the theoretical base that some advertising content factors have a significant impact on advertising value and that advertising value and privacy lead to consumer adoption intentions concerning the three types of mobile advertising.

The study findings show that in permission-based advertising, informativeness, entertainment and credibility have positive effects on advertising value. Therefore, if permission-based advertising provides practical information, entertainment properties and credibility advertising content it can increase the advertising value of permission-based advertising. Advertising value relates positively to the consumer adoption intention. Therefore, adding advertising value will enhance consumer adoption intentions concerning permission-based advertising. The findings indicate that privacy has a positive effect on consumer adoption intentions. Increasing the perception of privacy for permission-based advertising will increase the adoption intentions of consumers.

In incentive-based advertising, only credibility positively affects advertising value. Credibility enhances the value of incentive-based advertising and increases consumer adoption intentions. Therefore, advertisers must emphasize the credibility of advertising content in order to gain the trust of consumers. Furthermore, privacy still has a positive effect on consumer adoption intentions. In location-based advertising, entertainment and credibility positively affect advertising value. Hence, while possessing high entertainment value and

credibility, advertising value and the adoption intention of location-based advertising will be improved accordingly. Also, advertising value and privacy are both important for influencing consumer adoption intentions.

In academia, Ducoffe (1996) suggested that entertainment and informativeness have positive effects on advertising value while irritation produces negative effects [8]. Brackett and Carr (2001) and Haghirian et al. (2005) also argues that entertainment, credibility and informativeness have positive effects on advertising value and that irritation produces the opposite result ([4];[18]).

The study's findings indicate that values in all types of advertising will positively affect consumer adoption intentions. Furthermore, a higher perception of privacy leads to higher adoption intentions. However, when advertising value was compared to privacy in regard to consumer adoption intention, results showed that the perception of high privacy levels will not affect consumer adoption intention for both permission-based and incentive-based advertising. According to the respondents, under permission-based and incentive-base advertising, consumers recognize that they will receive those advertising messages; so, the importance of privacy is lower than that of advertising value. However, for location-based advertising, compared with mobile advertising value, privacy still has significant effects on consumer adoption intentions. Hence, location-based advertisers should not only increase their advertising value, but also pay attention to the perceived privacy concerns of consumers and promote their superior privacy mechanisms with the consumer in mind.

Mobile advertising systems are well developed throughout the world, however, in Taiwan, the mobile advertising still has not been broadly adopted by consumers. Management implications and promotional strategies are suggested as follows: (1) *Enhancing substantial information:* substantial information is important. It helps consumers to understand what they can buy, especially in permission-based advertising. Providing clear information is very important to advertising value. For example, cooperation between Nike and Yahoo has led to Nike banner ads in Yahoo! Mobile. If consumers accept this advertising, they will see the stories of eight sport stars; (2) *Increasing entertainment content:* in both permission-based and location-based advertising, entertainment features within advertising content invite consumers to browse. Consumers expected to receive both permission-based and location-based advertising. If advertisers can pay attention to entertainment features, it will increase advertising value. For example, in the collaboration between Hyundai and Sprint, if consumers view the advertising, they can download their favorite songs; (3) *Reducing irritation*: although irritation in the three types of advertising appears to have had no impact on advertising value in this study, respondents indicated that consumers accept advertising content passively; if they receive too much similar advertising, it leads to irritation. Therefore, advertisers should be careful about the frequency of mobile advertising message to avoid negative effects; (4) *Importance of credibility*: mobile advertising with real-time functions and the credibility of advertising content become very important. In this study on the three types of advertising content, consumer recognition of credibility can increase advertising value; (5) *Privacy protection:* improving privacy protection will increase consumer adoption intentions. Even with permission-based advertising and incentive-based advertising, privacy is of lower value than advertising value in the consumer's mind; advertisers should still emphasize consumer privacy protection. In summary, when

advertisers send mobile advertising, they should ensure they are providing substantial information, increasing entertainment, reducing irritation, and emphasizing both credibility and privacy protection, thereby increasing advertising values and encouraging consumer adoption intentions

More smart phones are being promoted by firms and being adopted by consumers than in the past. Advertisers should pay attention to the application of mobile phone ads. For instance, advertisers can provide simple and timely advertising to attract consumers using location-based advertising, especially in the travel and tourism industry. Regarding incentive-based advertising, providing various benefits (e.g. money rewards or no-charge application software) to increase the browse rate of mobile ads is useful. In permission-based advertising, providing customized ads targeting the various characteristics of customers is important. These methods can be adapted to a variety of industries. The limitation of this research is that it is based on only 343 respondents. However, respondents who are involved in the adoption decision of mobile advertising decision. Future research could extend the scope of samples, and add other discussion factors, such as risk attitudes, and various user types to expand the conceptual framework. A broader approach (e.g. multidimensional scale, structure equation model, etc.) would be valuable in analyzing the causal relationships among the factors.

ABSTRACT

This study applies Grifell-Tatjé and Lovell's (1999) profit change decomposition methodology to analyze the profit changes of Taiwan's semiconductor industry, including designs, fabrications, packaging and testing firms during the period 2005-2007. The profit change will be decomposed into three sources: (1) the productivity effect (including the technical change effect and operating efficiency effect), (2) an activity effect (including product mix effect, resource mix effect and scale effect), and (3) price effect. From the decomposition, we can not only understand the total profit change but also the relative contribution of each effect on the total profit change. From the decomposition results of the profit change can provide useful information to the managers of Taiwan's semiconductor industry to the establishment of future profit enhancement strategies.

Keywords: Data envelopment analysis, Profit, Productivity, Semiconductor industry.

INTRODUCTION

When the growing demand for knowledge-based products and services are shaping the global economic landscape, the role of knowledge in achieving competitive advantage has become a major consideration in management. And the semiconductor industry plays an important role in Taiwan's Economic activities. Table 1 shows Taiwan Semiconductor industry Production Output Value which involves design, fabrication, package, and test output value. In 2008, the output value of the IC design industry has accounted for 25.8% of the world, ranking the second in the world. The output value of Taiwan's IC foundry industry has accounted for 67.2% of the world. The IC packaging industry ranks the world's first. Therefore, the relative performance of Taiwan's semiconductor industry is an important topic. Huang (2007), Chen (2008), and Huang (2008) analyze the operational efficiency of Taiwan's semiconductor industry based on the productivity approach. On the other hand, Chen (2004) uses the cost efficiency approach to analyze the semiconductor industry. Liu and Wang (2008) employ data envelopment analysis (DEA) to measure the Malmquist productivity of semiconductor packaging and testing firms in Taiwan. They use slacks-based measurement (SBM) and Super-SBM models to obtain more accurate measurements. They also made comparisons between the results from SBM, Super-SBM and CCR models. Lu and Hung (2010) use DEA

to measure the operating performance of the vertically disintegrated chain in the integrated circuits (IC) industry. And the research indicates that the IC design firms perform better than IC fabrication and IC packaging/testing firms. Altogether, semiconductor firms in Taiwan still have room for performance improvement. In addition, the empirical results suggest that an IC company's scale of size does play an important role in influencing its operating efficiency.

Table 1 Taiwan Semiconductor Production Output Value Unit: Hundred Million NT$

	2004	2005	2006	2007	2008
IC Design	2,608	2,850	3,234	3,997	3,749
IC Fabrication	6,239	5,874	7,667	7,274	6,542
IC Package	1,566	1,780	2,108	2,280	2,217
IC Test	577	675	924	1,023	965
IC total output value	10,990	11,179	13,933	14,574	13,473

Most previous studies focus on the relative performance of the semiconductor industry. But few studies analyze the linkage between the source of profits and the relative performance of Taiwan's semiconductor industry. Sahoo and Tone (2009) use radial and non-radial methods to decompose the input-based physical capacity utilization into technical inefficiency, ray economic capacity utilization and optimal capacity idleness of the India banks. Coelli, Grifell and Perelman (2002) use a ray economic capacity to decompose the gap between the capacity utilization and the optimal capacity utilization of the international airline companies. Lim and Lovell(2009) apply a different decomposition approach to the unbalanced panel of US Class I railroads, a short-run profit change decomposition model is used to attribute intertemporal profit change to its causal factors. This study finds that productivity improvements and an increased scale of production contributed to increases in profit, and that variation in operating efficiency had a mixed impact on profit. And this study also finds that relative changes in rail rates and variable input prices exerted downward pressure on profit. Asaftei (2008) divides the changes in ROA of the US commercial banks and analyzes the impact of financial innovations and deregulation. Hadley and Irz (2008) implement the profit change decomposition methodology developed by Grifell and Lovell (1999) to investigate profit changes for cereal farms drawn from the Farm Business Survey in England and Wales for the period 1982 to 2000. The results of the analysis show an overall decline in profit levels. Tseng (2007) applies Grifell and Lovell's (1999) decomposition approach to the banking industry of Taiwan and investigates the influence of profit change during the Asian financial crisis and economic recessions in Taiwan.

According to previous literatures, no one have applied the decomposition approach to Taiwan's semiconductor industry, therefore our study applies Grifell and Lovell's (1999) decomposition approach to analyze the profit changes of Taiwan's semiconductor industry. The profit change will be decomposed into three sources: (1) the productivity effect (including the technical change effect and operating efficiency effect), (2) an activity effect (including product mix effect, resource mix effect and scale effect), and (3) price effect. From the decomposition, we can not only understand the total profit change but also the relative contribution of each effect on the total profit change.

This study uses Data Envelopment Analysis to decompose the profit change of Taiwan's semiconductor industry. Following Grifell and Lovell(1999), firstly, the profit change will be decomposed into the price effect and the quantity effect. Secondly, the quantity effect will be decomposed into the productivity effect and the activity effect; the productivity effect will be decomposed into the operating efficiency effect and the technical change effect; while the activity effect will be decomposed into the scale effect, the resource mix effect and the product mix effect. From this study, we hope that the decomposition results of the profit change can provide useful information to the managers of Taiwan's semiconductor industry to the establishment of future profit enhancement strategies.

METHODOLOGY

The Production Technology

We consider a business using N resources represented by the nonnegative input quantity vector $x=(x_1,...,x_N)$to produce M products represented by the nonnegative output quantity vector $y=(y_1,...,y_M)$. The business pays resource prices represented by the strictly positive input price vector $w=(w_1,...,w_N)$, and receives product prices represented by the strictly positive output price vector $p=(p_1,...,p_M)$. These prices may be exogenously determined by the forces of market competition, or by a regulatory agency, or they may be endogenously determined by the business itself. Business profit in period t, π^t, is defined as the difference between total revenue and total cost, and $\pi^t = p^t \times y^t - w^t \times x^t = \sum_i p_i^t y_i^t - \sum_i w_i^t x_i^t$, $t=1,2,...,T$. We are interested in identifying the determinants of the change in profit from one period to the next, ($\pi^{t+1} - \pi^t$), which can be positive, zero, or negative.
We now provide the structure of production technology. The production set in period t is the set of output quantity vectors and input quantity vectors that is feasible with technology in place in period t :

$$S^t = \{ (y^t, x^t) : y^t \text{is producible with } x^t \}, \quad t=1,2,...,T$$

An output set is the set of all output quantity vectors that are producible with a given input quantity vector and with the technology in place, and is defined in terms of S^t as following:

$$P^t(x^t) = \{ y^t : (y^t, x^t) \in S^t \}, t=1,2,...,T$$

Output sets are assumed to be closed and convex, and to satisfy strong disposability of outputs. The outer boundary of an output set is its output isoquant

$$\text{Isoq } P^t(x^t) = \{ y^t : y^t \in P^t(x^t), \lambda y^t \notin P^t(x^t), \lambda > 1 \}, t=1,2,...,T$$

The output sets [$P^t(x^t)$ or $P^{t+1}(x^{t+1})$] are within-period output sets containing the set of output quantity vectors which could be produced by an input quantity vector with technology prevailing in that same period. We also make use of the mixed-period output sets $P^{t+1}(x^t)$, which contain the hypothetical but analytically useful set of output quantity vectors which input quantity vector x^t could have produced with the help of technology prevailing in the subsequent period $t + 1$; and $P^t(x^{t+1})$, which contains the equally hypothetical and equally useful set of output quantity vectors which input quantity vector x^{t+1} could have produced had

it been forced to use technology prevailing in the previous period t. Mixed-period output isoquants Isoq $P^{t+1}(x^t)$ and *Isoq* $P^t(x^{t+1})$ are the outer boundaries of these mixed-period output sets, and are interpreted similarly.
An output quantity vector y^t must belong to its contemporaneous output set $P^t(x^t)$, but it need not be located on its outer boundary Isoq $P^t(x^t)$. We need a measure of the distance from an output quantity vector y^t to Isoq $P^t(x^t)$.
A within-period output distance function is defined in terms of a within-period output set as
$D_o^t(x^t, y^t) = \min\{\phi : y^t / \phi \in P^t(x^t)\}$
$D_o^t(x^t, y^t) \le 1$ because $y^t \in P^t(x^t)$, and $D_o^t(x^t, y^t) = 1$ mean $y^t \in Isoq\ P^t(x^t)$. Thus $D_o^t(x^t, y^t) = 1$ signals that x^t is producing maximum feasible output with technology prevailing in period *t*, and $D_o^t(x^t, y^t) < 1$ suggests that x^t is producing only $[100 \times D_o^t(x^t, y^t)]\%$ of maximum feasible output with technology prevailing in period *t*.

An *input set* is the set of all input quantity vectors capable of producing a given output quantity vector with technology prevailing at the time, and so
$L^t(y^t) = \{x^t : (x^t, y^t) \in S^t\}, t = 1,2,...,T$

Input sets are assumed to be closed and convex and to satisfy strong disposability of inputs. The inner boundary of the input set is its *input isoquant*
$Isoq\ L^t(y^t) = \{x^t : x^t \in L^t(y^t),\ \lambda x^t \notin L^t(y^t),\ \lambda < 1\}, t = 1,2,...,T$

Mixed-period input sets $L^{t+1}(y^t)$ and $L^t(y^{t+1})$ are defined exactly as mixed-period output sets ,and mixed-period input isoquants Isoq $L^{t+1}(y^t)$ and Isoq $L^t(y^{t+1})$ are defined as mixed-period output isoquants. Although an input quantity vector x^t must belong to the input set $L^t(y^t)$, it need not necessarily belong to its inner boundary Isoq $L^t(y^t)$.

An input distance function, which is the reciprocal of the Debreu–Farrell input-oriented measure of operating efficiency, provides a radial measure of the distance from an input quantity vector to an input isoquant. It is defined as:
$D_i^t(y^t, x^t) = \max\{\theta : x^t / \theta \in L^t(y^t)\}$
$D_i^t(x^t, y^t) \ge 1$ since $x^t \in L^t(y^t)$, and $D_i^t(x^t, y^t) = 1 \Leftrightarrow x^t \in Isoq\ L^t(y^t)$. Mixed-period input distance functions $D_i^{t+1}(x^t, y^t)$ and $D_i^t(x^{t+1}, y^{t+1})$ are defined in the same manner as mixed-period output distance functions, and $D_i^{t+1}(x^t, y^t) \gtreqless 1$ and $D_i^t(x^{t+1}, y^{t+1}) \gtreqless 1$.

Profit Change Decomposition

In this section, we will decompose business profit change between periods *t* and *t* + 1. The method is to proceed in three stages, which are described in Figure 1. In the first stage we decompose the profit change resulting from a movement from (x^t, y^t) to (x^{t+1}, y^{t+1}) into a pure quantity effect that holds prices constant, and a pure price effect that holds quantities constant.

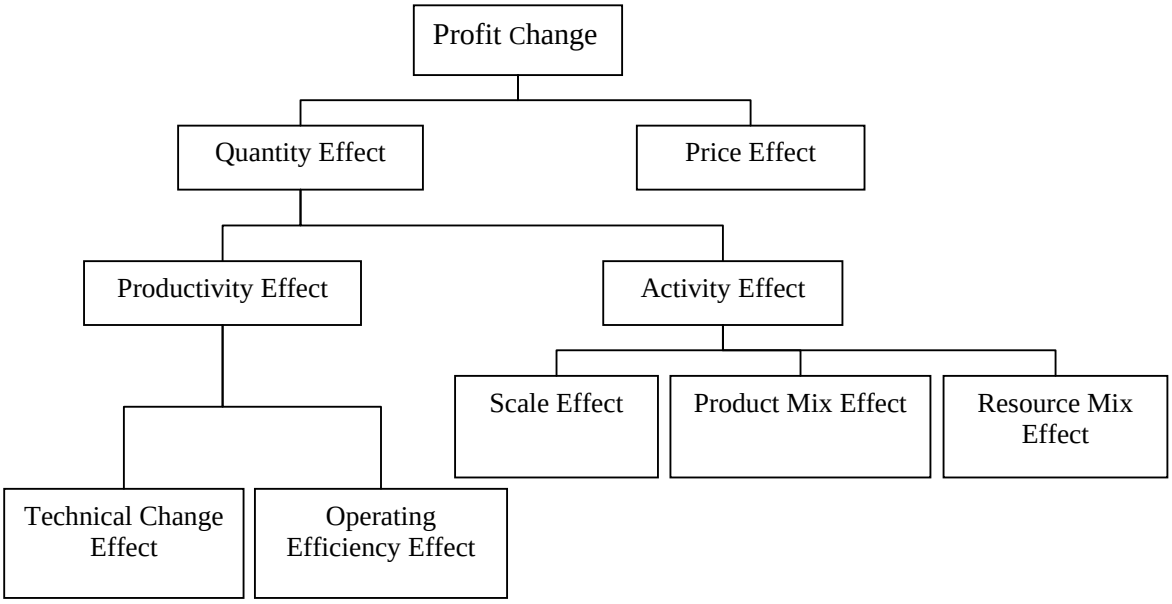

Figure 1. The Profit Chang decomposition

1. The profit change between period t and period t + 1 decomposes as:

$$\pi^{t+1} - \pi^{t} = \left[p^{t} \times \left(y^{t+1} - y^{t}\right) - w^{t} \times \left(x^{t+1} - x^{t}\right)\right] + \left[\left(p^{t+1} - p^{t}\right) \times y^{t+1} - \left(w^{t+1} - w^{t}\right) \times x^{t+1}\right]$$

quantity effect ***price effect***.

The profit change between period t and period t + 1 decomposes as quantity effect and price effect. The quantity effect shows the impact on profit of an expansion or contraction of the business, holding prices fixed. The price effect shows the impact on profit of changes in the price structure of the business, holding quantities fixed.

2. The quantity effect between period t and period t + 1 decomposes as

$$\left[p^{t} \times \left(y^{t+1} - y^{t}\right) - w^{t} \times \left(x^{t+1} - x^{t}\right)\right]$$
$$= \left[\left(p^{t}\right) \times \left(y^{B} - y^{t}\right) - \left(p^{t}\right) \times \left(y^{C} - y^{t+1}\right)\right] + \left[\left(p^{t}\right) \times \left(y^{C} - y^{B}\right) - \left(w^{t}\right) \times \left(x^{t+1} - x^{t}\right)\right]$$

productivity effect ***activity effect.***

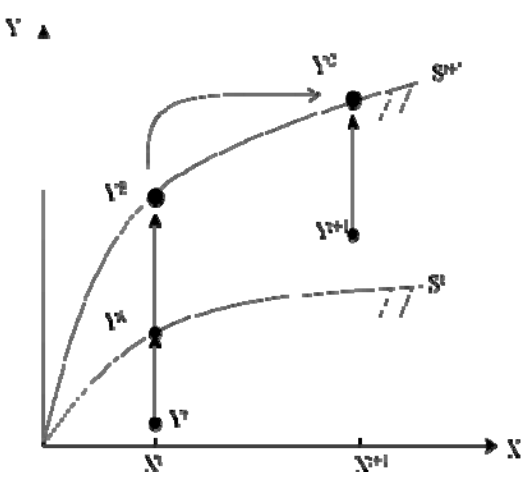

Figure 2 The Profit Decomposition (M = N = 1)

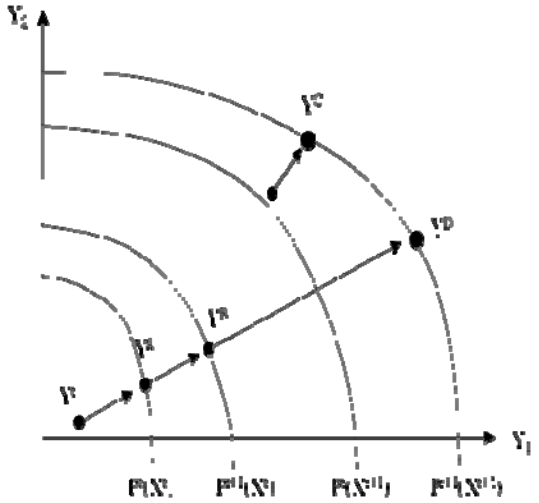

Figure 3. The Profit Decomposition (M = 2)

Figure 2 assumed that $M = N = 1$, it provides a picture of decomposition of the quantity effect. In period t (x^t, y^t) $\in S^t$ and in period $t + 1$ (x^{t+1}, y^{t+1}) $\in S^{t+1}$. The track from (x^t, y^t) to (x^{t+1}, y^{t+1}) can be decomposed into three components and this exerts an influence on profit change, with importance and guidance depending on the prices and how they change from the base period to the comparison period.

The activity effect is measured along the path from y^B to y^C, and represents the change in output ($y^C - y^B$) caused by the change in resource utilization ($x^{t+1} - x^t$). It appears that if output production increases proportionately more (less) than resource usage does then scale economies (diseconomies) cause the activity effect to contribute positively (negatively) to profit change. The activity effect is generally conceived as reflecting the consequence of changes in the scale and scope of the organization. However, there is more to the activity effect than just economies or diseconomies of scale, since the scope size of the activity effect has yet to be introduced. Moreover, both the output change and the input change are weighted by base period prices, and so the price structure matters as well. The productivity effect compares the path from y^B to y^t in period t with the path from y^C to y^{t+1} in period $t + 1$. Although (x^t, y^t) and (x^{t+1}, y^{t+1}) are observed but the output quantity vectors y^B and y^C are unobserved. Consequently, in order to make this decomposition procedure empirically useful, it is necessary to be able to find the unobserved output quantity vectors from the observed quantity data.

3. The productivity effect between period t and period t + 1 decomposes as $\left[\left(p^t\right)\times\left(y^B - y^t\right) - \left(p^t\right)\times\left(y^C - y^{t+1}\right)\right]$

$$= \left[\left(p^t\right)\times\left(y^B - y^A\right)\right] - \left[\left(p^t\right)\times\left(y^C - y^{t+1}\right) - \left(p^t\right)\times\left(y^A - y^t\right)\right]$$

technical change effect ***operating efficiency effect***.

The decomposition of the productivity effect is illustrated in Figure 2. Both the technical change effect and the operating efficiency effect influence the revenue side of profit change.

The technical change effect is the increase in output quantity ($y^B - y^A$) allowed by the improvement in technology, the output quantity increase being measured with base period output prices. The operating efficiency effect is compared the difference between period productive inefficiency ($y^C - y^{t+1}$) and base period productive inefficiency ($y^A - y^t$), both evaluated at base period output prices. The decomposition of the productivity effect is also illustrated in Figure 3. In Figure 3, which allows M = 2, the technical change effect is the equiproportionate increase in output quantities ($y^B - y^A$) allowed by the improvement in technology [$P^{t+1}(x^t) \supset P^t(x^t)$], measured with base period output prices. The operating efficiency effect is the difference between comparison period productive inefficiency ($y^C - y^{t+1}$) and base period productive inefficiency ($y^A - y^t$) are evaluated at base period output prices.

4. The activity effect from period t to period t + 1 decomposes as

$$\left[\left(p^t\right)\times\left(y^C - y^B\right) - \left(w^t\right)\times\left(x^{t+1} - x^t\right)\right]$$
$$= \left[\left(p^t\right)\times\left(y^C - y^D\right)\right] - \left[\left(w^t\right)\times\left(x^{t+1} - x^t\right)\right] + \left[\left(p^t\right)\times\left(y^D - y^B\right) - \left(w^t\right)\times\left(x^E - x^t\right)\right]$$

product mix effect resource mix effect scale effect.

The decomposition of the activity effect is not adequately illustrated in Figure 2, because the movement from y^B to y^C combines the scale effect with the product mix effect and the corresponding movement from x^t to x^{t+1} combines the scale effect with the resource mix effect. The scale and product mix effects are disentangled in Figure 3. In Figure 3 the output side of the scale effect holds the product mix fixed along the path from y^B to y^D which used base period output prices to estimate the adjustment, as input use increases from x^t to x^{t+1}. The product mix effect is measured along the path from y^D to y^C which used base period output prices to evaluate the adjustment. The sum of the scale effect and the product mix effect produces a movement from y^B to y^C, which corresponds to the output side of the activity effect.

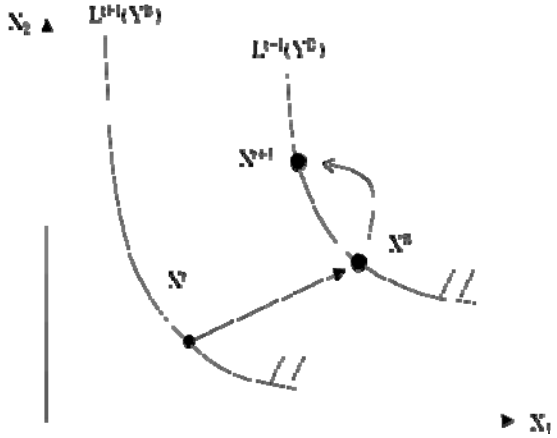

Figure 4 The Profit Decomposition (N = 2)

The final decomposition is illustrated in Figure 4, partial because the output quantity vector is fixed either at y^B or at y^D. In Figure 4, which allows N = 2, the input side of the scale effect holds the resource mix fixed along the path from x^t to x^E using base period input prices to evaluate the adjustment. The resource mix effect is measured along the path from x^E to x^{t+1}, it

also use base period input prices to evaluate the adjustment. The total of the scale effect and the resource mix effect produces a movement from x^t to x^{t+1}, which corresponds to the input side of the activity effect.

Decomposition step 1-4 and Figures 2–4 aim to prove that is possible to decompose the profit change come of producer's movement from (x^t, y^t) to (x^{t+1}, y^{t+1}) into several sources in principle, even in the multiple input and multiple output case. Through the profit change dismantling process, profit change can decompose into the six major sources: price effects, operating efficiency effect, technical change effect, scale effect, resource mix effect and product mix effects. And the six sources are mutually exclusive and exhaustive sources of profit change between period t and period $t + 1$.

EMPIRICAL RESULTS

The data are from the Taiwan Semiconductor Firms' List published by Taiwan Semiconductor Industry Promotion Office. And we use the Grifell-Tatjé and Lovell's (1999) profit change decomposition methodology to analyze the performance changes in semiconductor design, fabrications, packaging and testing firms in Taiwan for the period for 2005- 2007. There are 92 companies in this category, and the calculations are based upon two inputs: operating cost, employees, and two outputs: domestic value, export value. All data were retrieved from Taiwan Economics News Service (http://tej.com.tw) and Market Observation Post System (http://newmops.tse.com.tw). The data presented in this paper has been normalized and/or transformed as required.

Table 2.Profit Change Decomposition for Taiwan Semiconductor industry during 2005–2007

Unit: Thousand NT$

Year	profit change	=	quantity effect	+	price effect
2005-2006	13,747,143		11,048,507		2,698,636
2006-2007	55,968,320		60,115,250		-4,146,930
Average	34,857,732		35,581,879		-724,147

In table 1, the profit change is positive in 2005-2007 most of profit coming from quantity effect. On the average, quantity effect is a positive effect and price effect is a negative effect to the profit.

Table 3.Quantity effect decomposition for Taiwan Semiconductor industry during 2005–2007

Unit: Thousand NT$

Year	quantity effect	=	productivity effect	+	activity effect
2005-2006	11,048,507		5,094,729		-5,953,778
2006-2007	60,115,250		31,673,261		-28,441,989
Average	35,581,879		18,383,995		-17,197,884

The productivity effect has contributed positively to quantity effect however activity effect has contributed negatively to quantity effect in every year 2005–2007.

Table 4.Productivity effect decomposition for Taiwan Semiconductor industry during 2005–2007

Unit: Thousand NT$

Year	productivity effect	=	technical change effect	+	operating efficiency effect
2005-2006	5,094,729		39,843,666		34,748,937
2006-2007	31,673,261		72,710,528		41,037,267
Average	18,383,995		56,277,097		37,893,102

The technical change effect in every year is positive effect as well as operating efficiency effect. The technical change effect and operating efficiency effect have contributed positively to productivity effect in every year 2005–2007. Generally, the productivity effect was positive contribution to profit change.

Table 4.Activity effect decomposition for Taiwan Semiconductor industry during 2005–2007

Unit: Thousand NT$

Year	activity effect	=	product mix effect	+	resource mix effect	+	scale effect
2005-2006	-5,953,778		3,569,425		7,926,072		-1,597,131
2006-2007	-28,441,989		-23,840,348		5,722,888		1,121,246
Average	-17,197,884		-10,135,462		6824480		-237943

Table 4 indicates the product mix and resource mix effects are positive contribution but the scale effect is negative during 2005-2006; the scale effect and resource mix effect are positive contribution but the product mix effect is negative during 2006-2007. Generally, the resource mix effect was positive contribution however the product mix and scale effect were negative contribution to activity effect.

CONCLUSION

This study applies the profit decomposition approach employed by Grifell-Tatjé and Lovell (1999) to decompose the profit change in order to obtain in-depth information by analyzing each individual component. This study has explained the profit decompositions using data describing the operations of a sample of Taiwan Semiconductor Firms. We are able to implement the decompositions for each firm and the results of the decomposition of the profit change can provide useful information to the managers of Taiwan's semiconductor industry to the establishment of future profit enhancement strategies. In this paper, the result indicates average profit change is positive in Taiwan Semiconductor industry during a period of 2005-2007; the quantity effect, productivity effect, technical change effect, operating efficiency effect and resource mix effect are positive; the price effect, activity effect, product mix effect and scale effect are negative to profit change.

INNOVATION TRIGGERS AND ROLE OF INDIAN EDUCATIONAL INSTITUTES.

Dr H.G.Joshi, Reader, Manipal Institute of Management.

ABSTRACT

In the new millennium the daunting challenge of eradicating unemployment and underemployment among educated youths should be accepted collectively by the Government, Universities, Business Schools, Students and Industrial forums. Universities are centres of learning and have always been places where the skills and knowledge of students are chiseled to suit the requirements of the work place. The interactions of the students of the University with local industry and several socio-economic organizations would be useful in understanding the dynamics of business. 'Globalization' has created an inter-related and an inter-linked world, generating opportunities and also throwing up challenges. In order to cope up with these challenges education system must respond to these changes and without compromising on quality. Keeping in view the technological change and impact of globalization on job requirements, innovative approach in the design of the curriculum, organizational policies and practices and of course faculty attitude need to be modified. Using US model of reaping 70% of GNI from Small Businesses, India should also take a coordinated and integrated approach in executing the already framed plans in true spirit to excel by transforming job-seekers into job-providers. The role of educational institutes is undoubtedly to enhance students' knowledge which helps them to earn their bread and butter. Students who join various courses will have apprehensions regarding their career prospects. Institutions, on the other hand need to provide curricula that can match Industry i.e. expectations and add value to education. This calls for innovative ways of doing things. This paper describes the initiative of Indian Universitys in general and Manipal University in particular to transform knowledge of students and faculty towards building an innovative world through BOP experiment.

Keywords: Entrepreneurship, positive environment, Gross National Income, Base of the Pyramid (BoP).

Innovation triggers and Role of Indian Educational Institutes.

"Preparing today's students for success and eventual leadership in the new global marketplace is one of the most important responsibilities in education today.
-**John T. Chambers,** Chairman and CEO, Cisco

Universities aiming at world class standards would act as exemplars for other universities in benchmarking standards of teaching and research to those prevailing in the best universities in the world. There is no doubt that India possesses a number of educational institutions that have made their mark, and will continue to make their mark, on the world stage. But the rise of this country to become one of world's economic powerhouses begs for expansion in

India's higher education system. India is already the world's largest democracy. In two decades, it will be the most populated country in the planet, and by 2050, it is likely to become the second largest economy in the world.

The process of globalization along with rapid advances in Science and Technology has created an inter-related and an inter-linked world, generating opportunities and also throwing up challenges. In order to cope up with these challenges, education system must respond to these changes without compromise on quality. Quality faculty is important to maintain high standards of Universities, so that world class graduates, post-graduates and Doctoral students are produced. This is the challenge of the future, which all Indian Universities have to overcome jointly with the Government. Universities are centres of learning and have always been places where the skills and knowledge of students are chiseled to suit the requirements of the work place. The interactions of the students of the University with local industry and several socio-economic organizations would be useful in understanding the dynamics of business. Keeping in view the technological change and impact of globalization on job requirements, innovative approach in the design of the curriculum, organizational policies and practices and of course faculty attitude need to be modified. Using US model of reaping 70% of GNI from Small Businesses, India should also take a coordinated and integrated approach in executing the already framed plans in true spirit to excel by transforming job-seekers into job-providers. The role of educational institutes is undoubtedly to enhance students' knowledge which helps them to earn their bread and butter. Students who join various courses will have apprehensions regarding their career prospects. Institutions, on the other hand need to provide curricula that can match Industry i.e. expectations and add value to education. This calls for innovative ways of doing things. India has the necessary potential to become a global leader in the knowledge economy. However, this cannot be achieved without the universities playing a prominent and leading role. Globally, higher education is poised to become more responsive to societal needs. Although many developments have taken place in the Indian higher education system, it still has to come to terms with modern society.

The Role of Universities:

-Need for innovation and skill oriented education:

In the words of Honorable President of India, Mrs Prathibha Patil –
"In India the problem is more of employability, than of unemployment. The skills that people have are not appropriate for securing employment. Universities are centers of learning and have always been places where the skills and knowledge of students are chiseled to suit the requirements of the work place. Universities help a nation in giving it economic vitality, scientific prowess, a broad outline of social change and global competitiveness, through innovation and research".

With 54 crore youth, India has one of the largest young populations of the world. A nation, that is growing, requires a talented and well trained population to harness opportunities into visible and concrete results. Globally, higher education is poised to become more responsive to societal needs. The university outreach programme concept is fast picking up globally, and many universities use it for community development and building relationships with

industries. The need is to find ways of use the 'whole' university, incorporating the various recent developments and meeting the requirements of various stakeholders of higher education.

R&D and India- need for Innovation

In India the system of innovation remains rather weak and fragmented (Chaminade and Vang, 2006a and 2006b, Vang et al 2007). The collaboration with other firms, final users or universities is very limited. And the importance of the home market neglectable. Even though India is catching up in terms of accumulating S&T capabilities, the capacity to transform those resources into new products and new services is still rather limited.

According to the famous columnist Thomas L. Friedman (Friedman, 2005). China and India will become the new innovation power houses of the world. Indeed, in just one decade the number of firms locating R&D departments in India and China has grown very rapidly. In 2005 China and India were hosting 18% of the world R&D sites (only 8% in 1997) (UNCTAD, 2005). Only that year, 252 new foreign direct investments in R&D projects were located in China & India (80% of South, East and SE Asia). India is currently considered to be the second most popular destination of offshore R&D for certain industries (The Economist Intelligent Unit, 2007). Looking at this numbers, there is no doubt that there is something happening in that corner of the world and that there are reasons to be watchful. There is a very extensive stream of literature on innovation studies that highlights that there is a very long way between investments in research (R&D) and innovation (launching new products, processes or services in the market). Innovation is definitively not a linear process that starts with R&D but is the result of a complex interactive process (Kline and Rosenberg, 1984), where new ideas emerge as a result of the interaction with universities, other firms, etc.

Role of Universities in Innovation:

Mr Kapil Sibal, Minister for Higher Education opines that A great research university is not built from the bricks and mortar of its campus, but of the students and scholars who inhabit it, and the discourse and ideas they share. A university exists not for the purpose of handing out diplomas to those who go through its doors, but to advance knowledge and to educate young people to become critical thinkers and society's leaders. A world-class university avails its students not just of courses of study, but of an environment that facilitates learning and growth in all areas of human endeavor. At the most fundamental level, a world-class university contributes to the world in three ways: through research, through education, and through institutional citizenship.

First, by facilitating advancements in science, technology, and medicine, research universities help spur economic prosperity and the advancement in the health and quality of life in communities across the world.

Second, by educating students, great universities prepare the next generation of leaders, leaders who will be able to tackle new problems and new situations with maturity and flexibility and who see the world with curiosity and an open mind.

Third, by acting as models of institutional citizenship, world-class universities contribute to the betterment of society and instill in their students social responsibility and an appreciation of service to their communities.

How to achieve it:

-Inspiring innovation

In a "knowledge economy," nations prosper by virtue of their capacity to innovate – to develop and introduce new products, processes, services, and even, new ways of thinking. The extent to which such innovation happens is a function of the continuing advance of science. As the principal source of basic research, comprehensive universities play a fundamental and irreplaceable role in encouraging economic development and national competitiveness. This basic research is motivated by the quest for intellectual discovery, not some practical objective-but in the long run, it is the wellspring for all commercially oriented research and development. That fact, that fundamental research occurs within the university – rather than in government laboratories, non-teaching research institutes, or private industry – is an essential element of allowing a university to realize its full potential. When researchers are isolated in research institutes, students – especially undergraduates are deprived of exposure to first-rate scientists, their methods, and their research.

The research undertaken in universities must not stay in the academic buildings and laboratories where it is born. To drive national innovation, it must move from theory to practice, and the university plays a key role in this process as well. Engagement with industry is a central function of the modem research university, as commercializing faculty inventions benefits both the university and the broader society.

-Training future leaders

Second, just as faculty members contribute, through their scholarship and research, to the intellectual vigor of their nation and the world, they also serve to shape the future leaders of their nation and, again, the world. The phrase "the knowledge economy" that is so often spoken about would seem to suggest that universities impart to young people what is most obvious – that is, knowledge. But the best universities do not practice the mere transfer of knowledge from teacher to student. They focus not on the mastery of content, but on the development of their students' capacity for independent, critical thinking.

Universities exist to teach young people how to think, not what to think. Professors must serve as mentors, as sources of inspiration, not merely as lecturers and graders. Students, too, should not find their development limited to the classroom.

- Bettering society

A university leads by example, both in its local community and in the-world. Acts of institutional citizenship have benefits on two levels: they represent a positive force for human welfare, and they also inspire students to embrace social responsibility in their own lives. The global economy places great emphasis on science-rooted technologies. Hence university-

educated students and university–industry research collaborations have become the focus of future plans of both government and industry worldwide. Traditional academic and business cultures have begun to accommodate each other in mutually supportive arrangements in the larger interests of a global economy.

Manipal University and BOP Initiative:

Manipal University is a name to remember, not just across the length and breadth of India, but worldwide. The fact that students from 52 countries are studying here is a testimony to this fame. Fired by the desire to provide health care and other essential services to the people of this region, Dr TMA Pai transformed the plateau into what it now is. He turned the wilderness into a sanctuary of education.

Located on the west coast of South India, Manipal was a barren wasteland, a plateau with wild animals. It was this plateau that Dr TMA Pai decided to change. His vision for Manipal covered a wide spectrum of interests because he himself donned many hats. Then in 1993, MAHE was accorded a deemed university status under Section 3 of the UGC Act 1956, by the Ministry of Human Resource Development, Government of India. Today, it has 20 constituent institutions comprising medical, dental, engineering, architecture, nursing, allied health, pharmacy, management, communication, information science, hotel management, biotechnology, regenerative medicine etc. The university offers Bachelors', Masters' and Doctoral degrees in various specialties.
The University provides excellent educational facilities to over 17,000 students in its constituent colleges. It also has an active alumni base of over 65,000 students across the world.

With all the experience gained from producing several thousands of graduates, backed by experienced faculty, excellent academic and clinical facilities, Manipal University boasts of an educational environment with a touch of world class.

Manipal University is providing the finest infrastructure and facilities to its students for learning and research. In fact some of the facilities, like the Innovation Centre, have served as a valuable 'incubation centre' for industry and research. The state-of-the art innovation centre bridges the gap between university and industries for industrial academic research.

Base of the Pyramid (BOP) Approach:

Over the past three years, Manipal University and Philips have been working together to acquire a greater understanding of the challenges and opportunities in addressing the emerging consumer, earlier known as Base of the Pyramid. A chair was setup at Manipal University to promote- Idea Generation, Concept Development, Research, Community Development, Rural Linkages and Student Exchange programmes. This partnership started with more funding of projects at Manipal University. This attempt has now matured to include ideation, market data collection and prototyping of ideas into proofs of concepts. Philips brought to the table the industry perspective on commercialization of ideas, concepts on IP generation, infrastructure and access to the best talent within the company. In turn Manipal University contributed diversity of disciplines that is unique to a well-grown

University. We have experts from technical, managerial, life science and healthcare sitting around the same table creating ideas and solutions for the prospective consumers.
Both Philips and Manipal University have shared this experience with other likeminded parties from industries, the academia, NGOs and Government Organisations. The ambition is to create an ecosystem built around ' Open Innovation' that will ultimately meet the aspirations of emerging consumers. This has resulted in the collaboration with other organizations such as MS Swaminathan Research Foundation (MSSRF), kTwo Technology Solutions, Intel, Electrocare Systems and Perfint Health care Solutions, Nokia Research, Intellectual Ventures etc. in this program.

The Innovation platform at Manipal

Avishkara (Idea Generation): The broader theme for the awareness session is ' development of cost effective solutions and services for emerging consumer segment'. Over a period of time Manipal BOP has developed a platform which helps Idea Generation, Submission, Evaluation and shortlisting of the ideas. It has also built a cross disciplinary team consisting of students and staff from various disciplines such as science, engineering and Management groups. So far approximately 220 ideas in the areas of healthcare, lifestyle, education, energy, nutrition, community development have been selected for the processing. Each one is a new business idea and can be translated into a product or service.

Ankura (Proof of Concept): The purpose of this exercise is to develop ' Proof of Concept' through knowledge integration. The concept development project activities are carried out in 'multi-disciplinary customer centric innovation' with student interns sponsored by industry. The tasks are mainly concept enrichments based on a User Need Analysis, Technology development and Patent and Design. Under this programme, nearly 20 concepts have been developed through multi-disciplinary teams comprising medical, technology and management teams.

Arpana (Market Analysis and BOP knowledge development) : The basic idea behind this programme is understanding the pulse of BOP community and providing the solutions at the grassroots level. Various projects are undertaken to carryout the following:

- User research study for designing the solutions for BOP
- Market analysis to understand the felt needs at the grassroot level
- Process model for Local development of the products
- Development of BOP knowledge base.

As a result of the above programme, more than 40 studies have taken place to identify market trends, 15 user research studies for designing products for BOP consumers, enabling IT for Manipal Rural health care delivery model, publication of Book on BOP integrated approach and knowledge portal.

Role of Manipal University

Manipal University has taken the initiative to make several innovations in nurturing student's innovative capabilities through BoP platform.

Idea Generation workshops, Student Internship Programmes, Problem Based Student Projects, Research to Product Scheme are a few to highlight. All constituent institutes take part in the programmes and hence provide a wide spectrum of interested student and faculty stream. It has experimented a novel idea of ideation workshops, wherein, societal problems are kept in mind. Each institute while conducting their Ideation Workshops takes into account their field of interest, available resources and social problems to be addressed. It is a multi disciplinary approach where any short fall in the resources will be discussed with other institutes through a mechanism and thus will be able to carry forward the idea germinated to the next level.

The experience

Students of various disciplines were grouped taking into account their educational background. Accordingly, each heterogeneous group was made to understand the problems of the given theme and find out the best solution to it in terms of a product or service. The exercise was carried out on a weekly basis and the outcomes were recorded. In each stage of a new idea, faculty experts in the said field accompanied students' groups in polishing the idea germination stream. The ideas, after screening by the faculty experts were tried into their technical and other necessary requirements in the second stage of workshop. The result was so productive that almost 14 ideas only in the field of child and health care could be transformed into a product/ service. The rest of teams who were entrusted with the work of Market Research now became active to sense the marketability of such new products. Hence, Institutes of Manipal University has been contributing its inputs and expertise in the operation of BOP initiative of Manipal University. The role of each institute is to provide expertise and from the operational view point, each institute has a Coordinator to who will provide useful link to other teams for expert services.

The Basic MANTRA followed:

1. Explicit the assumptions: To unlock innovation one should start by exposing the rules and behaviors inside one's institution that might be hindering innovation in the first place. Often times more important than getting answers is asking the right questions.
2. Challenge the assumptions: The second step is to challenge the outlined assumptions. Ask oneself "what if we decided to do the complete opposite?".
3. Welcome failures: One need to pursue failure to innovate and consequently to succeed.
4. Use multiple sources of innovation: Innovation can emerge from anybody surrounding us. Keeping eyes, ears open to explore new idea is the mantra of success.
5. Go beyond product innovation: Instead of focusing exclusively on product innovation one should think how they can innovate their processes, their structure, their business model and even their market.
6. Spot changes both as threats and opportunities: Each time focus on threat and apply reverse thinking process to modify the threat part of the idea.
7. Execute: Good ideas come from acting and not from thinking. Many people sit in front of the drawing table and try to come up with the so-called "killer application" or the "next big thing". This is a plain waste of time.

Learning's for the Constituent Institutes:

Through the above exercises, Each Institute could deliver right kind of goods to its students. As it is clear that students' expectations are very high when they join the course, they were highly satisfied when they were asked about their experience in such workshops. This type of exercise is very useful in attaining the vision of the institute and thus goes along with University Mission. The reality is as a University, it could oblige the students by providing the following:-

1. The alternative for job: Students, instead of job oriented study, will focus on strengthening their innovative skills. In due course of time, they can be best- suited to any kind of situations.
2. Employability: The employability and marketability increases compared to any other traditional Universities.
3. Knowledge pooling: With lots of fellow team members, students' capacity to pool knowledge increases. At the same time, University can also make use of such information as the base of future activities.
4. Interesting and interactive sessions: More focus on interaction can be given and thus even the class rooms become their laboratory.
5. Healthy environment and understanding between Constituent Institutes
6. Friendly Faculty-student relationship through out the University
7. Innovative spirit among the student community
8. Positive contribution to the social and economical problems.

Learning for the University:

Manipal University could achieve success in delivering Knowledge due to its committed and concerned effort. In the process the following emerged as the results:

1. Multi disciplinary team: A multi disciplinary team comprising of experts from Medicine, Engineering, Information System, Industry and Management is available for projects and consultancy.
2. Research to Product: Faculty and students concentrate more on issue based research and such articles published validate their concept thus leading to a new product or process.
3. Rural Based Study: With the BoP platform, exploring the potential market of BoP and providing useful community service is made possible. Students and faculty could gauge the real problems of rural people and could find out viable solution to them. In real sense this should be the priority of every Indian University.
4. Industry-Academia Linkage: Even though it is difficult to trace the primary-secondary relationship between Academics and Industry, in true sprit, both students and faculties do keep in touch with Industries for matters like Industrial projects, Student and Faculty exchange programmes, Board of Studies, etc.
5. NGO Linkages: Manipal University also has NGO linkage as the direct impact of BoP initiative.

CONCLUSION

The role of a University can be multidimensional in nature. Apart from producing a good number of graduates, it can also aim at producing good citizens who are capable of transforming present social, economical and political problems into opportunities. The students are mostly unaware of such opportunities and therefore it is the responsibility of every University to provide and nurture the innovative instinct of students admitted. If needed 'Innovative thinking and New idea generation' could be the part of the curriculum so that everybody will be in a position to experience the beauty of knowing one's own potential. Positive climate of such nature open up not only the students' innovative ability but also transform their ways of thinking in all parts of their life.

A KM MODEL FOR ORGANIZATIONAL COMPETITIVENESS: VALIDATION THROUGH A CASE STUDY IN HIGHER EDUCATION

Teresa L. Ju, Lunghwa University of Science and Technology, Taiwan
tju@mail.lhu.edu.tw

Ru-Jen Lin, Lunghwa University of Science and Technology, Taiwan

ABSTRACT

Ju (2006) proposed a KM research framework for organizational competitiveness, which has the following characteristics:

- *KM consists of four distinct processes: knowledge creation/acquisition, storage/retrieval, sharing/dissemination, and utilization/enhancement. These processes can be carried out in any order.*
- *These KM processes are supported by four contextual elements: organization structure and culture, work practices, enabling technologies and tools, and individuals and Ba.*
- *Organization structure facilitates employee empowerment so that employees are compelled to acquire and utilize knowledge to solve their problems.*
- *Organization culture encourages employees to share knowledge with their colleagues. Leadership is instrumental in shaping such culture.*
- *Work practices are such that any task must be executed according to a standard operating procedure. If deficiency or improvement is found in an SOP, then the lessons learned must be documented for later update. Theses work practices facilitate knowledge utilization, creation, and enhancement.*
- *Enabling technologies and tools such as knowledge codification standards, knowledge repositories, intranet, semantic web, and application software, should facilitate knowledge storage, retrieval, transfer, and dissemination.*
- *Individual's expertise that is still in the form of tacit knowledge must be described in a database so that the individual can be called upon when needed. Ba is any setting or arrangement that facilitates knowledge creation and acquisition.*

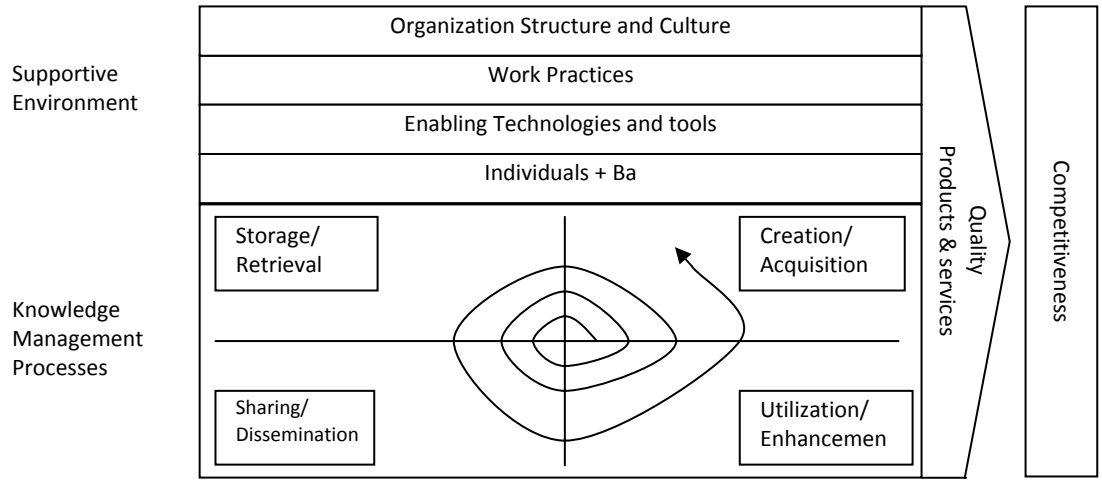
Ju's framework has every flavor of a KM model but it has not gone through rigorous empirical study. Therefore, this study develops four propositions and justifies its validity as a KM model.

Keywords: Knowledge management, Knowledge management Model, Organizational competitiveness

INTRODUCTION

Research interest in knowledge management (KM) has grown rapidly in academic and industrial communities. Utilizing knowledge accumulated in an organization can be a strategic weapon to acquire a competitive advantage. Today, KM becomes more important because globalization of business, leaner organization, organizational memory lost, and technological advance. Because of the emergent nature of the KM field, there is a lack of suitable and practical KM models to use in organizational applications.

Ju [11] proposes a research framework (hereafter called "the framework" for short) (Figure 1) to provide a context for developing a feasible and practical methodology for process-oriented KM. The framework describes the KM processes in an organization and a desirable supportive environment for the KM processes. The KM processes are performed for organization competitiveness; any activity may add value or provide input to another activity. In the supportive environment, the "Organization Structure and Culture" component fosters knowledge creation, use, sharing and innovation. The "Work Practices" component ensures that work-related insights and experiences are documented. The "Technology" component provides existing and emerging technologies for knowledge representation, storage, dissemination, utilization, etc. The "Individuals + Ba" component promotes the synergy between individuals and the settings in which knowledge creation, sharing, and innovation take place. These components provide across-the-board support to the KM processes



Source: Adapted from Ju (2006)

Figure 1 Ju's KM research framework

The framework resembles a KM model but lacks rigorous scrutiny. Therefore, this study will bridge the gap by answering the following research questions:

- How do we justify the framework as a valid KM model?
- Why organizational competitiveness can be attained or enhanced if the organization's KM practices subscribe to the KM model?

REVIEW OF LITERATURE

A pragmatic definition of data, information and knowledge

Data, information and knowledge are points along a continuum of increasing value and human contribution [3]. Data – the signals about human events and activities that we are exposed to each day – has little value in it self, although to its credit it is easy to store and manipulate on computers. Information is what data becomes when we as humans interpret and contextualize it. It is also the vehicle we use to express and communicate knowledge in business and in our lives. Information has more value than data and, at the same time, greater ambiguity – as any manager will attest who has ever argued over how many interpretations the terms "customer", "order" and "shipment" can have inside the same company. Knowledge is information within people's minds; without a knowing, self-aware person there is no knowledge. Knowledge is highly valuable, because humans create new ideas, insights and interpretations and apply these directly to information use and decision making.

Information Management vs. Knowledge Management

Information Management concerns how an organization can effectively acquire and utilize IT resources to develop superb IT capability, and combines this IT capability with other related capabilities within and outside of the organization to support organizational processes and management, which in turn will enhance organizational performance and competitiveness.

Because all knowledge starts as information, many companies regard KM as synonymous with IM. Carried to the extreme, such a perspective can result in the profoundly mistaken belief that the installation of a sophisticated information-technology infrastructure is the be-all and end-all of KM. Effective KM depends not merely on IT platforms but more broadly on the social ecology of an organization. [8]

Knowledge Management Essentials

KM dimensions and KM Methods

The bulk of current thinking about KM has four dimensions: "process", "type", "level" and "context" [4]:

- Process – Thoughts are not spring into existence out of nothing, it is the result of a series of factors that come together over time.
- Type – Knowledge is not a simple, stable quantity. Different schools of philosophy and sociology give different accounts. Currently, the importance of tacit and explicit knowledge is recognized by managers and is the subject of considerable work within KM.
- Level – Individuals are the fundamental building blocks, particularly in knowledge-intensive systems, but most individuals accomplish their work in groups, using resources provided by the organization.
- Context – Fundamentally, nothing has any meaning outside a context – hence, where a piece of information is meaningful or not depends on its context. KM efforts should begin by specifying their meaning-making context(s) and build from there.

KM methods can be categorized into four styles: dyamic, system-, human-oriented, and passive [2]. The emphasis of the dynamic style is on both (i) knowledge reusability through information technologies and (ii) knowledge sharing through informal discussions among employees. This dynamic style results in higher performance. Human- and system-oriented styles do not show any difference in terms of corporate performance; the passive style is less effective. This outcome is in line with previous observations that both tacit and explicit knowledge are important in capitalizing on corporate knowledge.

Making knowledge visible

Three aspects of knowledge are, or can be made, visible. They are activities involving knowledge, outcomes based on knowledge, and investments in knowledge [20]:

(1) Knowledge activities that can be made visible
- The identification and development of informal networks and communities of practice within organizations. These self-organizing groups share work interests and passions, usually cutting across a company's functions and processes. Knowledge maps are valuable guides that can assist employees of large or medium-sized companies to ascertain who knows what.
- The development of symbols and signals that highlight the importance of knowledge.

(2) Knowledge outcomes that can be made visible
- Accumulation and use of patents, new drug approvals
- Product development and service innovation
- Cycle time, customer retention and measurable corporate reputation

(3) Knowledge investments that can be made visible
- How much technical and nontechnical training are individuals consuming?
- What is the rationale for purchasing groupware and collaboration technologies other than to improve knowledge flow?
- How much is invested in competitive and environmental scanning and in other forms of strategic research?

These visible manifestations of knowledge enable comparisons of knowledge projects within and across companies, as well as providing a base set of numbers (of people, currency, time, and so forth) from which to derive metric for evaluating knowledge efforts.

Effective KM

The continuous conversion of knowledge into information and information into knowledge is a key element of what companies must do to develop and apply knowledge successfully. If knowledge resides primarily in people and it is people who decide to create, use and share their ideas to attain business results, then KM is as much about managing people as it is about managing information and IT. Building an effective social environment within which people operate is a crucial requirement for effective KM. [3]

Fahey and Prusak [6] point out eleven deadliest sins of KM:

Error 1: Not developing a working definition of knowledge
Error 2: Emphasizing knowledge stock to the detriment of knowledge flow
Error 3: Viewing knowledge as existing predominantly outside the heads of individuals
Error 4: Not understanding that a fundamental intermediate purpose of managing knowledge is to create shared context
Error 5: Paying little heed to the role and importance of tacit knowledge
Error 6: Disentangling knowledge from its uses
Error 7: Downplaying thinking and reasoning
Error 8: Focusing on the past and the present and not the future
Error 9: Failing to recognize the importance of experimentation
Error 10: Substituting technological contact for human interface
Error 11: Seeking to develop direct measures of knowledge

Factors that influence KM in organizations include [10]:

- Managerial influences: leadership, coordination, control, measurement
- Resource influences: financial, human, material, knowledge
- Environmental influences: competition, fashion, markets, technology, time, and the government, economic, political, social, and educational climate.

Critical success factors of KM initiatives can be categorized into five primary categories [9]: leadership; culture; structure, roles, and responsibilities; information technology infrastructure; measurement.

Company approaches to KM

The truly distinctive aspects of KM fall into two key categories: the creation of knowledge and the use of knowledge. There is a strong connection between knowledge creation and innovation in product and service development. KM programs, therefore, are explicit attempts at:

- Designing and installing techniques and processes to create, protect and use explicit knowledge
- Designing and creating environments and activities to discover and release tacit knowledge
- Articulating the purpose and nature of managing knowledge as a resource, and embodying it in other initiatives and programs.

Some repositories included what might be called “information about knowledge”. This is information that guides the seeker to knowledge, whether in the form of a document or an expert. So-called “knowledge maps” and “knowledge yellow pages” or expertise directories describe a set of knowledge categories, the location of the knowledge and, in some cases, its condition and value

Applying KM in Higher Education

Higher education is a major sector dealing with knowledge. On the academia side, there are curriculums, monographs, publications, patents, etc. On the administration side, there are rules and regulations, directives, standard operating procedures, and other official documents. From human resource point of view, there is expertise related to academic knowhow and administrative knowhow. All of these artifacts and tacit knowledge contribute to organizational knowledge [11].

KM can be applied in higher education in the following ways [13]:

(1) For the research process, a repository of:
- Research interests within an institution or at affiliated institutions (potential subcontractors).
- Research results (where possible) and funding organizations (federal agencies, foundations, and corporations) with easy search capabilities to facilitate interdisciplinary opportunities.
- Commercial opportunities for research results.

(2) A portal for research administration procedures and best practices related to funding opportunities:
- Pre-populated proposals, budgets, and protocols.
- Proposal-routing policies and procedures.
- Award notification, account setup, and negotiation policies and procedures.
- Contract and grant management policies and procedures.
- Technical and financial report templates and policies and procedures.
- Overview of internal services, resources, and staff.

(3) For the curriculum development process
- Repository of curriculum revision efforts that includes research conducted, effectiveness measures, best practices, lessons learned, and so forth.
- Repository of content modularized and arranged to facilitate interdisciplinary curriculum design and development.
- Portal of information related to teaching and learning with technology, including faculty development opportunities, outcomes tracking, lessons learned, best practices, technology overviews, and so forth.
- "Hubs" of information in each disciplinary area, including updated materials, recent publications, applicable research, and so forth.
- Repository of pedagogy and assessment techniques, including best practices, outcomes tracking, faculty development opportunities, and research.
- Repository of analyzed student evaluations updated each semester for lessons learned and best practices for all faculty.
- Portal for new faculty with guides for developing curriculum, working with senior faculty, establishing effective teaching styles, advising do's and don'ts, supervising PhD students, and so forth.
- Repository of corporate relationships to identify curriculum design advisory task forces, guest speakers, adjuncts, case study sites, and so forth.

(4) For alumni services
- Portal for student services for both students and for faculty and staff at the institution so that they are well informed to advise students. Information could include policies and procedures related to admissions, financial aid, registration, degree audit, billing, payment process, advising and tutoring, housing, dining, and other services. This portal could be personalized for individual schools or student groups to customize service offerings.
- Portal for career placement services (potentially part of a large portal for all corporate connections) to provide a one-stop service center for students, but also for faculty and staff to ensure they are informed.
- Repository of student affairs services for faculty and staff to ensure all constituents understand existing services and can provide proper advising.
- Portal for alumni and development services to minimize redundant efforts; capture contact reports; and link to research, curriculum, and career development efforts.
- Portal for information on outreach constituents to integrate efforts and minimize redundant efforts.

(5) For administration services
- Portal for financial services (that is, budgeting and accounting) that includes FAQs, best practices, procedures, templates, and communities of interest to share information and serve as impetus for improvement efforts.
- Portal for procurement (that is, purchasing, accounts payable, receiving, warehousing) that includes FAQs, best practices, procedures, templates, and communities of interest (for example, by commodity, purchasing vehicle, vendor, and so forth) to share information and serve as impetus for improvement efforts (for example, leverage lessons learned from others in the institution, design on-line vendor sites such as Web-based catalogs).
- Portal for human resources (that is, vacancy-to-hire, payroll, affirmative action, and so forth) that includes FAQs, best practices, procedures, templates, and communities of interest to share information and serve as impetus for improvement efforts.

(6) For strategic planning
- Office of Knowledge Management, emerging from the previous Office of Institutional Research.
- Portal for internal information that catalogs the strategic plans, reports developed for external audiences (for example, IPEDS, accreditation reports), clear data definitions, presentations by executives, and so forth.
- Portal for external information, including benchmark studies, environmental scans, competitor data, links to research groups, higher education research groups and publications, presentations by executives, and so forth.
- Monthly “market watch” developed in tandem with Admissions, Continuing Education, Alumni and Development, and others that document key trends and potential implications.
- Repository of data related to accountability and outcomes tracking by monitoring assessments, performance indicators, benchmarking, and so forth.

Higher Education System in Taiwan

Higher education system in Taiwan is similar to the two-semester system in the U.S. but there are a few differences:

- All universities and colleges in Taiwan, whether they are government-funded or private-owned, are under the auspices of the Ministry of Education (MOE) [17].
- Their performance is evaluated periodically by MOE with a common set of performance criteria [16].

RESEARCH METHODOLOGY

Case Study Research

A case study is an empirical inquiry that investigates a contemporary phenomenon within its real-life context, especially when the boundaries between phenomenon and context are not clearly evident. The case study inquiry copes with the technically distinctive situation in which there will be many more variables of interest than data points. Yin [21] identified relevant situations for five different research strategies: experiment, survey, archival analysis, history, and case study. If the form of research question is 'how?' or 'why?', if it doesn't require control of behavioral events, and if it focuses on contemporary events, then case study is a suitable research strategy. In this study, since KM takes place in real-life context and the research questions ask 'how' and 'why', therefore, case study research strategy is chosen.

Designing the Case Study

For case studies, five components of a research design are especially important [21]: its research questions; its propositions, if any; its unit(s) of analysis; the logic linking the data to the propositions; and the criteria for interpreting the findings. In this study, these components are manifested as:

Research questions

- How do we justify the framework as a valid KM model?
- Why organizational competitiveness can be attained or enhanced if the organization's KM practices subscribe to the KM model?

Propositions

Proposition 1: If the framework doest not cater to the critical issues addressed in the Review of Literature section, then it is not a valid KM model.

Proposition 2: If the framework doest not represent every legitimate KM practices in the case university, then it is not a valid KM model.

Proposition 3: If organizational competitiveness is not attained or enhanced even though the KM practices in the case university satisfy the conditions stated in the framework, then the framework is not a valid KM model.

Proposition 4: If an amended framework is rid of the above deficiencies, then it is a valid KM model.

Unit(s) of analysis

Since the universities and colleges in Taiwan are all under the auspices of MOE, their organizational structure and workflow are largely similar. Since they are evaluated and accredited by MOE with a common set of criteria, their organizational goal and constraints are also similar. Therefore, any university or college can be considered a representative or typical case. In this study, a university of science and technology has been chosen because the primary investigator of this study has close social connection with the key personnel of this case university, thus enjoys full cooperation from the interviewees and easy access to the relevant information for the case study.

Data collection covers both administrative and academic sides. Observation is carried out at the university level, and interview is conducted at the department level.

Logic linking the data to the propositions

To answer the research questions, this case study will be conducted in five phases:

(1) The framework is checked against the KM issues compiled in the Review of Literature section, and any deficiencies are amended.
(2) Evidence of KM practices is collected through observation and interview.
(3) The amended framework is checked against the evidence, and is further amended if any legitimate KM practice is not covered by the framework.
(4) Whether the evidences that subscribe to the amended framework foster organizational competitiveness is determined.
(5) If the (amended) framework fosters organizational competitiveness, then it can be justified as a valid KM model.

Criteria for interpreting the findings

In this study, any findings that are not directly related to organizational competitiveness will be discarded.

COLLECTING CASE STUDY EVIDENCE

Evidence collected falls in the 10 years of the founding president's tenure, from August 1994 through July 2003. Whatever happened during this period reflects the president's leadership. Also, many of the interviewees have taken different administrative positions through those years, thus afford a holistic perspective about and continuing involvement in the KM practices in the university.

Observation

The investigators gain a tentative overview of the case university by observing the work environment and scanning available documents. A good narrative about the case university is found in its 10th Anniversary Commemorative Edition.

Interview

Interviews are aimed at understanding the KM practices that are geared to organizational competitiveness; more specifically, to earn commendation from MOE's periodic evaluation, gain recognition in the academic community, and recruit top quality students.

Interviewees are key personnel of the university who have served in different capacities during the 10 years time. These interviewees and the titles they served are listed below:

- Dr. J (Vice president, Dean of the Academic Affairs, Chairman of the Department of Information Management)
- Dr. M (Dean of the Student Affairs, Director of the Center for General Education)
- Ms. O (Dean of the General Affairs, Secretarial General of the Secretarial Department, Director of the Personnel Department)
- Dr. H (Dean of the College of Management, Director of the Research and Technology Cooperation, Director of the Library and Information Center)
- Ms. H (Director of the Accounting Department)

As can be seen from this list, they have been the head of 12 administrative or academic departments, quite comprehensive and representative.

Interview questions are open-ended, based on the framework, and tied to the propositions. Responses from the interviews are summarized in the following categories:

About the supportive environment

- Leadership and Culture
  The president is fully aware of the power of IT and allocates sufficient investment in information infrastructure. All staff must be conversant with e-mail, Web browser, word processing, spreadsheet, and presentation software.

  He appoints many teachers from the Department of Information Management to key administrative positions because of their information management expertise. He also relies heavily on the vice president to play the role of CKO.

  Although the term "KM" is not often cited, uses of information for problem-solving and decision making are abundant.

- Structure and Incentives
  To streamline the use of information, the university has merged the library and the computing center into one Library and Information Center

There is a policy that hands out small prize for individuals who contribute ideas to streamline workflow.

- KM guidelines
  There are no KM guidelines in place.

- Work practices
  The administration side has implemented the ISO 9001 system, which requires standard operating procedure (SOP) for all routine tasks. Documentation update is strictly enforced.

  There is a policy for job rotation every three years.

- Enabling technology and tools
  The library and Information Center has maintained an integrated database and document repository, and an information portal. The latter is embedded in the university web site.

  Every worker is provided with a personal computer and job-related software, and access to the internet.

- Individuals + Ba
  The university encourages its employees to form special interest group for knowledge sharing. It also holds seminars on various topics regularly for administrative staff.

About the KM processes

- Knowledge Creation/Acquisition
  Administrative staff are not aware of knowledge creation but ISO 9001 system requires them to document what they have done and what they have learn. Knowledge creation is mostly done by the teachers in the form of lecture notes, research papers, patents, etc. Knowledge acquisition is mostly done through library service. There are no explicit activities relating to Nonaka, Toyama and Konno's [19] SECI style of knowledge creation.

- Knowledge Storage/Retrieval
  Official data and documents are stored in the integrated database and document repository. Retrieval is done through the information portal. Accounting information and personnel information are stored in proprietary databases as required by government regulations.

  The Office of Academic Affairs has accumulated some canned programs to retrieve data for various purposes.

- Knowledge Sharing/Dissemination
  Collaborating with the Library and Information Center, a Teachers' PDA system was developed for teachers to track what they have done and what they have achieved

during the academic year. The information is accessible by the administrative need-to-know and the individual teacher. This is an interesting proposition for knowledge sharing because teachers hate to waste time in entering the 'trivial thing' but they love the system's report generating capability that can produce the teacher's resume for NSC funding application and even more significantly, to provide a complete account of the teacher's achievements several years back for tenure and promotion review. The administrative and academic departments can aggregate teachers' data into reports for various needs by the university and MOE.

Conference attending suppose to be a good channel for knowledge sharing, but the university does not fund these activities due to government regulations. One of the Department Chairman tried to organize a forum for his colleagues to meet regularly to exchange ideas of their research but only got a lukewarm reception.

There is no explicit effort in knowledge dissemination.

- Knowledge Utilization/Enhancement
  Because people do not have clear definition of knowledge they cannot distinguish knowledge utilization from information utilization. A significant use of knowledge for competitiveness is the Yearly Quantified Performance Review Chart for the academic departments. The performance indices are those used by MOE in higher education evaluation and accreditation. This chart put all the departments of the same college in competition, essentially gives those fall behind a kick in the butt. This measure certainly gives a boost to the university's competitiveness.

  Knowledge enhancement is not clearly seen.

ANALYZING CASE STUDY EVIDENCE

Amending the Framework

Regarding the framework, through review of literature, this study find that it is desirable to replace the 'Organization Structure and Culture' component with two separate components, namely, 'Leadership and Culture', 'Structure and Incentives', and add two more components, namely, 'KM Guidelines' and 'Metadata for Shared Context'. Leadership comes primarily from the CEO but it can also come from CKO. Culture normally is shaped by leadership. Structure and incentives refer to those specifically linked to the KM practices. KM guidelines could be reminders such as the "Eleven deadliest sins of KM". Metadata for shared context allows knowledge sharing and exchange.

Reviewing the Amended Framework against the Eleven Deadliest Sins of KM

On Error 1, the KM model requires a KM program to establish KM guidelines in which a working definition should be given.
On Error 2, Knowledge flow is clearly identified with the KM processes.
On Error 3, The 'individual+Ba' component caters to the tacit knowledge.
On Error 4, The 'Metadata for Shared Context' component caters to shared context.

On Error 5, The 'individual+Ba' component pays great respect to tacit knowledge.
On Error 6, The 'Knowledge Utilization/Enhancement' activity emphasizes knowledge use.
On Error 7, The 'Leadership and Culture' component can call for thinking and reasoning.
On Error 8, The 'Leadership and Culture' component can also put focus on the future.
On Error 9, The 'Structure and Incentives' component can encourage experiment.
On Error 10, The 'individual+Ba' component enforce human contact.
On Error 11, The KM model measures competitiveness, not knowledge.

So the amended framework is free of the sins.

Reviewing the Amended Framework against the Evidence Collected from Interview

In view of the responses from the interviewees, any activity that has a connotation of KM is covered by the amended framework. It should be noted that the case university does not have a KM initiative per se, therefore, there are no sufficient KM evidences to probe the amended framework.

CONCLUSION

Returning to the propositions, they are all substantiated; therefore, the amended framework is deemed to be a valid KM model for organizational competitiveness. The contribution of this case study is that this KM model can guide an organization to initiate a KM program, and as long as it subscribe to the KM model, competitiveness will be achieved.

After this case study we found that the university we selected is not an ideal case in terms of KM practices, but at least we have earned how to select next case and what to look for. At that time, we will tackle the generalization issue.

Hao-Erl Yang,.Department of Business Management, Tatung University, Taipei

ABSTRACT

The development of tourism in many countries not only provides a lot of employment opportunities, but also brings huge foreign exchange earnings. All countries have attached great importance to develop the tourism industry hence. In order to let the world know the true, the good and the beautiful of Taiwan, we should make good use of the characteristic of nature environment, culture heritage, infrastructures, atmosphere, and affective image to enhance tourism attraction and to promote the national visibility. It is important to lead the vivid destination image to go deep into passengers' heart and reach the real competitive advantage of tourism market. However, few authorities neglect the influence of the destination image toward the destination of the choice of passengers; it may decrease the visit willing. The objectives of this study are described as follows: (1) to understand the factors influencing the destination image; (2) to assess the effects of the destination image on tourists' behavioral intentions; (3) to provide the tourism manager, the business and the authority with some suggestions.

This study uses website to distribute questionnaires. The number of useful sample is 277. Structural equation modeling (SEM) is used to test the hypotheses presented by the use of AMOS 6.0. The results are as follows:

1. *Socioeconmic Environment/ Infrastructures approximate positively influences behavioral intentions.*
2. *Atmosphere and Natural environment have no influence on behavioral intentions.*
3. *Affective image and Cultural environment have positively influence on behavioral intentions.*

The study suggests that the tourism manager, the business, and the authority should understand which destination images would have effects on the behavior of tourist before they pursue the tourism development. They also have to listen to the advices of the tourists and improve the tourism environment in the further. Therefore, the tourists make word-of-mouth marketing for the destination to ensure the successful tourism development.

Keywords : Destination image, Behavioral intentions, Affective image, Cultural environment Business

1. INTRODUCTION

According to the World Tourism Organization (WTO) published data, the received number of international tourism were 760 million persons, offshore tourism income were US$622 billion in 2004, as well as the received number of international tourism were 846 million persons, offshore tourism income were US$733 billion in 2006. The World Tourism Organization forecasts that 1 billion persons will travel abroad all over the world in 2010 and it will reach 1.6 billion persons in 2020. Therefore, the global tourism industry will be prosperous development (Executive Yuan, R.O.C. (Taiwan), International Taiwan Service Portal, 2009, http://www.i-taiwan.nat.gov.tw/ct/index.php).

In order to develop the tourism of Taiwan, we should make good use of the characteristics of nature environment, culture heritage, infrastructures, atmosphere, and affective image to enhance tourism attraction and to promote the national visibility. It is important to lead the vivid destination image goes deep into passengers' heart and reach the real competitive advantage of tourism market. The objectives of this study are described as follows: (1) To investigate factors influencing destination image formation; (2) To assess the effects of the destination image on tourists' behavioral intentions; (3) To provide the tourism managers, the business, and the authorities with some suggestions.

2. LITERATURE REVIEW

Based on the model of San Martín & Rodríguez del Bosque (2008), this study added a dependent variable, behavioral intentions, to mainly integrate construct of destination image and behavioral intentions exploring how destination image influences behavioral intentions.

2.1 Destination Image (DI)

Destination image has been defined in various ways. All impressions, beliefs, ideas, expectations and feelings compiled towards a destination over time (Kim & Richardson, 2003). Destination image includes two parts, the traditional cognitive approach and the recent cognitive–affective approach. The cognitive structure of destination image includes factors such as "natural environment", "cultural heritage", "tourist infrastructures" or "atmosphere" (San Martín & Rodríguez del Bosque, 2008). Combining two components may have a better explanation for the destination image, but not be entirely determined by its physical properties (Baloglu & Brinberg, 1997).

The competitiveness of tourism industry becomes severer so realizing the image formation process may improve the attractiveness and market competitiveness of tourist destinations (San Martín & Rodríguez del Bosque, 2008).Destination image refers to an individual's mental representation of knowledge, beliefs, feelings, and overall perception of a particular destination (Lee et al., 2005). Natural resources, social environment, infrastructure, recreation environment, culture heritage, political and economic factors, and atmosphere of the place are involved in the destination images (Yen & Rajamohan, 2008). The individual collets varied

information and reorganizes a meaningful mental concept of destination image for themselves (Leisen, 2001).

2.2 Behavioral Intentions (BI)

Zeithaml et al. (1996) found that customers perceived service quality to produce behavioral intentions after actual service experience. Behavioral intentions can be regarded as indicators whether customers will remain with or defect from the company, and be separated into favorable and unfavorable behavioral intentions. Favorable behavioral intentions mean the customer has positive and significant relationship with the company, such as increase the volume of their purchases and willingness to recommend the company to others. On the contrary, unfavorable behavioral intentions mean the customer has negative responses or dissatisfaction relationship with the company, such as a reduction in the amount of business with the company or complaining the company with third party. It shows that customers' behavioral intentions be influenced by service quality and satisfaction strongly.

Lot of literature of behavioral intentions has been found. Service quality was found to have a direct impact on visitors' future behavioral intentions (Cole & Illum, 2006). González et al. (2005) illustrated the influence of service quality and customer satisfaction on behavioral intentions in the tourism industry clearly. Lee et al. (2004) proposed that service quality is an antecedent of satisfaction and satisfaction plays a mediating role between service quality and behavioral intention. Further, service quality has a direct effect on behavioral loyalty, implying that the effect of service quality on behavioral intention is as important as that of satisfaction. Behavioral intentions are defined as the opinion visitor about the goodwill to revisit the destination or the willingness to recommend the destination to others (Chen & Tsai, 2007).

2.3 The relationship between Destination Image and Dehavioral Intentions

Cho (2008) interpreted that location attractiveness, which concerns the overall perception of a location, is a main factor that prompts travelers to a destination. Tourists' satisfaction is a indicator of their intentions to revisit and recommend the destination to others in the tourism research (Yoon & Uysal, 2005, Chi & Qu, 2008). Furthermore, the destination characteristic has positive influence on perceived destination image and intention to recommend (Eklnci & Hosany, 2006). As satisfied tourists are more possible to revisit the same destination, and are more willing to share their pleasant experience with their relatives and friends (Baker & Crompton, 2000). In addition, destination image and perceived value into the "quality–satisfaction–behavioral intentions" paradigm belong to an integrated tourist behavior model. Destination image have both direct and indirect effects on behavioral intentions. Moreover, the causality of path "destination image → trip quality → perceived value → satisfaction → behavioral intentions" has been proved by Chen & Tsai (2007). Therefore, destination image has the positive relationship with behavioral intentions.

3. METHODOLOGY

3.1 Research Framework

According to San Martín & Rodríguez del Bosque's (2008) model, research motives, research objectives, and the literature review, the research framework is presented in Figure 1.

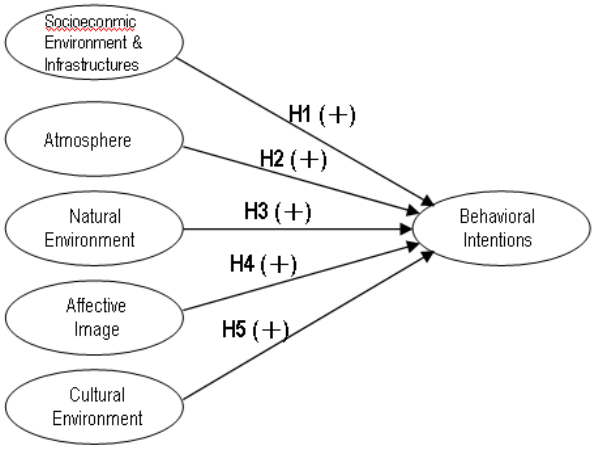

Figure 1 Research Framework

3.2 Data Collection and Sampling Design

This study's data are collected by means of website questionnaire survey. The 323 respondents produced a total of 277 usable questionnaires resulting in a response rate of 85.8%.The sample was comprised of 55.6% females. In terms of age, 35% in the 20s and 36% in 30s constitute the majority respondents. Less than half of the respondents are married (41%) and in terms of education level, senior high school (5%), college or university (57%), and graduate school (38%), constitute the respondents.

The respondents are asked to indicate their agreement or disagreement with the statements provided, using 7-point Likert type scales with anchors of 1 to indicate "extremely disagree" and 7 to indicate "extremely agree".

4. DATA ANALYSIS

This study examined the formation of destination image and the relationship between the destination image and the behavioral intentions. Structural equation modeling (SEM) was used to test the hypotheses presented earlier by the use of AMOS 6.0. According to Anderson and Gerbing's two-stage procedure, confirmatory factor analysis (CFA) is used in the first stage and structural equation model is used in the second stage in turn (Anderson & Gerbing ,1988).

4.1 Measurement Modeling Analysis

CFA is a measurement model, used to relate the observed, recorded, or measured variables to the latent variables (constructs) and examine whether or not the data can represent what the researcher really wants to measure. This study used a hierarchical confirmatory factor analysis to exam goodness of fit statistics, including the second-order, the five factors, and the single factor. Then, the five factors model shows the fittest statistics of measurement model in this study (Table 1). So we use the five factors measurement model to search the influence of relation between the destination image and the behavioral intentions.

Table 1 Goodness of Fit Statistics of the Alternative Measurement Models

Fit Measures	Second-Order Model	Alternative First-Order Models		Fit Criteria
		Five Factors	Single Factor	
Chi-Square	**254.0**	**239.6**	**1064.1**	
Chi-Square DF	**99**	**94.0**	**104**	
Chi-Square/ Chi-Square DF	**2.57**	**2.55**	**10.23**	**< 3**
Goodness-of-Fit Index (GFI)	**0.90**	**0.90**	**0.65**	**> 0.9**
The Adjusted Goodness-of-Fit Index (AGFI)	**0.86**	**0.90**	**0.54**	**> 0.8**
Comparative Fit Index (CFI)	**0.93**	**0.93**	**0.53**	**> 0.9**
Normed Fit Index (NFI)	**0.88**	**0.90**	**0.51**	**> 0.9**
Root mean square residual (RMR)	**0.07**	**0.06**	**0.15**	**< 0.05**
Root Mean Square Error of Approximation (RMSEA)	**0.075**	**0.075**	**0.18**	**< 0.08**

Convergent validity, discriminant validity, and reliability analysis are further examined for the measurement model. The *t*-test of factor loading is commonly used to examine convergent validity. As Table 2 shows, all *t* values are significant at $\alpha = 0.001$. Hence, convergent validity is successfully achieved. In addition, each item's reliability is higher than 0.5 and each construct reliability is higher than the general recommended level of 0.70 for the research instruments (Nunnally, 1967). The variance extracted reflects the overall amount of variance in the indicators accounted for by the latent construct. In Table 2, all variance-extracted estimates are above 0.50; thus, the overall variance extracted is successfully achieved (Fornell & Larcker, 1981).

The chi-square difference test is applied to evaluate the discriminant validity of two constructs by calculating the difference of the chi-square statistics for the constrained and unconstrained measurement models. Discriminant validity is achieved if the chi-square difference (with 1 d.f.) is significant, meaning that the model in which the two constructs are viewed as distinct (but correlated) factors is superior (Hatcher, 1994). All the chi-square difference statistics for each pair of constructs in this study are significant; therefore, discriminant validity is achieved.

Table 2. Overall Results from Test on Reliability and Validity

Framework Component	Standardized Factor Loading	*t* value [a]	Item Reliability	Construct Reliability [b]	Variance Extracted [c]
Socioeconomic Environment /Infrastructure(SI)				**0.885**	**0.658**
SI1	**0.778**	**40.947**	**0.605**		
SI2	**0.836**	**21.436**	**0.699**		
SI3	**0.846**	**28.200**	**0.716**		
SI4	**0.782**	**17.000**	**0.612**		
Atmosphere(AT)				**0.975**	**0.575**
AT1	**0.711**	**28.440**	**0.506**		
AT2	**0.742**	**12.793**	**0.551**		
AT3	**0.818**	**16.694**	**0.669**		
National Environment(NE)				**0.837**	**0.634**
NE1	**0.771**	**32.125**	**0.594**		
NE2	**0.896**	**28.000**	**0.803**		
NE3	**0.710**	**15.778**	**0.504**		
Affective Image(AI)				**0.896**	**0.742**
AI1	**0.899**	**37.458**	**0.808**		
AI2	**0.860**	**20.476**	**0.740**		
AI3	**0.823**	**19.595**	**0.677**		
Cultural Environment(CE)				**0.898**	**0.747**
CE1	**0.920**	**41.818**	**0.846**		
CE2	**0.878**	**27.438**	**0.771**		
CE3	**0.789**	**17.152**	**0.623**		

Note: a: $t > 1.96$; b: Construct Reliability > 0.7; c: Variance Extracted > 0.5

4.2 Structural Equation Modeling Results

Structural equation modeling (SEM) is used to test the hypotheses presented by the use of AMOS 6.0, after validating the data fit the proposed five factors measurement model. The overall structural model exhibits a good level of fit: Chi-Square/Chi-Square DF = 2.49; the goodness-of-fit index (GFI) = 0.90, the adjusted goodness-of-fit index (AGFI) = 0.90, the comparative fit index (CFI) = 0.93, and the normed fit index (NFI) = 0.90 are all exceeded or equaled 0.9; the root mean square residual (RMR) = 0.056 was approached 0.05; the root mean square error of approximation (RMSEA) = 0.07 was lower than the recommended minimum of 0.08. Therefore, the structural model fits pretty well.

One-tailed test is used to verify the hypotheses supported or not (Table 3). With One-tailed α=0.05, critical value=1.645; *t* value ($t > 1.96$) of Hypothesis 4 and Hypothesis 5 are 2.95 and 2.77. It means Affective Image and Cultural Environment positively influences behavioral intentions. For One-tailed α=0.10, critical value=1.282; *t* value of Hypothesis 1 is 1.68. It presents Socioeconmic Environment/ Infrastructures marginally positive influences behavioral intentions, so Hypothesis 1 is regarded as supported in this study. However, *t*

value of Hypothesis 2 and Hypothesis 3 are 0.14 and 0.54 not above 1.96. So Atmosphere and Natural Environment not influence behavioral intentions (Figure 2).

Table 3 Results of Hypotheses Test

Research Hypothesis	Path	Standardized Path Coefficient	*t* Value	Results
H1	Socioeconmic Environment & Infrastructures → Behavioral Intentions	0.17	1.68	Supported
H2	Atmosphere → Behavioral Intentions	0.03	0.14	Not Supported
H3	Natural Environment → Behavioral Intentions	0.08	0.54	Not Supported
H4	Affective Image → Behavioral Intentions	0.39	2.95	Supported
H5	Cultural Environment → Behavioral Intentions	0.16	2.77	Supported

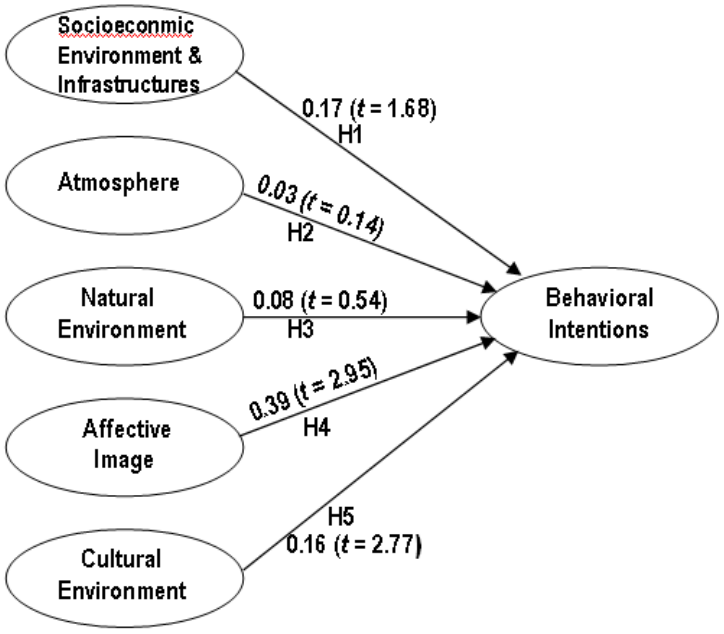

Figure 2 Structural Model Results
Note: t >1.96

5. CONCLUSION

The objective of this study is to assess the effects of the destination image on tourists' behavioral intentions. To go a step further, it would facilitate the tourists to revisit or recommend the destination. In sum, atmosphere and Natural Environment not influence behavioral intentions. Socioeconmic Environment/ Infrastructures, Affective Image and Cultural Environment positively influence behavioral intentions.
The tourism manager, the business, and the authority should understand which destination images would affect the behavioral intentions of tourist when they pursue the tourism development. They also should listen to the advices of the tourists and improve the tourism environment in the further. Therefore, the tourists make word-of-mouth marketing for the destination to ensure the successful tourism development.

ORGANIZATIONAL TRUST – A CRITICAL REVIEW OF THE EMPIRICAL RESEARCH[1]

Dr. Joanna Paliszkiewicz, Warsaw University of Life Sciences, Poland
joanna_paliszkiewicz@sggw.pl

ABSTRACT

The concept of trust has become popular in public debate and academic analysis. The growing importance of trust has been related to global organizational developments such as increasing flexibility of organizational relations, growing knowledge intensity of tasks, rising importance of lateral relations and continuous change. The purpose of this article was to analyze how the concept of trust is approached and defined in various disciplines, in order to reach a generally acceptable definition that could be used in business research. The concept of trust appears in many disciplines. In this article the concept is reviewed from the perspective of social psychology, philosophy, economics and market relationship. The study reviewed empirical research on organizational trust. Although trust has emerge as an important factor in organizational relationships, there are still major conceptual and methodological challenges to be met studying this complex concept.

Keywords: trust management, organizational trust, trust between coworkers, trust between leaders and employees

INTRODUCTION

The concept of trust has become popular in public debate and academic analysis. In high income countries this interest is associated with concern for the decline of trust in governments and professionals, and in developing countries has been prompted by debates around the motion of social capital. Trust has been identified as a major factor influencing such thing as capital investment, the sales of high-value investment goods, relationship marketing, cross-cultural communication, learning and various types of cooperation such as high-tech development projects, as well as transaction governance and costs. Trust management become also very important inside organization.

The purpose of this article was to analyze how the concept of trust is approached and defined in various disciplines, in order to reach a generally acceptable definition that could be used in business research. The study reviewed empirical research on organizational trust. The purpose of the study was also evaluation the advancements and setbacks in current empirical research in terms of measuring organizational trust. This paper analyzed the theoretical approach and the measurement issues covered in studies on organizational trust. Although trust has emerge as an important factor in organizational relationships, there are still major conceptual and methodological challenges to be met studying this complex concept.

[1] Article prepared in the scope of the realization research project entitled "Trust and organizational performance" (No. N N115 549238) financed by Ministry of Science and Higher Education in Poland.

TRUST IN VARIOUS FIELDS

The concept of trust appears in many disciplines. In this article the concept is reviewed from the perspective of social psychology, philosophy, economics and market relationship.

Trust in social psychology

Trusting behavior as seen in social psychology implies allowing oneself to be in a potentially vulnerable position relative to another, while possessing some knowledge of the other that inspires trust in his goodwill, i.e. in his good intentions (Luhmann 1979). Thus risk and some information about the potentially trusted person or situation are seen as necessary conditions for trust to exist. Many of the psychologists define trust as a personal trait (Rotter 1967), while other researchers stress its social aspects. J.R. Gibb (1978) a psychologist has created theory that trust is instinctive, and, as a feeling, is so close to love. Trust in everyday life is a mix of feeling and rational thinking. Personality psychologists such as Wrightsman (1966) and Rotter (1967) have viewed trust as a personality trait that reflects the general expectancies of the trustworthiness of others. These expectancies are relatively stable dispositional characteristics that depend on personal experiences and previous socialization.

Trust in philosophy

The great philosophers have written very little about trust. For example Plato and Aristotle, have only indirectly implied trust while discussing cooperation and friendship and the virtues of the human being (Beier 1986; Hosmer 1995). Philosophers see trust in a variety of forms and versions. For example Herzberg (1988) trusting another person means having trusting attitude towards the other person, without specifying where he is trusted, as could be said that after judgment somebody is relied in upon certain aspects. Thus trust is implicit, not given on grounds and is never a rational option. Herzberg similarly like Baier (1986) and Lagerspetz (1992) draw attention to the implicit nature of trust, which is not given on grounds and is not a rational option. Philosophers emphasize the trusting attitude, often unconscious, as being part of basic conduct of life. Reliance is seen as a narrower concept somebody might be relied upon in certain respects. Reliance is therefore also viewed as an outcome of grounded expectations, and as separate from trust.

Trust in economics

Economics have not traditionally paid much attention to the role of trust in market exchange. The neo-classical ideal market, with perfect information and pure competition between independent and faceless traders, does not involve trust as a central concept, since the competitive market is supposed to control any deception. Also, rational choice theory excludes differences among actors, which means that no one of them is more, or less, trustworthy then the others. That is to say, of the actors were all perfectly honest, doing their best to fulfill their commitments, then there would be no problem of trust (Blomqvist 1997).

The shifts in focus towards imperfectly competitive markets in which a small number of traders build long-term relationships and make relation-specific investment, has drawn attention to this issue. Those economists who do see the notion of trust as relevant and useful,

regard it as mutual confidence, where by an individual or firm trusts second individual or firm to do has it has promised to do (Zucker 1986). For example according to M. Sako (1992) trust can be treated as a state of mind, an expectation held by one trading partner about another, that the other behaves or responds in a predictable and mutually acceptable manner. Arrow (1974) considered trust as a basic element not only for organizations but also for the economy in general, affirming that trust is a lubricant to economic exchange.

Trust in market relationships

Many researchers have identified certain critical success factors in relationships inside organizations, one of the most critical, is trust. Trust facilitates more open communication, information sharing and conflict management (Seppanen, Blomqvist, Sundqvist 2007). Trust is believed to be critical as it is seen to increase predictability, adaptability, and strategic flexibility. In general trust is seen to reduce transaction costs such as management costs, internationalization costs, social complexity. It also paves the way for informal network collaboration and collaborative innovation. It is also acknowledged that trust may be a critical factor in enhancing business performance and a source of sustainable competitive advantage (Seppanen, Blomqvist, Sundqvist 2007).

Trust leads to the kind of constructive and cooperative bahaviour that is vital for long-term relationships (Morgan, Hunt 1994). In the literature trust has been also recognized as an important attribute of industrial networks (Haansson 1982).

The success of personal sales is believed to depend upon trust, i.e. on the customer's willingness to trust the salesperson and the salesperson's ability to demonstrate trustworthiness. Both these are regarded as necessary conditions for completing a sale.

According to Anderson and Naurus (1990) trust is the firm' belief that another company will perform actions that will result in positive outcomes for the firms as well as not take unexpected actions that result in negative outcomes. In this definitions trust was modeled as an outcome of cooperation. In the literature the importance of trust in reducing the dysfunctional interaction in strategic alliances has also been noticed (Kiling 1989). Trust is usually seen as an outcome of an interaction process in which trust relationship develop gradually. However, reputation and fist impression are very important, as in many cases people never get another chance to prove their trustworthiness.
Barney and Hansen (1994) have developed a three level trust: weak-form trust, semi-strong-form trust and strong-form trust. According to them, weak-form trust exists in competitive commodity markets, where there are limited opportunities for opportunism and thus no real vulnerabilities. Semi-strong trust exists when parties find it irrational to behave opportunistically, perhaps for the fear of losing their reputation. In strong-form trust (also called principled trust) the parties have internalized values, principles and behavioral standards, which reflect the two partners' history, culture and personal beliefs and which counteract opportunism.

Author see trust as the belief that another party: a) will not act in a way that is harmful to the trusting firm, b) will act in such a way that it is beneficial to the trusting firm, and c) will act

reliably d) will behave or respond in a predictable and mutually acceptable manner. Trust can be seen as a bridge between past experiences and anticipated future.

However, although trust has been studied in a variety of disciplines, each of these disciplines has produced its own concepts, definitions and findings. In fact, even within a given field, there is often a lack of agreement and focus of effort (Lewicki, Bunker 1995). The outcome is a multi-dimensional family of trust concepts, each with a unique focus. Despite the eclectic nature of trust research, researchers from every discipline do acknowledge the value of trust. Trust enables people to live in risky and uncertain situations (Mayer, Davis, Schoormann 1995). It provides the means to decrease complexity in a complex world by reducing the number of options one has to consider in a given situation (Lewis, Weigert 1985). Trust can also be viewed as a kind of social capital that makes coordination and cooperation between people possible (Misztal 1996; Putnam 1995).

A REVIEW OF APPROACHES IN THE MEASUREMENT OF INTER-OGANIZATIONAL TRUST

Up till now, most studies on trust in organizations have focused on trust among members of an organization, such as trust between an employee and his/her direct supervisor or the organizational leader (Aryee et al., 2002; Deluga, 1994; Dirks, 2000; Dirks & Ferrin, 2002) or between peers (Dirks, 2000; Langfred, 2004). Also in the literature we can find studies of trust in an organization as a system (Creed & Miles, 1996; Huff & Kelley, 2003, 2005).

Trust among members of organization

Trust among members of organization was examined by many researches for example Chattopadhyay & George (2001), Ferres, Connell, & Travaglione, (2004), McAllister, (1995), Dirks & Ferrin, (2002), Dirks & Skarlicki (2004).
Among studies on trust in coworkers, McAllister's (1995) study of trust in peers showed that interaction frequency, peer-affiliative citizenship behavior, and cognition-based trust influenced affect-based trust. Cognition-based trust is based on individual thinking about and confidence in the other and based on "good reasons" as evidence of trustworthiness. Affect-based trust, is grounded in the emotional bonds between individuals involving mutual care and concern. Kiffin-Petersen and Cordery (2003) found that trust in coworkers partially mediates the relation between individuals' propensity to trust strangers and their preference for working in a team. Ferres et al. (2004) found coworker trust to be related to higher perceived organizational support, lower turnover intention, and higher affective commitment. However, these outcome variables were organization-focused and present a potential mismatch in the level of independent variables and outcomes.

According to Sonnenberg (1994), trust increases when people are perceived as competent. If employees believe that they can depend on their coworkers to produce a quality piece of work that would affect their job in a positive way, they will be willing to trust the judgment of those competent coworkers.

The employer, as the "trustee" in the relationship with employees, can develop and sustain a high level of trust by improving the employees' confidence in the organization and increasing

the employees' indebtedness to the employer through certain human resource management practices such as extensive welfare benefits or investments in employees' careers (Creed & Miles, 1996).

Trust between an employee and his/her direct supervisor or the organizational leader

Most of the work on trust in specific targets has focused on trust in a direct leader, such as supervisor, manager, or work-group leader (e.g., Aryee, Budhwar, & Chen, 2002; Butler & Cantrell, 1984; Deluga, 1994; Tan & Tan, 2000).

Researchers have found trust in different referent types to be related to different sets of outcomes. For example, Tan and Tan (2000) explored supervisor and organization as trust referents and found that the former is affected by the perceived ability, benevolence, and integrity of the supervisor and leads to satisfaction with supervisor and innovative behavior, whereas the latter is affected by procedural and distributive justice and results in higher organizational commitment and lower turnover intentions.

Wintrobe and Breton's (1986) argument that there is a potential conflict between vertical trust (trust between the employer and employees) and horizontal trust (trust among employees). They argue that when employees do not trust their management, they band together for collective action.

Immediate supervisors often have frequent and direct contact with subordinates in daily work. Supervisors' actions and behaviors, which are essential in determining the subordinates' attitudes, provide the foundation for trust (Whitener et al., 1998). Supervisory support is a strong indicator of the quality of exchange relationships between employees and supervisors (Stinglhamber & Vandenberghe, 2003). When supervisors express concern for their employees' well being, help them with career development, and value their work, they signal to their subordinates that they are interested in a close and social exchange relationship. To equalize or ensure a balance in their exchanges, employees will feel obligated to reciprocate the good deeds and goodwill of the supervisor. By discharging their obligations for services provided, they demonstrate their trustworthiness and the gradual expansion of mutual services (Blau, 1964). Reciprocation between supervisors and their subordinates reinforces and stabilizes trust, the axis upon which social exchange revolves (Blau, 1964). Trust relationships further enable people to make emotional investments, because they believe in the intrinsic virtue of such relationships and that these sentiments are reciprocated (Lewis & Weigert, 1985). Wayne, Shore, and Liden (1997) suggested that employees often generalize their experiences with their supervisors to the organization. Indeed, it has been observed that employees' trust in supervisors is associated with their trust in the organization (Wong, Ngo, & Wong, 2003). As their trust in the supervisor increases, their favorable perceptions of the organization also increase (Pearce, 1993). Thus, as supervisors build a social exchange relationship with employees and fulfill employee perceptions of the organization's obligations through providing social support, employee trust in the organization increases (Whitener, 1997).

In some studies positive relations between trust and team performance were found (Klimoski and Karol 1976; Costa et al. 2001; Costa 2003), other studies found trust in team members unrelated to team performance (Porter and Lilly 1996; Aubertand Kelsey 2003). A study of Langfred (2004) of self-managed teams even shows that trust can be negatively related to performance. He found that in teams with a high degree of individual autonomy, high trust leads to a reduction in team monitoring, which leads to lower performance than in teams with high individual autonomy and a high level of monitoring.

Organizational trust

Even though trust in the leader has been found to correlate with organizational trust (Aryee et al., 2002), the antecedents of trust in the organization are different from those of trust in the leader (Tan & Tan, 2000). Findings from some studies suggest that the insecure future of the organization, inadequate working conditions, and poor treatment (Kiefer, 2005) or job insecurity (Wong, Wong, Ngo, & Lui, 2005) could lead to employees' distrust in the organization. Whitener et al. (1998) suggested that organizational factors such as structure, human resource policies and procedures, and organizational culture would affect employees' perceptions of trust.

Interpersonal trust is considered an important mechanism to stimulate satisfaction and commitment of members and enhance organizational effectiveness. Interpersonal trust building is an interactive process in which individuals learn or unlearn to establish and maintain trustworthiness, under given organizational (contextual and structural) settings, and subject to policies directly or indirectly, positively or negatively sanctioning the building of interpersonal trust. Stable intentions for behaviour can be stimulated by durable policies, structures and contextual settings.

Lee and Stajkovic (2005) tested Mayer et al.'s (1995) model of organizational trust and found that trust in a specific team member led to great cooperation in work teams, a likely result of accumulated social capital. In their study, Chattopadhyay and George (2001) found that temporary workers scored lower on trust than did internal workers in temporary worker-dominated groups, but Chattopadhyay and George found no parallel effect in the internal worker-dominated groups, and that difference is likely a result of differential work status.

Trust in organizations involves employees' willingness to be vulnerable to their organization's actions. This willingness can be rendered only when an organization clearly communicates its actions to its employees through informal and formal networks. An important source of information is the employee's immediate social environment, which largely comprises coworkers. According to the social information-processing theory (Salancik & Pfeffer, 1978), the social environment provides cues that employees can use to construct interpretations and model their attitudes and behaviors. Festinger (1954) suggested that information from the social environment is salient and relevant particularly when the receiving employee regards the individual sources as very similar to him- or herself. Also, Festinger argued that if information from formal channels is absent or ambiguous, employees will start to rely on the social environment to derive interpretations. Therefore, individual employees' impressions can be influenced by the attitudes and behaviors of those coworkers whom they perceive as similar to themselves. Then, the individual employees regard the

attitudes of coworkers as socially acceptable and model their beliefs according to those of their coworkers (Salancik & Pfeffer). Thus, it is reasonable to suggest that employees' trust for their coworkers influences trust in their organization, because employees who trust their coworkers are likely to regard their coworkers' perceptions as relevant and socially acceptable. Hence, when these trusted coworkers perceive that the organization's actions are beneficial, the employees are likely to be influenced by this same belief and subsequently construct similar perceptions that the organization can be trusted. Studies that have shown that employees who communicate with one another frequently share similar interpretations of organizational issues (Schmitz & Fulk, 1991).

According to Zucker (1986) organizational trust can stem from the owner's personality (small firms) or from strongly centralized decision structure and organizational culture, which makes the organization regularly interact in a particular, "trusting" way. Barney and Hansen note that the organization's values and beliefs may be supported by internal reward and compensation systems, together with decision-making systems reflecting culture. This organizational trust can also be called routine trust, and it comes up especially in connection with long term, institutionalized relationships. In organization there is also general trust at the company level, and that is based on a company's good reputation or resources.

Trust in the workplace has been shown to have a strong and robust influence on a variety of organizational phenomena, including job satisfaction, stress, organizational commitment, productivity, and knowledge sharing (Kramer 1999). Abrams et al. (2003) suggest that "trust leads to increased overall knowledge exchange, makes knowledge exchanges less costly, and increases the likelihood that knowledge acquired from a colleague is sufficiently understood and absorbed that a person can put it to use". Precursors of trust include environmental and contextual factors and "malleable relational features" such as shared language and shared vision (Levin, Whitener, Cross 2006). Other research has explored the effect of characteristics of the relationships in which trust occurs, such as strong versus weak ties (Levin, Cross 2004; Hansen 1999), and of characteristics of the individuals in the relationships, such as the length of their tenure and their perceived trustworthiness (Levin, Whitener, Cross, 2006).

PRACTICAL IMPLICATIONS

In an era of competition, organizational resources are precious and limited. Any opportunity for the organization to improve the effectiveness of its people and reduce impediments in the organization is limited. Because of the significance of trust in coworkers in determining trust in organizations and important outcomes like organizational commitment and performance, it would be reasonable for organizations to develop a climate of trust among employees. As part of the implications of the present study, organizations should also cultivate cultures that promote trust among coworkers, trust between managers and employees and organizational trust. Because of the significance of benevolence and integrity as factors of trustworthiness, organizations can promote, through visions and campaigns, the need to be benevolent to fellow coworkers and to exhibit high levels of integrity.

CONCLUSION AND DIRECTIONS FOR FURTHER RESEARCH

The theory of trust is still developing. Researches disagree on the nature and definition of this complex concept. Studies conducted so far take very different theoretical backgrounds and the chosen empirical context. This paper provides an overview of the range of approaches that have been used in investigating trust in different settings. Various disciplines have different basic assumptions about trust. Te economists; rational and calculative view of trust, for example, contrasts strongly with the philosophers' attitudinal and ethical view. Social psychologist underline the reliability of the word or promise and the fulfillment of obligations, whereas economists see trust as a response to expected future behavior and recommend the use of hostages to ensure rational behavior. Social psychologists and philosophers emphasize the personal and inter-personal aspects, while economics, lawyers and most market researches emphasize inter-organizational trust.

The investigation showed that most employers would be eager to cultivate employees' trust in the organization. The benefits of trust should be obvious to all, but how to develop such trust remains a challenge to most employers. The mutual investment employee-organization relationship approach could initiate trust in employees, but support from the immediate supervisor is both synergistic and fundamental. The findings should be useful to human resource management practitioners in firms. The study also contributes to the accumulating evidence that the mutual investment in employee relations in organization approach may be a wise human resource management tool for many, if not all, employers.

Trust is measured mainly according how much, is any, a respondent trusts the other party. But this does not increase our understanding of what trust really is. Respondents may easily ascribe various meaning and contents of trust, thus actually answering different questions. It could well be argued that existing attempts to measure trust are not able to capture the whole phenomenon, trust being both context- and situation – specific, and being perceived subjectively by separate individuals having their own distinct histories.

It will be challenging in the future research to study how trust is assessed, signaled and created. The findings from the article indicate the possibility of studying the question further.

ABSTRACT

Contemporary enterprises functioning in a turbulent environment have to continuously adapt to new challenges. Therefore, it is necessary for an enterprise to have adequate competencies which will provide it with a permanent competitive advantage and let it function and develop in a long-term perspective. An important role in gaining and maintaining such an advantage by enterprises is played by their knowledge-based internal resources, known as corporate competencies. The difference between the current status of the company's competences and their desirable level defines as the competence gap.
Thus it is necessary to adequately identify and analyze the signals coming from the environment, taking into account their influence on the current and future situation of the company as a whole, and also predicting on the basis of such signals the directions of the changes in the environment and core competences which condition the company's functioning in the future. The problem is to what degree enterprises are able to identify the expectations of the environment and how quickly they can undertake some corrective actions through the processes of corporate learning. Substantial support in this area can be provided by professional consultants who, due to their knowledge and experience, back up their client's enterprise in an objective and independent way, identifying and reducing the competence gap.
The paper presents the results of empirical research performed in order to determine the factors that support or hinder the identification of competence gap and the course of corporate learning processes in Polish enterprises.

Keywords: professional consulting, organizational competencies, competence gap, reducing competence gap

INTRODUCTION

Contemporary enterprises functioning in a turbulent environment have to continuously adapt to new challenges. Therefore, it is necessary for an enterprise to have adequate competencies which will provide it with a permanent competitive advantage and let it function and develop in a long-term perspective. An important role in gaining and maintaining such an advantage by enterprises is played by their knowledge-based internal resources, known as corporate competencies.

The idea of "corporate competencies" has been defined in many different ways, however, it can be stated generally that they are the enterprise's specific skills referring to the placement of its resources, together with its cognitive abilities which make it possible to undertake activities leading to reaching assumed goals. Corporate competencies of an organization include elements such as its unique, specific knowledge, experience and skills which have all

been developed by this organization and which give it a competitive advantage. In the environment of knowledge-based economy, the role of competencies is increasingly important and it can be assumed that this tendency will continue.

Thus, it is necessary to identify continuously the environment's requirements – in the context of key competencies indispensable to create and strengthen a permanent competitive advantage, as well as the company's adequate reaction through the processes of corporate learning. The actual requirements of the environment set against the enterprise's current competencies make the so called "objective competence gap" which can be perceived to a different degree by the company's management board. The majority of enterprises are aware of this discrepancy, either in a situation when problems have already arisen or they anticipate such problems and confront them with the company's actual competencies. What is identified as a result is the so called "subjective competence gap" which gives an impulse to initiate corporate changes. The competence gap understood in this way can be defined as a discrepancy between the competencies remaining at the company's disposal, assuming their optimal use, and the competencies which are necessary to meet the company's aspirations.

Thus, competence gap is the difference between the current status of the company's competences and their desirable level. The idea of a "gap" understood as a lack, a deficiency has a pejorative tone as such. Likewise, competence gap which result in the following key, negative effects in the company:

- it hinders or even makes it impossible for the company to develop, or even poses a threat to its further existence,
- it hinders improving the company's competitive position,
- it hinders creating innovation: of products, processes or business models.

It should be stressed, however, that analyzing competence gaps occurring in the particular competence areas of an enterprise does not fully take into consideration the aspect of complexity and structurization of organizational competences. Ensuring the effectiveness of a number of organizational processes requires that the company should have at its disposal competences which make it possible to coordinate the actions implemented in different competence areas, which means that studying gaps in individual areas is usually insufficient for a full recognition of the competence gap existing in the company.

Thus it is necessary to adequately identify and analyze the signals coming from the environment, taking into account their influence on the current and future situation of the company as a whole, and also predicting on the basis of such signals the directions of the changes in the environment and core competences which condition the company's functioning in the future. It should be noted, however, that competence gap may be motivating to introduce changes in the company and it orientates the processes of the organization's improvement. The problem is to what degree enterprises are able to identify the expectations of the environment and how quickly they can undertake some corrective actions through the processes of corporate learning. Substantial support in this area can be provided by professional consultants who, due to their knowledge and experience, back up their client's enterprise in an objective and independent way, identifying and reducing the competence gap.

PROFESSIONAL CONSULTING
