Table of Contents

Session 1: Strategic Management- policies, risk, new markets, pricing, outsourcing and value chains

Session 2: Financial management in industrial operations- branding, investment, and cost management

Session 3: Management of technology and innovation- applications, cases, and new product/ service development

Session 4: Productivity and quality management- process improvement and customer focus

Session 5: Decision theory and analysis- process and decision-making tool

Session 6: Change and contemporary management- human capital and emerging trends for future management

Session 1: Strategic Management- policies, risk, new markets, pricing, outsourcing and value chains

S1 - 1	Project management in Asian car companies *Supachart Iamratanakul*
S1 - 17	Strategic information and customer-oriented systems: the role of competitive priorities *Oscar F. Bustinza, Daniel Arias-Aranda and Vanesa Barrales-Molina*
S1 - 18	Perceived risks and risk reduction strategies in online group-buying *Fei-Fei Cheng, Tien-Yin Liu and Chin-Shan Wu*
S1 - 26	An analysis of pricing telecommunications network services with data mining methods *Jongsawas Chongwatpol*
S1 - 38	New connect in comparison with multilateral trading facilities in Europe. irregularities in the functioning of the polish MTF market. *Roman Asyngier*
S1 - 55	Correlated risk assessment and its managerial applications *J. N. Pan and Sheau-Chiann Chen*
S1 - 75	Popular online promotion strategies among different industries *Chin-Shan Wu, Yi-Ting Huang and Fei-Fei Cheng*
S1 - 76	Innovations in higher education system, based on the example of the faculty of economics, Maria Curie-Skłodowska university, project synergia case *Agnieszka Sitko-Lutek and Aneta Karasek*

S1 - 86	Innovations in the context of risk management *Anna Karmańska, Tomasz Michalski and Adam Śliwiński*
S1 - 103	Formulation of marketing information and communication strategies in Taiwan tourism industry *Tzong-Ru(Jiun-Shen) Lee, Yu-Hsuan Kuo and Per Hilletofth*
S1 - 112	Is habit influenced construct for online repurchase intention? *Chinho Lin and Watcharee Lekhawipat*
S1 - 127	Product portfolio management - current challenges and preconditions *Arto Tolonen, Hanna Kropsu-Vehkapera and Harri Haapasalo*
S1 - 145	Surname as a luxury brand: brand value perspective *Barbara Mróz-Gorgoń*
S1 - 157	An investigation of key successful factors of biotechnological industry performance in Taiwan ~ also an analysis of traditional Chinese medicine *Shang-Yung Yen, Shu-Mei Tang and Wei-Chih Wu*
S1 - 171	The effect of the minimum wage on the competitiveness of economy *Anna Krajewska, Piotr Krajewski and Katarzyna Piłat*
S1 - 190	The value chain of a sustainable development organisation *Jan Chadam, Malgorzata Polkowska Zbigniew Pastuszak and Nada Trunk-Sirca*
S1 - 202	Outsourcing strategies and negotiation power in security sector *Jouni Juntunen, Mari Juntunen, Vesa Autere and Pekka Kess*
S1 - 215	Do training funds raise the pace of training? The case of Mauritius *Oluyemisi Kuku, Peter F. Orazem, Sawkut Rojid and Milan Vodopivec*
S1 - 236	The role of fair trade in developing corporate social responsibility: an empirical examination based on multiple cases *Khuram Shahzad and Ilkka Sillanpää*
S1 - 256	Employees' theft behaviour: a study in large retail organisations in Kuala Lumpur *M. Krishna Moorthy, Felix Chee-Yew Ng, Mahendra Kumar a/l Chelliah, King-Tak Yew and Lee Ah Suat*
S1 - 267	AEC and Thailand brand *Yupin Patara and Nicha Tanskul*
S1 – 269	The importance of building and rebuilding trust in organizations *Joanna Paliszkiewicz*
S1 - 279	To develope Taiwan tourism development strategies based on the travel experience in Thailand *Tzong-Ru (Jiun-Shen) Lee, Hui-Chu Tung and Cheng-Chun Hsieh*

S1 - 286	Conceptual strategic framework for decision support system of Thai fruit *Sawang Panjun and Punnamee Sachakamol*

Session 2: Financial management in industrial operations- branding, investment, and cost management

S2 - 1	Formation of brand evidence in retail banks *Chiachi Tsan and Hsin-Fu Chen*
S2 - 19	Life insurer financial management: space risk analysis in the case of Poland *Adam Śliwiński*
S2 - 33	Can heuristic valuation improve investment performance of individual in investors? *Mariusz Kicia*
S2 - 50	Influence of globalization and integration processes on accounting regulations on the example of Poland *Małgorzata Kamieniecka*
S2 - 65	Investment analysis in public-private-partnership projects: any common ground for public and private investors? *Pekka Leviäkangas, Pekka Kess and Jaakko Kujala*
S2 - 79	Influence of project management maturity on projects' costs *Seweryn Spalek*
S2 - 86	Business models in construction – construction managers' viewpoint *Aki Pekuri, Laura Pekuri and Harri Haapasalo*
S2 - 88	Threat of insolvency of private sector companies on the example of Poland, Czech Republic and Slovakia *Justyna Franc-Dąbrowska and Małgorzata Porada-Rochoń*
S2 - 98	The selection of project in rapid environment's industry using zero based budget *Supachart Iamratanakul*
S2 - 110	Comparing manufacturing and services sourcing against R&D sourcing *Marzieh Shahmari Chatghieh, Harri Haapasalo and Anyanitha Distanont*
S2 - 131	A conceptual model of corporate entrepreneurship in banking industry *Bobby Boon-Hui Chai and Harry Entebang*
S2 - 137	Extending the UTAUT model in M-banking adoption *Ching-Mun Cheah, Aik-Chuan Teo, Keng-Boon Ooi and Jessica C.J. Wong*

S2 - 142	Using sustainable competitive advantages to measure technological opportunities *Josu Takala, Matti Muhos, Sara Tilabi, Mehmet Serif TAS and Bingli Yan*
S2 - 164	The relationships among stocks, bonds and gold: safe haven, hedge or neither? *Shu-Mei Chiang, Chi-Tai Lin and Chien-Ming Huang*
S2 - 181	Warrant SEOs in an emerging market: evidence from Thailand *Polwat Lerskullawat*
S2 - 197	Business justifications for rapid productisation in small- and medium -sized companies *Kai Hänninen, Matti Muhos and Harri Haapasalo*
S2 - 211	Institutional arrangement, technological innovation and application evolution: the rise of China's emerging computing infrastructure *Jiang Yu and Yue Zhang*
S2 - 239	Inter-organizational relationship and innovation performance in electronic supply chains *Jao-Hong Cheng , Chih-Ming Lee and Mu-Chung Chen*
S2 - 245	E-business analysis of real estate companies *Delvin Grant and Emna Cherif*
S2 - 257	Exploring the dynamic interdependence in the east Asian stock markets *Suthawan Prukumpai and Yuthana Sethapramote*
S2 - 279	Organizational learning: a mediating factor between technological innovation and TQM *Voon-Hsien Lee, Keng-Boon Ooi, Chee-Keong Choong and Kee-Luen Wong*
S2 - 282	Determinants electricity demand in industry and households *Štefan Bojnec and Drago Papler*
S2 - 283	Developing credit rating indicators of customers for electronic companies *Hsiao-Chen Chang, Kuang-Hsun Shih, Ming-Fang Lee and Yi-Hsuan Chou*

Session 3: Management of technology and innovation- applications, cases, and new product/ service development

S3 - 1	Supervision and protection of e-data in sensitive information systems *Vladimir Šimović, Matija Varga and Marin Milković*
S3 - 25	A novel infrastructure for data sanitization in cloud computing *Cheng-Yuan Ku and Yu-Siang Chiu*

S3 - 29	Electronic word-of-mouth: the moderating roles of product involvement and brand image *Chinho Lin, Yi-Shuang Wu and Jeng-Chung Victor Chen*
S3 - 48	The internet of things: the revolution of tomorrow or the overrated technology of today? *Aelita Skaržauskienė and Marius Kalinauskas*
S3 - 61	The building blocks of consulting service excellence *Adeline A. Pacia*
S3 - 80	Relationship performance on self-service technology: relationship maintenance and perceived relationship investment *Powen Fang, Yaochuan Tsai and Hsinhsin Chang*
S3 - 107	Online media evaluation of disaster management *Panom Gunawong and Jiratiwat Pongnaparuk*
S3 - 117	The antecedents of innovation climate: cross-level mediation perspectives *Li-Yueh Lee and Veasna Sou*
S3 - 139	The antecedents and mediators of new product development success *Les Tien-Shang Lee*
S3 - 161	Conceptualizing productization from the Yin Yang perspective *Tuomo Kinnunen, Harri Haapasalo, Kris M Y Law and Kai Hanninen*
S3 - 162	Threats and the protection of electronic information with regard to social networks *Matija Varga, Vladimir Šimović and Marin Milković*
S3 - 179	Mediating role of knowledge sharing on information technology and innovation *Onwika Kaewchur and Kongkiti Phusavat*
S3 - 189	Grants, enterprise innovativeness and efficiency *Sabina Žampa and Štefan Bojnec*
S3 - 203	The effect of cultural and economic conditionings on innovativeness in economics *Agnieszka Sitko-Lutek and Aneta Karasek*
S3 - 222	Self-disclosure on social network sites in adolescents: the exploratory study of Thai students *Yupin Patarapongsant and Issariya Woraphiphat*

S3 - 238	Development of cloud virtualization technology and its application in manufacturing management system- a case study *Shang-Liang Chen, Cheng-Hung Kuo, Ying-Han Hsiao, Sin-Ru Wang, Yun-Yao Chen and Chiang Hsu*
S3 - 252	Managing knowledge to enhance the performance of the grassroots technological innovation for Thai SMEs *Somchai Numprasertchai and Haruthai Numprasertchai*
S3 - 264	Productisation: a literature review *Janne Harkonen, Harri Haapasalo and Kai Hanninen*
S3 - 297	Website adoption: overview of Malaysian cost engineering firms *Ms. Zarina Syuhaida Shaarani and Abdul Rashid Abdul Aziz*
S3 - 310	System supporting location of service works - case study *Jędrzej Trajer, Małgorzata Jaros, Bronisław Gołębiewski and Radosław Winiczenko*
S3 - 318	A study on the adoption of cloud technology service in tourism *Shu-Ping Lin and Shou-Yen Lin*
S3 - 326	How knowledge integration mechanisms affect product innovation in the NPD process? *Teresa Tiaojung Hsu, Kuen-Hung Tsai and Yi-Chuan Liao*
S3 - 342	Business case analysis for rapid productisation *Tuomo Kinnunen, Kai Hänninen, Harri Haapasalo and Hanna Kropsu-Vehkaperä*
S3 - 355	Green product positioning and purchase intention in Malaysia *Sathiswaran Uthamaputharan and Muslim Amin*

Session 4: Productivity and quality management- process improvement and customer focus

S4 - 1	Measurement of disconfirmation in online purchasing behavior *Chinho Lin and Yu-Huei Wei*
S4 - 11	Exploration of consumers' behaviours connected with product reuse *Monika Nalewajek and Radosław Mącik*
S4 - 24	An evaluation of manual material handling tasks in a manufacturing company *Grepo, Lorelie, Yabis, David John and Po, Ronald Aaron*
S4 - 42	Benchmarking in higher education *Jerzy Woźnickia, Mariusz Luterek and Iryna Degtyarova*
S4 - 54	Brand and corporate image of a sport organization as a factor of building loyalty *Agnieszka Rak*

S4 - 66	Role of monitoring and controlling quality in TQM *Sanjana Brijball Parumasur and Patsy Govender*
S4 - 84	Consumers' perception of retail formats – case of Poland *Radosław Mącik, Dorota Mącik and Monika Nalewajek*
S4 - 98	Customer-based performance on customer relationship management: the role of customer relational information process *Hsinhsin Chang, Powen Fang and Fangju Cho*
S4 - 120	Product quality improvement through response surface methodology: a case study *HE Zhen, ZHANG Xu-tao and XIE Gui-qing*
S4 - 131	The implementation of customer relationship management within Taiwanese banks *Ying-Yueh Su, Yen-Ku Kuo and Bang-Lee Chang*
S4 - 138	Applicability of the (Q,R)-model in maintenance materials management *Antti Puurunen, Jukka Majava, Hanna Kropsu-Vehkapera and Pekka Kess*
S4 - 153	Private higher education in Slovenia *Dušan Lesjak and Vesna Skrbinjek*
S4 - 161	Shopping cart abandonment: a comparison between American and Taiwanese perspectives *Chuleeporn Changchit and Tzong-Ru Lee*
S4 - 175	The impact of online banking on customer service delivery in the Malaysian banking industry: KANO's model approach *Tasmin, R., Alhaji Abubakar Aliyu, Norazlin, H. and Josu Takala*
S4 - 189	The innovation from buyer and supplier's collaboration *Ya Ling Tsai and Huei-Ying Chen*
S4 - 197	TQM and family owned business: performance and sustainability *Boon In Tan, Kee Luen Wong and Chee Keong Choong*
S4 - 205	Customer definition and representation in market-driven product development *Jukka Majava, Jouko Nuottila, Harri Haapasalo and Kris M.Y. Law*
S4 - 222	Why consumers resist mobile payment? A conceptual model *Aik-Chuan Teo, Ching-Mun Cheah, Keng-Boon Ooi and Jessica C.J. Wong*
S4 - 227	The impact of trust and stereotypes on the type of doctor-patient relationship – a study on Polish health care market *Katarzyna Krot*

S4 - 236	Measuring and developing customer satisfaction with the balanced critical factor index method *Mika Kuronen and Josu Takala*
S4 - 245	Public business services in a sparsely populated area – case study *Martti Saarela, Eija-Riitta Niinikoski and Matti Muhos*
S4 - 259	An integrated optimization model for distribution center location with considerations of population and income *Aditi Dwivedi and Namkyu Park*
S4 - 271	Safety culture maturity model in upstream: oli and gas industry in Thailand *Bordin Vongvitayapirom and Kongkiti Phusavat*
S4 - 298	Investigating the perceived of e-leadership style change and its consequence in virtual context *Kai-Tang Fan*

Session 5: Decision theory and analysis- process and decision-making tool

S5 - 1	Evaluating accuracy of a time estimator in a project *Thanh-Lam Nguyen, Wei-Ju Hung, Ming-Hung Shu, Lin-Ying Hsu and Yueh-Hung Yeh*
S5 - 8	Time-dependent vehicle routing problem in Bangkok *Warinda Kiatdherarat, Pathai Suwannawiwat and Kamol Limtanyakul*
S5 - 15	A system dynamics model of trust, knowledge sharing and stability of strategic alliance *Chinho Lin and NguyenDong-Thai Dao*
S5 - 28	Integrating ERP benefits, competitive priorities and performance measures *Oscar F. Bustinza, Daniel Arias-Aranda, Vanesa Barrales-Molina, Carmen Haro Dominguez and Nieves Perez Arostegui*
S5 - 29	Providing semantic interpretation to OLAP queries. Application to hospital management data warehouses. *Carlos Molina, Belén Prados-Suarez, Miguel Prados de Reyes and Carmen Peña Yañez*
S5 - 39	Rule generation based on novel two-stage model *Kuo-Ping Lin, Ching-Lin Lin, Yu-Ming Lu and Ping-Feng Pai*
S5 - 61	Forecasting model for the international tourism demand in Taiwan *Thanh-Lam Nguyen, Jui-Chan Huang, Chuang-Chi Chiu, Ming-Hung Shu and Wen-Ru Tsai*

S5 - 71	Basic quaternary design table using geometrical design *Jen-der Day and Hsien-Tang Tsai*
S5 - 78	Scenario prediction of Japanese software industry through hybrid method *Yasuo Kadono*
S5 - 85	Tool wear condition monitoring in tapping process by fuzzy logic *Ratchapon Masakasin and Chana Raksiri*
S5 - 94	The internet banner ad and users' attitudes *William Flores, Jengchung Victor Chen and William H. Ross*
S5 - 96	Development of MRP Framework for Job Shop Environment *Sakurat Intrto and Pornthep Anussornnitisarn*
S5 - 97	Identifying data quality/ information quality research: framework and evolution *Tan Zhang, Yue Wu1, Hongyun Zhang, Yuewen Liu and W. Huang*
S5 - 109	Validating performance based critical actions in a high tech start-up *Veli-Pekka Vuoti, Josu Takala,Wenshan Yang, Nurul Aida binti Abdul Malek, Yang Liu, Alexander Mäntylä, Patricia Kronman, Andreas Kreuzer and Afnan Zafar*
S5 - 125	Mining it business texts to analyze technology trends *Sumali J. Conlon and Lakisha L. Simmons*
S5 - 126	A value assessment model for sustaintable smart cities *June Wei*
S5 - 128	Mobile ordering system structure and demand analysis *Kuang-Husn Shih, Fu-Ju Yang, Ching-Wen Lin and Ching-Yi Lin*
S5 - 135	Forecasting with Fourier residual modified ARIMA model- the case of air cargo in Taiwan *Thanh-Lam Nguyen, Peng-Jen Chen, Ming-Hung Shu, Bi-Min Hsu and Yi-Chang Lai*
S5 - 147	The civilizational determinants of Poland's development *Elżbieta Mączyńska*
S5 - 160	Enhancing project management – a quality gate usage *Saroj Koul and J. Joshuva Alexander*
S5 - 173	Challenges for knowledge transfer in virtual NPD - case study *Päivi Lohikoski, Anyanitha Distanont and Harri Haapasalo*
S5 - 193	Early stages of technology-intensive companies in southern California *Matti Muhos, Pekka Kess, Lada Rasochova and Del Foit*

S5 - 200	Study on resource allocations for sustainable competitive advantage *Josu Takala, Daryna Shylina, Teppo Fross and Johannes Malmi*
S5 - 218	A demerit control chart for customer satisfaction survey *Worlaluck Jankrajang*

Session 6: Change and contemporary management- human capital and emerging trends for future management

S6 - 1	Mobile tourism the hidden jewel of the tourism industry? *Garry Wei-Han Tan and Keng-Boon Ooi*
S6 - 15	Social network reactions to a flood situation *Panom Gunawong and Phatchayathit Jankananon*
S6 - 25	"Novel smart map" design for the tourism industry *Hsin-Jung Lu and Lee, Tzong-Ru(Jiun-Shen)*
S6 - 34	Personality traits and professional responsibility – preliminary model *Radosław Mącik and Dorota Mącik*
S6 - 51	The hidden cultural management factors in English cram schools *Shao-hua Chang*
S6 - 52	Adequate temperature and humidity for books and people in a library *Bang-Lee Chang, Hui-chen Lee, Yen-Ku Kuo, Ying-Yueh Su and Ching-Tzu Chen*
S6 - 73	Bridging competence and curriculum for complex change *Chi-Cheng Chang*
S6 - 87	Validating knowledge/technology effects to operative sustainable competitive advantage *Josu Takala, Jari Koskinen, Yang Liu, Mehmet Serif Tas and Matti Muhos*
S6 - 103	The antecedents of expatriates' creative engagement *Li-Yueh Lee and Veasna Sou*
S6 - 124	Implementing balanced scorecard of Government MIS Department－using AHP and fuzzy AHP methods *Yi-Hui Liang*
S6 - 132	Organizational competencies and the enterprise's effectiveness *Urszula Skurzynska-Sikora*
S6 - 143	Using clue as a software platform to teach artificial intelligence: continuing investigation and development *Adrian A Angeles, Bernardo Z Cinco and Paul Vincent S Contreras*

S6 - 144	A study on relationship among organizational trust, organizational justice and organizational spirituality *Yen-Ku Kuo, Tsung-Hsien Kuo, Chien-Ting Lin, Yung-Heng Lee, Bang-Lee Chang, Ying-Yueh(Janice) Su and Li-An Ho*
S6 - 151	Relationship between knowledge management practices and library users' satisfaction: a preliminary result of Malaysian university libraries *Che Rusuli M.S., Tasmin R., Takala J., Norazlin H., K Phusavat, Walsh J. and Raja Abdullah Yaacob*
S6 - 174	An empirical study of users' continuance intention and word of mouth toward SNA (social network app) *Huei-Hsia Hsu, Chia-Cheng Chang and Tzu-Hong Lin*
S6 - 184	Training, creativity and innovation *Valerij Dermol and Nada Trunk Širca*
S6 - 194	Market demand, green innovation, and firm performance: evidence from hybrid vehicle industry *Ru-Jen Lin, Rong-Huei Chen and Thao-Minh Ho*
S6 - 210	Drivers for sustainable green supply chain – case of the Indian automobile industry *Saroj Koul and yatish prasad dasari*
S6 - 224	The perceived key factors of public e-service *Chien-I Weng, His-Peng Lu, Kuang-Heng Shih and Kai-ling Chen*
S6 - 241	The relationships among green operations, green innovation, and environmental performance *Rong-Huei Chen, Ru-Jen Lin and Yen-Ju Lin*
S6 - 257	Knowledge dynamics and innovation: case studies in a sparsely populated area *Harri Jokela, Eija-Riitta Niinikoski and Matti Muhos*
S6 - 269	Construction of knowledge creation: a conceptual framework *Khalid Abdul Wahid, Haruthai Numprasertchai and Yuraporn Sudharatna*
S6 - 284	Personal values and gift giving: the case of choosing a restaurant for hosting dinner *Peeraya Lekkumporn*
S6 - 313	Effectiveness of polish and foreign disdcriminant models *Sławomir Juszczyk and Rafał Balina*
S6 - 324	A comparison study between Oracle R12 and manufacturing planning and control theory for MRP implementation *Tippamas Chorpha and Pornthep Anussornnitisarn*

Proceedings of 2013 International Conference on
Technology Innovation and Industrial Management
29-31 May 2013, Phuket, Thailand

PROJECT MANAGEMENT IN ASIAN CAR COMPANIES

Supachart Iamratanakul, Kasetsart University, Thailand
supachart9@gmail.com

ABSTRACT

Purpose *– This paper intends to present personality traits of successful project managers that tend to restrain standardization efforts within organizations yet contribute heavily to success. The paper also determines analyses and recommends various new and existing project management techniques which are used in Asian car companies.*
Design/methodology/approach *- The paper has analyzed the present and future strategies of Asian car market conditions based on interviews and other findings of the company. The project and interview analysis also employed to defines a set of recommendation which these companies can follow as a general project management office (PMO) unit.*
Findings *- Low cost Vehicles are driving the growth of automotive industry in emerging economy, such as China & India. It offers immense opportunities for global players in these economies. Asian countries, such as Thailand, Philippines, Indonesia, Malaysia, are expected to be the potential markets for automotive industry due to AFTA (ASEAN Free Trade Area). From long-term perspective, cheap financing and prices discounts, rising income levels, and infrastructure developments will drive the growth in majority of Asian automotive market. Thailand is emerging as a manufacturing hub for foreign automotive players, due to AFTA under which export tariff are very less.*
Originality/value *- Based on the Asian market, their strategic planning and organizational objective, the paper provides a clarified view of how these automobile companies in Asia work with Project Management Strategies. This contribution is unique for project managers to fit their manufacturing industry needs with the PMO strategies.*

Keywords: Project/ Program management, Asian car market, Project/Program management office, Strategic planning
Classifications: Research paper

PROJECT DESCRIPTION

The project examines, determines, analyses and recommends various new and existing project management techniques which are used in Asian car companies. The information of various popular brands of Asia are collected and are analyzed to perform a survey and a list of interviews to get the best known tools and skills in Asia. Every company has its own project management skill set and its own organizational structure. This project focuses on study of individual company and learns their tools and differentiates them.

The analysis is done to create affair line of difference among these organizations. No matter how similar the product is, or how its structure is complicated. Every organization follows its own project management rules. Type of Project management teams may vary from company to company or maybe even project to project.

Project management skills remain in high demand within Asian organizations. Ironically, project management methods and practices remain inconsistent even though numerous templates, methodologies and repositories are available for use in improving consistency in project management practices (e.g., PRINCE2, PMI BOK).

The paper shows:
1. The personality traits of successful project managers tend to constrain standardization efforts within organizations yet contribute heavily to success. Such characteristics include individual determination, focus, and ability to influence, drive to deadline / key performance indicators;
2. The demands of business sponsors play a major part in subverting initial project objectives;
3. The involvement of external suppliers and system integrators in particular, tends to skew project management within large-scale projects.

Asia has always been popular for its new concepts and for bringing new platform products for the world. Asian car companies have shown a tremendous success rate in the previous years. Now and from the past, they have been innovative and succeeding in newer ventures by following their project management strategies and making changes to them as per the requirements.

China, India & ASEAN countries are the major driving markets for Asian automotive industry. "Asian Automotive Industry (2007)" report provides objective analysis on Asian Automotive industry to explore the potential opportunities and challenges faced by the industry.

The key findings for this paper:
1. Low cost vehicles are driving the growth of automotive industry in emerging economy, such as China & India. It offers immense opportunities for global players in these economies.
2. Asian countries, such as Thailand, Philippines, Indonesia, Malaysia, are expected to be the potential markets for automotive due to AFTA (ASEAN Free Trade Area).
3. From long-term perspective, cheap financing and prices discounts, rising income levels, and infrastructure developments will drive the growth in majority of Asian automotive market.
4. Thailand is emerging as a manufacturing hub for foreign automotive players, due to AFTA under which export tariff are very less.
Poor infrastructure affecting the growth pattern in Asian automotive industry e.g. commercial vehicles dominates Indonesian and two wheelers in Sri Lankan automotive market due to the poor roads.

Key Issues and Facts Analyzed

1. Automotive Industry performance of major Asian countries.
2. What opportunities exist for the automobile players in Asian automotive industry?
3. Major challenges and driving forces for Asian automotive industry.
4. Who are the major competitors in Global Passenger car industry?

Key Players Analyzed

This section covers the key facts about major players currently operating in the Asian automotive industry, such as General Motors, Toyota Motor, Ford, Nissan, Honda, and Hyundai.

THE BACKGROUND OF PROJECT MANAGEMENT

To start this section, one must be understand what a project is. A project is defined by Project Management Institute (PMI) Standard committee in "A guide to the project management body of knowledge" as "A temporary endeavor undertaken to create a unique product or service" (Institute, 2004). A project is a one-time activity with the following attributes (Meredith and Mantel, 2006).

1. A well-defined purpose
2. A life cycle starting slowly, reaching peak, then declining
3. Interdependencies and system interactions within the organization, the industry, and environment in which it exists
4. Uniqueness about its objectives, operational characteristics and outputs
5. Deliberate conflict built into it.

A project can also be considered that (Nicholas, 1990):

- Involve a definable purpose and end result specified in terms of cost, schedule, and performance requirements.
- Cut across organizational lines and utilize skills and talents from multiple disciplines and organizations.
- Involve unfamiliarity, uncertainty, and risks. Given that a project differs from what was previously done, it also involves unfamiliarity.
- Encompass new technology, which, for the organization undertaking that project, possess significant elements of uncertainty and risk.
- Are temporary activities with personnel, material, and facilities assembled to accomplish as goal within a scheduled time frame. Once the goal is achieved, the project ceases to exist. The project resources may be reconfigured to begin work on a new goal.
- Is the process of achieving a goal, going through distinct phases, called the *"PROJECT LIFE CLYCLE"*.

A project includes any series of activities and tasks. Those activities and tasks should be:

- Definable in terms of a specific, finite objective
- Infrequent, unique, or unfamiliar to the existing organization
- Complex with respect to organizational interdependence in detailed task accomplishment
- Critical to the company in terms of extent of commitment in resources, market potential or some other aspect that has significant impact on the company's business position.

The key elements of project management are classified as follows:

Table 1: The elements of project management

Elements	Issues
Project participants	Bring people to frontier Manage people in team
Project organization	Manage organization in multi-function environment Manage people of different functions
The project itself	Start, executed, and control a project Manage the process
Project resources	Manage the resources such as financial resources, supplier, internal resources, etc.
Project system interactions	Interface with external organization Link to outside world
Strategic fit of the project	Manage strategic issues for the project Must have strategic fit in a project

STRATEGIC VIEWPOINT OF THE PROJECT

Projects are building blocks in the design and execution of organizational strategies (Cleland, 1999). This is because a good management of projects can identify a project's priority and have a clear link to the strategic plan of organizations. Strategy is also viewed as its implementation can be made possible by projects (Gray and Larson, 2006a). The accomplishment of strategy is mostly planned to meet the future needs of the organizations' customers so that the projects of those organizations should contribute value to their strategies. For example, a desired outcome could be fast time-to-market, high quality, and low-cost products (Milosevic, 2003; Milosevic and Srivannaboon, 2006). The organization can determine its strategic purposes such as the ability to deliver competitive products and provide services or the ability to support organizational processes through the following components (Cleland, 1998a).

Table 2: Modern project management's viewpoint

The components of strategic management to achieve the organization's purposes	Explanation
Organizational Design	It is "the alignment of people, specialized activities, and resources of the enterprise through a process of decentralization of authority, resources of the enterprise through a process of decentralization of authority, responsibility, and accountability (Cleland, 1998b)." Organizational designs use various structures such as organizational chart to "portrays the alignment of resources within the enterprise (Cleland, 1998b)."
Roles	Organization roles are "the individual and collective parts played by the members of the organization."

Table 2: Modern project management's viewpoint (cont.)

The components of strategic management to achieve the organization's purposes	Explanation
Style	The manager and follower style is "the manner in which knowledge, skills, and attitudes are expressed by the people who play roles in the company."
Supporting Systems	The supporting systems are "those associated with the organizational processes, such as manufacturing, finance, marketing, and R&D."
Resources	The resources are "the basis of the ability of companies to be successful and the bottom line of organizational performance."

A successful project is strategic in nature because when a project is planned, its concept should (Cleland, 1999):

- Contribute to the organizational objectives, goals, and mission
- Standard in the way that the project can be managed
- Handle the market and other environmental factors, which have an impact on the project and the organization.

There are two reasons why project managers need to understand strategy (Gray and Larson, 2006b). Those reasons are illustrated as follows:

1. Project managers can make appropriate decisions and adjustments
2. Project managers can be effective project advocates.

Those reasons support the needs for project managers to understand the strategic management. The strategic management is "the process through which organizations analyze and learn from the stakeholders inside and outside of the organization, establish strategic direction, create strategies that are intended to help achieve established goals and execute those strategies, all in an effort to satisfy key organizational stake holders (Harrison and St. John, 1998)." The strategic management process for project management is described in the following sequence and shown in figure 2-6 as a schematic of major activities required (Gray and Larson, 2002; Gray and Larson, 2005).

A. Review and defined the mission of the organization
B. Set long-range goals and objectives
C. Analyze and formulate strategies to reach objectives
D. Implement strategies through projects

PROJECT ANALYSIS

1. General Motors

General Motors in Asia has common processes across all four regions in General Motors. Units within each region implement local programs to enhance the model to fit business needs. GM had recently bought Saab and part of Fiat Auto and held stakes in three Japanese carmakers. Ford Motor Co. had looked at Daewoo and walked away. Now called GM

Daewoo Auto & Technology, the South Korean automaker has emerged as an engine for GM's fast-growing Asian operations. With its ability to turn out well-finished cars at low cost, Daewoo supplies GM with affordable cars for more than 150 markets around the world. GM has been pushed back by aggressive Asian rivals; it is a predator here in the Far East. Unfettered by legacy costs and image problems, GM is clawing market share from others. It expects its Asian operations, including Australia and India, to increase its regional market share by more than half, to 10 percent by 2010.

2. Ford

Ford has three best practices for project management. The first type of best practice is the Ford's executive sponsorship of an electrical/electronic systems engineering project management office. This office standardizes project management and engineering team that is aligned with the vehicle programs. It also acts as a single governance board for the project management office framework. The department's director, chief's and the electrical business planning and technology office participate in the governance board through weekly project management meetings to provide support and shift priorities as required.

Additionally, professional project managers consult on the implementation, execution and maintenance of the project management office as well as assisting with the transfer of project management knowledge for the organization. The electrical /electronic systems engineering departments has also internalized project management as a discipline in the engineering roles and responsibilities and provided training to the entire organization, with follow-up auditing processes in place for implemented projects. It has always been Ford's intent for engineers to develop competencies in the area and build an in-house project management discipline.
Transferring the leadership and ownership of project management from professional project managers to the engineering division is one of the recent changes in project management that Ford has implemented with positive results. This transfer has allowed further entrenching of the organization's goal of increasing project management maturity.

Ford Motor Co. differentiates between projects and programs. The electrical/electronic systems engineering project management office acts as the central project manager to standardize projects. The office engages defines projects that usually have a short frame with a clearly defined scope and clear allocation of resources. Whereas the whole organization focuses on program management, specific projects are managed as programs.

3. Hyundai

Hyundai has been making huge strides in quality improvement. In survey after survey, Hyundai has made important gains, impressing the industry and our owners alike. Did you know that Hyundai has over 900 engineers dedicated solely to quality? The support of talented and visionary suppliers is another key component. Hyundai major component of any project is quality assurance.

4. Toyota

There has been a change in Toyota Organizational structure since 1990s. The new organization is aimed at multi-project management. It has three vehicle development centers

in which multiple projects are grouped together, in contrast to either traditional single-project-oriented or function oriented organizations.

Toyota has often been considered a leader in adopting new organizational structures and managerial processes in both manufacturing and product development. Toyota production system, symbolized by its JIT and Kanban systems, has been targeted as one of the best practices in manufacturing by many firms, not only in automobile industry but also in other industries. With respect to product development organization, Toyota led in establishing a project-based management system, which aimed at coordinating activities in different functional areas into a well-integrated new product.

Many Japanese leading automobile companies and Toyota have been developing new product lines or replace existing products using their new and unique project management skills.
At Toyota, project management system that assigns too much autonomy to each product manager may concentrate too heavily on developing multiple new products through autonomous Project-oriented organizations. For example, Chrysler's project team approach, used LH and Neon Projects, might only appropriate for optimizing the development of one product at a time. In contrast, Toyota managers have considered that a project team approach is not an efficient way for large firms to develop many products concurrently that could share similar technologies and components.

Asian automobile firms started changing around 1995. There were two interrelated issues. First, rapid growth in production levels at the Japanese firms virtually ended. The aggressive product strategy of Japanese automobile firms in the 1980's, such as frequent new product introductions and replacements, had been partially based on their assumption of continuous rapid growth. The new environment seemed to require some changes in strategy, as well as in company organizations. Second, the importance of cost reduction became even more critical for international competition than before. In addition to the appreciation of the yen, Japanese advantages in development and manufacturing productivity have been diminishing. Both factors have had a strong negative impact on the cost advantages they had been enjoying.

5. Honda

Honda has a reputation for innovative product designs and advanced engine technology. The reputation has required an effective mix of project management skills and functional skills in engine R&D. With regard to project management, Honda tends to assign most engineers full time to specific product teams. In contrast, at other Japanese firms and at most other firms and at most other auto makers in Europe and United States, component engineers usually take responsibility for two or three vehicle projects at the same time. Spreading technical expertise across multiple project is one of the major characteristics of a matrix organization, as opposed to independent product or project teams, such as Chrysler's. When it starts work on a new product, Honda forms a temporary project team that resembles a task force of engineers from different functional areas.

Honda does have strong managers, which it calls Large Project Leaders(LPLs).Although top management has slightly reduced their authority in recent years ,the LPLs are still more powerful than project managers in traditional matrix organizations such as Renault and Mitsubishi. Therefore, they have been really close to the ideal heavyweight project manager.

INTERVIEW ANALYSIS

1. Interview Analysis from Project Manager from General Motors

The interview helped to mark some standards and the project management strategies the general motors have used and tend to implement in Asian market. GM is currently in the implementation phase of several critical projects. Their strategy allows them to move closer to global systems, and help them eliminate additional unique systems and reducing cost. Their project management team which is hired from all over the globe to meet the competitive Markey globally and establish its standing in Asian market develops a semi-annual check to enhance the ordering/selling of the vehicle.

General Motors project management office trains its manufacturing unit executives to have an aggressive plan of continuing training the people in each division of the unit. The Pm team makes sure that each person has technical skill enhancement plan which the company needs to complete. The project management team also has been focusing on Structural cost reduction IN Asian manufacturing units for their cars. Project Management team in General motors portrays a never-ending focus on I/T organization-not just internally ,but how can they, I/T ,help the business be more efficient, productive and responsive.

One very important strategic change that Asian GM is looking for is Globalization. They want to maintain the agility to leverage GM'S globalization and take advantage of opportunities as quick as possible in the Chinese, Japanese and Indian markets. General motor project management team has come up with third generation model of me I/T sourcing, so that they can effectively manage new suppliers and foster their partnerships in Asia.

The manager also explained how the company was striving to achieve growth and more success in their future venture. The manager also shared their top priority list strategic changes and tools for their current management. They want to drive revenue growth .Due to the weak market, they are go in to emphasize the extent of the challenges the company makes and translate their improvements in products quality and manufacturing into better financial results. They plan to cut almost $9 million in fixed costs through plant consolidation.

2. Interview Analysis from Team Manager from Honda

The team Manager shared more of a general view rather than any particular project details. This has been Honda's common dialogue by reaching the public in a common manner instead of generalization. The team manger informed that the project management group in their company often are maintained and run by the top executive .Except the manufacturing plants and marketing the projects are managed by top executives which act as a project manager. The Project Management and the strategic planning team recently viewed various changes around them due to the continuous Asian car competitive market. Asia has seen a never before competition by massive and small sized company in the previous years.

Manager very deeply explained the project management group which is trying to continue to develop the growth opportunity in China and India. These are the two most fast growing car industry markets in Asia currently. The Asian Honda PM team is trying to collaborate

themselves with Brazil, UK to get the best available tools and methods to perform the right activities and grow rapidly.

The management team has attracted various young members and retained the old ones.

The content management team is planning to develop internal systems that can facilitate the acquisition, management and control of all technical content and intellectual property. The meetings held in Honda for Project managers and team managers, project light and expand the offerings of SAE meetings and conferences outside Asia. In Honda the team manager mentioned that engineers are the winners and the project manager is the guidance to their success. Honda project management tools do an about-face on everything from decision-making to design. Honda is one of the Auto companies in Asia showing a profit. Honda team manager says it is determined to maintain its presence in Asia -- awaiting the accomplishment of various new tools and technical approaches used by Project Managers. The company bought out its Thai partners, taking a 93% stake in the company. It is relatively easy for Honda to change its mind, unlike other Asian companies, such as Nissan or Mitsubishi Motors. Its manufacturing line is flexible. The number of platforms is small. In the case of the Accord, Honda has only one platform, but five lines. Production is different in each market. This level of flexibility is quite unique.

3. Interview Analysis from Executive from Toyota

The executive from Toyota India gave some insight on the company's past and current corporate plans and the development which will take place in Toyota by its Program Managers.

The executive before being interviewed that all their company strategies related to the idea" Toyota does: building quality, reliable cars with good value and taking care of customers". He was keen on making us understand the need of newer techniques and certified PMs in Toyota in Asian centers. Toyota's program managers are focusing more on the business plans at the moment. He also stressed on the fact that their company makes every quarter a milestone instead of a year. The executive was very enthusiastic on mentioning their success of surpassing General Motors in the world last year in April. Toyota as a company continues to grow and expands our footprint; it is more incumbent on us to re-double our efforts to improve the things that got them at this peak.

The project management team has worked hard towards quality ,efficiencies getting better, cost-saving efforts, innovation and technology investments pay off and have been able to cycle those into production...customer service at the dealership improves. All the things that are the factors of success continue to become more important as you the company gets bigger.

Toyota is not in a state of constantly confronting problems and changing directions but is executing a strategy and plans that have been envisioned in the past. The approach the company takes is a more conservative decision-making process that tries to avoid wrong decisions and therefore it takes longer to make decisions. But once a decision is made, the quality is better and the organization is aligned with it. Execution is then painless, quick and accurate. Ten years ago, the company made a significant change by investing in hybrids and

fuel-efficient vehicles. Nobody else did it or was doing it. That has really paid off the last couple of years. They made the change not in a crisis or because of a problem but because it was the appropriate time and the future dictated that for good business. Toyota has grown globally and become a global organization and is deriving the bulk of the volume no longer in Japan.

4. Interview Analysis from Chief Manager from Suzuki

Chief Manager of engineering department was interviewed to pour some light on the insights and ongoing projects in the company. He clarified that unlike rumors Suzuki had a very strong project management cell and which is in accordance to the company's organizational objective. The manger talked about the initiative it has taken in the Asian market.
At Suzuki Japan, young recruits are never put in the shop floor straightaway to handle production and workers because this is a job they would be least fit to do with their level of maturity. On the other hand, they would be fit to do technical related work because they would have just come out of engineering colleges. They come with fresh minds and they are given fresh projects.

Rapid product development using concurrent engineering is our next best practice wherein the lead-time is shortened. Suzuki has have also adopted TQC and TQM practices. Our growth since 1990 can be attributed to the TQM approach. TQM basically has three aspects. It is a system of excellence to sustain the best results through the best process. Respect for people is the other component of TQM. Right from the level of the workmen, we have various forums for employees to participate in self-improvement activities. We have suggestion schemes, quality circles, cross- functional teams, and supervisory improvement.
Suzuki has a skill matrix for engineers and managers. Based on it, they identify training needs of their engineers in a project. They prepare modules, some of which are also provided by overseas and indigenous faculty. The top two quality circles are sent to Japan, Singapore, and Thailand to participate in the QC conventions there. The candidates are then sent to auto fairs in Europe. Training is also provided at Suzuki. Suzuki is one of the most reliable sources of automobile engineers and technical team projects to come from Japan.
Suzuki has been the center source of product for middle size market. It has mostly very affordable cars. The engineering manager stressed on the fact that the company was trying to figure out new strategies to mend their team in such a manner that they can compete with the higher end car sat a lower price.

5. Interview Analysis from Senior Manager from Hyundai

Hyundai Motor is pursuing a policy of global expansion. Its current objective in the Asian car manufacturing market is to win over car buyers in the world's biggest market is crucial to the company's hopes of building a globally recognized brand. The executive explained their strategy for breaking into the industry's top five by 2011 .The Company relies on a rapid buildup in two of the world's fast-growing markets: China and India. According the senior executive their vice president recently declared "The Company's resources will be focused on expanding our presence in emerging markets this year."

Hyundai very important project Management strategy which is being used in almost all its projects is to identify the changing technology strategy of Asian companies in response to

changing business/technology such. Hyundai is hiring special Project Manager to mark its name in the big market effectively. Hyundai till now has hired more than 60 exclusive project managers to assist their venture for next two years. Hyundai Is collaborating with external Project management allocators like it did in 2004 to expand its scope and get more knowledgeable about newer methods and a strong project management team.

RECOGNIZED STRATEGIES

1. Collaboration

Companies in Asia have collaborated their Project management resources and other teams to get better exposure and more perfect tools to enhance their strategies in Asia and go global. A company like Toyota Motor Corp. developed long-standing social and economic relations with a network of suppliers. Higher levels of trust and less fear of opportunistic behavior than was normal in the U.S. characterized both sides of these relations. Toyota relied far less on formal contracts than a company like General Motors Corp. (GM). The result was that Toyota and its suppliers felt able to undertake more joint development work, to exchange sensitive potentially vulnerable information, and to operate a tighter just-in-time component delivery system. A further illustration of the positive contribution trust makes concerns knowledge creation through intercultural teams. Each team was composed of members who came from different national units, either within a multinational corporation or its alliance network. Five of the six teams were operating from the outset within a formal (contracted) context; their members also came from middle hierarchical levels (such as senior engineer).
Honda also developed a similar collaboration with a Europe based company for cost effective management. The Program managers at Honda researched and found the most suitable model for their company and hired the Europe base company for this purpose. Honda's cost-modeling process extends well beyond simply determining the cost of a part or component. It is an integrated process that takes into consideration every factor that contributes to the total cost.

2. Green Business Strategy

More companies are leading the charge to develop and invest in environmentally friendly technology -- not just because its good for nature, but it's also good for the bottom line. Honda and Toyota, rocket along with soaring oil prices, and this has force them to respond quickly and make some major changes in their projects. Ford has already brought technology from Toyota for its Explorer SUV hybrid. Hyundai in Asia have projects ready for hybrid cars. The project Management teams in various companies have trained themselves in the green manner and differentiating the option in the project which are not sustainable to the environment.

3. Expansion

GM has signed a framework pact for the sale and export of approximately USD $1 billion worth of vehicles, components, machinery and equipment to our flagship joint venture in China. Meanwhile, Ford has signed a similar deal worth more than USD $800 million. That deal includes the sale of more than 30,000 North American-built vehicles to China starting from 2009. Additionally the blue oval will sell transmission components and parts (starting

this year) to its joint venture in China. Not to be outdone, Toyota has announced plans to build a second production line in China, which will cost $380 million in investments. The new production line will build more Toyota Camry.

4. International Market place

General Motors, Ford Motor Company, and Chrysler Corp. (now part of DaimlerChrysler following its merger with Daimler-Benz AG) – accounted for 68% of the passenger cars produced in the United States in 1997. The remaining 32% of U.S.-made cars came from Asian and European "transplant" firms. Along with these giant assemblers, the automotive commodity chain also includes parts manufacturers. The auto parts industry is fragmented, consisting of thousands of suppliers ranging in size from small shops to large multinationals. The auto parts segment of the chain is divided between original equipment manufacturers (OEMs) and the replacement market.

5. Supplier Based Technology

Selection of supplier based on technology has become important for the project management offices for manufacturer whose focus is on product and launch flexibility. However, quality becomes strategically important when the manufacturer is focusing on volume flexibility. Inventory management and technology roadmap are very important project management strategies with robust influence on all three forms of manufacturing flexibilities, namely product flexibility, launch flexibility, and volume flexibility. In sum, the manufacturer needs to understand clearly which flexibility of its operation is required, and then adopt a working supplier selection and management strategy.

CONCLUSION

1. A number of project management tools/templates have been developed, however there are no documented processes around how and when to use them.

Result: Utilization of project management tools is not consistent.

2. There is no structure or unified approach to the management of team projects:
Individual project managers within the department apply different approaches to the overall management of their projects (i.e., everyone has a different method of working). Project managers have had to learn how to "work around" each other. A number of Project Management (PM) processes, such as risk management, issues management, and project staffing, are performed on an informal basis.
Project schedules are maintained by project managers on an individual basis (i.e., "off-line).

Result:
1. Project management processes are not consistent or repeatable across team projects.
2. Little or no opportunity for information sharing/learning between project managers/teams.
3. Extremely low probability of configuring the Project Management Office (PMO) to effectively and efficiently support the organization's project community

3. There are several types or categories of project plans implemented within the department that serve differing company objectives.

Result: Several off shoot plans are being created to accommodate cross project reporting and dependency management.

4. Project managers within the new business team are forced to wear many hats (i.e., project manager, technical lead, as well as ongoing maintenance and operations responsibilities).

Result: Many projects are not completed in a timely manner. No distinguishable difference in approach to "project" work vs. "day-to-day" operations.

5. A number of "individual" project management challenges were also identified:

Project Management Challenges/Pain Points

1. No existing templates to provide adequate guidance: How and when to use them, where to access them, how to complete them, etc.
2. There is no way to identify the availability of department resources for project work.
3. Business owners set unrealistic time-frames for completing projects. There is no realistic validation of date.
4. Individual project managers within the department do not know what other project managers are working on, making it difficult to identify and support the information requirements of other projects.
5. Current project management tools and templates are not centralized. Impossible to create a complete end-to-end project plan.
6. Project prioritization process unclear, making it difficult to determine which projects to focus on and apply resources to.
7. Individual project managers do not follow the same project management process.

Assessment

Projects should be segmented across functional groups within the organization. Each function should develop "Project Plans" for its own work independent of other functions and thus no end-to-end project plans should exist. To help alleviate this problem a system of milestone "hand-offs" should be developed to identify the cross function work dependencies. This however, can necessitate the need for a consolidated master milestone plan that requires additional effort to support and maintain.

While most of the approaches taken by the team's project managers are implemented out of a need to "get the job done", they are indicative of an organization with no structured approach to executing projects. This has led to inconsistencies and inefficiencies across the organization.

It is possible to address each of these findings on an individual basis and develop individual project team solutions. However, such an approach, without consideration of the enterprise as a whole, will lead to minimal success with mediocre results .In Asia ,such an approach is

very common ,many car companies fall in this pit unknowingly .Thus, newer strategies can resolve this problem.

These issues are really symptomatic of a larger issue within the organization. There is no formal recognition of "Project Management" as a viable management concept. It is at best an afterthought, and not seen, nor used as an effective management concept. Though no fault of the organization, this is indicative of an immature project management organization.

Value Proposition

The ability of a car company business to succeed is driven by it's effectiveness in implementing strategic change in a rapidly changing environment. Asia has a very rapid dynamic environment. The competition has to be dealt with a lot of vision. Developing an organizational project management framework for the systematic management of projects, programs and portfolios in alignment with the organizations strategic goals is a proven means of implementing strategic change and achieving business success.

Implementing organizational project management involves embedding skills, knowledge, process, tools and organizational structures within an organization to support this framework to deliver strategic change. An organization's effectiveness in delivering business strategy can therefore be called its organizational project management capability. Most organizations are at a low level of maturity. Building this maturity iteratively is the key to more effectively delivering the organization's strategy.

Project management technology is a major component in enabling project management capability. It provides a means of automating the analysis of project scope, cost and time, and the complexities of managing this across multiple projects. Any technology implementation needs to assess the business processes that will be required to support it, the skills and knowledge that needs to be in place within the user base, and what organizational changes are necessary. All this needs to be in line with the organizations project management maturity. Focusing on the technology leads to trying to leapfrog maturity levels, and the associated cultural challenges that come with this.

Lack of project management adoption is typical because the organization tried to implement toolset functionality that required a higher level of maturity than the organization was actually at. An organizational project management toolset should be deployed at an appropriate level of maturity, and be capable of evolving over time in line with your processes and people.

To achieve increasing levels of project management capability it requires greater sophistication in terms of tool usage, and therefore increasing maturity in terms of processes and people in place. When it comes to implementing project management technology it is important is to walk, skip then run.

Recommendation

Based on the findings outlined above:
In order to add value to the organization, project management must support the team in the achievement of its corporate objectives. Project management strategies provide this support by ensuring that the company pursues, and effectively manages; only the projects that contribute to the attainment of their goals and strategies. This level of Value-Added Project Management can only be attained within the business through the implementation of a structured Project Portfolio Management (PPM) Program. Effective implementation of a structured PPM Program, in turn, can only be accomplished through a strategically functioning PMO. Thus, the PMO serves as the mechanism or conduit through which a structured PPM Program is established and maintained within the organization.

To this end, a three phase approach to creating a strategically positioned PMO that will be used to develop and implement a structured PPM Program for the organization.

Phase 1. Develop Project Management Strategy for Your Organization - The objective of this Phase is to identify goals and strategies and define Project Management objectives based on the company's goals and strategies and demographic location. A Project Management Sponsor should be identified to drive the overall development and implementation of the Project Management objectives. A Project Management Governance Committee should be created to ensure that the PPM Program developed achieves its established Project Management objectives.

Phase 2. Create a Project Management Office (PMO) for PPM Program - The goal of this Phase is to determine the level of maturity required of the PMO to achieve your Project Management Objectives. Establish the charter for the PMO and to setup and staff the PMO.

Phase 3. Develop and Implement the PPM Program - The intent of this Phase is to assess the team against its required level of maturity identified in Phase 2 and establish a baseline.

Future Research

The further study could extend the finding to other regions of car companies. The comparison between Asian car companies and European car companies can be the interesting topic. The role of foreign car companies playing in domestics markets can also be the valuable study.

ACKNOWLEDGEMENT

The authors would like to thank Faculty of Business Administration at Kasetsart University for financial support in this research. We also would like to acknowledge our thanks to the anonymous reviewers for their valuable comments.

ABSTRACT

Purpose: *The analysis of key business variables and support decisions to facilitate the Information Systems (IS) are essential tools available to organizations to manage their decision making policies. In this sense, this article examines how the implementation of information systems (IS) management and customer relationship (CRM) affects the customer's competitive strategy and business performance.*
Design/methodology/approach: *A survey is used to collect data. Empirical analysis utilises Structural Equation Modelling (SEM).*
Findings: *The main findings show a significant positive relationship between integration and skills developed by IS and competitive priorities related to flexibility, innovation and time. Similarly, it is found that the integration of SI is positively and directly related to the customer results while the relationship between the skills developed by SI are positively but indirectly related to these results, being the mediator of the relationship above competitive priorities.*
Originality/value: *The conclusions obtained clarify the role of resources and capabilities generated by IS in organizations, extending the analysis of field theories like Resource-based and Knowledge-based view of the firm in this area.*

ABSTRACT

Purpose: *The purpose of this research is to examine the relationship between risk perceptions (financial, performance, social, time and privacy risks) and risk reduction strategies (brand loyalty, word of mouth, past experience, money back guarantee, store image, shopping, major brand image, free sample, website reputation, and payment security) in online group buying context.*
Design/methodology/approach: *A questionnaire survey was conducted in campus. There are 212 questionnaires were received, and 198 of them are valid.*
Findings: *The results from current study suggested that when subjects perceived financial risk, the brand loyalty, word of mouth, money back guarantee, website reputation and payment system will be adopted to reduce the risk. In addition, performance risk is related to brand loyalty, word of mouth, money back guarantee, major brand image and free sample. Time risk is related to shopping and website reputation, while privacy risk has significant correlation with shopping. There are no risk-reduction strategies related to social risk. Thus, the practitioner have to try some other ways to reduce social risk.*
Practical implications: *Results from current study provide useful knowledge to help the operators who are running online group business in understanding useful strategies to reduce different risks perceived by their potential customers. For example, building strong brands and store image, encourage consumers to spread positive word of mouth are useful ways to mitigate consumers' concern about the performance of the product/service.*
Originality/value: *Online group-buying is one of the fasted growing business model. However, knowledge regarding consumers' concern and possible ways to relief the perceived risks in online group-buying context are limited. Results from current study can contribute to the field by illustrating the useful strategies the e-vendors can use to reduce possible concerns.*

Keywords: Online group-buying, perceived risk, risk reduction strategy, e-commerce

INTRODUCTION

With the popularity of the internet, online shopping has become one of the most important shopping patterns. In addition, group-buying as a new business model also grows fast in recent years. In Taiwan, only 11% of users use online group-buying in 2009, but the number doubled to 22.3% in 2010. However, although online group-buying grows rapidly, complaints have also increased, Popular consumer disputes about online group-buying include: (1) restaurants claim the seats are full, unable to reserve, or even there has seat but still not accept who has coupon purchased from online group-buying website; (2) the restaurants do not indicate the consumption restrictions (such as meals cannot enjoy a free supply of ice cream); (3) actual product served or price compare to the information post on the group-buying site is different. It reveals that a transaction via group-buying site is convenient, but also involves lots of perceived risks and unexpected consequences. Thus, it is important for group-buying marketers to understand how to adopt different risk-reduction strategies to relief consumers' potential perceived risks. The objective of current study is to examine the relationship between perceived risks and risk-reduction strategies to understand how to reduce which perceived risk by using which reduction strategy in online group-buying context.

LITERATURE REVIEW

Online Group Buying

Online group buying was introduced in the mid-1990s, as a market mechanism that collects consumers' orders to obtain volume discounts (Kannan & Kopalle, 2001). This mechanism not only benefits consumers but vendors. Due to more people lower price, consumers have incentive to recruit more customers, so that internet vendors will be able to minimize consumer acquisition costs at the same time to offload excess inventories (Kauffman & Wang, 2001). Anand and Aron (2003) considered online group buying is composed of demand aggregation and quantity discounts, more demand more discounts, let consumer get better condition to purchase. Yuan and Lin (2004) considered online group-buying use time to exchange money, more quantity lower price, buyers have coordination abilities with vendors to achieve price discount which they want, but at the same time waiting for other buyers. Thus, the goal of online group-buying is to create a win–win situation between vendors and consumers, so as to maximize the aggregate social welfare by making each party better than they would be in the absence of this mechanism (Kauffman, Lai, & Ho, 2010).

Perceived Risk

Since the 1960s, the theory of perceived risk has been used to explain consumers' behavior. Bauer (1960) is the first one that developed perceived risk from psychology theory. According to Bauer (1960), consumers' behavior involved risk because their purchasing actions ''will produce consequences which he cannot anticipate with anything approximating certainty, and some of which at least are likely to be unpleasant''.

Cox (1967) proposed the perception that consumer get from the buying action is related to "Financial" or" Social-psychological". Woodside(1968) considered perceived risk has three dimensions: "Social", "Functional" and "Economic". In addition, Roselius (1971) indicated consumer might suffer time loss, hazard loss, ego loss and money loss. Jacoby and Kaplan

(1972) added financial risk and physical risk, proposed five type of perceived risks: financial risk; functional or performance risk; physical risk; psychological risk; and social risk.

Consumers are easier to perceive risks when shopping online than in physical store (Akaah & Korgaonkar, 1988; Tan, 1999). The reason might be that online group-buying can't sure that all shopping objects and condition would be completely success and finish, therefore, consumer will face financial risk, performance risk, psychological risk, physical risk, social risk and time risk. For online shopping, the major concern for consumer is network security and information privacy problem (Miyazaki & Fernandez, 2001). To sum up, in online group-buying environment, consumers may face seven risks, which include financial risk, performance risk, social risk, time risk, and privacy risk.

Risk-Reduction Strategies

Roselius (1971) proposed eleven strategies that consumers used to reduce risks regarding time loss, hazard loss, ego loss, and money loss. The strategies include endorsements, brand loyalty, major brand image, private testing, store image, free sample, money back guarantee, government testing, shopping, expensive model, and word of mouth. Derbaix (1983) fixates on the relationship between nine kinds of risk-reduction strategies (Money-back guarantee, Store Image, Advice of friends and relatives, Salesman's advice, Expert advice, Brand loyalty, Major Brand Image, Shopping, and Expensive mode) and different perceived risks. Akaah and Korgaonkar (1988) focus their research on direct-mail marketing, they use conjoint investigation to analyze the relative importance of the eight kinds of risk-reduction strategies in consumers' mind, the conclusion is that "Money-back guarantee" is the most essential strategy, and then are "Manufacturer's name ", "Product cost", "Distributor's reputation", Free sample/trial", "Endorsement by a trusted person", "Brand experience" and "Product newness".

Mitchell and Greatorex (1993) combined risk-reduction strategies suggested by Roselius (1971), Guseman, and Derbaix (1983) and proposed 14 strategies to reduce the risk of purchasing service: (1) trying the product/service before purchase; (2) reading advertising material about the product/service; (3) reading consumer guides; (4) choosing a cheaper product/service; (5) choosing a brand/supplier of the product/service which is well known or popular; (6) purchasing the same brand of the product or using the same supplier of the service that you purchased/used before, i.e. be brand loyal; (7) using the image of the product/service as a guide; (8) ensuring the product/service has some form of guarantee, (9) shopping around to compare what is on offer; (10) choosing a more expensive product/service; (11) favoring the products/services which are endorsed by a celebrity; (12) taking the advice of family and friends; (13) choosing a product/service which is subject to some sales promotion; (14) taking the advice of the sales assistant.

RESEARCH METHOD

Research Method

The purpose of this study is to explore the relationship between perceived risks and risk-reduction strategies in online group-buying environment. The perceived risks examined in this study include financial, performance, social, time and privacy risks. In order to choose appropriate risk-reduction strategies in current study, a pilot test was conducted. The result

suggested ten popular strategies in online group-buying context: brand loyalty, word of mouth, past experience, money back guarantee, store image, shopping, major brand image, free sample, website reputation, and payment security.

Operational Definition and Measurements

The operational definition and measurement of each variable was summarized in Table 1 and Table 2.

Table 1. Definitions of perceived risks

Perceived Risks	Operational Definition	Reference Source
Financial risk	Financial loss of consumers, including defect product, extra expense after purchase and the possibility of Internet hackers to steal credit card information.	(Cases, 2002; Forsythe & Shi, 2003; Lim, 2003)
Performance risk	The product is not as expect or does not match with the seller's description.	(Cases, 2002; Forsythe & Shi, 2003; Grewal, Gotlieb, & Marmorstein, 1994)
Social risk	Products purchased by consumers may lead others laugh.	(Featherman & Pavlou, 2003; Pires, Stanton, & Eckford, 2004)
Time risk	Waste time to exchange the defect product, too slow the web page download speed and the seller respondent	(Featherman & Pavlou, 2003; Lim, 2003; Tan, 1999)
Privacy risk	Personal information be stolen, resold or leak out.	(Cases, 2002; Forsythe & Shi, 2003; Lim, 2003)

The measurement of perceived risks was adopted from Peter & Tarpey (1975). Each subject was asked to provide the possibility and importance of each risk that might occur in online group-buying. The seven point scale was used in which 1 represent very impossible/the least important, while 7 represent very possible/very important.

Table 2. Definitions of risk reduction strategies

Risk reduction strategies	Operational Definition	Reference Source
Brand loyalty	Buy the brand you have used before and have been satisfied with in the past.	(Roselius, 1971)
Word of mouth	Ask friends or family for advice about the product.	(Roselius, 1971)
Past experience	Relying on past personal experience	(Cases, 2002)
Major brand image	Buy a major, well-known brand of the product, and rely on reputation of the brand.	(Roselius, 1971)
Free sample	Use a free sample of the product on a trial basis before buying.	(Roselius, 1971)
Shopping	Shop around on your own and compare product features on several brands in several stores.	(Roselius, 1971)

Money back guarantee	Buy whichever brand offers a money-back guarantee with the product.	(Roselius, 1971)
Store image	Buy the brand that is carried by a store which you think is dependable, and rely on reputation of the store.	(Roselius, 1971)
Website reputation	The reputation of the website.	(Cases, 2002)
Payment security	Payment process has guarantee.	(Cases, 2002)

This research uses five point scale to measure the risk reduction strategies. One indicate very not helpful and 5 indicate very helpful. The same scale was also used by Cases (2002), Mitchell and Greatorex (1993) and Roselius (1971).

Sample Collection

A questionnaire survey was conducted in campus. Before the subjects agreed to participate, a brief explanation was provided. Every subjects will fill in the questionnaire after they understand the purpose the study and agree to join. About 10% of the subjects were pull out from a lucky draw and were provided with a small gift as the incentive. There are 212 questionnaire were received, and 198 of them are valid.

RESULTS AND DISCUSSION

Demographic

The subjects were composed by 53.5 % males and 46.5% females. The majority of the subjects are undergraduate students (83.8%), followed by graduate students (16.2%). They ages mainly around 15-19 (52.0%) and 20-24 (47.5%) years old.

The Correlations between Perceived Risks and Risk- Reduction Strategies

Pearson correlation analysis was conducted to examine the relationship between perceived risks and risk reduction strategies. The result indicated that financial risk is related to money back guarantee, store image and payment security; while performance risk is related to brand loyalty, word of mouth, money back guarantee, major brand image and free sample. Time risk is related to shopping and website reputation, while privacy risk has significant correlation with shopping. There is no risk-reductions related to social risk.

Table 3: The Pearson correlation analysis of perceived risks and risk reduction strategies.

	Financial	Performance	Social	Time	Privacy
Brand loyalty	.008	.151*	.030	.062	.029
Word of mouth	.121	.146*	-.058	.078	.136
Past experience	.049	.035	-.112	-.043	.054
Money back guarantee	.200**	.174*	-.001	.062	.126
Store image	.174*	.204**	-.069	.045	.126
Shopping	.055	.099	.035	.207**	.153*
Major brand image	-.059	-.153*	-.008	.048	-.030
Free sample	.125	.180*	-.070	-.039	.100
Website reputation	.121	.094	-.030	.141*	.135
Payment security	.140*	.032	-.030	.121	.101

CONCLUSION

The results from current study suggested that when subjects perceived financial risk, brand loyalty, word of mouth, money back guarantee, website reputation and payment system will be adopted to reduce the risk. Derbaix (1983) found out when it comes to financial risk, consumers more likely seem brand loyalty, money-back guarantee, store image and shopping as the most critical strategy. Brand loyalty and money back guarantee is consistent with the results of this study. Van den Poel & Leunis (1999) also indicate money back guarantee ranks highest for both financial and performance risk but especially so with respect to reducing financial risk. People who concern about the product is not as expect, tend to release the risk by brand loyalty, word of mouth, store image and shopping. Lutz & Reilly (1973) said consumers tend to use more sources of information when faced with increasing degrees of perceived performance risk. Physical risk, worried about the health will be injured, shopping and free sample are helpful. Derbaix (1983), shopping is the most efficient way to decrease the psychosociological risk; except shopping, this study find out the psychological pressure from group-buying can ease by money back guarantee, free sample, website reputation and payment security. Time risk, by website reputation to infer the possibility of receive defective product is relatively low, therefore, needless to wait for replacement time. For privacy risk, word of mouth and website reputation can confirm website security, observe each shop's privacy strategy during shopping and payment security that claim personal information will not leak out, there strategies can reduce privacy risk.

CONTRIBUTIONS

If consumers would like to obtain more product information or verify the accuracy of the information from multiple sources, they often refer to the opinions of friends and relatives who purchased the same products or rely on shopping strategy, then compare the contents and qualities of different offerings. Therefore, vendors should act with honesty and provide detailed information as much as they can in order to avoid the concerns and complaints which make by consumers that will hurt the reputation the companies had tried very hard to establish.

Highly concerned about the possibility of the leakage of their personal data due to online group-buying and such worries may affect their purchase intention. Therefore, vendors should take heed of the proper protection of personal data of consumers and assurance of transaction security so as to reduce the perceived risks.
In order to reduce the waiting time and increase the purchase intention, vendors are suggested to have powerful search and navigation, quality and detailed product information, rapid response, simple and safe payment system and build up good reputation to attract more consumers.

Consumers are worried about all kinds of unexpected situations after the purchase of products and fear that their rights will be affected. Therefore, they are likely to choose the vendors with good reputation or have warranty because they believe that the better these vendors have been, the more experienced they are in handling unexpected situations or more adopt in risk preventions. Therefore, the vendors should strive to provide solutions to all kinds of unexpected situations in order to obtain the recognition from consumers for the quality of products.

AN ANALYSIS OF PRICING TELECOMMUNICATIONS NETWORK SERVICES WITH DATA MINING METHODS

Jongsawas Chongwatpol†, NIDA Business School, National Institute of Development Administration, Thailand
email: jongsawas.c@ics.nida.ac.th

ABSTRACT

Research on developing pricing mechanisms for telecommunications service providers has been going on for decades. Many agencies have adopted various pricing schemes to charge their subscribers. However, due to the changes in the economic environment and technological infrastructure, the loss of subscribers is one of the important issues nowadays and these agencies need to adjust their pricing mechanisms to improve retention, to recover the cost of operations, and to maximize profitability. Practically, current pricing mechanisms do not reflect the changes in subscriber behaviors. This study seeks to fill this gap and examines how data mining techniques can help in making telecommunications pricing decisions. Consequently, any telecommunications service providers can evaluate their pricing strategy with respect to the organizational objectives and subscriber satisfaction perspectives.

An in-depth study of a state telecommunications service agency, OneNet - a division of the Oklahoma State Regents for Higher Education, is conducted. OneNet operates as an enterprise-type fund that provide cost-effective, equalized access to advanced network and telecommunications services to educational, governmental, and health care entities. OneNet must recover their costs through billing their subscribers and by justifying appropriations directly from the state legislatures.

Our experiments are based on a data base of 5,000 U.S. domestic subscribers. Many data mining techniques such as stepwise regression model, decision tree, and artificial neural network (ANN) are used to analyze data sets with multiple predictor variables, which include both network and non-network related factors. Our preliminary results show that types of circuits, membership fees, maintenance and repair costs of network-related equipment, and hub locations are the key factors that categorize OneNet's subscribers into four groups. Pricing mechanisms for each group are developed separately based on the identified key factor characteristics. Although we present this research in the context of OneNet, it is equally applicable to other providers of telecommunications services.

Key Words: Data Mining, Pricing, Telecommunications, Neural Network, Decision tree

INTRODUCTION

Research on developing pricing mechanisms for telecommunications service providers has been going on for decades. Many agencies have adopted various pricing schemes to charge their subscribers. However, due to the changes in the economic environment and technological infrastructure, the loss of subscribers is one of the important issues nowadays and these agencies need to adjust their pricing mechanisms to improve retention, to recover the cost of operations, and to maximize profitability.

Practically, current pricing mechanisms do not reflect the changes in subscriber behaviors. This study seeks to fill this gap and examines how data mining techniques can help in making telecommunications pricing decisions. Consequently, any telecommunications service providers can evaluate their pricing strategy with respect to the organizational objectives and subscriber satisfaction perspectives.

An in-depth study of a state telecommunications service agency, OneNet - a division of the Oklahoma State Regents for Higher Education, is conducted. We follow the CRISP-DM model, which is Cross Industry Standard Process for Data Mining. CRISP-DM model is used as a comprehensive data mining methodology and process model for conducting this data mining study by breaking down this data mining project in to six phases: business understanding, data understanding, data preparation, modeling, evaluation, and development. This study is organized as follows. First, related research on pricing telecommunications networks are briefly reviewed in Section 2. In section 3, we take a case study of OneNet, which is considering integrating Data Mining approach to help making pricing decisions. Our research methodology is then discussed in Section 4. Overall results of various predictive modeling and their discussions are presented in Section 5. Conclusion and future research direction are presented in the last section of this paper.

BRIEF LITERATURE REVIEW

Many pricing schemes have been proposed for pricing telecommunications networks. These pricing schemes can be classified into three main categories: cost-based pricing, pricing for best effort services, and pricing with Quality of Service (QoS) guarantees.

Cost-based pricing refers to prices that are directly related to costs. Some of the cost-based pricing models that have been proposed include Fully Distributed Cost (FDC) pricing, Ramsey pricing, and Flat rate pricing. FDC pricing is wildly used as it allocates the total common and shared costs that agency incurs while providing the services to the clients (Courcoubetis and Weber, 2003). Ramsey pricing is a linear pricing scheme that can be used to maximize social welfare and minimize economic misallocation under the constraint of recovering costs. Ramsey prices are sustainable when service providers charge different prices to different customer groups (Berg, 1998). Flat rate pricing is another well-known pricing structure used by service providers. A customer pays a fixed amount for a service at the time the contract is purchased regardless of the actual usage. Customers are charged the average cost of other customers in the same customer group (Courcoubetis and Weber, 2003).

"Best effort" refers to a network service that treats all types of traffic indifferently with no delivery guarantee and with the possibility of traffic loss (Shin et al., 2006). Best effort pricing scheme is employed to overcome the issues of fairness to customers and resource utilization in the case of cost-based pricing when some customers tend to overuse the resources and consequently is resulted in penalizing light users as compared to the heavy one. Usage-based pricing (Li and Wang, 2005, MacKie-Mason and Varian, 1995) is one of the first best-effort pricing schemes introduced to charge the customers for what they actually consume. This pricing scheme can be used to allocate service classes to different uses, to prioritize usage of a congested resource so that customers who value the access the most will get the highest priority, and to recover the costs of providing services. Congestion discount (Keon and Anandalingam, 2005) refers to a pricing approach using price discounts as an incentive to shift demand from congested to uncongested periods in telecommunications systems. Charging flexible contracts (Courcoubetis and Weber, 2003) can benefit both service providers and customers. Customers can vary the amount of bandwidth by changing their contract without the need to predict and reserve maximum resource requirements, while the service providers can provide more services to customers, with or without the need to reserve the resources.

Lastly, Quality of Service (QoS) refers to networks that are capable of providing better service to selected network traffic over various technologies by providing different priorities to different users or data flows, ensuring no traffic loss, and providing timely delivery guarantees (Shin et al., 2006, Guerrero-Ibanez et al., 2010, Keon and Anandalingam, 2005). QoS pricing involves technological enhancements such as Integrated Service (IntServ), Resource Reservation Protocol (RSVP), Multi-Protocol Label Switching (MPLS), and Differentiated Service (DiffServ) architectures (Shin et al., 2006). Thus, QoS pricing schemes introduced in the literature are related to these network architecture issues. For instance, Karsten et al. (1998) have proposed an embedded charging model in the RSVP architecture for an integrated services network. Fankhauser et al. (1998) included the RSVP charging and accounting in the IntServ network. Additionally, Bouras and Sevasti (2005) presented a model for the service provisioning procedure for the deployment of DiffServ-based Service Level Agreements (SLAs) in a bilateral fashion.

This brief literature review of network services pricing schemes is not intended to be comprehensive, but it does illustrate the large number of choices available to internet service providers to select and implement pricing models. However, these pricing schemes do not reflect the changes in customer behaviors, switching from one pricing mechanism to another. Additionally, there are many potentially important factors in both related to network and non-network variables that are neglected in the pricing decision. This study offers a wide range of decision variables based on the pricing evaluation though data mining approach. Consequently, such variables can be included in the current pricing schemes.

Case Example

OneNet, a division of the Oklahoma State Regents for Higher Education, operates as an enterprise-type fund that provide cost-effective, equalized access to advanced network and telecommunications services to educational, governmental, and health care entities. OneNet must recover their costs through billing their subscribers and by justifying appropriations directly from the state legislatures. The main clients served by OneNet are K-12 schools, colleges and universities, career technology centers, courts, libraries, state and federal agencies, and hospitals and clinics. OneNet established a cost-based pricing rate structure by focusing on the allocation of the costs of serving different types of clients and of different bandwidth offerings. Table 1 Presents OneNet's current rate charged to its clients with various bandwidth-based tier charges.

Table 1: Current Rate

No	Name	Mbps	Rate
1	SUD	0	$22.00
2	56K	0.056	$263.00
3	T1	1.5	$514.00
4	T1-OH	1.5	$514.00
5	Ethernet	10	$1,300.00
6	DS3	44.736	$3,510.00
7	Fast Ethernet	100	$2,300.00
8	OC-3	155	*ICB
9	OC-12	622	*ICB
10	Gigabit Ethernet	1000	*ICB

*ICB: Individual Case Basis

The rates OneNet currently charges for its services are quite straightforward, following a simple cost-based pricing model that averages all cost components for all clients at a given bandwidth rate. However, rapid changes in the economic environment, client utilization, and technologies have increased pressures on the network's infrastructure, client connection policies, and the operating budget, raising the question as to whether the current rates are adequate to recover its cost of operation. Another problem is that that current rate does not reflex the changes in i) financial support such as State Appropriations, State Universal Service, and private funding, ii) the operating budgets, or iii)network infra-structure. For instance, if funding support is cut, the revenue generated from these fixed rates will not cover OneNet's cost of operations. In addition, the current rate structure does not reflect the changes in E-Rate, funds from the Universal Service Fund to assist K-12 schools in obtaining affordable telecommunications and internet access. Additionally, other factors such as the high costs of new technology investments and upgrades, the costs to provide additional value-added services, or the cost associated with new bandwidth offerings generate the need to reassess whether OneNet's rates recover its costs of operations.

METHODOLOGY

In this study, we follow the CRISP-DM Model, a popular data mining method as a complete blueprint for this study (Shearer, 2000). After understanding the domain of pricing telecommunication network services and developing the objectives of achieving pricing decision though data mining approach, we begin our analysis by understanding the relevant data source, accessing data quality, and discovering first insights into the data. The next step is toward data preprocessing from the initial raw data to the final dataset, ready for the model development. This preprocessing step takes about 90% of time to clean, transform, construct, and format the relevant data. We then apply analytical data mining techniques to understand and predict rates charged to OneNet's clients. We also need to evaluate and assess the validity and the utility of our developed predictive models before deploying the data mining results into the domain as stated in the objectives of the study. Figure 1 presents the overall CRISP-DM framework of this study.

The first part of this study is to utilize data mining approach to understand the important factors that customers switch from OneNet to other internet service providers. The second part of this study focuses on determining the suitable pricing model for each customer group based on the customer segmentation profile.

Our experiments are based on a data base of 5,000 U.S. domestic subscribers in which 3,708 customers currently subscribed to OneNet's network and 1,292 customers are considered the loss of subscribers. A completed list of variables obtained, which include network and non-related network variables, is given. These variables, for instance, include

- Site ID, type of the organization, circuit speed, business location, equipment type, governing funding support, private funding support, circuit cost, equipment cost, administrative cost, rent expense, equipment maintenance expense, information service, library database subscriptions, membership fees, fiber relocation cost, and intra-agency payment.

Data Preparation

The next step in this analysis is to examine the quality of the data. In order to identify whether any inconsistencies, errors, or extreme values exist in the dataset, frequency distribution, descriptive statistics, and cross-tab analysis are performed. We then assess whether or not the data is complete or has missing values and what variables to be included in the model. Since including such variables with high-missing values in the model or even applying missing value imputation method can lower the quality of our findings, we make an assumption that the model excludes variables with over 50% information missing; see similar methodology from Park and Edington (2001).

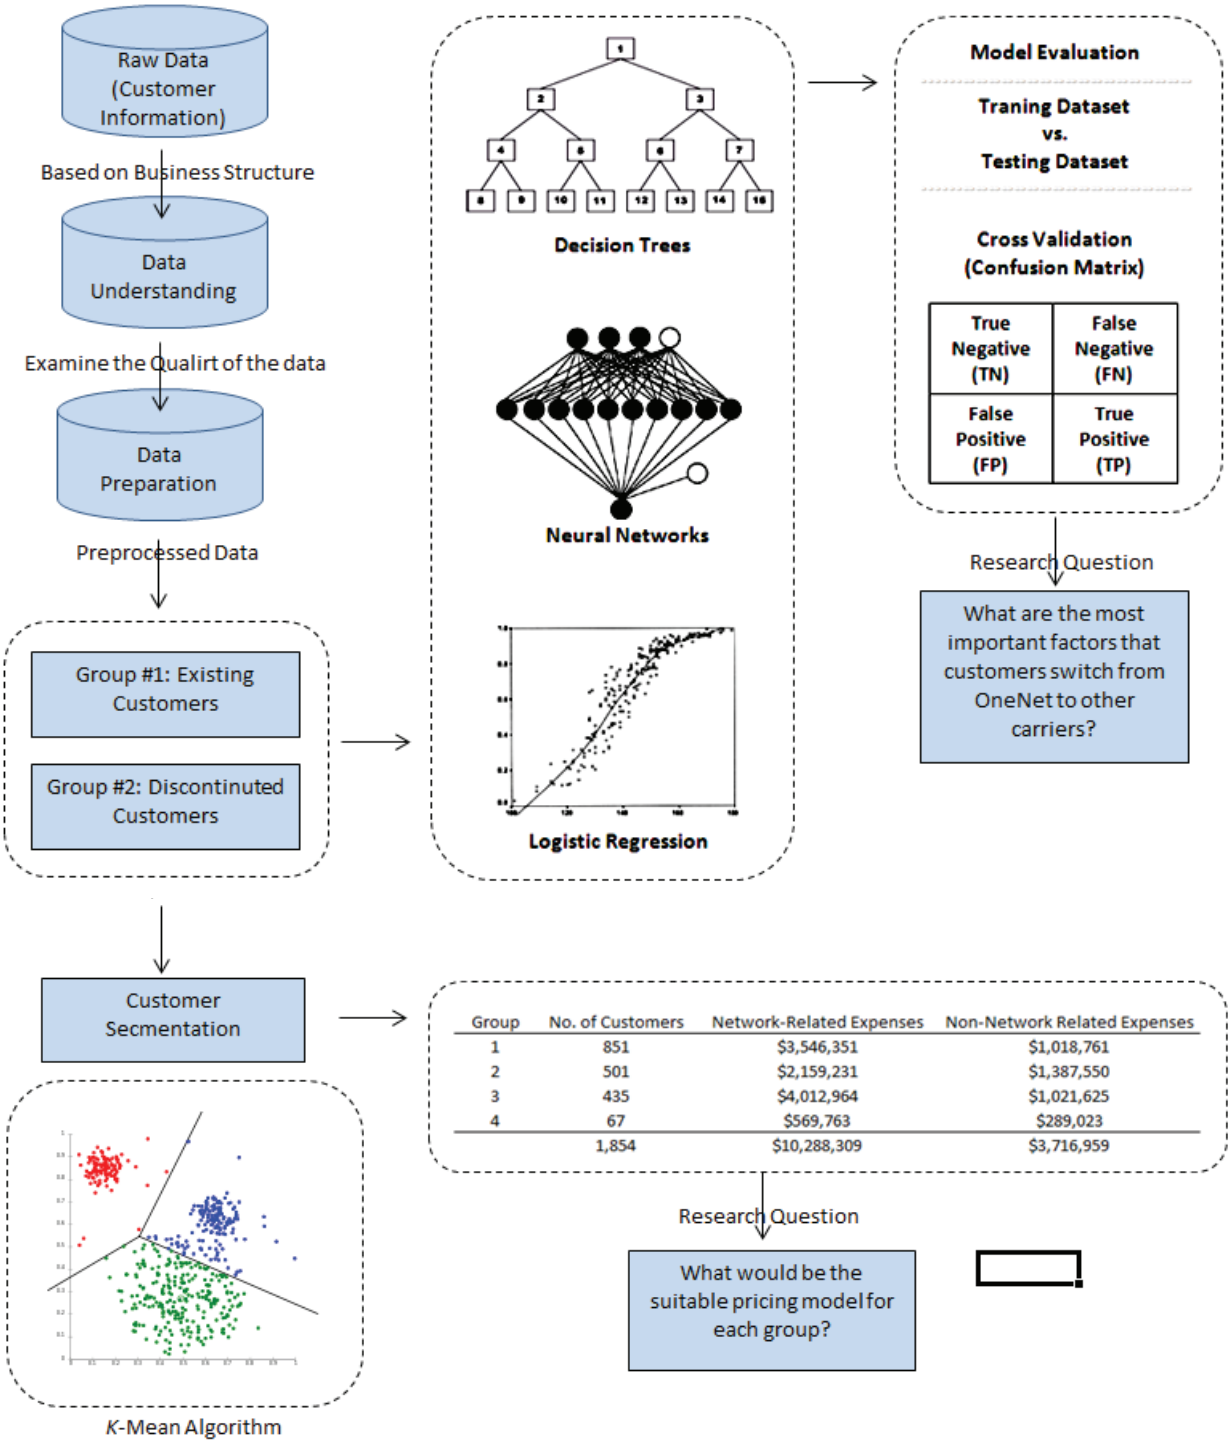

Figure 1: The Overall CRISP-DM Framework

Prediction Model

Many data mining techniques such as logistic regression model, decision tree, and artificial neural network (ANN) are used to analyze data sets with multiple predictor variables, which include both network and non-network related factors.

- Logistic regression is often used to predict an outcome variable that is binary or multi-class dependent variables. It allows the prediction of discrete variables (dependent variables) by a mix of continuous and discrete predictors as the relationship between dependent variables and independent variables is non-linear. It builds the model to predict the odds of its occurrence instead of point estimate event in the traditional linear regression model.
- Decision tree is another data classification and prediction method commonly used due to its intuitive explainability characteristics. Decision tree divides the dataset into multiple groups by evaluating individual data record, which can be described by its attributes. It is also simple and easy to visualize the process of classification where the predicates return discrete values and can be explained by a series of nested if-then-else statements.
- Artificial Neural Network (ANN) is a mathematical and computational model for pattern recognition and data classification through a learning process. It is a biologically inspired analytical technique, simulating biological systems, where learning algorithm indicates how learning takes place and involves adjustments to the synaptic connections between neurons. Data input can be discrete or real valued; meanwhile the output is in a form of vector of values and can be discrete or real valued as well.

For a technical summary including both algorithm and its applications see Jackson, 2002, Turban et al., 2011, and Shearer, 2000)

PRELIMINARY RESULTS

After excluding variables with outliers and high missing values, we first develop predictive models on the original sample dataset, which is composed of 2,400 records (1,200 existing customers and 1,200 losses of subscribers). The binary variable of OneNet's clients (Target = 1 for the loss of subscribers and Outcome = 0 for existing customers) is the output variable of the prediction models. After recoding all categorical input variables, the selected variables are tested whether the association between the input variables and the logit of binary target variable satisfy the linearity assumption. The problematic variables are then transformed to satisfy such assumption. Different models are constructed and compared in order to predict the loss of subscribers. Both training and testing datasets do not differ significantly for any of the variables studied. Training dataset is only used to extract models by the data mining algorithms. Then, those models derived in the training data set are then applied on the testing dataset for the correct discovery of intrusions. In other words, this testing dataset is used to prune the models generated by the data mining process in the training dataset to avoid overfitting and instabilities in the classification accuracy. Statistical analyses are performed using SAS Enterprise Guide 4.3 for data preparation and SAS Enterprise Miner 7.1 for model development and comparison.

We use three different criteria to select the best model on the testing dataset. These criteria include false negative, prediction accuracy, and misclassification rate. False negative (Target = 1 and Outcome = 0) represents the case of an error in the model prediction where model results indicate that hip fracture occurrence is not present, when in reality, there is an incident. The false negative value should be as low as possible. The proportion of cases misclassified is very common in the predictive modeling. However, the observed misclassification rate should be also relatively low for model justification. Lastly, prediction accuracy is evaluated among the three models on the testing dataset. The higher the prediction accuracy rate, the better the model to be selected. The details of performance measures are outlined as follows:

- True Negative (TN): the number of subscribers who are predicted to stay with OneNet and actually are staying with OneNet.
- True Positive (TP): the number of subscribers who are predicted to leave OneNet and actually were moved to other service providers.
- False Negative (FN): the number of subscribers who are predicted to stay with OneNet but actually were moved to other service providers.
- False Positive (FP): the number of subscribers who are predicted to leave OneNet but actually are staying with OneNet.

Figure 2 presents the classification table and the prediction results of the logistic regression, neural networks, and decision trees model. Neural network model produces the best results with overall misclassification rate of 8.69%, followed by the decision trees and logistic regression with misclassification rates of 9.29% and 9.46%, respectively. Neural Network model also has the lowest false negative rate of 8.59% and decision tree model comes out as the runner up with false negative rate of 9.19%. Thus, we select the neural network model as our final model to predict the loss of subscribers.

Our preliminary results show that types of circuits, circuit costs, government funding support, and hub locations are the key factors that lead to the loss of subscriber to OneNet.

		Target (Actual Value)	
		No (0)	**Yes (1)**
Outcome (Model)	**No (0)**	True Negative (TN)	False Negative (FN)
	Yes (1)	False Positive (FP)	True Positive (TP)
	Per-class Accuracy	TN/(TN+FP)	TP/(FN+TP)

Overall accuracy = (TP+T
False Negative = FN/(T
Misclassification Rate = (FP+F

Figure 2: Prediction Results and Model Comparison on the Testing Dataset

After understanding the causes of loss of subscribers, the next step is to determine the pricing mechanism so that OneNet can use in charging its clients appropriately. We first segment all 3,708 customers into sub-groups that share similar characteristics. The *k*-Means Algorithm is deployed in the clustering process. See Collica 2011, for the details on customer segmentation and clustering using SAS enterprise miner. Table 2 presents the group segmentation after applying the *k*-Means algorithm. Our preliminary results show that types of circuits, membership

fees, maintenance and repair costs of network-related equipment, and hub locations are the key factors that categorize OneNet's subscribers into four groups.

Table 2: Group Segmentation Based on the k-Means Algorithm

Group	No. of Customers	Network-Related Expenses	Non-Network Related Expenses
1	851	$3,546,351	$1,018,761
2	501	$2,159,231	$1,387,550
3	435	$4,012,964	$1,021,625
4	67	$569,763	$289,023
	1,854	$10,288,309	$3,716,959

Linear regression-based pricing is developed for each group. As a non-profit organization, the primary goal is cost recovery; therefore, the values of dependent variables for calibrating models are from the actual cost allocated to individual clients, defined as Rate (R_i) where "*i*" refers to the group members. In this analysis, we split the data at random into two sets (estimation and validation data), build the regression model on the estimation data, apply this regression model on the validation data, and then compare predictive fit and regression estimates between the estimation sample data and validation sample data. We also perform stepwise regression on these independent variables to simplify the model and to determine which variables are among the highest correlation with the dependent variables.

The following equation represented an example of the rate charged to its clients in group #1, where B_i refers to the baseline bandwidth subscription, L_i refers to the Last Mile Costs, and C_i refers to the channelized cost.

$$R_1 = 804.06 + 1.8\ (B_i) - 1.08609(L_i) + 1.853\ (C_i) \quad \text{--------- (1)}$$

The associated independent variables are varied among groups. However, a non-linear regression rate structure can also be appropriated to determine the rates charged to individual customers. For instance, Equation #2 represents the rate charged to member group #2.

$$R_2 = -35.90 + 875\ (B_i^{0.56}) \quad \text{--------- (2)}$$

The rate derived from the non-linear regression is based on the direct variation in bandwidth subscriptions. The higher the bandwidth clients subscribe to, the higher the rate charged to clients. In contrast, the rates derived from the linear regression vary not only depending mainly on the Last Mile, but also on the direct variation of bandwidth subscription and the reverse variation of the client group.

DISCUSSION AND CONCLUSION

With data mining approach, OneNet is able to understand the nature of its customers who switch to other carriers as they can provide the same services with the same or even lower rates. First, the preliminary results show that types of circuits, circuit costs, government funding support, and hub locations are the key factors that lead to the loss of subscriber to OneNet. OneNet can utilize this information to determine what incentives can be adjusted and offered to its clients to improve retention and, meanwhile, recover its cost of operations. For instance, since government funding is one of the key reasons of the loss of subscriber, the current rate charged to its customers should reflect the changes in funding support such as E-Rate, funds from the Universal Service Fund to assist K-12 schools in obtaining affordable telecommunications and internet access.

Secondly, we segment the customers into 4 groups based on customers' characteristics such as types of circuits, membership fees, maintenance and repair costs of network-related equipment, and hub locations. We then develop pricing model that is suitable for each group members. Consequently, OneNet can decrease the perception of unfairness to individual customers who tend to overuse the resources compared to other members in different groups. Linear and non-linear regression models are example of rates charged to customers in groups #1 and 2, respectively.

Note that we present this study as a pilot study to determine whether appropriate data is available, to understand the exploration of data mining approaches, and to develop initial models to determine what factors influence the pricing decision. With only 3,708 data records from an organization, our findings are still limited and the model and the model appears not to be generalizable. Thus, the final paper will include predictive modeling results with larger sample sizes and different organizations so that the finding can be applicable to other providers of telecommunications services.

NEWCONNECT IN COMPARISON WITH MULTILATERAL TRADING FACILITIES IN EUROPE. IRREGULARITIES IN THE FUNCTIONING OF THE POLISH MTF MARKET.

Roman Asyngier, Maria Curie-Sklodowska University, Lublin, Poland
roman.asyngier@gmail.com

ABSTRACT

Introduction: *It is hard to consider five years of the functioning of the NewConnect market explicitly successful. On the one hand, the market quotes an increase of quoted instruments which is unusual in other multilateral trading facilities. On the other hand, it does not result in quality improvement of this market. Low value of public offers, limited share liquidity and excessive number of penny stock companies discourage investors from investing in this market and inhibit its further development.*
Methodology and the purpose of research: *An analysis of statistical data showing development of the NewConnect market will be presented in the article as well as its position in comparison with other multilateral trading facilities in Europe. It will help to achieve the goal of the article that is defining activity areas of the NewConnect market which inhibit its development. On the basis of organizational and legal solutions used by selected European markets, some actions will be indicated which could be implied by an organizer of the NewConnect market in order to eliminate its functioning problems.*
Results: *MTFs are currently organized by regulated markets(it is defined by Directive 2004/39/WE of European Parliament and Council from 21 April 2004 on Markets in Financial Instruments - MiFID) in 15 European countries. Straight majority of markets function as MTF(Multilateral Trading Facilities) and only three as regulated markets(RM). An unquestionable leader of multilateral trading facilities in Europe is London's AIM. Over a thousand of quoted companies are reflected in 40% of capitalization of European markets and generated turnover of their shares is over 56%(data from the end of 2012).*

Established in 2007 NewConnect is an average size MTF market in Europe as regards capitalization and turnover. However, the Polish market stands out strongly as far as the number of quoted companies is concerned. With the number of 429 issuers at the end of 2012, NewConnect is a vice-leader of juxtaposition. In the years 2010–2012 nearly 350 companies debuted on NC, which was almost half of debuts in all MTFs in Europe.

However, the amount does not result in a proportional increase of issuer capitalization and investors' interest measured by volume of trade. As regards mean capitalization of quoted companies, NC outdistances only the Luxemburg market. Equally bad the NC market looks in comparison with competitors as regards a mean transaction value which was only 350 Euro in 2012. Average turnover per one company is also one of the lowest among European MTFs. One of reasons of this state of things is a very low value of offers within IPO. In the years 2007–2012 it was only 670 thousand Euro and was definitely the lowest from all significant MTFs in Europe.

A negative perception of the NC market by investors is worsened by an excessive number of penny stock companies which results in rate variability, especially in case of companies with

share market value below 10 grosz. At the end of 2012 as many as 221 companies had unit price of shares below 1 PLN, from which even in 53 cases a closing price was lower than 10 grosz.

A key problem of the market is a poor financial condition of issuers. Nearly half of quoted on NC companies recorded losses in I half-year of 2012. At the end of 2012 as many as 68 companies had the value of owners' equity below one million PLN whereas in 13 cases the value was negative. Only from September 2012 to January 2013 13 companies filed a bankruptcy petition.

***Conclusions:** Lower value of public offers, low capitalization of companies, limited liquidity of shares, excessive number of penny stock companies and poor financial condition of issuers are basic drawbacks in the functioning of the NewConnect market. The consequence is a little interest of investors and decreasing turnover. And the result are falling valuations of quoted companies. Within the last 5 years NC Index has been the weakest index among significant MTFs in Europe in a direct comparison as well as regarding relative strength towards regulated markets in a particular country. Reasons for that state of things should be seen in an inappropriate organization of the NewConnect market and too liberal regulations allowing issuers' shares to enter stock exchange turnover.*

A market organizer should think first of all about toughening regulations which allow issuers to enter stock exchange market. In order to do that and following the example of Alternext and Entry Standard markets, the Warsaw Stock Exchange ought to introduce a minimal value of capitalization, share capital or an offer within IPO of issuer. Additionally, the organizer should determine a minimal free float of shares(the best way is to follow the example of Alternext – in quota terms) introduced into market turnover which will probably reduce the problem of dramatically low liquidity of many instruments. A solution for the issue of penny stock companies could be introduction of minimal market price of shares like it is in the First North market.

INTRODUCTION

Stock markets worldwide undergo constant rapid changes. In the times of growing competition among the major second-hand trading markets, they are looking for the market niches that can be taken advantage of. The aim is to provide the investors with easier and cheaper access to the ratings of various assets. This supports the development of a multi-segmental structure for financial instruments trading.

One of the fastest growing segments of this complex structure of financial instruments trading are securities trading platforms, named according to the Directive of the European Parliament, as multilateral trading facielities – MTF (European Union, 2004). Their history in Europe dates back to 1995, when the London Stock Exchange decided to launch the AIM market. In 2007, the Warsaw Stock Exchange joined the group of stock exchanges that organize multilateral trading facielities.

Five years of the Polish NewConnect market and related operations, however, cannot be definitely described as a success. On the one hand the market has recorded the growth of listed instruments, that unparalleled to other multilateral trading facielities. On the other hand, it does not reflect in the improved quality of this market. Low value of public offerings,

limited marketability of stock as well as excessive number of cheap or small-ticket companies, discourage the investors from investing in this market and hinder further development of this market.

This paper presents an analysis of statistical data showing the development of the NewConnect market and its position in comparison with the other multilateral trading facielities in Europe. This is to serve the aim of the article, that is to define the areas of the NewConnect that hinder its development. On the basis of organizational and legal solutions in a number of European markets, appropriate actions, that could be implied by the organizer of the NewConnect market to eliminate the operational problems, will be recommended.

PROFILE OF NEW CONNECT MARKET

In August 2007, the Warsaw Stock Exchange in Warsaw launched the NewConnect market, the model of which followed other similar markets in the world. The Polish MTF was created for start-up companies of a high technological potential and development, seeking to raise capital from several hundred thousand to several millions of zlotys (Pastusiak, 2007).
The market and its operations are mainly governed by the Alternative Trading System Regulations developed by the organizer of the market, namely the Warsaw Stock Exchange. As a non-regulated stock market, the NC is not under the direct supervision of the Financial Supervision Authority. Therefore, the law and related regulations governing the regulated market are inapplicable.

This results in low formal requirements to be met by the issuers attempting to emit the shares to trade in the Polish MTF. The most important are as follows:

- development of adequate documented information (information memorandum),
- unlimited transferability of stock,
- going concern - a company cannot be under bankruptcy or winding-up proceedings,
- assistance of an Authorised Adviser and Market Operator (Market Maker).

On 15th of April this year, concurrently with the launch of a new UTP trading system, the Warsaw Stock Exchange introduced new requirements for a minimum nominal value of shares (10 groszy) and free float (15% of the stock must be held by at least 10 stockholders, none of whom owns more than 5 % of voting rights at the General Assembly and is not affiliated with the issuer).[1]

A special role in the organization of the NC market is vested with the so-called Authorised Adviser (AD). This function is performed by financial, legal and investment advisory companies and audit companies that are included in the list kept by the MTF organizer. AD's role is to support the Issuer in the IPO process, especially in the preparation and approval of the information memorandum and placement of the issue. The Issuer is obliged to co-operate with the AD over a minimum of three years after its debut.

The Companies intending to place their stock in the MTF market might conduct the emission of shares within a public offering or a private placement. The public offering, according to the Polish law and related regulations needs to be addressed to more than 100 investors, and it entails drawing up a prospectus, approved by the FSA. Private placement, addressed to fewer than 100 investors, is easier to perform and much cheaper. In this case, the issuer

develops just an information memorandum approved by the Authorised Adviser (the Financial Supervision Authority's approval is not required).

Companies listed on the NC are obliged to fulfil the information requirements. An issuer is required to provide all the required information, that might have a significant impact on the valuation of listed financial instruments, in a form of relevant reports. Additionally, it needs to submit periodic reports on a quarterly and annual basis. Quarterly reports issued in an abridged version must contain selected financial data.[2] The full annual reports are audited.

Development of the NewConnect market in terms of the number of IPOs and listed companies is impressive. The year 2011 when the number of companies almost doubled was particularly notable in this regard. Despite significant declines of the NCIndex, particularly in the years 2008, 2011 and 2012, the market capitalization increased every year.

Table 1: Statistical data concerning NewConnect market in 2007-2013

Year	2007	2008	2009	2010	2011	2012	I-III 2013
Number of listed companies	24	84	107	185	351	429	436
Number of IPOs	24	61	26	86	172	89	12
Number of entries	0	1	3	8	6	11	5
NCIndex rates of return (%)	44,17	-73,51	30,14	27,65	-34,39	-20,09	-1,68
Market capitalization (millions of PLN)	1 185	1 437	2 554	5 138	8 488	11 088	10 241
The value of session turnover (millions of PLN)	151,3	413,2	539,7	1 753,3	1 858,5	1 140,9	238,1
Number of transactions	59 674	247 576	323 729	877 947	1 082 130	773 343	206 596
Number of transactions per session	719	980	1 285	3 470	4 311	3 106	3 332
Average capitalization of companies (millions of PLN)	49,38	17,11	23,87	27,77	24,18	25,85	23,49
The average value of turnover attributable to one company (millions of PLN)	6,30	4,92	5,04	9,48	5,29	2,66	2,18*
Average value of transaction per session (millions of PLN)	2 535,44	1 668,98	1 667,14	1 997,05	1 717,45	1 475,28	1 152,49

*Data restated for comparability for the full calendar year
Source: Own calculations based on data available at www.newconnect.pl

The volume of the stock listed in the Polish MTF is less impressive. While the value of the session-based turnover continued to grow until 2011, the growth rate was disproportionate to the increasing market capitalization. Apart from the initial operational period of the NC, that was not a full year, significant market indicators, i.e. the average company capitalization, the average value of turnover per one company, and the average value of transactions peaked in 2010.

The data for 2012 that is indicative of a nearly 40 percent drop in the turnover and nearly 30 percent drop in the number of transactions as compared to 2011 are particularly disturbing. The downward trend of turnover was also maintained in the first three months of 2013. If in the following months of this year, the data will not change significantly, the average turnover

per one company, and the average value of transactions will reach the lowest values in the whole history of the NC's operations.

MULTILATERAL TRADING FACIELITIES IN EUROPE

History of the alternative trading system markets in Europe is inseparably connected with the creation of the UK Alternative Investment Market. AIM has been designed for small-sized and emerging companies, satisfying the requirements of the regulated LSE market (Doidge et al., 2007). It has been intended to provide a kind of counterweight to the rapidly growing American over the counter NASDAQ market.

AIM, establish by the London Stock Exchange, was not only the first market of such kind in Europe. It has been a model to follow by newly created MTF markets in Europe. Despite the sizable success achieved by the AIM, European stock exchanges have been slow to start this type of market. Other mainstream European MTF today were established as late as in 2005 and they were: Alternext, Dritter Markt, First North, and the ESM (Table 1). One year later, the MAB Expension was established, and in 2007 this group was joined by Oslo Axess and NewConnect. Not all of the twenty-first century alternative markets in Europe still exist today. In 2008, the MTF markets were closed in Ljubljana and Bratislava.

The vast majority of markets operate as an MTF (*Eng. Multilateral Trading Facilities called)*, and only three of those are regulated markets *(RM – Eng. Regulated Market).* The Federation of European Securities Exchanges (FESE) in some countries, distinguishes several segments of the capital market, identifying them as special markets.[3] Such a situation has been the case in Italy. Besides the STAR market specified in the table, there still exist the Mercato Expandi (as the RM) and AIM Italia (as MTF).[4] Several European stock exchanges also operate alternative bonds trading.[5]

Table 2: Statistical data of multilateral trading facielities in Europe (at the end of 2012)

Source: Own calculations based on websites of stock exchanges and statistical data of the European Federation of Exchanges, the London Stock Exchange and Borsa Italiana:
http://www.fese.eu/en/?inc=art&id=4; http://www.londonstockexchange.com/statistics/markets/aim/aim.htm;
http://www.borsaitaliana.it/borsaitaliana/statistiche/sintesi-mensili/2012/sintesimensili201211.en_pdf.htm [14.03.2013]

AIM is now the undisputed leader of alternative systems in Europe in almost every way. More than a thousand of listed companies translates into 40% of the capitalization of European markets and generated stock sales volume representing more than 56% (Table 2). If we exclude the regulated markets (STAR, ISM and Oslo Axess) from the analysis, the advantage of British market over the rest of the European MTF would be overwhelming.

NewConnect is, in terms of capitalization and turnover, an average sized MTF market in Europe. Polish market definitely stands out in terms of the number of listed companies. With the number of 429 issuers at the end of 2012, NewConnect was the runner-up of the ranking. In 2010-2012 a number of 347 companies made their debuts in the NC, which accounted for almost half of new listings on all other MTF in Europe, and ranked the Warsaw Stock Exchange among the world leaders.[6]

Quantity, however, does not translate into a proportional increase in the capitalization of issuers and investors' growing interest measured by the volume of turnover. In terms of mid-cap listed companies, the NC is ahead of only the Luxembourg market. The NC market as compared to its competitors in terms of an average value of the transaction which in 2012 amounted only EUR 350 does not look promising either. Average turnover of a company is also one of the lowest among European MTF.

THE ORGANISATIONAL STRUCTURE OF SELECTED MARKET IN THE EUROPEAN MTF

In conformity with the Directive of the European Parliament, alternative markets may be established by the stock exchanges that lead the regulated markets (European Union, 2004). Stock exchanges organize MTF and set out the rules of their operation. The rule for the multilateral trading facielities is that formal requirements, fees and information obligations of issuers are much smaller than in the case of the major stock exchange markets (Mendoza, 2008; Gomber & Gsell 2006). This allows the companies that do not meet the requirements of the regulated market to raise capital from the capital market. It is of significant importance especially in fast-growing industries, based on intangible assets (modern technology), requiring different forms of funding sources.

Table 3: Comparison of the admittance requirements for stock issuers listed in the European MTF (as of 15 April, 2013)

	AIM	Alternext	Entry Standard	NewConnect	First North OMX	ESM
Minimum capitalization / equity capital	none	Min. capitalization 4,5 mln EUR	Min. equity capital EUR 750 thousand	none	none	Min capitalization 5 million EUR
Minimum age of the company	none	2 years	2 years	none	none	none
Minimum stock face value or issue price	none	None	Min. denomination of one share 1 EUR	Min. denomination of one share PLN 0,1	Min. price of issuance EUR 0,5	none
Min. free float	none	2,5 million EUR	10 % of issuance	15% of shares	10% of shares	none
The initial fee	depends on the capitalization of the company: min. 7396 – max. GBP 427971	depends on the capitalization of company: min. 10.000 – max. 3 million EUR	fixed EUR 1.500	fixed PLN 6.000	fixed EUR 5.400	fixed EUR 4.000
The annual fee for listing	depends on the capitalization of the company: min. 4863 – max. GBP 47926	depending on the number of shares min. EUR 2.800 – max. EUR 50.000	fixed EUR 5.000	1 year PLN 1.500, following – depending on the capitalization: min PLN 3.000 – max PLN 8.000	paid quarterly, depending on the capitalization of the company: min. EUR 1400 - max. EUR 9200	fixed EUR 4.000

	AIM	Alternext	Entry Standard	NewConnect	First North OMX	ESM
The obligation to cooperate with the adviser	Nominated Adviser – cooperation throughout the entire trading period	Listing Sponsor – cooperation throughout the entire trading period	Deutsche Börse Listing Partner - cooperation throughout the entire trading period	Authorized counsellor – cooperation throughout 3 years with the possibility of shortening to 1 year	Certified Adviser – cooperation throughout the entire trading period	Adviser – cooperation throughout the entire trading period

[14.03.2013]

By setting out regulations for alternative markets, each stock exchange market is guided by the operational objectives. Despite generally related actions of respective MTF, the organizers are free to form any laws and related regulations which translate into a variety of adjustments. At this point, the operational principles of the six largest MTF in Europe organized as an MTF, in terms of capitalization and turnover, will be elaborated upon. The choice was made according to the ability to compare the organization of the most developed MTF affiliated to the NC market, which is aimed at achieving the assigned targets. Thus, the analysis excluded STAR, Oslo Axess and the ISE markets, organized as regulated markets. The criteria allowing for a fairly simple comparison were juxtaposed. The criteria defined in detail by the markets, like the information requirements of issuers were not covered by the analysis.

Table 3 contains the regulation-based requirements relevant to this article. The comparison clearly shows the London AIM as the most liberal one in terms of approach to the requirements to be met by the issuer in order to be admitted for listing in the stock exchange. There are no requirements relating to the minimum capitalization, distribution of stock, or the stock face value. The market is also available for start-ups.

Among the analyzed markets, the most stringent admittance rules apply to Alternext and Entry Standard, which have international ambitions (Hilton, 2008). These markets are not available to start-ups, as there is the admittance requirement to run business operations for at least two years before admittance is permitted. Both of them have also high requirements for capitalization or stock capital. To ensure adequate marketability of stock, both Alternext and Entry Standard fixed the minimum free float. Additionally, in the German market, the face value per share cannot be less than 1 EURO.

Very similar principles apply to First North and NewConnect. In both markets there is no capitalization-based requirements and the age of the company requirements. On the other hand, the criteria for stockholder dispersion and the value of one share apply but in the Scandinavian market there is the requirement for the minimum value of the shares, and in the Polish market – there is the requirement for the face value of the shares. It should be noted, however, that until March 2013, these criteria did not apply to the NewConnect market, and the market admittance requirements almost followed the ones applicable to the AIM market.

The Irish ESM market uses a very simple criterion for admittance, which is limited only to the size of the company's market capitalization. Out of all the analyzed markets, this criterion is the most demanding and is as high as 5 million Euros.

The organizational structure of all the analyzed MTF in Europe is based on the activity of the operators, that can, according to the Polish market, be described as Authorised Advisors. They perform primarily advisory services, provide support for the IPO process and fulfil the obligations posed for the companies listed on the stock exchange. In the respective markets their role may, however, be much more extensive. For example, in the London's AIM, the *Nominated Advisers* play also a supervising role for the stock exchange participants (Arcot et al., 2007). In all the analyzed markets, the issuer is obliged to co-operate with the Authorised Adviser, not only for the purpose of the IPO process but also during the entire period of trading. The Polish NC is the exception since the co-operation with the advisor is required for a period of only three years and can be shortened up to one year.

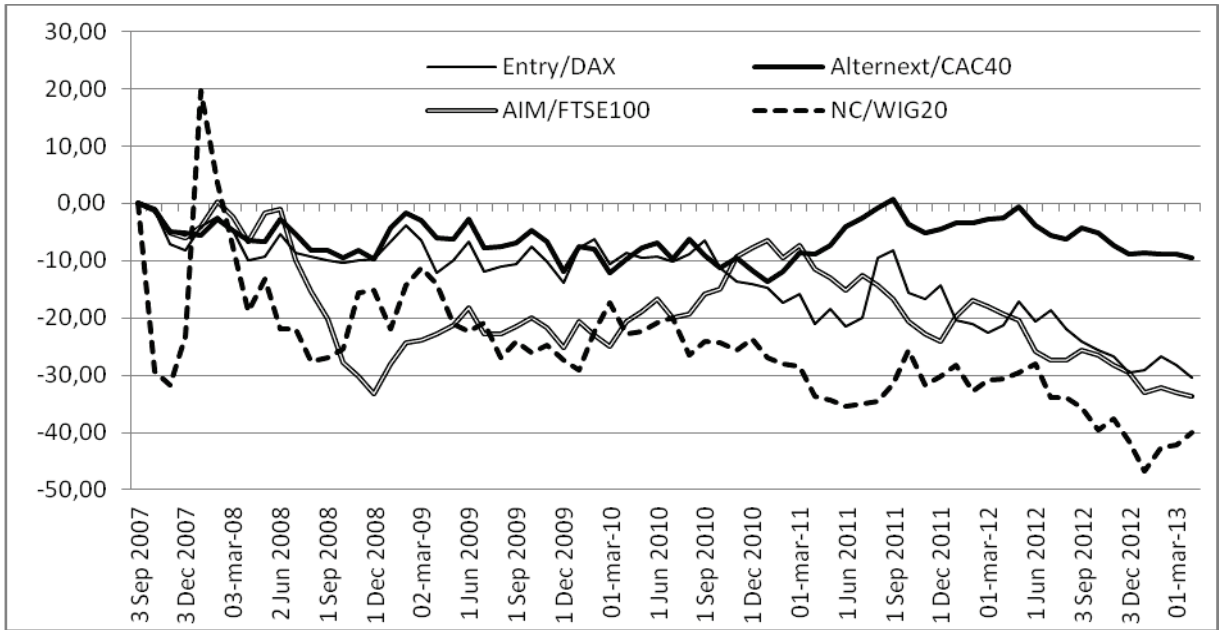
Each organizer of the MTF market makes the issuers liable for a fee payable for placement of financial instruments in the market and an annual fee for the listing of the shares. The approach of stock exchanges in the MTF markets is very different in this respect. A similar one is represented by AIM and Alternext markets, that charge high entry fee, the amount of which depends on the capitalization of the company.[7] As far as the Alternext fee is concerned, it seems outrageously high because it can reach up to 3 million Euros. This is due to the fact that the same rules apply to both the MTF and the main trading floor of the NYSE Euronext. However, taking into account the size of the capitalization of the companies seeking to enter the market share in those markets, usually not exceeding 100 million (EUR or GBP), the fee shall not exceed tens of thousands in the relevant currencies. On a similar basis both markets also charge an annual fee for the listing of the shares, whereas the maximum thresholds are clearly lower. The annual fee in the AIM depends again on the market capitalization of the company, and as far as the Alternext is concerned, on the number of shares placed in the market.

Admittance fees for all other markets are considerably lower and are payable at fixed rates. The fees payable do not differ much from one another and range from EUR 1,500 to EUR 5,400. In the case of fees payable for the trading of shares, Entry Standard and ESM markets consistently apply fixed rates. In the First North, as well as AIM, the fee is dependent on the capitalization and is calculated on a quarterly basis.

NewConnect uses a mixed system. In the first year of trading it charges a fixed rate fee in the amount of PLN 1500. In subsequent years, the fee is dependent on the height of the stock market capitalization and ranges from PLN 3000 up to PLN 8000.

AMENDMENT PROPOSALS IN THE CONTEXT OF THE NC MARKET PROBLEMS

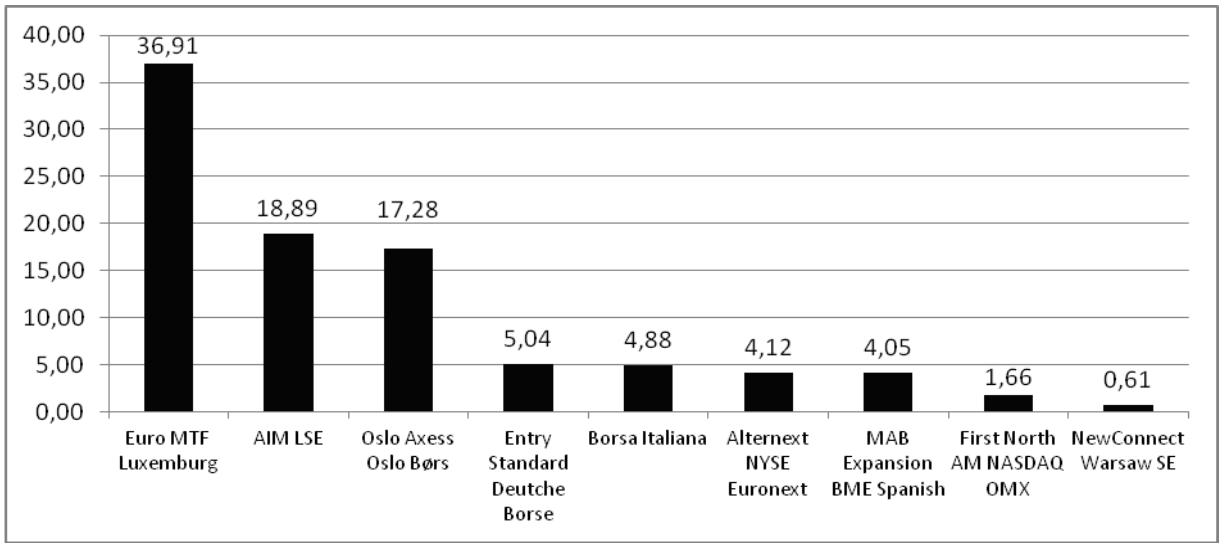
Low capitalization of companies and the limited stock marketability are the basic shortcomings of the NewConnect market, resulting from the comparison of the European MTF statistics. The consequence of that is the weakening interest of investors, disappearing sales and falling stock prices. The reluctance of investors to make transactions in the Polish market is clearly manifested by the relative strength of the selected alternative markets indices as compared to the regulated market indices, leading these markets (Figure 1). Since its inception, the relative strength of the NCIndex above decreased as compared to the WIG index by 40%. None of the MTF markets' indices presentedreported in this period was so weak in comparison to the domestic regulated market.



Source: Own study

Figure 1: Relative Strength Index of the MTF markets

It seems that this state of affairs result from too liberal rules governing the stock trading in the stock exchange and an organizational shortcomings in the primary market. There is no fixed or minimum capitalization requirements or the requirement for a target size of equity offerings in the NewConnect market. Furthermore, issuers use the simplest and least expensive path to the IPO by means of a private placement (private placement). Since the inception of the NC, only 17 issuers have decided to conduct public offerings.[8] It is suffice to say that in 2008-2012 the average value of the public offer equalled only to 613 thousands of EUR, which was by far the worst result of all the major European markets (Figure 1).



Source: Own study based on: http://www.pwc.pl/pl/ipo-watch-europe/index.jhtml [14.04.2013]

Figure 2: Average value of funds raised in the European MTF in 2008-2012 (in millions of EURO)

In this context, the organizer of the market should tighten the rules admitting issuers to the public market. First of all, according to the model of Alternext, Entry Standard and ESM, the Warsaw Stock Exchange should introduce the minimum value of capitalization, stock capital or public offer within the IPO issuer. This would eliminate the appearance of the "micro offers", that are a commonplace in the NC market.

In addition, the organizer should seek to reduce private placement or at least eliminate it (small free floMTF resulting in turnover limitations). Implementation of a minimum free float of 15% of shares traded in March 2013 is certainly a step in the right direction. However, concerning the average capitalization of a company listed in the NC, out of only 6.35 million Euros, 15% of the free float has an average value of less than 1 million Euros. It seems that following the model of the Alternext and the related introduction of the free float amount, for example, in the amount of at least 0.5-1.0 million Euro, would probably reduce the problem of dramatically low marketability of many instruments.

From the point of view of the aim of the article, an important issue of the NC market is the so-called "quality" of issuers admitted to trading, in terms of their financial and organizational background. The evidence of the problem is previously presented statistical data on mid-cap companies against the European MTF, as well as the financial results of the issuers. In 2012, less than 60% of them made a profit, and less than 10% of companies paid dividends. In this case, 19 companies had a negative book value and in nearly fifty companies it did not exceed 1 million PLN. At the end of the first quarter of 2013 as many as 28 companies have a market value of less than 1 million PLN.[9] The seriousness of the problem is indicated by the last verification of market segmentation made by the Board of the Warsaw Stock Exchange (26 March 2013). The segments of the NC High Liquidity Risk and NC Super High Liquidity Risk included 183 companies qualified by the organizer.[10] At the same time, in terms of the NC Lead index, created for the leaders of the market, who may apply for a transfer to a regulated market trading, only 18 companies were qualified.[11] However, a list of companies applying for bankruptcy is most disturbing. Only since September 2012 it has been reported that as many as 14 issuers filed for bankruptcy (liquidation or voluntary debt arrangements).

The reporting obligations, as well as compliance with the corporate governance rules for issuers are also challenging for the majority of issuers. The previous section of this article presented the solutions that can have a positive impact upon the operations of the Polish MTF, and it seems appropriate to introduce an obligation to co-operate with the Authorized Advisors throughout the entire trading of shares of the issuer, not just for the first year. Such regulations are applied by the MTF's and are further discussed in the article. It seems reasonable to impose a duty of prospects' monitoring on the AD's and increase the range of consultancy services for the issuer.

The negative perception of the NC market by investors is exacerbated by an excessive number of penny shares, resulting in high volatility in exchange, especially in the case of companies with a market capitalization of less than 10 groszy. At the end of the first quarter of 2013 more than half of the companies had a unit price of shares of less than 1 PLN, and in 56 cases the closing price was lower than of 10 groszy.[12]

Table 3: Market value of shares listed on the NewConnect market in 2007-2013

Price range	Number of shares at a given price range						
Year	2007	2008	2009	2010	2011	2012	III 2013
0,01-0,09	0	3	6	9	28	53	56
0,10-0,99	1	30	35	61	138	168	172
1,0-9,99	18	47	54	94	146	168	162
>10,00	5	4	12	21	39	40	49
Total number of companies	24	84	107	185	351	429	439
% of the company's share prices < 1 PLN	4,17	39,29	38,32	37,84	47,29	51,52	51,94
% of the company's share prices < 10 groszy	0,00	3,57	5,61	4,86	7,98	12,35	12,76

Source: Own study

The problem of cheap companies stems i.e. from the cost of carrying out the cheap stock issuance in a private placement and tolerance of deep splits by the organizer (complete or partial). Many a time the shares were sold at a price of a few dozen groszy, corresponding to the face value of the shares, and often the next big issues to be made at the lowest possible price of one grosz.

The introduction of the German model of Entry Standard and the Nordic First North of minimum face value of shares in the amount of PLN 0.1, will probably reduce the problem of new issuers only slightly, but will not affect the already listed companies. At the end of March 2013 three companies had a number of shares exceeding 1 billion of units, and another 29 - more than 100 million.[13]

The solution of the problem will probably require making a few adjustments at the same time. The organizer should raise the minimum market value of shares to the level of that applied by the Firt North (EUR 0.5). In addition, the proposed solution is to suspend the stock trading, when the arithmetic average market price during the last three months is less than 5 groszy, until the time of share consolidation process. In case of failure to comply with the prescribed re-split within a given time period, the shares of the issuer would be excluded from the stock market. In the case of the average rate of less than 10 groszy, it would be advisable to transfer them every time to a single-price auction. These rules not only restrain the problem of the "penny shares" but at the same time eliminate the problem of multi-million offers of shares sold at the lowest possible prices.

The issues to consider still include the fees for issuers and the minimum time of the issuer's operations (age). In the case of initial and annual fee for trading instruments, the related increase would rather not translate into an improvement of the issuers' "quality". In the context of the problems with excessive issues of shares, it is advisable to think about the establishment of the annual fee formulae, according to the Alternext model, that would be dependent on the number of shares placed in the market, and no longer on the NC-market capitalization. Regarding the minimum time of the companies' operations, applying for listing of the shares in the NC market should require for a minimum age of the issuer but it would be unjustified in the light of the NC market development strategy, because it was created with a view of, inter alia, emerging companies and stary-ups.

SUMMARY

After nearly five years of operations, the NewConnect market is at a crossroad. On the one hand, the market is developing dynamically, which comparing to other markets, is shown by an unprecedented growth of listed instruments. On the other hand, quantitative growth does not correlate with the improvement of the quality of the market and the interest of investors. Small capitalization of companies, and thus often low free float of shares, not a very good financial standing of the issuers and high volatility due to the excessive number of penny companies, effectively discourages investors from placing their funds in the market. This results in a very low increase in the turnover, inadequate to the rapidly increasing number of listed shares.

Trading regulations implemented by the Warsaw Stock Exchange in recent months should have a positive reception in the Polish MTF. In the author's opinion, these changes are too shallow and not sufficient to solve the problems accumulated over the years. Therefore, to restore the efficient operations of the NC, further changes are needed, which means sometimes bold and radical decisions of the market's Organizer.

The good news in terms of the introduction of the new regulations is the announcement of the forthcoming changes by the new President of Warsaw Stock Exchange, Mr. Adam Maciejewski. Representatives of the Warsaw Stock Exchange, the Association of Individual Investors and the Polish capital market entities continue the discussion on the need for further implementation of regulations that should be healing for the operations of the Polish MTF market.

ABSTRACT

In this paper, we present a new approach of correlated risk assessment by linking the multiple process capability indices and loss functions, in which the multivariate process capability indices and multivariate loss functions describe the likelihood and consequences as a result of nonconformities in multivariate manufacturing or environmental system respectively. Then, the associated relationship equations are developed using multivariate methods. Moreover, a step-by-step procedure is provided to facilitate the implementation of the correlated risk assessment.

Given the multivariate process capability indices, we show that the expected loss can be estimated by our developed relationship equations. Two numerical examples are also given to demonstrate how the correlated manufacturing and environmental risks can be properly assessed by linking the multivariate process capability indices and multivariate loss function. The risk information of likelihood and expected loss classified in the four planning zones of a strategic planning matrix provides practicing managers and engineers with a decision making tool for prioritizing their quality improvement projects when conducting risk assessment for any multivariate process or environmental system. Once the existing quality/environmental problems and their Key Performance Indicators (KPI) are identified, one may conduct risk assessment by applying the relationship equations to evaluate the impact of correlated risk on manufacturing processes or multiple environmental emissions inside company and it can lead to the direction of continuous improvement for any industry.

Keywords: Correlated risk assessment; multivariate process capability indices; multivariate loss functions; quality management; environmental management.

INTRODUCTION

In today's business environment, almost every industrial product has more than one quality characteristic and those characteristics may be correlated. Thus, it is important for companies to evaluate the correlated risks associated with their processes to increase the system safety and product quality. Environmentally speaking, this process of correlated risk analysis can also help reduce hazardous waste being released from their facilities. Traditionally, engineers perform process capability studies to analyze the key characteristic performance by using multivariate process capability indices for measuring process performance. Quality improvement actions can be taken if the process is not capable of meeting specifications. In addition, quality engineers seek to emphasize the urgency of process improvement to senior

management by quantifying the likelihood of nonconforming products and their impact on expected quality loss and costs (Pan and Lee, 2010).

Engineering System Risk Assessment (ESRA) systematically evaluates probabilities and consequences of acute, catastrophic failures ((Ayyub, 2003), (KarimiAzari et al., 2011), (Montague, 1990)). According to (Ayyub, 2003), risk is commonly evaluated as the product of the likelihood of occurrence and its impact or severity of its occurrence, namely, RISK= LIKELIHOOD x IMPACT, where likelihood is expressed as the probability of a nonconforming event and the impact represents risk as an expected value or as an average loss. Both (Montague, 1990) and (Ayyub, 2003) have discussed the Quantitative Risk Assessment (QRA) methods at length.

Recently, such quantitative risk assessment methods have been extended to supply chain management (Vilko and Hallikas, 2011) and the "green supply chain" (Wang et al., 2012), which is timely since environmental concerns are drawing much more attention from both academia and industry. Many Statistical Process Control (SPC) tools and principles as applied to quality management are equally useful in achieving environmental improvements. For instance, (Corbett and Van Wassenhove, 1995), and (Madu, 1996, 2004) offer a deep analysis of the broad range of quality control methods that can be applied to environmental management. One benefit of SPC is that it helps operators see and understand problems. Environmental SPC applications also have similar benefits. Operators rarely see the actual, negative impact of pollution caused by a process, but if it can be visualized in real-time through SPC much greater control is possible. (Corbett and Pan, 2002) propose that process capability indices, which measure the degree to which the process is capable of remaining below the existing regulatory limits, can be used as a measure of the environmental quality of a process.

Striking the right balance between tight controls of key processes and still maintaining cost-effectiveness is precisely the purpose of SPC. In order to prevent further environmental contamination, the adoption of SPC environmental risk assessment tools should include process capability indices and an associated loss function for accurately monitoring and evaluating environmental performance. A step towards correlating likelihood with expected loss was taken by (Pan, 2007) as a new loss function-based risk assessment method. It links univariate process capability indices (used to describe the likelihood of nonconforming events) and loss functions (used to describe the impact of such events). The likelihood and consequence resulting from the nonconformance is thus evaluated simultaneously.

The next step then is to build the linkage between the multivariate process capability indices and multivariate loss functions. Hence, this paper explores this relationship especially in terms of the correlated risk of a multivariate manufacturing process as well as assessing the correlated risk for an environmental system. Two numerical examples are given to demonstrate how the correlated manufacturing and environmental risks can be properly assessed by linking the multivariate process capability indices and multivariate loss function.

LITERATURE REVIEW

1. Risk assessment

A well-known classical method for conducting risk assessment is failure mode and effect analysis (FMEA), as described in for instance (Kolarik, 1995). Sometimes a criticality analysis component is added to this, as for instance in the D1-9000 standards at Boeing. This involves identifying each process step that may fail, then assigning rankings for occurrence probability, severity, and detectability. The "occurrence ranking" indicates how likely a failure is considered to be (where higher scores correspond to higher probabilities), and is related to the process capability indices. The "severity ranking" indicates the potential impact of a failure (with higher scores corresponding to more serious impact). The "detectability ranking" indicates how likely it is that a failure can go undetected until its full impact materializes; in the traditional quality control setting, this is the probability of shipping products containing an undetected defect. Higher scores again correspond to higher probability of defects going undetected. The three rankings are then multiplied, and higher total scores indicate higher risk. The other related applications of FMEA can be found in (Wang et al., 2009), (Kenchakkanavar and Joshi, 2010), (Chuang, 2010) and (Nassimbeni et al., 2012).

Risk assessment methods have also ranged from simple classical methods to fuzzy approach mathematical models. (Wang et al., 2009) proposed fuzzy risk priority numbers (FRPNs) for prioritization of failure modes. For solving the risk assessment model selection, (KarimiAzari et al., 2011) used the fuzzy Technique for Order Preference by Similarity to Ideal Solution (TOPSIS) method to solve the risk assessment model selection problem under a fuzzy environment.

2. Multivariate process capability indices

In the past, univariate process capability indices have been used to measure the process performance. Various multivariate statistical methods are now employed when several quality characteristics are interdependent or correlated. (Wang and Chen, 1998) simplified the computation of multivariate process capability by using principal component analysis. (Chan et al., 1991) proposed a multivariate process capability index C_{pm} using the concept of Mahalanobis distance. (Chen, 1994) proposed a general multivariate capability index that allows elliptical and rectangular specifications. (Foster et al., 2005) later proposed a new multivariate capability index using a process-oriented basis representation.

To develop a quantitative capability measures of a multivariate process in relation to its specifications, (Taam et al., 1993) proposed two multivariate process indices MC_p and MC_{pm}. Their multivariate process capability index MC_{pm} is defined as the ratio of two volumes, i.e.

$$MC_{pm} = \frac{vol.(R_1)}{vol.(R_2)}, \qquad (1.)$$

where R_1 is a modified engineering tolerance region (see Figure 1) and R_2 is a scaled 99.73% process region, which is an elliptical region if the underlying process distribution is

assumed to be multivariate normal. Moreover, the modified engineering tolerance region is the largest ellipsoid that is centered at the target and falls within the original engineering tolerance region. Thus, the MC_{pm} index can be rewritten as

$$MC_{pm} = MC_p \frac{1}{D}, \qquad (2.)$$

where $D = (1 + (\boldsymbol{\mu} - \mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu} - \mathbf{T}))^{1/2}$ is a correcting factor if the process mean $\boldsymbol{\mu}$ deviates from the target $\mathbf{T}$, $\boldsymbol{\Sigma}$ is process covariance and MC_p is written in Equation (10)

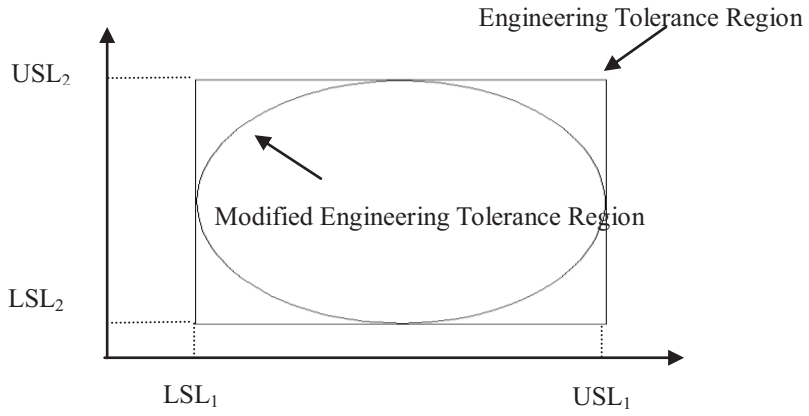

Figure1: Illustration of engineering tolerance region and modified engineering tolerance region.

(Wang and Du, 2000) proposed to use principal component analysis to evaluate the process performance for multivariate data. (Wang et al., 2000) reviewed the three multivariate process capability indices proposed by (Hubele et al., 1991), (Taam et al., 1993) and (Chen, 1994). They pointed out that Hubele's three-component capability vector lacks simplicity and could be confusing in its interpretation and use. Although Taam's MC_{pm} index accurately reflects process variability and centeredness, it does not take into account the correlation between multiple quality characteristics. (Pan and Lee, 2010) revised Taam's modified engineering tolerance region based on the assumption that the correlation of multiple quality characteristics is consistent with the correlation among specifications. The relationship between Taam's modified engineering tolerance region (the regular one) and our revised engineering tolerance region (the slant one) for a process with a bivariate quality characteristic is illustrated in Figure 2.

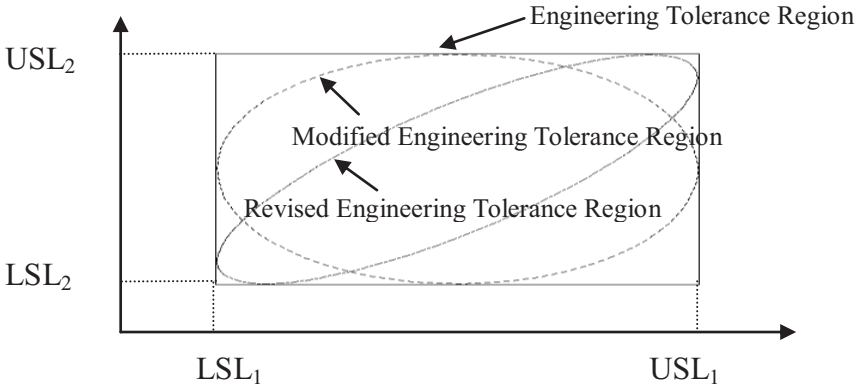

Figure 2. Relationship between Taam's modified region and Pan and Lee's revised engineering tolerance region

To overcome the drawback of overestimation using the MC_p and MC_{pm} indices, (Pan and Lee, 2010) proposed a revised engineering tolerance region (see Figure 2) and redefine new multivariate process capability indices, NMC_p and NMC_{pm} indices. Similar to MC_{pm} ratio of the two volumes shown in Equation (1), the new multivariate process capability index can be defined as

$$NMC_{pm} = \frac{Vol.(E_{d,\mathbf{A}^*,\mathbf{T}})}{Vol.(E_{d,\boldsymbol{\Sigma},\boldsymbol{\mu}})}\left(1+(\boldsymbol{\mu}-\mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu}-\mathbf{T})\right)^{-1/2}, \tag{3.}$$

where a revised engineering tolerance region

$$E_{d,\mathbf{A}^*,\mathbf{T}} = \left\{\mathbf{X}\in\mathbf{R}^v \mid (\mathbf{X}-\mathbf{T})'(\mathbf{A}^*)^{-1}(\mathbf{X}-\mathbf{T}) = d^2\right\}, \tag{4.}$$

and where the elements of matrix $\mathbf{A}^*$ are given by

$$\rho_{ij}\left(\frac{USL_i - LSL_i}{2d}\right)\left(\frac{USL_j - LSL_j}{2d}\right) \quad i,j = 1,\ldots,v, \tag{5.}$$

$\mathbf{T}$ is the target vector, ρ_{ij} represents the correlation coefficient between the *i*th and *j*th quality characteristics and $(USL_i - LSL_i)$ denotes the *i*th specification width for each side of rectangle circumscribed to the ellipsoid $E_{d,\mathbf{A}^*,\mathbf{T}}$. The NMC_p index can be used to evaluate the performance of process precision (i.e. the variability in relationship to the revised engineering tolerance region) and the NMC_{pm} index can be used to evaluate both process precision and accuracy (i.e. the deviation from the target).

3. Loss function for multivariate cases

(Pignatiello, 1993) presented a quadratic loss function for multiple-response quality problems. He showed that this function is a generalization of the single-response Taguchi's quadratic loss function. The multivariate loss function can be defined as

$$Q = (\mathbf{X} - \mathbf{T})'\mathbf{C}(\mathbf{X} - \mathbf{T}), \tag{6.}$$

where **X** is a *px1* vector of quality characteristics, **C** is a *pxp* positive definite matrix of costs which represent the losses incurred when **X** deviates from the target vector, **T** is the target vector for *p* quality characteristics of interest, p is the number of quality characteristics. The quality loss matrix **C** can be expressed as

$$\mathbf{C} = \begin{bmatrix} C_{11} & C_{12} & \cdots & C_{1p} \\ C_{21} & C_{22} & \cdots & C_{2p} \\ \vdots & \vdots & \ddots & \vdots \\ C_{1p} & C_{2p} & \cdots & C_{pp} \end{bmatrix}. \tag{7.}$$

Note that if C is a diagonal matrix, then the loss function is the sum of *p* single-response quadratic loss functions. For non-diagonal **C** matrices, the off-diagonal elements are related to the incremental losses that are incurred when the *i* th and the *j* th pair of quality characteristics are simultaneously off-target.

(Pignatiello, 1993) further showed that the expected multivariate loss function can be expressed as:

$$E(Q) = (\boldsymbol{\mu} - \mathbf{T})'\mathbf{C}(\boldsymbol{\mu} - \mathbf{T}) + tr(\mathbf{C}\boldsymbol{\Sigma}). \tag{8.}$$

RELATIONSHIP BETWEEN $MC_{p,pm}$, $NMC_{p,pm}$ CAPABILITY INDICES AND EXPECTED LOSSES

1. Relationship between $MC_{p,pm}$ capability indices and expected loss function

Assuming that the vector **X** of quality characteristics follows a p-dimensional multivariate normal distribution with mean vector $\boldsymbol{\mu}$, variance-covariance matrix $\boldsymbol{\Sigma}$ and its Taam's process capability indices $MC_{p,pm}$ values are given, then the relationship between $MC_{p,pm}$ capability indices and expected loss function can be derived as below:

1.1 The nominal-the- best case

Given the MC_p, MC_{pm} values and $MC_{pm} = MC_p / D$, the relationship equation can be written as

$$\left(\frac{MC_p}{MC_{pm}}\right) = \left(1 + (\boldsymbol{\mu} - \mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu} - \mathbf{T})\right)^{1/2}, \tag{9.}$$

where the MC_p index represents the ratio of a modified tolerance region with respect to the process variability as written in Equation (10).

$$MC_p = \frac{\left(\prod_{i=q}^{v} r_i\right)\pi^{v/2}\left[\Gamma(v/2)+1\right]^{-1}}{|\boldsymbol{\Sigma}|^{1/2}\left(\pi K(v)\right)^{v/2}\left[\Gamma(v/2)+1\right]^{-1}}, \tag{10.}$$

where $r_i = (USL_i - LSL_i)/2$, $i = 1,...,v$, USL_i is the upper specification limit for the *i*th quality characteristic, LSL_i is the lower specification limit for the *i*th quality characteristic, $|\cdot|$ is a notation of determinant and $\Gamma(\cdot)$ is a Gamma function. Taking the square on Equation (9), one can obtain Equation (11)

$$\left(\frac{MC_p}{MC_{pm}}\right)^2 - 1 = (\boldsymbol{\mu} - \mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu} - \mathbf{T}). \tag{11.}$$

Equation (9) will vanish if $MC_p = MC_{pm}$, which means the process is on-target and the first term in Equation (8) becomes zero. Thus, we only need to consider the loss due to the process variation and the expected loss function can be reduced to $E(Q) = tr(\mathbf{C\Sigma})$。

Referred to the lemma stated in (Johnson and Wichern, 2007), the relationship between determinant and trace can be expressed as Equation (12).

$$tr(\mathbf{B}) = \sum_{i=1}^{p} \frac{|\mathbf{B}|}{|\boldsymbol{\Lambda}_{(i)}|}, \tag{12.}$$

where **B** is a *p* x *p* positive definite matrix, $|\boldsymbol{\Lambda}_{(i)}| = \prod_{k=1,k\neq i}^{p} \lambda_k$, λ_i is the *i* th eigenvalue of **B** matrix. By Equation (12), one can derive the relationship equation between expected quality loss and MC_p index.

$$E(Q) = tr(\mathbf{C\Sigma}) = \frac{1}{(MC_p)^2}\left(|\mathbf{C}||\mathbf{M}|\sum_{j=1}^{p}\frac{1}{|\boldsymbol{\Lambda}_{(j)}|}\right), \tag{13.}$$

where $|\boldsymbol{\Lambda}_{(j)}| = \prod_{k=1,k\neq j}^{p} \lambda_k$, λ_j is the *j* th eigenvalue of $\mathbf{C\Sigma}$ matrix, $\mathbf{M} = diag\left(r_i^2 / \chi^2_{p,0.9973}\right)$, $\chi^2_{p,0.9973}$ is the 99.73% percentile of Chi-square distribution with *p* degree of freedom.

For the nominal the better case, MC_p and MC_{pm} values will be different if the process mean deviates from the target. To derive the relationship equation between the total expected loss and $MC_{p,pm}$ indices, we consider both the quality loss due to the process variation which can be expressed by Equation (12) and the quality loss due to the process mean deviated from the target which can also been expressed by the $MC_{p,pm}$ values using the following lemma stated in (Johnson and Wichern, 2007).

$$\mathbf{x}'\mathbf{B}\mathbf{x} = \left(\frac{\sum_{i=1}^{p} \lambda_i y_i^2}{\sum_{i=1}^{p} y_i^2} \right) \mathbf{x}'\mathbf{x}, \tag{14.}$$

where $\mathbf{B}$ is a $p \times p$ positive definite matrix, $\mathbf{x} \neq \mathbf{0}$, λ_i is the i th eigenvalue of $\mathbf{B}$ matrix, $\mathbf{y} = \mathbf{P}'\mathbf{x}$, $\mathbf{P}$ is the orthogonal matrix consisting of p unit eigenvectors.

By Equations (13) and (14), one can derive the following relationship equation between expected loss and Taam's $MC_{p,pm}$ values

$$E(Q) = k_N \left(\left(\frac{MC_p}{MC_{pm}} \right)^2 - 1 \right) + \frac{1}{(MC_p)^2} \left(|\mathbf{C}||\mathbf{M}| \sum_{j=1}^{p} \frac{1}{|\mathbf{\Lambda}_{(j)}|} \right), \tag{15.}$$

where k_N is the ratio of " $(\boldsymbol{\mu} - \mathbf{T})'\mathbf{C}(\boldsymbol{\mu} - \mathbf{T})$ divided by $(\boldsymbol{\mu} - \mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu} - \mathbf{T})$ ", $|\mathbf{\Lambda}_{(j)}| = \prod_{k=1, k \neq j}^{p} \lambda_k$, λ_j is the j the eigenvalue of $\mathbf{C}\boldsymbol{\Sigma}$ matrix.

Equation (15) implies that given Taam's MC_p , MC_{pm} values and quality loss matrix **C,** the expected quality loss for nominal-the-best case can be estimated.

1.2. The smaller- the- better case

Assuming that the vector $\mathbf{X}$ of quality characteristics follows a p-dimensional multivariate normal distribution with mean vector $\boldsymbol{\mu}$, variance-covariance matrix $\boldsymbol{\Sigma}$, then the MC_{pm} index can be written as Equation (16) for the smaller the better case.

$$MC_{pm} = \frac{MC_p}{\left(1 + \boldsymbol{\mu}'\boldsymbol{\Sigma}^{-1}\boldsymbol{\mu}\right)^{1/2}}. \tag{16.}$$

By setting $\mathbf{T}$ =0 in Equation (11), one can obtain Equation (17).

$$\left(\frac{MC_p}{MC_{pm}} \right)^2 - 1 = \boldsymbol{\mu}'\boldsymbol{\Sigma}^{-1}\boldsymbol{\mu}. \tag{17.}$$

If the quadratic loss function is considered, then the expected loss can be expressed as Equation (18).

$$E(Q) = \boldsymbol{\mu}'\mathbf{C}\boldsymbol{\mu} + tr(\mathbf{C}\boldsymbol{\Sigma}). \tag{18.}$$

Given $MC_{p,pm}$ values, one can derive the following relationship equation between expected loss and $MC_{p,pm}$ values via Equation (19) for the smaller the better case.

$$E(Q) = k_S\left(\left(\frac{MC_p}{MC_{pm}}\right)^2 - 1\right) + \frac{1}{(MC_p)^2}\left(|\mathbf{C}||\mathbf{M}|\sum_{j=1}^{p}\frac{1}{|\boldsymbol{\Lambda}_{(j)}|}\right), \tag{19.}$$

Where k_S is the ratio of $\boldsymbol{\mu}'\mathbf{C}\boldsymbol{\mu}$ divided by $\boldsymbol{\mu}'\boldsymbol{\Sigma}^{-1}\boldsymbol{\mu}$, $|\boldsymbol{\Lambda}_{(j)}| = \prod_{k=1,k\neq j}^{p}\lambda_k$, λ_j is the j the eigenvalue of $\mathbf{C}\boldsymbol{\Sigma}$ matrix。

Equation (19) implies that given Taam's MC_p , MC_{pm} values and quality loss matrix **C,** the expected quality loss for smaller- the- better case can be estimated.

2. Relationship between $NMC_{p,pm}$ capability indices and expected loss function

Similar to the proof as stated in section 3.1, one can derive the following relationship equation between expected loss and $NMC_{p,pm}$ values hold for the nominal-the-better case:

$$E(Q) = k_N\left(\left(\frac{NMC_p}{NMC_{pm}}\right)^2 - 1\right) + \frac{1}{(NMC_p)^2}\left(|\mathbf{C}||\mathbf{A}^*|\sum_{j=1}^{p}\frac{1}{|\boldsymbol{\Lambda}_{(j)}|}\right), \tag{20.}$$

where k_N is the ratio of " $(\boldsymbol{\mu}-\mathbf{T})'\mathbf{C}(\boldsymbol{\mu}-\mathbf{T})$ divided by $(\boldsymbol{\mu}-\mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu}-\mathbf{T})$ ", $|\boldsymbol{\Lambda}_{(j)}| = \prod_{k=1,k\neq j}^{p}\lambda_k$, λ_j is the j the eigenvalue of $\mathbf{C}\boldsymbol{\Sigma}$ matrix. In Equation (4), if we let $d^2 = \chi^2_{1-\alpha,v}$, then the NMC_p index can be written as

$$NMC_p = \frac{|\mathbf{A}^*|^{1/2}\left(\pi\chi^2_{1-\alpha,v}\right)^{v/2}\left[\Gamma\left(\frac{v}{2}+1\right)\right]^{-1}}{|\boldsymbol{\Sigma}|^{1/2}\left(\pi\chi^2_{1-\alpha,v}\right)^{v/2}\left[\Gamma\left(\frac{v}{2}+1\right)\right]^{-1}} = \left(\frac{|\mathbf{A}^*|}{|\boldsymbol{\Sigma}|}\right)^{1/2} \tag{21.}$$

and the NMC_{pm} index can be written as

$$NMC_{pm} = NMC_p / D, \tag{22.}$$

where $D = (1 + (\boldsymbol{\mu} - \mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu} - \mathbf{T}))^{1/2}$. The term D in Equation (22) denotes a function of Mahalanobis distance between the process mean and target vector $\mathbf{T}$. It can be used to measure the process deviation from target vector $\mathbf{T}$. Note that the univariate C_p and C_{pm} indices can be considered as a special case of new multivariate NMC_p and NMC_{pm} indices if $v = 1$ and $1 - \alpha = 0.9973$.

Equation (20) implies that given Pan and Lee's NMC_p, NMC_{pm} values and quality loss matrix **C,** the expected quality loss for nominal-the-best case can be estimated.

If the quadratic loss function is considered, then the expected loss can be expressed as Equation (18). Given NMC_p and NMC_{pm} values, one can derive the following relationship equation between expected loss and $MC_{p,pm}$ values by Equation (23) for the smaller the better case.

$$E(Q) = k_S\left(\left(\frac{NMC_p}{NMC_{pm}}\right)^2 - 1\right) + \frac{1}{(NMC_p)^2}\left(|\mathbf{C}||\mathbf{A}^*|\sum_{j=1}^{p}\frac{1}{|\boldsymbol{\Lambda}_{(j)}|}\right), \qquad (23.)$$

Where k_S is the ratio of $\boldsymbol{\mu}'\mathbf{C}\boldsymbol{\mu}$ divided by $\boldsymbol{\mu}'\boldsymbol{\Sigma}^{-1}\boldsymbol{\mu}$, $|\boldsymbol{\Lambda}_{(j)}| = \prod_{k=1,k\neq j}^{p}\lambda_k$, λ_j is the j the eigenvalue of $\mathbf{C}\boldsymbol{\Sigma}$ matrix. Equation (23) implies that given Pan and Lee's NMC_p, NMC_{pm} values and quality loss matrix **C,** the expected quality loss for smaller-the-better case can be estimated.

To facilitate practitioners in conducting the correlated risk assessment, a step-by-step procedure is listed as below.

1. Perform a multivariate process capability study with the required sample size.
2. Collect measurement data and perform a normality test for the collected data.
3. Calculate the new NMC_p and NMC_{pm} indices using Equations(21) and (22).
4. Given the new NMC_p and NMC_{pm} indices, calculate the expected losses for either nominal-the-best or smaller-the-better cases using Equations (20) and (23) respectively.
5. Perform the sensitivity analysis of risk (obtain various expected losses under different hypothetical process capability indices) and then setup a realistic goal for future quality improvement.
6. Evaluate the risk information of likelihood (reflected by process capability indices) and expected losses (represent impact) for different multivariate processes. Then prioritize various quality improvement projects by using the strategic planning matrix as shown in Figure 5.

NUMMERICAL EXAMPLES

Example 1 Manufacturing risk assessment using Sultan's manufacturing data.

(Sultan, 1986) discussed an example in which the Brinell hardness (H) and tensile strength (S) are two quality characteristics for an industrial product. The engineering tolerances for H and S are given by (112.7, 241.3) and (32.7, 73.3) respectively and the target vector of H and S is $\mathbf{T}' = [177, \quad 53]$. After collecting 25 measurements as listed in Table 1, a multivariate process capability study is conducted (assuming the process is in control).

Table 1. The 25 measurements of Brinell hardness (H) and tensile strength (S) for an industrial product.

H	S	H	S	H	S
143	34.2	141	47.3	178	50.9
200	57.0	175	57.3	196	57.9
160	47.5	187	58.5	160	45.5
181	53.4	187	58.2	183	53.9
148	47.8	186	57.0	179	51.2
178	51.5	172	49.4	194	57.5
162	45.9	182	57.2	181	55.6
215	59.1	177	50.6		
161	48.4	204	55.1		

By performing Shapiro-Wilk test, we found that the 25 collected measurements follow a multivariate normal distribution with the sample mean vector $\bar{\mathbf{X}}' = [177.2, \quad 52.32]$ and the sample covariance matrix $\mathbf{S}$, where

$$\mathbf{S} = \begin{bmatrix} 338 & 88.8925 \\ 88.8925 & 33.6247 \end{bmatrix}.$$

Then, the matrix $\mathbf{A}^*$ can be obtained as below:

$$\mathbf{A}^* = \begin{bmatrix} 349.52131 & 92.01022 \\ 92.01022 & 34.83724 \end{bmatrix} \qquad \text{(Based on Equation (5))}$$

The actual relationship among the 99.73% process region, 99.73% revised engineering tolerance region and engineering tolerance region is illustrated in Figure 3.

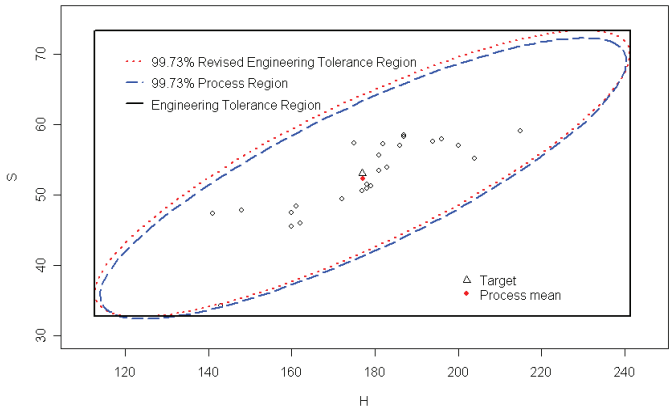

Figure 3. Relationship among 99.73% revised engineering tolerance region, 99.73% process region and engineering tolerance region in example 1.

Apparently, the process mean is close to the target and the "99.73% process region" is approximately equal to the "99.73% revised engineering tolerance region". The comparison results of using various multivariate process indices for estimating the performance of an industrial product are summarized in Table 2. Since the estimated conforming rate for this example is 99.91% under the assumption of multivariate normality for the underlying process distribution and the new indices $NMC_p = 1.0351$ and $NMC_{pm} = 1.0087$, based on Equations (21) and (22) respectively, are nearly equal to 1; which indicates that the 99.73% process region is close to the 99.73% revised engineering tolerance region and the process mean is close to the target (see Figure 3). Thus, the true process performance can be correctly reflected by the new indices NMC_p and NMC_{pm}, i.e. the process is capable. Whereas, the process capability is overestimated by Taam's two new capability indices $MC_p = 1.8751$ and $MC_{pm} = 1.8272$, based on Equations (10) and (2) respectively, since the correlation among multiple quality characteristics are not taken into account. Thus, it is suggested that the new indices NMC_p and NMC_{pm} be used in assessing the likelihood of nonconforming. Furthermore, assuming that the quality loss is \$0.8 per unit when the hardness value is deviated from the target and the quality loss is \$1 per unit when the strength value is deviated from the target, while the quality loss is \$0.89 per unit when both characteristics are deviated from the target, the quality loss matrix can be expressed as：

$$\mathbf{C} = \begin{bmatrix} 0.8 & 0.89 \\ 0.89 & 1 \end{bmatrix}, \qquad \text{(Based on Equation (7))}$$

, $|\mathbf{A}^*| = 3710.48$, $|\mathbf{C}| = 0.0079$ and $k_N = 4.8303$ (Based on the ratio of $(\boldsymbol{\mu} - \mathbf{T})'\mathbf{C}(\boldsymbol{\mu} - \mathbf{T})$ divided by $(\boldsymbol{\mu} - \mathbf{T})'\boldsymbol{\Sigma}^{-1}(\boldsymbol{\mu} - \mathbf{T})$).

Given the multivariate process capability indices $NMC_p = 1.0351$ and $NMC_{pm} = 1.0087$ (as listed in Table 2), the expected quality loss can be estimated by Equation (20), i.e.

$$E(Q) = k_N \left(\left(\frac{NMC_p}{NMC_{pm}} \right)^2 - 1 \right) + \frac{1}{\left(NMC_p \right)^2} \left(|\mathbf{C}| |\mathbf{A}^*| \sum_{j=1}^{2} \frac{1}{|\mathbf{\Lambda}_{(j)}|} \right)$$

$$= 4.8303 \left(\left(\frac{1.0351}{1.0087} \right)^2 - 1 \right) + \frac{1}{(1.0351)^2} \left(0.0079 \times 3710.48 \left(\frac{1}{0.0592} + \frac{1}{462.1942} \right) \right),$$

$$= 0.256 + 462 = 462.256$$

which is the same as the expected loss calculated by Equation (8), i.e.

$$E(Q) = (\boldsymbol{\mu} - \mathbf{T})^T \mathbf{C} (\boldsymbol{\mu} - \mathbf{T}) + tr(\mathbf{C\Sigma}) = 0.256 + 462 = 462.256 .$$

Hence, we demonstrate that the calculation of expected quality loss using the relationship equation between multivariate process capability indices and loss functions is accurate. One advantage of using our proposed relationship equation is that the impact of process capability indices on the $E(Q)$ can be clearly understood by quality practitioners. The other advantage is that the risk assessment conducted in this way can facilitate the sensitivity analysis of risk and then setup a realistic goal for future quality improvement. For example, if the improvement measures successfully applied to the existing process (given that its NMC_p and NMC_{pm} indices have been increased to 1.5), then the expected quality loss can be reduced to $ 220, i.e.

$$E(Q) = k_N \left(\left(\frac{NMC_p}{NMC_{pm}} \right)^2 - 1 \right) + \frac{1}{\left(NMC_p \right)^2} \left(|\mathbf{C}| |\mathbf{A}^*| \sum_{j=1}^{2} \frac{1}{|\mathbf{\Lambda}_{(j)}|} \right)$$

$$= 4.8303 \left(\left(\frac{1.5}{1.5} \right)^2 - 1 \right) + \frac{1}{(1.5)^2} \left(0.0079 \times 3710.48 \left(\frac{1}{0.0592} + \frac{1}{462.1942} \right) \right) = \$220$$

On the other hand, if the management team wants to reduce the quality loss in half, then the team needs to setup a goal for the quality improvement project to bring NMC_p and NMC_{pm} index values up to 1.5. If the continued quality improvement measures have been successfully applied to the existing process (given that both NMC_p and NMC_{pm} indices have been increased to 2.0), then the expected loss will be lowered to only $116, i.e.

$$E(Q) = k_N \left(\left(\frac{NMC_p}{NMC_{pm}} \right)^2 - 1 \right) + \frac{1}{\left(NMC_p \right)^2} \left(|\mathbf{C}| |\mathbf{A}^*| \sum_{j=1}^{2} \frac{1}{|\mathbf{\Lambda}_{(j)}|} \right)$$

$$= 4.8303 \left(\left(\frac{2}{2} \right)^2 - 1 \right) + \frac{1}{(2)^2} \left(0.0079 \times 3710.48 \left(\frac{1}{0.0592} + \frac{1}{462.1942} \right) \right) = \$116$$

Table 2. The basic statistics and multivariate process capability indices in example 1.

Basic statistics for H and S[a]	Process capability indices
Sample Mean for H=177.2	MC_p =1.8751
Sample Mean for S=52.32	MC_{pm} =1.8272
Standard deviation for H=18.385	NMC_p =1.0351
Standard deviation for S=5.799	NMC_{pm} =1.0087
Correlation coefficient between H and S=0.834	

[a] H represents hardness, S represents tensile strength

This numerical example shows that by linking the multivariate process capability indices and multivariate loss function, one can perform the sensitivity analysis between the expected loss and process capability indices. Since the expected loss represents impact and process capability indices reflect the likelihood/opportunity of product failures, the simultaneous consideration of impact and likelihood provides a useful guideline for quality practitioners in performing the correlated risk assessment for any multivariate manufacturing process.

Example 2 Environmental risk assessment using the air pollution data from Song-Shan station.

There are 58 surveillance stations established by EPA of Taiwan to monitor the air quality in Taiwan. Song-Shan is an administrative district in Taipei city; the capital of Taiwan and a domestic airport is located there. It is also well known for a long history of higher pollution in Northern Taiwan region. The air quality data of PM10 and O3 collected by Song-Shan station are discussed since PM10 and O3 have potential threat to health. The recent hourly data were collected by Song-Shan station. In this example, daily average is used and we drop some missing data due to measurement failure. The basic statistics of air pollution data at Song-Shan station are summarized in Table 3. We found that the original air pollution data for PM10 and O3 did not follow a bivariate normal distribution at α=0.05. After performing the Box-Cox normal transformation method proposed by (Andrews et al., 1971), the scatter plot of air pollution data at Song-Shan station shows that the transformed data follows a bivariate normal distribution (see Figure 4). Note that we take an exponent of 0.6248 to the original O3 data and an exponent of 0.1933 to the original PM10 data for normal transformation.

Table 3. The basic statistics of air pollution data at Song-Shan station.

Air Pollutants	Sample means	Std. deviation	Correlation coeff.
O3	24.5204	10.2247	0.2694
PM10	58.6192	26.7534	

The upper specification limit (USL) for O3 stipulated by the EPA of Taiwan is set to the hourly average = 0.12 p.p.m., while the USL for PM10 is set to the daily average = 125 $\mu g/m^3$. After calculating the $MC_{p,pm}$ and $NMC_{p,pm}$ index values for the transformed data, the comparison results of using various multivariate process indices for estimating the O3 and PM10 air pollutants at Song-Shan district are summarized in Table 4.

Table 4. The basic statistics and multivariate process capability indices of O3 and PM10 after normal transformation.

Basic statistics for air pollutants	Process capability indices
Sample mean for O3=7.2240	MC_p =11.6806
Sample mean for PM10 =2.1613	MC_{pm} =1.0392
Standard deviation for O3=1.9514	NMC_p =11.3181
Standard deviation for PM10=0.1938	NMC_{pm} =1.0070
Correlation coefficient between O3 and PM10=0.2472	

Assume that the additional cost per patient due to the increase of respiratory diseases (caused by PM10 and O3 in Song-Shan district) = \$83.36 when only O3 exceeds the USL; an additional cost per patient due to the increase of respiratory diseases =\$53.16 when only PM10 exceeds the USL; and an additional cost per patient due to the increase of respiratory diseases = \$66.45 when both PM10 and O3 exceed the USL, then the environmental loss matrix can be expressed as:

$$\mathbf{C} = \begin{bmatrix} 83.36 & 66.45 \\ 66.45 & 53.16 \end{bmatrix}, \qquad \text{(Based on Equation (9))}$$

and $\left|\mathbf{A}^*\right| = 17.2000$ (Based on Equation (5)) , $\left|\mathbf{C}\right| = 15.8151$, $k_s = 53.2463$ (the ratio of $\boldsymbol{\mu}'\mathbf{C}\boldsymbol{\mu}$ divided by $\boldsymbol{\mu}'\boldsymbol{\Sigma}^{-1}\boldsymbol{\mu}$).

Based on Equations (21) and (22), NMC_p = 11.3181, NMC_{pm} = 1.0070 (as listed in Table 4), then the expected daily environmental loss can be estimated by Equation (23), i.e.

$$E(Q) = k_s\left(\left(\frac{NMC_p}{NMC_{pm}}\right)^2 - 1\right) + \frac{1}{\left(NMC_p\right)^2}\left(\left|\mathbf{C}\right|\left|\mathbf{A}^*\right|\sum_{j=1}^{2}\frac{1}{\left|\boldsymbol{\Lambda}_{(j)}\right|}\right)$$

$$= 53.2463\left(\left(\frac{11.3181}{1.0070}\right)^2 - 1\right) + \frac{1}{\left(11.3181\right)^2}\left(15.8151\times 17.2000\left(\frac{1}{0.0064} + \frac{1}{331.8355}\right)\right)$$

$$= 6673 + 332 = 7005$$

In other words, the average daily cost increase of medical expenses in Song-Shan district in terms of the likelihood of respiratory diseases/multivariate process capability indices = \$7005, which is the same as the expected loss calculated by Equation (8), i.e.

$$E(Q) = (\boldsymbol{\mu} - \mathbf{T})^T\mathbf{C}(\boldsymbol{\mu} - \mathbf{T}) + tr(\mathbf{C}\boldsymbol{\Sigma}) = 6673 + 332 = 7005$$

Note that MC_p = 11.6806, MC_{pm} = 1.0392 (based on Equations (10) and (2) respectively)

are very close to $NMC_p = 11.3181$, $NMC_{pm} = 1.0070$ due to the low correlation coefficient (=0.269) between O3 and PM10. Moreover, significant gaps exist in between $MC_p = 11.6806$ and $MC_{pm} = 1.0392$ as well as in between $NMC_p = 11.3181$ and $NMC_{pm} = 1.0070$, which indicate the existing levels for the air pollutants of PM10 and O3 are much higher than the target level of zero though only a few points exceeding the USL as shown in Figure 4. This numerical example further shows that by linking the multivariate process capability indices and multivariate loss function, the simultaneous consideration of expected loss (represents impact) and process capability indices (reflect likelihood of failure) provides practitioners a useful guideline in performing the correlated risk assessment for any environmental system.

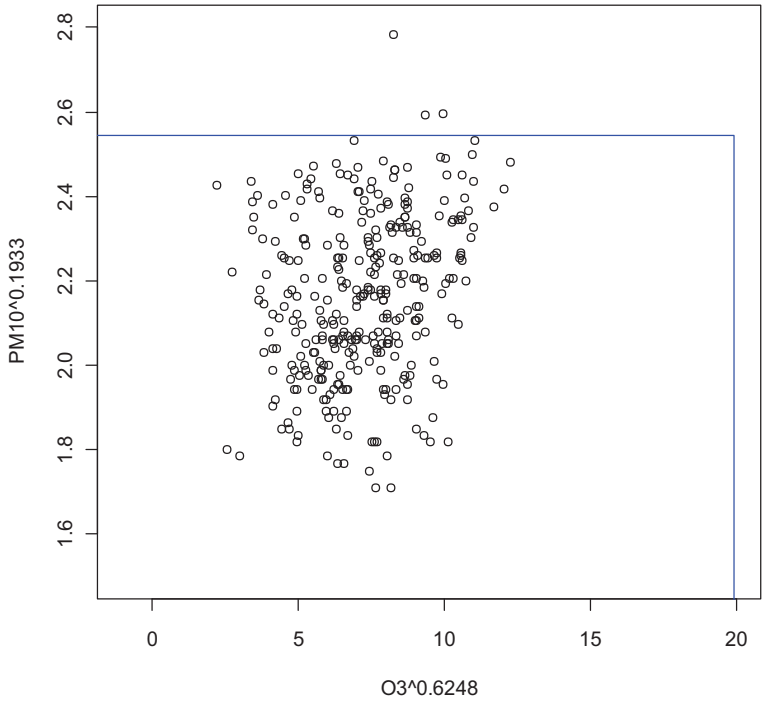

Figure 4. The scatter plot of air pollution data with upper specification limits for O3 and PM10 at Song-Shan station (after normal transformation)

STRATEGIC INSIGHTS AND MANAGERIAL IMPLICATIONS

After obtaining the relevant risk information of likelihood and expected losses from the key multivariate processes, practicing managers and engineers can categorize quality or environmental improvement projects in the following four planning zones of a strategic planning matrix.

(a) Priority zone – high impact (in terms of high expected loss) and high likelihood (in terms of low capability indices).
(b) Long-term zone – high impact and low likelihood (in terms of high capability indices).
(c) Contingency zone – low impact (in terms of low expected loss) and high likelihood.
(d) Non-priority zone – low impact and low likelihood

The strategic planning matrix containing four zones as shown in Figure 5 is used for these assessments.

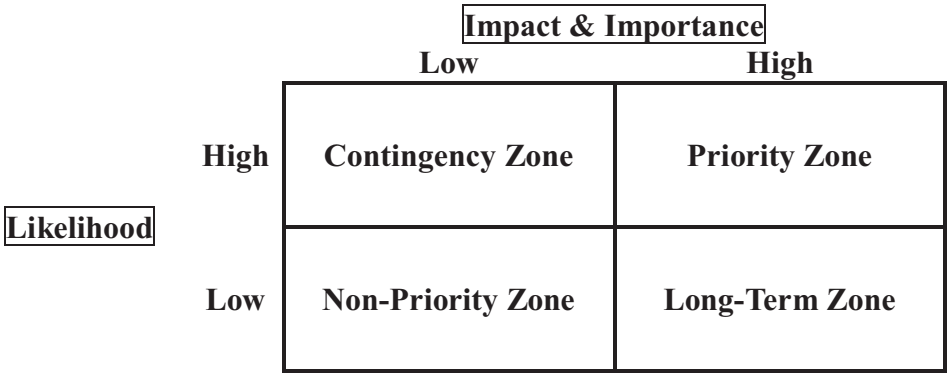

Figure 5. The classification of four planning zones based on the impact and likelihood

It is worthy to note that (1) special attention and immediate corrective action efforts need to be taken if quality improvement projects fall into Priority Zone (2) long-term planning and proactive action efforts shall be taken if quality improvement projects fall into Long-Term Zone (3) contingency plan need to be formulated to cope with the emergent conditions if quality improvement projects fall into Contingency Zone (4) maintain the status quo, i.e. the practitioners do not need to pay too much attention if quality improvement projects fall into Non-Priority Zone.

The risk information of likelihood and expected loss classified into four quadrants helps practitioners to prioritize quality improvement projects when conducting correlated risk assessment for any multivariate process or environmental system. Once the quality improvement projects are prioritized, the new approach of correlated risk assessment can lead to the direction of continuous improvement for any industry.

In terms of industry use, it is unlikely that smaller corporations that have difficulty applying FMEA to their operations could benefit from correlated risk analysis. A commitment to SPC and its processes is the most conducive environment for this advanced process monitoring. As well, industries whose products involve complicated components and assemblies such as aerospace, automotive or military contracting have the most to gain from correlated risk analysis. On the environmental side, chemical processing industries such as petro refineries, steel plants or plastics manufacturing could benefit by verifying that their output of pollutants is well within governmental tolerance and regulation.

CONCLUSIONS

Correlated risk assessment with its emphasis on the loss function is an essential tool for multi-response quality engineering. In this paper, we propose a new approach of correlated risk assessment by linking the multiple process capability indices and loss functions. With the multivariate process capability indices, we have shown that the expected quality loss can be estimated for both the-nominal-the-best and the-smaller-the-better cases. The two numerical examples demonstrate that expected losses can be estimated by various multivariate process capability indices and they show the advantage of using our proposed relationship equations.

The new multivariate process capability indices properly reflect the actual nonconforming rate.

To implement correlated risk assessment in practical applications, existing quality or environmental issues must be identified. Then, Key Performance Indicators (KPIs) and their multivariate process capability indices are developed to quantify the system. At this point risk can be assessed by applying the new relationship equations to evaluate the impact of correlated risk on manufacturing processes, or on multiple environmental emissions, such as SO_2 and NO.

ABSTRACT

Purpose: *The objective of this study is to explore what types of sales promotions are frequently used by online stores from different industries.*
Design/methodology/approach: *The content analysis were conducted based on the data collected from four industries : online music service provider, Internet bank, automobile website, and TV channels website. Online sales promotion activities from ten websites in each industry were collected, resulting in 40 websites to serve as sample website. An online sales promotion framework which includes ten popular sales promotion strategies was proposed based on previous studies to serve as the basis of content analysis.*
Findings: *Contests and sweepstakes is the most popular online promotion strategy used by all the selected websites, followed by patronage awards, price-offs, and free gifts are also confirmed as the frequently used promotion strategies on the Internet. The results also revealed that, for music website, price-off is the most popular sales promotion strategies. Contest & sweepstakes and patronage awards are prevalent for Internet banks. In addition, product warranty is the most frequently used promotion strategy in automobile industry. Finally, contest & sweepstakes promotion is the only one that is frequently adopted by TV channel websites.*
Practical implications: *The online promotion classification framework suggested in current study provided a reference for practitioners to understand the possible online sales promotion strategies to choose. Further, current study provides information regarding the popularities of online sales promotion across different industries. Thus, business owners can take the industrial characteristics into consideration when choosing the appropriate promotion strategies.*
Originality/value: *As most previous studies mainly discussed different types of online sales promotion strategies, current study is one of the limited research that addressing the online promotion strategies used by different industries. The results indicated that different industries adopted different online promotions because of industries characteristics.*

INNOVATIONS IN HIGHER EDUCATION SYSTEM, BASED ON THE EXAMPLE OF THE FACULTY OF ECONOMICS, MARIA CURIE-SKŁODOWSKA UNIVERSITY, PROJECT SYNERGIA CASE

Prof. Agnieszka Sitko-Lutek, Departament of Economics, Maria Curie-Skłodowska University in Lublin, Poland
e-mail: agnieszka.sitko-lutek@poczta.umcs.lublin.pl

M.Sc. Aneta Karasek, Departament of Economics, Maria Curie-Skłodowska University in Lublin, Poland
e-mail: aneta.karasek@poczta.umcs.lublin.pl

ABSTRACT

Purpose: *The work will aim at analyzing the system of higher education in Poland, in the context of global economy and our membership in the EU. Both strong and weak sides of the Polish educational system will be identified against the background of other countries. The study will present good practice regarding the improvement of the practical aspect of competences acquired by the students of the Faculty of Economics at Maria Curie-Skłodowska University in Lublin due to the project called "SYNERGY - Shaping the competences of the students of the Faculty of Economics , UMCS, through acquiring practical knowledge".*
Design/methodology/approach: *This paper has been based on analysis of educational system in Poland. It includes a case study of project Synergia, which aim is shaping the competences of the students of the Faculty of Economics , UMCS, through acquiring practical knowledge.*
Findings: *Building bridge between science and business, acquisition of practical competencies and improvement of specialist competencies could lead to better preparing students to find job when they graduate. Information which competences are required on labour market is also valuable for them to participate in specific trainings. All this activities are implemented in Project Synergia and can improve the situation on labour market.*
Originality/value: *The authors present detailed information and results of project.*

Keywords: higher education, innovations, competences, students, educational system
Classification: Case study

INTRODUCTION

The development of higher education system and courses of studies which would meet requirements and challenges of modern world fulfils a significant role in the process of shaping knowledge-based economy. As a result of growing tendencies for globalisation and integration, the potential and quality of higher education system constitute vital factors of socio-economic and cultural growth and boosting competitiveness of countries and regions as well. As a result of these processes a growing number of publications in one language are published and growing mobility of students and academic staff is observed. At the same time unification of studying processes takes place visible in e.g. the English model of bachelor, master's and doctoral studies.

The fundamental conditioning of higher education systems is the economic context. Greater financial resources translate into a greater degree of independence in shaping educational offer, developed infrastructure and possibility of employing the best academic teachers. (Keller 2006; OECD 2009).

Globalisation is also visible as regards universities' educational function. In recent years the number of students studying outside their country of origin has increased. This ability to attract foreign students testifies to attractiveness and competitiveness of universities.

The above mentioned processes of globalisation constitute a considerable challenge for Polish universities who must compete on the global market of educational services.

The process of globalisation poses numerous challenges for universities. Graduates ought to be prepared for competing on the global labour market, ought to possess knowledge and skills allowing them to undertake employment in any country. The analysis of advantages and disadvantages of education system in Poland revealed that when compared with other countries, there is still room for improvement. Realisation of innovative projects at universities provides opportunities for the perfection of the process of education.

When joining the EU on 1st May 2004, Poland became the signatory of the Bologna Declaration as well. The Bologna Declaration is a document defining all activities and task leading to the unification of education system across European countries. The main objective of the declaration is the development of the European Higher Education Area until the end of 2010, in which students can choose from a wide and transparent range of high quality courses and benefit from smooth recognition procedures.

EDUCATION SYSTEM IN POLAND

In Poland, the main statute concerning higher education system is the bill on higher education system from 27th July 2005. Universities (apart from those headed directly by specified ministries) are supervised by the Ministry of Science and Higher Education.

OECD Report[1] highlights strong and weak sides of the Polish educational system. This research based on cross country analyses and the strong sides are:

- large number of PhD students in Polish tertiary institutions,
- there are a number of positive developments regarding the links between the tertiary education system and the labour market,
- good examples of partnership between institutions and industry,
- career placement and advisory services appear to be available for students in the most Polish tertiary institutions.

[1] Fulton O., Santiago P., Equist Ch., El-Khawas E., Hackl E. (2007), OECD Review of Teriary Eduaction,Poland, OECD 2007.

The weak sides of Polish educational system are:

- low level of public spending on R&D (higher education expenditure on R&D as a percentage of GDP in 2005 was 18 position in ranking of 19 OECD countries),
- annual expenditure per student by educational institutions in primary through tertiary education in Poland rank among the lowest and amount to 5135 USD, with average in OECD countries 8354 USD. In USA, on the other hand, these expenditures amount to 14923 USD[2],
- limited patenting activity.

A SWOT analysis of education sector outlined in 2007-2013 Strategy for the Development of Education indicates strong and weak areas of education in Poland. Among the assets one can find: a large number of universities which vary as regards their educational offer, high gross enrolment ratio, low percentage of 18-24 years-old dropouts in relation to the number of students in the education system, system of financial assistance for students, more than tripled number of students gaining PhD degrees, autonomy of universities. The disadvantages of the system include: low percentage of students of mathematics, natural sciences and technology in the total number of university graduates, weak relationship of science and higher education with economy and labour market, insufficient utilization of R&D potential of universities, ineffective university management system, teaching curricula not fit for preparing students for entering labour market, low percentage of students of further education (underdeveloped system of further and distance education), relatively low expenditures per student in USD as regards the purchasing power. Advantages include: relatively young age structure of the population; increase in the number of the well-educated entering labour market; low regional discrepancies as regards primary, middle and secondary education, strong position of exact sciences and achievements in some of the applied sciences (e.g. medicine, programming); relatively low cost of work as compared with the EU[3].

Poland as a member of EU prepare National Cohesion Strategy for 2007-2013, which a strategic objective was formulated as a result of an analysis, including the analysis of higher education system, which indicated discrepancies in the level of socio-economic development of the country and its regions as compared with other EU countries. The objective will be accomplished by the implantation of Operational Programmes co-financed by the EU. National Cohesion Strategy outlines such disadvantages as: insufficient ties between education system and labour market, high unemployment rate, especially among the youth, women and the unqualified, insufficient promotion of entrepreneurship among citizens in the course of education. In education area one of the weak side is poor level of practical competences of students which lead to high young unemployment. Unemployment rate of young under 25 in March 2013 in Poland was 28,1%, but the EU average was 23,6%[4].

In 2007-2013, the Ministry of Science and Higher Education serves as the Intermediate Body for three operational programmes: Innovative Economy, Human Capital and Infrastructure and Environment. 4,1 billion EUR is available in the framework of these programmes. The amount will be allocated to development and modernisation of universities, research infrastructure, R&D projects, maintaining the high level of education and increasing the

[2] Education at a Glance 2011: OECD Indicators.

[4] Data come from Eurostat Datebase.
http://epp.eurostat.ec.europa.eu/portal/page/portal/employment_unemployment_lfs/data/database

overall number of students of courses which ensure attractive employment opportunities. Polish entrepreneurs have the opportunity for acquiring funds to be used for the development of cooperation with research sector. On the basis of students' requirements analysis and opportunity for funding "Synergia" project was introduced.

The structure of unemployment by education shows that employing a large part of the unemployment is not possible, because in current institutional conditions and the characteristics of the current economy, they have inadequate employment to those qualifying equipment[5].

PROJECT SYNERGIA

In order to meet graduates' and employers' requirements the realisation of the project titled "SYNERGY - Shaping the competences of the students of the Faculty of Economics , UMCS, through acquiring practical knowledge" was started. The project is co-financed by the European Union under the European Social Fund under the Operational Programme Human Capital (OP HC) and will be realised at the Faculty of Economics of the MCSU in Lublin in the period between October 2010 and September 2014.

The main objective of the project is bridging the competence gap among graduates of the faculty by improving the practical aspect of education for 1120 students.

The particular aims of the project include:

- strengthening practical elements of teaching through initiating and developing the Faculty's collaboration with enterprises and institutions,
- organizing on-the-job training courses and internships for university students,
- creating the Council of Entrepreneurs as an advisory organ for the Program Council of the Faculty of Economics, UMCS,
- university classes taught by practitioners,
- implementing by students practical projects in enterprises and institutions, under the supervision of research assistants,
- enhancing knowledge of mathematics in students of the first year of full-time university courses, 1st cycle, at the Faculty of Economics, UMCS, through their participation in remedial courses,
- preparing the graduates more efficiently for their entering the job market, through offering interpersonal training courses and courses in starting and running business activities,
- facilitating the contact of our students with potential employers, through organizing panel meetings with representatives of enterprises and institutions, as well as workshops.

All students undertaking education at the faculty in the period of running the project can apply for support in its framework and at the end of 2012 in project participated 1,820 university students.

[5] Thieme J.K. (2009), Higher education. Challenges of XXI century. Poland, Europe, USA, Difin, Warsaw, pp.276.

The project has been running at the Faculty of Economics of Maria Curie Skłodowska University in Lublin since October 2009. In the framework of the project, a variety of activities are undertaken all aiming at improving the practical aspect of education. It seems relevant to enumerate the most important among these and their results achieved until the end of 2012.

In the framework of the project, activities have been undertaken in the following areas:

- business-science cooperation,
- acquisition of practical competencies,
- improvement of specialist competencies,
- popularisation of project's results.

Detailed actions undertaken in these areas will be presented below.

Business science cooperation

In order to link the process of education at the MCSU Faculty of Economics and R&D undertakings more closely with business practice, a Business Committee was established. The committee consist of distinguished managers of businesses and financial institutions and heads of professional and self-government associations.

The mission of the Business Committee is the establishment of a cooperation platform between domains of science and business practice which would lead to the effective utilisation of available resources as regards socio-economic development of the region[6].

The Committee assumed the accomplishment of the following objectives as the aim of their operation:

1. Exchange of information and experiences in the area of science and business practice.
2. Initiating mutually beneficent activities and issuing opinions on proposed projects.
3. Organisation of joint undertakings as regards partners' standard operations or realising public interest [7].

Entities interested in assistance as regards solving problems present in their business or institution may obtain such assistance in the framework of "Synergia" project. Such activities are realised in the framework of practical projects where students working in task forces under supervision of coordinators put forward resolutions to the problem. From the point of view of employers the exercise seems valuable because such solutions are innovative, cost free and frequently contribute to solving the problem. 133 students took part in practical projects in companies since the beginning of running the project until the end of 2012.

Another form of business-science cooperation is the provision of internships in businesses and institutions. Entities interested in offering practical trainings and internships can submit their offers along with their requirements. As a consequence, the entities are entered into the database of organisations cooperating with the MCSU in the framework of SYNERGIA project. Next, based on their own preferences and requirements, students apply for the internship. Upon completion of the recruitment process the candidate is qualified to

[6] http://www.umcs.lublin.pl/articles.php?aid=6550&mid=13&mref=39990
[7] http://www.umcs.lublin.pl/articles.php?aid=6550&mid=13&mref=39990

participate in the internship and the internship agreement is signed. 426 students participated in practical trainings held by businesses and institutions and 13 graduates participated in paid internships since the beginning of running the project up to the end of 2012.

In order to adjust teaching curricula to the requirements of labour market, research regarding the level of graduates' competencies compatibility with labour market's requirements is conducted regularly. In order to identify employers' opinions as regards the graduates of the Faculty of Economics such research methods as survey questionnaire, statistical analysis and focus group interviews are used.

A survey was carried out with the use of the Virtual Cooperation Platform of the MCSU Faculty of Economics (VCPFE) by means of a questionnaire. Research carried out in the framework of the project indicated, on employers' part, the necessity of improvement of graduates' practical preparation. In addition, among the students' competencies' components, domain knowledge and skills require improvement. According to employers' recommendations and opinions, graduates lack practical knowledge and skills. However, the tendency seems lower as compared to results of research conducted in 2009/2010 academic year[8].

Acquisition of practical competencies

Research conducted in the framework of the project indicates that practical knowledge and skills are extremely desired by employers.

In order to acquire practical competencies students participate in practical projects contracted by businesses and institutions. This is aimed at providing students with the opportunity of becoming familiar with specific aspects of consulting work and provide setting for applying their knowledge into solving particular problems of the entities as regards their operations. Students work in task forces headed by coordinators where they work on their individual projects. Individual teams' results are presented during a public presentation and evaluated by managers, executives and heads of the company/ institution who select projects with the greatest potential for practical application. Owing to the participation in such practical projects, students gain the opportunity of presenting their own knowledge, skills and predispositions to employers, which constitutes a valuable source of information on prospective employees.

Students of the MCSU Faculty of Economics can acquire these by participating in free-of-charge training and paid internships. Almost 400 offers are available every year. Such offers are continually updated. If need be, when participating in trainings and internships, students can rely upon assistance of the project staff.

Realisation of practical projects where students solve existing problems of businesses and institutions provides them with the opportunity of becoming familiar with realities of the economy and its requirements. As a consequence, students realising practical projects apply their knowledge in practice and improve their skills.

[8] Karasek A., Grela G. (2012), Report on the analysis of information on level of graduates' competencies of the Faculty of Economics compatibility with labour market's requirements, Lublin, pp.26.

Objectives of the project are accomplished by holding classes conducted by experts. For the duration of the project, such classes, under the name "Practical aspects of entrepreneurship" have been introduced into the curriculum of the following undergraduate courses: Economics, Management and Finances, Finances and Accounting. Classes are held by various experts and are tailor-made for the particular course. 931 students participated in such classes since the beginning of running the project until the end of 2012.

Improvement of specialist competencies

The project also offers assistance to freshmen whose knowledge of mathematics is insufficient. "Remedial Courses of Mathematics" are specially designed for them. The course lasts 25 hours. 255 student participated in such courses until the end of 2012.

Trainings constitute yet another form of support offered in the framework of the project. Initially, two trainings were planned: "Establishment and running a business" and "Interpersonal Training". Every year, the offer is supplemented with additional two trainings as requested by students. Up to now, besides the above-mentioned, the following trainings were organised: "Computer Accounting" (3 editions), "Decision-Making Simulation" (1 edition), "Stock Exchange Investments" (1 edition). 289 students participated in these trainings since the beginning of running the project until the end of 2012.

Popularisation of project's results

The realisation of the project is supported by a Virtual Cooperation Platform of the MCSU Faculty of Economics (VCPFE) which serves as a virtual meeting place for students, faculty members, businesses, business environment institutions and self-government bodies as regards exchange of information on: practical projects' realisation. participation in internships and employment services.[9] Until the end of 2012 there were 2901 active users of the platform[10].

Users of the VCPFE can be divided into the following groups:

- students of the MCSU Faculty of Economics- including present and prospective graduates of the faculty,
- faculty members- employees of universities expressing willingness to participate in the project,
- businesses- employers, owners, business environment institutions,
- monitoring bodies- including project teams' members, project's administration staff[11].

Project's stipulations were presented during the opening conference. Representatives of businesses and institutions, university faculty members and students were among the participants. As a result of the discussion it was agreed that the development of mechanisms for systematic exchange of experiences and knowledge transfer between businesses and universities will constitute the key aspect of cooperation. The initiated joint activities

[9] Wiechetek Ł., Supporting the cooperation between science and business with the use of e-learning tools on the project Synergia ex ample [in:] Information technology in practice, M. Miłosz (editor), Polish Informatic Society, Lublin 2010, pp.28.
[10] Own data.
[11] Wiechetek Ł., Supporting…, *op.cit.,* pp.30-31

contributed to the improvement of cooperation of businesses and institutions with universities. The cooperation will prove beneficial for elevating the level of student's practical competencies and students' preparation for entering labour market.

3rd Gala of Science and Business organised jointly by the MCSU Faculty of Economics and Lublin Confederation of Private Employers- Lewiatan constituted an extension to the conference. At the Gala, "Gold Course Record Books of Business" were awarded in three categories:

1) The Best Internship Provider;
2) Perfect Employer;
3) The Most Pro-Student Company

The "Gold Course Record Books of Business" is an award given by the MCSU Faculty of Economics students to distinguishing businesses and institutions as regards their openness towards students' needs in terms of improvement of competencies. The idea of the award arose in the framework of "Synergia" project.

In order to develop a multi-disciplinary platform for the exchange of knowledge in the areas of services, engineering, business, management, education and social sciences in the area of synergy the "International Journal of Synergy and Research" was established. Synergy seems to be the main expected factor of different business and/or social activities in contemporary, networked, electronic, interconnected, real-time, knowledge-based economy.

Professor Binshan Lin from Louisiana State University (Shreveport, USA) was appointed as the content-related consultant of the project. Professor Lin's participation in the project provides high-quality contend-related assistance for its realisation. Professor Lin assistance guidance is available as regards publication of papers in international journals, including those listed in ISI and JCR. Moreover, Mr. Lin presented American experiences in the domain of business-science cooperation and commercialisation of research results. Examples of good practices concerning business- science cooperation originating from higher education system in USA proved invaluable.

"Synergia" project has been awarded four times by the Ministry of Science and Higher Education and the National Centre for Research and Development. The ministry considers the project as novel, innovative and distinguishing from among other educational projects realised in the framework of Human Capital Operational Programme. The ministry appointed the project as the model to be presented to reporters in the framework of STUDY TOUR (16.11.2010) and then featured in a national newspaper (Gazeta Wyborcza; June 2011). As one out of eight national projects, "Synergia" project was presented in the catalogue titled "The Innovative 2011" which promotes projects co-financed by the EU.

SUMMARY

In order to meet requirements of globalisation and knowledge-based economy and also growing competitiveness among universities, a variety of activities are undertaken, but innovation of education deserves more attention among these.

Building bridge between science and business, acquisition of practical competencies and improvement of specialist competencies could lead to better preparing students to find job when they graduate. Information which competences are required on labour market is also valuable for them to participate in specific trainings. All this activities are implemented in Project Synergia and can improve the situation on labour market. A summing-up conference is foreseen to conclude the project. Representatives of businesses and institutions, academic staff and students from Poland and other countries will be in attendance. The conference will be devoted to the exchange of points of view and experiences concerning business-science cooperation, financing this cooperation, the issue of clusters in economy, requirements of employers as to graduates of courses of economics, evaluation of their competencies and methods of meeting these requirements. There will be also possibility to discuss about the expectations of employers to graduates in economics and evaluation of their level of competence.

ABSTRACT

Modern companies seeking to increase in the value have to be innovative. This is because innovation is an attribute of a knowledge-based economy, the competitiveness of enterprises, the market value of the company's growth and the challenge for many industries, not just those who are exposed to rapid technological progress. Innovations are a necessity component in products, processes and business model of the organization, logistics, environment and marketing. Human capital is a key factor in that component which. The paper refers to risk management of the innovative company. The authors ask a question: What determines limits of innovation and what fields of management are key elements of success? Two fields are identified: cost management of innovation process and insurance connected to that process. Background for the deliberations undertaken is knowledge based management of innovative company.

INTRODUCTION

Business activity conducted in any place and at any time is risk related. What is characteristic of a "given place and time" is the specificity of the risk factors, the risk level as well as the availability of tools to manage this risk.

The era of knowledge based economy, which the world enters dynamically, reveals many new factors and necessities which a modern company needs to consider and cope with if it wishes to continue its activity. A significant area of factors which are significant here is the innovativeness of activity, in a broad meaning of the word. Innovativeness is a sign of the era of the knowledge based economy and what is characteristic of this era is the fact that its "soft" borders are marked only by business ethics. Holistically, one may ask about the borders of innovation introduced into business. Are they determined by:

- actual needs of end consumers and as a consequence needs (demand) of companies participating in the chain of value delivered to these customers or first of all
- actual "needs of earning" on investments in companies from the chain of value for customers?

This paper does not attempt to answer this question. It analyses the problem of management of innovation programmes and projects introduced by individual companies from the microeconomic perspective. Bearing this in mind, it is necessary to distinguish three areas to focus on in an innovative company:

A) knowledge management and diagnosis of innovation potential,
B) innovation cost management,
C) innovation management in the risk conditions.

Innovations, i.e. something new, with no standard set before or only to a certain extent based on well-known models and solutions in each of the aforementioned areas give rise to a specific **uncertainty** in business activity. Thus, the undertaking of the innovation activity should be preceded by an attempt to identify the risk factors, which may allow for its limitation once identified within this uncertainty. Knowing the risk factors one may undertake attempts to manage in risk conditions, which grossly simplified may be understood as the application of preventive instruments and solutions focused on identified risk factors and thanks to it preventing the potential implementation of risk with effects of the scale initially predicted or refunding the incurred losses as a result of the implementation of this risk.

I. Knowledge management and innovation potential diagnosis

Innovations always require a new ”knowledge” and high ”organisational efficiency.” Thus, they are stuck in the corporate ”intellectual capital” (human, organisational and relative). Innovations may occur only in those companies where this capital actually exists and is reflected in the competences of the managerial staff.

Presently, one of the innovation underlying skills is the so-called knowledge engineering or data mining. This skill consists in the ability to reveal the knowledge hidden 2 in different sources of scattered data, e.g. in databases and may have a great impact on the decision to undertake an innovation process and to determine the way of its implementation.

In the context of innovation, the acquisition of a broadly perceived new knowledge is only one of the aspects of the corporate knowledge management. Another aspect to be considered is the assessment efficiency skill: (1) its business usefulness, (2) risk related to its potential application, (3) advantages resulting from its application. The skill is a starting point for the launch of the innovation process. For this reason it is indispensable to **recognise the corporate innovation potential**, at least in these areas of competence. It is a prerequisite for the innovation process management when this process is accompanied by uncertainty and different risk factors, which is discussed later.

II. Innovation cost management

From the microeconomic perspective, disregarding the reason for innovation activities, it may be effortlessly stated that ”business success” measured for example with the growth in market value is achieved by the companies which accurately prepare their innovations. The very idea of innovation is not enough though it is a driving mechanism of the whole innovation project. The innovation, if it is to work, needs to be implemented, and this is connected with costs related to the innovation undertaking. At present, when it is generally claimed that a company is a source of costs not incomes, the **development of corporate competence within the innovation cost management is crucial**. The discussion below presents the authors’ self-designed approach to the problem of innovation cost management in an individual company.

In the area of innovation undertaking cost management the risk factors are found on two cost planes: *ex ante* (planned costs) and *ex post* (incurred costs). In order to identify these factors it is necessary to:

(1) define the cost object appropriate for the adopted notion of innovation,
(2) define the cost model which will determine the information structure of innovation undertaking costs,
(3) set the system of records of the incurred innovation costs and the system of controlling,
(4) set the method of monitoring of innovation undertaking cost effectiveness in the course of the whole period of the "innovation effect."

Re. 1)
The definition of the **cost object** is derived from: (1) the corporate perception of innovation, (2) the ability to classify innovations according to their kinds as well as (3) the identification of the innovation process stages and (4) activities conducted during these stages.
From the microeconomic perspective, **innovation is a solution suitable for business application and constituting a novelty, at least from the perspective of the company launching this solution.**[1]

The definition of the cost object does not need to consider classifications based on their importance. It is not significant whether it is a breakthrough, original or imitative innovation. What is important is the criterion of the field of innovation which may be the company's 3 product offer, a process conducted in the company or the organisation of selected activity and the process of reaching the introduction of changes within these innovation fields.

Bearing this in mind, the starting point in considerations of the innovation process cost may be the material presented below (Table 1), which is at the same time a demonstration of the features of (components) of the cost object under discussion.

[1]Innovation notional review according to among others: J.Schumpeter (early 20th century), Programme for better economic competitiveness of the EU member countries (called the Lisbon Strategy) (2000), S.Stern, M.Poter, J.L. Furman, Oslo methodology and the Polish Central Statistical Office, Guidelines of the Ministry for economy and Labour for the needs of the Polish Agency of Development of Competitiveness (PARP), see: M.Boniecki, R.Grabowski (2007), *Parametry charakteryzujące innowacje (Parameters characteristic of innovation)*, [in:] A.Karmańska (ed.) *Zarządzanie kosztami jakości, logistyki, innowacji, ochrony środowiska (Quality, logistics, innovation and evironmetal protection cost management)*, Difin 2007, pp. 120-129.

Table 1. Phases, stages and activities as drivers of costs in cost object implementation – innovation process

Cost drivers of a cost object – innovation process				
Kind of innovation: product – process – organisational	Phase	Stage	Cost characteristics	Activity
	FI. Research	EI.1. conceptualisation of research	the costs of activity implementation including the planning and organisation of the research process of innovation projects	D.I.1.1. D.I.1.2. (...) D.I.1.n.
		EI.2. research process implementation	the costs incurred in relation to research completing the existing state of knowledge important for innovation projects; costs of development of scientific idea to the practically useful form; the cost of creation of vision (of a project) of product, process of organisational innovation	D.I.2.1. D.I.2.2. (...) D.I.1.n.
	FII. Research work	EII.1. conceptualisation of re-engineering of innovation implementation conditions	the costs of setting the scope and method of reengineering of corporate conditions to the form suitable for the introduction of innovation solutions; the costs of technical and business documentation for the future phase of business application of innovation	D.II.1.1. D.II.1.2. (...) D.II.1.n.
		EII.2. implementation of re-engineering of innovation implementation conditions	the costs of work on the transition from the research phase to operational phase of the project; costs of launching the reengineering of conditions, e.g. the preparation of manufacturing space, retooling machines and equipment, reorganisation of work and staff training	D.II.2.1. D.II.2.2. (...) Dz.II.2.n.
	FIII. Operational activity with application of innovation	EIII.1. phase of business use of innovation	the costs incurred in relation to the newly manufactured product or commercial application of a new technological process or a new organisational solution	D.III.1.1. D.III.1.2. (...) D.III.1.n.
		EIII.2. innovation effectiveness monitoring during its business life rime	the costs of new solutions with regard to monitoring of innovation undertaking cost effectiveness during the whole period of "innovation effect" and controlling in the same scope.	D.III.2.1. D.III.2.2. (...) D.III.2.n.

Source: authors' own material.

Generic cost drivers in the process of innovation appear in the activities conducted at every stage of every phase of the innovation process. The drivers are identified as a stage or phase of innovation process are exclusively synergic aggregates of generic drivers. The presented concept of the structure of innovation undertaking cost drivers (implemented in the process of innovation) is a visualisation of the cost object, i.e. the innovation process and is a starting point for the cost management related to this process.

Re. 2)

Both on the plane *ex ante* and *ex post* it is important to determine the model of allocation and cost calculation, thanks to which it will be possible to subordinate the cost (*ex ante* and *ex post*) to the activities isolated in the innovation process. The conception to be seriously considered here is the time driven activity based costing (TD-ABC), which may be relatively easily introduced into the area of cost management. It is possible to: (1) identify detailed activities making use of the presented visualisation of the innovation process (see Table 1 for example D.II.2.n) and (2) effect cost allocations applying an understandable cost allocation key, which is a man-hour in the TD-ABC conception. Considering the issue of a cost model

appropriate for application with regard to the innovation process it also has to be decided whether the activities in the innovation process will be allocated with costs indirect for these activities, i.e. costs of other activities not occurring in the innovation process but the ones whose implementation determines the corporate potential to undertake the innovation process. In this place, taking into account the degree of complexity of cost calculations, the cost of conducting them as well as a doubtful information management value of the result of cost calculation, it is suggested that full-costing conception should be rejected and the **conception of activity costs directly connected with the innovation process**, i.e. direct-activity-costing should be applied instead.

Re. 3)

Innovation cost management requires, like cost management in other areas, the information not only about the innovation costs planned but also those incurred. Furthermore, this kind of management should be a permanent process with regard to all the detailed activities isolated within the innovation process. This means that, with regard to every individual activity, it is indispensable to:
1. classify, register and calculate the costs of activity,
2. report the costs incurred,
3. determine cost creating factors with no value added to the activity,
4. introduce reengineering focused on the elimination from the activity of the factors with no value added to it,
5. control the cost effectiveness management of the activity

The classification, registration and calculation of costs requires an appropriate structure of codes in the company allowing for the easy identification of the incurred costs and associating them with the place they come from, which in the case of innovation processes are the activities isolated in it. These codes are also useful in cost aggregate creation including cost values of, for example, a selected group of activities. The inclusion in the account books of the changes resulting from the application of TD-ABC as well as related detailed solutions will require special instructions and staff training but the advantage from the possession of cost information dedicated to the innovation process cannot be disputed. These costs abundant in extensive detailed classification obtained due to the accurate definition of the cost object and its internal activity classification, create a well-developed information base for cost controlling, which may use different models of causal analysis of deviations as well as the analysis of operation quality and as a consequence the whole process.

Re. 4)

Detailed attention should be paid to the information structure of the report on the innovation process costs. This report in indispensable for the cost controlling of this process.
Two managerially useful conceptions of the report structure may be offered. The first one is presented in Table 2.

Cost pool codes			Activity	Costs ex ante t=1 (1)	Costs ex post t=1 (2)	Deviations t = 1 (2)-(1) (3)	Costs ex post t = -1 (4)	Change in % (2)-(4)/(4) (5)

new knowledge will be acquired. If it feasible, there is a question when and what it will include and whether it will be useful for the company. In every phase there is "uncertainty" specific to a given phase. In the innovation process management in the risk conditions, in all the phases there is a group of the same risk factors which appear in every phase. It is determined by the financial possibilities of activity implementation connected with the innovation undertaking in a given phase, the activity technical feasibility and the creative competence (creativity) of the staff conducting a given activity.

Re. 5)

Setting the method of monitoring the innovation undertaking cost effectiveness during the whole period of the "innovation effect" is the core of assessment of advantages resulting from the innovation process. It seems that an auxiliary indicator may be the formula based on the scrutiny on the dynamics of EVA (Economic Value Added) value set for the third phase of the innovation process at a given moment of analysis in connection with the sum of costs

value calculated *ex post* for the completed phases (1 and 2) of the innovation process and the accruing cost value of the third phase. The scrutiny should follow during the whole period of economic life of the third phase of the innovation process.
The conception of this authors' self-designed formula may be presented in the following way:

$$EI = EVA_{3rd\ phase} / \sum_{i=I}^{II} Cost_{phase\ i} + \sum_{t=1}^{n} Cost_{phase\ t}$$

where:
EI – innovation process effectiveness ratio
i – the 1st and 2nd phases completed, isolated in the cost object – innovation process
t – period of implementation of the 3rd phase, isolated in the cost object – innovation process

INNOVATION MANAGEMENT IN THE RISK CONDITIONS

The implementation of the assumptions and goals formulated earlier and connected with the use of human resources and material means poses, for the entity undertaking this sort of tasks, numerous problems related to decision making and activities which make up the process of management. It is worth noting that the decisions and activities in the management process are related to risk, which is an inherent quality of any activity. Hence, there is a term in the English language: Risk Management, which can be interpreted as management in the risk conditions. Implementing five basic functions of the management process (planning, organisation, chain of command, coordination and control), a business entity is exposed to the implementation of risk, both pure and speculative. The risk management procedure consists in working out and using instruments which would raise the effectiveness of the management process with regard to the formulated assumptions and goals. In the majority of considerations we are confined to the pejorative understanding of risk, i.e. we identify the implementation of risk with a loss, which does not fully correspond to the situation of entities interested in business activity. The innovation activity risk whose implementation may bring considerable profits may be a typical example. The innovation process requires support. The companies which implement innovations need support due to a special kind of activity connected with entering new unexplored areas and uncertainty related to it. The innovation process should be properly managed from the stage of planning to implementation to launching. We can see an

important role of risk management and insurance as a method of minimisation of the effects of implementation of a given risk. Through the minimisation of effects of undertaken activities (risk related to it), companies may be more willing to undertake innovation activities. There is an important question to be asked whether the implementation of risk causes an impulse to innovation activity or on the contrary the innovation activity causes a higher exposure to the implementation of a given risk. In this part of the article we will present the research results concerning the development of the insurance sector in Poland. These results constitute the basis for an attempt to answer the question: Does the insurance sector through an appropriate offer and other behaviours which may be perceived as elements of the risk management process support the development of corporate innovativeness or is it

rather passive focusing on risks already diagnosed (fire, flood, theft or accident). Due to quantitative limitations, the article presents only the most important research results and conclusions resulting from them.

3.1. Insurance sector – results of analysis

Methodology used

In this study two groups of measures are used: measuring the distance and measuring similarity. The measure μ describing the degree of similarity between dimension structures of the two objects is defined with the following equation:

$$\mu_{i,p} = \frac{z_i \circ z_p}{|z_i||z_p|}$$

Where: $z_i \circ z_p$ denotes the scalar multiple of vectors zi and zp containing all dimensions of the particular objects and the length of the vectors. This means that the value of the μ is between -1 and 1 as the scalar multiple is a cosine of the angle between the vectors.
The measure of similarity of objects' dimensions d*(i,p) is defined by the following equation:

$$d^*(i,p) = 1 - \frac{1}{2\sqrt{kn}} * d(i,p)$$

$$0 \le d^*(i,p) \le 1$$

Where: k denotes the number of objects and n, the number of dimensions, is a normalized version of the differentiation of objects' dimensions d(i,p).

$$d(i,p) = \sqrt{\left(\sum_{i=1}^{k} (z_{i,i} - z_{i,p})^2\right.}$$

Where: dip denotes the distance between the objects i and p and zijzpj the values of dimension j of object i and p respectively.
The research was conducted by means of the multidimensional statistical analysis. Because of the comparative procedures (comparison of the same entity in different periods) taxonomic 8

procedures were used. The comparison was made with regard to the development of the insurance sector consisting of four subsectors: *catastrophe insurance, life insurance, health insurance and financial insurance.* In each subsector there were three groups of diagnostic features. Before the beginning of research the database was created including the implementation of selected diagnostic features in the years 1991-2010 (the features are presented in Enclosure 1). Eventually, the number of features was decided after the analysis of correlations between them; whereas the length of observation series was determined by means of availability of implementations of features from all the groups.

The database includes the implementations of diagnostic features for the analysed period. Initially it was planned to conduct the analysis of the years 1991 – 2010. However, the gathered data allowed for the full comparisons for the period 2000 -2010 (due to the availability of the feature implementations from all the groups). The period of the last 10 years may be regarded as interesting from the perspective of economic changes. In this time there was a period of good economic situation as well as a slowdown (the 2007 crisis).

The construction of the database was based on the information from reliable statistical sources published by the following institutions: the National Bank of Poland, the Central Statistical Office, the Financial Supervision Authority, IMGW and the Ministry of Health.

The analysis of the obtained correlation coefficients justifies the use of all diagnostic features. We remained with the expert selection, although we discern correlations which as a consequence of the use of statistical methods of selection of diagnostic features would cause the elimination of some features.

Next, the assessment was made of the sector development directions in the selected years of the analysed period. For comparison, the benchmark was set. In our case the benchmark was set in the group of experts based on algorithms presented by well-known statisticians (Z. Hellwig), separately for individual kinds of diagnostic features. In the case of stimulants the benchmark was calculated as a diagnostic feature of maximum value in the analysed period increased by a standard deviation for the whole time series. In the case of destimulants the benchmark value is 0 or minimum value decreased by a standard deviation, depending on which of the two values is higher. For nominants the benchmark value was set as an average value increased by a standard deviation or median depending on the character of the feature and the number of available observations. In order to maintain the clarity of the presentation the radar charts weren used. The chart axes are the analysed subsectors (in the case of sector analysis) or feature group (in the case of subsector analysis). Thus, Subsector 1 stands for catastrophe risk; Subsector 2 for life insurance; Subsector 3 for health insurance and Subsector 4 for financial insurance. The results of calculation for the measure of differentiation of levels d^* and structure similarity μ^* are presented in the charts below respectively.

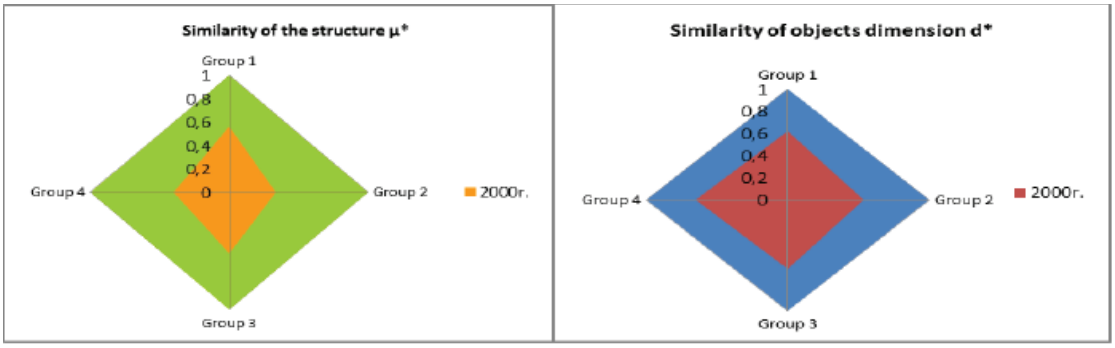

Figure. 1. Similarity of the structure and similarity of objects dimension in 2000 in comparison to reference object. (Reference object is market yellow and blue colour).
Source: author's own materials.

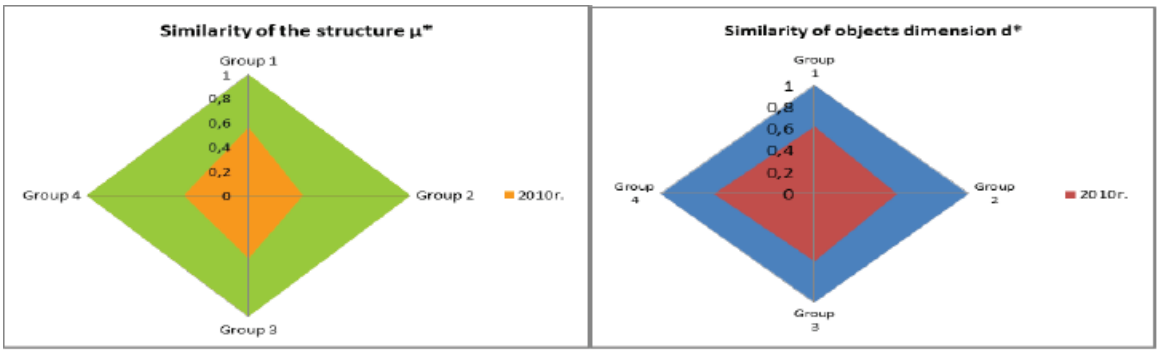

Figure. 2. Similarity of the structure and similarity of objects dimension in 2010 in comparison to reference object. (Reference object is market yellow and blue colour).
Source: authors'own material.

In the analysed period there were important changes in the insurance sector. The presented calculations on the basis of comparison of similarity measures in the years 2000-2010 in the insurance sector indicate a definite improvement in the life insurance subsector in 2005 and the stabilisation since then. As far as the health and financial subsectors are concerned, the period 2000-2010 is characterised by a constant improvement of the structure features (close to the benchmark). In the case of catastrophe insurance the applied measures reflect the occurrence of natural catastrophic phenomena.

The second stage of research makes a comparison of the development insurance subsectors. Like in the case of the comparison of the whole sector at the first stage the correlations between features were examined. Next, the calculation of the structure similarity measure and differentiation of feature levels was conducted. The results are graphically presented in radar graphs in Enclosure 2 to the present article.

Analysing the subsectors it should be underlined that within the subsector of catastrophe insurance, there is a dangerous phenomenon of negligence of preventive actions connected with the implementation of the risk of flood (diagnostic features in group 3 concerned this risk). Besides, it should be pointed to the sensitivity of the applied measures to the weather factors (group1). In the sector of life insurance there was a considerable increase in economic features (group 1). There was a change in the significance of financial and social features in the analysed period. In 2005 group 3, i.e. social feature, approached the benchmark the closest, financial features also became more important. However, already in 2010 the

significance of these groups decreased. In the sector of health insurance there is a perceptible rise in activity of households (group 2) and decline in the significance of the state policy (group 1). The signals of the activeness of the market in this sector are weak. Within the sector of financial insurance the biggest changes occurred in the third group (microeconomic features) and group 2 (operations of insurance companies and banks).

CONCLUSIONS

In many literature titles the problems of risk management are considerably simplified or oversimplified through the inaccurate interpretation of the phrase Risk Management. In numerous works the dominating perception of this notion is ”risk management” in the literal meaning. As a result complex problems derived from the disciplines of the management Science and the Risk Theory have been grossly limited, instead due to the needs of the financial market sectors, the problems of risk are being consistently developed. The management instruments so important for the effectiveness of the Risk Management procedure have been pushed into the background. This complicated procedure requires a 10

comprehensive approach combining the problems of risk with efficiency and effectiveness of the instruments applied in the course of implementation of the aforementioned functions of management. Only the joint consideration of the process of risk with distinguishing such categories as: *the subject of risk, risk implementation, probability of risk implementation* or *risk implementation effects*, which occur as the components of the risk process with the management instruments and tools allows for the full comprehension of the idea and goals of this procedure. The main goal of risk management is the improved effectiveness of the entity’s operation through an appropriate reaction to the risk connected the entity’s activity. The example to be quoted may be innovation activities, where the management of knowledge, cost and the whole process in the risk conditions should be coherent and mutually complementary. Innovative companies apart from the application of knowledge as well as an appropriate analysis and budgeting (allocation) of costs within algorithms of behaviour compliant with the risk procedure management should be supported by the insurance sector. However, the examination of the sector shows that in Poland in the analysed period the insurance market was not innovative and it did not create innovation supporting services (and it is where the insurance risk appears due to the financial aspects of innovation). Simultaneously, insurance did not encourage investment in research and development. An essential function of insurance as a specific financial market sector is to encourage economic growth through the redistribution of gathered capitals. Insurance as one of the basic financial tools of the Risk Management procedure should play an important role in the process of development of innovation and as a consequence the economic growth.

ABSTRACT

Purpose: *The purpose of this research is to formulate marketing information and communication (ICT) strategies for Taiwan tourism industry.*
Design/methodology/approach: *This research uses a literature review to identify problems and solutions of Taiwan's tourism industry. One of the identified problems is used as an example to formulate marketing ICT strategies.*
Findings: *This research has identified twenty-five main problems and forty-eight solutions of Taiwan's tourism industry and formulated marketing ICT strategies for one of the identified problems.*
Research limitations/implications: *The subsequent research can apply other research method to improve the reliability and validity.*
Practical implications: *The application of marketing ICT strategies can be used in other country's tourism industry and be adapted to other industries as well.*
Originality/value: *This research clarifies the problems of Taiwan's tourism industry and applies marketing ICT strategies in Taiwan tourism industry.*

INTRODUCTION

The tourism industry is highly valued and generally acknowledged as a tertiary industry. One reason for this is that the traveling and staying of tourists outside their usual environment may bring tourism revenue. In addition, the tourism industry involves many other industries such as hotels, catering, aviation, transportation, and so forth. This implies that once the tourism industry prospers, it may push other industries forward as well. It will not only bring tourism revenue but also increase consumption and employment. As a consequence, tourism makes vital contribution to the overall economy.

Taiwan (or Republic of China, ROC) is an island country; its territory is not large but includes abundant nature landscapes and distinctive artificial scenery. For instance, Taroko National Park is well known for its majestic canyon and precipice and city of Tainan preserves lots of historical sites. Taiwan possesses rich natural resources that can be used to expand tourism industry. Moreover, tourism industry was listed as one of the Taiwan's six emerging industries, which proves that tourism is becoming more and more important.

Many countries have started to give more attention to the tourism industry. The United Nations World Tourism Organization (UNWTO) claims that the tourism industry has become a vital source of earning foreign exchange. In Taiwan, approximately 8% of foreign exchange is derived from tourism industry and it accounts for more than 15% of Gross Domestic Product (GDP). According to the statistics of the Tourism Bureau of ROC, foreign exchange earnings in Taiwan from tourism were up to 260 billion NT$. UNWTO also predicts that the tourist attendance will increase to 1,602 million in the world in 2020. As a result, the tourism industry plays an important role to a country and the whole world.

According to the World Tourism Barometer, the tourist attendance was increasing during 2011 and the Asia's growth rate of international tourist was up to 14.1% compared to 2010. Among the Asia countries, Taiwan's tourist attendance was up to 29% especially. Recently, the mainland tourists are increasing. One reason for this is that the government of ROC has promoted tourism for several years and another is that the government has signed the Specific Arrangements Concerning Cross-Strait Tourism in 2008. Taiwan's visitor arrivals had come to 6 million in 2011 consequently (Table 1).

Table 1: Taiwan's Visitor Arrivals 2006-2011

Year	Total		
	No of Visitors	Growth Rate %	Index 1991 = 100
2006	3,519,827	4.19	189.80
2007	3,716,063	5.58	200.38
2008	3,845,187	3.47	207.34
2009	4,395,004	14.30	236.99
2010	5,567,277	26.67	300.20
2011	6,087,484	9.34	328.25

Source: Tourism Bureau of Republic of China (R

The sales volume of smartphones was 420 million and that of tablet personal computers was 41 million in 2011. The most important fact is that the total sales volume of these two products was more than personal computers, proving that the tendency of mobile computing is coming. Taiwan has endeavored to develop the information and communications technology (ICT) industry for several years; therefore, it has solid foundation of the infrastructure and rich experiences in manufacturing and management. The government of ROC also kept investing in ICT research, as well as encouraged creation and invention. For the sake of expecting they could lead the development of related industries and bring the knowledge spillovers effect for other industries to increase work efficiency, promote productivity and raise value added, and spur the economic growth.

Although Taiwan has put a lot of efforts on the tourism industry for many years and the visitor arrivals are increasing stably, there still is room for improvement. As the ICT industry has become more and more important, the tourist attendance has increased rapidly, and ROC has allowed travel in Taiwan, the number of tourists will probably increase day by day, and it certainly will change the state of Taiwan's tourism industry. This research investigates how the use of ICT can improve the Taiwan's tourism industry. The aim is to formulate marketing ICT strategies for Taiwan tourism industry. In essence, main problems and solutions of Taiwan's tourism industry is identified and based on these some marketing ICT strategies are formulated.

The remainder of this paper is structured as follows: To begin with the research approach is described shortly in Section 2. Thereafter, a literature review on main problems and solutions of Taiwan's tourism industry is provided in Section 3. After that, we use one of the identified problems as an example (some of Taiwan's tourism corporates and shopping areas lack of marketing ability) to formulate marketing ICT strategies in Section 4. Finally the research is concluded in Section 5.

RESEARCH APPRAOCH

This research uses a literature review to identify problems and solutions of Taiwan's tourism industry. Articles that discuss main problems, and possible solutions to these problems, have been collected within five specialized business fields: (1) product management, (2) marketing management, (3) human resources management, (4) research and development management, and (5) financial management. Since the identified problems and solutions were too many and diverse from each other, they were classified into different groups. One of the identified problem groups (some of Taiwan's tourism corporates and shopping areas lack of marketing ability) is used as an example to formulate marketing ICT strategies for Taiwan tourism industry. We expect the marketing ICT strategies will attract more foreign tourists to Taiwan and become a case study for the development of other countries' tourism industries.

LITERATURE REVIEW

Much literature discusses problems and solutions in Taiwan's tourism industry. Our literature review revealed twenty-five main problems of Taiwan's tourism industry (Table 2). Since the identified problems (No. 1-25) were quite many and diverse from each other, they were classified into different problem groups (Table 3). For example, problem No. 8, 14, 15, and 23 in Table 2 are all descriptions of the problem "Service quality in some Taiwan's tourist spots is not satisfying due to employee lack of capability". We therefore categorize them into the same group (A) in Table 3.

Table 2: Main Problems of Taiwan's Tourism Industry

Authors	No	Problems
Deng et al. (2007)	1.	There were few proper channels for tourists to communicate with the hotel proprietors.
	2.	The ways that hotel proprietors deal with the customer relationship problems are usually inadequate and their ability of external communication is insufficient.
Chen (2005)	3.	Although there are many well-known tourist spots in Taiwan, the level of tour packages are not deep and wide enough; leading to low value added.
Hsieh et al. (2008)	4.	The communication and propagation ability of B&B owners is insufficient, and they also lack of effective promotions.
	5.	The expenditure of most Taiwan's tourist spots is too high.
Lee et al. (2008)	6.	The channel strategies of Taiwan's tourism are deficient.
	7.	Taiwan's tourist spots and shopping areas are short of impressive integrating brand elements and corporate Images.
Yeh and Wang (2001)	8.	Service quality of some tourist spots shopping areas in Taiwan couldn't satisfy their customers.
Dai (2008)	9.	Most of Taiwan's tourism corporates are medium and small-size enterprises, and that's the reason why it's usually uneasy for them to get financing loans.
	10.	Financial transparency of medium and small-size tourism corporates is defective and some of them even lack of accounting system.
Hwang and	11.	The average wages of Taiwan's tourism are too low.

Authors	No	Problems
Chen (2009)	12.	The job satisfaction of staff is low, but the employee turnover rate is high.
Lee (2005)	13.	Most the meals in the tourist spots or shopping areas are lack of distinguishing features and creation.
	14.	The on meal speed in the tourist spots or shopping areas is slow.
	15.	The meals and dinning environments in some of the travel sites are not that hygienic.
Chen and Wu (2009)	16.	The contents of package tours are indistinctive.
Otto and Ritchie (1996)	17.	The positions of most Taiwan's travel sites are ambiguous.
Chih et al. (2006)	18.	The duties of employees are unclear.
	19.	Some of the tourism corporates don't provide equitable promotion methods and employee evaluation system.
	20.	The standards of recruiting are various.
Liu and Chen (2011)	21.	Most of the mini tourism corporates can't keep their customers staying longer and lack of local tourism industry planning to promote economic growth.
Lai et al. (2011)	22.	Some of the Taiwan's traveling sites are too remote to reach.
	23.	The guides in the tourist spots are insufficient.
	24.	Most of the tourism corporates were unclear towards the policy and government grants.
Denhning et al. (2005)	25.	Most of Taiwan's tourist spots had low prestige on the internet.

Table 3: Problem Groups of Taiwan's Tourism Industry

Problems	No	Problem Group
8、14、15、23	A.	Service quality in some Taiwan's tourist spots is not satisfying due to the employees lack of capability.
9、10	B.	Financial infrastructure in some medium and small-size tourism corporates is incomplete.
11、12、18、19、20	C.	Personnel management and staff motivation are defective in some tourism corporates.
1、2、5	D.	Inefficiency in communication with customers.
3、4、6、25	E.	Some of Taiwan's tourism corporates and shopping areas lack of marketing ability.
13、16	F.	Meals and leisure activities in some tourists spots are insufficient and without innovation.
7、17	G.	There are barely any brand elements and proper positions in most of Taiwan's tourism corporates
21、24	H.	Taiwan's tourism industry lacks of integrated planning to create revenue.
22	I.	Some of the Taiwan's traveling sites are too remote to reach.

Based on the generated problem groups, forty-eight corresponding solutions were identified in the literature review (Table 4). In Table 4, we can see the different problem groups and the corresponding solutions. The solutions not identified from literature review were deduced by analogy by the authors.

Table 4: Solutions To Main Problems of Taiwan's Tourism

Problem Group	No	Solutions	Authors
A. Service quality in some Taiwan's tourist spots is not satisfying due to the employees lack of capability.	A1.	Select outstanding students from department of tourism, tourism experts, and the employed of relative industries to well-known foreign hotels or institutes to pursue further education every year.	Chen and Chen (2008)
	A2.	Provide education and training for attendants and apply standard operating procedure (SOP) to manage them.	
	A3.	Set up internal tourism staff training, for instance subsidizing to run senior leader programs of tourism, inviting experts to participate in seminars.	
	A4.	Improve the environmental sanitation.	Lee (2005)
	A5.	Set up standard purchase and produce systems to make sure every segment is checked on.	
B. Financial infrastructure in some medium and small-size tourism corporates is incomplete.	B1.	Establish accounting system.	Dai (2008)
	B2.	Make use of government resource.	
C. Personnel management and staff motivation are defective in some tourism corporates.	C1.	Concerned about employees.	Hwang and Chen (2009)
	C2.	Design inner compliant channels.	
	C3.	Arrange employees' insurance and retirement systems.	
	C4.	Create particular and harmonious corporate culture.	Lee (2010)
	C5.	Establish employee motivational system based on their achievement.	
	C6.	Build up management and employee evaluation system.	
	C7.	Design main tasks and responsibilities of gross root employees.	Chih et al. (2006)
	C8.	Provide professional training for employees.	
D. Inefficiency in communication with customers.	D1.	Establish member data system.	Deng et al. (2007)
	D2.	Take account of relationship marketing.	
	D3.	Establish the interaction with customers via social network.	
	D4.	The B&B proprietors should show consideration actively for their customers, even open their hearts to each other.	Lu et al. (2008)
E. Some of Taiwan's tourism corporates and shopping areas lack of marketing ability.	E1.	Increase promotive tour packages.	Chen (2005)
	E2.	Take advantage of internet marketing, public reports, and travel magazines to raise prestige.	Huang (2006)
	E3.	Apply strategic alliance to different business fields or the same trades.	
	E4.	Adopt search engine optimization (SEO)	ComScore (2009)
	E5.	Take advantage of Internet marketing and try to make the information on websites abundant and orderly.	Lee et al. (2008)
	E6.	By sharing the articles on Blogs to create loyal customers.	
	E7.	Adopt location based service (LBS).	
	E8.	Enrich customers' cultural knowledge with local impression, environment, and resources.	Benz and Fürst (2002)
	E9.	Develop products with stories to make customers touched.	Liu et al. (2011)
	E10.	In compliance with area feature to invite international competitions or exhibitions to Taiwan hereby let more people acquainted with Taiwan.	

Problem Group	No	Solutions	Authors
F. Meals and leisure activities in some tourists spots are insufficient and without innovation.	F1.	Combine with local products to create diversity of dishes.	Lee (2005)
	F2.	Design experience activities which combined with local culture, natural landscape, and ecological environment.	Rossman (1989)
	F3.	Apply local and community life culture creatively into your corporate's core ideology.	
	F4.	Apply local cultural features into your corporate culture.	
	F5.	Provide theme activities such as entertainments, education, and virtual reality to enrich customers' life experiences and emotional feelings.	Lin and Huang (2009)
	F6.	Design experience activities for tourists to learn cultural knowledge and experience different life styles.	
	F7.	Provide interactive guidance, narration service, or guidance facilities.	
G. There are barely any brand elements and proper positions in most of Taiwan's tourism corporates	G1.	Establish brands and corporate images.	Lee et al. (2008)
	G2.	Design the environment with the same theme to create obvious atmosphere.	Otto and Ritchie (1996)
	G3.	Design the environment with five senses experience to improve the recognition of brands.	
	G4.	By visual designing to create space harmony.	
	G5.	Adopt knowledge management systems (KMS).	Lai et al. (2011)
H. Taiwan's tourism industry lacks of integrated planning to create revenue.	H1.	Coordinate with government policies to create tourism revenue.	Landry (2000)
	H2.	Enhance the marketing ability to attract more foreign tourists.	Wu (2011)
	H3.	Coordinate with neighboring tourist spots to develop a win-win situation.	Chen et al. (2008)
	H4.	Tie in relative festivals to attract more tourists.	Liu et al. (2011)
	H5.	Establish local integrated marketing platform.	Carayannis and Alexander (2006)
I. Some of the Taiwan's traveling sites are too remote to reach.	I1.	Mark the routes on Google Map.	Lai et al. (2011)
	I2.	Provide shuttle services.	

The literature review shows that there still are lots of challenges in the front of the Taiwan tourism industry (Table 3). Although there are many tourist spots, which are no less amazing than the foreign, lack of integrated planning and undistinguished characteristics of traveling sites, limits the success. The literature review also shows that there are plenty of solutions to the identified problems that should be considered (Table 4). Nevertheless, the state of Taiwan's tourism is different from the past. Taiwan has put a lot of efforts on ICT industry and has a sturdy foundation. In the following, we will focus on the combination of Taiwan's tourism and ICT on the identified problem of "Some of Taiwan's tourism corporates and shopping areas lack of marketing ability" We expect it will make more foreigners know about Taiwan and further attract them to make a tour there.

AN EXAMPLE OF APPLICATION OF ICT

As the ICT is evolving, the ways people live and travel have changed a lot. For example, the Internet age brings more creative business models and marketing skills and even makes social networks become new media. The smart phones also bring us a more convenient life style.

ICT means using technology to reach the telecom communication effect and changes the instrumentality of communication between people through the broadcasting of voice, words and messages. As the matter of fact, we suggest using marketing ICT strategies within the Taiwan tourism industry to solve the identified problem of "Some of Taiwan's tourism corporates and shopping areas lack of marketing ability". In the following, we provide recommendations with regard to three areas: (1) Social network marketing, (2) Location Based Services and (3) Internet marketing channel. This may strengthen the connection with foreign tourists and increase the value added in Taiwan's tourism industry.

Social Network Marketing

We can use social networks to conduct integrated marketing. For instance, making mini short videos to introduce different local images and characteristics to tourists traveling from different countries with different needs. The videos can then be broadcasted through satellite TV or Internet (e.g., Youtube) to create topics and discussions. We want to motivate traveling to Taiwan by using the videos to increase the visibility of Taiwan and change the mindset of foreign tourists. Moreover, tour spots and shops can set up official Facebook pages or use Twitter to create interaction with the potential visitors. For example, creating events for fans that can be shared with friends in order to have a chance to win discount coupons or other prices. This allows the shops or tour spots to make exposure to consumers frequently and to revoke the memory of the consumers to increase sales.

Location Based Services

The tourists can freely use the Radio Frequency Identification (RFID) personal navigation with different language versions to find answers and information and by combining it with QRcodes, it will also increase the involvement of the tourists. QRcodes have been used widely in the daily life and could also be used in the tourism industry on websites or tour spots to inform the tourists in a faster and better way. It is also possible to add information about parking options and public toilets on the QRcode or include QRcode in shopping catalogues to allow tourists to buy souvenirs by phone. The tourism industry can also use instant messages or QRcodes, to send information about discounts once the tourists arrive to a location. This will make the tourist more familiar with the surroundings and hopefully increase their interest to other products and services.

Internet marketing channel

On an Internet based selling platform we can place information about local specific products to increase the valued added and to conduct integrated marketing. For example, the Taobao net or the largest tour news media, the TraNews, is going to launch Malaysia and Taiwan ECMALL website to advertise specific products in Taiwan to different countries. A website is able to introduce the full range of products and service and to provide links to tour spots in Taiwan. In addition, it could give information about shops to make foreign visitors more eager to visit Taiwan. Development of different Apps with food maps and traffic ways in Taiwan would facilitate tourists traveling in Taiwan.

Summary

The use of marketing ICT strategies in the tourism industry in Taiwan is more than the above shown examples. It could reduce the distance to potential consumers by allowing an efficient mean of communication. This allows foreigners to get access to information about Taiwan to improve their interest and willingness to visit Taiwan. In the longer run this will help Taiwan tourism industry to grow.

CONCLUSSION

There are many island countries like Taiwan with abundant nature as well as culture sights. However, the problem is that island countries are difficult to connect to other countries. Thus it is a hard work to develop the tourism industry. Today, with the advancement of ICT it is not that difficult to make foreign visitors aware of Taiwan but to attract them to visit. In our literature review we have identified twenty-five problems and forty-eight solutions. However, the development of tourism industry is more different now than before. The government of ROC has worked hard on the tourism industry in recent years and actively developed the ICT industry. If we use ICT strategies in tourism industry, it may bring us opportunities. We expect it will not only make more foreign visitors come to Taiwan but also upgrade the industry in Taiwan and make Taiwan as a case study in the tourism industry.

ABSTRACT

Purpose: *Habit is treated as a construct of marginal focus on attitude, and in particular on the expectancy-value perspective, as antecedents of behavior. In online business context, repeat purchase behavior of customers is critical for the prosperity and survival of online stores; the habitual behavior may be reinforced as a moderator of repurchase intention and adjusted expectations when used by satisfied customers. The purpose of this paper is to investigate the moderating role of online shopping habit on the relationship between customer satisfaction and online repurchase intention, and between customer satisfaction and adjusted expectations.*
Design/methodology/approach: *In this paper, we develop an analytical model that examines the impact of online shopping habit on online repurchase intention and adjusted expectations. The model was tested using structural equation modeling for data collected from 204 respondents.*
Findings: *Our empirical results indicate that online shopping habit is not significant driving forces of online repurchase intention and adjusted expectations, but it has indirect effect through customer satisfaction. In fact, customer satisfaction has a positive effect on online repurchase intention, and adjusted expectations.*
Originality/Value: *Our findings suggest that online shopping habit is necessary but not influence on driving forces of online shopping behavior. In term of post-satisfaction, adjusted expectations have a significant mediating influence on the link of customer satisfaction and online repurchase intention.*

Keywords: Online shopping habit, Customer satisfaction, Adjusted expectations, Online repurchase intention
Paper type: Research paper

INTRODUCTION

In today's competitive market as a consequence of the Internet's significant, online shopping business has transformed from a trendy emerging shopping channel and also become a supplementary shopping channel (Limayem and Hirt, 2003). Recent survey research reveals that critical factor to the success and profitability of online business is customers' repurchasing and loyalty (Chiu et al., 2009). Customers' repurchasing is challenging in context of online shopping. Especially in the current competitive in online business where the

majority of online retail is to drive online buying intention. Therefore, the important to identify the significant determinants of online repurchase intention (Khalifa and Liu, 2007).

The critical factor for a strong bond with customers' online repurchase intention is customer satisfaction (Wen, 2012, Lin et al., 2010, Wen, 2009, Anderson and Srinivasan, 2003). While many researches use satisfaction as an indicator of repurchase (Anderson and Srinivasan, 2003), that is an emotional reaction which influences attitude and provides a pleasurable level of consumption related fulfillment (Oliver, 1997a). Although numerous of prior researches propose that satisfaction serve as the underlying determinant of repurchase intentions (Lin et al., 2010), it is still necessary to examine the customer satisfaction and repurchase intention on online business environments (Ha et al., 2010). In online context, the link between customer satisfaction and repurchase intention seems to be more complicated (Anderson and Srinivasan, 2003, Hennig- Thurau and Klee, 1998) and our understanding of mediating roles between customer satisfaction and repurchase intention, which is also for shopping behavior, is much more limited (Kaveh et al., 2012).

In prior research about repeated behaviors, habits as the role in explaining repurchase intention (Gefen et al., 2003, Limayem and Hirt, 2003) when behavior is repeated and becomes habitual, it considered by automated cognitive processes in which a habit is practiced (Khare and Inman, 2005). Some researchers suggest that a weak habit may lower the sensitivity of consumer retention to satisfaction (Anderson and Srinivasan, 2003), the habit construct is also of appeal to practitioners. Thus, examining the effect of habit on online repurchase intention can improve our understanding of online business.

To fill this knowledge void, this research attempts to examine how adjusted expectations mediate the impact of customer satisfaction on online repurchase intention link in a post-purchase. Specifically, we adopt a contingency approach to examine whether online shopping habit moderates the relationships among customer satisfaction, adjusted expectation and online repurchase intention.

In the next sections, we provide a description of the background theory about this research and develop a series of hypotheses. We describe our research method in section 3. Then, the last two section present data analysis and results, followed by a discussion of the research implication, and limitation and future research.

THEORETICAL BACKGROUND AND HYPOTHESIS

The last decade has seen an increasing body of theory-based research on online shopping intention. While online retailers often face a challenge about how to acquire and retain customers (Tsai and Huang, 2007, Chen and Hitt, 2002, Keaveney and Parthasarathy, 2001, Bolton et al., 2000), and drawn from psychology, expectancy disconfirmation theory, attitude-behavior model and a contingency theory to develop the model; fig.1 presents our conceptual research model; the development of this model is established in online customer retention. This study extends prior research models with applying expectancy disconfirmation which more detailed analyses the relationships between customer satisfaction and repeat purchase in online environment. In addition to, we apply the adjusted expectations, which are expectations updated on online post-purchase (Yi and La, 2004) as the link between customer satisfaction and online repurchase intention. In this research model, we recognize the

complicated online consumer behavior phenomenon (Darley et al., 2010), and customers focus on the satisfaction rather than emphasis on technology (Porter, 2001, Wind and Mahajan, 2002, Grant et al., 2007). Following a contingency theory and attitude-behavior model, we extend Khalifa and Liu (2007) the model by capturing the moderated effects of online shopping habit.

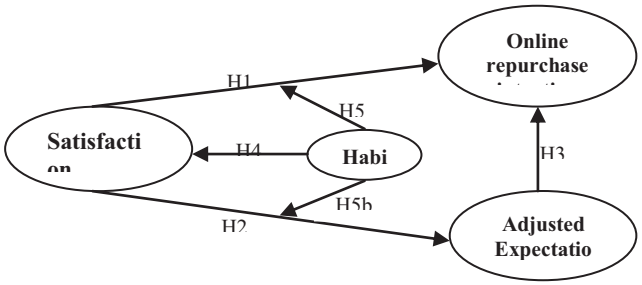

Figure1: Research model

1. Customer satisfaction and online repurchase intention

It is important for retailers to understand customer's repurchase intention and the factors that influence repurchase intention (Patterson et al., 1997) because increased repurchased encourage profitability and achieve customer loyalty. Repurchase is also significant to continue the flow of the company's profitability (Hansemark and Albinsson, 2004). Prior research literatures have yielded several key antecedents as influencing a customer's intent to repurchase (Petrick et al., 2006, Tam, 2004, Eggert and Ulaga, 2002) such as customer satisfaction, service quality, perceive value, past experience/behavior, etc.

A number of researchers have stated that traditionally customer satisfaction is proposed as the most significant factor leading to the firm's profit and repurchase intent (SurabayaUniversity, 2012). Martínez Caro and Martinez Garcia (2007) indicate that customer satisfaction has been driven by cognitive and affective beings, where some comparison standard is compared to the actually perceived performance (Homburg and Giering, 2001).

Based on online environment, Customer satisfaction is one of the key criteria that is significant for online shopping operators (Mihelis et al., 2001), it has been used to increase profitability and long-term growth of any online retailers and strongly related to identifying future intention. Improving customer satisfaction is essential for increasing customer revisits, and crucial for repurchase intention (Gupta and Kim, 2010). Hence, the understanding of factors affecting to online customer satisfaction is important to online retailers for predicting customer behavior or behavioral intention and to respond the need for explaining the post adoption behavioral decision and provide a view of customer satisfaction in online shopping. Therefore, we propose the following hypothesis.

H1. Customer satisfaction has a positive effect on online repurchase intention.

2. Customer satisfaction and adjusted expectations

Yi and La (2004) have defined adjusted expectations, which are updated from the initial expectations as new information is acquired or expectations updated through accumulated consumption experiences as "post-purchase satisfaction." From expectancy-disconfirmation theory is that expectations are understood as an antecedent of customer satisfaction and it acts as the standards in evaluating satisfaction on consumption experience (Oliver, 1980, Yi, 1993), whereas adjusted expectations play the role of post-satisfaction judgments that are the expectations adjust over time through accumulated or current consumption experiences (Jones and Sasser, 1995, Yi and La, 2004).

The basis of the preceding discussion, we focus on conceptualize adjusted expectations that affected by customer satisfaction. Therefore, we propose following hypothesis.

H2. Customer satisfaction has a positive effect on adjusted expectations.

3. Adjusted expectations and online repurchase intention

There is at present little online shopping research that using of adjusted expectations (Ha et al., 2010) to illustrate consumer behavior instead of initial expectations is relevant given the similarity ways in which both types establish their causal relationship with satisfaction and repurchase intention. In the marketing area, the individuals' expectations change quickly (Johnson et al., 1995), so a revision of individual expectations can occur even during consumption (Oliver, 1997b).

Especially in online environment, retailers need to enhance consumers' expectations in order to lead them to repurchase, the more customers have good experiences and feelings, and the higher expectations are adjusted according to the increasing repurchase expectations from the great expectation of customer (Rust and Oliver, 2000, Szymanski and Hise, 2000). Therefore, we propose following hypothesis.

H3. Adjusted expectation has a positive effect on online repurchase intention.

4.Online shopping habit and customer satisfaction

The concept of habit has been studied in various disciplines, such as psychology, social psychology, consumer behavior, organizational behavior and information systems (Limayem et al., 2007). (Limayem and Hirt, 2003). In the previous research, Limayem and Hirt (2003) proposed that habit is major driver of affect. Affect represents to emotions, feelings, moods and attitudes of customer (Chen and Cheng, 2012). It suggests that customer satisfaction is affecting (Bhattacherjee, 2001). By increasing a favorable feeling towards a behavior (Triandis, 1971), habit affects satisfaction directly (Limayem and Hirt, 2003).

Habit also has been used to predict consumption behavior in online context. For example, Liao et al. (2006) showed that consumers' intention to continue using a B2C web site is determined by its perceived usefulness, trust and habit. In online shopping, individual with online shopping habit would turn to the behavior response instead of a physical outlet automatically without further consideration when they feel shopping needs (Khalifa and Liu,

2007). In this study, online shopping habit can be viewed as an automatic behavioral response as it has become spontaneous in online shopping due to the learned association between the shopping behavior and satisfactory results (Aarts et al., 1998, Wood and Neal, 2007, Verplanken, 2006). Therefore, the following hypothesis is proposed.

H4.Online shopping habit has a positive effect on Customer satisfaction.

5. Moderating roles of online shopping habit

Prior research has explored the moderating role of habit. For instance, Khalifa and Liu (2007) examined the moderating role that habit plays between satisfaction and online repeat purchase intention. They suggested that satisfaction may not necessarily lead to an intention to return to an online store in the absence of habit. The influence of the determinants of online repeat purchase intention may be contingent upon the development of the habit of using the online channel (Chiu et al., 2012), and thus the importance of customer satisfaction will increase. In other word, online shopping habit positively moderates the relationship between customer satisfaction and online repurchase intention.

H5a. Online shopping habit positively moderates the relationship between customer satisfaction and online repurchase intention.

There is at present no online shopping research that testing of the role of habit on relationship between customer satisfaction and adjusted expectations. In cognitive judgment process expectations are understood as an antecedent of customer satisfaction, whereas adjusted expectations which are advocated a new paradigm of post-satisfaction judgments that customer expectations adjust over time through accumulated and current consumption experiences (Johnson et al., 1995). When once a behavior has become a habit, it implies a well-practiced behavior (Ouellette and Wood, 1998). Customer satisfaction is influenced from prior experiences (Lee et al., 2008, Jang and Namkung, 2009). Therefore, habit should be included as a potential moderating effect. Consequently, this study argues that online shopping habit positively moderates the relationship between customer satisfaction and adjusted expectations. Thus, we propose following hypothesis.

H5b. Online shopping habit positively moderates the relationship between customer satisfaction and adjusted expectations.

RESEARCH MEDTHOD

This section describes the research methodology employed to test the conceptual model of this study is shown in Figure1, Online shopping survey and structural equation modeling (SEM) were exploited to test the model. The concept model for this study is first described, followed by description of the measurement development and data collection respectively.

1. Measurement development

The research model contains 4 constructs including a moderator – online shopping habit. In order to measure online shopping customer perceptions, the questionnaires were formulated based on relevant literature to obtain validity. The key constructs of the research model

namely, online shopping habit, customer satisfaction, adjusted expectations, and online repurchase intention. The respondents were asked to think of a specific online store from which they had previously shopped.

To measure the various constructs, validated items were adapted from extant studies and revalidated for this study. All the focal constructs of the model were measured using reflective constructs that were adapted from the literature and designed using a seven-point Likert scale to facilitate measurement, with a rating scale from (1) "strongly disagree" to (7) "strongly agree."

The measurement for online repurchase intention was draw from Limayem et al. (2000) and Khalifa and Liu (2007); it was measured the future propensity of a customer to repeat purchase intention at a specific intention online store from which he/she had extant shopped by using three items that have been common to measure future intention as indicators of actual behavior. The scale for measurement online shopping habit was draw from Khalifa and Liu (2007), Triandis (1979) indicated that habits can be measured by the automatic behavior tendencies developed during the past history of individual and it also has and interactive effect.

Customer satisfaction construct was defined as a cognitive and affective response to the consumptions experience. The four-item for this construct were adapted from the satisfaction measure developed by Bhattacherjee (2001), these were designed to assess users' attitude with the evaluate product. Another scale to measure for adjusted expectations construct that the literature showed a considerable controversy concerning certain relationships that were established in cognitive-affective models of consumer behavior. With eight-item adapted from Bhattacherjee (2001), these were measured the updated expectations of prior expectations after the consumption experience. Detailed descriptions of actual wording and response scales are given in Appendix A.

2. Data collection

The information and data for this study is general Taiwanese customers who had shopping experience through Internet shopping. The online shopping has been an expansion and explosive growth of online shopping malls (Chen et al., 2009, Kwon and Chung, 2010). Purchasing a product through an online channel is popular in Taiwan, and the approximate number of people involved in online shopping exceeded 3.285 million in one month during 2009 (Chen, 2012). According to the report of the Marketing Intelligence Center (MIC) showed that the B2C e-commerce market value of Taiwan in 2011 was estimated to reach NTD 250 billion (US$8.33 billion) in 2011 (Li, 2011).

Due to this research focuses on the cumulative customer satisfaction construct and the purpose of this study was to examine the effect of purchase importance on satisfaction, post-purchase evaluation in adjusted expectations and the effect of online shopping habit in the repurchase intention. Therefore, our research respondents from the survey composed of 204 Taiwan online customers who had previously shopped at least four times in buying products or services from a specific online store. They came from various demographic areas of Taiwan and consisted of 129 females and 75 males. The respondents are relatively young: about 96 percent of all are lower 35 years old and quite experienced in Internet usage, with 97

percent of more than 4 years of Internet experience. About 62 percent online shoppers have a few times of online shopping in a months.

ANALYSIS RESULTS

This analysis of the data was analyzed by partial least square (PLS), a structural equation modeling (SEM) technique. The PLS procedure (Wold, 1989) has gained interest and use among researchers in recent years because of its ability to model latent constructs under conditions of non-normality and small to medium sample size (Chin and Gopal, 1995, Chin, 1998b). It allows the researchers to explain the relationship within a model (Fornell and Bookstein, 1982) and assesses the relationship between constructs and between the constructs and their measurement items; it also enables a simultaneous analysis of whether the hypothesized relationships at the theoretical level are empirically confirmed (Liu and Khalifa, 2003). This ability to include multiple measures for each construct also provides more accurate estimates of the path among constructs are provided typically biased downward by measurement error when using techniques such as multiple regression (Limayem et al., 2001). Furthermore, PLS can accommodate the presence of moderating effects, SmartPLS 2.0 M3 was used for our analysis. The bootstrap resampling method (500 resamples) was employed to determine the significance of the path within the structural model.

1. Measurement validation

We used PLS method to assess the psychometric properties of all scales used in this study. A set of deliberation in PLS methods was to evaluate on the criteria of reliability, convergent validity and discriminant validity (Fornell and Larcker, 1981, Chin, 1998a, Hulland, 1999) using composite reliability, factor loading, and average variance extracted (AVE).

The research model consisted of four latent variables which they employed reflective measurement model and performed on each of the multiple-item scales. For the measurement model, the adequacy of the measures can be determined by examining the individual item reliabilities, which is represented by the loading to the respective construct. The standardized loadings of each item should be greater than 0.7 (Chin, 1998b). Table 3 shows the item loadings obtained the model with all constructs. The results show that all items are reliable with loading over 0.7.

In evaluation of the internal consistency, which is an indicator of reliability of the combined test items used to measure each specific construct. The composite reliability (CR) scores clearly indices exceeded the recommended value of 0.70 which demonstrating adequate internal consistency of the scales (Chin, 1998a). From table 2 below, it shows the result of all constructs are of very high degree of reliabilities (all of them are above 0.90) and internal consistency. The convergent validity of the scales was assessed by two criteria (Fornell and Larcker, 1981): (1) all indicator loadings should be significant and exceed 0.7 and (2) the average variance extracted (AVE) by each construct should exceed the variance due to the measurement error for the construct (i.e., AVE should exceed 0.50). Table 2 shows that all of the items exhibit a loading higher 0.7 on their respective constructs, and the AVEs range from 0.70 to 0.92. Thus, these data allowed the conclusion that the constructs had appropriate reliability and convergent validity.

To ensure the discriminant validity, we examined by using the following two tests. First, the cross-factor loadings indicate good discriminant validity because the loading of each measurement item on its assigned latent variable is larger than its loading on any other construct (Chin, 1998a). Second, the square root of the AVE from the construct should be greater than the correlation between the construct and all other constructs. The correlations between the relevant constructs are significant lower than the square root of the average variance extracted. Therefore, the discriminant validity of the constructs is well established.

2. Testing the structure model

The standardized PLS path coefficient and R^2 value, which are differently estimated without the moderating effects of online shopping habit, are denoted in parentheses.

As predicted, the estimates obtained using the structural model support the view that customer satisfaction (β = 0.493, p < 0.001) significantly influence online repurchase intention, and it (β = 0.746, p < 0.001) significantly influence adjusted expectations, which accounts for 65.8% and 64% of the variance respectively. Therefore, customer satisfaction had positive effect on online repurchase intention and adjusted expectations to recommend support H1 and H2. Furthermore, online repurchase intention is significantly influenced by adjusted expectations (β = 0.335, p < 0.01), which accounts for 65.8% of the dependent variable's variance, which to recommend support H3.

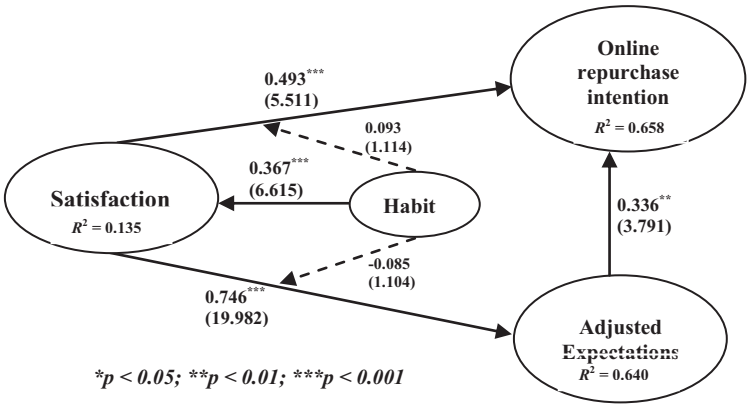

Figure2: PLS results for proposed research model

Further, we also examine the effect the online shopping habit on customer satisfaction. Online shopping habit significantly influence customer satisfaction (β = 0.367, p < 0.001), accounting for 13.5% of the variance. Finally, all interaction indicators were computed in order to reflect the latent interaction variables (Chin et al., 2003). For example, because four indicators represent customer satisfaction and three indicators represent online shopping habit in our measurement model, the procedures will generate twelve indicators reflecting the interaction term, i.e. online shopping habit *x* customer satisfaction. The moderating roles of online shopping habit were not supported. Online shopping habit insignificantly reinforces the positive impact of customer satisfaction on online repurchase intention (β = 0.093) and adjusted expectations (β = -0.085) respectively.

DISCUSSION

The paper employs contingency approach and synthesizes other prior research on online post-purchase regarding online shopping habit that moderates the relationship between customer satisfaction and adjusted expectations with regard to their individual effect on online repurchase intention. The findings suggest that customer satisfaction plays key roles both in direct and indirect effect on online repurchase intention. Furthermore, online shopping habit moderator is found to be insignificant.

The results provide empirical support for previous studies. Customer satisfaction has a positive effect on online repurchase intention, implying that customer satisfaction is primary driver of repurchase intention; it also has an indirect effect on online repurchase intention through adjusted expectations. We proved our expectation that adjusted expectations have a positive effect on online repurchase intention. this finding is supported by Yi and La (2004) and Ha et al. (2010). Adjusted expectations are considered to be an essential driver of repurchase intention; therefore, it is imperative for online retailers provide to view adjusted expectations as the updated from the initial expectations. In addition to this, our findings confirmed adjusted expectations as mediator between customer satisfaction and online repurchase intention. Due to comsumers' expectations are constantly changing; adjusting to the information they gradually acquire (Sánchez- García et al., 2012). In this context, ther adjusted expectations are updated from the initial expectations as new information is acquired, and are influenced by customer satisfaction (Yi and La, 2004).

IMPLICATIONS

1. Theoretical implications

This study makes three contributions to our understanding of online repurchase intention. The first contribution is the importance of examining customer satisfactions from general attitude prospective. We know that customer satisfaction vary over time, it is well recognized both the cognitive and affective element that response to a product/service stimulus mold consumers' evaluative judgment. Customer satisfaction has a direct positive effect on repurchase intention, where the level of affective exerts a stronger than cognitive. This means that retailers not only should offer a high quality in product/service, but they should also stimulate the emotions to enhance arousal of the customers. Furthermore, satisfaction also has an indirect influence on repurchase intention through adjusted expectations as does expectancy-disconfirmation, which expectations updated through cumulated or current consumption experiences. Transactional customer satisfaction as well as cumulative satisfaction can influence future expectations and thus repurchase intention.

2. Practical implications

Results of this study offer useful implications for practitioners interested in enhancing the value of their offerings by encouraging satisfied customers to engage in repurchase intention.

Customer satisfaction factor drives online repurchase intention. Hence, customers may be segmented into two groups. The first group is satisfied customers and the other group is unsatisfied customers, each of groups should be assigned different marketing objectives and

priority of repurchase efforts. For the satisfied customers group, the primary marketing objective should be continue the customer loyalty by stimulating the emotions of the customers, adding elements of excitement and surprise in order to enhance the arousal of the customers. For unsatisfied customers group, practitioner may enhance the development of specific habit with particular online shop by contributing cognitive and affective beings. To contribute cognitive being, considering that cognitive evaluations of perceived quality are the basis of expectancy-disconfirmation, this means that practitioners should make an effort a high quality service so as to get a more favorable expectancy-disconfirmation, and demonstrated that quality evaluations are positively related to repurchase intention. Additionally, to improve customers' affective state via a function of the level of pleasure and arousal that positively emotions influence on satisfaction.

LIMITATIONS

This study and their results have several limitations and also indicated direction for future research. First, as the scope of our research is based on one Internet shopping website, participants' feedback is only for that specific shopping mall. Thus it is recommended that the sampling frame be expanded to general online shoppers and a wide range of samples and products. A second consideration concerns a possible response consistency bias online that response to one measure in a questionnaire may have a tendency to respond to later measures in a manner they believe to consistent. Such a bias could result in stronger relationship among variables than might actually exist. Third, in this study uses self-reported measures, which may not be the most accurate way to assess affect or future behavior. In addition to, the data are cross-sectional and not longitudinal; the posited causal relationship could only be inferred rather than proven. Fourth, the role of online shopping habit in enhancing repurchase intention may vary across industry contexts, and it may not be as it does in contexts where online shopping remains in its infancy stage.

CONCLUSION

In conclusion, our study examine emphasizes the importance of the roles of adjusted expectations and online shopping habit in the achievement of online repurchase intention. As verified by our data, adjusted expectations mediate the impact of customer satisfaction on online repurchase intention link in a post purchase, whereas online shopping habit is not significant driving forces of online shopping behavior.

Appendix A. Questionnaire items

Online Shopping Habit (HA)
HA1 Shopping online has become a natural act for me.
HA2 Whenever I think of shopping, the Internet comes to my mind.
HA3 Online Shopping has become spontaneous for me.

Customer Satisfaction (CS)
How do you feel about your overall experience of this purchase?
CS1 Dissatisfied to satisfied
CS2 Displeased to pleased
CS3 Frustrated to contented

CS4 Terrible to delight

Adjusted Expectations (AE)
AE1 I now expect this Internet store will provide good after-sale service.
AE2 I now expect this Internet store will provide very efficient transaction processing (e.g., fast retrieval of information, ordering, payment processing and scheduling delivery).
AE3 I now expect this Internet store will be very convenient.
AE4 I now expect the design of this Internet store's website will allow easy navigation.
AE5 I now expect the products offered by this Internet store to be what I will seek.
AE6 I now expect this Internet store to provide descriptions of the products that are very informative.
AE7 I now expect buying online from this store will be a good decision.
AE8 I now expect this website will be an overall pleasing shopping experience.

Online Repurchase Intention (RI)
RI1 I anticipate to repurchase from this Internet store in the near future.
RI2 It is likely that I will repurchase from this Internet in the near future.
RI3 I expect to repurchase from this Internet store in the near future.

ABSTRACT

Purpose: *The main objective of this study is to clarify the current challenges relating to Product Portfolio Management (PPM). Also, any preconditions for active PPM in terms of concepts, processes, tools, KPIs and governance models are analyzed.*
Design/methodology/approach*: Current state analysis of product portfolio management practices are based on both, a thorough literature review and several case companies. Case companies represent many business areas such as HW, SW, services and even combinations of them, solution providers.*
Findings: *The role of PPM is not to be a follower of activities caused by customers, product development, sales, deliver and care organizations, and processes. The primary role of PPM should be active management of current product portfolio, over product life cycle, instead of merely focusing on new product development. Product portfolio management as a concept and process is not that well understood and in place like other business processes.*
Research limitations: *The limitations of this study include analyzing a limited number of companies. Also, the experience of the analyzed companies varies from only few years to a relatively long history.*
Practical implications*: The implications of this study include the potential preconditions of clarifying the role of product portfolio management. The findings can aid business managers in understanding the PPM as an entity that has a role in managing products and portfolios based on strategic and financial targets over product lifecycles.*
Originality/value: *This study approaches PPM from a more comprehensive viewpoint than the traditional NPD focused PPM that is mainly covered by the existing literature. A company's future portfolio is seen as a sum of the existing product portfolio and the products created via NPD. Existing product portfolio is also expanded by possible products introduced by joint ventures. This article questions whether PPM ought to be considered equally as a business process, similarly as product, sales, delivery and care processes.*

Proceedings of 2013 International Conference on
Technology Innovation and Industrial Management
29-31 May 2013, Phuket, Thailand

Key words Active product portfolio management, Product Portfolio, Product management, Strategic Management and Key Performance Indicators (KPIs)
Paper type Research Paper

INTRODUCTION

New products are seen vital for securing a company's competitive position in the market (e.g. Balachandra et al., 1997; Poolton and Barclay, 1998; Lynn et al., 1999), while development of new products is strongly driven by various customer requirements. However, there are also several other drivers that initiate product development (e.g. Majava et al., 2012). Aside new product development, also existing products are upgraded frequently to achieve cost reductions and improve product performance (Hänninen et al., 2012). Today, also company mergers and acquisitions are meaningful ways to enter new markets and widen a company's product portfolio without conducting new product development. This kind of environment leads easily to widening product portfolios as has occurred in several industries during the recent decades. (e.g. den Hartog, 2012).

The common belief is that a diverse product portfolio will have a positive effect on a company's sales volumes. A wide product offering is seen to allow reaching many customer segments and a larger market share. A high product variety is thought to stimulate sales by segmenting customers and attracting variety-seeking shoppers. (Wan et al., 2012). This coin also has its other side that is often ignored in the discussion. In fact, internal product variety and complexity usually reduce sales per product variant. (Cooper and Griffiths, 1994; Randall and Ulrich, 2001; Thonemann and Bradley; 2002; Pil and Holweg, 2004; Wan et al., 2012). Product variety is often justified by fulfilling customers' requirements. However, too wide product range can lead to mass confusion by the customers, thus weakening sales (e.g. Jiao et al. 2007, Wan et al. 2012). One example of the positive effects of reducing this type of mass confusion is Procter and Gamble increasing its sales by 10 % by reducing the number of versions of its Head and Shoulders shampoo from 26 to 15 (Wan et al. 2012).

Product variety has emerged as a source of competitive differentiation responding to the requests for increasingly customized products and services, when the variety is even desired (Hayes et al., 2005). One aspect that is often ignored in the literature is managing the product plans, products under development, and products in the market over the product life cycles, from an end–to-end viewpoint. Today, companies are often too focused on managing single products instead of managing the entire product range. Consequently, companies could benefit from considering several product families rather than separately optimizing each product. (Salvador et al., 2002).
This research paper aims to analyze the current main challenges of product portfolio management faced by companies. This article analyses the PPM practices of selected case companies. Process management methodology is used as a base frame for the used interview questionnaire. Challenges identified based on the interviews are classified to clarify the most common and significant ones. Product Portfolio Management, as any other processes, requires availability of certain building blocks as preconditions. This paper also aims to clarify these

preconditions to further improve product portfolio management practices over the product life cycle.

The above discussion can be condensed into the following research question:
RQ1. What are the challenges related to product portfolio management?
RQ2. What are the preconditions for product portfolio management?

This study addresses the research questions by using a qualitative approach, through case company interviews and a literature review.

EARLIER RESEARCH

1 Product Portfolio Management

Portfolio management approach can be applied in various areas to manage a set of activities conducted by the same pool of resources (Vähäniitty, 2006). The main objectives of portfolio management can be defined as 1) maximizing the value of portfolio, 2) balancing the portfolio, and 3) linking the portfolio to business strategy (Cooper et al., 1997a).

In addition, portfolio management can be seen as a higher management level decision making process for managing uncertainty, dynamic opportunities, strategic goals, and interdependencies between portfolio items to obtain clear decisions based on agreed criteria (Cooper et al., 2001).

Products can be evaluated based on their strategic importance and ability to become top class products. Also, resources should be allocated to products according their business value. (Ward and Peppard, 2002).

2 Product Portfolio Management challenges

Many product portfolio related challenges have been presented in Hewlett-Packard's portfolio management and operations research (Ward et al., 2010). According Ward et al. (2010) the following challenges have been identified for offering multiple similar products: 1) increase of overall demand volatility, 2) reduced forecasting accuracy, 3) impact to revenue and cost of the product over life cycle, 3) increase in inventory-driven costs and order-cycle time, 4) increased liabilities to channel partners, 5) increased cost for operations, R&D, marketing and administration, and 6) complexity of product lines that confuses customers, sales representatives, channel partners and even driving business to competitors.

Ward et al. (2010) also present solutions to overcome these challenges. These solutions are grouped into managing product portfolio by a "complexity ROI calculator" within product creation life cycle, and managing product variations by a "revenue coverage optimization tool" after product launch.

The interests towards product portfolio management have increased due to many negative side effects of the portfolio management not being done properly. Cooper et al. (2001) have listed the

following negative aspect such as a) missing strategic criteria in project selection resulting in unimportant and low value projects and too many of them and b) deficient go/kill decisions for low value projects resulting in too many extensions, modifications, enhancements, short term projects and lack of focus.

One of the challenges of product portfolio management is the lack of consistent interest and understanding by senior management). Senior management involved in technology is seen to have the most important role in PPM, followed by senior management in general, and corporate executives. Marketing and Sales managers are seen to have the least important role as they are seen to operate at the customer front end, with a clear role in project selection and portfolio management. (Cooper et al., 2001).

One of the most significant weaknesses of existing commercial IT-solutions for PLM is poor support of product life cycle activities outside the actual product development process. Second significant gap is the integration of mechanic, electronic, software, and services components, and elements such as the full view over products. (Saaksvuori, 2011).

3 Process management approach for creation of building blocks for active product portfolio management

The "three levels" of performance: organization, process and job/performer levels can be seen as an ecosystem dimension to business performance (Rummler and Brache, 1990). According to Rummler and Brache (1990) organizations produce their outputs through cross functional work processes, organizations being only as good as their processes. Processes are performed by individuals holding various jobs. Rummler and Brache (1990) also present three "performance needs" of goals, design (structure of organization, processes and individuals,) and management based on clear KPIs. According to Rummler and Brache (1990) is the criticality of cross functional processes to the quality, productivity, cycle time, and cost of any company.

The success of improvement projects are based on project management sitting on the seat of three legs; people, process and technology. The organization strategy and goals of processes to be linked together. People to perform the tasks according processes and related performance metrics to be capable to make things on more predictive way rather than proactive. The foundation for the framework is organizational strategy and process architecture. (Jeston and Nelis, 2008).

Improvements can be done in two different ways in principle such as by breakthrough type of approach or by continuous improvement. Business Process Re-engineering (BRP) has been utilized for more radical changes. The BRB methodology includes several phases: reaffirmation of the vision, core process identification, process analysis, process re-design, blueprinting and implementation planning. (Slack et al. 2012).

According to Jeston and Nelis (2008) the foundation for Business process management consists of following building blocks: 1) process leadership, 2) process governance, 3) process

performance, 4) strategic alignment, 5) people capability, 6) project execution, and 7) technology.

The building blocks for active product portfolio management can be formed as following: a) strategy and key performance indicators, b) organization and people as governance model, c) core processes and tools including technology and information systems.

RESEARCH PROCESS

The research process is shown in Figure 1.This research is qualitative in nature. Product and product portfolio management was first studied by using the existing literature as a key source. The empirical study consists of industrial interviews.

Figure 1. Research process.

Process management theory and approach was utilized to create a comprehensive questionnaire for the empirical part of the study and to analyze whether the current practices apply process management methodologies. The viewpoints are organization, processes, target setting and key performance indicators. Also the question about data availability has been taken into analysis.

Five selected companies (Table 1) were interviewed to clarify the current practices and challenges related to product portfolio management. The interviews were recorded, extracted and transcribed to enable thorough analyses. The selected five companies represent both large/global and small/growing businesses working in different areas such as solutions, HW, SW, and Services products, or all of them simultaneously. The number interviewees are dependent on the size of the case company. In bigger companies the interview has been conducted as work shop of cross functional group of managers while in smaller companies only CEO, R&D manager or Product Management have been interviewed.

Table 1. Company characteristics

Company	Portfolio characteristics	Operational maturity	Interviewees' responsibility areas/roles	Number of interviewees
A	Small portfolio of HW products and related emerging service business managed directly by CEO	New national rival in mature business	CEO	1
B	Large portfolio of solutions, HW, SW and Services products under strategic renewal.	Experienced global innovator in mature business with strong R&D investments	PPM development manager, product data manager, F&C manager, product manager (2), Process dev manager (2)	7
C	Small innovative portfolio of SW products	Growing international presence in growth business	CEO, R&D manager	2
D	Small portfolio of HW and SW products	Experienced growing company in growing global business	R&D manager	1
D	Medium size HW product portfolio under strategic renewal	Experienced global leader in declining business, new growth and business potential via portfolio renewal	Product Management Manager	1

Based on the interview material, high-level product portfolio management challenges and requirements were identified by using inductive logic. The findings were grouped based on process management approach.

RESULTS AND ANALYSIS

Portfolio management challenges

All interviewed companies see potential for improvement in their product portfolio management. The results are presented following similar process management methodology and structure as in the interview questionnaire. Product portfolio management challenges generic to all interviewed companies are presented using the following five sub groups:

1) Product portfolio challenges in general
2) Product portfolio management challenges related to processes and tools
3) Product portfolio management challenges related to ownership and governance models
4) Product portfolio management challenges related target setting and key performance indicators (KPIs)
5) PPM challenges related to data availability

1 Portfolio management challenges in general

Product portfolio management is seen as a generic challenge in case companies regardless of the size, maturity and history of the company. Product portfolio management is viewed nearly non-existent, not only from processes and tools perspective, but from strategic target setting and follow up, ownership and governance model point of view. **The idea and the role of PPM as higher level analysis and decision making process for the entire product portfolio including new and existing products is not thoroughly understood.**

The entire product portfolio and sub portfolios have been not clearly defined and agreed while different groups of products, units, modules and technologies have been called as portfolios. Overall, the visibility over product portfolio as a whole is not seen to be consistent.

The size and proliferation of the product portfolio are seen as the most common challenges in case companies. In some cases, even when the company is relatively new, they have already too many products to be maintained and updated compared to their capabilities. In this type of cases the total revenue share per product decreases. Products and their technical relations to each other are seen even more complicated to maintain. Several versions of same products are simultaneously sold and produced over many years resulting in **cannibalization** within product families, and even outside them. Product cannibalization is not planned and managed consistently, resulting in negative product business cases and/or obsolete materials. Usually the management focus has been more on new products ramp ups while the removal of old products has not been given adequate attention. In an ideal situation, product ramp down activities are done in a synchronized manner with ramp ups (phase in / phase out management).

Lack of product portfolio level business case thinking is seen to exist. The focus has been more on single components, modules, units and products rather than on an entire product portfolio. **The durations of product life cycles** are seen not to be planned in original business

plans for new products. Companies have simply followed their customers' behavior and their requirements.

Product portfolio management is tightly connected to concepts and methods applied in product life cycle management and product data management. **The reporting capabilities** on portfolio, sub-portfolio and product levels are seen dependent on product data management concepts and data structures. In some cases, the required data would even be available but existing design, PDM, configurator and ERP –tools are not utilized consistently in reporting.

The clean-up and renewal of product portfolio is seen as a company level challenge that requires strong leadership from top management. Lack of clear ownership for product portfolio management and product management decreases the capabilities to manage and **communicate the change** efficiently in co-operation with main stakeholders such as R&D, Sales, Operations and Services.

The above described challenges are common for the analyzed case companies. Table 2 summarizes challenges that are more specific for the individual case companies. .

Table 2. Company specific challenges on product portfolio management in general.

A	no company specific challenges – only common challenges exist
B	partly separated HW and SW product development road maps, fast technology and cost reduction initiatives, compatibility challenges, too short life cycles per product version to reach positive breakeven
C	lack of visibility and understanding on customer demand, opportunities for cross selling not well utilized, connection to end user experience and their behavior exist only in narrow local area
D	the way how product portfolio and saleable products have been structured and coded impacts the size of product portfolio and the capabilities of delivering right products
D	no company specific challenges – only common challenges

2 Processes and tools related challenges in PPM

Business processes such as R&D (also referred to as product process), Sales, Deliver and Services processes are seen to be described at a higher level, and even structured in more detail as sub processes in most of the case companies. The challenge is not seen to be the lack of process management theory and overall practices. **Process management concepts and descriptions have been not been implemented for the entire product portfolio management** due to lack of overall understanding product portfolio management concepts. Product decisions and activities have been done more in an ad-hoc and intuitive manner, and in bigger companies at the lower levels of business units. Due to lack of processes, product decisions are done too

quickly and without real analysis of the market demand and understanding the potential for profitable business.

Only a couple of strategic and tactical product portfolio management tools have been utilized by the case companies. For the entire product portfolio evaluation the most typical and used tool is a "product road map", in all case companies. For the evaluation of individual product development projects the "state gate process" –approach has been used by only some of the case companies.

The above mentioned challenges are common in the case companies. There are not many specific challenges related to processes and tools due lack of product portfolio management process as such. Some more specific challenges experienced in case companies on processes and tools are summarized in table 3.

Table 3. Company specific challenges related to portfolio management processes and tools.

A	only one product layer modeled and managed by current ERP tools (which is the main data source), product portfolio cannot be modeled, evaluated and managed as full structure from top to down, overall main business processes have not been described yet
B	product portfolio and product road map presentations are created and maintained manually by Excel and PowerPoint applications even common tools such as PDM, Configurator and ERP and the data inside them could be utilized better, product portfolio revenue data is grouped by certain global invoicing codes under the structure of business lines which makes product profitability analysis difficult
C	overall main business processes have not been described yet
D	no company specific challenges – only common challenges
D	no company specific challenges – only common challenges

Many strategic and tactical tools are available for the evaluation and management of product portfolio in theory. Not many of them have been even identified and only couple of them has been utilized.

3 Portfolio ownership and governance models related challenges in PPM

The definition of ownership is seen to require more clarity as responsibilities and expected activities are not clear. The product portfolio ownership can mean both business and technical responsibilities but many other views as well.

The clarity of product portfolio ownership is seen to be dependent on consistent definitions of product portfolios, product families, applications and platforms. In many case companies there

are no written and formal product portfolio definitions, due to which neither have ownership statements been done. The wider the offered solutions and systems are, more they are seen to cross the borders of possible sub-product portfolios, resulting in more challenges on final ownership, both from sales recognition and technical viewpoints. Offered solutions and systems can consist of many HW, SW and Service products, and can be combinations of all of them.

The ownership and governance of product portfolio management differs based on the size of the company. In the biggest company there is a separate product portfolio management team organized in addition to product managers in separate business units and business lines. In the smallest company, the product portfolio ownerships has been taken by CEO. In medium sized companies the ownership is seen as very collegial and taken by the executive board, or cross functional management team.

Only in one case company there is separate product portfolio management function organized. Even though the team was named a year ago, they still have challenges in applying their role and to get visibility over the entire product portfolio. The similar group of people is currently being created by another interviewed company. This type of group can be created by grouping existing product managers together as a centralized team. In all of the other interviewed companies the ownership is taken by CEO or R&D manager. At the highest level, a group of executives form cross functional and collegial final ownership of product portfolio but even at that level the responsibilities are seen to have room for clarifications. **The overall challenge is to have dedication, time and resources for product portfolio management on needed level of organization.**

Due to lack product portfolio management, or related ambiguities, some key product decisions are seen to be done only at business line / product manager level, or even within customer account teams, without strategic analysis of product suitability to company's product portfolio. More specific challenges face by the case companies related to ownership and governance model are summarized in table 4.

Table 4. Company specific challenges related to product portfolio management ownership and governance models.

A	in practice CEO leads decision making for product decisions, no written and formal ownership statements done**,** product portfolio management would require dedicated time and focus
B	wider the prepared solution is more challenges there are on the final ownership both from sales recognition and technical ownership viewpoints, sales Item level ownership is clear, the definition of ownership requires more clarity as responsibility and expected activities, dedicated and centralized PPM team has been nominated and working but they should have better overview and visibility into product portfolio
C	product ownership topic has not been discussed in company
D	the challenge is the collegial responsibility, no focused and dedicated time and responsibility for active and systematic product portfolio management
D	still some application and platform type of products do not have that clear owners due to missing process and resource gaps both on technology and business side

4 Target setting and key performance indicators (KPIs) related challenges in PPM

The usability of product portfolio management as a concept and a tool for strategy implementation has not been consistently understood and utilized by the case companies. The main reason for this is seen the lack of product portfolio management understanding as a concept.

Most commonly, the product portfolio management targets have been set for the value maximization, such as revenue, sales, cost, investments and profitability targets in the case companies. The financial targets have been set at the company level, and only in few cases at the level of sub-product portfolios. In addition, the case companies are targeting to reduce their product portfolios and to clean-up data. Both of these targets can be connected to the strategic fit of the portfolio. Also, the "state gate" –process related milestone criteria can be seen as strategic targets, and KPIs on individual products and project levels.

The targets for the balance of the portfolio are not recognized by the interviewees.

On the side of key performance indicators the financial measures are the most common. Total sales revenue, cost and profitability at a company level are the most common ones. **The profitability has been measured only at a company level**. In most of the cases this is not even technically possible due to implemented data and reporting structures of the products. Measuring profitability at a company level might be one of the most critical challenges in case companies. The size of the product portfolios have been mainly measured such as number of sales items and

certain other specific types of items. The strategic fit and the balance of the portfolio have been not measured at all. More specific challenges related to product portfolio management target setting and key performance indicators are summarized in table 5.

Table 5. Company specific challenges related to portfolio management target setting and key performance indicators.

A	target setting and KPIs in relation to PPM exist on the area of financial measures only
B	system level solution as combination of many products from several business units creates additional challenges for target setting and use of KPIs, usage of few global invoicing codes creates additional challenges to identification of real profitability of final solutions, sub portfolios and products
C	the tracking of both sales and cost could be done on product level but not practiced yet, the revenue forecasting methods are not in place and possible future sales can be only mirrored back
D	lack of more strategic evaluation of potential new customers and their strategic fit to company's business model and capabilities
D	lack of strategic product portfolio management target setting and KPIs in relation to company's new strategy

5 PPM challenges related to data availability

The data targets for product portfolio management have not been specified thoroughly by the case companies due to overall lack of product portfolio management as a concept. The product portfolio management as dynamic executive level analysis and decision making process is seen to require data availability and reporting from many angles.

The data challenges identified by the case companies are very generic related to the availability of product master data such as bill of material, item codes in different data structures, product compatibility and configuration rules, list of sales items, products and header level systems and solutions.

The data availability, directly from design tools, product data management tools, ERP tools and sales configurators have been not utilized by managers directly. The reporting capabilities of the tools are seen not to be most flexible, and usage of them is seen to require special competences. Instead of using the data from operative tools, the portfolio management related data has been created manually and presented by universal office applications by management. The smaller the company is the better competence the management has to use operative data systems. **Overall the data availability for the use of portfolio management is seen to require better**

specifications on data requirements. More specific challenges on data availability are summarized in table 6.

Table 6. Company specific challenges related to data availability

A	data is available only on one product and data structure layer from the ERP tool, the company has major need for product portfolio and product data definition as concept and structure as critical for new ERP-tool configuration and implementation
B	multiple data systems are in place and consolidation of them creates additional challenges for the availability, the information in operational product design tools, product data management tools, sales configurators, ERP tools and services related tools are not consistently utilized in product portfolio management due to lack of competences of using them and partly due to missing reporting capabilities, instead many data files are created manually resulting in reporting errors
C	technically product data is available centrally but reporting capabilities require improvements
D	in principle all needed product data exists but current product coding method makes the data management inefficient, design-, PDM- and ERP- tools exist but the integrations of them are partly manual
D	new modular and platform based product concepts required to be implemented to new ERP tool with limited the amount of product configurations and rules

Preconditions for product portfolio management

Product portfolio management is seen as a generic challenge in case companies. The viewpoints to product portfolio management challenges include: 1) generic challenges, 2) processes and tools, 3) ownership and governance model, 4) target setting and key performance indicators and, 5) data availability.

Due to current level of understanding, and the existence of product portfolio management practices in the case companies the improvement activities may need to be started from the very basics. Preconditions for product portfolio management improvement, derived based on both theory and interviews, can be summarized as follows:

1. **Creation of basic understanding on the idea and concept of product portfolio management.** The very basic training could be given starting from executive board level to get justification and approval for further improvement needs on the topic. The training can be started to unravel the negative impacts and inefficiencies caused by lack of product portfolio management. Tackling the basic questions such as what, how, when and by whom, are seen important for improving product management practices, especially the question why.

2. **Creation of product portfolio management strategic targets and KPIs** based on company strategy. Strategic targets could be classified as a) strategic fit, b) maximized value, c) portfolio balance and, d) portfolio size. Strategic targets can be aligned with overall capabilities of the company. Each strategic target could be divided to measurable sub-targets and key performance indicators.

3. **Creation of strategic product sub-portfolios** to be able to group products according strategic buckets. Sub-portfolios, product families, applications and platforms are formed and created based on agreed criteria and then prioritized. The synergy between product families to be utilized, not only in marketing and sales, but also in technology development and for the benefit of deliver and service processes. The product portfolio renewal and clean-up can be managed based on modular product platforms and data models to gain efficiency in creation and implementation of them.

4. **Creation of product portfolio management ownership and governance models** to manage the entire group of all sub-portfolios and products over the life cycle. New product development, ramp up, maintain, ramp down, warranty and removal phases can form the continuous renewal of product portfolio according strategic and tactical targets. Product portfolio governance models could be organized based on functional responsibilities and/or based on cross functional steering bodies. The difference in product portfolio management and product management to be clearly communicated and implemented. By nomination of dedicated ownership and man power for product portfolio management could improve the focus and speed up the required activities.

5. **Creation of product portfolio management processes and tools** for the dynamic analysis and decision making. Systematic yearly, quarterly, monthly or even weekly management practices could improve the implementation of strategic and tactical targets consistently. By using agreed processes and tools the needed tasks can be done by agreed roles of people in right order, right time and quality. As an enabler the related processes and tools need to be trained and implemented through all sub portfolios and business units under control of product portfolio management.

6. **The data availability** should be developed according needed information for both strategic and tactical management of product portfolios. This requires first the understanding of product portfolio management as a concept, processes and tools but even more as strategic targets and KPIs. The data specification for product portfolio management can be connected to overall product master data specification requirements.

CONCLUSIONS

Product and business evolution from HW orientation to SW products and inclusion of services has been ongoing already for some time. Many companies sell and deliver combined solutions that are a sum of HW, SW products and related services. Offering a wide variety of products complicates a company's product portfolio, potentially resulting in some challenges. Opportunities for additional and new business and turnover may be missed if product portfolio is not actively developed and renewed. The product portfolio renewal and clean-up can be managed based on modular product platforms and data models to gain efficiency in product creation, maintenance and removal phases. Ideally product portfolio renewal happens in balance of new product introductions and old products removals and by synchronized combination of them. This study analyzes the current product portfolio management related challenges faced by companies.

The challenges related to the product portfolio management were identified in practice. The portfolio management is a generic challenge in case companies regardless the size, maturity and history of the case companies. The challenges start from the disconnection between company strategy and expected product portfolio management strategic targets and follow up. The overall idea and the role of PPM as a higher level analysis and decision making process for product portfolio renewal is not thoroughly understood. The usability of product portfolio management as a concept and a tool for strategy implementation is not consistently implemented while only a couple of strategic and tactical product portfolio management tools are utilized by the case companies. The profitability is measured only at a company level due to current data and reporting structures. The entire product portfolio and sub-portfolios are not clearly defined. Lack of product portfolio level business case thinking can be seen as growing size and proliferation of the product portfolio and as product cannibalization. Product portfolio management processes are not described and documented in case companies. The definition of product portfolio management ownership is seen to require more clarity. The governance models of product portfolio management are not structured and implemented formally over entire product portfolio. The overall challenge is to have focus and time by dedicated resources for product portfolio management on needed levels of organization. The data targets and data specifications for product portfolio management have not been defined thoroughly by the case companies.

The preconditions for implementing product portfolio management practices need to be well connected to the fundamental main challenges. One of the very basic preconditions is to enhance the understanding over the idea and concept of product portfolio management, followed by the creation of product portfolio management strategic targets and KPIs according company strategy. Next preconditions are more operative as creation of strategic product sub-portfolios and related product portfolio management governance models. Dynamic and active product portfolio management processes and tools need to be defined and implemented. Finally the last proposed precondition is the creation of data requirement specification according for the need of portfolio analysis and decision making.

The implications of this study include the potential preconditions of clarifying the role of product portfolio management. The findings can aid business managers in understanding the PPM as an entity that has a role in managing products and portfolios based on strategic and financial targets over product lifecycles.

The limitations of this study include analyzing a limited number of companies. Also, the experience of the analyzed companies varies from only few years to a relatively long history. Regardless of that the portfolio management is seen a generic challenge in case companies.

Several questions were raised up during the analysis which might prove worth further researcher activities, including: a) what are definitions of listed preconditions in more detail for implementing them in practice b) Can product portfolios be visualized to increase the understanding over the entire product portfolio c) How is product portfolio management connected to other business processes, and d) Should product portfolio management be raised to the level of other business processes such as R&D (Product process), Sales, Deliver and Service Processes.

SURNAME AS A LUXURY BRAND: BRAND VALUE PERSPECTIVE

Barbara Mróz-Gorgoń, Institute of Marketing, Department of Fundamentals of Marketing, Faculty of Economics Sciences, Wrocław University of Economics, Poland
Email: barbara.mroz-gorgon@ue.wroc.pl

ABSTRACT

Purpose *- This article deals with a type of luxury fashion brand whose name is at the same time the famous surname. The author's views are based on the analysis of the examples excerpted from fashion market.*

Apart from the benefits in the form of a known brand "name" and no necessity to involve great expenditure on promoting the name, the use of a form of a famous artists' surname as a brand can bring the brand managing companies some problems. In case of luxury brands, managers have to face up for instance, to the problem of market segmentation and target group selection. In case of using a famous surname, strictly connected with the world of fashion, determining the target group of consumers to which the market offer will be addressed is a task requiring more subtlety than in the case of other brands.

The purpose of this article is to show the possibilities of making use of famous surnames as luxury fashion brands of products as well as to attempt to verify the thesis put forward by the author that the use of this type of branding and an appropriate marketing strategy can be an excellent form of promoting a given country and culture.

Design/methodology/approach *- The conclusions presented in the paper are based on the literature review, a case study and the results of the author's own research of primary character (sample of 80 respondents) whose aims was to attempt to identify the recognisability of the brands under analysis and to connect their images with the country of origin of a given artist in consumers' consciousness.*

Findings *- The thesis presented in the beginning of the article was confirmed, that the use of this type of branding and an appropriate marketing strategy can be an excellent form of promoting a given country and culture. Both brands (however Kenzo in lesser degree, what results from lower recognition of the brand itself) are respectively associated with culture and Italian and Japanese motives, whereas Versace brand was defined as the one reflecting the Italian climate.*

Originality/value *- Most of researches focus on one instrument of the marketing-mix in that area , that is the promotion of the luxury, fashion brands, their advertising campaign, value of the brand and only few researchers deals with the issue of their business activity. In the literature, one can hardly find the research focusing on the creation of fashion brand identity, by using surname as a brand, which is a very often concept in the fashion and design world, and other elements, such as characteristic national motifs. Most of the authors describe the origin of the brand and its evolution. The study shows , on the examples of Kenzo and*

Versace, that there is a possibility of creating the fashion brand and its identity through the consequent marketing strategy, by using the surname of the designers and traditional, for the specific culture, values and elements.

Keywords: brand, strategy, brand image, brand identity, promotion, design
Classification: Viewpoint

INTRODUCTION

Apart from the benefits in the form of a known brand "name", the use of a form of a famous artists' surname, such as Kenzo and Versace, as a brand can bring the brand managing companies problems too. First of all, while the designers are just at the beginning of the career path, it takes time to become recognizable and then- famous (not always). To be able to counteract problems the company should, like every other firm, gain the specific information about the market, the consumers needs and their preferences but in that case- using the surname as a fashion brand, such as Kenzo and Versace, it's very important to pitch the company offer (4P) to the brand "name" exquisite.

Brand

"Brand" is a very wide concept and the number of the definitions of "brand" which can be found in literature best reflects this complexity. Nowadays, not only the brand researchers attempt to define this term; this concept is often invoked both in specialised – marketing and commerce – literature as well as in everyday life, in which it seems to have become an essential part of every consumer's dictionary all over the world – irrespective of latitude. As a result of such popularisation, this term is intuitively used by the majority of purchasers. In spite of no specialised knowledge, consumers can instinctively specify what the brand actually is.

Along with the progress of civilisation and the more and more changing environment conditions as well as with the increase in purchasers' needs, the term "brand" has been evolving and extended. The brand is a name, a symbol, a pattern or a combination of these elements. It is given by sellers or their group in order to identify goods or services as well as to distinguish them against a background of competitive products. (…) The brand thus identifies the product as well as its manufacturer or deliverer (Kotler &Armstrong&Saunders, Wong 2002, p. 626).

Generally speaking, the brand is a unique unit. It is a kind of a shortcut, by means of which people asses how a given company works, what it produces, offers and sells. A well designed and developed brand is a dynamic image in the customers' minds. (…) Therefore, a powerful brand creates for itself a kind of quasi-monopoly (Barlow& Stewart 2010, p.16).
The brand can also be defined as a product which provides functional benefits plus the added values which certain consumers value to a sufficient extent in order to make a purchase"(Jones 1986:16[in]: Altkorn 2001, p.12) or as a product which has certain features which allow to distinguish it from other products of the same category – that is – the products which fulfil the same need; these differences can be real or symbolic (Keller, 1998, p. 4).

The brand is a name and symbol associated with a known and trustworthy experience which gets both into the head and into the heart (Taylor , 2010, p.95). It is developed in order to precisely identify the product and distinguish from the competitors' offer (Mruk, 2002,p.15).

Taking into consideration the above-quoted definitions, we can notice that they are different from one another in terms of their notional scope and that they show several approaches to the brand. Some of them present the brand in broader terms whereas others narrow down the scope of its meaning. The brand is most often treated as a characteristic aspect of a product and its important, if not the most important, element of the competitive advantage. Such identification in consumers' awareness (product diversity) is, next to cost leadership, the strategy of achieving the competitive advantage. It is worth noticing that many scholars suggest the differentiation strategy with reference to the products which are prone to differentiation (so they are heterogeneous) whereas the cost leadership strategy occurs most frequently in the case of homogenous goods so this concerns such goods which have a slight chance of differentiation or there is no such possibility at all (the so-called the *commodity* strategy). However, the market reality shows that even the homogenous products have the possibility of existing in consumers' minds as one of their kind and of winning the competitive fight and it all is thanks to the creation of a unique brand. "Constructing a brand involves many elements, which together make a comprehensive impression: the product itself, the label on the packaging and the exposition, product name, the manner in which the profits of purchasing the products are presented as well as advertising and promotion. The brand encompasses physical features (smell and taste), aesthetic features (look), rational elements (the ratio of quality to price, utility) and emotional elements (Moi, 2009, p.55).

Brand awareness is the purchaser's ability to recognise to which category of products a given brand belongs as well as the purchaser's ability to recognise the brand. We distinguish two types of brand awareness: spontaneous awareness (*brand recall, spontaneous brand awareness, unaided brand awareness)* and supported awareness (*brand recognition*). Spontaneous awareness informs what percentage of the respondents of a given population spontaneously listed the brand X, when asked about a given product category (Kozielski, 2004, p.260). The modern process of creating brand awareness which we know is the art of instilling and communicating the company's or organisation's values and character through connecting with its logo. Psychology calls it a symbolic connection and regards it as the fundamental learning process. Creating brand awareness is an art, the rules of which change at a fast pace therefore what is recommended is its constant development and openness to widening, deepening or sometimes even changing the line of thought in this respect.

Considering the essence of the brand, it seems vital to refer to other key terms connected with the brand. These are – brand identity and brand image. "Brand identity means the vision of the potential reception of the brand by the customer, or – to put it differently – the desired way of perceiving the brand, created by brand sponsor. It could also be defined as a certain comprehensive message about the brand, sent by the seller to the potential receivers by means of all marketing instruments (Altkorn, 2001, p. 39). Thus, it is a certain emphasised otherness of a given brand, the image of its uniqueness which proves its value. "The task of identity is to define brand importance, intention and vocation" (Kall, 2001, p.25). The defined brand identity established the direction of brand management over time. It is worth stressing that "the marketing name constitutes the most important distinguishing mark which – at the same – co-creates the product brand. It is also the main element of the widely understood brand

identity (*corporate identity, CI*) (Zboralski, 2000, p.38). As claimed by M. Géraldine (Géraldine, 2009,p.52), identity materialises itself only when the whole organisation puts it into action.

Brand image is the collection of feelings connected with brand recognition by its purchasers. In the literature on this topic, we may find the opinions, according to which brand image is a peculiar mental reflection, or even the entirety of the associations with the brand which let distinguish it from analogous products. And although, as stated by J. Altkorn (Altkorn, 2001,p.38), the analogies are most frequently referred to the functional features, this is not appropriate. The associations and convictions connected with the brand pertain to not only the material but also virtual features. Such notions as the "elegant", "traditional", "Swiss" brands, apart from the material benefits and attributes, also involve the whole set of relatively permanent ideas about social as well as mental values which are associated with its use. Brand image is the consequence and result of its reception and of consumer's awareness identity. The father of advertising, Earnest Elmo Calkins (1868-1964), was the first to suggest that the ideals of product purchasers are included in the products. They reflect the aspirations of particular people, their families and social positions (Barlow &Stewart ,2010,p. 38).

One of the most essential components of the brand is its name which may be pronounced, involves letters, digits, words and their combinations. For products and companies, it is like names and surnames for people. It allows consumers to identify and compare the offers of given sellers, considering them worse, better or simply similar to others (Barlow &Stewart, 2010,p. 38). The visual elements of a brand are symbols, trademarks written in a specific way, with the use of specified colours or a specific font(Mruk &Rutkowski, 1999,p.61). Marks, colours as well as fonts and their size can have an enormous influence on the way of brand reception and selected properly, they can enhance the effect of the brand message and make the impression of uniqueness on consumers and therefore become remembered forever. The symbol, the visual element of the brand, is constituted by three key elements:

- typography, so the typeface (logotype),
- graphic elements,
- colours.

Just as a nation's flag expresses the distinct identity of a country, so, too, a logo, helps to establish the name and define the character of a corporation. Effective logos become synonymous with the organizations they portray. They are instantly recognized by millions of people, and help to identify their companies and convey a message about the brands for which they stand (dinesh.com, 2013).

Clothing brands are a status symbol today. Most clothing companies such as Prada, Chanel, Versace, Kenzo, etc make the most of putting their logos on any clothing item that they make.

The next vital element which is sometimes referred to in the definitions of the brand is "product". The product is all that can be offered in the market in order to fulfil some need (Kotler, 2005,p.409). Having in mind the hierarchy of needs described by Maslow, especially in the context of brands known world-wide, we can pose one question about which needs are satisfied by the very product and which by a given brand? It is obvious that the need of attiring with clothes can be fulfilled by each clothing selected appropriately for weather

conditions but not each clothing will provide people with such feeling or prestige and uniqueness as are given by the attire by Prada.

In the hierarchy of product identification, we can distinguish the following four basic elements: colour, form, name and number. However, it is just the name that is an especially important element because – especially in the era of the Internet – what has no name by and large does not exist and is not noticed by consumers. Today, in the world of global market and the idea of "born global" which motivates the creation of a forming company's strategy, managers cannot take the liberty of using ill-considered nomenclature. The name should be clear in each language and easy to pronounce.

The use of a surname

Among all the elements of effective symbolism (used during brand construction), there is a parameter which belongs to the most important ones in brand construction: the surname which is a brand itself. Deciding about the adoption of such a specific brand name, the managers of a given company have to make a decision about the way of its graphic representation. There are two possibilities: either in the form of an individual logotype created on the basis of one of the existing typographies – here a good example in Chanel, Kenzo and Versace brand or as a totally individual stylised signature suggesting its authenticity: Guerlain and Cardin.

Irrespective of the fact that the surname used will function in the logotype or signature, they have the advantage over the non-surname brands in the fact that they directly point to a certain set of values comprising their reputation: tradition, know-how, genius's vision, charisma and frequently also the face – the parameter which is extremely significant in the case of endorsing, for example, the cosmetic products (the signatures of Sabatini, Campbell are a good case in point). In the case of the surname brands, the context of a given person's individual contribution to the creation of a brand moves to the first place – at least in the first phase of brand life. From the moment of acquiring the surname by banks, funds, stock exchange investors etc., the time of the surname is numbered. It starts to be perceived definitely more like an institution than a person; as a company and not as a human being. What is noteworthy is the fact that it is easier to identify a brand with a person and this unique "aureole" comprising this person's personality than to create this aureole around a new name and brand. Provided the company takes care of the products it offers, in creating the brand strategy, it is just a well selected surname that can be a guarantee of an excellent standard.

There are many strategies and ways of positioning the brand in a market. However, not all of them are suitable to be used in the global market. In the literature on this topic, the scholars list from seven to ten strategies (ways) of brand positioning. The brand can be positioned with reference to a famous personality (a star) from the world of sports, culture, politics or entertainment. Such person is then called a brand ambassador. It is assumed that the features and opinions of this person will be transferred onto the brand. In view of the above, what is of crucial importance is the appropriate selection of the candidate for the ambassador, especially on an international scale. This person, most of all, has to be commonly known and bring about positive associations. The most frequent figures used for this purpose are athletes (e.g. . Jordan, Z. Zidane, D. Beckham), models (C. Schiffer, N. Campbell), singers (C. Dion,

Madonna). The risk here is connected with the fact that when the selected person loses his/her reputation for different reasons, then the negative associations also become connected with the brand. What is more, the careers of starts, especially of athletes and models (with only a few exceptions), do not last too long therefore such strategy will not provide long-lasting effects (Szwajca, 2009, pp.51-52). In the case of historical figures such as Chanel and Dior such risk is absent. These figures are the icons of high culture, they were outstanding artists and therefore their surnames constitute brands themselves and can successfully accompany the highly emotional (i.e. *high-touch*) products.

The products of both brands Kenzo and Versace use symbols of culture of their creators, however it's their genius that gives them a new form and as an interpretation of these traditional symbols, they are today associated with the names of two greatest designers.

Kenzo Brand

The House of KENZO was founded in Paris in 1970 by Takada Kenzo. Kenzo, a native of Himeiji, Japan, attended Tokyo's prestigious Bunka Fashion College as one of its first male students before making the move from Tokyo to Paris, where he opened his first boutique, "Jungle Jap." He surprised the fashion world with his originality and the apparent celebration of diverse cultures, nature and colors in his designs.

Bold stripes, swirling, chintzy florals, geometric patterns and folkloric scenes were Takada's signatures, blended together in pieces inspired by his native Japan, the American Mid-West and South American art (Walker, 2013). "Jap wrap" become his moniker.

Following his success in the 1970s, he launched a series of new collections for men, women and children. Since 1988, KENZO PARFUMS has been the creator of some of the most groundbreaking fragrances of the past decades.

In 1993, the KENZO brand joined the LVMH (Moet Hennessy Louis Vuitton) company.

In 1999, Takada Kenzo decided to leave the artistic direction of the KENZO brand and set out on a new journey in life. This year also celebrated Kenzo's 30th anniversary in the industry. The year 2000 marked the birth of FlowerbyKenzo, a fragrance that invented the scent of the poppy, and quickly became a classic in the perfume world. Since then KENZO PARFUMS continues to express the original values of the brand: attachment to nature, poetry, mixing of East and West and a playful marriage of contrasts. These elements along with the vagabond spirit of the brand are present in all forms of KENZO PARFUMS, from its magnificent installations of poppy fields around the world, to its faithful dedication to every detail of a fragrance creation.

In 2001, a skincare line, KENZOKI, was launched. Built around four Asian plants (Rice Steam, Ginger Flower, Bamboo Leaf and White Lotus), the range brought a new approach to skincare; a marriage of pleasure and efficiency (Kenzousa.com, 2013).

As a vision and mission statement the company declares, that "KENZO has always worked towards a multicultural world, a world of colours and beauty, with nature as a vibrant, inexhaustible source of inspiration. Classic, contemporary, or visionary, the women's and

men's perfumes Kenzo created are based on values of life, energy, and a deep-rooted equilibrium" .

Kenzo designs are strictly connected with the elements of Japanese culture. The example of such connection is captured in the bottle of perfume called *Flower by Kenzo* which resembles the shape of a Samurai sword – *Wakizashi.*

The image of Kenzo is developed very solicitously. Apart from the mentioned design, the logotype and pictures used by the brand in the communication process with customers, maintain a consistent character. The logotype which at the same time constitutes the surname of the brand creator, resembles the sign of the Japanese alphabet, as an usual font is applied. When reading the history of Kenzo brand which is available on the Kenzo website, the reader will notice that the text is decorated with artistic pictures of Japanese flowers, whereas a great number of advertisements present variations of Japanese kimonos.

Everything created by Takada Kenzo, coherent brand concept and its message attract the best specialists who want to work for this world-known brand. Carol Lim and Humberto Leon stated in the interview for "The Independent" magazine: "We were offered the opportunity to work on a number of different projects, but the Kenzo brand was the most attractive to us. Not only due to us being long-time fans, but because we wanted to participate in the storytelling of the brand to a whole new generation" (Walker, 2013).

Versace brand

The history of Versace started with the vision of one man in Italy and became a family affair. Gianni Versace SpA, usually referred to as just Versace, is a family owned fashion house headquartered in Milan. Gianni Versace started the company in 1978 with the help of his older brother Santo and his younger sister Donatella.

Gianni Versace was born on December 2, 1946, in Reggio di Calabria, Italy. He began designing clothes at the age of 22 when a local garment maker hired him to design a collection. At the age of 26, he moved to Milan to begin a career in fashion. The first Versace signature collection was premiered in March of 1978 and the first menswear collection was presented in September of the same year. Gianni Versace gained worldwide recognition as an innovative fashion designer (Wagley, 2010).

Versace's illustrious career was decorated with numerous awards, including four L'Occhio d'Oros and an American Fashion Oscar in 1993. Some of his most imaginative creations could be found in theatres; the designer was often applauded for his costume designs for such ballets as Richard Strauss' Josephlegende in 1982, Gustav Mahler's Lieb und Leid in 1983 and Bejart's Chaka Zulu in 1989. In 1987, Versace was awarded with theater's Maschera D'Argento prize (Biography.com, 2013).

Since 1982- the beginning of an ongoing collaboration with La Scala Theatre, Milan, designing costumes for Josephs Legende (Richard Strauss, directed by Pier Luigi Veronesi) Versace's costumes are featured in stage events worldwide (Versace.com, 2013).

On July 15, 1997, 50 year old Versace was murdered in his South Beach home in Miami, Florida.

The explosion of colour, the sharply revealing cuts, and luxurious fabrics that characterized the Versace range were geared to those who wanted to be noticed, to assert their wealth and sexuality, to feel they were at the cutting edge of a rock'n'roll lifestyle. Versace offered customers the promise of standing- out, being noticed, and, almost, wearing a price tag. His designs shouted wealth and status through a megaphone. This ostentation was enhanced by lavish advertising that ensured label recognition and public identification of the style (Gundle, 2008, p.360).

Since Gianni Versace has a strong artistic and literary roots run, and fond of ancient Greek mythology, so he used the Greek mythology, the snake made parthenopipes "Medusa" as a brand trademark.

Legend of Medusa connection with the goddess Athena (Athena) Zhengyan Doo Korea, it was Athena punished her and his head into a monster snake. According to legend, if the eye connects with the Medusa would be turned into stone. In this way, Medusa was later used as a "fatal attraction with a woman" symbol.

Gianni Versace did with Medusa logo, Versace may be a glimpse of the brand style: bright, exaggerated and momentum to force people (Allenlin, 2009).

Versace based the development of his brand on the concept derived from Greek mythology, however his creativity (his brand still pays tribute to these patterns) referred to antic Rome, human infatuation and passion. Versace designs keep the balance between elegance and vulgarity, full of colours and Mediterranean motives, are inseparably bound with the Italian culture. The relationship between Versace and Opera, which originates from Italy, emphasised his Italian style in even more explicit way.

Other marker of and next reference to the Italian culture and tradition, in which the family, home and common feast constitute a priority value, is the line Versace home, whose offer includes the entire variety of decorative elements for home, in particular porcelain collections with Jellyfish and other patterns characteristic for this brand.

Results of own research

In March 2013, the author carried out a ballot research on the sample of 80 respondents. The questionnaire included questions concerning the image of examined brands – Kenzo and Versace. The respondents were the students of different fields of study at Wrocław University of Economics studying within the Erasmus program. These were the representatives of the following countries: Portugal, Spain, Hungary, Germany, Austria, Russia, Belarus and Ukraine, between 21-23 years old. The majority were women (68%), and the men (32%) were the remaining part.

From among the respondents, merely 5% did not recognise the Kenzo brand, 95% agreed that Kenzo is a well-known brand, whereas the Versace brand was estimated by all the respondents as the most famous one.

The majority of respondents, i.e. 60% define the Versace brand as an exclusive brand, whereas the Kenzo brand was defined in the same way by merely 45% of the respondents.

The question concerning emotions expressed by a given brand, 80% of the respondents associated the Versace brand with the feeling of happiness and stated that it is a 'romantic' brand and 'for all age categories of both sexes', whereas as far as Kenzo is concerned, the opinions of the respondents were divided: 40% associate it with the feeling of happiness, whereas for 45% of respondents this brand is perceived as a 'sad' brand. The half of the sample defined Kenzo as a mysterious brand and 35% agreed that this is a brand for young women.

The next part of the questionnaire was connected with the image associated with the country of origin of the brand creators, whose surnames are now the names of the brands.

All respondents knew the country of origin of the Versace brand and stated that the designs with the logo of Versace refer to Italian culture and reflect Italian atmosphere.

In case of Kenzo brand, the result was much more complex. A vast group i.e. 25% of respondents determined that it is an American brand, whereas merely 45% of respondents gave a correct answer (brand of Japanese origin), the remaining part (almost 30%) marked the answer "I don't know".

All questioned respondents were able to recognize the creator of the brand and the 'giver' of the tone of its name - Gianiego Versace, whereas in case of Kenzo brand, merely 25% had such knowledge (the majority admitted that the origin of this brand in unknown – 45%, and 30% marked the answer that Kenzo is the name of a flower).

SUMMARY

As a result of carried out research, it may be stated that the Versace brand is commonly recognisable, whereas the Kenzo brand is less known in Europe.

The reception of these two brands is completely different. Versace is perceived in a very positive way, as a romantic brand, associated with the feeling of happiness, whereas Kenzo brand obtained the byname of a sad and mysterious brand. Transferring the feelings of respondents into the language of music, both brands can be defined in the following way: Versace – brand in major key, Kenzo in minor key.

The majority of respondents defined both brands as exclusive ones, however smaller group of respondents perceives the Kenzo brand in this manner, what reflects the expectations of both brands, as it is encompassed in the description of these two brands.

The aim was also achieved in other case. Both brands (however Kenzo in lesser degree, what results from lower recognition of the brand itself) are respectively associated with culture and Italian and Japanese motives, whereas Versace brand was defined as the one reflecting the Italian climate.

On the basis of the analysis of the examples of two chosen brands and studies of the subject literature and own research, it may be stated that the connection of the creator's surname in the combination of the elements of a given culture emerging as the motives of offered products and fixed and characteristic brand elements, constitute an appropriate combination of the directed message of the brand and they commonly strengthen the associations connected with a given brand.

And that is the hypothesis and the direction for further research, in the future.

The thesis presented in the beginning of the article was confirmed, that the use of this type of *branding* and an appropriate marketing strategy can be an excellent form of promoting a given country and culture.

AN INVESTIGATION OF KEY SUCCESSFUL FACTORS OF BIOTECHNOLOGICAL INDUSTRY PERFORMANCE IN TAIWAN ~ ALSO AN ANALYSIS OF TRADITIONAL CHINESE MEDICINE

Shang-Yung Yen, Professor, Graduate Institute of Management of Technology, Feng Chia University, Taiwan

Shu-Mei Tang, Professor, Department of Financial & Economic Law, Asia University, Taiwan

Wei-Chih Wu, EMBA, Feng Chia University, Taiwan

ABSTRACT

The ever-prospering development of information and communication technology (ICT) in recent years has changed how people conduct communication and their commercial behaviors. A large number of industries, such as semi-conductor and biotech sectors, find themselves in a high-velocity environment, wherein the market demands, peer rivals, and technologies are in a constant change, industrial structure and boundary are becoming blurred and intensively competitive. To survive in such a rapidly changing and highly competitive environment, all industries begin to map out winning strategies as their top priority. Taking biotech industry as an example, and by reviewing of related literature, analysis on the current industrial status, and through analytic hierarchy process (AHP), this paper intends to draw out the key elements that have the most impact on the success of operational performance on biotech industry in Taiwan, and shall conduct further interpretation of the correlation between these elements and the decision-making process. Since the traditional Chinese medicine is a valuable traditional knowledge and has an advantageous position of biotech industry in Taiwan. This paper is also intended to look into the difficult problems and choke points that the TCM met in industries, officials and academic circles in the past, and analyze the present information of them for the purpose of offering these issues with more appropriate suggestions to Taiwan government. In the past years, the learning studies of Chinese medicine have accumulated a number of research results, but such results are unable to be applied effectively to and become one of important industries in Taiwan.

Key words: Traditional Chinese Medicine (TCM), biotechnology industry, patent, intellectual property rights, R&D, Taiwan

INTRODUCTION

Advancement of biotech technology can upgrade our national competiveness, and serves to expand national hi-tech domain, which in turn ensure the continuous growth of the macro-economy. Given the scarcity of natural resources, it is undoubtedly that the development of Taiwan's industries should steer away from those with heavy reliance on energy and of high pollution rates. Therefore, the development of technology- and capital-intensive biotech industry has become an important issue that concerns both the government and the industry.

Since its high-tech-intensiveness, the lengthy developmental time-span, the astronomical R&D cost and high risk involved, plus the large gap in terms of invested resources we have made compared with those of advanced counties, Taiwan's biotech industry are now encountering a host of problems: weak research groundwork, insufficient R&D capability, lacking of global marketing network, and relatively smaller scale, among many others. In facing and overcoming the challenge, Taiwan still has a long road ahead.

A majority of the industry are either small or medium businesses, to which the stickiest problem required to be tackled is operational performance. This leads to the imperative issue of developing effective countermeasures; including (1) Key success elements impacting the operational performance of Taiwan's biotech industry. (2) Impact of human resources has on the operational performance of Taiwan's biotech industry

The manpower and capital involved in biotech industry usually exceed the limited capacity of other domestic industries. Therefore, the key elements for smooth development of the industry lie in the quality management, and R&D talents. In this way, the focus is on the human capital indices: management's capability, employee's capability, corporate cohesion, and the acquiring, cultivating, and recruiting of researchers, developers, and top-grade biotech professionals.

McCarthy E. Jerome divided marketing in his *The Marketing Mix of 4P's Model* into 4Ps: product, price, place, and promotion. He proposed, therefore, that the organization that can identify the best marketing strategy and followed by putting them into action, tends to own more competitiveness than others. Biotech is a cutting-edge technology featuring high

knowledge-intensiveness, technology-intensiveness, lengthy R&D time span, and high risk (Roberts *et al*., 1989). D'Aveni (1994) points out in his *Hyper-Competition* that a world leading industry is the one who has in command of many intangible assets, especially professional knowledge and know-how. In this section, we will discuss several technologic indices, including acquisition and transfer of technology, partnership alliance, and technologic uniqueness.

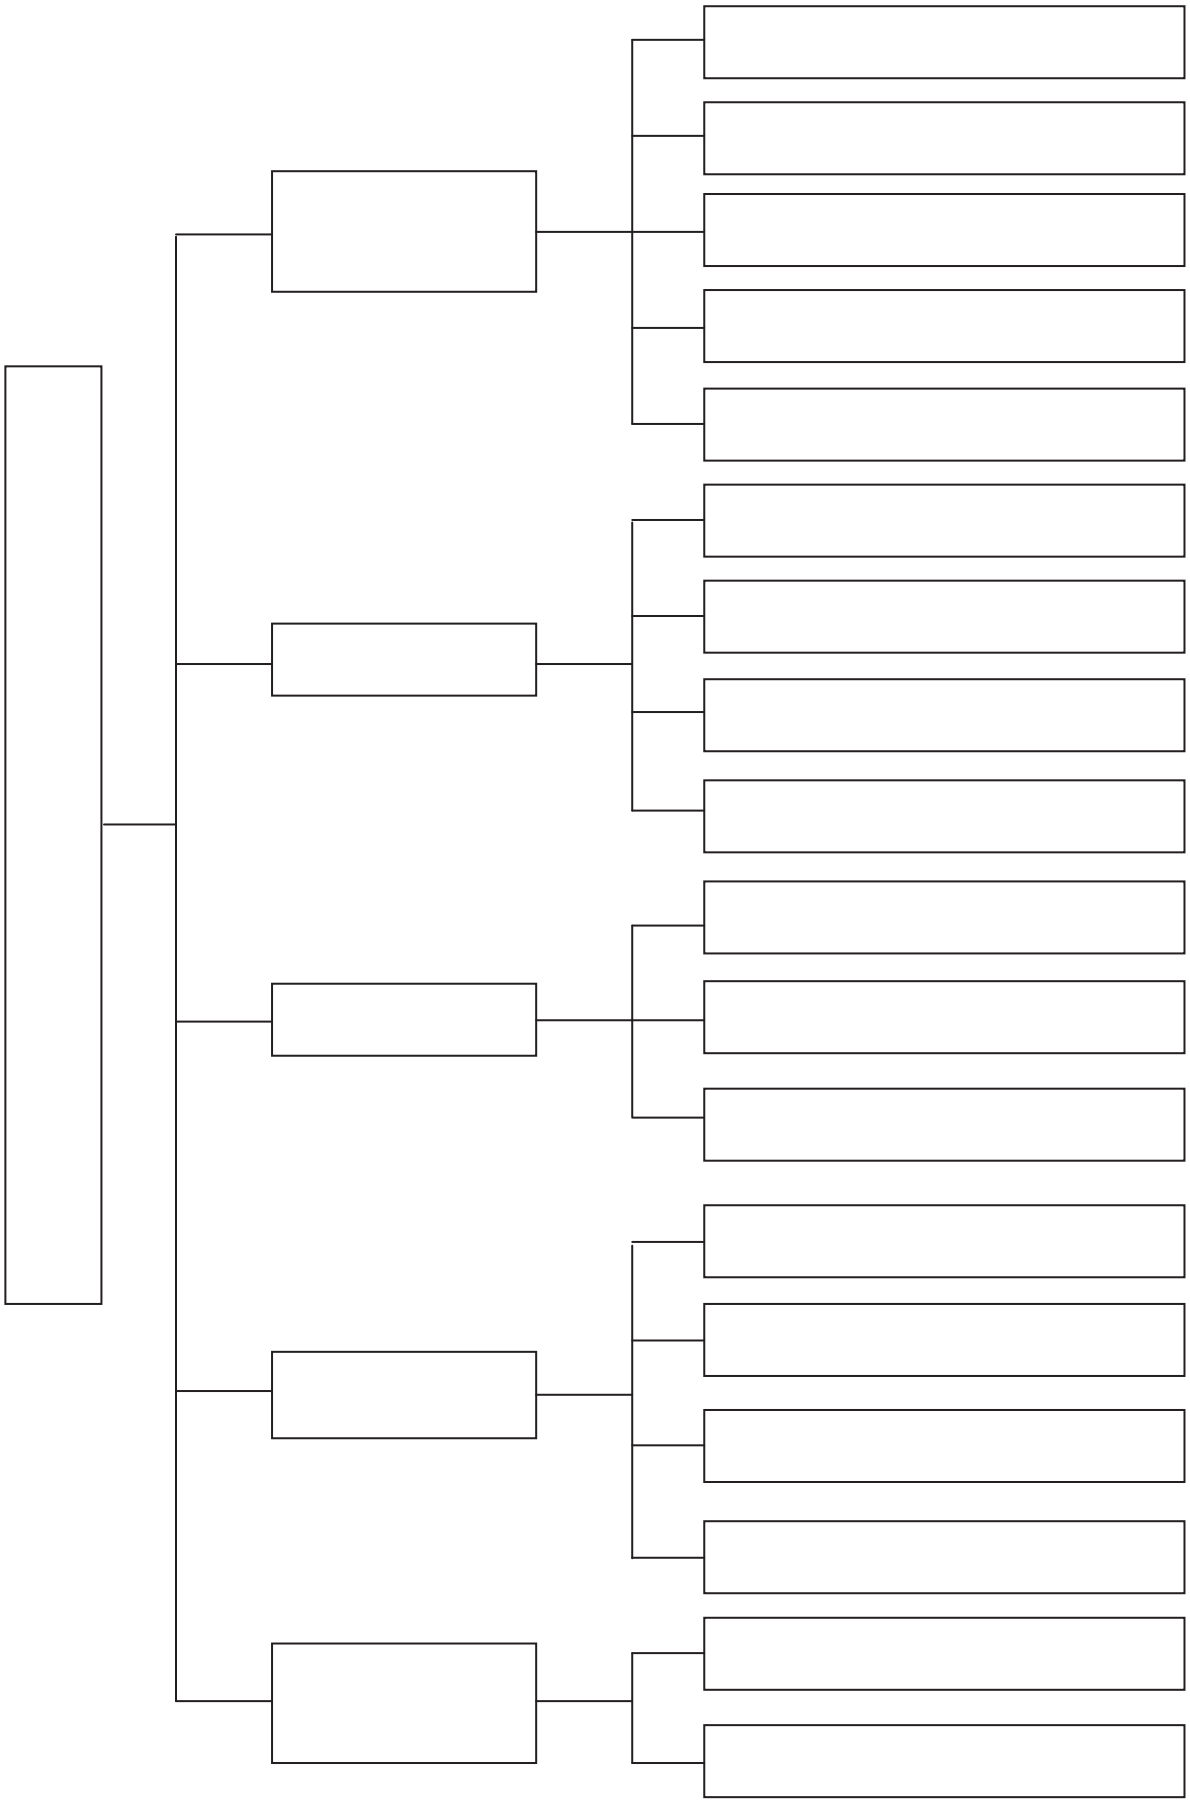
In his *Post-Capitalist Society*, Drucker (1993) argued that innovation is a new ability that can create wealth out of resources, makes resources realize the highest efficiency, and can change the value and satisfaction consumers derive from resources. The purpose of innovation lies in introducing new products, process, and service, to initiative systematic changes in order to increase customer satisfaction and product value. Innovation includes product innovation, new manufacturing process techniques, new structure and management system, and new market development project and management solutions.

In an age of knowledge economy dominance, the economic profits and values created by intangible assets are innumerably tremendous. Governments across the world are putting full efforts in coping with the developmental needs of the industry through providing various subsidiaries and incentives to biotech R&D and innovation, and by amending IPR-related laws and regulations.

RESEARCH DESIGN AND METHODOLOGY

Targeting Taiwan's biotech industry, the present study adopts expert survey to conclude the key success elements. An AHP is used to analyze the returned questionnaires from respondent experts and scholars in the field, and eventually screens out the resultant key success elements.

The present study aims to explore the key success elements of Taiwan's biotech industry. Through reviewing of related literature and industrial analysis, we conclude the major elements, which are then divided into the following three hierarchic tiers as belows:



Sample

The Study group is composed of 45 participants who are representative experts and scholars of biotech industry in Taiwan. They were asked each to complete the questionnaire voluntarily during April-May 2009. 25 of the participants returned completed forms but 3 did not answer properly to the questions. They were later dropped from the analysis so that final study samples are made of 22 individuals.

Analysis results from experts and scholars

(A) Analysis results of success factors

After software analysis, the success factors of framework of this study has shown in table 1 as followings.

Table 1 Analysis results of success factors

KSF	Weight Value	Rank	λMax=5.11 C.I.=0.027 C.R.=0.024<0.1
Human resource factors	0.107	5	
Marketing strategy	0.165	4	
Technical factors	0.2	3	
Innovation Strategy	0.229	2	
Intellectual property rights and patent	0.3	1	

Based on the analysis result, experts and scholars regard IPR and patent rights (with a priority weight of 0.3) have the greatest impact on the operational performance of biotech industry.

(B) Human resources

Table 2 Analysis results of human resource

KSF	Weight Value	Rank	λMax=5.06 C.I.=0.015 C.R.=0.013<0.1
The ability of executives	0.137	5	
The professional competence of staff	0.172	4	
Centripetal force of staff	0.222	3	
R&D personnel's acquisition and cultivate	0.226	2	
Recruiting Outstanding talent	0.242	1	

(c) Marketing strategy

Table 3 Analysis results of marketing strategy

KSF	Weight Value	Rank	λMax=4.02 C.I.=0.005 C.R.=0.006<0.1
Product Strategy	0.289	2	
Pricing strategy	0.211	3	
channel strategy	0.31	1	
Promotional strategy	0.19	4	

Analysis results show that experts and scholars regard channel (with a priority weight of 0.31) has the greatest impact on the operational performance of biotech industry.

(D) Technology

As shown in Table 4 below, technology analysis with software yields the following priority weights:

Table 4

KSF	Weight Value	Rank	λMax=3.00 C.I.=0.002 C.R.=0.004<0.1
Technology acquisition and transfer	0.223	3	
Alliance Partnership	0.253	2	
Technical uniqueness	0.523	1	

Based on the analysis result, experts and scholars regard technologic uniqueness (with a priority weight of 0.523) has the greatest impact on the operational performance of biotech industry.

(E) Innovation strategy

As shown in Table 5, analysis of innovation strategy elements yields the following priority weights.

Table 5

KSF	Weight Value	Rank	λMax=4.01 C.I.=0.004 C.R.=0.004<0.1
Process innovation	0.191	3	
Product Innovation	0.366	1	
Managerial Innovation	0.302	2	
Market innovation	0.141	4	

Analysis results show that experts and scholars have regarded product innovation (with a priority weight of 0.366) as the most influential factor to our biotech industry.

(F) IPR and patent

Results of software analysis of IPR and patent rights show that patent rights (with a priority weight of 0.0667) have the most influential power on the operational performance of biotech industry in table 6

Table 6 Results of software analysis of IPR and patent rights

KSF	Weight Value	Rank	λMax=2.00 C.I.=0.003 C.R.=0.003<0.1
Intellectual property rights	0.333	2	
patent rights	0.667	1	

(G) Overall assessment of the key success elements

Based on the expert survey, we conduct an overall analysis on the AHP framework. Overall analysis and comparison between all priority weights show that patent rights, among all key success elements, is the most influential factor to the biotech industry considered by experts and scholars. These influential factors are shown in table 7.

Table 7 Overall assessment result of the key success elements

KSF for the second layer	Weight Value	KSF for the third layer	Weight Value	Overall Weight Value	Rank
Human resources factors	0.107	The ability of executives	0.137	0.015	18
		The professional competence of staff	0.172	0.018	17
		Centripetal force of staff	0.222	0.024	16
		R&D personnel's acquisition and cultivate	0.226	0.024	15
		Recruiting Outstanding talent	0.242	0.026	14

KSF for the second layer	Weight Value	KSF for the third layer	Weight Value	Overall Weight Value	Rank
Marketing strategy	0.165	Product Strategy	0.289	0.048	8
		Pricing strategy	0.211	0.035	11
		channel strategy	0.31	0.05	6
		Promotional strategy	0.19	0,031	13
Technical factors	0.2	Technology acquisition and transfer	0.223	0.044	9
		Alliance Partnership	0.253	0.051	7
		Technical uniqueness	0.523	0.1	2

		Product Innovation	0.366	0.084	4
		Managerial Innovation	0.302	0.069	5
		Market innovation	0.141	0.032	12
Intellectual property rights and patent	0.3	Intellectual property rights	0.099	0.099	3
		patent rights	0.2	0.2	1

Findings of the study show that, regarding the cognition contents of operational performance, IPR and patent rights are the two most important factors considered by biotech experts and scholars, followed by innovation strategy, technology, marketing strategy, and human resources. This indicates the consensus of all experts and scholars that IPR and patent rights are the most important factors to Taiwan's current biotech industry. In addition to the protection provided by IPR and patent rights, it also takes the coordination of good innovation strategy, and well-developed and unique technique to attain a higher goal of operational performance. To reach even higher, the industry will have to strengthen its

marketing strategy and human capitals.

Besides these above survey results, the open questionnaires have resulted in a consensus point of view, that is, traditional Chinese medicine could be a best choice for Taiwan to develop its own industry

The Case of Traditional Chinese Medicine (TCM)

Taiwan is the first country in the world to include Chinese medicine in its national health insurance budget system. In a broad sense, "Chinese herbal drug" is an integrated term for Chinese medicine and herbal medicines that comprise natural ingredients, including various plants, animals, minerals, algae, and/or fungi, or extracts or composites of these ingredients. In Taiwan, no standard requirements that regulate the Chinese herbal drug industry currently exist. Chinese herbal drug manufacturers are generally categorized into three groups: (1) pharmaceutical companies that produce Chinese herbal drugs according to good manufacturing practice (GMP) procedures. The products primarily consist of traditional prescription drugs, including Chinese drugs, concentrated Chinese drugs, and Chinese prescription drugs with new indications or new administration routes. (2) Biotechnology companies that primarily develop new Chinese herbal drugs (including botanical new drugs). (3) Other companies that use Chinese herbal medicines as raw materials for various applications, including in health foods and cosmetics.

Traditional Chinese Medicine (TCM) has a recorded history of at least five thousand years in Chinese society and constitutes a vast treasure of Indigenous knowledge useful for human health, but the protection of intellectual property rights necessary for its scientific development is not adequate due to the nature of TCM. As in Western countries, such as the U.S.A., E.U. countries, Australia, Canada and Eastern countries such as China, Singapore, and Japan, Taiwan's legislation to provide legal protection for intellectual property rights necessary for the scientific development and practice of TCM must be strengthened. Because intellectual property right protection is difficult to extend to Indigenous knowledge such as TCM, efforts must be made to develop new Indigenous knowledge from TCM, both products and procedures, to enable IPR protection. Alternatively, a new legal framework could be developed to encourage the scientific development of TCM which would be protected as Indigenous knowledge. China and Taiwan have a vested interest in seriously pursuing the development of innovative ways to protect intellectual property rights to ensure the on-going scientific development of TCM for the benefit of Chinese companies as well as for the interest of public health world-wide.

The proposed and existing policies and legislation regulating complementary, alternative, and traditional medicine in advanced industrial countries is designed to provide strategies for addressing "…issues of policy, safety, efficacy, quality, access and rational use of traditional, complementary and alternative medicine." Examples include the Guidance for Botanical Drug Products approved by the U.S. FDA in June 2004, the EU Traditional Herbal Medicinal Products Directive of April 2004 which amends the Directive 2001/83/EC and requires all members to promulgate their own national laws regulating TCM by October 2005, the Canadian Natural Health Products Regulations under the authority of the Food and Drugs Act, the Pharmaceutical Administration Law and the 1992 Regulations on the Protection of Traditional Chinese Medicines in the People's Republic of China, and the WHO Traditional Medicine Strategy, 2002-2005. These documents all address the practice and use of traditional, alternative, and complementary medicine (TM/CAM), particularly herbal medicinal products; however, they are not sufficient to provide intellectual property rights to researchers.

Thus, protection of intellectual property rights regarding all aspects of the practice of TCM is an extremely important problem today. Researchers in many countries are applying scientific analysis to traditional Chinese medical practices and herbal remedies in order to ascertain their effectiveness and safety as well as to develop new products and practices. They also aim to develop production methods which guarantee high quality, safe products. Due to the high material and time cost, investors and researchers are reluctant to pursue the development of TCM if they cannot adequately protect their results through trademarks and/or patents. (Brown . 2000)

For a long time, numerous patent applications for Chinese herbal drug products have been submitted, with only a small proportion receiving approval. For patent applications, Chinese herbal drug products are commonly assessed as chemicals. However, Chinese drugs or herbal drugs are generally products based on traditional knowledge that is widely circulated among people; thus, they lack the element of novelty required for patents. According to the Intellectual Property Office, by the end of 2007, 141 Chinese herbal drug patent applications were approved, and the proportion of applications filed by Taiwanese researchers/developers had increased from 50% to 70%. This increase benefits the development of Chinese herbal drugs and biotechnology industries in Taiwan.

CONCLUSION

Because of the high value of knowledge protected by intellectual property rights in the global market, the protection of IPR for research and development of TCM is an important policy issue for the Government of China and Taiwan in term of improving biotech industry. Hence, the Chinese people have a unique opportunity to protect and develop their Indigenous knowledge of TCM for the benefit of all people and at the same time to generate income and recognition for the China and Taiwan as well as for the individual researchers and investors whose intellectual property rights it protects. Thus, it is in the interest of the governments of China and Taiwan to ensure the protection of intellectual property rights in the development of TCM by continuing to innovate in the application of IPR to TCM.

Regarding the key success elements, Daniel (1961) points out in his *Management Information Crisis*, "Most industries usually have 3 to 6 key elements that determine their success." The study selects the top six elements listed in Table 7, and use them as the key success elements. They are, in sequence of order: patent right, technologic uniqueness, IPR, product innovation, market innovation, and channel,

Accordingly, in its pursuit of success, a biotech manufacturer must: (1) establish comprehensive safeguarding measures to protect its IPR and patents; (2) focus on R&D and continuous innovation; (3) conduct innovative reform both on its products and market to gain an competitive edge; and (4) choose the appropriate channels, so that it can promote the development of biotech industry, emulate the standards of advanced countries, and synchronize with the world's bi-tech development.

THE EFFECT OF THE MINIMUM WAGE ON THE COMPETITIVENESS OF ECONOMY INTRODUCTION

Anna Krajewska, University of Lodz, Poland, Institute of Economics

Piotr Krajewski, University of Lodz, Poland, Institute of Economics

Katarzyna Piłat, University of Lodz, Poland, Institute of Economics

ABSTRACT

The costs of labour are an important factor affecting competitiveness of economy seen both at the macro- and microeconomic levels. One of the constraints which must be taken into account while examining the costs of labour are existing institutional arrangements, including the level of minimum wage and its relation to average wage.

The neo-classical theory assumes that increase in minimum wage leads to a number of adverse consequences in the economy: increased wages, fall in employment, inflation, and increase in public expenditure. This paper presents the results of empirical studies conducted in various research centres on the influence of minimum wage on the situation in the labour market. Based on the analysis of statistical data on Poland and other European Union countries an attempt is made to determine the impact of minimum wage on the economy.
The main purpose of this paper is to demonstrate that minimum wage affects not only economic aspects of the economy but also plays an important social function and counteracts excessive increase in income disparities. The following data will be used in the paper: variation of statutory minimum wages, minimum wages expressed in purchasing power standards, minimum wage level in relation to average gross and net monthly earnings, an attempt will be made to find correlation between these data and the rate of unemployment, inflation, GDP growth in Poland and the regional level of poverty.

The research can be treated as a contribution to the debate on the direction of changes in minimum wage (increase or decrease minimum wage, differentiate minimum wage across regions and young people or maintain uniform level in the country)

INTRODUCTION

During the economic slowdown the high level of unemployment is one of the fundamental macroeconomic problems. Therefore, it is particularly important to assess the impact of various solutions used in the labour market on the level of unemployment. It is often pointed out that in order to improve the situation on the labour market and increase the competitiveness of the economy it would be advisable to lower the minimum wage, taxes on labour, and unemployment benefits. Reduction in the minimum wage may in fact increase the demand for labour. However, lowering of taxes on wages and unemployment benefits

translates into a decrease in the income replacement ratio, i.e. in the relation of income while being unemployed to income from labour and, consequently may lead to an increase in labour supply. The paper begins with a brief historical overview and shows the essence of the minimum wage in the mainstream economics literature. Then, the authors outline the main conclusions of the study on the impact of the minimum wage on the labour market and income differentiation. Another part of the paper contains statistics on the evolution of the minimum wage and its relation to the average wage in the European Union. The authors made an attempt to assess the impact of the minimum wage on the development of unemployment in the EU by using an econometric model. The final part of the paper contains statistics on the Polish economy. The statistics demonstrate that the minimum wage does not harm the economy, i.e., it does not affect the growth of unemployment and inflation.

HISTORICAL CONTEXT

The minimum wage is the lowest remuneration which employers may legally pay to employees in full-time employment. Therefore, this is not a market category resulting from the demand and supply of labour but a conscious government's decision violating the rules of the labour market. Back in 1778 Adam Smith pointed out that that even "the lowest species of common labourers must everywhere earn at least double their own maintenance, in order that, one with another, they may be enabled to bring up two children" (Smith, 1954). This is an attempt to oppose the selfish tendencies of novice industrialists, well captured by Nina Assordobraj who studied the beginnings of the development of the working class and cited the following statement said by a beginning capitalist…"only the low pay can make the worker work regularly (…) A worker is the more lazy the cheaper is the food and the higher is the wage. The proper operation of a manufactory depends on a cheap worker whose pay is enough only for the necessary food and clothing."(Frieske, 2005).

The minimum wage has quite a long history. It was first introduced in New Zealand in 1894, and two years later in the state of Victoria, Australia (Budnikowski, 2009). This means that some 120 years ago the lowest wage was established for a legally employed worker doing simple tasks. Great Britain was the next country which introduced minimum wage in 1909. Much of the credit goes to Winston Churchill, the then Minister of Trade, who held that "It is a national evil that any class of Her Majesty's subjects should receive less than a living wage in return for their utmost exertions… where you have what we call sweated trades, you have no organisation, no parity of bargaining, the good employer is undercut by the bad and the bad by the worst; the worker, whose whole livelihood depends upon the industry, is undersold by the worker who only takes up the trade as a second string… where these conditions prevail you have not a condition of progress, but a condition of progressive degeneration."(Sloman, 2001). Therefore, the state was to define the minimum wage rates which should be respected by employers in order to reduce competition among employers aimed at reducing costs through reductions in wages, harmful for employees. Wage Councils were established in the UK. They were independent bodies which established fair minimum wage applicable to particular professions. In 1993 the Government abolished the Wage Councils and ceased to define the statutory minimum wage but in 1999 the institution was reactivated.

In the U.S., the minimum wage was introduced in Massachusetts in 1912 and in 1913 it was in force in 15 states although it related only to women and children (Mała encyklopedia ekonomiczna, 1962). From 1938 it came into force around the country. When signing the

minimum wage law President Franklin Roosevelt said, “Except perhaps for the Social Security Act, it is the most far-reaching, far-sighted program for the benefit of workers ever adopted here or in any other country.”, (Kamerschen, 1999). The law established the first nationwide minimum wage rate at 25 cents per hour. Over the following years the rate rose, in 1981 it rose to US$3.35 per hour. Regan administration found that the statutory minimum wage rate led to increase in employment, inflation, and bankruptcies and for several years (to 1988) froze the rate even though the purchasing power of wages has declined during this period by 27%. The Chairman of the U.S. Senate Committee on Labor and Human Resources, Edward M. Kennedy, engaged in a struggle for indexation of the minimum wage and stressed that the low, unchanged for years the minimum rate does not provide the full-time workers with resources to meet the basic needs of their families, while enabling the most ruthless and unscrupulous companies to exploit workers. Senator Kennedy believed that the minimum wage rate should be raised to US$4.65 per hour, and in addition, to avoid similar “errors” in the future, the minimum wage should be restored to half the average national wage. The minimum wage in the U.S. is different in different states. The official federal rate is US$7.25 while in four states it is less (US$6.25) and in 20 states more, (the highest in District of Columbia, US$8.25). President Obama’s proposal is to increase the minimum wage up to US$ 9–9.5 per hour.

The minimum wage was sanctioned by the International Labour Organisation in 1928. The ILO explained that the statutory minimum wage was introduced in order to:

1) Reduce the over-exploitation of workers, especially the uneducated, without professional qualifications
2) Ensure an adequate standard of living of people performing the simplest works, the fight against poverty
3) Eliminate certain forms of unfair competition in the labour market (such as discrimination against women, minors, foreigners), (Konwencje, 1996).

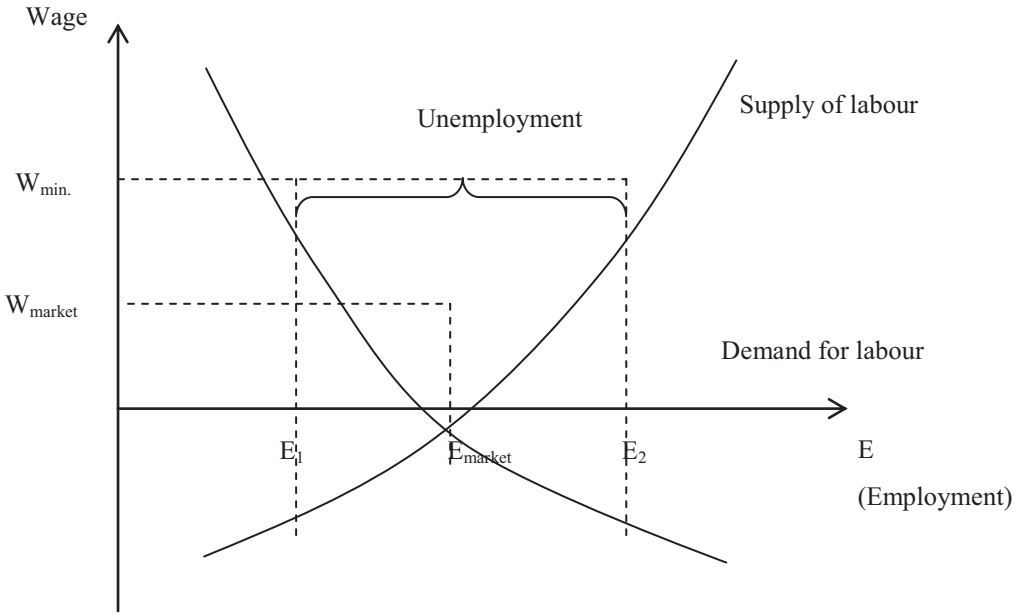
The amount of the minimum wage and its relation to the average wage is the result of collective bargaining involving the Government. The minimum wage can be determined by law or as a result of negotiations. It can be set per hour, per week, or monthly. Individual countries are free to shape the amount and coverage of the minimum wage. In most countries, the nation-wide Act on the minimum wage is in force. In some countries the amount of minimum wage is set by collective bargaining assuming certain differentiation of the amount across budget, profession, and region or employee wage. There are also countries in which negotiations are conducted in a decentralized manner at the level of individual companies.

THE MINIMUM WAGE IN THE THEORY OF ECONOMICS

Classical and neoclassical economics assume that market labour is perfect, i.e., neither companies nor employees can affect the wage level. Wage level and employment size depend on the relation between labour demand and labour supply. The demand for labour curve, as in the case of goods, is downward sloping. Increasing the wages decreases labour demand since it leads to increase in production costs. The supply of labour curve is upward sloping. The higher the salary the greater the number of people willing to work. The point where the demand and supply curves intersect determines the level of wages (W_{market}), at which the labour market is in equilibrium (E_{market}), i.e., there is neither shortage nor surplus of workers on the labour market. Minimum wage set by law (W_{min}) is higher than the market wage.

However, increasing the wages decreases the demand for labour (to E_1 in Figure 1) while the number of people willing to work increases (to E_2). Workers who are employed are gaining because their salaries are rising. At the same time, however, unemployment appears on the market, representing the difference between the demand for labour and the supply of labour (section E_1 E_2).

Figure. 1. Minimum wage on the competitive labour market



Source: Based on: D. Begg, S. Fischer, R. Dornbusch, (1993).

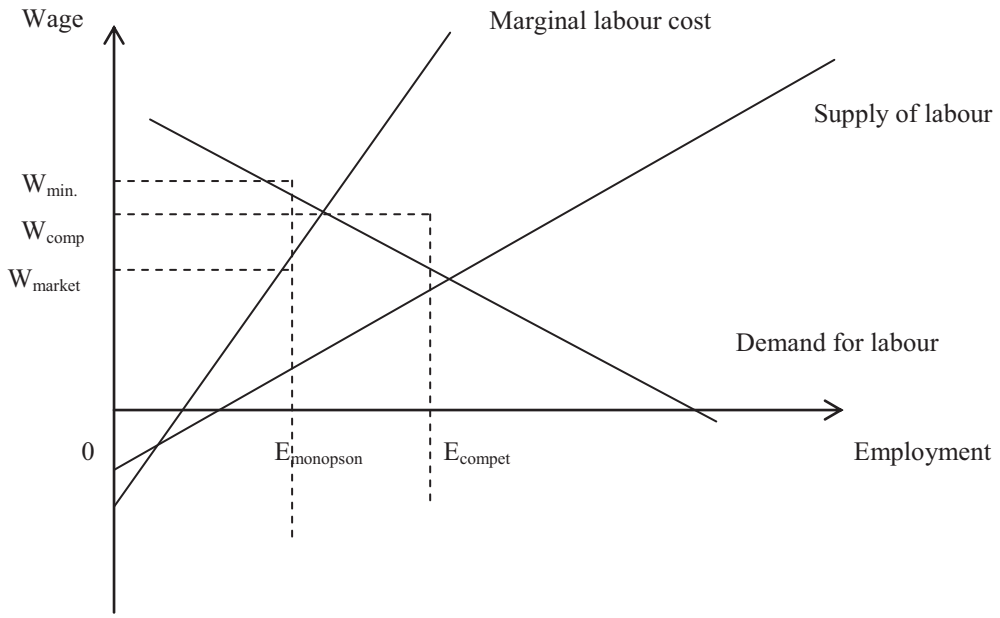
The neoclassical theory assumes that employers and employees do not have full information about the labour market. In such conditions increasing minimum wage prolongs the period of unemployment because the unemployed do not information about different wages in companies resulting from different entrepreneurship.

But the question arises; does the act on minimum wage always lead to increase in unemployment? Figure 1 shows that this will happen because the minimum wage, which is higher than the market wage, leads to a fall in demand for labour. It should be recognized that the labour market is not always fully competitive. Monopsony is an opposition to such market, i.e., it is a situation where a labour market is controlled by an employer who is dominant on the local market, such as steel plant, automobile factory in the city, in which there is no other industry. It may turn out, then, that minimum wage may have a positive effect on the employment.

In a competitive labour market wage is independent of manufacturer. Companies face a horizontal supply curve, which means that they can employ at the current price as many employees as they need. On the other hand, monopsonists face the upward sloping supply of labour curve which means that the more workers they want to employ the more they have to pay them. The increase in wage necessary to attract new employees means that (if companies do not discriminate their employees), they should also increase wages of those already

employed. The cost of hiring an additional worker is therefore higher than the level of wages of those already employed, hence, in Figure 2 the marginal cost of labour curve lies above the labour supply curve. A monopsony maximizing profit will increase employment till the marginal cost of labour equals the value of the marginal product of labour, which is at the same time the demand for labour curve. In a monopsony wage stands at W_{monops} and is lower than employment E_{comp} and wage (W_{comp}) in the competitive labour market. However, if the government sets the minimum wage at a level determined by the point of intersection of marginal cost curve and demand on labour curve this will not reduce the number of workers employed by the monopsony. However, if the government sets the minimum wage at the level that would be attained in a competitive labour market (W_{comp}) this would even increase the number of employed. With wage at the level of W_{comp} (which no longer depends on by how many workers more are employed) because profit maximizing companies increase employment till the moment when demand for labour equals the supply of labour.

Figure 2. Minimum wage in the competitive labour market



Source: Based on D. R. Kamerschen, R. B. McKenzie, C. Nardelli, (1999).

According to Keynes, an increase in the minimum wage does not harm the economy and does not lead to an increase in unemployment. Workers who are getting minimum wage generally have a high propensity to consume. The increase in their remuneration will increase total aggregate demand and therefore will also increase employment.

The minimum wage: A review of empirical studies

One of the main reasons why a minimum wage was introduced was to reduce poverty. A review of the research on the subject, conducted mainly in the U.S. (Burkhauser et al., 1996; Mishel et al, 1995), made by Stanisława Borkowska, shows that: "Aside from the differences in the results, the studies confirm that a large part of the increase in a minimum wage is not aptly addressed and does not contribute to the reduction of poverty. The point is that mainly

the young people receive the minimum wage and their income is not usually the main source of household income (Borkowska, 2005).

Opponents of the law on the minimum wage stress also its adverse social and monetary effects. The increase in the minimum wage makes employers look for a possibility to reduce non-wage components of labour costs. The opponents cite studies conducted in the U.S. The studies were a response to a proposal submitted in the 1980' in Congress to significantly increase the federal minimum wage. The studies suggest that raising the minimum wage is coupled with reduction of training programs (Hashimoto, 1982; Leighton and Mincer, 1981), abandonment of annual bonuses and bonuses for shift work (Wessels, 1980), reduction of social benefits, deterioration of working conditions, reduction of paid leave, and paid sick leave (Alpert, 1983). After analysing the results of various studies Walter Wessels believes that any increase in the minimum wage rate by $ 1 leads to a loss of 20 cents by an employee. He also notes that "The increase in the minimum wage should have resulted in the decrease in voluntary dismissals, but that did not happen. The number of dismissals grows, which means that the employee benefits are reduced in response to an increase in the minimum wage"(Wessels, 1999).

These observations are confirmed by the statistics collected in 2007 by the U.S. Department of Labor (Roth, 2007) which show that:

1) A mere 2.2% of total employment received the minimum wage ($5.85 an hour or about $11,500 per year).
2) Most minimum wage earners were young: more than half (51.2%) of minimum wage workers were between 16 and 24 years old another 21.2% were between 25 and 34.
3) Most minimum wage earners (about two-thirds) worked in food service. Many of these people received supplemental income in the form of tips, which the government did not track.
4) Most minimum wage earners never attended college.
5) Part-time workers are five times more likely to be paid the Federal minimum wage than full-time workers.

The minimum wage draws most criticism regarding its influence on the labour market. The minimum wage results in the fall in demand on labour and increase in unemployment. The extent of unemployment depends on the elasticity of demand for labour –the more elastic the demand curve for labour, the bigger the unemployment. So says the theory, but also the results of many empirical studies, and this affects especially young and low-skilled people. One of the first American studies on this subject demonstrates that an increase in the minimum wage from $1.25 in 1966 to $1.6 in 1972 increased unemployment among teenagers by 3.8% (Ragan, 1977). The negative impact of the minimum wage on unemployment was also confirmed by later studies (Neumark, Wascher, 1997 and 2007; Gunderson, 2005), and OECD reports. Empirical studies on the impact of the minimum wage on the unemployment rate are not, however, unambiguous (Brown, Gilroy, Kohen 1982; Addison, Blackburn, 1999). This may be due to the fact that a mere 1.4% of employees received the Federal minimum wage in the U.S. in 2005.

The Low Pay Commission set up in the UK in order to monitor the effects of the National Minimum Wage has not observed its negative effects. In 2005, the increase in the minimum wage did not have adverse impacts on inflation or employment and in fact the Commission

recommended to uprate the minimum wage even above the growth in the average earnings. A survey conducted among U.K. entrepreneurs in 2004 shows that almost 90% of respondents indicated that the increase in the minimum wage of no importance. In 2005, only 1.8% of all employees received the minimum wage. It is estimated that the re-introduction of the minimum wage in the UK in 1999 had the positive impact on the decrease in Gini coefficient and closing the gender pay gap (Low Pay Commission Report, 2005).

Also studies conducted in Poland assess the impact of the minimum wage on labour market in different ways. The econometric studies conducted by Bogdan Suchecki (1999) covering the years 1990 to 1997 show that the increase in the minimum wage by 10% led to a decline in employment of less than 1% (about 0.76%), but in the case of young workers (15-24 years of age) the same increase in the minimum wage led to a decline in employment of 4.6%. The studies also showed a strong relationship between the increase in the ratio of the minimum wage to the average wage, and the increase in the youth unemployment rate. The increase in this ratio by 1 percentage point is accompanied by a 0.61% increase in the unemployment rate in this group of workers. The findings of another study (Majchrowska and Żółkiewski, 2012) were similar and in addition pointed to the impact of the increase in the minimum wage on the increase in unemployment among low-skilled workers (Kurowska, 2008 and Wojciechowski, 2008).

Different assessment of the minimum wage emerges from a survey conducted in 94 companies representing different sizes and different forms of ownership. The majority of respondents believed that the minimum wage changes have no effect on employment. This also applies to employment of high school and university graduates (Borkowska, 2001). Much the same conclusion can be derived from studies by Zofia Jacukowicz (2007). They show that there is no alternative: low wages or unemployment. There was no correlation between the amount of the minimum wage and the ratio between the minimum wage to the average wage and the averages situation on the labour market in Poland.

The minimum wage in Poland and other countries of the European Union

Currently, the statutory minimum wage is in force in 20 of the 27 European Union countries. In five countries (Austria, Denmark, Finland, Sweden, and Italy), the minimum wage is set at the enterprise level through negotiations between the social partners. In the other two countries of the EU (Germany and Cyprus), the minimum wage is determined separately for individual groups.

The minimum wage denominated in euro is strongly correlated with the level of economic development and GDP per capita. The minimum wage is the highest in Luxembourg, (EUR 1,874 in 2013), and the lowest in Bulgaria and Romania (respectively EUR 158 and EUR 157). Poland (with EUR 377) ranks 12th among the 20 of the EU's 27 members which have national minimum wages. Comparing the level of the minimum wage in 2000 and 2013 (Table 1), it is clear that the differences between the minimum wage in the richest EU countries and Poland have decreased. In 2000, the minimum wage in Poland was 7.3 times lower than in Luxembourg, and in 2013 it was only nearly five times lower. These relations look different when we compare changes in the minimum wage in Poland with countries of Central and Eastern Europe. During the period under study the minimum wage increase rate was in all these countries higher than in Poland. In 2000, in Bulgaria and Romania, the

minimum wage denominated in EUR accounted for only 20% of minimum wage in Poland and in 2013 it rose to 42%.

Table 1. The minimum wage in the European Union in 2000 and 2013

Country	2000			2013			2000 = 100

Romania	20	34	20	20	157	42	416.8

Based on Eurostat.

Taking into account purchasing power parity the differences in the level of the minimum wage in the EU countries have diminished (Table 2). In Luxembourg, the minimum wage is four times higher than in Poland. The gap between Poland and new Member States is smaller when expressed in purchasing power parity.

Table 2. The minimum wage in the European Union in 2000 and 2013 in EUR by purchasing power parity

Based on Eurostat.

The International Labour Organization has adopted, that the minimum wage should represent 50% of the average wage (Convention No. 137 of 1970). This level of the minimum wage was also entered in the European Social Charter. The most similar relations among the EU countries can be found in France (48% in 2011, 49% in certain years) and Slovenia (47%). He lowest relationship between the minimum and average wage persist in Estonia (32%) and Romania (33%), although during the last 12 years (2000–2011) the minimum wages grew in these countries at the fastest rate (from 20% in Romania and 26% in Estonia). It is also worth noting that just before the current crisis (between 2005 and 2007), the relationship between the minimum wage and the average levels declined in many EU countries, which was dictated by the pressure to increase the competitiveness of the economy and reduce labour costs. However, when the crisis started in almost all EU countries, the relation between the minimum wage and average wage has begun to increase (Table 3). These tendencies become more visible when we take median into account.

The impact of the minimum wage on the unemployment rate: The panel analysis

In this section, we have tried to estimate the impact of the minimum wage and the income replacement ratio on the evolution of unemployment in the European Union. In the first place, we present the potential mechanisms of the impact of the minimum wage and the income replacement ratio on the labour market. Then, we examine the evolution of these indicators in Poland compared to other European Union countries and we verify the hypothesis that the value of the minimum wage or the income replacement ratio affects the development of unemployment, including the unemployment rate among people under 25 years of age. Empirical analysis was carried out for the European Union based on panel data from the years 1999 to 2012.

The value of the minimum wage affects mainly the demand-side of the market. The high minimum wage may in particular increase unemployment among people with lower qualifications. This effect may be accompanied by an increase in labour demand for higher-skilled employees or may decrease the overall level of demand for labour.

The income replacement ratio is defined as the ratio of income from various sources of state aid in the situation of job loss, to the income from labour. The income replacement ratio may affect the supply side of the labour market, affecting the motivation to work, or stop working (Strzelecka, 1998). If a sum of all unemployment benefits is only slightly lower than the net pay then a person who receives these benefits may have a little incentive to work. Consequently a high replacement ratio may lead to the so-called unemployment trap.

A potential impact of state regulatory actions concerning the minimum wage and replacement ratio on the development of unemployment has been verified on the basis of an econometric model.

The ratio of the minimum wage to the average wage (Eurostat data) in a particular country was adopted as the variable determining the impact of the minimum wage on the labour market. The income replacement ratio was defined in accordance with Eurostat methodology as a ratio of unemployment benefits paid in the event of becoming unemployed to net wage in the case of a person without children earning two-thirds of an average wage.
Moreover, since there is a correlation between the economic situation and the level of unemployment (see e.g. Martin, 1993; Czyżewski, Łapińska-Sobczak, 2001; Kwiatkowski, Kucharski, Tokarski, 2002), apart from variables related to the state policy, the demand gap was adopted as a variable explaining the development of unemployment rate. The paper is based on estimates of demand gap used by the OECD (2012).

The total unemployment rate (Eurostat data) is the dependent variable in the model.

Model parameters were estimated based on panel data from the years 1999-2012 for the countries of the European Union. Usually, a Fixed Effects Model (FEM), or a Random Effects Model (REM) is most frequently used in panel analysis (see Hayashi, 2000; Hsiao, 2003; Krajewski, Mackiewicz, 2007). As indicated, e.g. by Kennedy, the use of a Fixed Effects Model ignores completely the differentiation of cross-sectional variation. Cross-sectional effects are essential in our model and therefore the use of a Fixed Effects Model seems to be in this case unjustified. For this reason it was decided to use a Random Effects

Model which consists in conducting estimation with generalized least squares method which makes it possible to differentiate variance of the random variable across different countries (see Krajewski, Mackiewicz, 2006).

It was assumed in the model (due to the hysteresis effect in the labour market) that unemployment rate depends on the level of unemployment in the previous period. As a result, the model takes the following form:

$$u_{t,i} = \alpha_0 + \alpha_1 u_{t-1,i} + \alpha_2 \frac{w_{t,i}^{\min}}{\overline{w}_{t,i}} + \alpha_3 \frac{ub_{t,i}}{nw_{t,i}} + \alpha_4 \tilde{y}_{t,i} + \xi_{t,i} \quad ,$$

where:

$u_{t,i}$ -the unemployment rate in the *t* year in the *i* country,

$\frac{w_{t,i}^{\min}}{\overline{w}_{t,i}}$ - ratio of the minimum wage to the average wage in the *t* year in the *i* country,

$\frac{ub_{t,i}}{nw_{t,i}}$ - ratio of unemployment benefits paid to the net pay in the *t* year in the *i* country,

$\tilde{y}_{t,i}$ - the demand gap in the *t* year in the *i* country,

$\xi_{t,i}$ - random variable,

$\alpha_0, \alpha_1, \alpha_2, \alpha_3, \alpha_4$ - model parameters.

Based on the estimation of the model parameters the following estimates were obtained:[1]

$$u_{t,i} = \underset{(1,542)}{1,799} + \underset{(28,692)}{0,849} u_{t-1,i} - \underset{(-0,499)}{0,010} \frac{w_{t,i}^{\min}}{\overline{w}_{t,i}} + \underset{(0,147)}{0,001} \frac{ub_{t,i}}{nw_{t,i}} - \underset{(-5,579)}{0,232} \tilde{y}_{t,i} \quad , \quad R^2 = 0,864$$

The estimates show that the demand gap has statistically significant impact on the development of the unemployment rate in the European Union. The increase in the demand gap by 1 percentage point is on the average associated with an about 0.2 percentage point decrease in unemployment rate. Furthermore, the results indicate that unemployment has a strong hysteresis. At the same time the estimates show that neither the minimum wage nor the income replacement ratio does not in a statistically significant way affect the development of the unemployment rate.[2] Therefore there is no reason to reject the hypothesis that the formation of the minimum wage and the income replacement ratio do not affect the development of the unemployment rate.

The high level of the minimum wage or income replacement rate may primarily affect the development of unemployment for those earning less, less skilled, and therefore has greater impact on young people, under 25 years of age. In order to verify whether the minimum wage or income replacement ratio affects the unemployment rate for people under 25 the parameters of the following equation were estimated:

[1] The values of Student's t-tests are given in parentheses.
[2] At all standard levels of significance (i.e. 10%, 5%, and 1%).

$$u_{t,i}^{<25} = \beta_0 + \beta_1 u_{t,i}^{<25} + \beta_2 \frac{w_{t,i}^{\min}}{\overline{w}_{t,i}} + \beta_3 \frac{ub_{t,i}}{nw_{t,i}} + \beta_4 \tilde{y}_{t,i} + \zeta_{t,i} \quad ,$$

where:

$u_{t,i}^{<25}$ - the unemployment rate for people under 25 in the t year in the i country, (Eurostat data),

$\zeta_{t,i}$ - random variable,

$\beta_0, \beta_1, \beta_2, \beta_3, \beta_4$ - model parameters.

Therefore, the above equation is the same as equation (1), while the overall unemployment rate was replaced with the unemployment rate for people under 25. As before, a Random Effects Model was applied.

The results of estimation are as follows:

$$u_{t,i}^{<25} = \underset{(2,082)}{5,168} + \underset{(25,706)}{0,840} u_{t,i}^{<25} - \underset{(-0,437)}{0,019} \frac{w_{t,i}^{\min}}{\overline{w}_{t,i}} - \underset{(-0,465)}{0,009} \frac{ub_{t,i}}{nw_{t,i}} - \underset{(-5,267)}{0,470} \tilde{y}_{t,i} \quad , \; R^2 = 0,834$$

The results for the unemployed under 25 are similar to the results for all unemployed. There is also a strong hysteresis effect in the group of young people. Economic fluctuations affect unemployment rate among people under 25 even stronger than in the case of overall unemployment rate. The strong response of the explanatory variable to the changes in demand gap results from the fact that during economic slowdown the employers may in the first place dismiss low-skilled people.

From the point of view of the objectives of this paper the most import ant are the results obtained for parameters β_2 and β_3. As in the case of equation (1), no statistically significant relationship was found between the minimum wage or income replacement ratio, and the development of unemployment rate.

The aim of the study was to test the hypothesis that the minimum wage or income replacement ratio affects the development of unemployment, including the unemployment rate among people under 25. The empirical analysis was performed for the European Union based on the panel data from the years 1999–2012. Based on the estimates it was found that there was no reason to reject the hypothesis that the minimum wage and income replacement ratio do not affect the development of the unemployment rate. What is particularly interesting, the estimates do not indicate that the minimum wage nor income replacement ratio can adversely affect the unemployment rate among people under 25, while both the theoretical premises and many studies have shown that the negative impact of the minimum wage and income replacement ratio on the unemployment among young people should be particularly relevant.

The impact of the minimum wage on Polish economy

The minimum wage in Poland is low. In 2013 it is only € 377 and accounts for 36% of the average wage. So it is no surprise that the unions have been seeking for several years to raise it to 50% of the average wage, but they encountered strong resistance from the government

and employers. The liberal model of economic policy implemented in Poland clearly favours businesses. This is reflected in the reduction of taxes, more and more elastic labour market, low unemployment benefits which are paid for ever shorter time, reduced range of social benefits, tolerance for the large informal sector which makes it possible for employers to evade taxes and employ workers on unfavourable conditions. The attitude of the government, politicians, employers, the media, and many scientists towards the minimum wage is unfavourable.

These are the most often raised arguments of the opponents of the minimum wage, however, not supported by statistics:

1) Raising the minimum wage leads to an increase in unemployment. It should have been taken into account that there is no consensus in this regard, both in theory and research findings. Statistics on Poland show that unemployment is to the most extent correlated with economic fluctuations. The unemployment rate, especially among youth began to fall after Poland's accession to the European Union due to mass economic migrations of young Poles, mainly to the UK and Ireland. However, the global crisis has significantly slowed down this trend (Table 5).
2) Increase in the minimum wage leads to an increase in the average wage in the economy, which in turn produces inflationary wage-price spiral. Such a situation would arise if a wage growth rate was higher than productivity growth rate. Statistics show that GDP and productivity expressed in current prices grew faster than wages. Assuming that 2000 = 100, in 2012 these categories were as follows (Statistical Yearbook 2011, Statistical Bulletin, 2013):
   Gross average wage – 186.0
   Minimum wages – 214.3
   GDP at current prices – 220.4
   Labour productivity measured as GDP per 1 employee - 238.0.
3) The minimum wage and its rate of growth are often the basis both for the indexation of wages in the public sector and certain social benefits, such as unemployment benefits and certain industry-related benefits which results in increase in the fixed budget expenditure, unjustified by economic criteria (Wyżnikiewicz, 2012). These fears have not been confirmed neither by the social policy conducted in Poland nor by statistics. The statistics show that the budget expenditure for social purposes in Poland is systematically decreasing, and it also appears to be at a much lower than in other EU countries. In 2010 the budget expenditure for social purposes accounted for 17% of GDP against 21.6 of GDP in EU-27 (General Government Expenditure by Function, COFOG, and Eurostat).
4) The high minimum wage, considered to be too high by businesses, especially in the conditions of high unemployment and large grey economy, leads to a common practice of paying employees money under the table which furthermore aggravates the grey zone. Employees instead of being employed under the contract of employment work based on the so-called "Junk contracts", (the same duties as under the contract of employment but no rights). The fact that this is happening in Poland on a large scale is not a result of the lack of minimum wage law but because the legal system is weak and inefficient and tax system tolerates such activities, as well as because of the high unemployment, especially among young people and the poor social security system, which forces people to agree on the terms and conditions set by the employer.

5) The minimum wage threatens the existence of businesses; especially micro-businesses which operate on the verge of profitability and raising the minimum wage can lead to bankruptcy. This argument was used both by Michael Howard, the British Employment Secretary, who in 1992 pushed through the abolition of the minimum wage bill, saying, "There can be no conceivable justification for a policy which would, on its own, wreak our economy and devastate job prospects"(Sloman, 2001) and by contemporary Polish economists and even social policy scientists. For example, Bohdan Wyźnikiewicz (2012) believes that the increase in the minimum wage deteriorates conditions for operation of micro-enterprises, especially in small towns, where companies are unable to ensure the minimum wages for low-skilled workers. On the other hand Stanisława Golinowska believes that the minimum wage accounting for 40% of the average wage is relatively too high because "So defined, the minimum wage is a significant barrier to the development of small businesses where most jobs are created." (Golinowska, 2005).

Table 5. GDP growth rate, unemployment rate and the minimum wage

Year	Unemployment rate		The minimum wage in relation to:		GDP growth rate
	Total	Among people under 25	Average wage	Median

Source: Eurostat.

It is one-sided and overly simplistic reasoning, which does not coincide well with statistics, which demonstrate that contrary to appearances, businesses are doing very well. This is evidenced by:

1) High profitability of the corporate sector, even in the global crisis. In 2009, the gross profitability rate was 4.9% and a net rate 4.1% and in 2010 these rates even improved to respectively 5.2% and 4.4% (Statistical Yearbook, 2011). The last two years were also favourable in this respect, the gross profitability rate was 5.4% in 2011 and 4.2% in 2012 (Statistical Bulletin, 2013).

2) The decreasing share of employment–related costs in GDP in favour of other factors of production – from 40.2% in 2000 to 37.2% in 2010 as against 56.1% in Denmark and 53.6% in Sweden (Statistical Yearbook, 2011). At the same time, however, the investment growth rate is lower than the growth of GDP. Assuming that the year 2000=100 these figures were in 2010 (at current prices) as follows: GDP - 190.1; investment outlays) - 163.2, of which public investment - 204.0, and private investment - 141.0 (Statistical Yearbook, 2011).In 2011 GDP was 211.1, and investment outlays respectively: 182.7 and 236.1 – public investment, 154.3 private investment (Statistical Bulletin, 2013). Thus, high corporate profits are not fully allocated to the development and creation of new jobs.

This information shows that there reigns in Poland (among businessmen) the logic of cutting labour costs. There is a need for reflection – is it possible to live and think about starting a family with a minimum gross wage of PLN 1600 (€ 377)? One should also think about the economic cost of the decreasing share of labour costs in GDP in favour of other factors of production. And the argument that raising the minimum wage threatens the existence of many small, non-competitive companies can be answered with the words of the general chairman of the Polish Trade Unions and the Vice-President of the Trilateral Commission: "Entrepreneurs who are not able to pay decent wages to employees, should withdraw from business" (Guz, 2011).

To sum up - I think that raising the minimum wage up to 50% of the average wage is not dangerous for the Polish economy and will not weaken its competitiveness.

ABSTRACT

Purpose: *Balancing the economic, social and environmental aspects of company operation becomes a new DNA of the organization and a management philosophy for generating tangible results, not only for the company itself, but also its stakeholders. The article seeks to describe the approach to managing aspects of sustainable development and their integration into the business strategy and operations a Polish gas sector company.*
Structure / methodology / approach: *The text will detail how to integrate aspects of sustainable development, translated into company environment as corporate social responsibility (CSR), with particular business areas of company operation. Also presented will be a chain of values and synergies within the Company managed from the sustainable development perspective and the tangible effects of this management philosophy in terms of increased company value, changing organizational culture, improved efficiency, enhanced confidence from the organisation's internal and external environment and effective risk management.*
Conclusions: *Company management from the sustainable development perspective combined with a strategic approach to and implementation of this management philosophy ensure that the organization is lead in a responsible manner, and contribute to the increase in its tangible and intangible value. It is also conducive to effectively creating added value for the organisation's internal and external environment, which cannot be achieved if the business and CSR aspects of operation are not considered strategically and effectively integrated with each other.*
Originality / value: *The example covered in the article represents a proprietary model for CSR implementation which, after several years, has brought about tangible economic, social and environmental results. Following the change in its management philosophy and way of conducting business, the company was ready to undertake the implementation of new ambitious projects which are important for the national economy in terms of energy security. It has become a leader of the integration of gas transmission systems in Central Europe. The new management approach allowed the organisation to build new economic, social and environmental capital.*

Classification: Case study

Keywords (1-10): Sustainable development, Corporate social responsibility (CSR), Shared value, Value chain, Strategy

INTRODUCTION

The global economic crisis we have been experiencing for several years forced international institutions to investigate its causes and the mechanisms that need to be implemented in business processes in order to prevent such developments from happening in the future and achieve lasting improvement in the form of a sustainable development of the world's economy (Bonini, 2011; Chouinard et al., 2011; Economist Intelligence Unit, 2009). The European Parliament clearly indicated that the current global economic crisis arose from fundamental errors with respect to transparency, accountability, responsibility and from short-termism (European Parliament, 2013). Global institutions, including the United Nations, increasingly conclude that corporations may contribute to the development of a social market economy by providing jobs and facilitating economic recovery. In this context, the approach to corporate social responsibility (CSR) gains special importance as an element that enables the implementation of the sustainable development concept at the company level and is looked at in a broader context of the organisation's impact on the community it operates in and on the competitiveness of the economy (Du et al., 2010; Kotler & Lee, 2004; Pohl & Tolhurst, 2010). The UN and the European Commission set out the strategic directions for the implementation of the sustainable development concept at the company level but each firm should individually define the areas and CSR tools that are relevant to its business model (Laszlo, 2005). As is evident from a review of world trends in CSR implementation, the concept may be beneficial to organisations only fully integrated with their business strategies and is duly implemented in consideration of the company's external environment.

This meaning of social responsibility of business is also supported by the international standard ISO 26000. The fundamental characteristic of social responsibility is the organisation's readiness to accommodate community and environmental considerations in its decision making and to be held accountable for the impact of its decisions and actions on the community and the environment. This means both transparent and ethical behaviour that contributes to sustainable development, is in line with the applicable laws and consistent with international standards of conduct. It also means that social responsibility is an inherent element of all the activities of the organisation is practised in its relationships and takes into account stakeholder interests (Guidance on social responsibility, 2013). The concept of sustainable development, adapted into business practice as the Corporate Social Responsibility (CSR), is a chance to forge a long-term increase in the company’s value, which, in a longer term, translates into a competitive and responsible economy. For the CSR to play a strategic role, it has to be properly implemented at the company level.

In this article we are going to discuss the latest approach to the sustainable development concepts at the company level. The first of them known as creating shared value is presented by M. Porter and M. Kramer (2011). The second one proposed by W. Visser concerns the theory of the evolution of social responsibility from CSR 1.0 to CSR 2.0 (Visser et al., 2010).

Both approaches provided a stimulus for the implementation of the sustainable development concept and the integration of the aspects of social responsibility with the corporate business strategy in GAZ-SYSTEM S.A., a company operating in gas industry in Europe. Over four years ago, the company embarked on the process of transformation in strategic and operational management by integrating its business activities with sustainable development

aspects. As a result, business objectives are effectively achieved through increased involvement of the employees and good relations with the stakeholders and local communities where the company has an active business presence. Internally, the integration process has had a very positive impact on the organisation, especially in such areas as organisational culture or efficiency improvement, and ultimately has led to substantial growth of the company's value.

Strategic approach to sustainable development in business from CSR 1.0. to CSR 2.0

Wayne Visser identified five stages of CSR maturation, which go in parallel to economic growth (Figure 1). The first four stages (the Age of Greed, the Age of Philanthropy, the Age of Misdirection, the Age of Marketing) belong to CSR 1.0. Fully mature companies find themselves in the fifth stage of CSR implementation – the Age of Responsibility. Visser and Tolhurst argue that a positive contribution of to society is the essence of CSR 2.0 and it is not about marginal promotional or philanthropic initiatives but about the business philosophy (Visser & Tolurst, 2010). According to this theory, CSR should no longer be understood as "corporate social responsibility", but rather should be taken to mean "corporate sustainability and responsibility". CSR understood in this way is definitely an inherent part of the business strategy and an overriding philosophy in all areas of a company's operations.

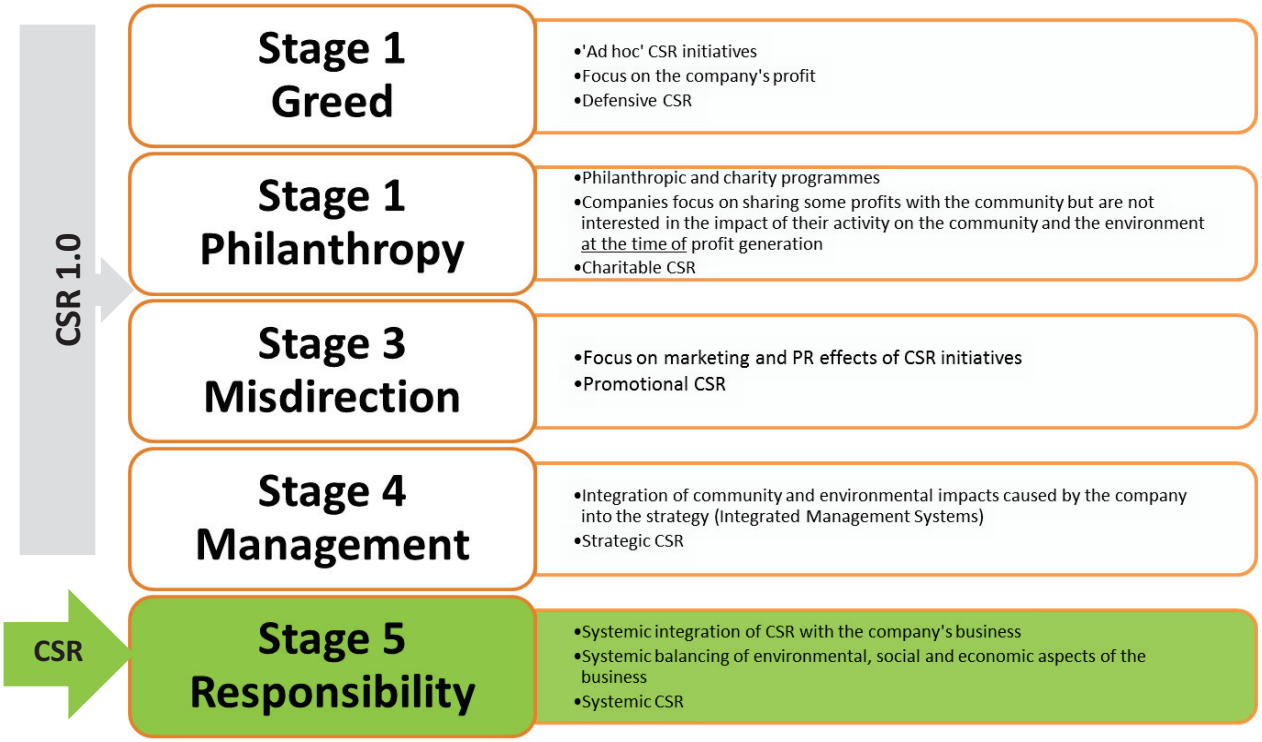

Figure 1. Evolution of CSR maturity
Source: Own analysis based on Visser (2011).

Top management should act as the ambassadors and key sponsors of the CSR implementation within an organisation as they set the strategic direction and goals and define the path the organisation must follow in order to implement business objectives taking into account the social and environmental impact of the organisation. The CSR 2.0 theory holds that

sustainable efficient growth that accommodates the interests of all stakeholders is key for the organisation.

In order to achieve efficient implementation of CSR 2.0 in business, a company has to apply certain principles that make up the DNA of this concept (Visser, 2011):
1. Connectedness – create multi-stakeholder relationships instead of mere relationships with shareholders and focus on value-creation.
2. Scalability – implement socially responsible practices on a sufficiently large scale and focus on the real benefits for society and the environment (rather than PR effects).
3. Responsiveness – respond to global problems even when this is uncomfortable for the company.
4. Duality – take into account a broader context, including local conditions, and select solutions that are most appropriate for them, instead of pre-defined principles.
5. Circularity – design actions that will be sustainable from the beginning to the end, avoid waste of resources, replenish human capital and nourish local communities.

Sustainable development should be the purpose of business. This goal may be achieved through responsible management of the company, primarily in the following aspects (Visser, 2011):

- economic sustainability and financial responsibility,
- human sustainability and labour responsibility,
- social sustainability and community responsibility,
- environmental sustainability and moral responsibility,
- investment sustainability and responsible investments.

Consequently, the essence of CSR 2.0 lies in a broad, comprehensive scale of actions in all the areas of business activity of the company and its responsible management at all levels.

Creating Shared Value (CSV)

In the context the discussion on the causes of the economic crisis, a similar theory was proposed by M. Porter and M. Kramer by defining the creation of shared value for business and society (Porter & Kramer, 2011). The theory moves away from a narrow perception of value understood as the optimisation of short-term financial performance. It encourages the accommodation of the needs of customers and a full range of stakeholders, which should determine the long-term success. Today, companies have to restore the ties between the business and the society and regain the trust of the public (Blowfield & Murray, 2008; Shockley-Zalabak et al., 2010; Cheney et al., 2007). The principle of creating share value consists in the generation of economic value in such a manner that, at the same time, creates social value by addressing the needs and problems of the society (Porter & Kramer, 2011). The authors argue that shared value is not synonymous with social responsibility, philanthropy or even sustainable development – it is a new way of achieving economic success. Rather than being a marginal component of a company's activity, it lies at the core of the philosophy and underpins the business. Porter and Kramer argue that the notion of share value may trigger a major change in the thinking about business, as they believe that creating shared value, instead of pure profit, should be the purpose of business. This in turn will unleash opportunities that will lead to increased innovation and productivity across the world's economy. The shared value concept assumes that markets are driven by social needs

rather than just by shareholders' expectations. At the core of this concept lies a conviction that the competitiveness of a company and the condition of the communities around it are very strongly related. As a result, overall resources of the economic and social value are increased.

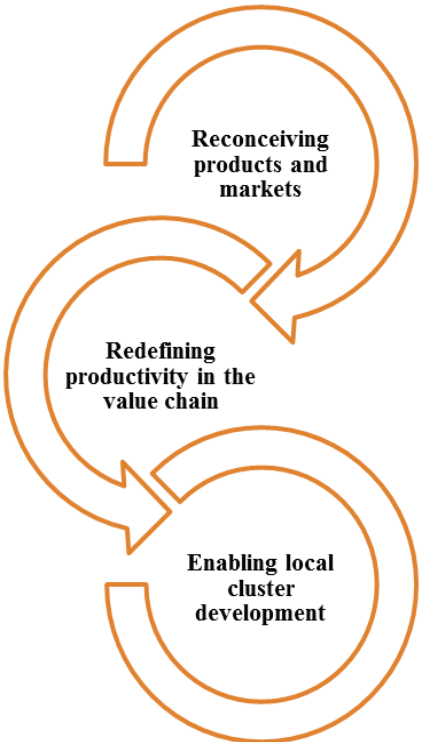

Figure 2. Creating shared value.
Source: Own analysis based on Porter and Kramer (2011).

By generating a profit that is related to a social purpose organisations can accelerate social progress and, at the same time, continue to grow. The creation of shared value implies the conformity to legal and ethical standards, as well as the mitigation of any damage caused by companies. The concept reflects a new way of companies' thinking about who are their customers, what is productivity and what are the external forces driving a company's success.

The shared value responds to the expectations of customers, business partners, employees and local communities a company operates in. The resulting competitive advantages will enable the creation of sustainable and long-term value of an organisation.

Case study: Change of management philosophy – strategic approach to social responsibility in GAZ-SYSTEM S.A.

GAZ-SYSTEM S.A. is responsible for the security of gas transportation in Poland, expansion of the transmission network, as well as investment projects integrating the European gas transmission system.

The first step to fostering social responsibility at GAZ-SYSTEM S.A. was taken in 2009 when the Code of Ethics was developed in cooperation with the employees and subsequently implemented. The Code defines the principles of ethically acceptable conduct and emphasises the key roles of the values the Company aspires to, including responsibility, commitment, professionalism, team work and respect.

Since 2009, the company has been a member of the Global Compact, an initiative announced by the UN Secretary-General, and has declared its commitment to the ten universal principles in the areas of human rights, labour relations the environment and anti-corruption. GAZ-SYSTEM S.A. puts a lot of emphasis on preventive environmental management while developing initiatives which are aimed to promote ecological responsibility and the application and spread of clean technologies. Each year, in line with the Global Compact requirements, GAZ-SYSTEM S.A. releases the Communication on Progress (COP) report.

Since joining the UN Global Compact in 2009, launching the Code of Ethics and adopting a set of clearly defined values, GAZ-SYSTEM S.A. has been able to consistently build its business strategy which incorporates the focus on sustainable development in the management of the organisation and integrates all the social responsibility measures taken within the company.

From that moment the company launched also the process of redefining its business objectives and the needs of the community in which it carries out its business through balancing the social, environmental and economic aspects. The stakeholders, both internal (the management) and external (customers, supervisory institutions) were invited to the process of business strategy redefinition. A series of workshops and external research resulted in the definition of strategic directions, including the one that is oriented at the management of the company from the sustainable development perspective and, at the same time, integrates all other business activities undertaken as part of other strategic directions. The implementation of sustainable development principles has become a core part of the corporate strategy, as sustainability is at the heart of our corporate culture, reflecting the values the Company aspires to. The process was largely in line with the CSR 2.0 implementation model proposed by W. Visser (Figure 3).

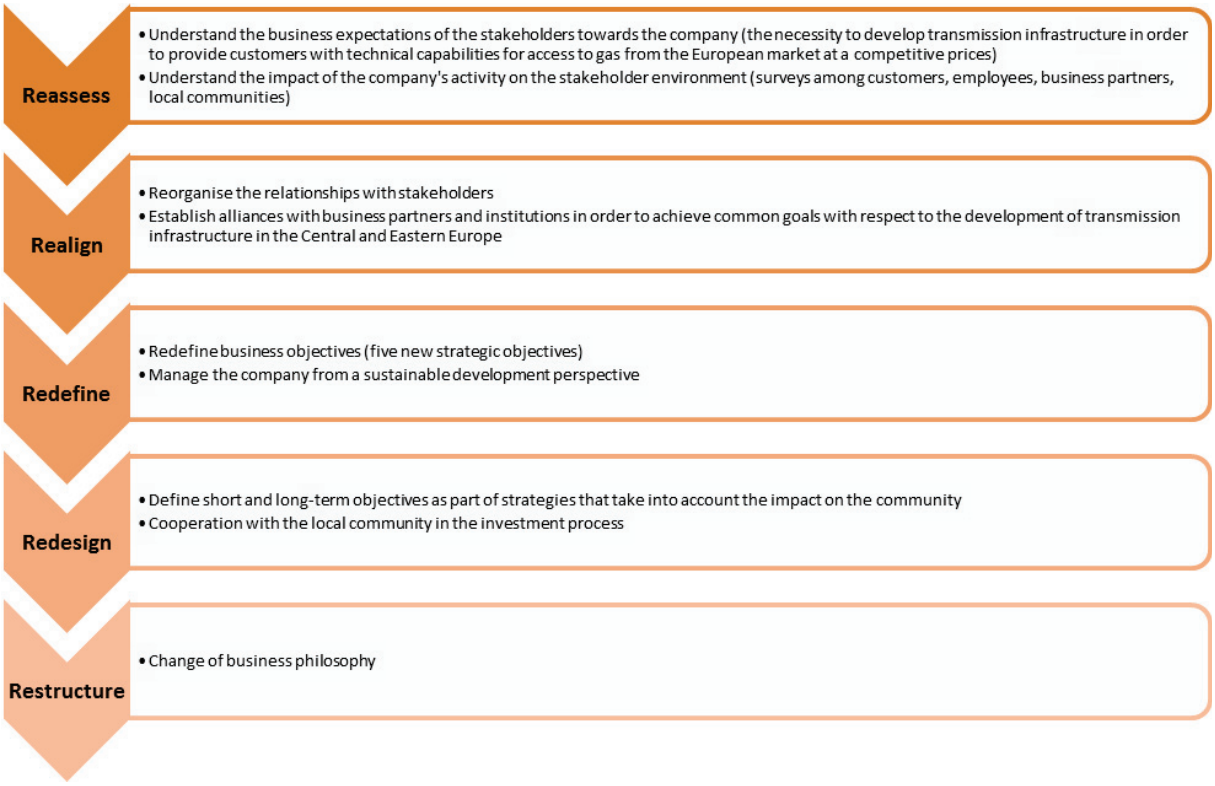

Figure 3. Implementation of CSR 2.0 in GAZ-SYSTEM S.A.
Source: Visser (2011).

This also means that in the process of redefining its business strategy the company applied the theory of creating shared value defined by Porter and Kramer. The company **reconceived its products and markets** by introducing new services and opening up to the opportunities of cooperation with other countries with regard to the expansion of gas infrastructure in Europe (the Czech Republic, Slovakia, Lithuania, Germany, Denmark). GAZ-SYSTEM S.A. also **redefined productivity in the value chain** by focusing on long-term, sustainable development through better utilisation of resources, improved work efficiency and more efficient processes management within the company. Furthermore, GAZ-SYSTEM S.A. **enabled local cluster development** through communication, community and promotional activity among the local communities where the company carries out its business (operates gas pipelines and builds new ones). Among other things, the company actively involved local communities in the implementation of ecological and environmental projects affecting their area. For several years, as part of the Natural Energy Fund, GAZ-SYSTEM S.A. supports local initiatives aimed at the improvement of natural environment, working together with municipalities and local institutions.

Company's key objectives include enhancing Poland's energy security and integrating European transmission systems with a special focus on such priorities as environmental protection and delivery of strategic investments in cooperation with local communities. The company is committed to pursuing sustainable development, which is a long term and multifaceted process reaching deep into our business practices. The so-defined strategic objectives are directed at ensuring that all our activity is carried out in line with sustainable development principles. While being in full compliance with these principles, GAZ-SYSTEM is dedicated to providing the security of our gas transmission system, as part of the

EU gas network, Creates conditions for the development of a liberalized natural gas market in Poland to boost the consumption of natural gas as an environmentally friendly fuel, Our work is therefore focused on ensuring lasting improvements in our operational and organisational performance to consolidate our position as a significant player on the EU gas market. Integrating the sustainable development concept with business strategy is of key importance to ensuring its efficient implementation at company level. A similar approach was adopted at GAZ-SYSTEM S.A., where the fifth strategic objective, concerning company management from the sustainable development perspective, determines all our work towards the delivery our adopted strategy (Figure 4).

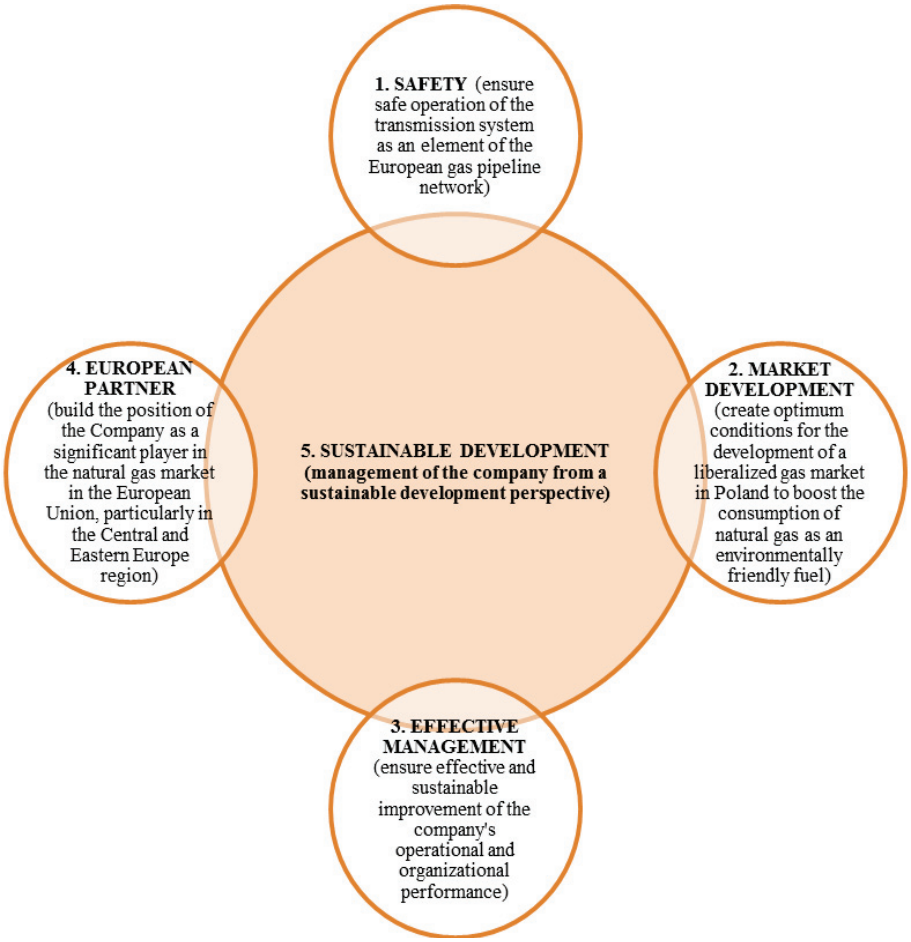

Figure 4: Strategic directions of GAZ-SYSTEM S.A.
Source: GAZ-SYSTEM S.A.

Case study: The value chain in GAZ-SYSTEM S.A. and the management from the sustainable development perspective

The incorporation of sustainable development dimension to the company's mission and vision, as a vital component of the management strategy and its close integration with all business areas of the company enabled a synergy effect and led to an individual value chain of the company (Figure 5). GAZ-SYSTEM S.A. understands CSR more broadly than mere community initiatives, philanthropy or promotion of environmental awareness, i.e. as an

inherent component of the management approach, which, in 2011, was incorporated to the company's strategy as the fifth strategic direction.

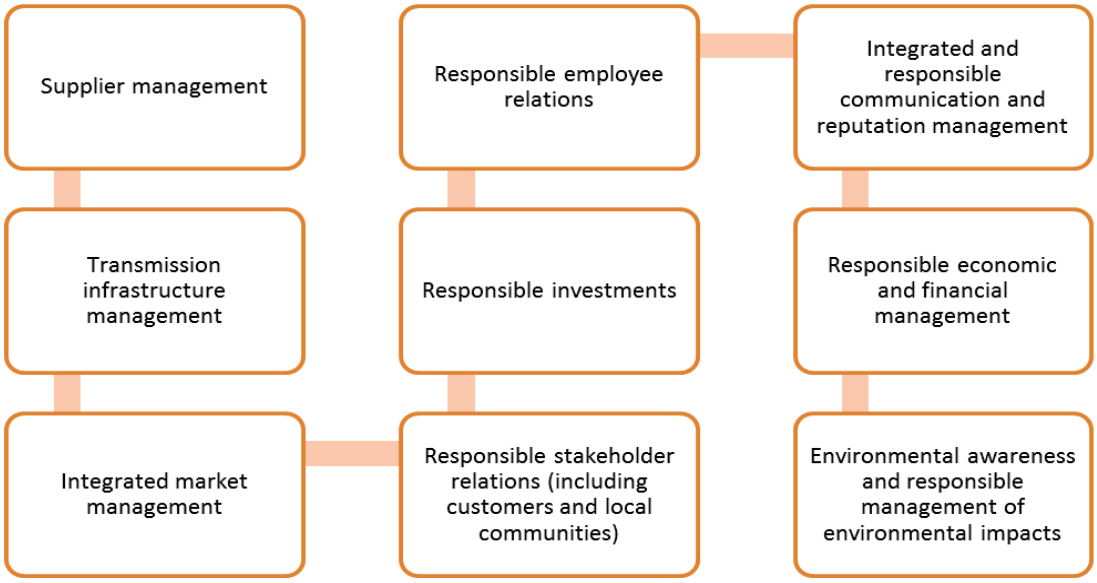

Figure 5. The value chain in GAS-SYSTEM S.A. as the effect of company management from the sustainable development perspective
Source: own analysis based on case of GAZ-SYSTEM S.A.

The integration of sustainable development aspects with the business areas of the company enables a comprehensive approach to building the organisation's value in individual areas, taking into account the influence on the society, the environment and the economy.

Owing to such business philosophy it is possible to build responsible relations with employees. For several years, the company has been ranked among Top Employers in Poland and in Europe, according to surveys carried out by the international firm A.ON Hewitt. Over a few years' time employee commitment increased from the level of 28% in 2007 to 85% in 2012.

In addition, for the last few years GAZ-SYSTEM S.A. has been implementing an ambitious investment programme including the construction of over 1000 km new gas pipelines in Poland and the first receiving terminal for liquefied natural gas (LNG) in Świnoujście on the Baltic coast. The value of the investment programme by 2014 is estimated at approx. USD 3 billion. The company attaches great importance to responsible execution of its investment projects in terms of their environmental, social and economic impact. Comprehensive communication with local communities about the projects being underway is also recognised as a key part of the investment process. GAZ-SYSTEM S.A. regularly organises information meetings for local authorities and landowners whose property is affected by the pipelines developed by the company. The meetings are attended by the employees of GAS-SYSTEM S.A. who are responsible for the project implementation. The representatives of contractors are also invited. The meetings offer an opportunity for discussing key issues concerning the project implementation, rights of way to property for the time of construction and

compensation payable to landowners. The participants receive information materials (leaflets on the project and the compensation procedure, posters with the pipeline route, etc.). Some meetings take the form individual consultations during which landowners may obtain information about issues of their concern, and trace the route of the gas pipeline running through their properties on professional maps.

In some municipalities information points are also being set up; these are an additional source of information for residents and anyone interested in the company's projects. In the years 2011-2012, in connection with the implemented in different regions of Poland, GAZ-SYSTEM S.A. held over 100 meetings with local communities, which were attended by over 2000 people. At present, the company is engaged in communication activities in over 70 municipalities in Poland. Each year, the company organises, on average, over 100 initiatives addressed to local communities.

The management of the company from the sustainable development perspective also facilitated the enterprise risk management (ERM) resulting in a more comprehensive and effective solution.

As a notable evidence of its commitment to balancing its economic interests with the expectations of customers, the company decided to reduced, already twice, its tariffs for gas transmission services. Thereby the company demonstrated that it is capable of financing a costly investment programme (worth over USD 3 billion until 2014) in a responsible manner, through efficient cost management and attracting favourable forms of financing for its investment projects (support from the EU, EBRD and EIB). The above-mentioned financial institutions operate very restrictive lending regimes, which involve examining the applicants' eligibility in terms of social performance and compliance with European standards. GAZ-SYSTEM reporting policy, including the annual COP reports for Global Compact and the reporting based on the internationally recognised GRI standard, greatly improve our credibility vis-à-vis the European financing institutions involved in our investment projects.

The integrated management of sustainable development aspects also enables the comprehensive management of corporate communication and image. Earlier In 2012, GAZ-SYSTEM opted for integrated reporting in accordance with the guidelines of the Global Reporting Initiative (GRI), The reports describe in detail the sustainable development initiatives undertaken by the company and present both the financial and non-financial performance. The document is updated annually. In order to ensure the comprehensiveness of the report, the company organised a series of workshops for its key staff and managers to define practical reporting guidelines. The participants collected essential data concerning the projects implemented by the company within respective areas of the business strategy. As a result, the report provides a comprehensive overview of the company's performance, including economic, environmental and social aspects according to GRI level B criteria. Its content was developed in consultation with our key internal stakeholders and approved by leaders of particular thematic areas. The reported data has been selected based on its materiality, which is defined by the company as the issues that are relevant in the context of sustainable development, both for the organisation itself and its stakeholders.

The impact of the integrated approach adopted by GAZ-SYSTEM in the field of corporate social responsibility, including integrated, consistent and reliable communication, is also

reflected in our positive media image. In 2012, over 90% of the nearly 6000 articles published gave a positive impression of the company, with the rest being predominantly neutral (a mere 0.02% of the publications carried negative overtones), which created a substantial positive media equivalent value.

The company did also implement a framework for managing the sustainable development aspects. To this end, the company prepared a document that describes the rights and obligations of the individual parties in the organisation and sets out the relevant communication principles. It is also an effective tool for the integration of social responsibility initiatives on a company-wide basis, and for the management of environmental, social and economic aspects.

In a 2012 survey conducted by a marketing research company, GAZ-SYSTEM was found to be perceived as modern, innovative and trustworthy brand. It enjoys the image of a prestigious employer that takes care of its employees and is a desirable place to work. Other features that make GAZ-SYSTEM S.A. from other companies include professional staff and dynamic growth, as well as overall reliability, integrity and trustworthiness. The brand connotations most frequently mentioned by the respondents were related to responsibility. The level of employee identification with the corporate brand is very strong, as demonstrated by the score of 82 out of 100. In the survey, business partners highlighted such advantages of the relationship with GAZ-SYSTEM S.A. as equal treatment afforded to all parties, operational effectiveness, responsiveness to customers' needs and professionalism of employees. The general perception is that the company has set the right directions for its growth and should carry on pursuing them. While local authorities are also positive about the cooperation with GAZ-SYSTEM S.A., some of them have expressed the need for more active policies designed to inform stakeholders of on-going and upcoming investment projects.

The company continuously develops its responsible approach to business and to this end, in 2013, it is planning to implement the ISO 26000 standard and integrate it with the currently operated Integrated Management Systems (for environment, quality and OHS).

CONCLUSIONS

Our consistent and long-term CSR policy which is fully integrated with the company's business strategy have brought measurable benefits to GAZ-SYSTEM by enhancing employee commitment and community trust levels. Socially responsible company management also translates into improved relations with stakeholders (business partners, financing institutions). The change of management philosophy allowed the company to build new economic, social and environmental capital. It also enabled the development of new competencies within the organisation and the fulfilment of new ambitious challenges related to the execution of investment projects that lead to improved competitiveness of the economy and energy security in Europe. This management model supports an effective creation of shared value and responsiveness to the expectations of customers and local communities as regards the company's commitment to promoting community interests. GAZ-SYSTEM S.A. brought a new quality to building stakeholder relations based on the responsibility of the company and its employees for their actions and for creating value also for the communities they operate in.

ABSTRACT

Purpose: *This research studies how the security-related outsourcing strategies and negotiation power of the public sector and the military and the relevant logistics service providers influence for indirect logistics costs.*
Design/methodology/approach: *A tentative model was devised from theoretical literature comparing how logistics strategy and negotiating power impact for total logistics costs through improved service quality and/or unit-cost reductions. The model was tested using survey data from 149 respondents from the Finnish Defence Forces, and the public sector and industrial firms in Finland via structural equation modelling analysis.*
Findings: *Contrary to the approach of classic assumption, where negotiating power correlates with strategy, the findings indicate that negotiating power and strategy do not correlate. However, together they affect direct costs and perceived service quality, which consequently decreases the indirect logistics costs.*
Research limitations/implications: *By understanding different impacts of strategy and negotiation power on direct logistics cost and perceived service quality, buyer of the logistics services may increase the service performance of their supply chain. The data is collected from one country, which may cause bias. Further studies would be required to test this research proposal in other countries.*
Practical implications: *To obtain improve service performance of the supply chain, buyers of logistics services could learn from the public sector and the military on how to use negotiating power and strategy to obtain better service in addition to short-term cost reductions, as both of them explains reduced costs in the long run.*

Originality/value: *This study is important to practitioners as well as academics since there is little quantitative research available regarding importance of logistics strategy and its impact to negation power and service performance of the supply chain.*

Keywords: Logistics strategy, negotiating power, service performance, structural equation modelling, supply chain management, military logistics
Classifications: a. Research paper

INTRODUCTION

According to Mentzer et al. (2001), supply chain management (SCM) can be seen as "the systemic, strategic coordination of the traditional business functions within a particular company and across businesses within the supply chain, for the purposes of improving the long-term performance of the individual companies and the supply chain as a whole". Because SCM tends to work best under circumstances where buyers have more leverage than suppliers (Cox, 2004a), and because the military is often a powerful logistics service buyer, we assume that its procurement activity would provide an interesting context for studying the influence of strategy and negotiation power for logistics costs. However, it is important to remember that there are usually several other factors influencing logistics costs, such as confidence and supply chain agility, which are not considered in this study.

Willcocks et al. (1999) argue that in the military, only non-core activities or its in-house core activities involving a partnership to mitigate the risks of outsourcing can be considered suitable functions for outsourcing. In the military context, there is no room for opportunistic behaviour especially among logistics service providers because failure of a supply chain to provide for forces operating in enemy territory can lead to enormous losses (Song et al., 2000; Juntunen et al., 2012). In Finland, the majority of the military is made up of reservists and thus having also adequate domestic transportation services is always important for the Finnish Defence Forces (Juntunen et al., 2011a). Further, in Finland, the military cooperate with the security-related functions of the public sector as much as possible in their daily routines and hence the both, military and public sector, have to use service providers they can trust during crisis situations. Further, military buy logistics services with a large and thus also LSPs (logistics service providers) are eager to have the military forces as their customer (Juntunen et al., 2011b).

The purpose of this research is to study how the effective strategies and negotiation power of the public sector and the military and the relevant logistics service providers influence for indirect logistics costs via service quality and direct logistics costs. To retort for this question, a tentative model is devised from theoretical literature and the model was tested using survey data from 149 respondents from the Finnish Defence Forces, and the public sector and industrial firms in Finland via structural equation modelling analysis.

We found that contrary to the approach of classic assumption, where strategy explains negotiating power, the findings indicate that strategy and negotiating power do not have statistically significant relationship. However, together they affect direct costs and perceived service quality, which consequently decreases the indirect logistics costs. Hence, to obtain improve service performance of the supply chain, buyers of logistics services could learn

from the public sector and the military on how to use negotiating power and strategy to obtain better service in addition to short-term cost reductions, as both of them explains reduced costs in the long run.

The paper first presents a theoretical background with tentative model based on previous research in logistics, service and relationship management. The following sections explain research methods and present the empirical data with the empirical analysis. Finally there will be discussion and conclusions which include also limitations and suggestions for further research.

THEORETICAL BACKGROUND

The concepts employed and their interconnections

According to Langley and Holcomb (1992), the value created through logistics has been viewed as one of cost efficiency versus competitive service levels. Another important aspect is the use of strategic alliances and long-term partnerships to secure both goods and services (e.g. Gentry, 1996) and all of these considerations is important when it comes to military logistics. Cost efficiency and service level need to endure within industry standards while simultaneously securing an adequate logistics capacity during unexpected crises (Juntunen et al., 2012). Hence, there is a strong agent-principal problem; how to make sure that LSPs are willing to provide first class services during crises situations? Further, according to Adam Smith (1776), incentives for agents are the dominant factor for efficiency. Because several contracts are vague or silent on a number of key issues and can give a room to opportunistic behaviour (Tirole, 1999), the contractual dilemma is a possible problem where the divergent interest between agent and principal will predictably lead to individually opportunistic behaviour and joint losses (Williamson 1971). Thus, security sector need to evaluate carefully what they can outsource, and especially, what kind of outsourcing strategy they have. In addition, it is a critical task for managers to understand and mitigate abnormal behaviours across the supply chain and agency theory serves this need by providing them with a useful tool to respond to transaction cost dilemmas through contractual and non-contractual remedies (Fayezi et al., 2012).

The classic economics standpoint is that in the long run there is a trade-off between service quality and costs (Juntunen et al., 2010), however, there are also studies which found that this trade-off may exist between direct cost and service quality but not between service quality and indirect or total costs (e.g. Juntunen et al., 2012). Unfortunately, because the relevant literature shows important discrepancies regarding the activities that should be included in the definition of logistics costs and there is no agreement on a exact definition of logistics costs, (Gonzales et al., 2007; Juntunen and Juntunen, 2010; Juntunen et al., 2012), this trade-off is challenging to study. Solakivi et al. (2009) divide logistics costs into direct and indirect costs where direct logistics costs include transportation and the cost of warehousing, whereas the sharing of indirect costs is much more difficult to determine because these are often in-house costs that may possibly be combined with various different functions. However, expenses related to physical operations are often quite clearly specifiable (Solakivi et al., 2009). In this research, we follow Juntunen et al. (2012) definitions where the term “direct logistics costs” includes transportation and warehousing costs, and “indirect logistics costs” includes

personnel costs and total logistics costs. In addition, because logistics costs do not have a specific universally-accepted definition even in the relevant literature, in this research respondents have given their answers based on their personal view of logistics costs in their line of business (e.g. Juntunen and Juntunen, 2010).

It is widely accepted decades ago that structure of the organization follows strategy (e.g. Chandler, 1962; Jones & Hill, 1988), and structure is the design of the organization through which the enterprise is administered. This can be extended for supply chain, and for example tight competition of suppliers weakens strategic networks and hence increases transaction costs (Jarillo, 1988). In addition, the industry structure view proposes that supernormal returns are mostly a function of a firm's membership in an industry with favorable structural characteristics (Porter, 1980; Dyer and Singh, 1998) and superior performance is a product of the correct "fit" between strategy and structure (Jones and Hill, 1988). Further, it is reasonable to assume, that management skills explains quality of strategy, and for example Grunert and Norden (2012) argue that management skills and character is positively related to bargaining power in SME loan bargaining. Hence we assume here that in addition to costs and performance of the supply chain, strategy influence also for bargaining power.

According to Juntunen et al. (2011a), a mathematical form of the Nash's (1951) negotiating model can be applied to logistics costs and the resulting profit sharing will reflect the relevant negotiating power. Because negotiating power consequences from factors such as market situation and relationship-specific assets among other things, negotiating power can be expected to influence direct logistics costs and of course also observed service quality.

Research model and hypotheses

According to Juntunen et al. (2011a; 2011b), the military does have considerable power as a buyer, but its negotiators must sustain a long-term perspective on outsourcing as the logistics services used must be capable of extreme efficiency even during a crisis. Further, military is very important customer for Finnish LSPs (logistics service providers) and thus also LSPs are willing to build up a strong strategic partnership with the military (Juntunen et al., 2011b). Therefore, we assume that the military, security sector and Finnish LSPs are willing to build up strategies that support cooperation and use their negotiation power to strengthen long-term partnership. In addition, because we study in this research deep partnerships, we assume that strategies of different actors support each other and hence respondents can actually evaluate their own strategy and it should affect also for their evaluation concerning military force's negotiation power. Hence our first hypothesis *(H1)* is that *existing strategy explains negotiation power*. Further, as strategy may influence also transaction costs and performance of the supply chain (e.g. Jarillo, 1988), our second hypothesis is that *existing strategy explains direct costs (H2)* and our third hypothesis is that *existing strategy explains experienced service level (H3).* The research model is developed based on Juntunen's (2010) outsourcing strategy model. It is expected that strategy may influence either direct costs or service quality.

Based on Nash (1951), negotiation power should influence for logistics costs and based on Juntunen et al. (2012) negotiation power should affect for service quality, we assume that *negotiation power explains direct costs (H4)* and *negotiation power explains observed*

service quality (H5). Finally, following Juntunen et al. (2012), we assume that *direct costs influence to indirect costs (H6)* and the *level of service influence to indirect costs (H7)*.

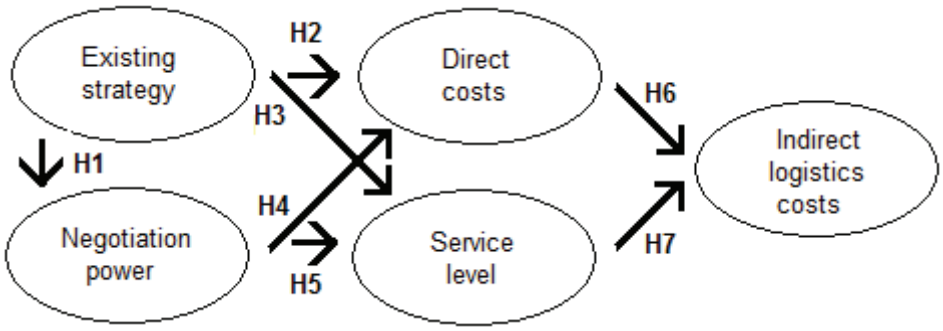

Figure 1: Research model

The concepts in the model can be seen as factors (or latent variables) that are not directly observable but can be concluded from other measurable variables. The operational measures were presented in a questionnaire as attitudinal statements based on a 7-point Likert scale. The anchors for questions related to service level were "weak" and "excellent" and all the other questions were anchored by "strongly disagree" and "strongly agree". The descriptions and the operational measures of the concepts are presented in Table 1.

Table 1: Latent variables and their operational measures

Latent variable	**Explanation and operational measures in the questionnaire**	**Label**
Service level	Refers to service levels experienced/produced	SERVICE
	• Recent experience of logistics service related to adhering to schedules	schedule
	• Recent experience of logistics service related to offering sufficient capacity	capacity
	• Recent experience of logistics service related to service-mindedness of personnel	service
Indirect costs	Refers to how outsourcing has decreased/is assumed to decrease the public sectors' and military's indirect logistics costs	INDICOST
	• Outsourcing has reduced total logistics costs	costlog
	• Outsourcing has reduced logistics personnel costs	costper

Latent variable	Explanation and operational measures in the questionnaire	Label
Direct costs	Refers to costs from physical logistics such as transportation and warehousing	DICOST
	• Outsourcing has reduced warehousing costs	costware
	• Outsourcing has reduced transportation costs	costtran
Existing strategy	Refers to the usage of the strategy in the respondents organisations	STRAON
	• We have made a logistics strategy in my organization	ologstra
	• Logistics strategy is informed in our organization and it has been take on use.	stratuse
	• Our logistics strategy is clear in leaded by top management	clearstr
Negotiating power	Refers to negotiating power with customers	POWER
	• Tight competition means customers can dictate the fees for transport	price
	• Transport entrepreneurs are "slaves" to the customers	slave
	• LSPs' expertise and impact do not affect their results, because customers take all the extra profits from the LSP branch	takeprof

METHODOLOGY AND ANALYSIS

Data description and estimation method

The data was collected in the spring of 2009 from the military, the security-related public sector and private industrial companies using web-based software. The sample size was 827 and we received 149 responses (18.01 %), which is quite acceptable considering recent developments in response rates (Larson, 2005). A non-response bias was studied by comparing different response waves (e.g. Armstrong and Overton, 1977) and in this study only 11.55 per cent of the responses in the entire questionnaire were not parallel in different waves. Hence, non-response bias seems not to be a problem in this study.

Responses originate from three groups. There were 45 respondents from the military, 33 respondents from the public sector and 71 from private enterprises. The respondents' organisations and companies from the public and private sectors represented were security related, and the non-military respondents from the private sector were requested to relate their

answers solely to their business relations with the military. Private sector companies are a vital part of the security sector in Finland, because there the military relies heavily on reservists. Respondents from the public sector included police and fire service personnel and health-care providers, whose organisations each have a duty to guarantee public safety and so to preserve functionality in crisis situations. Respondents included customer-relationship managers, service-production managers, brigade commanders, supply centre managers, rescue managers and materials managers (please see Appendix 1 for descriptive statistics relating to the groups). Even though minor differences among the responses, we continued on the structural equation models path because heterogeneous data should not be a problem if the structural equation model provides an acceptable fit (e.g. Juntunen et al., 2012).

The estimation was made using Lisrel software (Jöreskog et al., 2000; Jöreskog et al., 1993a). The normality of the variables was examined using Prelis 2 software (Jöreskog et al., 1993b) and the factor loading estimates, regression estimates between factors and estimates of the error terms were calculated using the ML (maximum likelihood) method based on a covariance matrix.

Data analysis

The research model was tested using the operational measures described above. Unexpectedly, despite the strength of the theoretical background to the research model, empirical analyses did not support the model as suggested (please see figure 2).

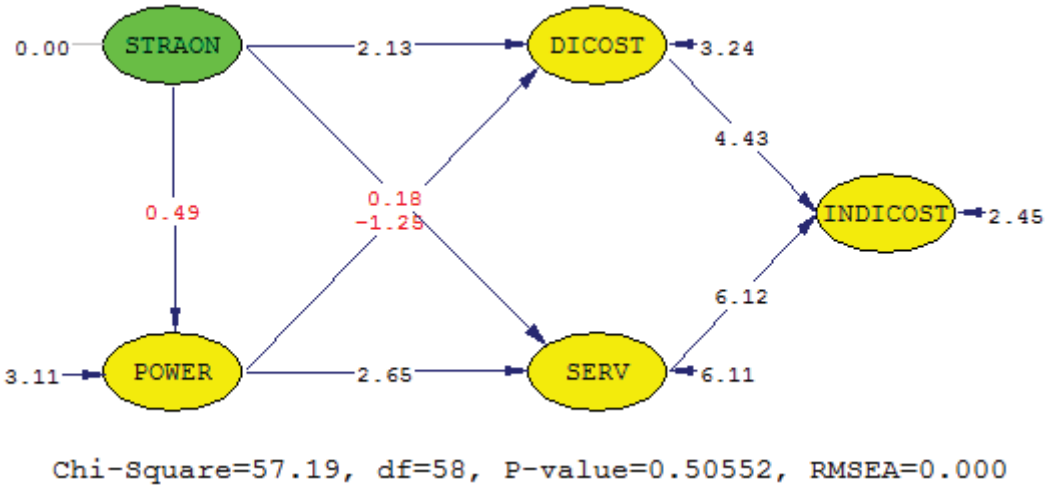

Figure 2: T-values in structural model

As seen in the figure 2, some relationships in the structural model are statistically insignificant level (t-values below 1.96 with red font – t-value 1.96 stands for 5 per cent probability). However, when removing statistically insignificant relationships, very interesting model was found. The new model is shown in Figure 3.

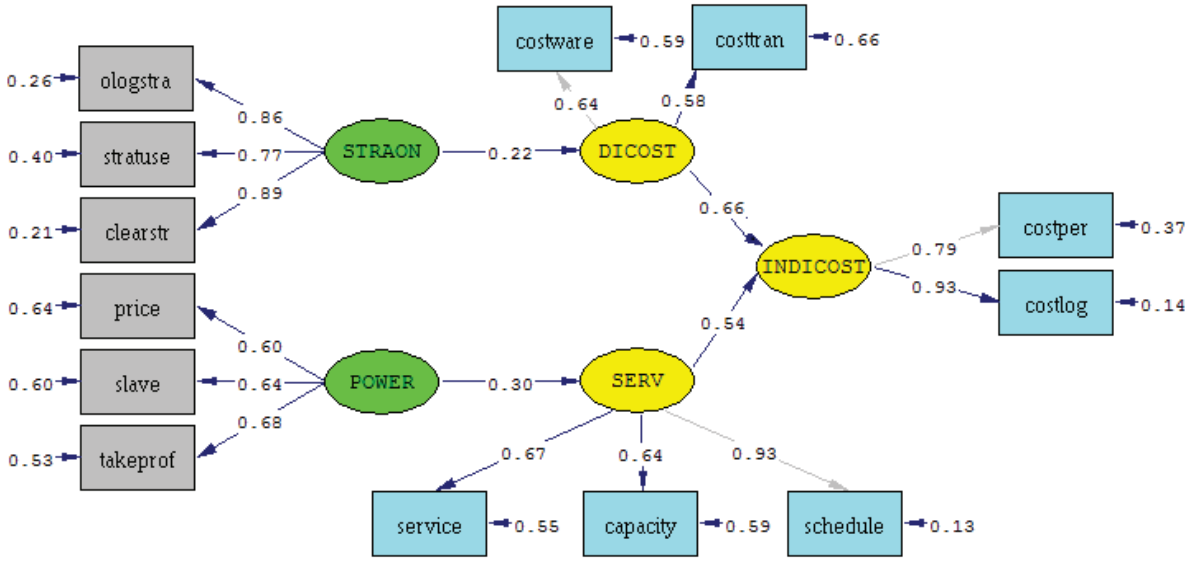

Figure 3. Empirical model

The empirical model provides a good statistical fit (see Table 2), and therefore recommendations based on the model will be clarified in the discussion below.

Table 2: Fit indices of empirical model

Test	**Value**	**P-value**
Chi-square (degrees of freedom)	57.86 (60)	0.554
RMSEA	0.046	
NFI	0.93	
CFI	1.00	
GFI	0.94	
SRMR	0.056	

Furthermore, all relationships in the model are statistically significant. The Chi-square test shows a very good fit of the model to the data, with the minimum acceptable p-value normally being 0.05. According to Browne and Cudeck (1993), an RMSEA value below 0.05 indicates a close fit of the model. Jaccard and Wan (1996) argue that the model's CFI, NFI and GFI value should be above 0.90. Thus, based on the all test values, the model can be

considered acceptable. Also, each latent variable has been examined individually (see Table 3).

Table 3: Construct reliabilities, average variance extracted and Cronbach's alphas.

Latent variable	**CR**	**AVE**	**ALPHA**
DICOST	0.545	0.427	0.562
STRAON	0.880	0.680	0.880
INDICOST	0.853	0.598	0.822
POWER	0.676	0.552	0.599
SERVICE	0.798	0.633	0.802

As direct logistics costs factor have only two measures, it remain unidentified without a complete structure and it is impossible to perform factor analyses of individual latent variables. This also weakens the usability of traditional test values such as construct reliabilities (CR), average variance extracted (AVE) and Cronbach's alpha (ALPHA), therefore, the results should be evaluated primarily on the basis of the fit indexes of the full model and on the theoretical background of the measures (e.g. Juntunen, 2010; Juntunen et al., 2010; Juntunen et al., 2011a; Juntunen et al., 2011b; Juntunen et al., 2012). For the most part, the CR, AVE and APLHA values also support the good statistical fit of the model. To conclude the analyses, in accordance with our empirical evidence, we reject hypothesis one, three and four but find support for hypothesis two, five, six and seven.

DISCUSSION AND CONCLUSIONS

The purpose of this research was to study how the effective strategies and negotiation power of the public sector and the military and the relevant logistics service providers influence for indirect logistics costs via service quality and direct logistics costs. More precise, we had seven hypotheses and we rejected hypotheses one (H1 - existing strategy explains negotiation power), three (H3 - existing strategy explains experienced service level) and four (H4 - negotiation power explains direct costs). We accepted hypotheses two (H2 - existing strategy explains direct costs), five (H5 - negotiation power explains observed service quality), six (H6 - direct costs influence to indirect costs) and seven (H7 - he level of service influence to indirect costs).

Interestingly we found that contrary to the approach of classic assumption, where strategy explains negotiating power, the findings indicate that strategy and negotiating power do not have statistically significant relationship. Thus, we suggest that strategy is a long-term

concept and changes to company's positioning in the markets at the long-run while negotiation power is dependent situation at the moment of negotiation, and hence there is no direct relationship between those concepts but they need something, like current market situation, between them. Further, we found that existing strategy explains reducing direct cost but it does not explain perceived service quality. We propose that strategy influence whether buyers use expensive or cheap LSPs, but those who use cheap ones do not differentiate between poor and good quality because their strategy is to use cheapest LSP and thus they have never faced good service quality. Negotiation power does not influence for direct costs as markets defines prices and even the strongest buyers cannot bargain below market prices, however, buyers with strong bargaining power face good service as LSPs are willing to secure their relationships.

Together strategy and negotiation power affect direct costs and perceived service quality, which consequently decreases the indirect logistics costs. The most important theoretical contribution of this paper is that even it seems that Nash's (1951) famous negotiation model does not work under competitive markets with the direct market prices; it works in the long run through service quality and indirect costs. In managerial perspective, buyers of logistics services could learn from the military on how to use negotiating power and strategy to obtain the both, better service and short-term cost reductions, as together those explain reduced costs in the long run. In practice, buyers should keep a few strategic partners without bidding games but instead follow market prices and also reward the best LSPs based on good service level. This kind of deep partnership may prevent LSPs' opportunistic behaviour and hence also reduce problems described in agent theory.

At the spring of 2009 (the timing of the survey), global economic slowdown was underway, which may have affected the choices respondents made. Further research would be needed to validate the results in the wider business sector. Further, the term "logistics costs" is often problematic in survey studies, thus more research would still be necessary in future to validate instruments for enhanced measurement of logistics costs in surveys. In addition, the context of logistics has not been widely studied from a corporate-branding perspective, and there are multiple additional dimensions, such as trust and relationships, which were not taken into account in the present study. All these new concepts might offer several new avenues for logistics services research.

ABSTRACT

Many developing countries have tried to increase firm provision of training by providing subsidies funded by taxes proportional to the firm's wage bill. These training funds, however,may backfire if the adverse effect of the tax on training incentives outweighs the positive effects of the subsidy. We show that the value of these training funds depends critically on the extent to which firms are liquidity constrained. If the effective firm discount rate is low, the disincentives outweigh the benefits. Using an administrative dataset on the Mauritius training fund, we show that larger, high-wage and more capital intensive firms are the most likely to offer to training without the subsidy, but that the subsidy creates an increased incentives for small firms to train. As a result, the largest firms pay more in taxes than they gain in subsidies while the smallest firms receive more benefits than they pay in taxes. Consequently, the program shifts net training investments away from the firms that would normally have the greatest return from training and toward smaller firms that would normally have the lowest return from training. It is doubtful that the program actually raises the incidence of training overall.

INTRODUCTION

One of the most intensively studied issues in labor economics over the past twenty years is whether active labor market policies improve economic outcomes. While the earliest studies reviewed by Heckman et al (1999) generally failed to find positive results, more recent reviews by Betcherman et al (2004) and Card et al (2010) have found more supportive evidence for the most common intervention, training.[1] The most successful training programs in both developed and developing countries appear to focus on on–the-job or firm-based training.

A common funding source for the training programs is to tax the firms that are also targeted for training programs. The earliest programs in Belgium, Cyprus, Denmark, France and the Netherlands began as narrowly focused sectoral training programs in the 1960s and 1970s. All represented some form of partnership between unions and firms in a specific sector accompanied by government coordination. The rationale for these funds is a presumption that firms under-invest in training in the absence of government intervention. The most common argument is that training increases the value of a worker in many firms and not just one, meaning that the firm that invests in training risks losing the investment if the worker is hired away by another firm. Using Becker's (1993) terminology, the greater the share of the training that is general rather than firm-specific, the greater the incentive for firms to free ride on the other firms' investment by raiding their trained workers rather than investing directly. This rationale makes the most sense when there are many firms using similar skills such as in a single industrial sector. The sectoral training agreements common in Europe allow all the firms to agree to pay equally for training through the payroll tax and then share in the benefits, forcing all firms to internalize the training externality.

In developing countries, it is more common for central governments to impose training fund programs across sectors without the explicit participation by labor collectives or firms.[2] These policies have been most popular in Latin America and Sub-Saharan Africa who each represent 27% of the total programs reviewed by Johanson (2009). Because these programs are not focused on a common set of skills, they invariably involve cross–subsidization of training intensive firms by others and so the justification for the European training programs does not hold. Nevertheless, these programs could address a second possible externality if there are returns to scale in the provision of generally valued skills. By pooling funds through the tax system and coordinating training through approved providers or direct government provision, the government can lower the unit cost of training. Absent that coordination, individual firms would end up paying much higher prices per unit of training and many would simply forego undertaking that expense.

[1] Classroom and workplace training represent 42% of all active labor market policy in developed countries (Card et al , 2010, table 3) and in developing and transition economies (Betchermanetal, 2004, table 4).
[2] See CEDEFOP(2008) for a summary of European training fund programs.

The rationale for government intervention in the provision of training is much weaker if the skills are specific to a single firm.[3]There is no incentive for other firms to poach trained workers whose skills have no added value outside the firm that provided the training, and so the free-rider problem does not exist. Because the skills are unique, there are no returns to scale in the provision of training. The only plausible rationale remaining for government intervention is that firms face liquidity constraints that prevent them from investing efficiently in their workers. In that case, it is possible that the public training subsidy will cause firms to invest efficiently in their workers.

Even if these market failures exist, it is not clear that they are sufficiently large to outweigh the inefficiencies caused by a payroll tax that lowers the return to investment if the tax is borne by the firm, or returns to labor supply if the tax is borne by the worker. Additionally, costs associated with collecting taxes and administering the training funds are unnecessary if the firms would have invested in training without the program. However, past studies have not examined whether these training fund programs are cost effective. Johanson's (2009) comprehensive review of 62 national training funds concludes that despite vast amounts spent on training, evaluation has been largely anecdotal and limited to assessments of outcomes against targeted levels. This is particularly true in developing countries where studies have yet to establish that firms face lower marginal costs of training or increase their training investments as a result of the training funds.

The need for evaluations of training funds is particularly urgent in Sub-Saharan Africa which faces the need to accommodate the fastest growing labor force in the world.[4] There are numerous areas where public dollars could be used to enhance job growth, and so investments in training carry a high opportunity cost. When asked what factors hinder business growth, African firms rank insufficient job skills as 11th most important, behind such factors as transportation, access to electricity, input costs, access to financing, and political instability. It is not obvious that training is the best use of scarce resources.

This paper use the Mauritius Training Fund as a case study of the performance of training funds. We examine whether the firms that engage in training are those that would be predicted to train in a standard Becker(1993) model of training or if the training fund alters the incentives to train. Next, we examine the implied patterns of cross-subsidization from the firms paying into the system to the firms receiving the training subsidies. That analysis shows which industries are taxed in order to subsidize others and whether small firms subsidize large firms or vice versa. Finally, we examine whether there is any evidence that the training raises labor productivity.

We find thatthe training subsidy does increases training for the smallest firms that would not otherwise train without the subsidy. However, large, capital-intensive, high-wage firms that would be expected to have the greatest incentive to train without the subsidy end up paying more in taxes than they receive in subsidies. Furthermore, the subsidies focus on classroom training

[3] Even with general skills, the firm might still provide training without government intervention if informationa asymmetries or other labor market rigidities make workers immobile (Acemoglu and Pischke, 1998, 1999).
[4] Statistics cited here are from McKinsey and Company (2012).

that has the lowest returns rather than on in-house training that has the highest returns in evaluations. We conclude that in Mauritius, for medium and large firms, the adverse effect of the tax on training outweighs the incentive effect of the subsidies. As a result, the training fund may well lower rather than raise the incidence of training in the country.

THE MAURITIUS TRAINING FUND

Following the Human Resource Development Act of 2003, allregistered firms in Mauritius are required to pay a training levy. The tax is proportional to the firm's total base wage bill, the aggregate of wages paid workers excluding overtime, bonus and benefits. The government then uses this money to reimburse firms for a portion of their training costs. In principle, firms can be reimbursed up to ten times the tax they pay into the training fund. The reimbursement rate falls as the total expenditure on training increases, but the reimbursement can still be as high as five times the training levy paid for the most training intensive firms.

The stated objectives of the training fund are to (i) promote human resource development in line with national economic and social objectives, (ii) stimulate a culture of training and lifelong learning at the individual, organizational and national levels for employability and increasing productivity; and (iii) provide the necessary human resource thrust for successful transformation of the economy into a Knowledge Economy. Only the last of these is sufficiently concrete to enable an evaluation, suggesting that the program should atypically induce training in the technology sector or other sectors that use information technologies.

Table 1 presents summary information for firm training using our industry and firm size cells. In all 9 sectors, training intensity rises with firm size. Propensity to train varies by sector between 6-10% for the smallest firms to 23-47% for the largest firms. Consistent with the stated objective to encourage the growth of the knowledge economy, training intensity is highest in Information Technology and Finance.

Nevertheless, one might expect that such a policy should have inducedmost firms to invest at least modestly in training every year, and yet only 9% participated in FY2008. One problem is that the training subsidy requires substantial paperwork, use of approved trainers, and prior approval of the training curriculum. The training is also subject to minimum participation of 10 workers if the training is offered in the workplace. These restrictions clearly limit the potential participation of smaller firms that may not have enough workers to train or sufficient expertise to manage the paperwork, consistent with the pattern of training by firm size found in Table 1.

However, the training fund is not necessarily geared to benefit large firms either. The program focuses on reimbursement for formal training with greater restrictions on training offered in firms rather than classrooms. However, the most common forms of training in Mauritius as in other countries are on-the-job and/or in house training (see Figure 1). Training provided by institutions has been declining in importance with firms complaining the skills are too generic to meet their needs. Other types of training such as reimbursement for tuition from overseas institutions, for domestic Master's training, or for bringing in a foreign expert represent a small

share of disbursements. And yet it is on-the-job training and in-house training that have been singled out as particularly effective in evaluations conducted in developed, transition, and Latin American economies (Betcherman et al, 2004).

If the training fund is eliminating a market failure due to liquidity constraints that constrain firm incentives to train, one would expect the program would have broad participation. Instead, Figure 2 shows that taxes levied on firms typically exceeded the training grants disbursed, so much so that the training levy was cut in half in FY2009. Only 9% of the firms provided training in the period we examine and the World Bank (2011) estimates that only 20% of firms have provided formal training that could qualify for reimbursement in the past. This level of training is below the 30% training incidence for Sub-Saharan Africa reported by Johanson (2009).

Training funds have been underutilized in other developing countries as well, causing the funds to be repurposed to other uses (eg Costa Rica, Gabon , Togo, and Zimbabwe). In some places, the funds were used to create a large government training bureaucracy rather than assisting firms (Colombia, Venezuela). In Mauritius, the number of private training institutions is increasing even as their share of training provision is declining and firms are complaining about their services.

Even if the Mauritius training fund is not fully utilized, it may still increase the propensity to train. To assess that, we need to establish a model of expected training in the absence of the government program. We turn to that next.

THEORY

Becker's (1993) theory of on-the-job training provides a useful framework for our evaluation, allowing us to predict which firms would participate. A firm's incentive to invest in training depends on the anticipated returns to training compared to the opportunity costs and direct costs of the training. Let $T_i$be a dummy variable that indicates whether the i^{th}firm invests in training. Training will occur if the expected net return from trainingR_i is positive. Probability that firm i trains is

$$\Pr(T_i = 1) = \Pr(R_i > 0) \quad (1)$$

R_i will take the form

$$R_i = N_i(\pi - \tau)[(\sum_{t=1}^{M}\left(\frac{1}{1+r}\right)^t)(T_i W_{it}^T + (1 - T_i)W_0^O)] + N_i(\pi - \tau)(1 - T_i)W_0^O$$

$$-N_i T_i W_0^O(1 + \tau) + N_i T_i(S_{i0}^T + \varepsilon_i^T - C_{i0}^T) \quad (2)$$

where$M$ represents the firm's time horizon over which it anticipates employing N_i workers. The firm earns a markup π on the wages it pays. The firm's cost of labor includes a tax rate, τ. The

firm must pay taxes into the training fund, whether or not it trains. If the firm trains, it pays the post-training wage, W_{it}^T for all $t>0$. If the firm does not train, it pays workers a constant base wage,W_0^O for all M periods. If the firm trains in period 0, it gets no output in period 0 but pays out the worker's opportunity wage along with the tax levy, $W_0^O(1+\tau)$. The remaining terms incorporate firm-specific costs and benefits from training, where the direct cost of training is C_{i0}^T, thetraining subsidy from the government is S_{i0}^T, and the firm also earns an unobservable positive or negative incremental per worker return to training, ε_i^T, that is known to the firm but not the econometrician. The marginal return to training is

$$\frac{\partial R_i}{\partial T_i} = N_i(\pi-\tau)[(\sum_{t=1}^{M}(\frac{1}{1+r})^t)(W_{it}^T - W_0^O)] - N_i(\pi+1)W_0^O + N_i(S_{i0}^T + \varepsilon_i^T - C_{i0}^T) \gtrless 0 \qquad (3)$$

If $\frac{\partial R_i}{\partial T_i} > 0$, the firm should invest in training. If negative, the firm will not train.Factors that make $\frac{\partial R_i}{\partial T_i}$ more positive will raise the probability of training. To begin, we assume that $W_t^T > W_0^O$ so that training raise worker productivity.[5] It is also requires that $\pi > \tau$ so that the profit from raising a worker's marginal product exceeds the taxes that would be paid on the resulting wage increases. $\frac{\partial R_i}{\partial T_i}$ becomes more positive and so likelihood of training increases with increases in the mark-up over wages π, increases in the training subsidy S_{i0}^T, increases in the productivity of training as proxied by the wage gap $(W_{it}^T - W_0^O)$, and increases in the unobserved profitability from training ε_i^T. The probability of training also increases with smaller tax levy imposed on the induced increase in wages, τ;with smaller interest rates that reduce the present value of future returns to training, r;and with smaller training costs C_{i0}^T.

The theory demonstrates the potential problem with training funds that generate revenues through taxes on wages. Training will raise wages and so the training fund policy taxes the return on training even as it lowers training costs. There is no guarantee that the policy will raise aggregate training in the economy.The training fund is most effective when firm's face liquidity constraints as represented by high interest rates r. The reason is that $\frac{\partial^2(\frac{\partial R_i}{\partial T_i})}{\partial \tau \partial r} > 0$: the tax does not affect the present value of training as much when the firm is discounting the future more heavily. However, if the constraints on liquidity are modest, the tax levy becomes more costly and the likelihood that the training fund increases probability of training diminsishes.

If the costs of training $C_{i0}^T$and the subsidy $S_{i0}^T$are constant and do not vary with firm size, equation (3) implies that there will be no size-bias in the incidence of training. In other words, C_{i0}^T and/or S_{i0}^T must be nonlinear in N to generate the size-bias we observe in the training data. Either or both of the following specifications could generate the rising incidence of training as firm size increases

[5] Training cannot lower productivity from the base level, but it is possible that the training adds no value so that $W_t^T = W_0^O$. In that case, the only reason the firm would engage in training is that the subsidy S_{i0}^T is so large that it fully compensates the firm for the lost production while the firm trains.

$$C_{i0}^T = \frac{c_0}{N_i} + C(N_i);\ C'(N_i) \leq 0 \quad (4A)$$

$$S_{i0}^T = S(N_i); S'(N_i) \geq 0 \quad (4B)$$

Equation (4A) suggests that firms face a fixed cost of participation due to paperwork involved in applying or validating the training and providing the required accounting to the government. Average cost of training falls with the size of the firm because these fixed costs are spread over a larger number of trainees and also because there may be increasing returns to training such that $C'<0$.[6] Even if the marginal cost of training is constant as N_i increases, there will be falling average cost of training as firm size rises. As for $S'(N_i) \geq 0$, the requirement that the firm have a minimum number of trainees to qualify for a subsidy generates a subsidy that increases in N.[7]

The theory suggests that there should be rising incidence of training as firms increase in size, as the subsidy increases in value, as training costs decrease, and as wages rise relative to the untrained wage. We test all these propositions in the next section.

EMPIRICAL SPECIFICATION

The theory suggests two specifications. The first treats training as a dichotomous variable. Using (3), we infer that T_i=1 if

$$I = (\pi - \tau)[(\sum_{t=1}^{M} (\frac{1}{1+r})^t)(W_{it}^T - W_0^O)] - (\pi + 1)W_0^O + S_{i0}^T - C_{i0}^T > -\varepsilon_i^T$$

If we approximate the index function $I(\cdot)$ by its reduced form, we have

T_i=1 if $I(\pi, W_{it}^T, W_0^O, \tau, C_{i0}^T, S_{i0}^T, N_i) > -\varepsilon_i^T$
T_i=0 otherwise (5)

If the unobserved return to training $\varepsilon_i^T \sim N(0,1)$, then (5) defines a probit equation. If instead, we have a continuous measure of training intensity, as for example if T_i is measured as the training cost as a fraction of total compensation, then the reduced form will be

$$T_i = f(\pi, W_{it}^T, W_0^O, \tau, C_{i0}^T, S_{i0}^T, N_i, \varepsilon_i^T) \quad (6)$$

[6] Black et al (1999) show that there are economies of scale in training that favor large firms.
[7] We can redefine T_i as training intensity such that $0 \leq T_i \leq 1$. That would make sense, for example, if firms invested between 0 and 100% of the workers time in the first period in training. In that case, firms that train will invest optimally by setting $\frac{\partial R_i}{\partial T_i} = 0$ in (3). For an interior solution, firms must face increasing costs of training or decreasing returns to training.

which we can approximate using ordinary least squares.

In our application, the training levy tax rate τ is the same for all firms and we assume the markup over the wage π is also fixed in expectation across firms. The base wage W_0^O should also be the same across firms in the same industry. Mauritius is a small island economy, and so it is logical to assume that worker mobility will equalize sectoral base wages throughout the island. Consequently, sectoral variation in W_0^O can be controlled using sector-specific dummy variables.The remaining observable explanatory variables in (5) and (6) that vary across firms include W_{it}^T, C_{i0}^T, S_{i0}^T, andN_i.

DATA

Our data source is an administrative data set that includes training levy, firm size and firm sector information for the universe of all registered firms in Mauritius in 2007. The data set also includes accounting data for about 30 % of the firms in 2007. The data are sufficient to allow us to approximate the information we need to evaluate the determinants of training in Mauritius.

Endogenous Variables

We have two measures of $T_i$available in the data set:

Training Incidence:A dummy variable equal to 1 if the firm trained in 2007.Only 9% of the firms reported training expenditures in 2007.

Training Intensity: The log of total training expenditures per employee in 2007. This measure presumes that when a large firm only trains a single worker, that represents a less intensive training investment than if a small firm trains its lone employee.

Exogenous Variables

The key regressors we require are measures of firm wages, training costs and the anticipated subsidy. The Mauritius administrative data did not include individual wages or the wage bill for the firm. However, it did include a measure of the aggregate training levy paid by the firm. Regardless of whether they train or not, each firm pays the training levy used to subsidize firm training. The levy is proportional to the firm's base wage bill which is total compensation excluding overtime, bonuses and benefits. That means that the training levy $\tau N_i \overline{W_i}$ where τ is the tax rate, N_i is the number of firm employees, and $\overline{W_i}$ is the average wage in the firm in year *t*. In log form, $\ln\left(\frac{\tau N_i \overline{W_i}}{N_i}\right) = \ln(\tau \overline{W_i}) = \ln(\tau) + \ln(\overline{W_i})$. In regressions, the effect of the tax rate will be captured in the constant term. Because sector dummies controls for variation in W_0^O, the coefficient on $\ln(\tau \overline{W_i})$is interpretable as the elasticity of training with respect to $(W_i^T - W_0^O)$, a proxy of the anticipated return to training.

The Mauritius administrative data provide information on the total cost of training including firm payments and the government subsidy for all firms that participate in the program. We compute an average cost per hour of training by dividing firm payments plus subsidies divided by the total hours of training across all trainees in the firm. To create an expected cost of training for each firm, we divided the data into 9 industrial sectors. Each sector was further subdivided into the three firm size groups defined in Table 1. The average training cost per hour for participating firms in each of the 27 cells is used as the expected training cost, C_{i0}^{T}. We use the log form of this measure.

We use a similar strategy to estimate the expected subsidy in each of the 27 cells. For each company receiving a subsidy in 2007, we compute the ratio of training grants received by the company to the firm's total expenditures on training. A small fraction of firms had ratios greater than 1. Since firms should only get back a fraction of their training costs, we expect this value to be less than one, and therefore set any values greater than one to one. Expected subsidy is the mean subsidy per across all training firms of this measure by sector and firmsize cell. Because these values vary between zero and one we left these as rates rather than converting to logs.[8]

A large literature suggests that there is more need for training in larger firms with more complex production processes and internal labor markets.[9]In addition, returns to scale in training may give larger firms a cost advantage in training provision (Black et al, 1999). Our firm size measure is total employment N_{i0}in log form.

Capital and skill are presumed to be complements in production, and so training is believed to be most important in firms with more complex production processes. Therefore, we include a measure of firm capital $K_{io}$to control for heterogeneity in training needs across firms. We only have capital asset measures for 4013 firms and so we use the log of the mean value per firm in each sector and firmsize cell as the common measure for all firms in the cell.

[8] As many of the values are close to zero, taking the log led to very large negative values for some and values close to zero for others, and so the log tended to exaggerate outliers. In addition, because for numbers close to zero, $ln(1+x)\rightarrow x$, leaving these values in rates did not depart much from the log transformation applied to the other measures.

[9]Doeringer and Piore (1985) showed how firm size led to the creation of internal labor markets, increased firm training, and lower worker mobility. Oi and Idson's (1999) review of the literature shows that worker mobility is inversely related to firm size.. Black et al (1999) show that the incidence of training rises with firm size because large firms have a cost advantage in offering training. Acemoglu and Pischke (1998, 1999) argue that asymmetric information on worker productivity leads to worker immobility that increases firm incentive to train. The asymmetric information they discuss is likely to be more important in large firms.

RESULTS

Training incidence and intensity

We report two specifications of the training equation inTable 2.[10] The results are quite consistent with one another, whether training is measured as a dichotomous variable or as a per worker investment. The results are also consistent with the theoretical predictions implied by equation (3): factors that raise the expected net return on training increase the likelihood that the firm invests. Noting that sector-specific dummy variables are used to fix the value of the base wage W_0^O, a 10% increase in the post-training wage relative to the base wage raises the probability of training by 4.8%. Recall that in the Becker framework, the firm's return to training is proportional to $(W_{it}^T - W_0^O)$, and so higher worker returns in the form of higher wages signal that the firm is making a higher return as well.

The other factors that should raise the returns to training also increase the incentives to train. Firm size and capital intensity both have strong positive effects on firm training probability and intensity. Ten percent increases in firm size and capital stock both raise the probability of offering training by 1%.All of these findings are consistent with a standard model of firm investment in on-the-job training.

Interestingly, expected training costs do not significantly affect the probability of training. That suggests that expected training costs are not an impediment to training, casting doubt on the justification of the training fund.

And yet the probability of training is quite sensitive to the expected subsidy in their sector/firm size cell. The large elasticity implies that relatively small subsidies greatly expand interest in training, holding constant factors that should increase returns to training. On the margin, firms that would not have invested in training without the training fund do invest with the promise of training subsidies. Without the subsidy, training would be concentrated in the largest, capital intensive firms with the most rapidly rising wage profiles.

None of the industry dummy variables are statistically significant individually or jointly. Outside the incentive offered by the subsidy, there is no evidence that the government favors one sector over another. Because training was supposed to target information technologies, these results suggest that the apparent bias toward information technology firms we observed in Table 1 exists because those firms have a greater need to train even without the training fund and not because the training fund is atypically raising training incentives for information technology firms.

[10] The goodness of fit is low, but our dependent variable is whether the firm invested in training in one particular 12 month period rather than the more theoretically appropriate measure which would be whether the firm ever engaged in training. We note that 20% of Mauritius firms train, but only 9% of them trained during our one-year window, an indication of considerable noise in the dependent variable. However, with the huge sample size, we were able to derive reasonable coefficients despite the noisy training indicators.

The question remains as to whether the training fund increases the incidence of training through the subsidy or lowers the incidence of training because of the tax. The consistent pattern of tax levy receipts exceeding disbursements seen in Figure 2 suggests that the nete effect may be to reduce training. We add additional evidence to that effect next.

Cross-subsidization in the Mauritius training fund

While the evidence from Table 2 suggests that firms would respond elastically to the issuance of training subsidies if the program were made more easily available, we have not documented whether the training fund reallocates from some firms and toward others. Table 3 divides the firms into the 27 firm size by industry cells. For each cell, we compute the total training levy paid by firms in the cell, the total subsidies received by firms in the cell, and the ratio of the benefits received to the taxes paid. Ratios above one indicate that the cell group received more in benefits than it paid in taxes while ratios less than one indicate the cell paid more in taxes than it received in training subsidies.[11]We also report the fraction of firms in each cell that engaged in training.

The results show a surprising result: the pattern of cross subsidization is from large to small firms. While small firms are not likely to train in the absence of the training fund, small firms receive more in training subsidies than they pay in taxes. The cross subsidization from large to small firms occurs in every sector. The largest ratios are not the targeted information sectors, but rather agriculture, wholesale and retail trade and transportation.

Moving up the size distribution, intermediate sized firms are more likely than small firms to invest in training, but only in information technology is the ratio of subsidy to training levy larger than it was for the smallest firm. Finance, hotels and information technology are the three sectors that received more in subsidy than they paid in taxes.

Curiously, it is the largest firms that should have the greatest incentive to train without the subsidy, but they are atypically taxed to subsidize the firms with the least natural inclination to train. In every sector but Finance, the ratio of benefits to taxes paid is lower for the largest firms than for the intermediate or small firms. Yet it is these largest firms that have the highest propensity to train in every sector.

Combining the inference derived from Tables 2 and 3, it seems clear that the Mauritius training fund alters firm incentives to train but it does so by taxing the firms with the comparative advantage in training in order to subsidize the firms with the least to gain from training. Coupled with the finding in Figure 2 that the training fund takes in more in taxes than it pays out in subsidies, it seems that the net effect may well be to lower the returns to training for large firms through the tax more than it lowers the marginal cost of training as would be the case if the presumed liquidity constraints on large firms were not severe. It does raise the incidence of training in the smallest firms that may indeed face liquidity constraints on training. Whether this

[11] We also computed cell values in per worker and per firm terms. The ratios were virtually identical.

is a general pattern of training funds in developing countries that tax firm returns to training in order to generate funds used for training subsidies is unclear, but the Mauritian policy is not dissimilar to the most commonly used training funds in Africa and Latin America. Our results suggest that the policy may be counter-productive.

Training effects on firm output and growth

We have only limited ability to examine whether training actually raise labor productivity, and so we offer these estimates as suggestive. Training intensive firms should have higher current productivity and should have greater potential for future growth. We embed the firm's training investment in a standard Cobb Douglas production function.

$$lnQ_{it} = \alpha_0 + \alpha_K lnK_{it} + \alpha_N lnN_{it} + \alpha_T lnT_i + X_{it}'\beta + \varepsilon_{it} \quad (7)$$

Our measure of output is total revenue reported in 2007. For this application, we need to use the actual capital measure and so we can only estimate the production function for about one-third of the firms. For this application, we use the continuous measure of training,lnT_i, as defined by the right-hand columns in Table 2. Note that we need to use predicted values of training to generate an expected level of training given the firm's observable attributes. The reason is that any one year's training level measures the long-run level of training investment with considerable error due to random labor turnover that changes the fraction of employees requiring training from one year to the next. The predicted training level will reflect the long term relationships between firm attributes, taxes subsidies, and propensities to train.

Training may not just change current output but it may change the pace of firm growth. If true, then the training effect may be better captured by equations of the form

$$ln\frac{Q_{it+1}}{Q_{it}} = \gamma_0 + \gamma_K lnK_{it} + \gamma_N lnN_{it} + \gamma_T lnT_i + X_{it}'\theta + \epsilon_{it} \quad (8)$$

Equation (8)is estimated using two alternative outcome measures:

Log Wage Bill Growth:The difference in logarithms of the total levy paid between 2007 and 2008 will be proportional to the growth in the wage bill.We use 2007 measures of capital, labor and training as regressors.

Log Employment Growth: The difference in logarithms of the number of employees between 2007 and 2008.

We report these regressions in Table 4. The production function estimates suggest that a 10 percent increase in training intensity increases current output by4.2 percent.However, training does not appear to affect growth in the wage bill or employment, suggesting that training does not alter the growth prospects of firms. More definitive conclusions would require a longer longitudinal record on training and nontraining firms to see if our cross-sectional production function estimates hold up over longer horizons.However, these results suggest that the benefits

of the training are largely confined to the firm providing the training and that the program does not generate positive externalities that spread to other firms not receiving training subsidies that might raise the growth rate of the economy as a whole.

CONCLUSIONS AND RECOMMENDATIONS

The Mauritius training program is aimed at encouraging firm training by imposing a levy on all firms and then reimbursing them a percentage of the expenses paid for some types of training. The levy is based on the firm's wage bill, meaning that the largest taxes are paid by firms with the most employees and/or that pay the highest wages, the firms that have the highest return to training in the absence of the program. The tax lowers incentive to train, even as the subsidy raises the incentive to train. Our results show that the factors that should increase the incentives to train in the absence of the training fund behave as expected and that training costs do not serve as an impediment to training. While the subsidies do raise the likelihood of training for firms that would not have trained otherwise, the greatest effect is on the smallest firms. As a result, the program disproportionately taxes the largest and most capital intensive firms that would be most likely to train without the program, and disproportionately benefits the smallest firms that would have the least incentives to train.

One problem is that the training subsidies target general skills such as those provided by domestic of foreign training firms and graduate programs and not training provided on-the-job or in-house. Evaluations in both developed and developing countries have found greater benefits from on-the-job training rather than the classroom training favored by the Mauritius training fund.

If the performance of the training fund is to be improved, it should target the type of training that is most useful in its absence – training specific to the firm. If more general skills are to be offered, it may be useful to follow the sectoral training model used in Europe in which the firms within a specific sector pool resources to invest in skills uniquely required by firms in the sector with the government serving in a coordinating role.

However, another option is to eliminate the training fund program altogether. As shown in the theory, the training fund is most effective when there are liquidity constraints on firms. There is no evidence that the largest and most capital intensive firms in Mauritius suffer from liquidity constraints, and as a result, theory predicts that the negative incentive effects of the tax outweigh the positive effects of the subsidy. As a result, the training fund may well lower the overall incidence of training, consistent with the result in Figure 2 that the program takes in more in taxes than in pays out in subsidies. It is virtually certain that there are alternate uses of these public funds that would produce a better return.

THE ROLE OF FAIR TRADE IN DEVELOPING CORPORATE SOCIAL RESPONSIBILITY: AN EMPIRICAL EXAMINATION BASED ON MULTIPLE CASES

Khuram Shahzad, University of Vaasa, Finland

Dr. Ilkka Sillanpää, University of Vaasa, Finland

ABSTRACT

Purpose: *Corporate social responsibility is becoming more and more important for the firms from developed countries. The main purpose of this research paper is to examine empirically the role of fair trade in developing corporate social responsibility (CSR) and to find out the dynamics of CSR being used in organizations.*
Design/methodology/approach: *This qualitative case study research reviews the fair trade incorporating the historical developments, its conceptualization, and main motives along with CSR and its historical developments and conceptualization including major theories of CSR. The role of fair trade is developed by identifying the importance of CSR factors. To empirically examine the role of fair trade in developing CSR, this research employs the comparative multiple cases in Finland and Pakistan.*
Findings: *The main conclusions are as following: fair trade firms give equal importance to economic, social, and environmental responsibilities. Further, this study identifies the important factors included in each level of corporate social responsibility. Findings also reveal that suppliers are important stakeholders of the firms. Moreover, it depicts the importance of fair trade in developing CSR for diversified products.*
Originality/Value: *This research highlights the importance of fair trade in developing the economic, social, and environmental responsibilities of fair trade firms by focusing an important stakeholder group (i.e., suppliers). These trends represent the increasing demand of fair trade in businesses and also help them to know the important factors in corporate responsibility by considering the significance of suppliers as important stakeholders.*

KEYWORDS: Sustainability, corporate social responsibility, integration, fair trade.

INTRODUCTION

Corporate social responsibility (CSR) has been described as important responsibility which improves firm's competitive advantage, market value and financial performance (Maloney 2009). Corporate social responsibility reduces exposure to reputational risk, encourages the ability to enhance brand image, and improves corporate reputation via positive relationships. It increases the customer loyalty and helps to improve culture and recruitment, motivation, and retention of staff (Maloney 2009).CSR helps to identify its stakeholders (i.e., organizational stakeholders, economic stakeholders, and societal stakeholders) and to meet their needs (Carroll 1983; Werther & Chandler 2006). By articulating relationships with these stakeholders and fulfilling their needs, firms realize the importance of CSR and sustain its performance.

On general level, corporate social responsibility (CSR) is linked to ideas like; sustainability, corporate citizenship, the triple bottom line, socially responsible investment, and corporate governance (Maloney 2009). However, Frankental (2001) argues that "*CSR is a vague and intangible term which can mean anything to anybody, and therefore is effectively without meaning."*Further, he comments that "*CSR is highly subjective and therefore does not allow for a universally applicable definition*". In spite of all these difficulties in defining the CSR, Carroll (1983) steps forward and defines the CSR in following way;*"Corporate Social Responsibility involves the conduct of a business so that it is economically profitable, law abiding, ethical and socially supportive. To be socially responsible then means that profitability and obedience to the law are foremost conditions when discussing the firm's ethics and the extent to which it supports the society in which it exist with contribution of money, time and talent".*

The main concepts studied in this research are fair trade, CSR, and importance of fair trade in developing CSR. Most of the studies have focused either on fair trade or CSR separately. Only few studies have linked these both concepts together. Table 1 summaries the main important studies used to develop the research framework. These studies help this research to draw a picture to answer the main question of the research. Some of the studies are totally based on the fair trade phenomenon and explaining its dimensions whereas some studies are enlightening different dynamics of CSR and its theories. More importantly, the main studies who link up both of them (CSR and fair trade) are mentioned which direct to represent the role of fair trade in corporate social responsibility. In this vein, this research provides a theoretical background in different methodologies and its focus to the concept.

Table 1. Some previous studies.

The purpose of this research is to help the managers to understand the importance of fair trade in developing CSR in their business activities by highlighting the importance of societal environmental responsibilities along with financial benefits. To empirically investigate the role of fair trade in developing CSR, this research chooses multiple cases as research strategy in food sector.

The main research question of the study is:

How does fair trade perform the main role in organizing or developing corporate social responsibility (CSR)?

Fair trade permits a realistic set of improved trading conditions that allow substantial volume to be traded against these improved conditions and it actually leads to an increase in producer income. It develops code of conduct and standards that really come to the reality of compliance, sustainable production and a better product with a better price (Perk 2006). Fair trade creates new ways in CSR to define better trading conditions that do not interfere with the market and create a social framework which allow prices to tell the truth about social and environmental production costs (Perk 2006).

Fair trade is an old business activity which adds ethics into business and seeks greater equity in international trade (Fairtrade Labelling Organization International 2009).Fair trade offers the better trading conditions in sustainable development for the fair trade producers and workers especially in the South. Fair trade organizations participate actively in supporting producers, raising the awareness and practice of conventional international trade. It helps the producers and workers to move from a position of susceptibility to security and economic self-sufficiency. Fair traders have done much to increase consumer and business awareness of the issues involved while helping small producers improves the conditions under which they work and live. Fair trade certified products help to increase availability and variety, to raising public awareness and to develop and manage the CSR in the organizations. Fair trade improves the social consciousness of the consumers and increase pressure toward the broader adoption of ethical codes of conduct by mainstream processers and retailers.

RESEARCH PARADIGMS

Methodological approach can be either qualitative or quantitative. This research consists of a qualitative research method with an inductive approach. Furthermore, qualitative research typically combines data collections methods such as archives, interviews, questionnaire, and observations. The evidence may be qualitative, quantitative, or both (Eisenhardt 1989). These different ways of data collection give flexibility to researcher in data collection than quantitative method. This means that researcher has an opportunity to get deep inside into the research phenomenon and come close to the respondents for the affective analyses. In conclusion, qualitative method is suitable to analyze the exploratory study by emphasizing on understanding and observing the concept (Ghauri, Kjell& Ivar 1995).

For this research paper, method base is qualitative research as research strategy. The qualitative research approach fits to the nature of research question (i.e., how) of this study, which starts as "*How does fair trade perform the main role in organizing or developing corporate social responsibility (CSR)?"*The choice of qualitative research will help to go

more in depth of research phenomenon. This research uses multiple case studies as research methodology. According to Yin (2003), "case study is an empirical enquiry that investigates a contemporary phenomenon within its real life context; when the boundaries between phenomenon and context are not clearly evident; and in which multiple sources of evidence are used". According to Eisenhardt and Graebner (2007), multiple case studies are beneficial in many ways as; 1) it provides replication logic, 2) it helps in extending the existing theory, 2) it helps to focus on real world context, and 4) it helps in developing theory. According to Eisenhardt (1989), the sampling of cases from chosen population is unusual when building theory from case studies. Such research relies on theoretical sampling (i.e., cases are chosen for theoretical, not statistical reasons).

The basic purpose of primary data was to get information that is related to personal understandings, experiences, and observations. As a result, primary data was collected through digitally recorded unstructured interviews with open-ended questions. Further, to gain the basic information about the case companies' histories, operations, industry context, annual profit, and current activities, secondary data was collected from case companies' websites, annual reports, and old magazines for a detail version of the information along with primary data.

Data analysis is an important part for developing results. Yin (2009) describes the data analysis as; examining, categorizing, recombining, and tabulating the evidences. He arranges the data analysis in two strategies;1) focuses on the relation of data with theoretical framework derived from literature, and 2) focuses on the development of case description and descriptive framework to present the data. Validity and reliability measures are used to test the quality of the study. These measures can be considered as an ideal of the research. Validity and reliability provide researcher a source to test the quality of the research and the credibility of the results. Whereas validity concerns not only with the data collection but focuses on the coherence of the research and relation of findings. It refers the accurate measures taken in research and truthfulness of the results (Saunders et al. 2007). Yin (2009) posits that validity can be divided into; construct, internal, and external validity. In conclusion, present research is not looking for causal relationships between the variables, so internal validity is not concerned in present study.

Reliability refers to minimize random error, enabling subsequent researchers to arrive at the same insights if they conduct the study along the same steps again (Gibbert et al. 2008). The key words here are transparency and replication. Transparency can be enhanced through measures like careful documentation and clarification of the research procedures Replication may be accomplished by putting together a case study database, which should include the case study notes, the case study documents, and the narratives collected during the research, organized in such a way as to facilitate retrieval for later investigators (Gibbert et al. 2008). In present research, questions were designed according to the theoretical framework so that respondents should have a focus on the main point to ensure the reliability. The idea was to develop a relationship between the questions and their explanation about the topic to explore relative results. The language used in interviews was English to minimize the risk of misinterpretation and misunderstanding the answers for the credible and reliable results. However, the results of the research are based on the subjective evaluation and subjective interpretation for respondents and the author. Thus, chosen respondents were the people who had a great knowledge about the fair trade and corporate social responsibility.

THEORY OF FAIR TRADE AND CSR

Fair Trade

Most of the world's biggest companies have started fair trade brands and they are trying to incorporate it into their CSR agendas. This has resulted in considerable sales growth for the network stakeholders (Fridell 2009). Fair trade (i.e., alternative trade) was developed as an alternative model of business with political activity, i.e. "a business and campaign" (Zadek & Tiffen 1996). The basic purpose of the international fair trade activities is selling products from marginalized Southern producers (Low &Davenport 2005). In the early 1990s, fair trade considerably developed and grown into the broad product groups, differentiating and directing the products in the biggest market. Fair Trade Labeling Organization (FLO), Fair Trade Foundation (FTF) and International Federation for Alternative Trade (IFIAT) are the authorities of fair trade that are engaged in oversee fair trade activities and to audit related organizations. A group of profit seeking companies was developed in 1990s; the purpose was to create a profit from ethical group of consumers, therefore, this era named as niche market era of fair trade. After that, many companies engaged in the fair trade business and expanded it into leading products lines that created the mass-market era of fair trade (Davies 2007). This era also resulted in development of fair trade conceptualization.

Raynolds et al. (2007) highlights the importance of groups involved in fair trade and defines the fair trade as "Fair Trade movement is comprised of a set of groups which are linked through their membership associations – the Fair Trade Labelling Organizations International (FLO), the International Federation of Alternative Trade (IFAT), the Network of European World shops (NEWS!), and the European Fair Trade Association (EFTA)." These organizations work together as a FINE network. FLO is a united organization which labels fair products to ensure the intensity of fairness in the products marked in large volume distribution. Moreover, there are tensions between two visions of radical and pragmatic. Radical conception observes fair trade as a tool, and the pragmatic concept highlights the inclusion of products from the South to North markets.
Figure 1 summarizes all about industry structure of Fair Trade organizations, containing four main groups of organizations; the producer organizations, buying organizations, umbrella organizations, and supermarkets. Umbrella bodies that consist of a combination of six further organizations, i.e., IFAT, FLO, NEWS, EFTA, FTF, and Shared Interest (Moore 2004). IFAT, FLO, NEWS, EFTA, FTF are the organizations that have discussed earlier, but there is an organization in umbrella bodies called shared interest. It is not a trade organization like other bodies, but it helps in trading activities by providing trade finance to the fair trade movement through a channel of clearing house, which has been serving producers certified by FLO.

Industry structure

Main organizations involved in the Fair Trade movement can be divided into four groups that further have detailed structure.

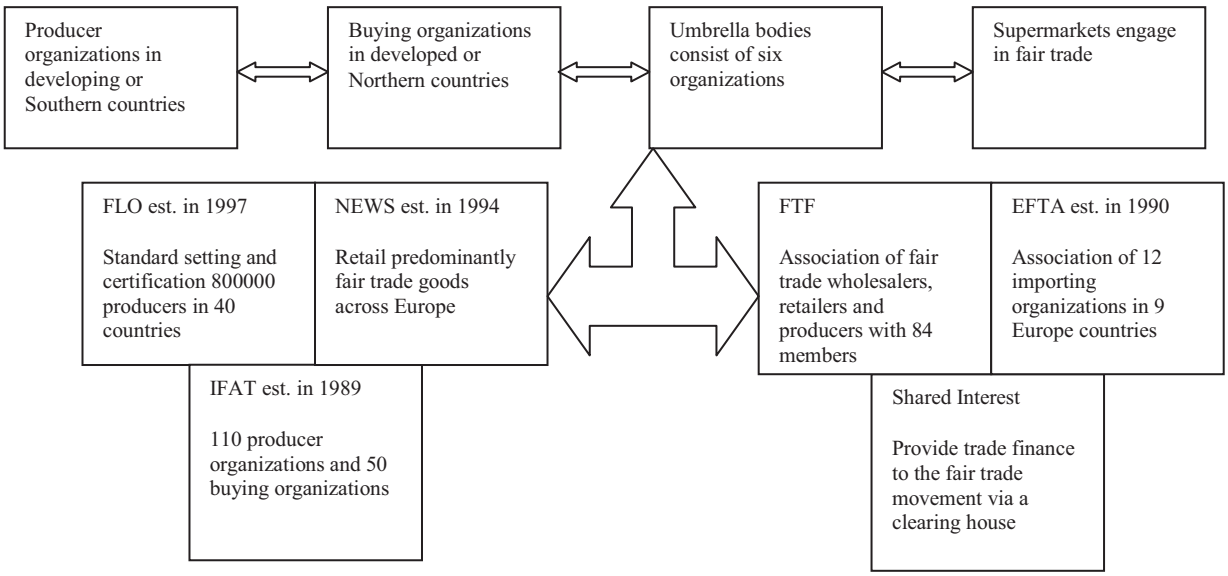

Figure 1. Industry structure of fair trade.

Fair trade movement is a link between social responsibility and free-market capitalism, which ensures the living wage, affordable credit facilities, and promote different activities that are sustainable for workers and environment (Linton, Chiayuan & Ann 2004). Low and Davenport (2005) identifies five different types of businesses, consisting of fair trade organizations, value driven business, proactive CSR business, defensive CSR business, and disbelievers.

In this research, some fair trade challenges exist that are complicated and overlapped. First challenge is all about the increasing activities of fair trade in the global market by capturing business partners, huge markets and customers, large-scale traders, distributors, supermarkets, and many other related retailers. Second challenge for fair trade arises from the incorporation of large-scale estates or plantations within fair trade production, requiring the needs production of extraordinary certified goods, integration of bigger numbers of producers, and workers. The third challenge of fair trade is about the changing nature of the movement. Traditionally, fair trade was depending on the Northern NGOs and Southern producers and workers, but now the trend of fair trade is changing and getting advance in its activities after the success of their hard work. The final challenge is all about the shifting consumer base (Raynolds et al. 2007), and its importance in the development (Hira & Ferrie 2006).

Corporate social responsibility

For the past many years, academia has been trying to explain and define the Corporate Social Responsibility (CSR) concept to develop a proper definition, but still lacks consensus on the conceptualization of CSR concept (Dahlsrud 2006). Moon (2004) argues that CSR is a complicated idea which cannot be clearly defined. It is difficult to distinguish CSR from related concepts of sustainable business, corporate citizenship, environmental responsibility, the triple bottom line; social, environmental, and corporate accountability. Further, research

presents multiple views on CSR, such as social performance, business ethics, social contracts, stakeholder management or triple bottom line (cf. Carroll 1979; Moon 2004; Valor 2005). CSR is a concept of core performances and responsibilities of the companies which has a strong impact on the societies in which they concern. It is not an optional set of activities for the organizations (Dahlsrud 2006).

Ideologies of corporate responsibilities

Spielman (2000) explains CSR ideology, and differentiates the responsible business behavior from irresponsible business behavior. He argues that in responsible business behavior, organizations focus more on economic welfare of employees to keep them retain and to provide benefits to the consumers with fair products. It is a group effort in an organization for the wellbeing of general public and especially for the environment. While, irresponsible business behavior is an act of serious actions such as (unethical economic harm) impose to the employees, unfair products and services to the consumers, unfair competitions with other organizations and harmful for the general public and environment (Spielman 2000).

Desjardins (1998) presents three kinds of CSR ideologies that are important for the organizations. These ideologies are;

- Owner focused ideology
- Stakeholder Ideology
- Broad responsibility Ideology

Owner focused ideology is called classical ideology. In this ideology, organizations focus on the revenue of shareholders by maintaining the high profit ratio and financial growth of the company (Desjardins 1998). Whereas stakeholder ideology is called neoclassical ideology. It signifies a general concept that organizations are responsible for their stakeholders in addition to their responsibilities for shareholders. This ideology is an integration process of economic, socio-cultural, and ecological responsibilities in which each level is a set of activities toward society, humanity and environment (Desjardins 1998).

CSR theories

Garriga and Mele (2004) developed CSR theories by using a structural approach to organize CSR into four proportions or groups that define the relationship between business and society. These groups are 1) Instrumental theory, 2) Political theory, 3) Integrative theory, and 4) Ethical theory.

Instrumental theory is a strategic tool to get economic goals and wealth creation. It is all about the profit increasing actions. Friedman presents it as “social responsibility of business is to increase its profit” (Friedman 1970). Further, Windsor (2001) argues that “a leitmotiv of wealth creation progressively dominates the managerial conception of responsibility” (Windsor 2001). There are three following sub-groups of instrumental theory; maximization of value of shareholders, achieving competitive advantage, and cause-related marketing actions (Garriga & Mele 2004). Whereas political theories represent the linkage between business and society based on the power and position in business. Political theories comprise of two major theories called “corporate constitutionalism”, and “corporate citizenship” (Garriga & Mele 2004). This group of theories focuses on the discovery, scanning of, and

response to the social stress to get social legitimacy, prestige and social acceptance. Integrative theories define the integration of social demands and business dependence on society (Garriga & Mele 2004). There are four groups in integrative theories that clear the concept of integration in CSR. These include; 1) issue management, 2) the principle of public responsibility, 3) stakeholder management, and 4) corporate social performance (Garriga & Mele 2004). Further, ethical theories posit that organizations should focus on the betterment of society by providing those best and harmless products and services, and they should contribute positive activities for the wellbeing of the society (Garriga & Mele 2004). In the positive activities, there are several ways to contribute, and these may be in different forms.

Corporate social responsibility and stakeholder theory have a strong relationship with each other. To survive and fulfill its economic and non economic objectives, firms have learnt to invest in CSR activities to meet the needs of various stakeholders (Argandona 1998; Harvey & Schaefer 2001; Post 2003). Stakeholders are those groups which have a stake in company's operations. They can be divided into three different forms of; 1) organizational stakeholders (i.e., employees, managers, and unions), 2) economic stakeholders (i.e., customers, creditors, distributors, and suppliers), and 3) societal stakeholders (i.e., communities, governments and regulators, and non-profit and non-governmental organizations) (Werther & Chandler 2006). In the same vein, Clarkson (1995) divided above stakeholders groups into two forms; primary and secondary stakeholders. The primary stakeholders consist of customers, distributors, shareholders, employees, and suppliers. Further, the secondary stakeholders consist of governments, competitors, and civil societies.

In stakeholder theory, the managers play an important role in supporting all stakeholders' groups with balancing and maximizing the interests of stakeholders overtime (Freeman & Phillips 2002). Regarding the responsibilities, this theory has articulated the shared sense of the value that managers create and bring them together. Stakeholder theory allows firms to produce outstanding performance by focusing on different relations with stakeholders (Freeman 1994). In the following figure 2, the important stakeholder's groups are identified:

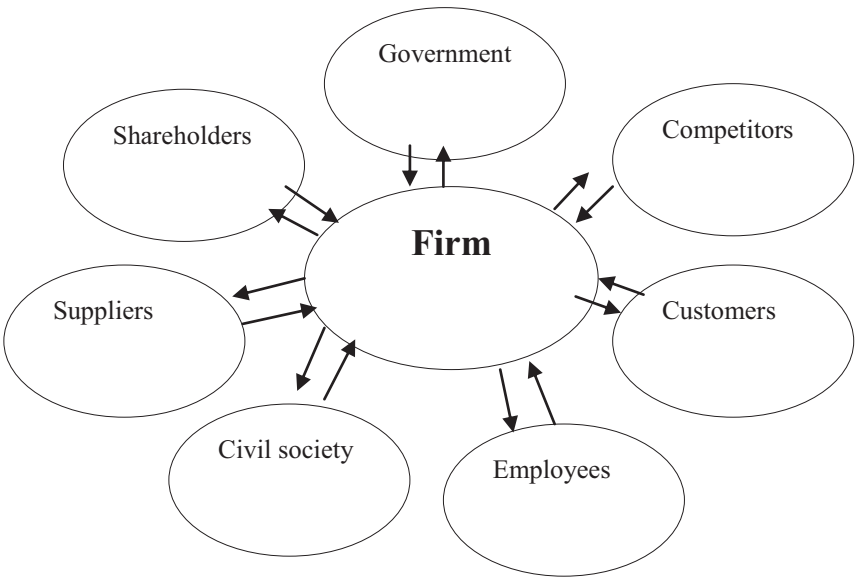

Figure 2. Stakeholder theory of the firm (Crane & Matten 2007: 59).

Stakeholder theory is one of the most used and prominent theories in international business activities and CSR discourses. Philips (2003) suggests that there should be a distinction between normative and derivative stakeholders in order to identify them. Normative stakeholders are those who have ethical responsibility towards the other social factors. The link between CSR and stakeholder theory demonstrates the relationship between social disclosures, and social and economic performance (Ullmann 1985).

Key elements of fair trade in corporate social responsibility

Stakeholders are an important part of the organization and all the firm's operations revolve around their significance. Economic responsibility focuses on the financial sustainability of the firms and it is integrated in firm's norms (Ketola 2009a). Socio-cultural responsibilities consist of those activities and practices that embody fairness, justice, standards and ethical responsibilities (Carroll 1991). Social responsibility symbolizes the standards, norms or expectations that replicate consumers, employees, shareholders and community's regard and respect or protection. Social responsibility is achieved by respecting the limits of human and culture. Developing countries are characterized by environmental degradations, which also affect the social conditions. In response to these limitations in developing countries, fair trade performs a key role to sustain and achieve the required objectives (Strong 1997). Whereas, fairly traded products encourage the model of consumption and production in those societies, which helps to reduce environmental stress, and to meet the needs of humanity. Fair trade products ensure the suppliers of developing countries for a standard production process, benefits of trade, and good working conditions for employees (Strong 1997).

Summary of theoretical framework of the research

Fair trade as a component of economy movement or objectives of corporate social responsibility and ethical trade can be viewed by several ways. This research focuses on the role of fair trade in corporate social responsibility means that fair trade is a part of ethical consumerism and many factors of CSR. Fair trade movement creates the environment for responsible business to become more responsible, community oriented and environment oriented. For the reason, customer demands for fair traded products also open the ways of awareness of fair traded products and to help marginalized producers in less developed countries. Moreover, fair trade movement encourages the community development and assigns power to the producers. To protect human rights, fair trade mechanism has become a complete package (Davies & Crane 2003).

In this sense, Figure 3 summarizes the role of fair trade principles in corporate social responsibility (CSR). The Figure shows the clear impact and role of fair trade in corporate social responsibility levels. This role of fair trade in CSR levels means that it also has a significant impact on internal and external stakeholders of the firm because all stakeholders are related to CSR values and areas: economic, social and environmental. These factors are kept into mind while collecting the empirical material while the focus is clearly on fair trade role in corporate social responsibility. Fair trade and corporate social responsibility concepts are closely related to some other concepts like ethical consumerism or ethical business but to get reasonable results, or to build a clear concept of role of fair trade, empirical data is collected only on the base of fair trade role in corporate social responsibility which is the key question of the research.

Furthermore, this research provides the impact of fair trade role in CSR's levels separately which means it discusses the stakeholder theory separately in CSR levels and relationships of all stakeholders to each other as well. Figure 3 elaborates the concepts of economic, social and environmental responsibility and consists of several important contents of three of responsibilities. Economic responsibility presents four main factors which are related to internal and external stakeholders. *Managerial factors* related to internal stakeholders that provide different management issues in CSR and the effects of fair trade in these issues. *Technical factors* are related to quality, machinery and production issues and they belong to internal stakeholders as well. *Financial dimensions* provide the clear picture of financial profitability and competitiveness and the last factor of economic responsibility is *economic factors* which is related to external stakeholders including costumers, society, economy etc. (Mikkilä 2005).

There are four factors of social responsibility discussed in this study related to internal and external stakeholders. These important factors of social responsibility show the effects of fair trade role in the society. Employment and cultural factors are related to internal stakeholders while societal and political dimensions are linked with external stakeholders. In these dimensions of social responsibility, fair trade performance in different areas is discussed empirically. Fair trade has a significant impact on the three levels of environmental responsibility. These dimensions of environmental responsibility consist of *industrial environment factors*, *natural resources factors* and *production and consumption factors* (Mikkilä 2005).

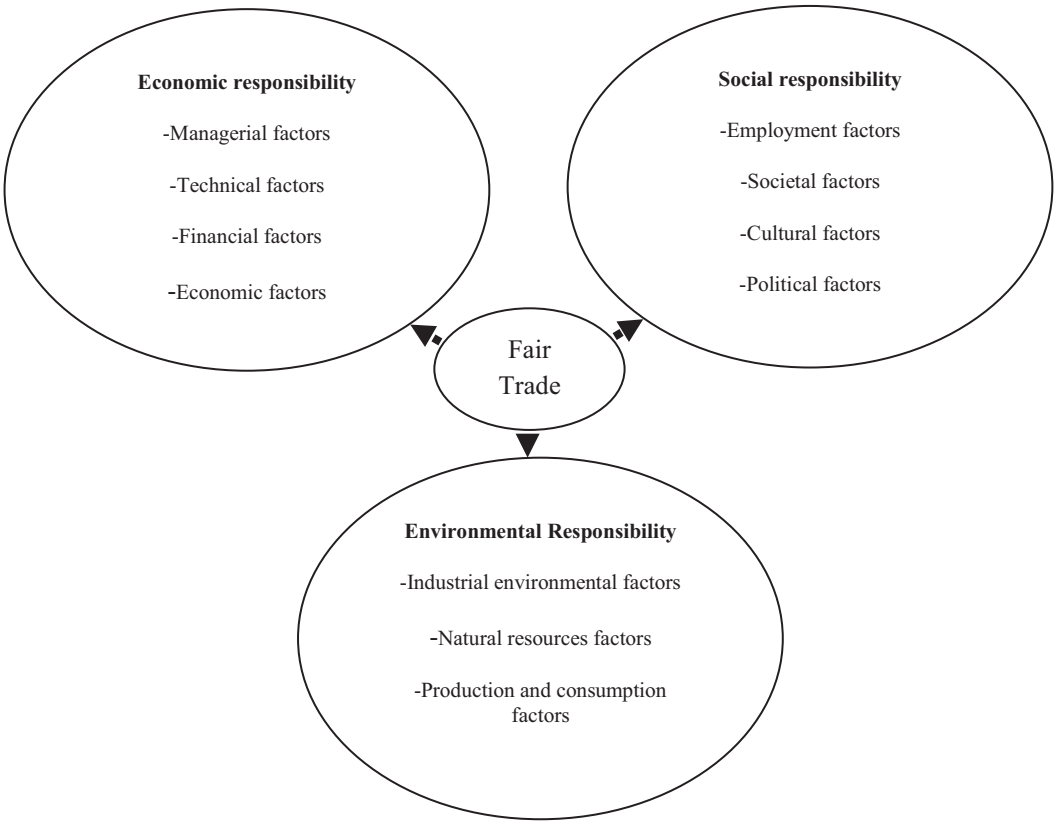

Figure 3. Theoretical framework.

EMPIRICAL STUDY

This research focused on the role of fair trade in developing CSR in case companies from Pakistan and Finland. CEO of Pakistani Company is interviewed and some officials from Finland Company are interviewed. Identical questions were asked to all of the officials and they have been allowed to answer after taking as much time as they want. Interview questions were developed according to the theoretical framework of the research so that results would create a combination between theory and empirical findings. By keeping in mind all above validity factors, data was collected and the results of this research demonstrate a key relation of fair trade role in corporate social responsibility in the case companies.

Mountain Fruits (Pvt.) Limited Pakistan was developed by the Aga Khan Rural Support Program in 2000. The purpose was to train the people to improve the drying fruit practices by utilizing the hygienic fruit drying system in the northern areas of Pakistan, and to create the opportunities for disadvantaged producers for organizing, producing, and selling the international quality products under fair trade mark. The company targets the producers of dried apricots, wild apricots; apricot kernels (sweet and bitter), dried apples, organic walnuts and almonds from the northern areas of Pakistan (Mountain Fruits). Furthermore, it helps the "mountain areas fruit farmers' association" (i.e., a group of 2,000 farming families from 78 different village organizations located in the mountainous northern areas of Pakistan) to promote their products in developed countries (e.g., United Kingdom) through fair trade. It trains the farmers in improved agriculture techniques, making the farmers to be flexible with the technology.

Reilu Kauppa is a non-profit organization, having 30 member organizations. The main goal is to raise awareness and promote fair trade in general. It licenses the use of fair trade certification mark in Finland and Baltic States. The company is also involved in monitoring and approving the usage of fair trade mark. There are 1500 fair trade certified products in Finland, and consumption of fair traded products in 2009 reached to € 86.9 million which makes € 16.31 per capita. The case organization is trying to tenfold its sales in coming 5 years (i.e., 2010-2015). According to the company's annual report (2009), 82% consumers in Finland know about fair trade, and 49% want to buy more fair trade products. Further, 78% consumers in Finland have a confidence on fair trade mark. In conclusion; the company provides an opportunity to producers in developing countries to promote their wellbeing through fair trade, and an opportunity to consumers in Finland to consume the fair trade products in line with their own values.

This section analyzes the theoretical model of this research in the light of findings from the above case companies. The discussion examines the role of fair trade in developing the corporate social responsibility (i.e., economic, social, and environmental factors). Economic responsibility focuses on the financial sustainability of the firms. Carroll (1991), and (Ketola 2009a) argue that business organizations are made for the economic activities, and profit motives are primary incentive for all the organizations. In the case company A (Mountain Fruits (Pvt.) Limited Pakistan), the intentions were to give economic benefits to farmers (i.e., suppliers). The main factors included in economic benefits were reducing production costs, assigning good prices to products, increasing competitiveness of producers' products, increasing their profitability, and helping them to reinvest some profit in expanding business. In the same vein, the case company B (Reilu Kauppa) is a non-profit organization. The case

company promotes fair trade between Finland and developing countries, with the intentions to give economic benefits to producers. The main factors included in economic benefits were; assigning good prices to producers' products, and increasing their profitability.

Case companies	Role of fair trade in developing the economic responsibility
Case company A	To reducing the producers' production costs, assigning good prices to their products, increasing competitiveness of their products, increasing their profitability, and helping them to reinvest some profit in expanding business
Case company B	Assigning good prices to producers' products, and increasing their profitability

Table 2. Role of fair trade in developing economic responsibility.

Socio-cultural responsibilities focus of those activities and practices that embody fairness, justice, standards and ethical responsibilities (Carroll 1991). Fair-trade labeling organizations and importers in developed countries ensure about the satisfaction of developing countries' producers in terms of their social needs. In the case company A the assurance of farmers' satisfaction with their social needs was the most important responsibility. The main factors included in social benefits were; following the national and international laws about the labor rights, providing fair salaries, employees training, employee's health and safety, managing employee's cultural diversity, education of village children, forbidding child labor, and creating opportunities for all without discrimination. In the same vein, the case company B also contributes to social welfare of producers in developing countries. The case company takes into consideration the needs and special characteristics of different-sized producer organizations and makes sure that they are fulfilled. The main factors included in social responsibilities are; fair Payton workers, no child labor, education of farmer's children, decent living standards of workers, schools, health clinics, safe water and simple bridges.

Case companies	Role of fair trade in developing the social responsibility
Case company A	Following the national and international laws about the labor rights, providing fair salaries, employees training, employee's health and safety, managing employee's cultural diversity, education of village children, forbidding child labor, and creating opportunities for all without discrimination.
Case company B	Fair pay to workers, no child labor, education of farmer's children, decent living standards of workers, schools, health clinics, safe water and simple bridges.

Table 3. Role of fair trade in developing social responsibility.

Organizations achieve environmental responsibility by staying within the limits of carrying capacity of ecosystems (Ketola 2009a). Ketola (2009a) argues that practices like usage of renewable energy forms, zero emissions, and recycled or renewable natural resources constitute as environmental responsibilities. The case company A makes sure that the

producer is making environmental friendly product. The main factors included in environmental responsibilities were; shipment by sea, wastage handling, pollution reduction. In the same vein, the case company B also helps the producers in preserving the environment. According to case company's 10th anniversary report (1999-2009), fair-trade environmental standards call for the protection of the natural environment and encourage to work towards organic practices. The environmental standards include; environmental impact assessment, planning and monitoring, soil and water protection, reductions in the use of agrochemicals and compliance with the FLO Prohibited Materials List, guidelines on correct waste management, and ban on genetically modified organisms (GMOs).

Case companies	**Role of fair trade in developing the environmental responsibility**
Case company A	Shipment by sea, wastage handling, pollution reduction
Case company B	Soil and water protection, reductions in the use of agrochemicals, correct waste management, and ban on genetically modified organisms

Table 4. Role of fair trade in developing environmental responsibility.

CONCLUSION

Most of scholars agree that fair trade is becoming more and more important for the firms from developed countries (e.g., Davies 2007; Fridell 2009; Hira and Ferrie 2006). In the light of this increasing interest in fair trade, previous research has focused on conceptualization of fair trade and its general benefits to producers in developing countries (e.g., Moore 2004; Fridell 2009; Low & Davenport 2005). Despite these recent interests, current research is silent in describing the comprehensive responsibilities of fair trade firms. This research therefore seeks to examine the role of fair trade in developing corporate social responsibility. The key findings of this research are: First, fair trade firms give equal importance to economic, social, and environmental responsibilities. This finding depicts that fair trade is an organized movement to help the marginalized producers in all areas of corporate social responsibility, comprising of economic, social, and environmental areas. Previously, research has either focused on the importance of fair trade for generating only economic benefits to producers (Smith 2007), and economic and social benefits to producers (Ronchi 2002; Lyon 2007; Mare 2008),or have considered fair trade as a form of CSR (Mohan 2009). However, this research finds that fair trade companies give equal importance to economic, social, and environmental responsibilities to develop the livelihood of the producers.

Second, this research identifies the important factors included in each level of corporate social responsibility (i.e., economic, social, and environmental). Figure 9 presents the main factors included in economic responsibility, social responsibility, and environmental responsibility of the fair trade firms. These findings support and extend the previous research on corporate social responsibility (e.g., Bennett 2002; Meehan et al. 2006; Carroll 1979).

Third, this research depicts that producers are important stakeholders of the company. Fair trade firms develop corporate social responsibilities by highlighting the significance of producers. By fulfilling corporate social responsibilities (i.e., economic, social, and environmental), the fair trade firms create goodwill of producers among consumers. Fourth,

previous research on fair trade has mostly focused on coffee (e.g., Ronchi 2002; Lyon 2007; Renard 2003; Low & Davenport 2005), giving limited evidence about the importance of fair trade for diversified products. However, this research depicts the importance of fair trade in developing corporate social responsibility for diversified products (i.e., Apricots, Apple, Wine, Coffee, and etc.).

Figure 4 shows the adopted model on the role of fair trade in developing corporate social responsibility. Model combines the theory and main empirical findings and depicts a rich picture that fair trade firms give equal importance to economic, social, and environmental responsibilities. Further, model depicts the important factors included in each responsibility (i.e., economic, social, and environmental) of fair trade firms.

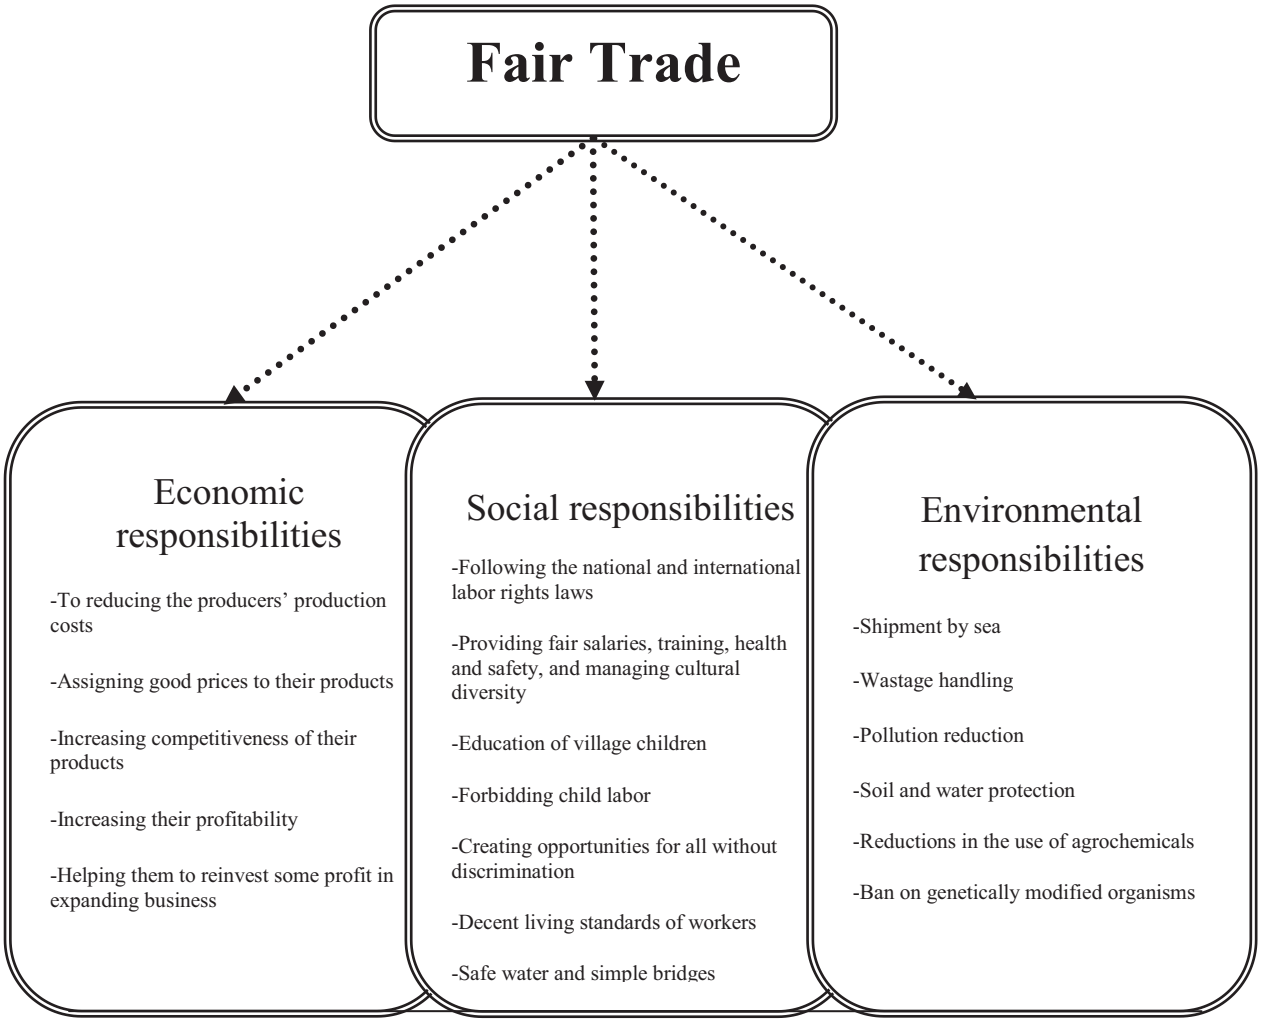

Figure 4. Developed framework of fair trade role in (CSR).

Managerial implications and future research suggestions

This research study has given results on the role of fair trade in developing corporate social responsibility. A major contribution of this research is that it highlights the importance of fair trade in developing the economic, social, and environmental responsibilities of fair trade firms by focusing an important stakeholder group like suppliers. Further, the research brings

out the important factors included in each responsibility (i.e., economic, social, and environmental) of fair trade firms.

These empirical findings have several empirical implications. Firstly, the demand of fair trade products is increasing in developed countries on general level, and specifically in Finland. According to the annual report of Reilu Kauppa (2009), 82% Finnish consumers know about fair trade, 49% want to buy more fair trade products, and 78% Finnish consumers have a confidence on fair trade mark. These trends depict that demand of fair trade is increasing in Finland. So, the Finnish firms should know the importance of fair trade and its role in corporate social responsibility. Secondly, research findings can help the Finnish firms to know the important factors involved in each responsibility (i.e., economic, social, and environmental) of fair trade firms. Thirdly, the research findings can help the Finnish firms to know about the significance producers of developing countries as an important stakeholder.

Regarding future research directions; firstly, research should incorporate the viewpoint of all stakeholders (i.e., producers, consumers, importers, distributers, and etc.) on the role of fair trade in developing corporate social responsibility. Secondly, most of previous research on fair trade has concentrated on a single product of coffee than diversified products. Future research should focus on the importance of fair trade in diversified products. Thirdly, most research on fair trade and corporate social responsibility is either conceptual or based on case studies. The future research should conduct quantitative research with bigger sample sizes to have more external validity.

ABSTRACT

Employee theft is one of the major factors of retail shrinkage despite many costly technological and widespread security measures. Employee theft cannot be ignored as it causes significant losses to employers. This study investigates the workplace factors that affect the employee retail theft behaviour. Although identifying theft is difficult, this study will help employers to further understand the retail employees' theft behaviour. This study was conducted in several large retail organisations in Malaysia's capital city, Kuala Lumpur. Data has been collected via questionnaire from 327 retail employees consisting managers, supervisors, retail employees and security personnel. The results showed that Compensation, Organisational Justice, Internal Control Systems and Punishment have a relationship with the Employees' Theft Behaviour. However, the Organisational Ethics did not influence the Theft Behaviour.

Keywords: Employee theft, retail theft, employee theft behaviour, workplace theft, Malaysia.

INTRODUCTION

Employee theft is defined as theft of anything of value from the employer by an employee or his/her accomplice. Methods include stealing merchandise, stealing cash, retaining receipts to show stolen items were paid for, voiding a sale or making a no-sale after a customer has paid and pocketing the cash, overcharging, short-changing, coupon stuffing, credits for non-existent returns and sliding product through the lane without charging (Mishra & Prasad, 2006).

The recent worldwide shrinkage survey named as The Global Retail Theft Barometer, 2011 (GRTB) conducted by the Centre for Retail Research, Nottingham, England for the year 2010-2011 revealed that 43.2% of the retail shrinkage was due to customer theft, 35.0% due to employee theft, 16.2% due to internal error and 5.6% due to suppliers-vendors frauds. As per the survey, total global shrinkage in the 43 countries surveyed costs retailers US$119.092 billion (US$119,092 million), equivalent to 1.45% of retail sales.

In The Global Retail Theft Barometer, 2011 survey, 20 Malaysian retailers with a combined sale of US$2.155 billion also participated. The findings of the survey revealed that as a percentage of total sales, retail shrinkage in Malaysia was 1.62 per cent, higher by 5.9% compared to 2009-2010, with a total shrinkage of US$271million. In this, the customer theft amounts to 51.2% (US$138.75 million) followed by employee theft at 23.3 % (US$63.14 million), administrative errors at 18.9% (US$51.22 million) and supplier or vendor theft at 6.6% (US$17.89 million). KPMG Malaysia Fraud Survey Report, 2009 revealed a total loss of RM63.95 million during 2006 to 2008 by the Malaysian companies due to employee fraud.

This study helps the employers to better understand the employees' theft behaviour so that the companies can recognise the intention of employees committing theft and solve the problem effectively.

RESEARCH OBJECTIVES

The research objectives of this study are:

- To determine the factors contributing to employees' theft behaviour in large retail organisations in Malaysia.
- To determine the most significant workplace factor that contributes to employees' theft behaviour in large retail organisations in Malaysia.

SIGNIFICATION OF THE STUDY

There are many empirical studies on theft in retail organisations in other countries. In the past, some studies had been carried out on workplace deviant behaviour in Malaysia, by Ku Ishak (2006); Kulas, McInnerney, Frautschy and Jadwinski (2007); Ahmad and Norhashim (2008); Finklea (2010); Omar, Halim, Zainah, Farhadi, Nasir, and Khairudin (2011); and Peng, Tseng and Lee (2011). The above literatures studied workplace deviant behaviour in total (Hollinger & Clark, 1982) which comprise of fraud and theft, vandalism, lying, spreading malicious rumours, withholding effort, aggressive behaviour, sexual harassment, property deviance, information deviance, and production deviance. Employee theft is only one of the above deviant behaviours; so, these literatures are inadequate to explain the

various factors contributing to workplace theft behaviour of employees in large-scale chain organisations. This study would provide insight on workplace factors that contribute to employees' theft behaviour in large size retail organisations in Malaysia.

THEORETICAL SUPPORT

Many theories have been developed and modified to identify the factors influencing the workplace theft behaviour. The Theory of Planned Behavior (TPB) would be used in this study to identify the factors that drives theft behaviour.

Theory of Reasoned Action (TRA) was developed by Icek Ajzen and Fishbein(1980). Later, their model was extended to Theory of Planned Behavior (TPB) by Icek Ajzen in year 1985. TPB is a theory that links attitudes and behaviours (Ajzen, 1991).

Initially, TRA was developed to examine the relationship between attitude and behaviour of a person. TPB was extended by Ajzen (1985, 1991) by incorporating perceived behavioural control since TRA was criticized that the model is neglecting the social factors that influences an individual's behaviour. Perceived behavioural control refers to a person's perceptions of how easy or difficult it is to engage in the particular behaviour. It addresses both internal control (e.g. persons's abilities) and external constraints (e.g. opportunities) needed to perform the behaviour (Ajzen, 1991).

TPB has been used in various studies to understand a number of different behaviours in which people engage. The theory has been applied by Ajzen and Driver (1992) to predict the relationship between leisure intention and the behaviour among a group of college students. They found evidence that the attitudes, subjective norms, and perceived control were predictive of leisure intentions among this group.

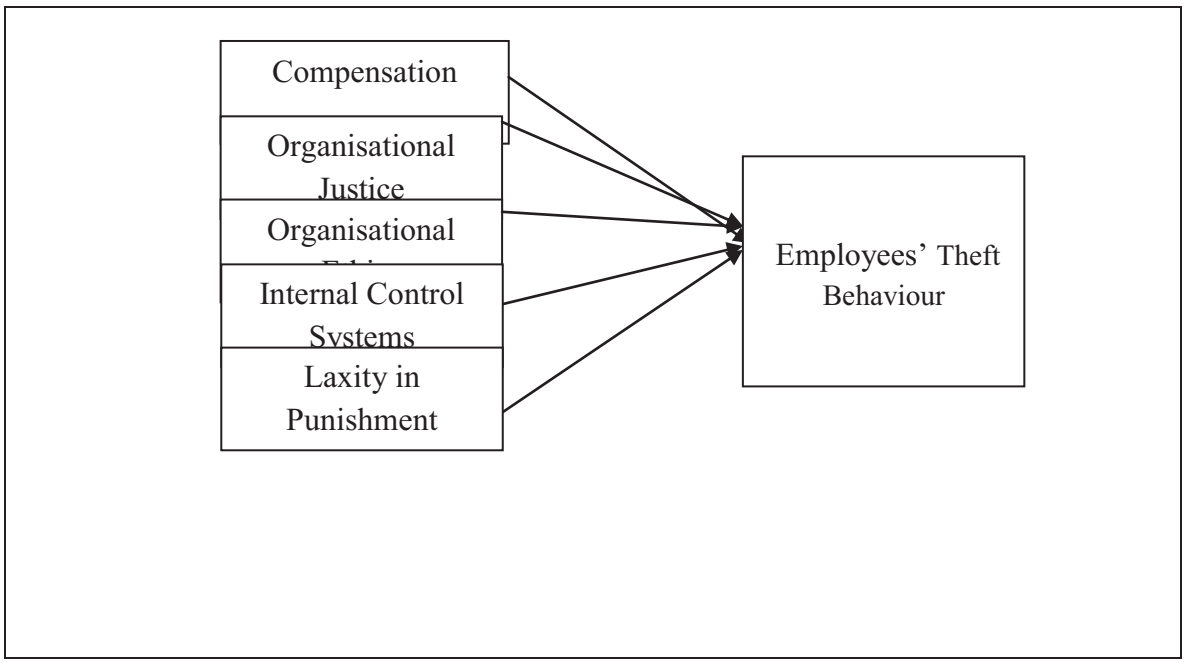
In 1992, Baxter, Manstead, Parker, Stradling, and Reason applied this theory in examining the driver's intention to engage in drinking and driving, speeding, close following and overtaking in risky circumstances. The findings of the model showed that perceived behavioural control can effectively predict the intentions to engage in these behaviours. Also, the model has successfully been applied in explaining such behaviours in employee use of information systems (Santhanam, 2002) and online grocery buying intentions (Hansen, Jensen, & Solgaard, 2004).

TPB theory has been used to assess the retail employee theft by Bailey (2006) and is widely used by the researchers to assess the unethical behaviours and thefts committed by people. Furthermore, TPB is used to explore the shoplifting behaviour by Tonglet (2002). She used this model with the intention to understand shoplifting behaviour and to determine the utility of TPB identification of the factors that led to it. She surveyed regular shoppers and students enrolled in two co-educational upper schools in the United Kingdom. The findings of the survey showed that the shoplifting behaviour is influenced by consumers' attitudes and views, social influence and perception of the risk of apprehension.

Lastly, retail employee theft is regarded as a volitional behaviour and this behaviour is likely to be influenced by people's perception, people's attitudes, normative beliefs and opportunities in engaging in this behaviour. So, TPB is appropriate to be applied in this study

to understand the employees' theft behaviour in large retail organisations in Malaysia. The employers are likely to have better understanding of the behaviour and factors contributing to such a behaviour.

CONCEPTUAL FRAMEWORK/RESEARCH MODEL



Source: Adapted from Employee Theft, Greenberg and Barling (1996)
Figure 1: The conceptual framework of workplace factors that influence the employee's theft behaviour in large retail organisations in Malaysia

This research aims to explain the relationship between the workplace factors and the employee's theft behaviour. Five hypotheses have been developed describing the relationship between the five workplace factors (compensation, organisational justice, oraganisational ethics, internal control systems and laxity in punishment) and employees' theft behaviour.

The target population consists of employees of large retail organisations in Kuala Lumpur, Malaysia. Due to the wide geographical coverage of the large retail organisations in Kuala Lumpur and huge number of retail employees, a sample of 325 managers, retail employees, supervisors, and security personnel of large retail organizations are studied.

RESEARCH INSTRUMENT

Questionnaire

The 40 questions questionnaire consisting of 7 parts begins with demographic profile followed by Part A: Compensation (Com), Part B: Organisational Justice (OJ), Part C: organisational Ethics (O E), Part D: Internal Control Systems (ICS), Part E: Laxity in Punishment (LP), lastly Part F: Employee's Theft Behaviour (ETB).

The independent variables are adapted from Greenberg (1990, 1993); Greenberg and Barling (1996); Kamp and Brooks (1991); Drinkard (1996) and Bandura (1986). Ordinal data is used as the scale of measurement for the variables. All items are measured on a five point Likert-scale, ranging from 1, strongly disagree to 5, strongly agree.

Pilot Test

Prior to the actual survey, a pilot test **has been** conducted with 30 managers, retail section employees, supervisors, and security personnel of large retail organisations in Kuala Lumpur to assess their understanding towards the questions aiming to ensure that there are no unclear items in the questionnaire and to guarantee the content validity of the research.

Table 1: Reliability Statistics for 30 respondents for pilot test

Variables	Cronbach's Alpha	No of items
Compensation	0.947	5
Organisational Justice	0.885	5
Organisational Ethics	0.947	5
Internal Control Systems	0.709	5
Laxity in Punishment	0.825	5
Employee's theft behaviour	0.927	7

Source : Developed for the research

Data collection procedure

After being satisfied with the pilot study results, 500 questionnaires were distributed to the managers, supervisors, retail section employees and security personnel in large retail organisations in Kuala Lumpur following convenience sampling they were selected because they carry out the daily operations and they are more familiar with the environment of the organisation. Thus, their responses **are** believed to be useful and reliable for this research. Out of 500 questionnaires distributed, 342 questionnaires **have been** received back. After removing the outliers, only 327 questionnaires were used for the analysis.

Data Analysis

Subsequently after collecting the data, SPSS17.0 was used to analyse the responses obtained. The analysis includes reliability test, normality test, Pearson correlation coefficient and multiple regression analysis. Descriptive statistics describe the main features of a collection of data quantitatively (Mann, 1995). Descriptive analysis is the transformation of raw data into a form that is easily understandable and interpretable. The common method used are calculating averages, frequency distribution and percentage distribution that are used in this research, followed by the Cronbach's alpha reliability coefficient to show how well the set of data are positively correlated to one and another .Next is the Pearson correlation coefficient and Multiple Regression Analysis (MRA) to answer cause-and-effect questions and make predictions. The significant level *(p)* in Pearson's Correlation Coefficient test in this study is 0.05 which means the confidence level is 95%. Hypothesis is rejected if the *p*-value is more

than 0.05 based on the results obtained from MRA as there is enough evidence to reject. While the general form of MRA will use a statistical method that simultaneously builds up a relationship between two or more independent variables with a dependent variable with the formula: $Y = \alpha + \beta 1x1 + \beta 2x2 + \cdots \beta nxn + \varepsilon$.

Results and Discussion

The results obtained are divided into four sections beginning with the descriptive analysis, whereby the demographic characteristics, central tendencies measurement are presented. Next is the scale measurement analysis showing the outcome of the reliability analysis and normality analysis, followed by the inferential analysis which includes Pearson correlation analysis and Multiple Regression Analysis (MRA)

Demographic profiles

The majority of the respondents are female (63.4%), and the rest of the respondents are male (36.6%). 36.6% of the respondents are below the age of 20, followed by 25.2% of people in the age group of 21-30, 16.4% in the age group of 31-40, 18.5% in the age group of 41-50 and lastly 3.4% in the age group of 50 and above.

47.1% respondents have a monthly gross income of RM500- RM1000, followed by 27.3% of people with the gross of RM1001- RM1500, 14.3% with gross income of RM1501-RM2000, 9.7% with an income below RM500 and lastly 1.3% above RM2000.

The majority of the respondents are Chinese with 50.1%, followed by 39.8% of Malays and 10.1% of Indians. Most respondents have an educational level of SPM (56.7%), followed by 23.1% below SPM level, 16.8% with a bachelor degree and 3.4%of diploma holders. On the average 56.7% of the respondents period of employment is currently below 1 year, followed by 1-3 years with 26.1%, 3-5 years with 18.1% and lastly 5 years and above with 6.7%. Concluding the demographic profile is the employment type question with two choices part time and full time employment, with 2.7% being part time while full time was 97.3%.

Reliability test

The research started with testing the reliability of the data to test the consistency and satiability of the data. The Cronbach's alpha of the six variables combined is 0.921, while the individual variables Cronbach's alpha ranges from 0.700-0.947. Thus the internal consistency reliability of the variables used in the study is considerably good according to Sekaran's (2000) rule of thumb.

Table 2: Results of Reliability Analysis for final data

Contructs	Cronbach's Alpha	Number of items
Compensation	0.803	5
Organisational Justice	0.700	5
Organisational Ethics	0.947	5
Internal Control Systems	0.702	5
Laxity in Punishment	0.822	5
Employee Theft Behaviour	0.805	7

Source: Developed for the research

Normality test

Normality test has been carried out to ensure that there is no outlier in the data since the outliers will distort the normality of the data. There are some outliers appeared from the data collected, hence from the data collected, 15 outliers were removed to ensure the data is free from outliers.

Pearson correlation

The results showed a positive correlation between Compensation, Organizational Justice, Organisational Ethics, Internal Control Systems, Laxity in Punishment and employee theft behaviour. The highest correlation against the dependant variables is between Laxity in Punishment and Employees' Theft Behaviour (0.783), followed by Internal Control Systems (0.599), Compensation (0.548), Organizational Justice (0.432), and Organisational Ethics (0.358). No multicollinearity of independent variables is noticed.

Multiple Regression Analysis

Table 3: Results of Regression Analysis

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.496	.165		3.008	.003

	AVGPUN	.422	.032	.456	18.123	.012	.540	2.232

a. Dependent Variable: AVGETB

R Square 0.6521
F Value 39.7
P value for the model 0.011

Source: Developed for the research

The results of MLR showed a good model fit with F value 39.7 with overall model fit p value of 0.011. The four independent variables (other than Organisational Ethics which is not significant) jointly influence 65.21% of variation in the dependent variable.

Summary of statistical analysis

Table 4: Summary of statistical analysis

Hypothesis	Supported	Result
H1: There is a negative relationship between Compensation and employees' theft behaviour	Beta: - 0.239 Sig: 0.000	Supported
H2: There is a negative relationship between Organisational Justice and employees' theft behaviour	Beta: -0.204 Sig: 0.000	Supported
H3: There is a negative relationship between Organisational Ethics and employees' theft behaviour	Beta: - 0.596 Sig: 0.072	Not Supported
H4: There is a negative relationship between strong Internal Control Systems and employee's theft behaviour	Beta: -0.723 Sig:0.000	Supported
H5: There is a positive relationship between laxity in punishment and employees' theft behaviour.	Beta: 0.422 Sig: 0.012	Supported

Source: Developed for the research

The results show that the Internal Control Systems are more significant workplace factor in influencing the Employees' Theft Behaviour.

Limitations of the study

The sample size is a limitation as it lacks geographical coverage to search a wider range of respondents because of financial constraint and time, therefore this study's sample size is only limited to Kuala Lumpur which lead to the findings of the research inaccurate to be generalized as it is not based on all states in Malaysia.

This research is only based on large retail organisation, but small and medium organisations are also affected by employee theft but not represented.

The individual factors such as need, opportunity and personal characteristics were not considered.

Managerial Implications

The present study of employees' theft behaviour makes several noteworthy contributions towards retail operations in Malaysia. It is a major source of shrinkage for many retailers. Hence this study would help to shed some light to this observable fact that should not be taken lightly. Prior to seeking strategies to overcome the problem, the driver of such behaviours should be determined.

This research proposed variables such as Compensation and Internal Control Systems to show how they significantly influence the employee's retail theft. If these drivers are established, it would help the large retail management team to have a sound pay and compensation policy and a solid internal control system. The management team should also try to give the organisation more fair and justice to all levels of employees and additionally give a severe punishment for the employees who involve in theft. Although these drivers may have an adverse effect, but if with due care could actually work to the advantage of the management.

Theoretical Implications

With a good model fit and by accepting four hypotheses out of five, the study also supported the Theory of Planned Behaviour.

Recommendations

A longitudinal study should be conducted so that the time constraint could be eliminated and a more in depth study could be conducted, as employee theft could take time to be minimized, or better eliminated. Besides that, changes in technology and other variables not included could be tested and taken into account.

Small and medium organisations should also be included for further study as these organisations are also affected with thieving and dishonesty of employees. A study including small and medium retail organizations could really help the managers of those organisations to understand the behaviour and choose a suitable internal control system to help curb the employee's retail thieving problem.

Individual factors should also be included to analyse the employee theft behaviour.

CONCLUSION

Employee's theft has been increasing year after year. It is a significant source of retail shrinkage and needs to be addressed and prevented, as employees are family members to the organisation, having such betrayal, in actual fact shows disloyalty. Furthermore retail establishment is losing an immense amount of money, to the tune of $266million a year because of theft and 3.9% of it is reported to be from employees. Hence this is an issue which warrants both academics' and practitioners' attention.

AEC AND THAILAND BRAND

**Yupin Patara, SASIN Graduate Institute of Business Administration,
Chulalongkorn University, Thailand
Email: yupin.patara@sasin.edu**

**Nicha Tanskul, SASIN Graduate Institute of Business Administration
Chulalongkorn University, Thailand**

ABSTRACT

Situation: *Thailand will become part of AEC in the next 1-2 years. By becoming part of AEC there will be no trade barrier. Hence, as a result, Thai Brand or Thai Manufacturers will be facing with fiercer competition from the influx of foreign products.*

Motivation: *This paper is aiming at finding the way to support Thai products/manufacturers when it is not ready to compete with other products from AEC countries by utilizing the concept of ethnocentrism and animosity as well as cultural collectivism as a protection against the influx of other countries. Previous study has shown that people with higher ethnocentrism will have less favorability towards foreign product when the product is unnecessary. While, country of origin may have influence towards necessary product, nevertheless, animosity can reduce the preference towards that necessary product that is highly value in terms of country of origin in other country.*

Study Design: *Two experimental study will be conducted with the convenient samples, students subjects.*

- *Study 1: Between Subject Design: 2(Ethnocentrism: National Anthem vs. Control) X 3(Animosity: Animosity vs. Domestic Animosity vs. Anti-Domestic Animosity or Unity (Olympic))*
- *Study 2: Between Subject Design: 2(Ethnocentrism: National Anthem vs. Control) X 3(Animosity: Animosity vs. Domestic Animosity vs. Anti-Domestic Animosity or Unity (Olympic)) X 2(Culture: Independence Self vs. Interdependence Self)*

Product

- *The product that consumer will be evaluated will be composes of 2 categories which are necessary and non-necessary category*
- *The price would be manipulated such that local product is higher than international product*

Measurements:

- *Preference toward Thai Brand in Non-Necessary Category (Julie Cracker vs. Farmhouse Cracker)*
- *Preference toward Thai Brand in Necessary Category (Thai Rice vs. Cambodian Rice)*
- *WTP for Thai Brand vs. International Brand*
- *Manipulation on Price make International brand more expensive than local brand*

Manipulation Check

- *CETS (Shimp)*
- *Animosity (Kline & Ettenson)*
- *Inter/Independent Self*

Proceedings of 2013 International Conference on
Technology Innovation and Industrial Management
29-31 May 2013, Phuket, Thailand

THE IMPORTANCE OF BUILDING AND REBUILDING TRUST IN ORGANIZATIONS

Joanna Paliszkiewicz, Warsaw University of Life Sciences

ABSTRACT

Purpose: *Trust is important, because it allows people to form relationships with others and to depend on others—for love, for advice, for help. But trust also involves the risk that people they trust will not pull through for them.*
The aim of the article is to present empirical research connected with building and rebuilding trust in organization and to present method to measure level of trust in organization.
Design/methodology/approach: *In the article the research, which was done in the best Polish enterprises form Mazovia Province are presented. This work was supported by Ministry of Science and Higher Education in Poland. Article is connected with the realization of research project entitled "Orientation on trust and organizational performance" (No. N N115 549238).*
Findings: *In the article the approach to measure level of organizational trust is proposed. The study shows the connection between orientation of trust and organizational performance.*
Research limitations/implications: *The research was done in the best polish enterprises, so the research should be also made in other kind of enterprises.*
Originality/value: *The topic of trust is very important now, in the era of crisis. It is the first method of measuring trust level, which was checked in polish enterprises.*

Keywords: Trust, trust management, building trust, rebuilding trust

INTRODUCTION

The concept of trust is very important in all sphere of human life, especially now, in the era of global crisis. Trust enables people to feel more safety in the very fast changing world. To strengthen society and its major foundations, we need to build and rebuild trust. Nowadays, trust has decline for many reasons, and some of these have persisted for decades. This include societal issues, such as increasing suspicion due in part to decrease interaction among individuals, and institutional factors, such as the recent massive failures in the financial system or organizational malfeasance. Additionally, we can add violations of trust by many business, governmental, and religious leaders.

Trust is essentially important for successful cooperation and effectiveness in organizations, facilitates negotiations, reduces transaction costs, and even help to resolves international political conflicts. Trust enhances the ability to change and to support radical change. This is because trust is said to assist in learning, creativity and innovation.

The aim of the article is to show the importance of trust building and rebuilding and to indicate the relationship between trust in organization and organizational performance. The research was done in enterprises from Poland.

Building and rebuilding trust

Building trust in the organization plays an important role. Trust facilitates management, risk taking, effective use of resources as well as the impact on all activities of the organization. Previous research has shown that leaders are critical to build trust in organizations, and that trust in leaders is significantly related to a number of attitudes, behaviours, and performance outcomes.

Preparation to start effective process of building trust in the organization should begin from diagnose the situation in the organization. R. K. Sprenger (2009) suggests using the following questions, which can help in the diagnosis:

- What managers do to promote a culture of trust in a company?
- What criterias of behavior in organizations allow us to understand the culture of trust?
- What relevant subjects or objects of trust are in organization?
- What are the biggest obstacles of building a climate of trust in the company?
- Which of the rules in organization are the opposite of trust?
- How climate of trust is creating among the leaders?

Managers should diagnose whether the current business is based on trust or not. (hidden) E. M. Whitener, S. E. Brodt and J. M. Werner (1998) suggested that the existence of trust in the organization need the following behavior of managers: consistency in performance, integrity in action, proper communication, show of interest to employees. Example and support in building a climate of trust has to start from the management, but the attitude of the staff are also important. We can specify the appropriate behavior on the side of workers such as: tell truth, responsible behavior, effective communication, support to other staff, information about irregularities in the organization and organizational processes, a sense of responsibility for the success of the organization.

In the literature there are a lot of propositions of activities which influence of building trust in organization for example:

- Providing information - just in time (Deutsch 1973; Ellinor, Gerard 1998; Ryan, Oestreich 1998);
- Giving positive and negative feedback to staff in an appropriate manner (Zand 1972; Johnson, Johnson 1995; Ryan, Oestreich 1998);
- Speaking openly about problems (Deutsch 1973; Gabarro 1978);
- Being honest to others (Deering, Murphy 1998);
- Initiate and accept changes in decisions in they are needed (Zand 1972; Johnson, Johnson 1995; Ryan, Oestreich 1998);
- Listen and accept advice of other people (Zand 1972; Gabarro 1978; Ryan, Oestreich 1998);
- Giving and receiving help and support (Deutsch 1973; Johnson, Johnson 1995; Ryan, Oestreich 1998);
- Showing interest and caring for others (Deutsch 1973);
- Delegating responsibilities to personnel (Zand 1972; Zand 1997, Deutsch 1973; Costigan, Ilter, Berman, 1998; Nelson, Cooprider, 1996);
- Delivering on promises and telling the truth (Deluga 1994; Hosmer, 1995; Humphrey, Schmitz 1998; Jones, George 1998; Karsgaard, Schweiger, Sapienza 1995);

- Showing respect to others (Costigan, Ilter, Berman 1998; Nelson, Cooprider 1996);
- Demonstrating loyalty and job satisfaction (Bigley, Pearce, 1998; Sabherwal 1999).

In the literature there are some proposition of model of organizational trust building. For example R. Galford i A. S. Drapeau (2002) proposed model SEEKER consisted of the following elements:

- **S**how that you understand the needs of individuals and groups;
- **E**stablish the rules;
- **E**xplain what resources are available to use;
- **K**eep promises;
- **E**ngage in communication;
- **R**einforce others by proper behaviour.

M. Armour (2007) confirmed that building trust should focus on four factors: climate, character, behavior, and culture. First, leaders must create a climate of trust, so that employees feel: safe, informed, treated with respect, valuable to organization and understood (**S**afe, **I**nformed, **R**espected, **V**alued, **U**nderstood – SIRVU). Trust will develop in the employees if they meet leaders of the following characteristics: **H**umility, **I**ntegrity, **T**ruth, **R**esponsiveness, **U**nblemished fair play, **S**upport and encouragement, **T**eam care (HI-TRUST).

Costs of loss of trust affect different areas of the organization. It all depends on what kind of trust has been destroyed. Loss of trust is associated with negative emotions of people such as: anger, fear, which strongly affect humans (Solomon, Flores 2001). According to R. J. Bies and T. M. Tripp (1996) loss of trust can be defined as a situation where the perceived hoping that he/she trusted did not meet its expectations. For example the lost of organizational trust can be connected with (Gibb 1991; Shockley-Zalabak, Morreale, Hackman 2010):

- Errors in the formulation of strategy and unclear vision of action,
- Changes, acquisitions, restructuring, redundancies,
- A breach of ethics,
- Political environment,
- Lack of communications,
- Unclear policy of the organization,
- Exerting pressure on the workforce,

The costs of trust lost are related to: broken reputation, negative attitude to work, negative thinking, making bad decisions and decreasing of income.

Rebuilding trust to the leaders or the organization is a very difficult process, and in some cases even impossible. Studies on the breach of trust are carried out in the context of interpersonal (Lewicki, Bunker 1996; Sitkin, Roth 1993) and social (Shapiro 1987; Zucker 1986).

The first step leading to rebuild trust is to admit to mistakes. Then, propose amendments taking into account the views of all interested parties. Trust must be rebuilt in a natural way. It cannot be a result of the transaction. You cannot force anyone to trust. Each party must demonstrate good will and recognize the needs of others.

Restoring confidence in the organization is a process which can be influenced mainly by the action in the area of development and non-financial incentives.

Examples of such activities include:

- Participation in non-standard and / or strategic projects;
- Increasing autonomy resulting from increasing participation in decision-making;
- Closer contact with senior staff;
- Giving support from mentors;
- Improve access to critical business information.

Presented examples do not require financial investment and only a deep commitment of executives. Efforts should first be concentrated on key employees, because at the labor market they can find better position. The rebuilding of trust can also be better when managers will be train in soft skills such as empathy, communication, coaching. The trust is important not only in organization but also in contacts with business partners, clients and society.

METHODOLOGY

Instrumentation

Three questionnaires were used - Measures of Organizational Trust Questionnaire Measures of Managers Trust Questionnaire and Measure of Organizational Performance Questionnaire. In these three questionnaire five point Likert scale was used (strongly agree = 5, agree = 4, neither agree nor disagree = 3, disagree = 2, and strongly disagree = 1).

Measures of Organizational Trust Questionnaire and Measures of Managers Trust Questionnaire were proposed by Paliszkiewicz based on a review of literature that included research studies of R. P. Barraglio, S. E. Condrey (2009); C. Caldwell, S. E. Clapham (2003); A. M. Evans, W. Revelle (2008); S. Gächter et al. 2004; E. L.Glaeser et al. 2000; K. Jones, L. N. K. Leonard 2008, P. Kanawattanachai, Y. Yoo (2002); and R. Seppänen et al. 2007. In Organizational Trust Questionnaire the items were as follows:

1. There is atmosphere for honest cooperation among employees.
2. Clear expectation connected with results and aims from all employees.
3. Employees are willing to share knowledge.
4. Employees openly admit and take responsibility for the mistakes they have made.
5. Employees avoid participating in gossip and unfair criticism of others.
6. Employees are willing to take part in trainings.
7. Periodic meetings take place between employees and the management.
8. In general the work responsibilities are established and clear.
9. The criteria of promotion are clear in every position.
10. Evaluation of employees is fair.
11. The relationship between employees is good.
12. All employees are treated fairly
13. The interests of workers are taken care of.
14. Team work is encouraged and preferred.
15. Employees are encouraged to take part in decision-making.

Measure of Managers' Trust Questionnaire:

1. In dealing with people never be too careful
2. You should not trust other people until you do not know them well
3. Most people will lie if it will then be able to get something
4. Employees in your company when the opportunity arises to gain something will be dishonest
5. In these days in your company you can only count on yourself and only trust yourself
6. Relations between employees are connected with rivalry
7. Employees in your company wish other the best
8. Most people in your company keep promises
9. In your company a new ideas are implement and work conditions are improved
10. In your company people can open discuss what is wrong
11. In your company your employees feel accountable for their tasks and do not have to be monitored
12. In your company staff for most of the time trying to be helpful to others and do not care only about self-interest
13. In your company motivation of people is high
14. In your company managers are mostly advisors and intellectual partners to employees
15. In your company the innovativeness, taking risk and originality are preferred

In case of questions from 1 to 6 (measure of manager's orientation on trust) the scale was changed that 5 was always the good answer.

Measure of Organizational Performance Questionnaire was used to measure organizational performance. This questionnaire is based on the work of R. Deshpande, U. Jarley, F. Webster (1993) and S. Drew (1997). This measure can be thought of as a variation of the balances scorecard method. The organizational performance is assessed by the use of global output measures such as market share, profitability, growth rate, and successfulness in comparison with key competitors. J. Paliszkiewicz (2007) modified this questionnaire to include the dimension of innovativeness. The items were as follows:

1. In comparison with the competitors, this company is more profitable.
2. In comparison with the competitors, this company has a larger market share.
3. In comparison with the competitors, this company is growing faster.
4. In comparison with the competitors, this company is more innovative.
5. In comparison with the competitors, this company is more successful.
6. In comparison with the competitors, this company has lower costs.

SUBJECTS AND PROCEDURE

The questionnaires were distributed to 469 managers (205 – upper management, 203 middle management, 61 – lower management) from 287 companies identified as the best enterprises according to the Forbes Journal in Mazovia Province in 2009. The research took place in the enterprises from the Mazovia Province in Poland from November 2010 to February 2011.

DATA ANALYSIS AND RESULTS

Collected data were analyzed using a k-means clustering method. In data mining, ***k*-means clustering** is a method of cluster analysis which aims to partition n observations into k

clusters in which each observation belongs to the cluster with the nearest mean. Euclidean distance was used as a metric and variance was used as a measure of cluster scatter.

For this method three dimensions were used: managers' orientation on trust (OM), organizational orientation on trust (OP) and organizational performance (WD). Manager's orientation on trust and organizational orientation on trust were measure in the scale from 15 to 75 and organizational performance from 6 to 30. The results are presented at the figure 1.

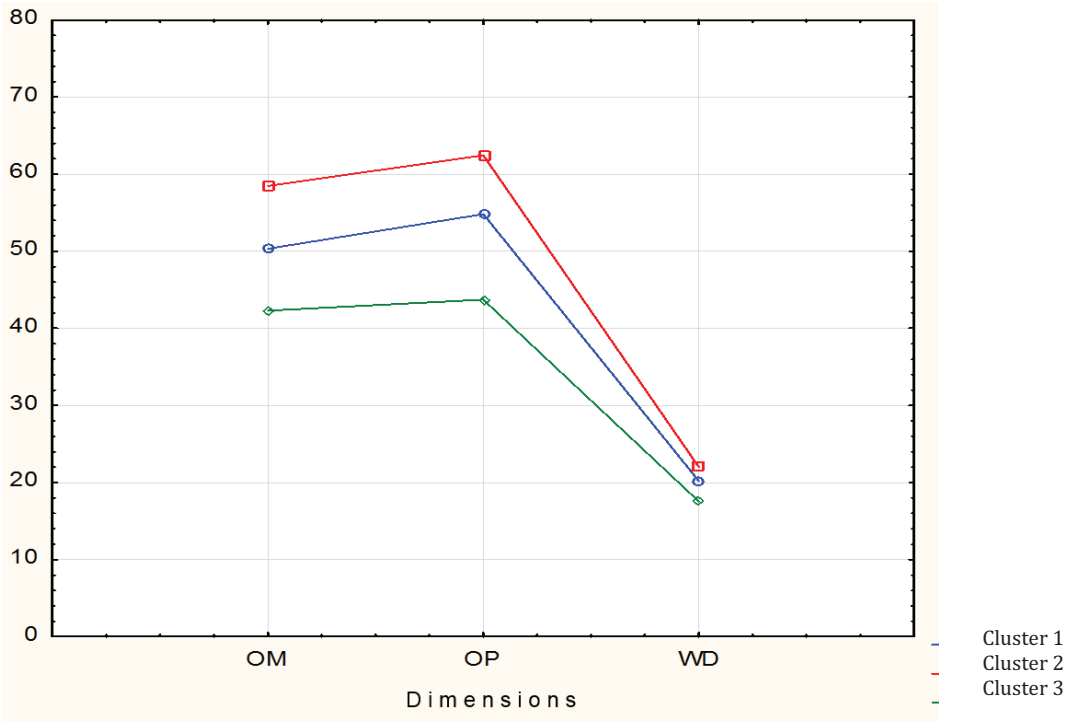

Fig. 1. K-means clustering method – 3 dimensions
Source: Author's research

According to the research the best results have enterprises in cluster 2, the worst in cluster 3. To first cluster 226 respondents were classified. Characteristic of the group is presented in table 1.

Table 1. Descriptive statistics – cluster 1

	Means	Standard deviation	Variance
OM	50,33	3,86	14,92
OP	54,81	3,44	11,85
WD	20,21	3,46	12,00

Source: Author's research

In cluster 1 the average orientation of managers on the creation of trust is 50.33, and is lower than the average of the whole population that is 55.93. Orientation companies to create trust are higher than average (52.10) and is 54.81. Average organizational performance is 20.21.

Descriptive statistics for the best cluster 2 are presented in the table 2. In this group there are 172 respondents.

Table 2. Descriptive statistics - cluster 2

	Means	Standard deviation	Variance
OM	58,47	4,37	19,10
OP	62,44	4,38	19,17
WD	22,02	3,68	13,53

Source: Author's research

In the cluster 2 the average orientation of the managers on the creation of trust and the average orientation of the company for the creation of trust is above the average calculated for the entire study population (OM is 58.47 and OP is 62.44).

In cluster 3 there are 71 respondents. Descriptive statistics are presented in table 3.

Table 2. Descriptive statistics - cluster 3

	Means	Standard deviation	Variance
OM	42,29578	5,119694	26,21127
OP	43,71831	5,926172	35,11952
WD	17,54930	4,771309	22,76539

Source: Author's research

The respondents in cluster three have the weakest results, both the average orientation of the managers on the creation of trust and the average level of orientation for the creation of trust companies is below average. Respondents also see the results of organizational performance as lower.

The results tend to create a few important conclusions of a theoretical nature. Research confirms the existence of a link between the orientation of the company to create trust and orientation of the managers on the creation of trust and the organizational performance. Trust is an important resource of the company and there is no substitute. Better results are achieved in organization when the orientation of the trust is higher in the two studied categories. The study also revealed the possibility of complete deprivation of resources by increasing trust seen as factor influencing on organizational performance.

SUMMARY

Trust allows to coordinate cooperation between partners who are and remain strangers to each other, and they do not know each other. It replaces the knowledge of other people and motives them to take actions. If ambitious economic goals have to be achieved we must trust to those who do not know personally. This is a problem for many people.

According to the research orientation on trust in companies in Poland is not high, it can be compare to the trust that is diagnosed for the whole country. Highest trust now declare young people between 18 and 34 years of age, people with higher education and well-paid. It may be concluded that over the years, when there will be a change of generations trust in our society increases, which should also have influence on economic performance of the whole society.

In organizations, managers often do not realize the role of trust and its impact on results of operations. But there are a lot of advantages connected with building trust culture:

- Integration of the company: efficient communication, effective implementation of change (eg, during the crisis) and effective and efficient management teams;
- Improve performance and increase competitiveness;
- Increase innovation by stimulating creativity, creating new ideas and intellectual potential of the employees;
- Increase in employee development. In an atmosphere of trust, people are more willing to share their knowledge;
- More effective management of human resources processes, e.g. recruitment and selection, adaptation, development, training, motivating, evaluating and rewarding employees;

From a practical point of view, the research showed the managers of enterprises, that management of trust is essential in the development of business and getting better results. The results showed that even in the best Polish companies is still much to do in terms of raising the level of trust. The results may encourage managers to follow companies with high trust level, and to build their own unique strategy for trust management. The companies could monitor the level of trust using the specially prepared tools such as proposed in this article questionnaire.

The results inspired to ask the following research questions for the future study: How trust is dependent on the characteristics of individuals or organizational culture? How does it happen that the trust will expire in a particular organization? How to rebuild trust in a particular organization? How to develop confidence in multicultural environments?

ACKNOWLEDGEMENT

This work was supported by Ministry of Science and Higher Education in Poland. Article is connected with realization of research project entitled “Orientation on trust and organizational performance” (No. N N115 549238).

ABSTRACT

The purpose of this research is to propose tourism development strategies in Taiwan based on author's travel experience in Thailand for past 10 years. Back in these years, one of the authors traveled from Taiwan to Thailand for more than 15 times, mainly in Bangkok and Chiang-Mai. The main task of these travels is to offer lectures in Kasetsart University and Chiang-Mai University. After lectures, the faculties in these two universities usually took the author to visit local spots to introduce the culture of Thailand. Based on the author's observation, tourists attracted by Thailand are because of the following reasons: first, Thailand's government put lots of effort in tourism. Second, People in Thailand are nice and friendly to new comers. Third, the nature environment is being preserved well, and last, the local culture with religion attracts people to visit. Later on, we propose several tourism development strategies for Taiwan.

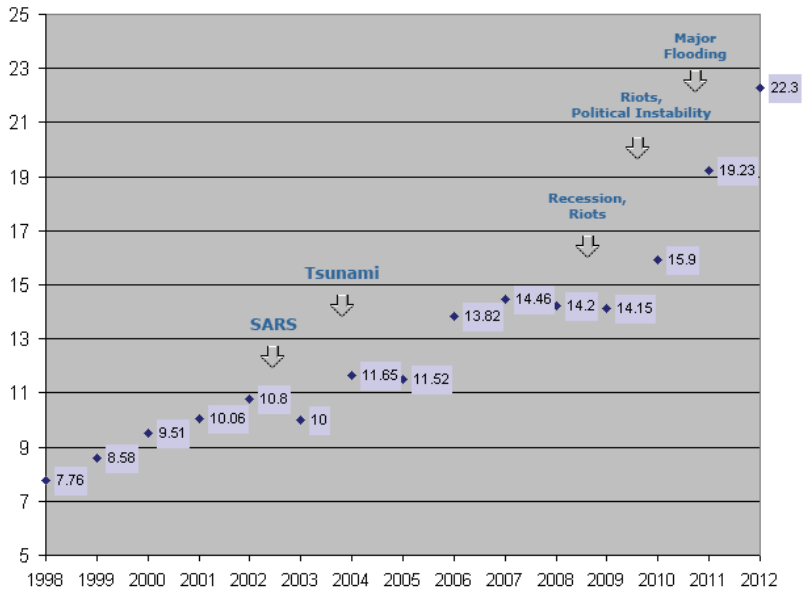
Keywords: travel, tourism, strategy formulation, Taiwan, Thailand

WHY DOES THAILAND DEVELOP TOURISM

In a time that the technology is improved and transportation well-developed, the global village is not a new concept anymore. From October to February, many residents who lived in the Northern Hemisphere will go to low-altitude tropical countries to stay away from freezing weather. As for the visitors visiting these countries, most of them will choose Thailand compare to other Southeast Asian countries to stay. This is why we came up with the motivation to research this issue.

According to the introduction of Thailand from the Thailand tourism bureau, Thailand used to be called Siam. Thailand's land area is about 5 million square kilometers, with around 69 million people. It's located in the central part of Indochina Peninsula between China and India. Most people in this country worship Buddhism and this country always has been the gathering place of religions, cultures, and many races in the Southeast Asian, which brought up Thailand's special culture and the best attraction to foreign tourists.

Lai (2006) pointed out that since the Vietnam War in 1960s, many American soldiers spent their holidays in Thailand increasing foreign exchange earnings and also improved the development of Thailand's architecture and facilities. Thailand's politics and economy didn't go as smoothly as always, though. Chen (2010) said that the financial crisis in 1997 impacted the environment of economy in Thailand heavily. But government combined the resources of private and public bureaus efficiently. It soon leaded Thailand's tourism out of the shadow of financial crisis by holding large international marketing activity "Amazing Thailand", plus spreading medical tourism and starting to use new airports. The data provided from the Office of Tourism Development (2013) displayed that although the political was unstable in 2009 and 2010, the financial bounce back and the flooding in middle Thailand in 2011, causing the number of tourists decrease, Thailand reaches its highest point of arrivals in the fourth season of 2012 which is 6.33 million, which makes the highest record in the last 15 years.



Source: www.thaiwebsites.com/tourism.asp, accessed on 2013/3/1

Figure 1 Yearly Tourist Arrivals to Thailand 1998-2012

Summing the above contents, the reason why Thailand develops tourism is not only that Thailand is the gathering place of politics and economy among the near Southeast Asian countries, but also the solution to deal with the impact of Vietnam War and financial crisis, which also speeded up the government's awareness and promotion to tourism. This research note is mainly to discover why Thailand's tourism is attractive and what Taiwan can learn from it. To answer this question, I'll use my own experiences back in these 10 years traveling to Thailand Bangkok and Chiang-Mai to discourse my observation and record them, in order to make the reference for this researches.

THE REASON WHY THAILAND'S TOURISM IS PROSPEROUS

Up 2013, many Southeast Asian countries such as Thailand, Singapore, and Malaysia all devote in promoting tourism. This research sorts out possible reasons why Thailand is able to attract foreign tourists after the long-term traveling experiences through Thailand, and divided them into four categories as Thailand's government, natural environment, the people in Thailand, and local culture, as follows:

(1) The Government of Thailand

- Thailand promotes the long-term travelers residency program to people who expected to reside in Thailand for up to a year, such as retirees or other specific groups.
- Thailand's government encourages tourism, and has real action, such as the huge international promoting activity called "Amazing Thailand".
- Thailand develops tourism earlier: From 1977, Thailand's government had started tourism development plan. The tourism has become the main income of Thailand's exchange, which makes Thailand's government more emphasize on developing tourism.

(2) Nature Environment

- Thailand has tropical weather with fruitful natural resources..
- Community—There are numerous rivers and to develop good water transportations. Local residents take bamboo raft as transportations.
- Geographic location—Thailand is located in the middle part of Indo-China Peninsula, the hub position of Southeast Asia. As the International Shipping Center, there is more than 80 airlines pass through. This made people around the world going to Thailand easily and conveniently.

Thailand gave a good foundation for tourism because they understood its superiority and made good use of resources.

(3) **People in Thailand**

- Most merchants in main tourism area can speak business English and European languages in order to make better communication with people from different countries.
- They use smile to interact with people, Thai is also called the country of smile because of that.

Thailand is a friendly country. With kindness greeting, Thailand makes tourists feel at home.

(4) **Local culture**

- Loyalty to Kings: Thailand has a unique and significant royal tradition, Thailand kings are esteemed by people and the king's posters and statues are visible everywhere.
- The Religion of Erawan Shrine: Buddhism is the national religion in Thailand, they believe Erawan Shrine is the god controlling prosperity in the human world and to praise harmonic.
- Provide Services of Releasing Stress, such as the Tai massage.
- Special Industries are Open. For example, Lady Boys and red-light districts.
- Special Spot: Merchants sale variable products in hot spots, such as Thailand night market, floating market, Thailand palace, and Erawan Shrine Altar.
- Special Show: Lady Boy show, crocodile show, elephant show and etc., become assigned package tours.
- Special Festival: Traditional Songkran Festival of April always attracts lots of tourists.

Summing the above possible reasons that Thailand can attract tourists to come to take a vacation, it can be classified into three parts: First, the local culture of Thailand is special. Second, travel plan is smooth and provide many shows. Third, government pays attention to tourisms. These factors make Thailand best choice of traveling in Southeast Asia.

SUGGESTION TO TOURISM RELATED INDUSTRIES IN TAIWAN

Taiwan used to emphasize on manufacturing and export processing. Taiwan government should change its focus on economy development by tourism or cultural and creative industries' diverse development to advance the economics. As for that, we listed the solutions Taiwan can

refer to do by the former stated observation how Thailand attracts tourists as follows:

(1) For Government of Taiwan

- As for the role the government should play, it can compare the visa passing solution in Thailand to provide faster visa and passing to attract tourists to have long-stay in Taiwan.
- Different form Thailand, Taiwan is located in the hub position of East Asia, the numbers of flights are considerably large every day. Taiwan should construct more high quality flying environment.

(2) For Nature Environment

- Climate— Taiwan has subtropical weather. The climate is mild and suitable for tourists all year.
- Geographic Location—Taiwan is an island country surrounded by sea. The topography of Taiwan is various and cause high biological diversities.
- Taiwan's land area is just 36,000 square kilometers. No matter you want to go to high mountains or the blue sea, you can arrive there within two hours. Compare with other countries, traveling in Taiwan to visit mountain or sea is more convenient.

Although the city of Taiwan has well developed traffic infrastructure; major attractions are located in remote regions. Hence, tourism industry in Taiwan can be further developed by having different types of tour packages around this island. In terms of Marketing, what Taiwan can do is that when tourists arrive at an attraction, they can check into places on a register and get one point. After collecting 10 points, they can get a souvenir for free.

(3) For People in Taiwan

- Taiwan should find its own soft power to find special point of Taiwan. Such as Taiwanese's enthusiastic which is always arouse foreigner's surprising.
- Taiwanese has good reputation in terms of friendly and mercy internationally. When serious disasters happen around the world, Taiwan's assistance always come thick and fast.
- Tourists from Europe and US prefer tidy and clean place to consume, Taiwan should enforce the train of cleaners to keep a nice homeland impression.

The recommended method of our research:

The government can provide different kinds of subsidies and educational training to

improve the quality of service of stores. The government can also train more young people to serve tourists in different languages. By doing this, we can show Taiwanese' hospitality.

(4) For Local Culture

- Taiwan has been dominated by Holland, Spain and Japan in sequence, so we fuse characteristics of multiple cultures.
- Performing Arts: Almost all of the adjacent countries have their unique performing shows; Taiwan needs to strengthen own traditional performing arts to make them become our traveling highlights. The traditional performing arts include aborigines' singing and dancing or "Din Tao", etc. By doing so, Taiwan's performances will gradually be on the world's stage.
- Snacks Culture: Snacks possess special cultural meanings. Taiwanese' will prepare occasional snacks for special festivals, such as sticky rice balls for Lantern Festival and zongzi for Dragon Boat Festival, etc. These phenomena show the simple life style of civilians.
- Night Market Culture: Night markets not only provide cheap but high-quality snacks, such as oyster omelets and steamed dumplings, but also provide different kinds of scarce products. Night markets are the place that you cannot miss while visiting Taiwan.
- Traditional Festivals: Taiwan can expand the scale when holding Taiwan's special festivals, such as Lantern Festival. For example, to invite travelers all around the world join with us to celebrate the festivals, making these festivals become international activities.

CONCLUSIONS

This research views the process of Thailand developing its tourism, and discovers that Thailand really makes the resources of the country into usable resources. Thailand's government noticed the strong potential of tourism a long time ago, which becomes the strategic motivation of Thailand to fulfill its national goal. Besides, because tourism is a service industry that involves with many other things, and to develop service industry is helpful of raising the efficiency of other industries, so tourism is an ideal leading industry. Based on the external effects that developing tourism can bring up, it relies on government to lead the process as the leading role. And regarding from Thailand's experiences, tourism is helpful to mediate the stress from financial impact.

The reason of Thailand's prosperous tourism industry is that the government can use their

resources correctly to show Thailand's distinctive fascination. Taiwan is a country with multi-culture; Taiwan composite environment is as good as Thailand. If Taiwan can find out Taiwan's core value by comparing transnational, be clear of Taiwan's position, grasp the advantage of the industry (For example, the quality of Taiwan's ICT industry is famous around the world, so we can apply it to the tourism industry in many ways.), show the beauty of Taiwan to the world, the tourists will naturally come to Taiwan in an endless stream.

CONCEPTUAL FRAMEWORK FOR DECISION SUPPORT SYSTEM OF THAI FRUITS

Sawang Panjun, Department of Industrial Engineering, Faculty of Engineering, Kasetsart University, Thailand, sawang26@yahoo.com

Punnamee Sachakamol, Department of Industrial Engineering, Faculty of Engineering, Kasetsart University, Thailand, fengpmsa@ku.ac.th

ABSTRACT

This article aims to propose a conceptual framework for Decision Support System (DSS) of Thai fruit's activities in Thailand. This research presents a new model with the application of Cold Chain Management, which will be integrated to the Quality Control (QC) of the fruits, harvest to extraction, storage and transportation process, and including the export of fruits to a customer in a foreign country. The framework also focuses on forecasting method to predict the damage caused by the choice of each activity in the process. The simulation analysis on logistic model will then be designed to determine the possibilities of outcome from various parameters, for example, farmers, exporters, appropriate age to harvest, mode of transportation of clients in each country, transportation costs, fines, and the rate of loss that is expected to occur. The Decision Support System will be used to aid the farmers on the optimal reasonable sale price, provide the exporters with the information on how to manage the fruits properly during shortages or harvest season. So that the fruits are available to the needs of customers in every moment, accessible raw materials, development of domestic production, higher quality export and minimum waste.

Keyword : Conceptual Framework, Decision Support System, Thai Fruit, Cold Chain

INTRODUCTION

Currently, Thailand is one of the most success fresh fruits export country to the world. In the year 2012 Thailand was export fresh fruits to overseas about 1,038 Million Tons with value 19,327 Million Thai Baht. When compare the fiscal year 2011, the value has increasing at 36.78% (Office of Agricultural Economics, 2013). Where, the important business partners as importer are China, Japan, United State of America, Malaysia, Indonesia, South Korea, United Kingdom, Vietnam, Australia, and Cambodia accordingly. Due to those importers are able to grow the plant but it does not fulfill internal consumption and cost of planting is tend to increase for each fiscal year. These reasons made the referred countries have to import fresh fruits from Thailand and Other export countries in a large volume. However the import rules of each county have a lot of limitation, some countries have strong focus and limit the concentration of retained pesticides, plant pathology, insects. It is for concerning about consumer sanitation as crucial issues. Many countries have the regulation to eliminate the oriental fruit flies by steaming prior to import to the country.

At present, fruits export industries are still have risks from raw materials quality which delivered from Thai farmer at high side. The quality of fruits is mainly focus on fresh, residual toxin. During the crop season, a bulk of fruits come out this made producers or fruits conversion factory have to invest a lot of cost to purchase and store raw materials. This leads to increasing of material storage cost. On the other hands, the study does not yet research for a proper packaging, methods of storage, and also the right data communication between purchaser, 3rd party logistic and buyer. From the problems, it was made raw materials and fruits products decay during transportation. Due to most of the products are easy to decay, having short storage time, and damaged from improper products arrangement especially for a long delivery time. Those factors made price per unit cost increasing significantly.

From above problem background, it is initiating the concepts for decision support system for Thai fruits processing from production till export information technology management. The information will collect the data for fruits harvest, separation, storage, transportation, and export. The information system is also including lost predictive system from chain activities and quality simulation model for each step of fruits processing through end user hand over. According to this system, it will connect activity and data from farms, factories, and final customers effectively. The system will develop and improve business process together with machine that involve in harvest process, transportation, separation, storage, accumulative, collection, production, filling, and distribution. Main subject of the model will tend to; minimize lost, waste, harvest time and amount of fruits at the same area; maximize selling price; generating an effective management system. So, making of decision support system for Thai fruits processing for export is important for total chain operation to. To increase planning ability, support, management control, packaging, storage, logistic, and distribution with effectively and productively, reduce lost and cost reduction, also increase chance of market share and continual market expanding for Thai fruits trading value.

DECISION SUPPORT SYSTEM for THAI FRUITS

Decision Support System (DSS) is a computerize system that enhance and made a bulk of data comes easy in term of data collecting and data analyzing for users. To solve the complicated problems or planning, DSS is able to increase level of a persons whose make the decision. it leads to time reduction and reduce human resources during analyzing period. (Jones et al., 1998) of those advance of information technology at current situation made farmers and exporters applied the information technology to use in their business (Kropff et al., 1998).

Major components that use for decision support are data system management, data analysis system which interaction between interface and users. To design for each module are differences depending upon objective of system target users. In the past time, analysis system and system processing of decision support system done by modeling and simulation. It was developed and used widely to promote decision support system for Thai fruit. Decision support system program was integrated with products quality model, data base, and application program together (IBSNAT, 1989). Decision support system for Thai fruits users are able to call for fruits genetic, soil preparation, growing, nursing, and harvest. The system is also able to retrieve for fruits separation methods, buyers, and market. These data will use to simulate level of products quality, products prices, expire date and shelf life; all together

with guide line for transport both domestic route and international route. Software will demonstrate these data in format of data table and comparable graph to let users decide on the proper track and time.

DECISION SUPPORT SYSTEM DEVELOPMENT

From literature review, it was found that the development of decision support system for use in agricultural data management from products care, quality inspection, proper transportation, and proper sale direction for export company and domestic farmers. By this concept the system will estimate cost, processing time, and rate of income from each choice. The system is also including for trace back action for goods and raw materials which involve in process. Finally, it is made farmers, exporters, importers, and consumers having trust in quality of products. For both supplier and customer to be consider for making business in further. This system will estimate quality of fruits after harvest. The quality of fruits was determined by day counting, and temperature measurement after harvest. Both parameter are inverse variation to products quality. Decision support system structure is able to describing as figure below.

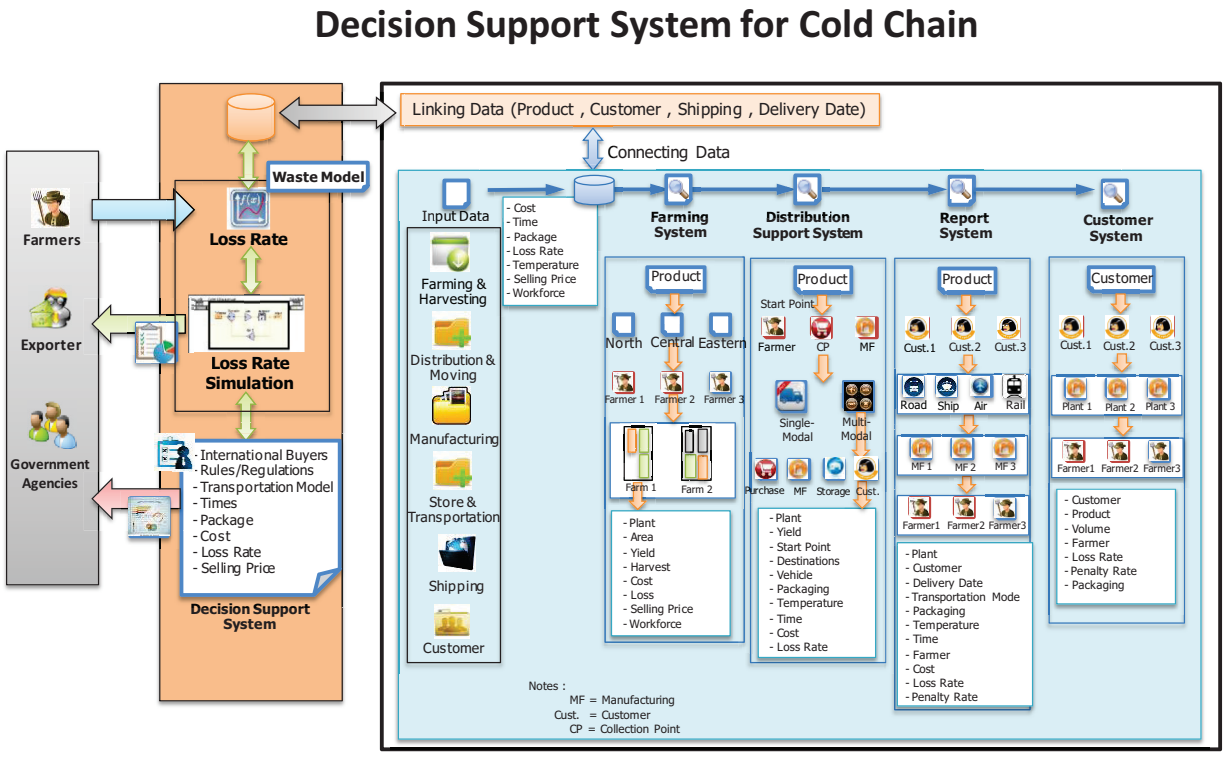

Figure 1: Structure of Decision Support System and quality evaluation system

According to Figure 1, the structure of decision support system for Thai fruits is consisting of many components which linked to relational data base. Refer to relational data base; it is collect detail for each parameter. Where, it is able to support for important data transfer to processing in quality model and lost model for each processing steps. Relational data has connected by dedicated data linking system to support decision support system for farmers,

exporters, importers, consumers, and government sectors. The developed decision support system for Thai fruits can describe in Figure 2.

Products Harvest System is the systems that operates for data collecting and propose the solution for agricultural management. It is for maximize quality and price based on harvest time, price of fruits, weather conditions, labor conditions, cost, transportation cost form farm to storage. These data will be collect by farmer interviewing and Thai fruits related business owner in each area of domestic farm.

Products Separation Data System is the system that collecting data and proposes for solutions of selective the system for quality, size, surface appearance, and bruised physical property. These data are effect directly to price level after fruits harvest.

Products Logistic System is the system that analyses for the factors which relevant to transportation cost for both in land and overseas. In general, cost of logistic is very important for business operation. It is effect directly to total cost of goods. Cost of logistic, the business owner must concerns for volume of goods which ship to final destination, loading time, expense, lost due to transportation. In some time, blank container has involved, so goods distribution center must be consider. Distribution centre is able to reduce cost by blank container. To collect the fruits from farm until ware house have enough fruits to fill in container.

Products filling system is the system which consider on the factors that related to products quality level. Due to the appearance of proper packaging for products and methods of transportation, it is made famers and buyers able to keep products on shelf longer than the products that use improper packaging. On the other hand a good packaging is able to reduce products damage due to transportation. Good packaging also shown a well appearance which gives a spiritual value, which provide value added for products.

Products quality controls system is the system that provides caring and nursing methods for fruit trees before and after harvest for fruits. A perfect body fruit trees will gives high products quality and quantity. It is lead to selling in high price due to a high quality of products. To control a proper level of water, fertilizer, plastic cover on fruits, and awareness of insects and disease on fruit trees are lead to a good products quality, which having a proper size to export. This system makes low loss and high products price. It is also a provide guide line to manage products during packaging in factory and transport to buyers both domestic and overseas.

Products auditing system is the system that use for evaluate quality of products after passed the conversion. Conversion means value added products and non-value added products, it was made change in products quality. This header is able to test experiment from real fruits, this experiment will start from fruits harvest, separation, transport to export factory, processing, packing, handling, and transportation to end users.

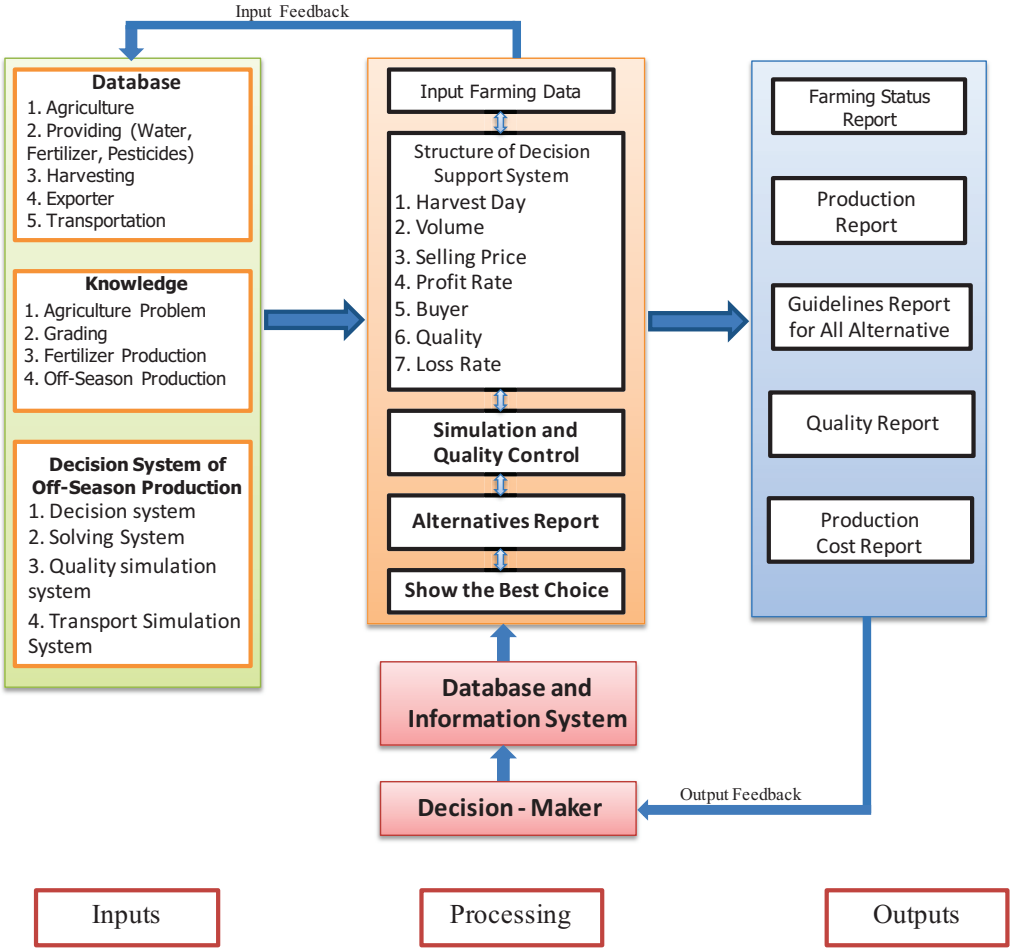

Figure 2: Decision Support System Structure and quality audit system

IMPLICATIONS AND LIMITATION

Implication

Refer to research, it was found that the factors that important on success of famers, exporter, and consumers decision making are alternative high probability data for decision making and also include up to date technology for developing data management. This system will provide information from information media for alternative ways of decision making, which included guide line of effective management and products and raw materials tracing by business operators. These factors are effect directly to business operation results, where some will reduce operation time and data retrieving in company. By those applied system to the company, it was made business owner whose produce fruit products for trade in domestic market and overseas market able to increase in competitiveness in market. However decision support system for Thai fruits is the system that proper for highly care fruits which having short shelf life. Also storage temperature is effect directly to quality of fruits especially for mango, mangosteen, longan, durian, rambutan, and pineapple. To increase level of competitiveness, business operator will look through lost, quality level, cost, revenue, regulation, and operating time. Those data is a must prepared from planting, nursing, havert,

to transportation to consumers. Where the data preparation and latest information technology are applied for data collection and presentation.

Limitation

It was found that, development of decision support system preparation for Thai fruit products some of users need to input and correction at real time but at current system. It is lead to user have to operating in a long time and use a lot of resources to complete decision support system effectively.

CONCLUSION AND DISCUSSION

Conclusion

Decision support system made business operators act their business effectively. It was prepared to serve business operators to work with high efficiency. On the other point of view, decision support system is also support business operator and prepares a choice of information for decision making. Decision support system is also stimulating staff in company to share their comment. Side benefits, decision support system is arrange and mange level of important issues from high important to less important and back up conference results for proper time in succession. On the other hand, decision support system is al so increase ability, efficiency, and productivity for the firm. Applying of decision support system is made the company save the time for decision making and reduce number of meeting with accuracy data and high reliability data.

Discussion

Way to develop decision support system in future, It will integrate cool chain management system from harvest, separation, storage, and logistic. It will concern for handling and storage improvement at proper temperature. Major reasons for decision support system improvement are extend shelf life, maintain products quality, and increase market share in overseas. Currently, some of fruits are export by air freight, which having a high transportation cost. The future of decision support system devilment will support for sea freight for Thai fruits which will lowering cost of transportation and make widely distribution to other countries.

Hsin-Fu Chen, Dept. of Finance, Lunghwa University of Science and Technology, Taiwan
Email: hsinfu@mail.lhu.edu.tw

ABSTRACT

Purpose: *The retail bankung industry has become increasingly competitive in Taiwan after the government's policy of deregulation and internationalization. Banks not only have to satisfy customers but also have to meet customers' needs and the changing preferences more effectively and effectively than their counterparts in order to maintain long-term competitive advantage. Building strong brand evidence in order to gain customers' attention has become one of the key issues in the industry. Nevertheless, relevant literature on the topic in the arena of retail banking industry, which plays an important part in the economy in Taiwan, is sparse. Therefore, the main purpose of this study is to explore the dimensions of brand evidence in the context of retail banking industry in Taiwan.*

Design/methodology/approach: *The study is conducted from the customers' perspective about how they perceive brand evidence in retail banks. The methodology employed is a combination of both qualitative and quantative methods including in-depth interview, focus group interview and factor analysis.*

Findings: *A questionnaire was established based on the result. After expert opinions and pretests, 200 questionaires were then distributed. The collected data were analyzed via factor analysis. The empirical results demonstrated that brand evidence was composed of five factors including employee service, core service, self-image congruence, brand name, and price.*

Originality/value: *In the practical aspect, the study presents the dimensions of customer perceive value and thus provide directions for retail bank parctitioners to enhance the customer perceived value. In the theoretical aspect, the result helps to establish a foundation for future development of a customer perceived value measurement scale specifically suitable for the retail banking industry in other contexts. It can also provide a theoretical base for further investigation on the relationship amongst value and other constructs.*

INTRODUCTION

The banking industry was well protected by the government over the past decades, especially in developing countries. Under the government's monopolistic protection, the government-controlled banks dominated the domestic market. Until the wake of the new centry, the banking industry has experienced major deregulation reforms to remove entry barriers for bank establishment worldwide and introduce more competition. Under such operation environment, banking industry has become increasingly competitive and practitioners not only have to satisfy customers, but also to meet their needs and changing preferences to maintain competitive advantage.

Nowadays, brands play an integral part in strengthening competitive advantage and they are increasingly valuable assets and resources of differentiation (Lim and O'Cass, 2001). A brand acts as a mechanism in engaging both purchaser and seller in a long run customer-brand relationship (Davis, 2000). To the customer, a brand identifies the attribute of the product, which in turn assigns legal responsibility to the product maker, and it provides a promise or bond with the producer (Lassar, *et al*., 1995). Brand also reduces search costs of consumers, perceived risk, and signal the quality of the product (Biswas, 1992; Shimp, 1993; Erdem, 1998; and Janiszewski and van Osselaer, 2000). Therefore, the brand becomes the advantages to the consumer in term of both economic and symbolic value. To the firm, branding plays a unique role because stronger brands not only boost differentiation among rivals, but also strengthen trust, facilitate visualization, reduce research costs, minimize perceived risks, and represent high quality from a consumer's point of view (Hosany *et al.,* 2006 and Kim *et a.,l* 2008). In addition, the advantages of strong brands are not only in the marketing of physical goods, but are also in highly prevalent where services are concerned.

Today, a number of theoretical frameworks have been proposed in an effort to understand how consumers think about, and respond to brands (Keller, 1998; and de Chernatony and Dall'Olmo Riley, 1998). The marketing researches also pay a lots attentions on how buyers verdicts on service brands (Grace and O'Cass, 2005). Whereas, Keller (2002) laid out a series of steps for building brand equity, and suggesting that consumer brand relationship is the final step. The consume-brand relationship depends largely on the successful establishment of the brand meanings. These meanings can be formed directly from a consumer's experience.

Although, there are available marketing researches on how consumer perceives service brand, these researches were conducted in developed countries (Grace and O'Cass, 2005; Şahin *et al.,* 2011; and Papista and Dimitriadis, 2012), there is little research on service brand in

Asian countries. This paper aims to investigate brand evidence of services in banking industry in Taiwan, and how the construct is formulated.

LITERATURE REVIEW

The service brand

Brand refers to "a name, term, sign, symbol, design, or combination of them which is intended to identify the goods and services of one seller or group of sellers and to differentiate them from those of competitors" (Kotler, 2006). A brand acts as a mechanism in engaging both consumer and seller in a long-term consumer-brand relationship (Davis, 2000).

In the service context, the service brand comprises multiple factors including customer perceptions of service quality, the people standing behind the service, and the quality of the supplier/customer relationship (Berry, 2000; Dall'Olmo Riley and de Chernatony, 2000). It is shown that in packaged goods, the physical goods is the primary representation of brand. However, with services, the company is the primary brand (Berry, 2000). This is argued in the literature that service is characterized by:

- Intangibility: the value delivered by the service provider is much less tangible;
- Heterogeneity: intensive interaction between the customer and the service provider makes each service encounter a heterogeneous experience;
- Inseparability: the production and consumption of service occur simultaneously and inseparably; and
- Perishability: services cannot be stocked and perish immediately after consumption finishes (Zeithaml *et al*., 1985; Bowen, 1990; Dall'Olmo Riley and de Chernatory, 2000; Lovelock and Gummesson, 2004; and Laroche, 2007).

Brand experience

Since service contains more intangible element than the physical goods counterpart, customers might search for more tangible cues inorder to evaluate the purchase. Recent research has focused on utilitarian product attributes and category experiences which provided by brands' consumption. Brakus *et al*., (2009) defined brand experience as sensations, feelings, cognitions, and behavioral responses evoked by brand-related stimuli that are part of a brand's design and identity, packaging, communications, and environments.

According to Alloza (2008), brand experience is a conception of the perception of the consumers, at every moment of contact they have with the brand. This includes the brand images projected in advertising, during the first personal contact, or the level of quality concerning the personal treatment they receive. Ambler *et al*., (2002) reported that brand experience is created when customers use the brand; talk to others about the brand; seek out brand information, promotions, and events, and so on.

Therefore, brand marketers must bond with consumers by staging holistic brand experiences (e.g., Schmitt 1999; Pine and Gilmore, 1999). The marketing strategies associated with the brand, effects the consumers "mind-set" with respect to the brandwhat they know and feel about the brand. The customer mind-set everything which exists in the customers' minds with respect to a brand (e.g. thoughts, feelings, experiences, images, perceptions, beliefs, attitudes and so on) that is defined brand equity (Ambler, 2000). When consumers look for, shop for, and consume the brands, they are exposed to utilitarian product attributes.

Moreover, they are also exposed to various specific brand related stimuli, such as brand-identifying colors (Belizzi and Hite, 1992; Meyers-Levy and Peracchio, 1995; and Gorn *et al*., 1997), shapes, typefaces, background design elements (Mandel and Johnson, 2002), slogans, mascots, and brand characters (Keller, 1987; and Brakus *et al*., 2009). These brand-related stimuli are considered as part of a brand's design and identity (e.g., name, logo, signage), packaging, and marketing communications (e.g., advertisements, brochures, Web sites) and in environments in which the brand is marketed or sold (e.g., stores, events). These brand-related stimuli compose the major source of subjective, internal consumer responses, which is referred as "brand experience" (Brakus, *et al*., 2009). Hence, brand experience is defined as subjective, internal consumer responses (sensations feelings, and cognitions) and behavioral responses evoked by brand-related stimuli that are part of a brand's design and identity, packaging, communications and environments.

Brand evidence

Brand evidence is the set of service brand associations experienced by the consumer during the pre-purchase and consumption stage. In the pre-purchase stage, consumers can evaluate the evidence of the service brand throughout its more tangible (or known) attributes such as the brand name and price (Janiszewski and van Osselaer, 2000). It is supported that the brand name is more important when there is a lack of available information (as is often the case with services) as the brand name becoming a surrogate for missing attribute information (Degeratu *et al*., 2000). Beside the brand name, price is another attribute of the brand that can

often be assessed prior to consumption.

However, from the consumer's perspective, price is much more than just a monetary figure. It is the perception of what is given up or sacrificed to obtain a product or service (Zeithaml, 1988) and is more aptly referred to as ''perceived price''. Dodds *et al*. (1991) expand on this concept by revealing the notion of ''perceived value'' as ''a cognitive tradeoff between perceived quality and sacrifice''. In addition, perceived value has received considerable attention in the literature because of its influence on purchasing behavior of the consumer (Eastlick and Feinberg, 1999; Sweeney and Soutar, 2001).

Neverthe;ess, what is easily seen or known about the brand is just a part of what contributes to the consumer's overall response to the brand. For instance, the consumer's evaluation process continues during consumption. On a basic level, the service provided (core service) and the way in which the service is offered (via the behaviors of service providers) is evaluated. On a more abstract level, the feelings aroused while using the service and the extent to which the image of the service is matched with the consumer's own also influence their overall evaluation of the service brand.

At the basic level, the core service and employee service are closely related in that the core service refers to the processes by which the service is delivered whereas the employee service refers to the behaviors or performances of the employees in the delivery of the service (Johns, 1999). In terms of the core service, Danaher and Mattsson (1998) provide an example which can effect consumer evaluations that the relative degree and intensity of activities and interactions to waiting periods during the service delivery may impact on evaluations and the duration per se have an influence on rating outcomes.

At the abstract level, feelings play an important role in consumer decision-making. Babin and Babin (1999) argue that feelings have a profound effect on consumption experiences and consumer reactions. Jayanti (1995) supported that due to physical cues often being limited, the inclusion of feelings as a basis for service evaluation is warranted.

It is possible that affective responses towards service providers may explain incremental variance in service encounter evaluation compared to cold cognitions. Because most service encounters are typically characterized by lack of information, uncertainty and high perceived risk (Jayanti, 1995).

Moreover, Keller (1998) assumes that the personality and behavioral traits of both the product/service brand and the customer are reflected through the user's image, the usage situation and the brand's personality. User imagery indicates the perceptions' consumers hold of the type of person who uses the product or service (Keller, 1998). These attributes can be formed from the consumer's own experience of contact with brand purchasers or through the image portrayed via marketing communications. On the other hand, usage imagery describes the situational factors in which the brand is used, for example, time of day, month, year, location or type of activity. In summary, user and usage imagery reveal the stereotypical user of the product or service in the context within which it is used (Biel, 1993; Sirgy *et al*., 1997). This is the perceptions within these imageries that often guide the development of brand attributes (Plummer, 1984).

In summary, the brand experience and brand evidence of service brands represents much more than just the extrinsic cues (e.g., brand name, design, logo, communication, servicescape, and price). It also represents all of the brand dimensions of the service that affect the consumer's evaluation of the brand, for example, the core service provided, the behavior and appearance of employees. The degree to which the brand's personality matches that of the consumer and the feelings aroused during service usage all contribute to the consumer's perception of the service brand. These dimensions (both tangible and intangible) provide the body of brand evidence accessed by service consumers. Thus, brand evidence provides the foundation upon which consumer reacts to service brands.

From the above literature search, it is preliminarily deemed that brand evidence is made up of seven major components. They are brand name, price/value/money, servicescape, core service, employee service, feelings, and self-image congruence. Brand name was measured by two items proposed by Grace and O'Cass (2005). Employee service was measured by multiple item scales adapted from previous research (Cronin and Taylor, 1992). Core service was scaled by five items from Grace and O'Cass (2005). Price/value for money was measured by four items adapted from Sweeney and Soutar (2001). Self-image congruence was used three-item scale proposed by Sirgy *et al*. (1997). Feelings measurement was adapted through Jayanti (1995) by three indicators. The result is shown below in table 1. The result can further be used to develop a questionnaire to collect consumers' perception towards the brand evidence.

Table 1: Summary of brand evidence diemmnsions

Dimension	Measurements	Sources
Brand name	This brand is famous This brand carries a sense of trust	Grace and O'Cass (2005)
Price/value/money	This brand provides a good service for the price. This brand offers value for money Using this service brand is economical.	Sweeney and Soutar (2001)
Core service	The core service provided is desire. The core service provided is reliable. I can depend on this brand to provide good core service. This brand provides quality core service. The core service provided by the brand is superior.	Grace and O'Cass (2005)
Employee service	I receive prompt attention from the service employees. Employees of this service are always willing to help me. The employees of this service are never too busy to respond to my requests. I can trust the service employees I feel safe in my transactions with service employees. Employees of this service are friendly.	Cronin and Taylor (1992)
Feelings	I feel happy when using the service I feel confident when using the service I feel impressed when using the service.	Jayanti (1995)
Self-image	The image of brand name is consistent with my own self-image. Using the service of brand reflects my social status. Most customers of this brand are the same as my status.	Sirgy *et al.* (1997)

The above result is then used to formulate the questionnaire for data collection. To summarize the above mentioned, the question for this research is proposed as "What factors made up the brand evidence?" We explore this from the consumers' perspective and use the bank customers as an example.

METHODOLOGY

The research process of this study is composed of the setting the research objective, followed by relevant literature research and adopting relevant research methodology including questionnaire design, data collection methods and data analysis. The research findings, conclusions and recommendations will be presented at the end.

Quantitative research methods including factor analysis and multiple regression are utilized in the study. Questionnaires were used to collect data for further analysis. The questionnaire was formulated according to the perceptual measures identified within the literature and adapted accordingly, and opinions from interviewed practitioners and consumers to make sure the comprehensiveness of the study.

In order to avoid ambiguity of the wording in the questionnaire, a pretest was undertaken before the questionnaire was finalized. Question items which were vague and not easily understood were modified or deleted. A total of 20 participants were asked to rate the questionnaires in terms of format, the measurements of all constructs, the customers information. The participants indicated minor wording issues and recommended the format to be more user friendly. The sampling frame is people who lived in the northern Taiwan area and over 20 years old prior to the interview. The sample method is snowball sampling. Questionnaires were distributed to the qualified respondents via trained personnel. A brief training and introduction on the objectives of the study to the data collection personnel were made prior to the questionnaire distribution in order to increase the response rate and make the questionnaire collection process smooth.

According to Hair, Anderson, Tatham and Black (1998), the sample size is suggested at the level of 5 to 10 respondents for each variable if the data set is to be factor analyzed, and the total sample size is advised to exceed 100. In addition, Hair *et al.,* (1998) also propose that the sample size to over 150 in order to be appropriate to obtain feasible solution. The questionnaire items for factor analysis are 20 and considering the possibility of no response and invalid questionnaires, we decided to use the upper bound to determine the sample size that is 200. In order to avoid invalid questionnaires, 20 more samples are included. Therefore

the total questionnaires distributed were 220.

The questionnaires were delivered to customers using mall intercept approach in major business area in Taipei. The respondents were asked about their demographic information, including gender, age and occupation.

RESEARCH FINDINGS

The profile of respondents

There were 220 respondents took part in the survey. 200 questionnaires were considered valid. The proportion of male subjects was 47.2%, the proportion of female respondents was 53.8%. Respondents aged under 39 years old represent 69.6% of the sample. The majority of the respondents are people working in the service sector (40.3%).

Reliability

The reliability was first tested and Cronbach‘s alpha coefficient, an index to evaluate internal consistency, was calculated. Reliability analysis refers to the measurement of reliability is to measure the degree of consistency or stability. We used SPSS analysis software package to measure the value of Cronbach's alpha reliability of this questionnaire, It is suggested that the Alpha exceeds 0.7 threshold to be reliable, and lower than 0.3 indicating low reliability (Hair *et al.,* 1998). The Alpha coefficient in this study is 0.932, implying the high reliability of the questionnaire.

In order to understand the respondents’ perception towards the brand evidence of retail bank, we undertake factor analysis summarize the parsimonious factors derived from the perception variables. Factor analysis is a multivariate statistical technique with an analysis of interdependence methods. It is used to summarize the information contained in a large number of variables into smaller number of factors in order to simplify the data set (Hair, Bush, and Ortinau, 2003). Before conducting the factor analysis, it is advised to know whether the data collected is suitable for factor analysis. the Kaiser-Meyer-Olkin (KMO) was first estimated. According to Kasier (1974), if KMO is larger, it means there is more common factors among the variables and thus more suitable for factor analysis. If KMO is smaller than 0.5, it is not suitable for factor analysis. The KMO of the study is 0.929 indicating the data is appropriate to be factor analyzed. In addition, Bartlett’s test of sphericity, a statistical test for the presence of correlations among variables, is undertaken. The chi square is 2933.798

($p<0.001$), showing statistical significance. It again means that the data set is suitable for factor analysis.

Factor analysis

To concentrate the effect of variables in research dimensions, every research variables are conducted with factor analysis. The scales were submitted to exploratory factor analysis. Using the principal component method, varimax rotation, and under the criteria of factor loading larger than 0.4 and eigenvalue larger than 1, four factors are extracted. The total variance explained is 63.253%, an acceptable level in most social science studies. The result is presented in table 3.

Table 3: Result of factor analysis

Items	Employee service	Core service	Self-image	Name	Price
I can trust the employees of this bank	.831				
I feel safe in my transactions with bank's employees	.825				
Employees of this bank are friendly	.810				
When using the service of this bank I feel happy	.801				
When using the service of this bank I feel confident	.753				
When using the service of this bank I feel impressed	.731				
Employees of this bank are always willing to help me	.566	.426			
The core service provided by this bank is reliable		.830			
I can depend on this bank to provide good core service		.819			
This bank provides quality core service		.805			
The core service provided by this bank suits my desires		.732			
The core service provided by this bank is		.713			

Items	Employee service	Core service	Self-image	Name	Price
superior					
Using the service of this bank reflects my social status			.820		
The image of this bank is consistent with my own self-image			.811		
Most customers of this bank are the same as my status			.759		
The brand name of the bank carries a sense of trust				.802	
The brand name of the bank is famous		.411		.778	
Using this banking service is economical					.751
This bank provides a good service for the price					.732
This bank offers value for money					.641

Originally, all items are deemed from six sub-constructs of brand evidence including brand name, core service, employee service, feelings, self-image congruence, and price/value/money. However, the result showed that they were extracted in five factors including employee service, core service, self-image congruence, name, and price. The only difference is that the first factor "employee service" was comprised of employee service and feelings. Factor two is core service; factor three is self-image congruence, factor four is brand name, and the factor five is price.

Convergent validity

In order to understand whether the research contains acceptable level of validity, we use a question item "Overall, I have a positive attitude towards the brand of the bank I most bank with." as the dependent variable and the five extracted factors as the independent variables to run regression analysis. Using stepwise regression from SPSS, five models were identified and Adjusted R^2 for model 5 is 0.588 ($p<0.001$). The five models are listed as follows.

Model 1：$Q_{21}=0.376F_2+3.429$

Model 2：$Q_{21}=0.374F_2+0.337F_1+3.426$

Model 3：$Q_{21}=0.373F_2+0.335F_1+0.248F_3+3.428$

Model 4：$Q_{21}=0.371F_2+0.327F_1+0.246F_3+0.213F_4+3.422$

Model 5：$Q_{21}=0.370F_2+0.323F_1+0.242F_3+0.212F_4+0.221F_5+3.42$

Where Q_{21} represents"Overall, I have a positive attitude towards the brand of the bank I most bank with."

F_1：employee service
F_2：core service
F_3：self-image congruence
F_4：brand name
F_5：price

The results indicate that the model was statistically significant, and the overall positive attitude towards the brand can be explained by the five factors extracted. Thus it is considered that the study demonstrates convergent validity.

Predictive validity

Using "I am willing to continue to bank with my bank" as the dependent variable and the four extracted factors as the independent variable, we run regression analysis. By using stepwise regression from SPSS, four models were identified and Adjusted R^2 for model 5 is 0.487 ($p<0.001$). The five models are listed as follows.

Model 1：$Q_{22}=0.438\ F_3+2.891$
Model 2：$Q_{22}=0.438\ F_3+0.326F_1+2.891$
Model 3：$Q_{22}=0.437\ F_3+0.326F_1+0.228F_2+2.892$
Model 4：$Q_{22}=0.436\ F_3+0.325F_1+0.226F_2+0.145F_4+2.893$
Model 5：$Q_{22}=0.436F_3+0.325F_1+0.225F_2+0.142F_4+0.111F_5+2.891$

Where Q_{22}:"I am willing to continue to bank with my bank"

F_1：employee service
F_2：core service
F_3：self-image congruence
F_4：brand name
F_5：price

The results indicate that the model was statistically significant, and the five extracted factors can be used to predict the consumers' intention to continue their relationship with the bank. Consequently, the study demonstrates predictive validity.

DISCUSSION AND MANAGERIAL IMPLICATIONS

The result from factor analysis showed that brand evidence is made up of five factors termed employee service, core service, self-image congruence, name, and price. The factor employee service was composed by employee service and feelings. This can be explained that banking customers appreciate employee service of a service brand thank to the two elements. Partly, the process of customer evaluations about brand evidence prior to purchase will be based on how the service is provided and the interaction between service staffs and customers. These interactions with employees, or the moment of truth, create customers' feelings. Therefore, in this research employee service and feelings were categorized under the same factor and named employee service. This result is supported by recent researches that brand evidence is created by the perception of the consumers, at every moment of contact they have with personal contact (Alloza, 2008). This also resembles the finding that brand evidence results from feelings and behavioral responses evoked by brand-related stimuli that are part of a brand's communications and environments (Brakus *et al*., 2009). It further supports the findings from the current study.

I has been observed that human interaction in service delivery is an important determining factor of customer satisfaction (Reeves and Bednar, 1996). The consumers' preferences toward face-to-face interaction versus computer transactions vary depending on demographics of the consumer and characteristics of the financial products and services (Lee, 2002). In addition, there has been a rise in professional service providers who help customers with transactions that are perceived to be "too technical, too important, or too difficult to be made oneself" (Kimball *et al*., 1997). Therefore, a professional employee service still exists as an efficient instrument to foster financial service (Schlager *et al*., 2011). In order to approach a professional employee service, the employees must be satisfied with their job so they will deliver excellent service to make customer satisfaction. Previous research has confirmed that job satisfaction can have a significant impact on service quality and, ultimately, on customer perceptions of service quality (Snipes *et al*., 2005). It is proposed some managerial implications for service brand especially for financial service.

Financial companies need to actively manage the employee service because it assists in the creation of a company's service brand. In implementing this, it is important to deliver value to employees that improve the level of employee satisfaction and result in good performance in their jobs, which will positively influence customers' experiences in the employee-customer interaction. Many managers believed the way to motivating service employees is to reward workers with money, bonuses, or raises (Timmreck, 2001).

Nevertheless, the work itself can provide job satisfaction because the task is fulfilling or enjoyable. Intrinsic job satisfaction may be psychological rewards employees get simply from doing their jobs. It may be that when service staffs are intrinsically motivated by their jobs, they look for optimal ways to serve customers. This type of motivation is quite different from extrinsic motivation which is about the material value one gets from others such as pay raises and bonuses. Although extrinsic motivations are important, they are normally not enough to keep service employees at their best (Snipes *et al*., 2005). It is suggested that managers should increase intrinsic job satisfaction as employees' perception of the job itself which may have a larger influence on service quality than other satisfaction factors. Aspects regarding to pay, contingent rewards, and operations have less of an effect on employees' service performance than intrinsic dimensions. It is explained that with extrinsic motivation, employees focus more on the rewards rather than the work itself, so work only well enough to get the rewards (Snipes *et al*., 2005). In addition, it is supported that financial services are quintessentially knowledge-intensive business (Grant and Venzin, 2009). Human resource management has to provide training opportunities to employees frequently, the environment for creativity and mentoring its.

Banks should build a social culture that focuses on friendly relationships among coworkers, adopt a "people-first" attitude, and offer interesting and challenging tasks for workers. Aforementioned, core service made up brand evidence, financial institutions should invest more to improve and expand core service. The financial products and services vary depending on customers' needs. Beside the current services such as loan, saving account, credit card, financial companies develop other services such as insurance, investment account. Insurance services should be variety with asset of basic demands such as motor vehicle insurance and homeowner's/renter's insurance; and another kinds of insurances regarding to health and income such as life insurance, disability income insurance are increasingly concerned (Lee, 2002). In term of investment accounts, financial institutions should consult those types of accounts in developed countries such as annuity accounts, retirement savings plan, asset management/investment management account, and packaged/ relationship banking accounts (Lee, 2002). In addition, financial institutions need to provide their products and services through different channels of delivery to meet the variety needs of customers (Krishnan *et al*., 1999). Since the right choice of channels of delivery can facilitate not just the marketing of products and services but also long-term relationship building (Baker *et al*., 1998). According to the results of T-test (table 5 and 6) that young generation was more appreciation the role of core service than old generation.

Therefore, financial companies should investigate a right mix of products and services to a right segment of customers to attract more purchasers. Furthermore, this is recommended that managers should indentify which types of customers desire which financial products and services and which types of delivery channels human interaction or computer transaction. The purpose here is providing the right mix of financial products and services to the right segment of customers through the right channels of delivery. In general, financial institutions should provide various their products and services to the right mix of segment customers through different delivery channels to meet the different demands of customers. The right choice of products and services with the right delivery channels can facilitate not only the marketing of products but also long term relationship building.

Self-image congruence plays an important role in determining customers' experiences. The higher congruity between brand personality, customers' self-concept and his/her image of other customers related to more stimulating, exciting, enjoyable, and interesting of brand experiences (Hosany and Martin, 2012). Financial marketers should develop distinctive brand positions reinforcing the perceived image/personality of the typical financial customers. Marketers should also develop an image closely matching the self-perception of potential customers. Financial marketers must adapt their advertising messages to target customers' self-concept. In addition, managers need to understand the role of self-image congruence, experiences in explaining word-of-mouth information. This finding suggested self-image congruence influences customers' experiences and through perception predicts intention to recommend. Creating positive impression generates higher perception levels and positively influences customers' behavioral intentions (Hosany and Martin, 2012).

The result inferred that brand name is factor of brand evidence. Therefore, understanding the driver that contribute to and detract from the strengthening of brand evidence is critical. Prior research suggested that by using an original, creative and different advertising strategy, companies can develop higher brand awareness and position perceptions of their brands (Buil *et al*., 2011). Several managerial implications arise from these results. Advertising is an important marketing communication tool for service companies influencing brand evidence. Marketing strategy should be invested to increase higher awareness of customers on brand image. Financial companies should pay attention to the design of their advertising campaigns, ensuring they are attractive and creative. Finally, managers should pay attention to the causal order among brand equity dimensions.

Managers have to first build brand awareness as a mean of anchoring the different associations consumers have of a brand such as perceived value, personality or perceived

quality. Later, managers should focus on brand associations as a way of generating greater brand reputation.

Fuelled by the realization that brands contribute greatly to the overall value of firm's assets, and strengthening brand reputation is necessary in service branding context. However, to date the theme of branding in the context of banking services in emerging country has received very little attention. Therefore, in achieving empirical validation, the model about what factors made up brand evidence and how consumer perceives service quality according to demographic variables have made significant contributions to the existing service branding theory in financial sector. This model allows current understanding that employee service is important to boost brand evidence.

However, the study is not without limitations. Since the research is at its preliminary stage, it can be further strengthened by increasing the sample size and including participants in other geographical areas, considering the effect that consumption behavior may be affected by different regions. In addition, this study was only conducted towards one bank; future research can be conducted on some more banks, so the results will be compared according to rich dimensions.

CONCLUSION

In the study the dimensions of customer perceive brand evidence are explored, and thus provide directions for retail bank practitioners to enhance the customer perceived brand evidence. In the theoretical aspect, the result helps to establish a foundation for future development of a customer perceived brand evidence measurement scale specifically suitable for the retail banking industry in other contexts. It can also provide a theoretical base for further investigation on the relationship amongst brand evidence and other constructs.

LIFE INSURER FINANCIAL MANAGEMENT: SPACE RISK ANALYSIS IN THE CASE OF POLAND

PhD Adam, Sliwinski Warsaw School of Economics, Poland
Email: asliwin@sgh.waw.pl

ABSTRACT

The aim of this paper is to demonstrate the effect of the regional death risk differentiation approach upon the financial management and profitability of life assurance companies. Such an aim involves answering the question of whether the application of regional death risk differentiation in the process of financial management at insurance companies can improve their financial performance? The above issue was explored on the basis of empirical research undertaken by the author. The research followed the pattern of premium differentiation for the main categories of assurance by regions in Poland. The research reveals that the application of the regional differentiation method indisputably results in the improvement of financial performance of insurance companies, without compromising the fundamental principles of the insurance business, (principle of equilibrium). By employing the regional differentiation method, an insurance company optimises its profitability, while at the same time maintaining the structure of deposits and investments.

INTRODUCTION

The economic processes taking place Ester and Central European countries in recent years has affected also the broad insurance sector. The social and economic transformations, the break up of monopolies and intensifying competition contributed to the development of business insurance. This is demonstrated by both the growing numbers of entities offering insurance products and the increase of the written premium per capita from US$ 5.00 in 1991 to some US$ 300.00 in 2010[1].

Despite such strong growth, the Polish insurance sector is still lagging considerably behind the Western economies. For example Polish insurance market accounts of 1,1% in total European market. The number of life insurance companies operates in Poland is equal to 33 where in UK for example the number reaches the level of 1300[2]. While the Polish insurance market is generally believed to be in the growth stage, it is of particular significance given the integration of Poland with the economic system of the European Union. EU integration and the progressing globalisation of financial services created a need for on-going monitoring and a revision of the current operating strategies, notably in their financial aspect. Many enterprises, mainly in the production sector, do not take out property insurance or refuse to provide life assurance or health insurance cover to their workforce quoting the need to cut costs as the reason.

[1] Data concerning Polish market. Own calculations based on Polish Insurance Chamber Statistics.
[2] *European market in Figures 2011*, CEA Statistics no 44, December 20122

The continued development of the insurance sector is in the interest of the insurance companies operating in Poland. Insurance companies should seek to optimise their financial performance and to improve the flexibility of their insurance services to contribute to improving the financial standing of the insured businesses and households as well. This is possible by an on-going search for factors improving the competitiveness of businesses and increasing insurance awareness among the general public. This is a difficult challenge. One of the success factors is the ability to combine the efforts of the management teams of insurance companies with research findings.

The increasing attractiveness of the insurance market in Poland results in a rapid growth of competition. The tough competition forces insurance companies to take specific actions which should, above all, seek to improve flexibility via product and organisational innovation. The strong competition creates the need to look for ways to optimise the performance of insurers, and to develop on a continuous basis new insurance products that meet the needs of customers. The products should fully meet the needs of customers at the lowest possible insurance premiums.

On the other hand the product should assure financial stability of insurance companies and ultimately ability to pay insurance claims. This is particularly important in the case of life assurance. The long-term nature of life assurance and the special nature of the attendant insurance risk (being the risk of death) renders the financial management at insurance companies offering life assurance products highly difficult and complex. Each decision has specific ramifications for a period of several, or even a dozen or so, following years.

There are few publications, either in Poland or in the world, examining in detail the risk of death and the application of the findings in assurance processes. It is even more difficult to find sources explaining and demonstrating the effect of regional differentiation of insurance (rates) premiums on the financial management of insurance companies. There are a number of research that examine effect on different factors on the purchases of insurance product from costumers side in the case of CEE countries[3]. However it is very difficult to find a study that examines the effect of regional risk differentiation on life insurance companies profitability by affecting insurance rates.

The aim of this paper is to demonstrate the effect of the regional death risk differentiation approach upon the financial management and profitability of life assurance companies. Such an aim involves answering the question of whether the application of regional death risk differentiation in the process of financial management at insurance companies can improve their financial performance?

The above issue was explored on the basis of empirical research undertaken by the author. The research followed the pattern of premium differentiation for the main categories of assurance by regions in Poland. Net premiums were used for comparison, excluding the costs of insurance operations.

[3] Look for example: A.Sliwinski, T.Michalski, M. Rószkiewicz, Demand for Life Insurance—An Empirical Analysis in the Case of Poland, *The Geneva Papers on Risk and Insurance,* 2013, 38, pp. 62-87,

1. Death Risk by regions in Poland

One of the key factors affecting assurance net premium level is the extent of risk covered by insurance, which in this case is the risk of death. The probability of death is a measure of death risk. Based on an examination of changes in the probability of death, one can make certain generalisations and draw consolidated conclusions on the death rate patterns in the population inhabiting a relevant region.

This part of the paper will focus mainly on presenting the differences in the probability of death by region. The differences may appear in the level of the calculated probability of death for individuals of various ages residing in specific regions, and may affect the level of premiums.

The table below presents the death probability figures for men aged from 18 to 30 for the Mazowieckie region and the corresponding figures calculated for the whole of Poland in 1997.

Table 1. Death Probability for Men in Mazowieckie Region vs. Death Probability for Men in Poland.

Age	Mazowieckie	Poland	DIFFERENCE
A	B	C	C-B
18	0.00125	0.00115	**-0.00010**
19	0.00146	0.00131	**-0.00015**
20	0.00124	0.00136	**0.00012**
21	0.00165	0.00136	**-0.00029**
22	0.00175	0.00135	**-0.00040**
23	0.00138	0.00135	**-0.00003**
24	0.00161	0.00138	**-0.00023**
25	0.00163	0.00144	**-0.00019**
26	0.00153	0.00151	**-0.00002**

Source: Author on the basis of *Trwanie zycia w 1997* (*Tabels of life 1997*), GUS (Main Statistical Office), Warsaw 1998.

As demonstrated clearly by the results, the death probability figures are different for different regions. For example, for a 30-year-old assured individual, the probability of death calculated on the basis of the Dolnoslaskie Region data is 0.001202. The equivalent probability, for example, in the Podlaskie Region is 0.000990, a difference of 17 percent. Similar differences occur for the other regionsand for the regional data-based death probability figures vis-à-vis death probability figures calculated for the whole of Poland, without regional differentiation. The differences are present in both men and women.

The resulting regional differences may cause differentiation of net premiums. One can therefore conclude that by applying the regional differentiation method, insurance companies can shape net premiums as appropriate. The death probability assessment methods and formulae used to calculate premiums are listed in Appendix 1.

2. Regional Comparison of Net Premium – Profitability Regions

The insurance premium embodies the obligation of the insurant towards the insurer for insurance cover during the period of insurance. The insurance premium is therefore the price of the insurance service, and therefore one of the most important considerations taken into account when selecting an insurance company. In emerging markets, where the insurance awareness is low, the premium level often becomes the only selection factor. This approach can bring immeasurable losses if the premium level is without justification established too low. Under the current circumstances, in an attempt to improve their financial performance, insurers should offer lowest practicable premiums ensuring realistic insurance cover to the customers and security to the insurance company.

One of the main objectives of the research presented is to demonstrate the effect of the regional differentiation method upon the level of life assurance premiums. The level of gross premiums is a direct derivative of net premiums. The differences in net premiums calculated on the basis of regional data will result in a proportional reduction of gross premiums. Given the above, the differences in the level of net premiums will likewise affect the final price of the insurance cover service.

In long-term life assurance, the level of net premiums is directly dependent on the average death risk for the period of insurance and the assumed technical interest rate. The net premium is calculated on the basis of the probability of death, assumed longevity and the probable period over which the insurance premium is expected to be paid. The calculations presented are based on the death risk analysis in the individual regions of Poland. The premiums have been calculated on the basis of regional (voivodeship) statistics (NUTS II) and compared with the currently effective net premiums. The Polish insurance market is a relatively young, maturing market. The majority of insurance companies do not maintain in-house statistics and rely on the premium tariffs calculated on the basis of death rate materials pertaining to the national population. The calculations presented apply to “pure” insurance, i.e. whole-life insurance, endowment insurance and pure endowment insurance. The calculations refer to the minimum sums of insurance specified under the general terms of insurance offered by the largest insurance companies operating in Poland. The calculations pertain to individuals from 18 to 35 years of age. This age group is the most numerous group of insurance company customers. The death probability figures assessed on the basis of regional data differ from those established with reference to the national statistics. It is this difference that affects the level of net life assurance premiums.

* R – is the difference between the premium level calculated based on national data and region-specific premiums.

Due to quantitative limitations and in order to maintain a clear structure of the paper, the comparisons below are presented for the Mazowieckie Region. Similar differences are found in the other regions of Poland. The calculation results are shown as charts presenting the relationship of the resulting differences (R)* in the level of premiums relative to the age at which the insurance is taken out. The charts below present the results of calculations and the attendant differences in the case of whole-life insurance, pure endowment insurance and endowment insurance.

Figure 1. Net Premium Comparison – Whole Life Insurance.
Source: Author.

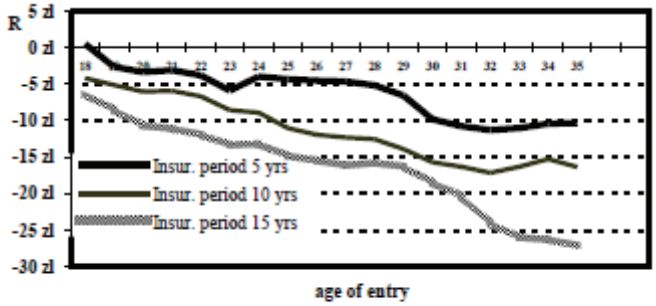

Figure 2. Net Premium Comparison – Pure Endowment Insurance.
Source: Author.

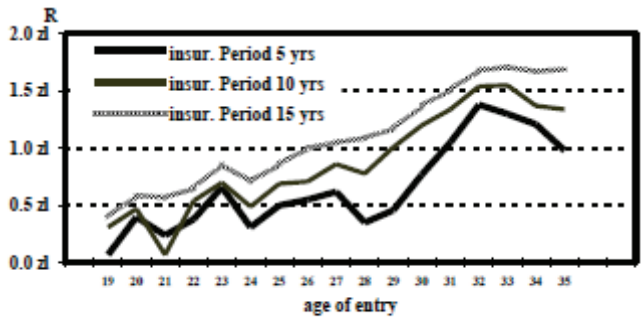

Figure 3. Net Premium Comparison – Endowment Insurance.
Source: Author.

The comparison has shown a difference in the annual net premiums calculated for the national statistics vs. based on the Mazowieckie Region data. The premiums calculated based on the regional data are lower than the premiums based on national statistics. Similar differences apply

to the other regions. While the insurance is taken out for several years and the group of the insured is quite numerous, this may have significant impact on the financial management of insurance companies and their profitability. Employing the regional differentiation method, the life assurance company may, while maintaining the fundamental insurance principles, reduce the level of premiums. The reduction will by no means endanger the financial viability of the insurance company.

In the case of endowment and mixed insurance, premiums calculated on the basis of the voivodeship data differ from the premiums established on the basis of the average national data. In the case of endowment insurance, the level of premiums based on regional data is higher than premiums based on national data. From the point of view of insurance companies, it would be unjustified to apply the regional differentiation method in this type of insurance. In practice, the endowment insurance does not occur as pure insurance. The reason is that, in this case, the insured would lose all the money collected upon his/her death. Mixed-type insurance is more beneficial to the customer.

An analysis of the arising difference reveals a certain pattern. In the case of life assurance, the difference grows with the age of the person taking out the insurance. This regularity does not occur in the case of mixed insurance. In mixed insurance, the resulting differences clearly depend on the period of insurance. For a period of 10 years the difference is twice as big as for five years of the insurance period. The longer the insurance period, the bigger the difference. Here, unlike in the case of life assurance, there is no clear dependence between the premium amount and the age of the insured.

As clearly demonstrated by the research conducted and the comparison between the amount of premiums calculated for regional data vis-à-vis national statistics, the regional differentiation method does affect the level of premiums calculated. As insurance premiums are the key source of income for insurance companies, any significant change in their level is bound to impact significantly upon their financial management.

The findings of the research and the conclusions drawn on the basis of the analysis of regional risk in Poland indicate that Poland has two areas with a similar type of risk. For these areas insurance companies could apply standardised premium tariffs. The list below presents a preliminary division of regional voivodeships together with their characteristics.

their characteristics.

Group I	Characteristics	Group II	Characteristics
Podlaskie		Dolnośląskie	
Podkarpackie		Kujawsko-Pomorskie	
Lubelskie		Warmińsko-Mazurskie	
Łódzkie		Lubuskie	
Świętokrzyskie	Higher average probability of death	Opolskie	Lower average probability of death compared to Group I
Małopolskie		Pomorskie	
Mazowieckie		Wielkopolskie	
		Śląskie	
		Dolnośląskie	
		Zachodniopomorskie	

Source: Author.

For specific ages, the premiums calculated on the basis of Group II regions are lower than the premium based on the average national statistics. The table below presents the irregularity of regional premium distribution as exemplified by life assurance. The irregularity factors were calculated using the following formula:

$$A = \frac{n\sum_{i=1}^{n}(x_i - \bar{x})^3}{(n-1)(n-2)\hat{S}_x^3} \quad (1)$$

where:

n – number of regions,

x_i – premium level in a specific region (voivodeship),

$\bar{x}$ - average premium level,

$\hat{S}$ – standard deviation.

Table 3. Irregularity of Regional Premium Distribution Irregularity as Exemplified by Whole Life Insurance.

Age	Average Premium Level	Skewness
18	0.00451	-0.2195
27	0.00683	0.0089
35	0.01015	0.2057

Based on the analysis presented, an insurance company is capable of optimising the premium level by dividing the country into profitability regions. This requires further detailed statistical research. For the regions defined, the insurer should vary the premium policy, thus maximising the value of the company and its profitability levels.

The calculation of insurance premiums is among the key tasks of the insurance company. This is because premiums, besides benefits and claims, are a principal item of cash flows and the profit and loss account of insurance companies. The premiums paid by insurants are the main item of revenues, while benefits and claims are principal cost items. The operational viability of an insurance company calls for equilibrium between the level of premiums, on the one hand, and the level of benefits and claims, on the other. This is above all due to the fact that the insurance company manages an insurance fund established from the premiums collected. The insurance company's equity is only secondary in balancing its revenues and expenditures. The size of the insurance fund depends on the projected incidence of future events covered by the insurance. One of the basic principles of the insurance company financial management is that of equilibrium between benefits and premiums. This principle requires a balance between the insurance fund, driven by the premium level, and the level of benefits and claims.

FINANCIAL MANAGEMENT AND REGIONAL PREMIUM DIFFERENTIATION

The level of premiums directly affects the size of the insurance fund from which the insurance company meets its obligations in the form of benefits and claims. In the light of the above, as a generalisation, it can be stated that the technical profit generated by the insurance company depends on the size of the fund and the level of benefits and claims paid by it. The increase in the technical profit on the insurance activities will directly affect the overall profit. While the capital structure of the insurance company is maintained, better overall profit will translate into improved profitability. Therefore, if the regional differentiation method increases the value of the balance of the insurance fund – net of benefits and claims – the application of the method will affect the profitability of the insurance company's capital. The impact of the presented method on the value of the insurance fund is shown in Table 4 which compares the course of endowment insurance up to 65 years of age for a group of 10,000 men aged 55, with the insurance amount of PLN 1,000**. The calculation rests on the assumption that the premium paid amounts to PLN 90 and death benefits are payable on 31 December of each year. The technical interest rate is 5 percent. The tables below present results obtained for the Mazowieckie Region. The number of the deceased in a given year follows from the 1999 probability of death calculation for the Mazowieckie Region.

As indicated by the presented data, after the benefits relating to the insurance cover are paid, the application of the regional differentiation method results in an increase of the balance of the insurance fund by some 38.5 percent for the Mazowieckie Region.

** The results of calculations for the Mazowieckie Region were compared with the calculations for such insurance presented in E. Stroiński, *Ubezpieczenia na życie* (*Life Assurance*), LAM, Warsaw 1996, p. 110.

Table 4. **Impact of the Regional Differentiation Method on Insurance Fund Value.**

Age	Number of insured	Current year premium	Current year premium plus residual from previous years after interest	Number of deceased in given year	Value of death benefits	Fund balance net of benefits	Value of endowment benefits
55	10 000	900 000	945 000	173	173 000	772 000

Figure 4. Value of Insurance Fund Balance by Region as Exemplified by Endowment Insurance.
Source: Author.

Similar differences are found in the other regions (see Table 6). Figure 4 shows a comparison of the insurance fund balance calculated for the national data and following application of the regional differentiation method. The application of the regional differentiation method results in an increase of the insurance fund balance. A slight decrease was only found in the Lodzkie Region. In the other regions the fund increases on average by 40.7 percent. In the Malopolskie Region the fund was up by 91.41 percent. It should be borne in mind that the analysis rests on a set of assumptions. The assumed number of the insured (10,000) is particularly important. The increases may be even higher for higher numbers of the insured.

The increase of the insurance fund balance has a direct impact upon the technical result of the insurance company. The better the technical financial result, the better the overall performance. Improved financial performance, in terms of both the technical and overall result, affects the profitability of the insurance company. The technical result drives the technical operations profitability ratio, which demonstrates the technical result as a percentage of premium generated on their own contribution. The higher the ratio, the better the standing of the insurance company.

High profitability means a speedy return of the capital employed by the owners to finance the insurance company and a high operational effectiveness. The research findings presented demonstrate that the regional differentiation method, by affecting the insurance company financial management, improves both technical and overall profitability of the business. Assuming that technical operating costs account for 30 percent of total costs, the application of the method would result in a improvement of the return on sales by some 10 percent. Better return on sales directly improves the return on equity and return on total capital of the insurance company. In a free market economy, in a highly competitive environment and where the investment ofcapital by insurance companies is legally restricted, this rate of increase should be seen as significant. The above profitability improvement may strengthen the competitiveness of an insurance company in the market.

Table 6. Value of Insurance Fund Balance by Region.

	Region	Value of insurance fund balance	% difference
1.	Dolnośląskie	PLN 491 045	29.30%
2.	Podlaskie	PLN 572 049	50.63%
3.	Kujawsko-Pomorskie	PLN 394 524	3.88%
4.	Podkarpackie	PLN 708 872	86.65%
5.	Warmińsko-Mazurskie	PLN 412 243	8.55%

16.	Pomorskie	PLN 605 923	59.55%

Source: Author.

Summing up, it needs stressing that the application of the regional differentiation method indisputably results in the improvement of financial performance of insurance companies, without compromising the fundamental principles of the insurance business, in particular the principle of equilibrium between benefits and premiums. By employing the regional differentiation method, an insurance company optimises its profitability, while at the same time maintaining the structure of deposits and investments.

The regional differentiation method could be applied in the process of developing a competitive advantage of insurance companies. The application of the method would result in dividing the common European market into the profitability regions, as those referred to above. The division would be based on the analysis of the risk of death in the individual regions of the European Union. The operational strategy driven by profitability regions will help strengthen the competitive edge over other insurers and secure the market position. However, before this strategy can be implemented, extensive research on the death risk in the European Union is necessary. The research should cover a period of several years to eliminate accidental variations. This is a very difficult task requiring financial expenditures as well as collecting a large body of requisite data, as a basis for analysis. The results could help identify European profitability regions for which it would be profitable to apply standardised premium tariffs.

The area of the European Union has been divided into *Nomenclature of Territorial Units for Statistics* (NUTS). The main purpose of the division is to single out territorial units for which statistical data would be collected. The data, collected by Eurostat, is used to assess the economic development in the individual regions. Insurance companies to assess the risk in the NUTS and to calculate insurance premiums could then use the data collected for the individual regions.

At the moment, in the EU there are 77 NUTS I regions, 206 NUTS II regions, 1031 NUTS III regions, 1,074 NUTS IV regions, and 98,433 NUTS V regions. The table below shows the division into NUTS units in the EU countries.

Table 7. **Nomenclature of Territorial Units for Statistics**

Source: A.M. Gmyrek, *Nomenklatura statystyczna NUTS-działania dostosowawcze Polski,* „Wspólnoty Europejskie" Nr 6(106) 2000, s.22

The differentiation into the NUTS units could be a factor justifying the regional insurance policy. The research at the NUTS II level also seems justified. While NUTS II and I, have the most extensive statistics, research conducted at the NUTS I level can turn out too general.

By examining the findings of research based on regional data in Poland and given the differentiation into NUTS units in the European Union, one can presume that differentiation of the premiums for the individual regions would have similar financial ramifications for life assurance companies. Using the death rate data in the individual NUTS units, insurance companies could optimise premiums based on an analysis of the insurance risk. This would undoubtedly lead to an increase of the balance of the insurance fund and consequently improve the profitability of the insurance business.

APPENDIX

Appendix 1

I. The probability of death calculated as the incidence of death in a population of people aged "*x*" before they reach the age of "*x+1*". The calculations also take migration into account.

$$q_x = 1-(1-q_x^{'})(1-q_x^{''})$$

In the above formula, the auxiliary variables $q_x^{'}$ and $q_x^{''}$ are calculated as follows:

$$q_x^{'} = \frac{\sum_t D_x^{'}(t)}{\sum[P_x(t-1)-0{,}5*R_{x+1}(t)]}; \qquad q_x^{''} = \frac{\sum_t D_x^{''}(t)}{\sum_t[P_x(t)+D_x^{''}(t)+0{,}5*R_x(t)]}$$

where:

$P_x(t)$ – number of living people aged *x* at the end of year *t*,

$B(t)$ – number of births in year *t*,

$D_x^{'}(t)$ – number of people *x* years of age deceased in year *t* among those born in year *t-x-1*,

$D_x^{''}(t)$ - number of people *x* years of age deceased in year *t* among those born in year *t-x*,

$R_x(t)$ – adjustment of the population due to migration in year *t* of people born in year *t-x*.

The adjustment of the population due to migration was calculated using the following formulae:

$$R_x(t) = [P_{x-1}(t-1) - P_x(t) - D_{x-1}^{'}(t) - D_x^{''}(t)]$$

$$R_0(t) = B(t) - P_0(t) - D_0^{''}(t)$$

II. The premiums were estimated using the following formulae:

1. Whole Life Insurance

The whole-life insurance can be described as the insurer's obligation to pay the party named in the policy upon the insurer's death a pre-agreed sum of money, regardless of whether the death occurs.

In accordance with the principle of equivalence of premiums and benefits:

$$l_x A_x = vd_x + v^2 d_{x+1} + v^3 d_{x+2} + \ldots + v^{w-x} d_w$$

Assumption:
- benefit equal to PLN 1.00.

Therefore, a single premium would be:

$$A_x = \frac{vd_x + v^2 d_{x+1} + v^3 d_{x+2} + \ldots + v^{w-x} d_w}{l_x}$$

Multiplying the numerator and the denominator by v^x gives:

$$A_x = \frac{v^{x+1} d_x + v^{x+2} d_{x+1} + v^{x+3} d_{x+2} + \ldots + v^w d_w}{v^x l_x}.$$

Introducing an additional commutative function C_x instead of $v^{x+1} d_x$, and C_{x+1} instead of $v^{x+2} d_{x+1}$ and applying the commutative function D_x gives:

$$A_x = \frac{C_x + C_{x+1} + C_{x+2} + \ldots + C_{x+w}}{D_x}.$$

In actuarial mathematics a sequence of numbers $C_x+C_{x+1}+C_{x+2}+\ldots+C_{x+w}$ is designated with a symbol (commutative number) M_x. Then the formula is as follows:

$$A_x = \frac{M_x}{D_x}$$

2. Pure Endowment Insurance

Pure endowment insurance is an insurance under which the benefits are paid only to those who have survived the period of insurance.

The equivalence principle can be represented thus:

$$l_x {}_nE_x = v^n l_{x+n}.$$

Solving this formula:

$${}_nE_x = \frac{v^n l_{x+n}}{l_x} = v^n {}_np_x.$$

The formula uses the survival probability for person's aged x in a period of n years. This formula can also be represented as a commutative function in which case the numerator and the denominator of the above formula have to be multiplied by v^x.

Introducing additional commutative functions C_x instead of $v^{x+1} d_x$, and C_{x+1} instead of $v^{x+2} d_{x+1}$ and using the commutative function $D_x = v^x l_x$ gives:

$${}_nE_x = \frac{v^{x+n} l_{x+n}}{v^x l_x} = \frac{D_{x+n}}{D_x}$$

3. Endowment Insurance

A endowment insurance is an insurance under which the benefits are paid upon death in the period of insurance and also when the insured survives the period of insurance.

The endowment insurance can be treated as the sum of periodic insurance and pure endowment insurance. A single premium in the endowment insurance is calculated using the symbol $A_{x:n/}$ and it is the sum of premiums from periodic insurance and pure endowment insurance. This is represented as follows:

$$A_{x:n} = A^1_{x:n/} + {}_nE_x.$$

Using the commutative numbers gives:

$$A_{x:n} = \frac{M_x - M_{x+n}}{D_x} + \frac{D_{x+n}}{D_x} = \frac{M_x - M_{x+n} + D_x}{D_x}.$$

Commutative functions:
$C_x = v^{x+1} d_x$
$C_{x+1} = v^{x+2} d_{x+1}$
$D_x = v^x l_x$

Assumptions:
- single premium,
- benefit equal to PLN 1.00.

CAN HEURISTIC VALUATION IMPROVE INVESTMENT PERFORMANCE OF INDIVIDUAL INVESTORS?

Mariusz Kicia, Ph.D., Maria Curie-Sklodowska University, Lublin, Poland
mariusz.kicia@umcs.lublin.pl

ABSTRACT

The paper presents concept of simplified valuation models and tests their usefulness in application by individual investors at the Polish stock market over 2000-2013. It is discussed whether it would be rational to combine common fundamental valuation methods of multiples and DCF, preserving the relative simplicity of multiples as well as complexity and consistency of discounted cash flows to provide useful hybrid tool even when individual investors follow behavioral heuristics and simplifications while making investment decisions. Results of experiments indicate that use of proposed valuation methods wouldn't have an unequivocal impact on investment strategy of irrational individual investors with quite a low average improvements of annual returns (from 5,2% to 10,5% extra return) only in about a half of all 415 analyzed stocks. Tests are preceded by results of the survey conducted on 66 experienced and 136 inexperienced individual investors to compare their investment techniques and attitudes. It is shown that rising experience in investment causes investors to follow intuition in risk assessment that may end in overconfidence. 74% of respondents without experience declared that they would measure investment risk in some way while practitioners usually don't use measures but rather sense risk. Inexperienced respondents are more likely to use Fundamental Analysis tools than real investors in practice. Answers also suggest that the more investors are experienced the more often they declare using Technical Analysis tools.

Keywords: individual investor, behavioral finance, investment strategy.

INTRODUCTION

The development of the financial market with increasing number of instruments traded, capitalization, and above all number and variety of market participants should lead to an increase in the degree of efficiency, according to the Efficient Markets Hypothesis (EMH). The implications of EMH are very profound for investors. If the EMH is true, prices are fair and give the return investors deserve. Security prices are exactly what they should be, given what is known at the time. The fact that prices are constantly changing does not contradict this. Prices are simply reacting to new information and constantly being fine-tuned in order to stay up to date. In theory, markets with weak EMH mean that technical analysis is a waste of time. At best, clever fundamental analysis (i.e. examination of drivers of value such as profits, market share, growth etc.) might if accurate predictions could be made independent of past trends. This might be possible if there were talented investors who able to convert new information into securities fair value before the rest of the market could do the same. However, if there is semi-strong EMH, even fundamental analysis would not be productive since share prices would reflect the latest available information. This is because the "instantly up-dated" market – with thousands of decision-makers - will always be ahead of an individual analyst in trying to incorporate the impact of the latest news into securities prices.

If this is the case, paying a portion of investment wealth to a fund manager does not make sense. Better to simply invest in a widely diversified fund (index fund) that tracks a market overall based on random and un-researched selections. The other option is beat the market with insider trading but this possibilities usually are not instant or even if non-public yet information is available ahead of the whole market using them is against the law. If insider trading fails in a long term strong EMH appears as all decision-makers are able to predict correctly even information that is confidential at the moment and incorporate into prices. That is rather uncommon as even developed markets dynamics usually puts them somewhere between semi-strong and strong EMH.

The financial market volatility and efficiency of its functions depends to a great extent on the behavior of the market participants. With the current size of the financial markets and their growing international relationships an individual investor may obviously become less important, although to quite shallow and developing emerging markets individual investors may play a significant role in pricing securities. Even if we assume that the market efficiency provides the same information at the same time to all (or almost all) decision-makers the way it is incorporated into market prices varies not only according to investment strategies, investment horizon but depends on pricing method, risk perception, timing and formal restrictions in potential decisions. In that case individual investors may act different than institutions and if they are a leading group of the market agents an informal and intuitive process of incorporating information into prices can end in speculative bubbles. That's why individual investors are called *quasi rational* or *irrational*. Financial market activity of irrational investors leads to an increase in market volatility. Empirical studies show that only one third of changes in stock prices is a result of changes in fundamental factors that can be considered as drivers of rational expectations. The remaining part of the volatility of stock prices is largely the result of the activity of irrational investors.

Even if strong EMH appears everyone wants to beat the market. To achieve this goal financial market participants are driven by different factors and tools for making financial decisions. None of the tools and methods of analysis however doesn't explain complexity of market volatility. Technical Analysis is based on past volatility only and it does not refer to the basic mechanisms of price discovering as a highly simplified approach. Fundamental factors cannot be considered as the only drivers of market volatility. Behavioral analysis shows that the market asset value often differs significantly from prices considered as fair but it is not a coherent approach although explaining market behavior by the behavior of its participants focuses more and more attention.

The modern theory of finance does not pay much attention to the irrationality of investors. It was assumed that they were an easy prey for other investors who were involved in arbitrage or carrying out speculative transactions focused on mean reversion. On the other hand waves of optimism due to increases of stock market indices and the waves of pessimism due to their declines prevailing among individual investors can be a reason why stock prices diverge from the levels of their fundamental values. If irrational investors are convinced that shares should be bought or sold as soon as possible even against EMH, overestimated stock prices may still rise and underestimated keep falling. The described behaviors induce another kind of financial market risk, the risk of irrational investors that may be persistent. It is observed when even if mispricing of market asset prices appears values are not corrected quickly.

Rational investors follow the course of events assuming that since the fundamental value of stock follows random-walk process then stabilizing speculation even without irrational investors is risky as relationships between market prices and fundamental factors is not stable. The uncertainty of these compounds is an arena of irrational investors acting as noise traders than reacting to change in fundamentals (Focault, Sraer, Thesmar 2011).

The reason for such a behavior may be a lack of tools that allow individual investors to formally estimate the fair value of instruments that would be a reference value when making investment decisions. That says individual investors do not have the appropriate decision-making tools. They rather use their intuition or simplified calculations due to a problem with obtaining proper information, its interpretation and the time restrictions. Hence, the common practice of their formal valuation method are simple but often unreliable multiples. In the absence of a reference point decision-making becomes emotional and similar to gambling than a planned investment. On the other hand the formulation of comprehensive forecasts and expectations regarding the situation of issuers, predicting revenues, expenses, profits, cash flows etc. exceeds the capacity of most individual investors though is necessary when the most complete and reliable methods of valuation (DCF) is applied by institutional investors.

With all the above problems in mind the question arises whether it would be possible to combine both of these fundamental valuation methods, preserving the relative simplicity of multiples as well as complexity and consistency of discounted cash flows (DCF) to provide useful hybrid tool even when individual investors will follow behavioral heuristics and simplifications while making investment decisions.

The paper presents the concept of such a tool and tests its usefulness in application to still emerging Polish stock market over 2000-2013. The sample of 415 companies listed on the main market of the Warsaw Stock Exchange was the subject of experiments in three variants of the heuristic (simplified) valuation model. Simulations were provided to test whether the use of the heuristic pricing model would improve the performance (average returns on investment) of hypothetical individual investor's single-asset portfolio. Models were also tested on fundamental data from both stand-alone and consolidated financial statements. The concept of the model and its testing is preceded the review of empirical studies on the investment behavior of individual investors including surveys conducted by the author of the article with 66 experienced and 136 inexperienced individual Polish investors.

INVESTMENT BEHAVIORS OF INDIVIDUAL INVESTORS

General Framework of Behavioral Investing

Activities of bounded rationality investors in financial markets has its theoretical foundations in the behavioral finance. Under this approach, decision depends on the decision making process so it is important to analyze investor's behavior from the perspective of cognitive psychology, in particular regarding formation of judgments and behaviors that accompany it (Shefrin 2005, Sławiński 2006).

Despite the fact that radical behaviorism opposed to cognitive psychology assumes that the explanation of behavior is not necessary referring to internal mental processes more and more behavioral finance concepts derive from cognitive psychology. Cognitive psychology

explains many patterns of behavior that are useful from the financial markets perspective, including especially those which may lead to speculative asset price growth in the securities markets. Such behaviors cover methods of formulating judgments (heuristics) that in a fairly simple way allow for making decisions and solving problems. In psychology, the most important cognitive heuristics include: anchoring, availability, framing and representativeness. These heuristics can be often found in investors' behavior (De Bondt 1998).

Anchoring facilitates decision making under uncertainty by referring potential solutions to a real (or imagined) value which is the point of reference for decision to be taken. Selecting the reference point is an important issue since depending on anchor the same decisions may be considered as profits or losses, causing other heuristics (e.g. mental accounting and adjusting appetite for risk). In financial investment anchoring enforced with availability heuristic (recalling information easily accessible in memory but not necessarily correct at the moment) appears frequently at the moment of security purchasing decision. Perception of current market prices level as reasonable and worth investment can be caused by media, reports already outdated or informal information from people who seem to be reliable (myth of expert). However anchoring lasts even longer when new information that should influence decisions and prices is ignored causing underreaction or sticky prices. That effect takes place even if initial anchor had no rational explanation.

Framing heuristic is observed when decision depends on the context the problem is presented for consideration. In financial investment decisions depend on information collected from stand-alone financial statements (easier in the analysis for individual investor and available in a shorter time) or consolidated statements (detailed yet more complex and requiring more efforts). Valuation Multiples depend on the selection of companies operating with a similar business model in the industry. Since there are no formal rules but only rational justification of competitors' selection it affects results of multiple evaluation. Simplicity of multiples method is fraught with risk of incorrect selection of perspective, because all that might seem to be even a little reasonable for investor is considered rational.

Following heuristic of representativeness while making decision we refer to a similar problems recognized in the past or we succumb to stereotypes. Therefore, it happens that investors are willing to acquire assets at unreal higher and higher prices that are observed in series of daily quotations and thus contribute to an even greater speculative price increases. Therefore, we can say that investors have a tendency to overestimate the near past events and ignore long-term observations. Following representativeness leads often to myopia in assessment.

The behavioral finance approach starts to play a significant role in practice of financial investment and is adopted and developed even by the most famous investors like George Soros who's strategy is well recognized as investing in value. He believes in two-way feedback relationship between perception and reality which supports the growth of self-reinforcing and ultimately self-decaying wave of market growth. Moreover, he argues that every market bubble is a complex of trend and misperceptions remaining in interaction with each other. G. Soros first of all noted that traditional economic theories are wrong because they assumed that humans behaved rationally and had access to complete information so that the quality of decision-making depended on knowledge. However, in his view of the Theory

of Reflexity humans' behaviors are guided by two interrelated components: the cognitive function and the manipulative function. In this case, the reflexity means that market expectations depend on perception of the situation while the situation itself is – among others – under the influence of market participants' expectations.

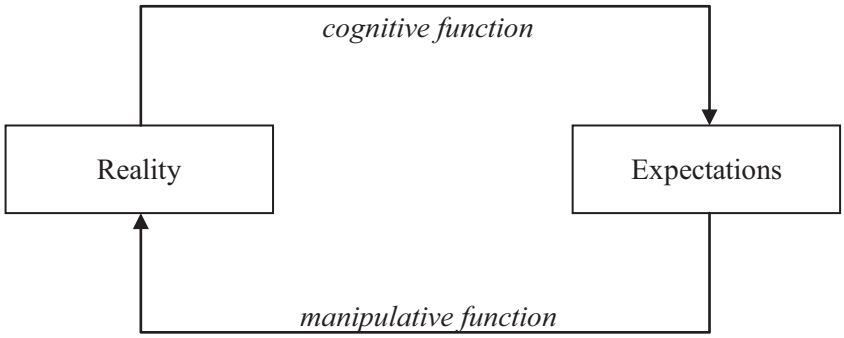

Fig. 1. The idea of George Soros' concept of the reflexivity

The theory applies exclusively to situations that have thinking participants. The participants' thinking serves two functions. One is to understand the world in which they live (the cognitive function). The other is to change the situation to one's advantage (the participating or manipulative function). The two functions connect thinking and reality in opposite directions. In the cognitive function, reality is supposed to determine the participants' views. The direction of causation is from the world to the mind. By contrast, in the manipulative function, the direction of causation is from the mind to the world, that is, the intentions of the participants have an effect on the world. When both functions operate at the same time they can interfere with each other. It means that humans change the situation at the moment they recognize it and make decisions upon the perception. The concept of reflexivity assumes that humans are imperfect in recognizing and evaluating information they perceive. Even if information is impartial itself its perception is subjective and there are as many subjective points of view as many market participants especially when if they don't follow some general formal restrictions or procedures. Cumulated subjective yet similar expectations move away from a rational justification if myopic individual investors are prevailing group of market participants. It is generally recognized that the complexity of the financial markets exceeds our capacity to comprehend it. The main source of difficulties is that participants are part of the situation they have to deal with. Confronted by a reality of extreme complexity we are obliged to resort to various methods of simplification – generalizations, dichotomies, metaphors, decision-rules, moral precepts, etc. These mental constructs take on an existence of their own, further complicating the situation.

Related Research

Empirical researches of investors' activities at the stock market highlight some specific behaviors of individual investors that can affect their portfolios performance. Numerous researches show inclination to follow heuristic thinking and cognitive or emotional biases when investing. The main areas of irrational behavior concern stochastic of price changes, pricing securities, portfolio management strategies and transaction practice (De Bondt 1998). Most individual investors follow a trend. The research provided among American Association of Individual Investors members show that 1% growth of stock market index in a

week increases the difference between investors expecting index to continue rising the following week and investors expecting index to fall. Moreover, investors sentiment depends on market performance in previous 100 days (De Bondt 1993) and trend or risk extrapolation for most of investors is only intuitive and naive (Andreassen 1988). Bull market makes investor more bullish, while bear market makes them more bearish.

Similar intuitive processes are observed in capital assets pricing. Only a few individual investors use formal pricing models, while a common practice is using informal information from other investors or financial advisors that may cause availability and anchoring heuristics. Individuals consider as the best investment stocks that recently grew sharply or are highlighted in media (Shiller 1990). They chose also overvalued companies with high price to book value ratio. Most of the individual investors do not use formal strategy rules and most of their decisions are random and often is not planned. Even if formal strategy exists it is being commonly broken (Shefrin i Statman 1997) and average individual investor portfolio is usually weakly diversified (Shefrin 2001, Benartzi and Thaler 2005).

The combination of situational and individual approaches to risk propensity through consideration of individual responses to different risk domains is another interesting and promising stream of research. The work of Weber and Milliman (1997), and subsequent work by Weber et al. (2002) represents an important development in this field. Authors found that while the degree of risk perceived in a situation could vary according to the characteristics of the situation, attitude to perceived risk (the degree to which people find perceived risk attractive) remained stable across situations for a significant portion of their sample. Work in this area (Fagley and Miller, 1997; Weber and Milliman 1997) shows that it is possible to be risk seeking in some areas of one's life and risk averse in others while having a relatively consistent view of risk.

M. Kaustia and S. Knupfer proved that there was a dependence between previous IPO success in Finland and the interest in participating another initial offer. That is an obvious evidence of mental accounting heuristic known as *house-money effect*. Authors stress that although there are still a few empirical evidences of how investors acquire knowledge and capture experience it was discovered that experienced investors usually fall in less behavioral traps than inexperienced stock market beginners (Kaustia and Knupfer 2008).

G. Chen, K.A. Kim, J.R. Nofsinger and O.M. Rui analyzing data provided by Chinese brokerage companies found quite a low effectiveness of Chinese investors' decisions. Authors prove that investors followed three basic heuristics: disposition effect, overconfidence and representativeness. Moreover, effects of disposition and overconfidence were stronger than compared to American investors and experienced investors were as susceptible to follow heuristics as beginners (Chen et al. 2007).

W.B. Elliott, F.D. Hodge and K.E. Jackson examined how individual investors' experience may influence not only on portfolio management techniques but also the way information are analyzed and processed. On one hand they proved that experience in financial investment has positive effect on portfolio returns but it wasn't clear if it influences relationship between the set of information considered as important and portfolio performance. Authors noticed that methods of obtaining, analyzing and integrating information differs with professional and individual investors (Elliot et al. 2008).

Finally, research provided by T.L. Liao analyzing 36 investment strategies at Taipei and Shanghai stock exchanges proved that market overreactiveness is a feature markets with shorter history. The younger the market the lower risk of publishing unexpected negative information and in consequence the more emotional is investors' reaction as well as market volatility. On the other hand, market development covering at least few cycles of economy experiences investors and causes that level of overreactiveness is significantly lower (Liao 2002).

Experienced and Inexperienced Individual Investors in Poland – Evidence from a Survey

Regarding existing differences in behavior of experienced investors and beginners CATI survey was conducted on Polish investors to discover if investment practical experience is correlated with stock market risk perception and tools that investors use to evaluate securities' value. These studies extend the state of knowledge regarding mechanisms of stock exchange, efficiency and rationality of decisions of market participants.

A total of 202 survey's observations registered from 25 August 2008 to 24 June 2010 were analyzed. Out of all observations, 66 were answers by respondents declaring themselves as investors, while 136 left by respondents inexperienced in investing. Both groups of respondents answered identical (in meaning) questions (see Table 1) although literary different as both had a different perspective of their own activities at a stock market (past and possible future). Respondents were asked to indicate on 6-point scale if and how strongly they agree (6 to 4) or disagree (3 to 1) with presented situations or did (would) they act as described in question. Answers from experienced in investing respondents regarded assessment of their own behaviors and attitudes. In case of inexperienced ones they assessed they were asked to imagine how they would behave as stock market investors if there were ones in the future. Confronting answers of both groups identified changes in attitudes and behaviors that appear when beginners become investors. The analyses of similarity in distribution of answers from all selected groups were provided with three standardized to [0;1] scale measures: Clark's coefficient of divergence (Clark 1952), Matusita distance measure (Matsusita 1955) and Walesiak's distance measure (Walesiak 1999).

Table 1. Survey questions on risk and investment analysis – experienced investors and inexperienced respondents

Code	Questionnaire for experienced investors	Questionnaire for inexperienced respondents
Q1	*All shares are the same risky.*	*All shares are the same risky.*
Q2	*I don't use a formal measure of investment risk. I sense it using intuition.*	*I wouldn't use a formal measure of investment risk. I would sense it using intuition.*

Code	Questionnaire for experienced investors	Questionnaire for inexperienced respondents
Q3	*Technical analysis (charts, patterns, trends, indicators etc.) is the best tool to forecast price movements and select assets.*	*Technical analysis (charts, patterns, trends, indicators etc.) would be the best tool to forecast price movements and select assets if I were an investor.*
Q4	*Fundamental analysis (financial results, macroeconomic data and events etc.) is the best tool to forecast price movements and select assets.*	*Fundamental analysis (financial results, macroeconomic data and events etc.) is the best tool to forecast price movements and select assets if I were an investor.*
Q5	*I rely on correlations selecting assets to my portfolio.*	*I would rely on correlations selecting assets to my portfolio.*

Distribution of answers are presented below (see Fig. 2 and Table 2). First of all attention must be paid to unequal gender distribution of participants with males active at the market and females dominating group keeping away from investment. That also reflects the reality of the Polish and also European financial markets dominated by males.

Answers distribution analysis show that there are no significant differences between experienced investors and inexperienced respondents in cases of market risk perception (Q1), use of Technical Analysis (Q3) and Fundamental Analysis (Q4). 79% of inexperienced group and 87% of investors disagree with statement saying that all shares are the same risky. Only 6% of experienced and 9% of inexperienced strongly agrees. All distance measures confirm that distribution of answers is similar. There are no statistically important (p=0,05) differences between answers of males and females of both groups although Clark's divergence suggests they differ. It is supposed that is only because of a low quota of experienced females participating the survey.

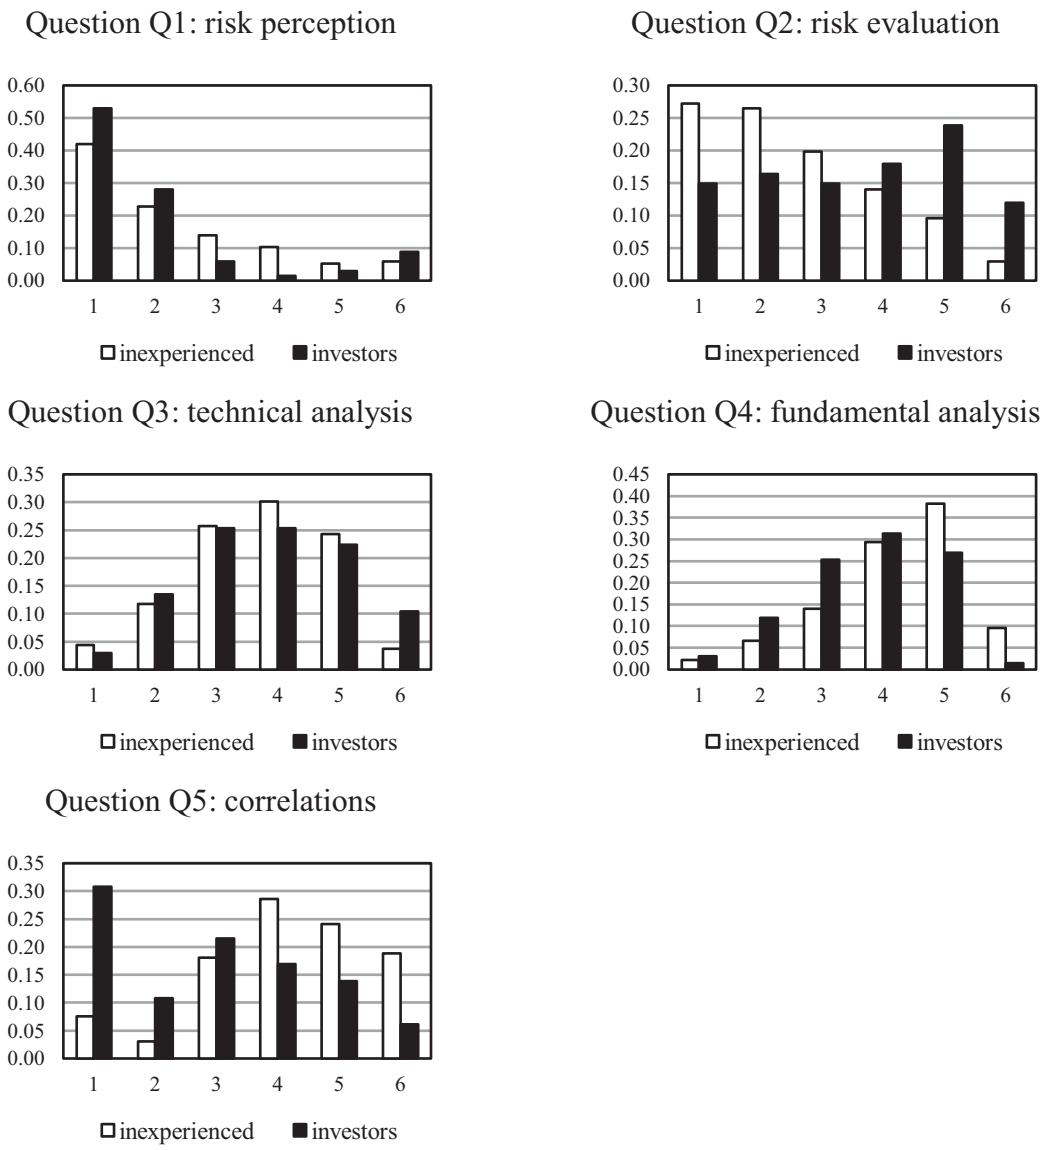

Fig 2. Distribution of answers – investors and inexperienced respondents

Table 2. Respondents' groups and their average notes

Group	N	Q1	Q2	Q3	Q4	Q5
male investors	56	2,02 (1,58)	3,38 (1,56)	3,84 (1,35)	3,82 (1,10)	2,88 (1,68)
female investors	10	1,90 (1,52)	4,40 (1,96)	3,80 (1,14)	3,00 (1,05)	2,70 (1,70)
inexperienced males	52	2,17 (1,63)	2,35 (1,30)	3,56 (1,32)	4,27 (1,12)	4,21 (1,49)
inexperienced females	84	2,35 (1,44)	2,75 (1,50)	3,75 (1,17)	4,15 (1,26)	3,90 (1,59)
Total	202	2,21 (1,53)	2,92 (1,56)	3,73 (1,23)	4,06 (1,17)	3,74 (1,59)

Similar findings are provided when interest in Technical Analysis declared by both groups is taken into account. In that case respondents are even more consistent: 58% of each groups believes that Technical Analysis is or can be a useful tool in stock market investment and 10% of experienced investors and 4% of the remaining group agrees with that sentence unconditionally. Answers suggest that Technical Analysis will be applied more often if investor is better experienced. In that case no important distinctions were found when investor's gender was considered.

Fundamental Analysis application as investment tool distinguish respondents. Average answers of both groups show that. It seems that investment practice verifies beliefs of beginners that stock market forecasts situation in the economy, financial results and macroeconomic data are simply reflected in security prices. Beginners becoming investors are faced with failure: Fundamental Analysis is more difficult than expected and if semi-strong or strong EMH is true it may be useless. Measures of similarity show that along with gaining experiences difference between males and females attitudes may appear: experienced men are more likely to use Fundamental Analysis.

Experienced and inexperienced investors distinct most in declarations of using correlation as one of investment tools. Correlation indicates that investor is familiar with portfolio theory and diversification. The high percentage of positive declarations of inexperienced investors (71% would use it and 19% always) is not surprising. Positive answer in this case may be considered as protecting self-esteem. Even if portfolio theory is known to inexperienced individuals most of them definitely don't know how to use correlation and how labor-intensive is using the theory in practice in that case. What is not surprising then is the fact that only one out of three experienced investors admits the use of correlation in practice and only 6% does it always or almost always.

The most interesting part of results was found when investment risk measurement was considered. Rising experience in investment causes investors to follow intuition in risk assessment. 74% of beginners and respondents without experience declared that they would measure investment risk in some way. Practitioners don't use measures but rather sense risk.

That is opinion of 54% of that group and in 12% it happens always or almost always. In comparison only 3% of beginners agree with that. Intuitive investing seems to be a common practice of individual investors.

HEURISTIC VALUATION – FROM DISCOUNTED CASH FLOWS TO MULTIPLES

Methods of using multiples as well as discounted cash flows to estimate fair value of stocks are widely documented in both literature and practice of the financial markets. For institutional investors or investment recommendations they are common performing evaluative functions, being a subject of negotiations in M&A transactions and rational reference being in line with formal investment strategy. The use of both methods at the same time is justified as they may present different values due to different underlying factors and procedures of valuation.

DCF valuation has the most solid fundaments in theory of finance and furthermore all other methods of valuation originate from the analysis of discounted cash flows. The advantage in the use of DCF valuation comes from the fact that it is the only method by which it is possible to estimate economic value of the company only based on potential cash flows that are expected to appear in a long term and by this it forces long term forecasting of all investment ventures. At the same time a long perspective of forecasts incorporates quite a huge level of risk that forecasts are incorrect. Moreover, often a large part of the value is accounted as residual value that is sensitive to changes of parameters.

Multiples should be considered as a supplement of DCF valuation and represents a relative value that should be achieved by security if all important factors (Earnings, Book Value, EBIT, EBITDA or other) were incorporated in its price to the extend the market does it with competitors with a similar business model. Reflecting current sentiment of the market is its biggest advantage of this method as well as ease in calculate even by individual investors. Selection of comparable public listed competitors may be a serious problem though. It may be impossible to achieve especially at the very stage of market development when cross-country comparison is not justified. The method doesn't include different profiles of risk and growth rate of company and its current value is estimated basing only on history or short term forecast. Nevertheless this is most common procedure of simple valuation.

In mergers and acquisitions (M&A), sellers and buyers normally base their price calculations on multiples of EBITDA, a figure often used by investors to analyze a company's value. EBITDA is extremely important in M&A transactions, and especially so for the determination of the purchase price. However, like all other estimation tools, EBITDA has inherent limitations and dangers (Kicia 2009).

The term is not formally defined by general accounting standards. While the theory behind multiples based on EBITDA may be sound, in practice reliance on these by sellers and buyers alike is often quite flawed. Additionally, the use of EBITDA in estimating value in small or family-owned business transactions creates difficulties in the negotiation process because of the limited availability and quality of financial statement information.

EBITDA is used in M&A transactions, in both binding and non-binding offers, in order to determine the purchase price that will be paid. In non-binding offers the use of EBITDA does not present a problem since the purchase price included is not enforceable against the parties in an eventual disagreement. However, in binding offers, EBITDA can be problematic for either side of the transaction when the EBITDA of the company is higher or lower than expected.

EBITDA forecasts is also one of the crucial parameters in DCF valuation as discounted cash-flows usually begin in healthy and profitable operating results. The aforementioned disadvantage of DCF valuation for all investors is its sensitivity to assumptions and forecasts. If DCF value is calculated on 20 years of forecast what is the quality of that forecast? Are we really able to estimate them correctly and if not maybe we should simplify the method and limit forecast up to forthcoming 2-3 years followed by estimated residual value. This approach would be promising for individual investors that are unable to discover future of valued companies due to lack of time, asymmetric information and computational problems.

Let us assume that we need a method that takes into consideration also behavioral nature of individual investors:

1. Representativeness and availability: investors predict next quarter results depending on information that is provided in last four quarterly financial statements. Their predictions cover revenues, EBIT and EBITDA profitability, rotation cycles of inventories, short-term receivables and current liabilities.
2. Myopia: investors are not able to provide a long term prediction. Instead of that they can simply incorporate a growth rate of revenues observed by comparing last four quarters (from Q_{-1} to Q_{-4}) to preceding four quarters (from Q_{-2} to Q_{-5}) and with stable EBIT profitability.
3. Framing: investors estimate company (share) fair value depending on stand-alone financial statements (usually announced earlier) or consolidated financial statements (usually announced later). Anchoring may appear when investors stick to values obtained from stand-alone statements even if consolidated statement is announced.
4. Investors need a simple method of estimating residual value of the company as they understand that a short term forecast is not enough to justify its value. The residual value can be obtained by a simple multiple of the last observed cash-flow or balance sheet values.
5. Risk free rate is observed as government debt YTM and credit risk margin at market level for similar companies.
6. All public companies are traded with the same beta equal to 1 as investors are not able to calculate their proper value. As a matter of fact in 90% of market reports and recommendations in Poland beta equal to 1 is assumed.
7. Investors are not able to estimate CAPEX and depreciation correctly without detailed information from the valued company so they assume that when CAPEX is done it will appear in company profitability or growth of revenues. Assuming CAPEX equal to depreciation simplifies procedure as in residual period.
8. Residual cash flows growth rate (g) is 0%.
9. Non-operating assets are equal to long-term investment assets and net debt is calculated depending on values observed in last announced financial statement (anchoring).

Assuming the above three alternative models of equity value were tested:

Model I. DCF proxy with simplified assumptions but still most complex calculations

$$EV_{QT} = \sum_{i=1}^{3} \frac{FCF_{QT-1} \cdot (1+er)}{(1+WACC)^i} + RV_{QT} + NOA_{QT-1} - ND_{QT-1}$$
$$RV_{QT} = \begin{cases} \dfrac{FCF_{QT-1} \cdot (1+er)}{(1+WACC)^3 \cdot WACC}, if\ FCF_{QT-1} > 0 \\ 0{,}99 \cdot RV_{QT-1} + 0{,}01 \cdot \dfrac{FCF_{QT-1} \cdot (1+er)}{(1+WACC)^3 \cdot WACC}, if\ FCF_{QT-1} \leq 0 \end{cases} \quad (1)$$

where:

EV_{QT} – equity value forecasted for quarter T
RV_{QT} – residual value forecasted for quarter T
FCF_{QT-1} – free cash flow of the last quarter
er – expected FCF growth rate (respecting assumption 2)
WACC – Waged Average Cost of Capital as in DCF (respecting assumptions 5-6)
NOA_{QT-1} – Non-Operating Assets as in statement for quarter T-1
ND_{QT-1} – Net debt as in statement for quarter T-1

Model II. DCF proxy with simplified calculation of residual value

$$EV_{QT} = \sum_{i=1}^{3} \frac{FCF_{QT-1} \cdot (1+er)}{(1+WACC)^i} + RV_{QT}$$
$$RV_{QT} = \begin{cases} TFA_{QT-1} + CA_{QT-1} - LR_{QT-1}, if\ FCF_{QT-1} > 0 \\ 0{,}99 \cdot RV_{QT-1} + 0{,}01 \cdot \left(TFA_{QT-1} + CA_{QT-1} - LR_{QT-1}\right), if\ FCF_{QT-1} \leq 0 \end{cases} \quad (2)$$

where:

EV_{QT} – equity value forecasted for quarter T
RV_{QT} – residual value forecasted for quarter T
FCF_{QT-1} – free cash flow of the last quarter
er – expected FCF growth rate (respecting assumption 2)
TFA_{QT-1} – Tangible Fixed Assets for quarter T-1
CA_{QT-1} – Current Assets for quarter T-1
LR_{QT-1} – Liabilities and Reserves for quarter T-1
WACC – Waged Average Cost of Capital as in DCF (respecting assumptions 5-6)
NOA_{QT-1} – Non-Operating Assets as in statement for quarter T-1
ND_{QT-1} – Net debt as in statement for quarter T-1

Model III. EBITDA x10 multiple

$$EV_{QT} = max\{0; 10 \cdot EBITDA_{QT-1} + NOA_{QT-1} - ND_{QT-1}\} \quad (3)$$

where:

EV_{QT} – equity value forecasted for quarter T
$EBITDA_{QT-1}$ – EBITDA value observed for quarter T-1
NOA_{QT-1} – Non-Operating Assets as in statement for quarter T-1
ND_{QT-1} – Net debt as in statement for quarter T-1

All proposed above heuristic valuation models were tested for improvement of potential investment results of hypothetical individual investors. First, for all but financial companies listed at The Warsaw Stock Exchange main market valuation procedures were applied for all available quarters. Financial data for the sample of 415 companies listed in 2000-2012 was provided by Notoria Service. Out of all valued companies for the next step were qualified only these with at least 12 quarterly valuations (reference fundamental values according to Model I, II and III separately for at least 3 years). For all periods with reference values of all selected companies 500 hypothetical transaction (open and close dates) were randomized and annual return for each transaction was calculated. The average annual return and standard deviation represented a distribution of possible returns for investors without fundamental reference value.

The same procedure was repeated but another 500 transactions were filtered by values provided by tested models for the date of transaction. That said if market price was higher than a heuristic fair value the company was recognized as overvalued and hypothetical investor cancelled buying. The average annual return and standard deviation represented a distribution of possible returns for investors with fundamental reference value provided by Model I, II and III respectively.

Comparing results of both samples for all companies it was analyzed if investors using heuristic models can improve their results of random investing. The same procedures were provided using stand-alone and consolidated financial statements.

RESULTS AND DISCUSSION

Results of experiments (see Table 3) indicate that the use of proposed valuation methods wouldn't have an unequivocal impact on investment strategy. With rather low average improvements of annual returns (from 5,2% to 10,5%) for about a half of all analyzed companies (from 43% to almost 56%) it rather confirms at least semi-strong EMH of Polish stock market in 2000-2012.

Table 3. The results of testing procedures

Test number	I	II	III
	IV	V	VI
Financial statements	stand-alone	stand-alone	stand-alone
	consolidated	consolidated	consolidated
Initial sample of companies	415	415	415
	415	415	415
Applied model of valuation	I	II	III
	I	II	III
Companies qualified for step II	288	178	181
	238	226	172
Companies with improved results using model	52,0%	50,0%	43,0%
	54,2%	55,6%	44,9%
Average increase of returns (standard deviation)	5,3% (6,0%)	5,2% (5,1%)	8,5% (14,6%)
	10,3% (14,2%)	5,8% (6,5%)	7,2% (6,5%)
Average decrease of returns (standard deviation)	-9,5% (14,2%)	-7,2% (7,1%)	-15,2% (19,1%)
	-8,6% (13,8%)	-7,7% (12,8%)	-13,3% (19,0%)
No. of stocks with increased results (difference in returns statistically significant, α=0,05)	20	7	10
	24	10	11
Average increase of returns with statistically significant improvement	15,4%	11,3%	20,2%
	28,3%	15,5%	14,7%
No. of stocks with decreased results (difference in returns statistically significant, α=0,05)	33	7	31
	23	11	22
Average increase of returns with statistically significant improvement	-26,6%	-14,1%	-32,8%
	-23,0%	-26,5%	-27,5%

Experiments show that it is possible to improve results with additional information on fair price levels but if we consider individual investors with random strategy of selection securities over the analyzed period valuation will not separate stocks to exact winners and

losers. Almost the same number of investors would improve their portfolio results as those who face downgrading their effectiveness. Possible average decrease in average return is in almost all cases higher than average increase for opposite securities. The one case is experiment IV with Model I and the use of financial information from consolidated statements.

In general, all the results indicate that simplifying valuation in a proposed methods may provide better results the less simplification if provided into the procedure of valuation based on discounted cash flows. The more it is consistent with complex DCF the better market tracking it may provide as better net results were provided by Model I on consolidated statements than most simplified multiple-based Model III. This result is not surprising if we mind that individual investors usually are not the group influencing market prices due to their capital dispersion. They could impact market prices in a long time if a large enough group of individuals would behave in the same way or would use the same analytical tools suggesting buying or selling at almost the same moment. Herding effects that appear in that circumstances could cause waves of growth or decline to the market. Shallow markets with rather low turnover, illiquidity and lack of rational investors may be a good example confirming that it is easier to manipulate prices. At the developed markets reality is different. Institutional investors both domestic and foreign with large capital allocated to the market induce trends or cease them and while fair price is defined by formal methods of valuation they may vary in assumptions of forecasts but usually represent comparable level of value. Individuals with their beliefs and intuitions have no other choice but accept market level even if they were sure their method of simplified valuation as well as forecasts were correct. Extra returns are consequence of timing and quality of forecasts than methods of incorporating them into prices established by the market.

Although presented results of experiments do not seem optimistic for individual investors and their strategies for the market are satisfactory. Among others they confirm that the Polish stock market is effective in at least semi-strong level of EMH as other most developed markets.

INFLUENCE OF GLOBALIZATION AND INTEGRATION PROCESSES ON ACCOUNTING REGULATIONS ON THE EXAMPLE OF POLAND

Małgorzata Kamieniecka, Department of Accounting, Faculty of Economics, Maria Curie-Sklodowska University in Lublin, Poland

ABSTRACT

Purpose: *The growing internationalization of the economies of individual countries, imposes on the national regulators the processes of harmonization and standardization in the accounting rules. The last 20-30 years, we have witnessed significant transformation of financial reporting of companies (changing forms of presentation and content of the reports). These changes result from the transformation of national economies caused by: 1) internal processes (change of ownership, the appearance of new legal forms of business and new financial instruments, changes in management methods, etc.), 2) external processes (increasing globalization and integration). This second group of factors is particularly important in countries such as Poland, which, in a relatively short period of time, restructured its economic system from state-controlled economy to a market economy, at the same time, intensively joined the European integration, thus implementing a number of regulations applied by the EU. The purpose of this paper is to determine the effect of changes in accounting regulations caused by the processes of globalization and integration (mainly European) on a national accounting model.*
Conclusions and findings: *The processes of globalization and integration have a significant impact on changes in national accounting models. These changes are intended to ensure the comparability of the effectiveness of the companies in transnational scale. The most important influence on the financial reporting in Poland, during the system transformation, had the EU Directive, and in the last 10 years - IFRS. However, it should be noted, that at this stage of development, it is not yet possible to fully standardize financial reporting, even in countries belonging to the same economic and cultural region of the world.*
Practical implication: *The structured knowledge about the experience in the implementation of international practices and regulations of the accounting of given country makes it easier to predict the possible reaction of business practice and legislation changes in the future (will allow predict the speed and depth of changes and the level of acceptance and perception of new reporting requirements, both by preparing reports, as well as the users of these reports). This knowledge is particularly important for policy makers and regulators because will allow them to plan properly the process of legislative changes.*
Design/methodology/approach: *The research methodology will include an analysis of the foreign and Polish literature on the subject, the review of polish, EU and worldwide accounting regulations, the inductive and deductive methods. The inductive method should prove useful in analysing the literature and law. The main conclusions will be drawn using scenario of deductive methods.*
Originality/value: *A number of scholarly articles on the changes in Polish accounting regulations in the last 20-25 years were published so far. However, they lack a clear indication of the relationship of these changes to the global processes of globalization and European integration. This article is an attempt to fill this gap.*

INTRODUCTION

The expectations of both external and internal financial information recipients have been growing, along with progressing globalisation. This forces accounting regulations to provide for universal presentations of data coming from financial statements. Harmonisation leading to higher comparability, followed by standardisation reflected in consolidated principles of identifying, measuring and reporting property and resultant items, have become common. Such processes are triggered by globalisation-induced capital-market integration around the world, and by the opening of domestic markets to foreign-investment companies, together with the simultaneous expansion of domestic entities beyond their country of origin.

Both individual investors and public institutions, including supervisory bodies, are more likely to appreciate the benefits flowing from commonly-known and universally-recognised financial-reporting frameworks, based on strong and globally-accepted accounting standards. These benefits include, in particular, better data comparability, higher willingness and better opportunities to invest abroad, more efficient asset allocation, lower capital costs, and higher dynamics of economic growth.

This article is aimed at determining the impact of changes to accounting regulations caused by globalisation and integration processes (mainly in Europe), on the domestic-accounting model. The analysis of changes to balance-sheet law partly covers the factors resulting from the systemic transitions which occurred in the Polish economy. The reporting entities' reaction to the amendments to Polish balance sheet law will also be examined.

The methodology of this study comprises an analysis of both foreign and Polish literature on the subject matter, a survey of Polish, European and global accounting provisions, and an outline of various studies on related issues.

Polish accounting prior to the systemic transitions

Prior to the Second World War, Polish accounting was governed by the Commercial Code of 1934, which merely laid down some general report-drafting principles to be followed by economic units (CC, 1934). It is argued that accounting at that time mainly served fiscal purposes (Foremna-Pilarska and Radawiecka, 2007).

The German occupation during the Second World War had a considerable influence on Polish accounting. This was when it acquired the continental features which are still to be observed. The first Uniform System of Accounts, which entered into force on 1 January 1946, was also based on German solutions (and, more specifically, on the German system of accounts and on its equivalent – the system of accounts of the General Government). The Uniform System of Accounts not only contributed to consolidating numerical data in the overall economy but also facilitated, through its flexible approach, adjustments to the specificity of a given sector or entity (at this point, the considerable freedom of costs measurement and reporting should be noted) (Jaruga and Szychta, 1997).

A few years after the War, Poland accepted the accounting solutions applied in the Soviet Union. Accounting was at that time oriented towards satisfying the needs of government planners, performing mainly control functions. The content and methods applied in the

accounting system were specified in more detail within the legal regulations. Together with the diversification of various economic divisions, in 1950 the Uniform System of Accounts was replaced by the Industrial System of accounts. This marked the end of the flexible approach, which was reflected by a detailed specification of the correspondence in accounting (apart from the economic content).Then introduction of the framework system of accounts in 1952, entirely based on Soviet solutions (entailing opting out of the use of the structure of costs by type and the overextended system of accounts) turned out to be the most disadvantageous change. Furthermore, the duplicated accounting technique was replaced by registered accounting (Biadacz, 2012).

Since around 1960, Polish solutions have prevailed over the Soviet ones. In 1959, a new system of accounts for socialised economic entities was introduced (which then provided the basis for establishing industrial systems, regarded as typical). Its form resembles Western European solutions, while its content was tailored to the needs of a centrally-steered economy. Another reform, dating back to 1976, facilitated aggregating reporting data countrywide by various sectors, including industries, branches, and divisions or fields of the national economy. According to the author of this study, this reform could serve as a concrete example of setting the contemporary directions of changes related to registering obligations. The first economic reforms at the outset of the 1980's (referred to as the thawing period) marked another turning point by introducing the possibility of using personalised in-house accounting systems (Jaruga and Szychta, 1997).

The reference period, from the point of view of this study, can be briefly characterised as the period of transitions in Polish accounting, caused firstly by German, and then by Soviet, influences.

Polish accounting regulations in the transition period towards a market economy

The beginning of the 1990's in Poland brought significant changes to economic entities, resulting from systemic and economic transformations. The shaping of free-market economy and the openness towards international cooperation forced the reconstruction of accounting paradigms. Amendments to balance-sheet law had to be profound, and their pace adjusted to political and economic developments. It had to be fast enough to foster these developments and, at the same time, properly timed to let the units concerned pursue preparatory processes related to IT systems and staff training. However, it should be noted that balance-sheet reform was facilitated by the relatively strong position of accounting theorists who had established contacts with global experts. Moreover, certain sections of general accounting theory (e.g. evidence-modelling theory and the deductive theory of the systems of accounts) were highly innovative, providing a valuable contribution to global expertise at that time (Brzezin, 1995).

At the outset of the transformation period, substantial changes were introduced to accounting legislation. The Regulation of the Minister of Finance (of 15 January 1991) on the rules of book-keeping entered into force as of 1 January 1991. It was the first Polish Act of law entirely devoted to accounting, separating it (not yet fully but to a large extent) from fiscal law. In line with the idea to strengthen the country's integration with Western European countries, this Act was based on the Fourth Directive of the EEC (today the EU). Poland established a diplomatic relationship with the European Economic Community in September

1989 (although until 1989 it had belonged to the Council for Mutual Economic Assistance, competitive with the EEC), and the agreement between Poland and the EEC was signed on 19 September 1989. Therefore, the amendments to balance-sheet law resulted, to a large extent, from political and economic decisions aimed at associating with Eastern European countries. Nevertheless, according to the author, these were internal processes that exerted a more important influence on the amendments to balance-sheet law at that time, including the fundamental property transitions to foster private-sector growth[1], the liquidation of monopoly structures, the price liberation and the activation of the capital market. The newly-introduced regulation governed such issues as the principles of book-keeping, stock-taking, the determination of the financial result, the principles of assets and liabilities valuation, accounting evidence and reporting. A uniform structure for the balance sheet, and the profit-and-loss account was established (The Regulation of 1991).

The reference Regulation was in line with the strategy of establishing an appropriate institutional and legal framework conductive to systemic transitions and, according to the author, it served its function exceptionally, paving the way for modern corporate reporting.

Nevertheless, as the Regulation failed to touch upon several crucial aspects of the economy (e.g. leasing, the consolidation of financial statements and the principles of drafting cash-flow statements), a number of issues remained under-regulated, and for some others alternative solutions were used. As a result, efforts were made to draft a new Act of law that would regulate accounting in a more thorough way. On 1 January 1995, the Accounting Act of 29 September 1994 came into force. Among the significant objectives that were adopted (which included determining, consolidating and stabilising the conditions to be complied with by accounting, ensuring the uniformity and transparency of accounting solutions, strengthening the position of accounting in line with the function it serves in the modern economy, and laying the ground for the provision of reliable and more detailed information for accounting purposes, useful in assessing the economic standing of various enterprises and institutions), the following are worth noting (Foremna-Pilarska and Radawiecka, 2007):

- further adjustments of Polish accounting solutions to the principles binding in EU countries (which proved especially important in the light of signing the Association Agreement with the European Community in December 1991, which entered into force on 1 February 1994, followed by an official application for the EU membership submitted by Poland in April 1994),
- attempts to adjust Polish accounting principles to the principles laid down in the International Accounting Standards (IAS) provided that:
  - they did not violate EU directives,
  - the application of international standards was feasible, given the development stage of the Polish economy at that time (as such a significant reconstruction of the entire economic system, which entailed the transition from a centrally-steered to a free market economy, is in principle a complex and long-lasting process, which is why in the mid-1990's the Polish economy was not yet ready to absorb the complex mechanisms of the IAS),

[1] In 1989 the GDP share of the private sector amounted to less than 30% and within nearly a decade it grew to approximately 75% (Rapacki, 2005).

considering the fact that when constructing the provisions of balance-sheet law, the legislator assumed that the directives had prevailed over international standards.

The harmonisation of Polish accounting provisions with the EU and international ones, at this development stage, was extremely significant, due to allowing foreign investments in the country and due to the inflow of international capital. In 1991-1995 the average annual dynamics of the growing inflow of foreign direct investments to Poland reached approximately 130% (including the order-book investments which proved significant, though their share in various years was subject to considerable fluctuations) (Weresa, 2002).

Based on the opinion of the European Council of 1997, Poland made considerable progress in establishing balance sheet law, in terms of its harmonisation with EU directives. The highest level of compliance was reached with the Fourth Directive (dated 1978 on the annual accounts of certain types of company) and with the Seventh Directive (dated 1983 on consolidated accounts) (Misińska, 2005). It should be borne in mind that financial reporting and accounting principles at that time were also referred to in three other directives:

- The Directive of 1986 on annual accounts and the consolidated accounts of banks and other financial institutions,
- The Directive of 1989 on the financial reporting of credit and financial institutions operating in Member States,
- The Directive of 1991 on annual accounts and the consolidated accounts of insurance establishments.

When compared to other countries, Poland internalised the above directives within its own legal system in an extremely short period, acting at an express pace. The average time span for introducing accounting directives to the domestic law of EU Member States was 10 years (e.g. the introduction of the Fourth Directive took 13 years in Italy, 11 years in Spain and 8 years in Greece).

Globalisation processes and the progression of European integration vs. Polish balance sheet law

The second half of the 1990's in Poland was a period of intensive efforts towards completing the Accession Agreement and being accepted as an EU member. To this end, the Committee for European Integration was established in August 1996 (whose aims included initiating and coordination adjustment work regarding legal institutions, as well as evaluating draft versions of legal Acts in terms of their compliance with EU laws), and the National Integration Strategy was enacted in January 1997. Poland launched the negotiations with the Council of Europe on 31 March 1998, which were preceded by screening, i.e. by examining the compliance of Poland's internal laws with Community laws. The partnership negotiations ended on 13 December 2002 and the Treaty of Accession was signed on 16 April 2003. Finally, Poland's accession to the European Union was effected on 1 May 2004.A survey of laws in terms of their harmonisation with EU regulations on balance-sheet law resulted in the so-called grand revision of the Accounting Act, introduced by way of the Act of 9 November 2000 on amending the Accounting Act, which became effective on 1 January 2002. The amendments were so considerable that the standard text of this Act was published in Journal of Laws of 2002, No. 76, Item 694. A relatively long *vacatio legis* of the new provisions was

applied to prepare enterprises for the incoming changes. The amendment work was also time-consuming and took over two years.

The new Act on amendments is considered to have become a modern Act of law, being much more practical in terms of the economic life of enterprises (Gnich, 2001).

The reference Act comprises 12 chapters, which comprehensively regulate the accounting principles in Polish entities, from book-keeping and stock-taking, to the valuation of assets and determination of the financial result, the settlement of company mergers, the reporting obligations of individual entities and capital groups, the audits and announcements of financial statements, and book-keeping services. The content of the reference Act is supplemented with annexes, including financial statement templates to be used by banks, insurance companies and other entities.

It is worth noting that the revision of the Accounting Act of 2000 was, to a large extent, also connected with the need to adjust domestic provisions to international standards, which had themselves undergone substantial changes in 1994 – 1999. This was reflected, i.a., by introducing IAS-based provisions (not regulated under EU directives) regarding property investments, equity instruments, and long-term contracts and mergers. Considerable changes also affected the principles of exchange-rate settlements and deferred-tax determination, along with introducing the notion of fair value and accuracy. The matters not regulated under the reference Act are subject to the domestic standards or the IAS.

Polish accounting at the outset of the 21st Century, as compared to the last decade of the 20th Century, absorbed certain features of Anglo-Saxon accounting (until 2000 it represented the typical continental model, with the caution principle dominating the true and fair view, and with significant, if not prevailing impact of tax principles over balance sheet guidelines). The emerging changes were also reflected in the establishing of the Accounting Standards Committee (ASC) by way of the Regulation of the Ministry of Finance (The Regulation of 2001).

The ASC operates within the Ministry of Finance and is comprised of accounting experts who represent various bodies participating in the establishing of accounting regulations (i.e. the Ministry of Finance, the Ministry of the State Treasury, the National Bank of Poland, and the Polish Financial Supervision Authority) and the largest professional accounting organisations (i.e. the Accountants Association in Poland and the National Chamber of Statutory Auditors) who delegate representatives of the scientific environment and auditing companies. In accordance with Paragraph 2 of the Regulation, the scope of activity of the Committee comprises:

a) establishing new domestic accounting standards, along with surveying and updating the existing ones,
b) issuing opinions on questionable accounting issues,
c) evaluating draft versions of accounting Acts,
d) analysing and evaluating draft versions of the IAS and their amendments,
e) cooperating with international accounting standardisation organisations,
f) undertaking other actions aimed at the harmonisation and standardisation of accounting principles.

The Committee cooperates with the European Financial Reporting Advisory Group (EFRAG) within the framework of the EFRAG "Pro-active Accounting" project, as its members form part of project working groups. The Committee analyses and evaluates international documents on an ongoing basis, including draft amendments to the International Financial Reporting Standards (IFRS), regarding the issues significant to Polish IFRS-affiliated entities.

So far (i.e. until April 2013), the Committee has issued:

- seven standards, i.e. No. 1. Cash-flow statements, No. 2. Income tax, No. 3. Unfinished construction services, No. 4. The impairment of assets, No. 5 Leasing and renting, No. 6. Reserves, - current calculation of periodic costs, and conditional liabilities, and No. 7. Changes in accounting principles (policies), estimated values, error correction, events after the balance-sheet date – approach and presentation;
- four opinions, i.e. on the accounting approach to property rights arising from the certificates of origin of energy produced from renewable sources, on determining the production costs for the purpose of the balance-sheet stock valuation, on the accounting approach to greenhouse-gas emission rights, and on certain principles of book-keeping;
- one recommendation on adopting the Code of Ethics for Professional Accountants.

The standards and opinions issued by the Committee are not absolutely binding (pursuant to Article 10, Paragraph 3 of the Accounting Act., In matters not regulated under the aforesaid Act, an entity may apply domestic accounting standards by referring to accounting principles (policy)). This non-obligatoriness is being strongly criticised in the accounting world and, as such, it may be subject to change as part of the next revision.

At the time when Poland was preparing its grant revision of the accounting Act, the European Commission realised that its accounting directives had failed to fully achieve the set objective, i.e. ensuring comparability of financial statements between the various Member States (the fundamental barriers included a protracted drafting, amendment and implementation process, together with the admission of alternative solutions) (Mućko, 2009). In consequence, in 2000 the European Commission decided[2] on further accounting harmonisation EU-wide, based on international standards.[3] The fear of the wide introduction of American standards (developed by the FASB) to global economic practices served as an additional argument. It was, therefore, decided that global standardisation based on the IAS/IAFS would be a better solution, as these standards were established by the International Standards Council (formerly Commission) which is a private institution, independent (unlike the FASB) of any Government (Holban, 2011).

In order to implement the strategy, it was necessary to lay down adequate regulations allowing for the application of IAS within the Community. To this end:

- most of the binding standards were modernised or improved, and some were replaced. The revised IAS/IFRS and their interpretations were finally adopted in 2004,
- accounting directives were generalised and simplified.

[2] The document entitled *EU Financial Reporting Strategy: the way forward* was adopted in June 2000.
[3] The first sign of the possible consolidation amendment to the EU financial reporting strategy, based on international standards, appeared in 1995, which was when companies listed on European stock exchanges were allowed to present consolidated IAS-based financial statements.

The legal basis for adopting IAS/IFRS as part of the Community legislation was provided by *Regulation No. 1606/2002 of 19 July 2002 of the European Parliament and Council on the application of international accounting standards.* The principal objective of the standardisation of IFRS-based financial reporting is to achieve more efficient and cost-effective functioning of the common capital markets and, in consequence, to foster the development of the internal EU market (The Regulation of 2002, Point 12).

In accordance with the Regulation, individual IAS/IFRS are included in EU law by way of executive regulations, provided that they satisfy the comprehensibility, usefulness, reliability and comparability criteria to be satisfied by financial information which is necessary to make economic decisions and to assess the management model. Pursuant to Point 11 of the justification of the Regulation, the IFRS approval mechanism shall function efficiently and provide a forum for the debate, consideration and exchange of information on international standards between the parties concerned, including in particular the entities in charge of developing domestic accounting standards, the securities market supervisory bodies, the bank and insurance supervisory bodies, the central banks, including the ECB (The European Central Bank), the professional environment of accountants, and users and entities drafting financial statements. This mechanism should serve as a means conducive to the general understanding of the international accounting standards binding within the Community. To this end, the obligatory IAS/IFRS endorsement procedure was adopted, which comprises:

1) issuing a recommendation on accepting or rejecting a given IAS/IFRS by the EFRAG), a private organisation providing advice to the Accounting Regulatory Committee,
2) approving a given IAS/IFRS by the Accounting Regulatory Committee (ARC) operating within the European Commission,,
3) issuing an opinion by the European Parliament,
4) issuing a regulation by the EC comprising the content of the IAS/IFRS adopted, and publicising it in all official EU languages in the Official Journal of the European Communities.

As shown above, IAS/IFRS adoption and interpretation within the EU legislation are not automatic and require a number of facilities. This sometimes leads to a considerable time gap between the adoption of an accounting standard by the IASB and its implementation in individual Member States. For certain standards (e.g. IFRS 9 concerning financial instruments or the standard for small and medium-sized enterprises), this procedure may last a couple of years. It can be, therefore, inferred that the IFRS-based standardisation of financial accounting does not mean achieving automatic compliance and comparability in various regions or countries in legal terms. In general terms, considering the specificity of countries/regions, resulting from cultural, mental, social, historical and other differences, achieving full comparability within a foreseeable period is hardly possible.

The reference Regulation imposed the obligation to draft consolidated IFRS-based financial statements, effective from the balance years beginning with 1 January 2005, on those companies whose securities were marketed in any of the Member States as at the balance-sheet date (The Regulation of 2002, Article 4). The decision on extending the catalogue of obligatory or voluntary IFRS-based reporting options to other companies was left to the Member States' discretion. Therefore, the European Commission allowed for the IFRS application by virtually all entities, whether they draft consolidated or unit-based financial

statements, and whether or not their securities are marketed publically (Regulation of 2002, Article 5).

Further to the adoption of Regulation No. 1606, the Polish Accounting Act had to be amended, as Polish companies were previously obliged to draft their financial statements by making the only and exclusive use of the principles of assets and liabilities valuation and determination of the financial result, as defined in the reference Act. Although in 2001 the Securities and Exchange Commission imposed an obligation on the companies listed on the stock exchange to disclose the differences between Polish regulations and the IFRS, this was only in qualitative, not quantitative, terms. The appropriate regulations were introduced by amending the Accounting Act of August 2004 (Journal of Laws No. 214, Item 2153), under which the Polish legislator extended to the banks the obligation to draft consolidated IFRS-based financial statements (Accounting Act of 2004, Article 55, Paragraph 5). The legislator further provided the possibility to draft IFRS-based reports, on a voluntary basis (at the verifying body's discretion), to the following entities (Accounting Act of 2004, Art. 54):

- issuers of *admitted* securities, i.e. issuers willing to apply for the admission to marketing on one of the regulated markets within the European Economic Area (both unit-based and consolidated),
- units forming part of an equity group, in which the dominating entity drafts consolidated financial statements according to the IFRS,
- branch offices of foreign entrepreneurs, provided that they draft financial statements according to the IFRS.

Therefore, the Polish legislator did not decide on the full adoption of the IFRS. There are still domestic entities which, despite their willingness to satisfy the stringent IFRS requirements, cannot do so. The Ministry of Finance, which regulated all accounting issues in Poland, adopted an evolutionary variant of changes to balance-sheet law, arising from adjustments to the requirements of the globalising world and progressing European integration.

This gives rise to the question of the role of the Accounting Act in the entities bound (whether obligatorily or voluntarily) by the IFRS. In fact, in accordance with Article 2, Paragraph 3, they apply the provisions of the reference Act, and the executive provisions issued on its basis, in the scope not regulated by the IASB. This means that wherever there are no specific IAS/IFRS regulations, they will first refer to the Accounting Act, and then possibly to domestic accounting standards. The provisions of the Accounting Act applied by the IFRS-bound entities, because of the absence of specific IAS/IFRS regulations, concern stock-taking, book-keeping, the principles of documenting economic events, the obligation to draft reports on current activity[4], the audit, approval and announcement of financial statements, data protection, and criminal liability.

The uniform text of the Accounting Act was published again this year (Journal of Laws of 2013, Item 330). This time, most changes which have occurred since the last but one publication of the uniform text in 2009 (Journal of Laws of 2009, No. 152, Item 1223)

[4] The obligation to draft reports on current activity may soon be included in international standards (as the work on further changes to IFRS 1 – Presentation of financial statements is now in progress), following which this regulatory area will no longer concern the IFRS-bound units.

resulted from other factors than the standardisation processes of corporate financial reporting.[5]

An assessment of the reaction of accounting entities and users to the changes to balance-sheet law

The reaction of accounting entities and users to the changes to balance-sheet law has been tracked using the example of changes to the Polish balance-sheet law which have occurred over more than ten years, and especially those caused by the adjustments to the requirements of EU regulations and IFRS.[6]

It should be noted that IFRS implementation is not an easy task. This is confirmed by an analysis of financial statements for the periods of transition to the IFRS and the subsequent periods of companies listed on the stock exchange in Warsaw conducted by the author for the purposes of this study. There are noticeable differences in the application of accounting principles between the first report prepared in compliance with IFRS and the next (and sometimes a few subsequent) reports. Usually they result from further adjustments of the reporting to international standards. This regards both the manner of presenting information in the report and the principles of valuation and formulation of particular items in the report. Also, accounting policies have evolved significantly. This study allows the conclusion that IFRS implementation is not a single action, or an easy and short-term one, but it requires excellent preparation, training and even – in a sense – a new understanding of the company, as reporting in compliance with IFRS requires more precise disclosures, viewing the company from a long-term perspective and heavy use of management accounting tools.

Accounting users notice that changing balance-sheet law towards their compliance with international standards bring about the harmonisation of internal reporting and better comparativeness between home and foreign companies, and in the case of entities active in many countries and continents, also harmonisation of internal reporting. This has been confirmed by the results of research conducted by PricewaterhouseCoopers (2006). The comparativeness of information is a very important feature of financial statements, regardless of the necessity to make analyses, establish changes and trends in the company's activities, and make proper investment decisions. That is why, to make it easier for recipients to compare the financial results obtained by companies conducting business in various countries, and to watch the character and dynamics of the changes occurring in companies, reports from various companies worldwide should be based on the same standards. At the same time a properly-prepared and useful financial statement should contain information comprehensible to the user (who has sufficient knowledge of the company's business activities and economics, and the functioning of the markets), thus the need for permanent training.

It should be noticed that in the first half of the 1990s in Poland, training sessions, courses and other forms of education were conducted at the universities and by the Association of Accountants in Poland (Jaruga *et al.*, 2007), covering international standards. These

[5] This is the outcome of reporting regulations through codified laws, which force continual amendments, while certain lack of flexibility results in the failure to adjust the amendment pace to the rapidly-changing economic environment.
[6] As regards the impact of the International Financial Reporting Standards implementation on a financial report, more than ten studies have been devoted to this issue, including: Jaruga *et al.*, 2007; Krzywda and Schroeder, 2007; Walińska, 2007.

initiatives have largely facilitated the practical implementation of international regulations. Nonetheless, professional courses, both for managers and for accountants, are still needed. This results both from the difficulty level of the IFRS as such, and their constant evolution, and from the expected increase in the number of companies reporting in accordance with the IFRS.

The noticed difficulties with IFRS implementation were most probably partially due to the lack of easy access to the contents of the international standards: the first official translation of the IFRS appeared as late as in the year 2004. This obstacle has already been overcome – the EU regulations make the publication of the IFRS obligatory (in the version accepted by the EU) in the official language of each Member State, Additionally, in Poland, with the participation of the Association of Accountants in Poland, every few years the standards are published in the version adopted by the IASB [International Accounting Standards Board] in the Polish translation in book form.

Some authors have pointed out that although reporting in compliance with the IFRS admittedly highlights the usefulness of financial information, but this is being done at the cost of comparativeness: *"in the case of the IFRS it is not possible to talk about reliability or comparativeness if there are several various answers in response to the question how to post or present a certain transaction in a financial statement*" (Kamela-Sowińska, 2006). Then, paradoxically, the implementation of identical reporting standards deprives the reports of the ability to make comparisons between various entities conducting business in the same country. This had been confirmed by research conducted, among others, by Ernst&Young in September 2006 (Observation, 2006).

The difficulties encountered by Polish business in the implementation process of international standards resulted from the typical continental model of domestic accounting, based on legal principles, with the superiority of the prudence principle, the weak position of the principle of business continuity, and the prevalence of content over form and the reluctance to extensively disclose financial data. The research conducted by Cebrowska, (Cebrowska, 1998) proved that Polish accountants prefer normative regulations and do not see a need to allow alternative solutions. Other research (Vellam, 2004) indicates that in Poland the main purpose of creating financial statements is not to satisfy the needs of a wide circle of users (including investors), but primarily to meet the requirements of the law, especially accounting law. Also, an analysis of court decisions proves that accounting law is the basis for judgments, which may result from insufficient knowledge on the part of the judges regarding the purposes and role of the accounting-information system. Apart from that, doubts occur as to the proper application of professional judgment, widely required by the IFRS, needed for the proper posting and valuation of many report items. Concerns exist over the possibility of abusing the estimating process based on the [professional] judgment to manipulate financial data. Similar doubts have been expressed by Romanian researchers (Ovidiu, 2011).

Probably, if relevant research was conducted in 2013, it would turn out that the pressure for a legalistic approach to accounting is weaker, especially in public entities because basing accounting on principles (not on rules) allows entities to "tailor their accounting policy to their needs", and because of that the image of the enterprise emerging from the statement might better reflect the economic realities of the enterprise. What's more, the increase of authority is very much appraised by investors, especially minority stakeholders, who, as such,

do not have access to internal statements. The IFRS disclosures policy is designed in such a way that a financial statement may primarily aid rational decision-making, so consequently it has to include an abundance of management information, while the disclosures complying with the requirements of accounting law primarily serve the implementation of the attesting and controlling functions of accounting.

Along with the noted advantages of the harmonisation and standardisation of accounting there are emerging doubts related to this. More and more tangible is the complexity of financial statements preparation processes, so that even accounting specialists have difficulties with interpretation and comprehension of the economic logic of accounting law regulations. Apart from that, it was noticed a long time ago that the more detailed amendments to the law, including accounting law, the more possibilities to evade it (Mączyńska, 2009).It should be the purpose of the regulators to design such laws which, not leaving doubts as to their interpretation, would at the same time allow sufficient flexibility, and thus, not bring about the necessity for further amendments.

CONCLUSIONS

The directions of changes occurring in accounting worldwide are being charted by International Financial Accounting Standards and their continuation in the form of International Financial Reporting Standards. In Poland, the practical appliance of accounting principles is "double-tracked": out of all the accounting entities, the majority is formed by the entities which practise accounting in compliance with the Accounting Act, and the other group of business entities keeping accounting books and prepare financial statements applies International Financial Reporting Standards (IFRS). According to official State statistics a little over 2% of all companies preparing financial statements reported compliance with the IFRS (1198 out of 53 148 entities)[7]. The role of the IFRS is bound to be growing. Poland is in the process of preparing further very important changes to balance-sheet regulations. The final shape of the standards is not yet known; consultations in this field are in progress. The expected changes are going to be significant enough to make an amendment insufficient and a new Act of law is going to be developed. Probably the Act is going to be divided into 3 parts:

1) regulations common to all entities preparing financial statements (also based on the IFRS),
2) regulations for small and medium-sized enterprises (with a number of simplifications provided for, decreasing the difference between balance-sheet regulations and tax law,
3) regulations for entities subject to the duty to have financial statements audited (stronger harmonisation of reporting with the IFRS).

The long period of preparing changes to balance-sheet regulations is – on one hand – related to the need to conduct very extensive consultations with a number of stakeholders, and, on the other hand – it is justified by the wait for the decisions of the European Committee and the Council with regard to reporting by small and medium-sized companies (it seems the IASB standard regarding these entities is not going to be adopted in *acquis communautaire* and extensive work is in progress on the directive regarding accounting in the SME sector).

[7] According to the data of the Central Statistical Office for the year 2008. The information was not gathered in the subsequent years.

Moreover, further changes to international standards, as such, are expected, due to their progressing convergence with the US GAAP (Generally-Accepted Accounting Principles) and the inevitable introduction of requirements for integrated reporting (for more on these subjects see Kobiela-Pionnier, 2012; Ignatowski, 2012), as well as with the possibilities and requirements of reporting with the use of XBRL (eXtensible Business Reporting Language). Therefore, the subject of this study is going to remain currently valid and will require further even more significant analyses, as the knowledge of the reactions of stakeholders to the changes to the balance-sheet regulations will allow the planning, and then the implementation, of subsequent amendments to the balance-sheet law.

The systematisation of data on past experiences related to the implementation of international practices and regulations in the accounting of a given State facilitates predictions as to the possible reaction and warns business practitioners and lawmakers about changes in the future. This will allow the assessment of the speed and extent of the changes, as well as the level of acceptance and perception of the reporting requirements by those preparing and those using the reports alike. This knowledge is especially important for lawmakers and regulating bodies, as it will allow them to property plan the process of legal-changes implementation. The example of Poland may be used to predict the behaviour of the other countries with similar experiences from the past related to the transition from the centrally-steered system and international isolation, and the subjecting of balance-sheet regulations to tax law and the legalistic concept of statehood. This study may be valuable for a group of developing countries which are about to make decisions on the direction of the financial-reporting harmonisation process, such as Nigeria, Turkey, Ukraine, India, Brazil, Argentina, Vietnam, and many others (an interesting study on the expected benefits and the impact of culture on the IFRS implementation process may be found in Lasmin, 2012; Terzungwe, 2012).

ABSTRACT

Purpose (mandatory): *The purpose of this paper is to show analytically that cash flow – based project analysis of private investors and cost-benefit analysis of the public sector conflict in many points in public-private partnership projects.*
Design/methodology/approach (mandatory): *The method of analysis is based on cash flow accounting and cost benefit analysis. A single-project company is used as a demonstrating case. The flows of cash (private investors) and flows of costs and benefits (public investors) are integrated in a single analytical framework.*
Findings (mandatory): *The findings show that the investors' (public vs. private) social, economic and financial targets are not necessarily coinciding. Prospecting of common ground and win-win situations becomes a crucial success factor for any public-private partnership project.*
Research limitations/implications (if applicable): *The current research on public-private partnerships is much focused on project delivery methods, contractual issues and discussion on the need of public-financed comparator. This paper will clarify the real problems faced.*
Practical implications (if applicable): *The paper will set some guidelines how to find the common ground for successful PPPs. It also points out potential conflict areas.*
Social implications (if applicable): *The paper in itself contains an element of socio-economic appraisal of projects that will increase the wealth and well-being of people.*
Originality/value (mandatory): *The originality of the paper lies on its generic approach to single-project valuation problem, combining the both sides of valuation aspects: private and public investors.*

Keywords: public-private partnerships, investment, project, cost-benefit, finance

INTRODUCTION, SCOPE AND OBJECTIVES

To overcome the problems of funding capital investments for example in transport, energy, and utilities sector, a number of solutions concerning capital provision, contractual arrangements, off-balance sheet financing (from the viewpoint of the state), among other means, have been introduced. For road transport projects, where the users are mostly individual drivers, tolling of road use is perhaps the most common manner of capital finance. Analogically, electricity customers pay the capital investments through their electricity bills. The capital investment recovery can be arranged in many other ways too: for example, through availability payments, shadow tolls, grants, exclusive monopoly positions, etc. Typical for these alternative arrangements, or arrangements that one way or the other supplement end users payments, is the public intervention in guaranteeing the revenues for the investors that provide the initial capital outlay to build the physical facility offering the service in question.

The approach of introducing private investors to finance, build and operate a major facility on behalf of the state, city, municipality or some other public entity is globally termed as public-private partnerships (PPP or 3P). The partnership is built on long-term contracts, concessions or leases to enable private investors to construct the facility and provide services to the public according to agreed – and in most cases very complex and extensive – contracts. The contractual side of PPPs is well covered in the management literature of infrastructure, transport, energy, finance, public economy, for instance, and good overviews are provided e.g. by European Investment Bank (Uppenberg *et al*., 2011), the World Bank (Estache *et al*. 2007 for transport; Marin, 2009, for water supply in developing countries, Cuttatree and Mandri-Perrott, 2011) and Organisation for Economic Co-operation and Development (OECD, 2008; Araújo and Sutherland, 2010).

Another feature that is quite common, though not exhaustive, for major PPPs is the project financing nature of investment and the whole life cycle of the effort. A project company is built up by the investors and the project company starts to prepare for the capital investment and finally for the operating phase of the investment. The reasons for setting up a separate project company are at least two-folded. First, the risks of the investment, of which the investors and the public side of the partnership could have an incomplete and uncertain picture, are isolated hence into a single-project entity and the investors are liable just to the extent of their invested capital to the project company. Secondly, for the public partners the single-project company represents a more transparent entity which is easier to monitor in terms of performance, service quality and finance than a larger and multi-business-segment entity, where the "project" represents just one among many.

The principle features of project financing are as follows (Brealey *et al.,* 1996, p. 25):

- The project is established as a separate company which operates under a long-term contract (a concession) obtained from the host government.
- A major proportion of the equity capital of the project company is provided by the project manager or sponsor, tying the provision of finance to the management of the project.
- The project company establishes comprehensive contractual relationships between the suppliers, customers and host government organizations.
- The project company is highly leveraged financially.

The project cash flows are divided by equity investors, debt investors, contractors and suppliers and users that receive the service. Equity investors are often the founders of the project company (i.e. contractors, developers, public authorities) and financial institutions that seek long-term investment opportunities, such as pension funds and insurance companies. Even individual persons can be equity investors if share issues are made public. Debt investors are usually banks, investment funds, and etc. that operate in the financial market routinely.

This paper forms a holistic and generic cash flow model on a single-project company and applies it in a framework where also the public benefits are included. Thus the model creates an analytical frame where each stakeholder's economic and financial positions can be pointed and studied. The model enables empirical data to be fed in in order to research real world examples and hence it provides a platform for further empirical analysis. The model has been already successfully applied to the first Finnish PPP road project, the E4 between Helsinki and Lahti (Leviäkangas, 2007).

This paper is furthermore a theoretical analysis more than an empirical one, but the model provided is relatively simple and allows first meta-analysis of large projects. However, the model is unable to capture contractual finesses which could have a radical impact on project outcomes from the viewpoint of stakeholders and project partners. (Leviäkangas *et al*., 2013) Methodologically, this paper falls in the cross-section of cost-benefit and cash flow analysis, bearing therefore an emphasis on investment theory, but both from the economic and corporate finance angles. This attempt to combine the public side's cost benefit analysis (CBA) and private side's financial analysis is the added value to the body of knowledge.

MOTIVATION FOR PPP: LITERATURE

The European Investment Bank approximated that on average about 3.9 percent of GDP was invested in infrastructure projects – including transport, health, education and utilities (electricity, gas, water supply) – in the European Union by old member states and about 5.1 percent by the new member states for 2006 – 2009 (Wagenvoort *et al*., 2010). These figures show how significant amounts are at stake.

Investors have been keen on infrastructure assets, but distinctive differences are within different classes of infrastructures (Inderst, 2010) as well as there are differences between investing in infrastructure funds and direct investing in specific projects (Bitsch *et al*., 2010). This paper deals with the latter alternative, i.e. direct investment in a single-project company.

PPPs have been endorsed owing much to their ability to clean governments' balance sheets. However, the new rules set in Europe by Eurostat in 2004 have taken partly away this advantage: any public sector commitments made towards PPP projects are now accounted as public obligation and recorded in national accounts accordingly, but yet depending on the level of risks borne by the private sector investors (Posner *et al*., 2009). The situation is not necessarily the same across the globe, though, and in some countries PPPs probably continue to work as an effective off-balance sheet financing tool for the national and/or local government.

PPPs are seen as a key to increase efficiency in service delivery, due to the hypothesis that private sector is more efficient in providing services for consumers or citizens than the public sector (see e.g. UNESCAP, 2011; Alfen *et al*., 2009), although truly empirical findings are scarcer – and some early experiences are controversial and the final truth seems to be highly contextual (Burger and Hawkesworth, 2011). Engel *et al*. (2010) argue that higher costs often encountered in PPP projects is not as such an argument in favour of public provision as these costs could imply deficient contract design rather than high costs *per se*.

SINGLE-PROJECT COMPANY – ANALYTICS OF CASH FLOWS AND BENEFIT GENERATION

The single-project company is shown in Figure 1. Its stakeholders include the aforementioned investors (debt and equity), the state, users, and suppliers and service providers. There are real cash flows between the project and its stakeholders and then there are less tangible benefits for the users, which do not necessarily account for cash flows but are nevertheless significant with regard to project's socio-economic appraisal. For example, transport projects' safety and travel comfort do not in all cases transfer to cash flows, but are still relevant criteria for the project to be accepted by the political machinery and general public.

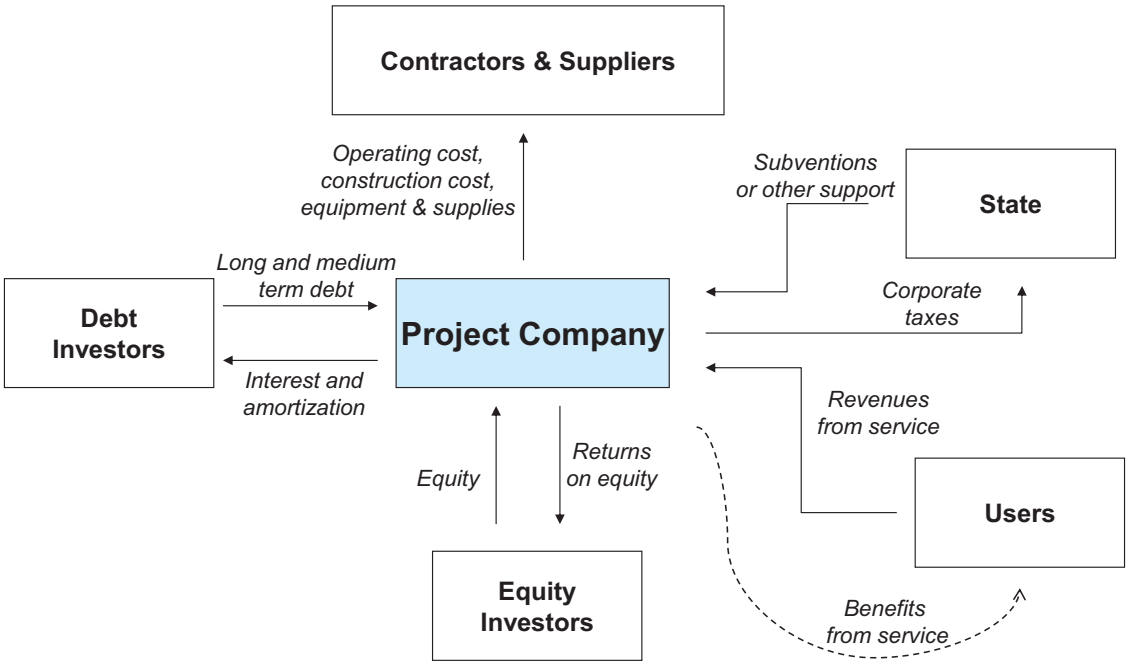

Figure 1. Single-project company (modified from Leviäkangas, 2007)

The above conceptual model can be translated into an analytical one. To start with, the following symbols are used:

Rev = revenues of the project company; the revenues are divided into revenues from users and revenues from the state: $Rev = Rev_U + Rev_S$

Ope = operating expenses of the project company; these are mainly all-year-round road maintenance and operating costs

ES = equipment and supplies costs needed for the build-up of the facility; running costs of materials etc. are included in operating costs *Ope*

Con = construction cost, i.e. the expenses of constructing the facility
C = total life-cycle monetary before-tax costs for the project company; $C = Con + ES + Ope$
Tax = corporate taxes paid by the project company
E = equity capital invested in the project company
D = debt capital raised by the project company
iD = interest on debt capital
A = amortisation of debt
Dep = depreciation of the project company's assets
T_c = corporate tax rate
Ben = benefits accrued to the users in socio-economic cost-benefit analysis (CBA)
Ext = external costs related to the project, included in CBA.

Only corporate tax is assumed, and any other taxes excluded, such as taxes of bondholders and equity holders. It is further assumed that the project company distributes immediately all the net cash flow earned to shareholders as dividends. This is a reasonable assumption since the whole idea of the project is to generate adequate and as-early-as-possible cash stream to investors. This at least partly removes the need for other tax considerations, as it is assumed that investors' net cash flows are treated according to other tax regimes, i.e. as personal income or corporate taxes of other owner entities. All cash and other monetary flows are shown in present value form, discounted by the rate that each actor prefers. Thus the same flow, e.g. outflow of the state and inflow of the project company are not of same present value to these stakeholders.

The free cash flow to investors (*FCF*) is the measure of wealth increase for them. This surplus is available for investors after their initial capital outlays (*E, D*). The free cash flow for shareholders which is after-tax net cash flow plus tax advantages from depreciation and interest payments

$$FCF = (1 - T_c)(Rev - Con - ES - Ope) + T_c Dep + T_c iD$$
$$= Rev - Con - ES - Ope - T_c(Rev - Con - ES - Ope - Dep - iD) = Rev - C - Tax$$

because taxes paid by project company must be

$$Tax = T_c(Rev - Con - ES - Ope - Dep - iD)$$

Since the calculus is done in present value terms it can be assumed that costs of construction, equipment and materials, *Con* and *ES,* equal *Dep* and should not be double-counted, we can simplify, because *Con, ES* and *Dep* occur in different accounting periods but must approximately at the end of the day equal to each other, and since operating expenses are as well tax deductible:

$$Tax = T_c(Rev - C - iD)$$

The total cash flows to single project company equity holders are defined as after-tax net revenues minus costs and expenses less the initial equity outlay, deducted further by debt service payments (amortization and interest)

$$TCF_E = (Rev - C - Tax - iD - A) - E$$

and the total cash flows to debt holders is the debt raised by the project company from the debtors plus the received debt service payments

$$TCF_D = (iD + A) - D$$

Summing these two form the total cash flows of the single-project company

$$TCF_E + TCF_D = Rev - C - Tax - (E + D) = FCF - (E + D)$$

which states that the incremental value produced by the single-project company to its owners is the free cash flow minus the initial capital outlays of equity and debt – as should be. The sum of owners' cash flows represent the project investors' investment's net present value followed when their invested capital is subtracted from present value of project company's cash flows.
The market value of the project company is the present value of free cash flows, i.e. the initial capital outlays plus the incremental value:

$$V_p = FCF = E + D + TCF_E + TCF_D$$

Depending on the leverage ratio of the project company the market value is different for the equity and debt. The market value of debt is the initial debt outlay plus the incremental available to debt holders

$$D_m = D + TCF_D = D + (iD + A) - D = iD + A$$

The market value of equity is the initial equity outlay plus the incremental available to equity holders

$$E_m = E + TCF_E = E + (Rev - C - Tax - iD - A) - E = FCF - iD - A = FCF - D_m$$

The market value of the single-project company may then be written as

$$V_p = E + D + TCF_E + TCF_D = (E_m - TCF_E) + (D_m - TCF_D) + (TCF_E + TCF_D) = E_m + D_m$$

STAKEHOLDERS' ECONOMIC AND FINANCIAL POSITIONING

1. Financial and economic flow matrix

Table 1 shows the flows of cash between stakeholders. The cash flow matrix indicates that it is fairly straightforward to calculate each stakeholder's net cash position, column by column. The non-cash items, i.e. the benefits and external costs generated by the project can usually be monetized according to standard cost-benefit analysis. The problem in many countries is that the standard does not exist, whereas for instance in the Nordic countries CBA is well standardized e.g. for transport infrastructure development projects. For many other marginal system improvements the situation is not necessarily so, even in Nordic countries. For example, the meteorological services are regarded highly beneficial for the society and users

of services, including both private citizens and organizations, but their benefits are studied seriously only recently (see e.g. Leviäkangas, 2009; Leviäkangas and Hautala, 2009). The benefits of any service provided by PPP projects, be they financial (cash) or otherwise monetized (non-cash), are highly dependent on not only their recognition but also on the valuation techniques applied (Leviäkangas, 2009).

Benefits that are usually non-cash but still paramount as socio-economic gains vary according to project type:

- transport infrastructure projects: typically accident cost savings, time cost savings
- water supply projects: health impacts
- energy projects: economy-wide external benefits.

Table 1. Cash flows, costs and benefits of PPP project (modified from Leviäkangas, 2007).

Equity investors	**Debt investors**	**Project company**	**Users**	**The state**	**Contractors & suppliers**	**Notes & explanations**
$-E$		$+E$				Equity investors invest E in the project company
	$-D$	$+D$				Debt investors invest D
		$-Con$			$+Con$	Project company constructs at expense C
		$+ Rev_U + Rev_S$	$- Rev_U$	$-Rev_S$		Project company receives revenues from the state
		$-Ope - ES$			$+Ope + ES$	Project company pays contractors for the operating (e.g. maintenance)
	$+iD$	$-iD$				Project company pays interest on debt
	$+A$	$-A$				Project company amortizes the debt
		$-Tax$		$+Tax = T_c(Rev - C - Dep - iD)$		Corporate taxes after expenses, depreciation* and interest
$+[(1 - T_c)(Rev - C) + T_cDep + T_ciD]$		$-[(1 - T_c)(Rev - C) + T_cDep + T_ciD]$				The surplus cash flow available for shareholders, paid by the project company**
			$+ Ben$ $- Ext$			The state accounts for benefits of users and third parties, i.e.

Equity investors	Debt investors	Project company	Users	The state	Contractors & suppliers	Notes & explanations
						the external benefits, as well as external costs

*Depreciation (*Dep*) equals the cost of depreciated assets (*C*); it is a matter of depreciation technique, existing accounting regulations and practices and, to certain extent, managerial choice how much of the incurred construction expenses are activated immediately in the income statement and how much are kept in the balance sheet as deferred expenses to be activated later as depreciation; at the end of the day, *C* must equal *Dep* and they must be accounted only once per accounting period.

** The available surplus for investors after interest and taxes = $(1 - T_c)(Rev - Con - ES - Ope - Dep - iD) = Rev - C - Ope - Tax$ = Free cash flow (*FCF*).

What is furthermore typical for these types of PPP projects is that some of them involve the direct collection of revenues based from the users of the service and possibly also from the public client - here it is referred to as "the state" but it could be any public agent working on behalf of the community and/or society. It is an inescapable fact that without these revenues any PPP is impossible to implement and the business case for private investment is missing.

The rules to satisfy different stakeholders' economic rationale are as follows. The shareholders of the project company must receive enough cash flow in order to cover their initial equity capital investment plus the interest they have placed on their equity:

$$(1 - T_c)(Rev - C) + T_cDep + T_ciD - E > 1 \Leftrightarrow (1 - T_c)(Rev - C) + T_cDep + T_ciD > E \Leftrightarrow FCF > E$$

stating simply that after-tax net cash in present value terms (discounted by required return on equity) after all costs in the project, and after interest and depreciation tax benefits (because these are tax deductible) must be greater than the initial equity placement.

In fixed period concessions, the project company is left in the end with empty pockets and liquidated after it has fulfilled its task of delivering the service. When the project company is expected to continue its existence over an indefinite period of time, the shareholders must consider the liquidity position of the company and other long-term obligations, such as pensions and re-investments.

For debt investors the rule is equally simple: the debt allowed to the project company must be paid back in full with required interest. Hence the interest and amortization cash flow in present value terms, discounted with required return of the debt holders, must exceed initial debt outlay:

$$iD + A - D > 0 \Leftrightarrow iD + A > D$$

For suppliers and subcontractors the case of project's profitability is of secondary importance as long as their contracts with the project company are economically worthwhile.

2. Cost-benefit rule

And it is now when the picture becomes more blurred: the net benefits that are received by the users and society (or community) as a whole must exceed the payments made to the project company, i.e.

$$Ben - Ext > Rev_U + Rev_S - Tax$$

which is in fact the comparison of benefits and costs of the project, and the aggregate benefit cost ratio is then simply

$$(Ben + Tax) / (Rev_U + Rev_S + Ext)$$

If we assume that the project is equally beneficial as PPP or as traditional public financed project (i.e. benefits remain constant), the comparison between PPP and traditional procurement (from the viewpoint of the state) must be done between revenues paid by the state and users and costs of the project. Would the costs be greater with traditional model than the revenues paid to the project company? Again, the comparison itself is rather straightforward and it brings forth the potential efficiency of the private sector, which on the other side is offset by the higher returns of the private investors.

Since many of the benefits received by the users or by the public can be non-cash, and sometimes very difficult to monetize, there is always room for speculation about the socio-economic profitability of the project. The more there are non-financial benefits to be considered, the more complex, blurry and debatable the picture gets. There is also the question of direct user financing and state (public) support and how these are divided between users and the state. For example, in shadow toll roads, where the state covers the "tolls" directly from its budget on behalf of road users, there is a justified argument that the rest of the tax payers are paying the road on ultimate beneficiaries' behalf. The same argument applies to state subsidies, be they in the form of grants or tax reliefs – the large crowd of tax payers is supporting a project that benefits perhaps only a local community, some restricted area of the country or a specific user group. A perhaps unlikely, but not totally unknown scenario of PPPs is encountered when the state decides on purely user financed projects just to be able to collect more tax revenues.

From users' point of view, there is a crucial difference how large the public intervention is, since it reduces their own payments for the service. The more direct are the user benefits, the more willingness to pay there is from the side of users. So, on one hand, for example, the private health care services have always been well-off even in countries where public health care is of wide coverage. The basic human need dictates a good business case for such services. On the other hand, it is difficult to picture an entirely privatized health sector that would not lead to severe social problems.

When user benefits are not that directly related to individuals' consumption power or well-being, the willingness to pay is reduced: the willingness to pay for safer travel is probably not significantly higher than willingness to pay for the mobility service in general. These social benefits sometimes represent a significant sum of the benefits of projects. For example, the

Finnish road projects' benefits are dominated by time savings and accident cost savings. The latter item represents on average more than one third of the total benefits of average road investments (Tervonen *et al*., 2010).

3. Uncertainty and risk

When decision making concerning investments is risk-neutral, the expected values of discounted cash flows and benefits may be used. The problem usually arises when in practice the public sector does not adjust their analysis (CBA) for risk whereas private sector does it with great piety. One place where this makes the difference is the discounting rate different parties use. The risk-adjusted rates of returns for private investors are by and large higher than those set by public investors. (However, this difference has been narrowing to almost non-existing in Europe, where some governments' credit ratings have been in fact riskier than private companies').

Private investors are not risk-neutral but risk-averse - no investor wants to take any more risks than necessary. This in turn means that the expected positive cash flows will have less present value than in risk-neutral case, and their value relative to investment outlay that occurs in the front end of the project will decrease.

DISCUSSION

A good project is a good project. Using different financing mechanisms does not change the nature of the project itself. It is a recognised fact that many countries have used PPPs to leverage their infrastructure and expanding it beyond true needs and hence including projects in their investment programs that would not have been financed via conventional routes, e.g. through state budget. In these cases these investments have led to excessive infrastructure with poor returns in the end. For instance, a significant share of Portugal's main road investments were carried out as shadow toll PPPs, which resulted in a severe financial distress of the state (Cruz and Marques, 2011). Later, many of these projects were changed into conventional toll roads, where users pay for real. In addition, PPPs have been used as an emergency exit from unsustainable public budget deficit leading to overinvestment or long-term commitments to pay off the private investments that put the state in even tighter position after state's payments for the service are due.

Another example comes from Finland. The first PPP project in the country was an upgrading of semi-motorway E4 between Helsinki and Lahti to a full motorway, meaning in essence the building of the second carriageway next to existing motorway and constructing new bridges and levelled intersections. Again, the shadow tolling was used as a financing method so that the state paid "tolls" for each vehicle kilometre travelled on the road. The project was analysed in detail to the extent that public documents allowed and it was reported that the state paid more for the road in the long run than it would cost using traditional public project procurement. (Leviäkangas, 2007) On the other hand, the project was built well ahead of planned schedule and has served the road using public in an impeccable manner.

The above arguments lead to the conclusion that direct user financing is most likely to be a more sustainable financing mechanism than such where the state or some other public intervention is stronger. Projects that often offer the possibility of direct user finance are such

where the service is tangible and there is a tradition of paying for it. Electricity, heating, public transport, water, etc. are the kind of services where users already are accustomed to pay, and hence these types of projects are easier to justify and there needs to be less government intervention. Some of these projects can rely on business customers: airports are in the end paid by airlines and ports by shipping lines, because visiting the service (i.e. infrastructure) is not free of charge. Thus there is a strong link between customers' willingness (and note, *tradition*) to pay and provide real cash in return of the service. This conclusion was also reached in Leviäkangas *et al*., (2011) when investigating the returns of Finland's infrastructures (roads, rails, ports, airports, water, energy). Especially basic need satisfying services, such as water and energy, proved to be very profitable.

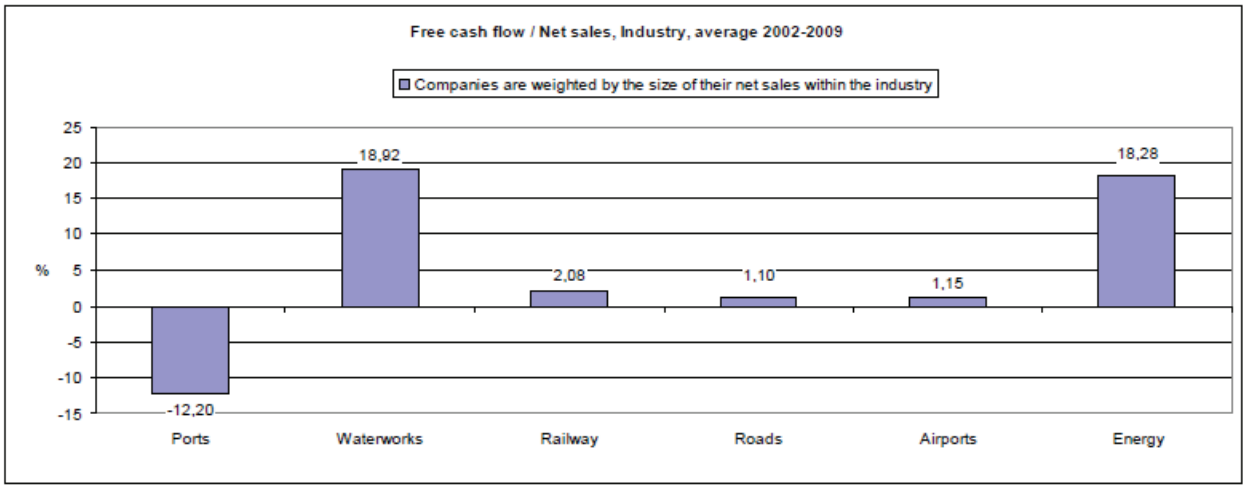

Figure 2. Free cash flows provided by infrastructures to their owners; the sample includes both public and private infrastructures (source Nokkala et al., 2011).

Since it is the after-tax net cash flow that dictates the project's financial viability to its owners, and since these revenues must come from the users or the state or both, it is the revenues and generated benefits that dictate almost the whole framework of PPPs, whether they are economically and financially sustainable in the eyes of investors and greater public. Benefits must exceed the revenues (as in our equation earlier) and revenues must exceed all costs and capital repayments. The more there are non-cash benefits, e.g. socio-economic returns, the more likely is the state or some other public financing called for, whereas when users receive tangible benefits directly, like water and electricity, the less likely is the need for public intervention.

Benefits such as safety or reliability belong to the category for which the real market-based willingness-to-pay is highly uncertain. Quite often research is carried out to point out the willingness-to-pay but these are typically stated preferences and not truly market tested. Willingness-to-pay is ultimately always tested by the market and if it remains untested, relying on it may be over-optimistic.

In sum, the analytical model points to the direction of prior studies. Private investors must rely on real cash flows and this may be ensured best by putting the service provision under market test and building on direct payments from the users. From the private investor point of view, the difference between state-paid and user-paid revenues is insignificant and if there is

a difference, it is likely to be in favour of the state. A state is, in most cases, less volatile customer than the consumers – provided of course that the government and political context can be regarded as stable. This is also something for the state and governments of recognize: involving themselves in the revenue logic of PPP projects they should be aware that they lower the risks of investment perhaps considerably. And this of course should be reflected to the returns paid to the investors.

For private finance policy the aforementioned reasoning seems to imply that only truly good projects with real, tangible service provision, should be considered to be implemented as PPPs. Poor projects that do not survive administrations' internal competition are not the best projects for PPPs, but vice versa. Also projects that must rely on market demand are probably the most suitable PPPs. Since PPPs have been applied to hospitals and schools in addition to traditional infrastructure projects, we should carefully distinguish who ends up paying for the project. A hospital may be a good thing, but unless it is completely private from the very start, the full amount of required revenues cannot essentially come from "customers", i.e. the patients, and the public sector must step forward to cover the investment amortization and running costs using tax payers' money.

Finally, we should perhaps detach ourselves from infrastructure –related thinking because infrastructures are highly capital intensive projects where revenues must be substantial in order to cover all costs and returns. Service sector is something where PPPs have been applied much less and where there could be in fact an even greater potential. Services are usually less capital intensive and moreover, usually more interfaced with direct customers.

Quite a bit has been discussed about public sector comparators. These are project models that are used in conjunction with PPP projects in order to be able to compare which financing alternative would be better from the public sector's viewpoint. This framework that was prepared for this paper shows that the comparator is perhaps not that necessary, or that at least it is not as difficult to construct as sometimes feared. Yes, there can and must be consideration whether the project is PPP or conventional, but in the end only the benefits against costs matters. If public sector can provide the same project effortlessly through its budget and in particular if the project generates a great deal of socio-economic benefits, there are few arguments for PPP. And on the other hand, if the project is relying on market demand and real cash flows, where is the case for public investment or intervention?

INFLUENCE OF PROJECT MANAGEMENT MATURITY ON PROJECTS' COSTS

Dr. Seweryn Spalek, Silesian University of Technology, Poland
spalek@polsl.pl

ABSTRACT

Purpose: *The purpose of this paper is to demonstrate the link between reaching a certain level of Project Management Maturity by the company and its projects cost performance.*
Design/methodology/approach: *The world-wide study was conducted in order to measure the influence of the Project Management Maturity level on the cost of projects. The survey was questionnaire based. As a result 194 cases were analyzed.*
Findings: *We found that an increasing level of maturity in Project Management can have an influence on the reduction of costs of projects managed by the company. However, the strength of this influence depends on various factors which are discussed in the paper.*
Research limitations/implications: *Research limitations are mostly connected with a limited range of industries available. Thus, limited representation led to a restricted cross-comparative study.*
Practical implications: *Companies assess their maturity levels in Project Management. The findings of this paper demonstrate to them the potential benefits they can gain by increasing their maturity level.*
Originality/value: *There is a limited number of world-wide studies on Project Management Maturity in companies. Moreover, the studies examining the influence of a certain maturity level on projects' key performance indicators are limited to single case studies. Therefore, the paper fills an important gap of knowledge in that area.*

Keywords: Project Management, Maturity, PMM, Costs, Influence, Company.
Classification: Research paper

INTRODUCTION

Projects are run by an increasing number of companies. Moreover, the number of projects run by companies has increased as well. Such a situation creates many multi-project environments, thus (Spalek, 2012) the management of them is a complex issue. Therefore, companies try to estimate how good they are at managing their projects (Liang, Liu, Lin, & Lin, 2007) (Tarn, Yen, & Beaumont, 2002). They perform maturity assessments in the field of Project Management (Becker, Knackstedt, & Poppelbuss, 2009; Grant & Pennypacker, 2006; Tervonen, Alapiha, & Haapasalo, 2009). The results of such assessments lead them to potential room for improvement and, as a result, gain a higher level of maturity. However, the question arises whether the improvement in maturity reflects in an improvement in a project's outcomes? If so, to what extent? In this article, we try to answer that question and fill in the gap of knowledge in that particular area.

THE ISSUE OF THE INFLUENCE OF ORGANIZATIONAL MATURITY ON PROJECTS' OUTCOMES

There are a number of models that could be used to assess maturity in Project Management in a company. Hillson (2003) argues that the number of practically implemented models could be over forty. Among them we can distinguish (Khoshgoftar & Osman, 2009) OPM3, CMMI (Twaites, Collofello, & Zenzen, 2004) (Twaites, Collofello, & Zenzen, 2004) (Twaites, Collofello, & Zenzen, 2004) (Twaites, Collofello, & Zenzen, 2004), P3M3 (Manzil & Javed, 2007), PRINCE (Zhang, He, & Zhang, 2012), BPMM (J. Y. Lee, Lee, & Kang, 2007), and Kerzner's Project Management Maturity Model. However, there is a very limited body of research conducted in the area as to whether the improvement in maturity reflects in an improvement in companies' operations (Liu, Chen, Chan, & Lie, 2008; Wang, 2008). Furthermore, the impact on the project's outcomes is investigated in single case studies in the chosen aspects of managing projects (Belt, Oiva-Kess, Harkonen, Mottonen, & Kess, 2009; Jiang, Klein, & Pick, 2003; Lee, Lin, & Pai, 2005). There is a significant gap in research on the correlation between Project Management maturity and projects' outcomes. The reason for this situation could be that (1) it is hard to determine the impact as the issue is multidimensional and (2) the commonly used Project Management Maturity models are adequate for the assessment of maturity in a case-studies approach, while in comparative studies they are hard to apply.

Therefore, in this article we try to advance the current state of knowledge by investigating the influence of Project Management Maturity on projects' costs.

RESEARCH DESIGN

This research was part of a wider international study sponsored by the *National Science Center*, whose purpose was to investigate Project Management Maturity in the chosen companies and its implications. In order to perform the comparative study among the companies, we built a maturity model which was used in the assessments (from level 1-the lowest, to 5-the highest) in a number of companies, mainly from the machinery industry. The study was questionnaire-based and was performed both online and also by using a traditional approach. The research instrument was validated by experts in the field. As a result, 447 samples were gathered, representing companies from a variety of countries. Among those companies, the ones reporting a maturity level of at least 2 were chosen. Their experts responded to the questions regarding the potential impact of maturity in Project Management on projects' outcomes. In this article, we will focus on the issue of cost only. The number of validated and analyzed data samples for that purpose is 194. Cronbach's Alpha tests confirmed the reliability of data reporting values over 0.97.

The respondents were to choose the impact of change in the maturity level on forthcoming projects in terms of cost. They ought to consider the change in maturity in the following areas: (1) Human Resources, (2) Methods, (3) Environment and (4) Knowledge Management. Furthermore, they were supposed to estimate the potential impact of the change in maturity in each area by one level up on forthcoming projects. The level of impact was described as follows; 1: No influence, 2: 1-10%, 3: 11-20%, 4: 21-30%, 5: over 30% on projects' costs reduction. The change in maturity was considered to be one of the following types: from 1 to 2 (1-2), from 2 to 3 (2-3), from 3 to 4 (3-4) and from 4 to 5 (4-5). The scale of maturity

levels was formed based on the framework proposed in the wider context of overall studies and is described as follows: LEVEL 1 - *Initial*, LEVEL 2 - *Standardized*, LEVEL 3 - *Appliance*, LEVEL 4 - *System Management*, LEVEL 5 - *Self-improvement* . The scheme of measuring impact is shown in figure 1.

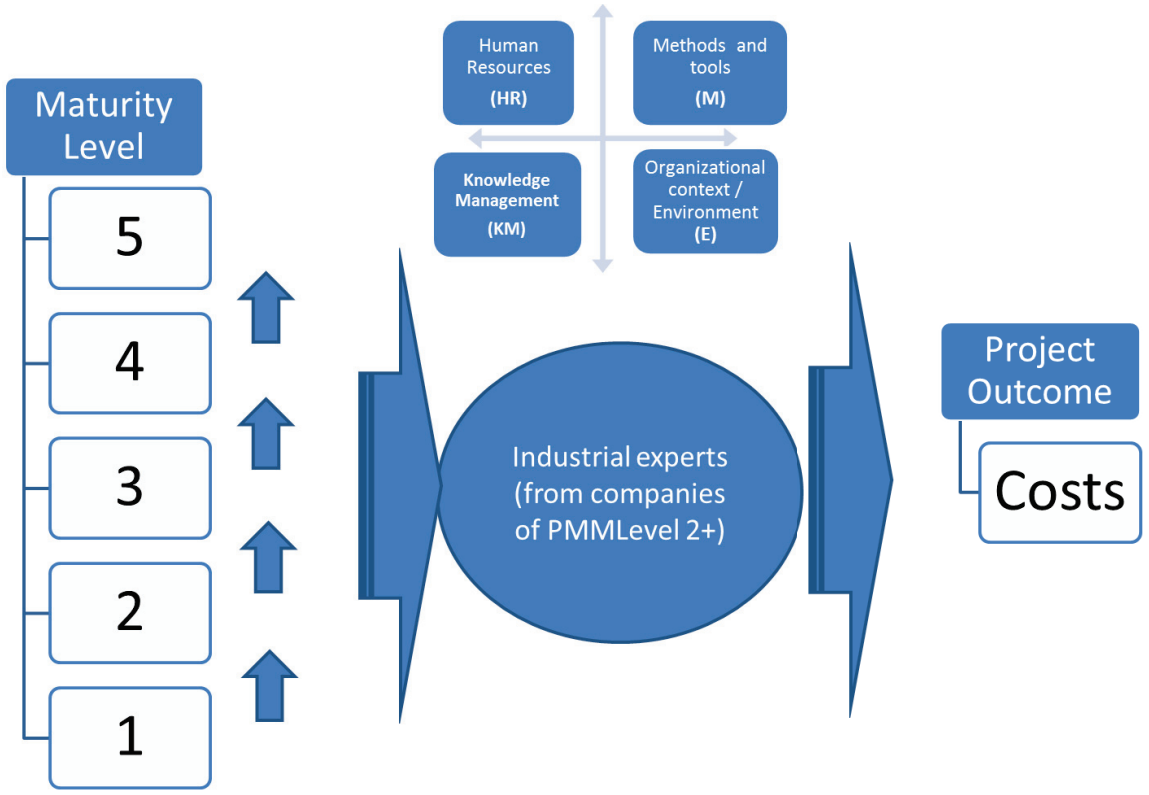

Figure 1. The scheme of measuring the impact of change in maturity on the project costs

RESULTS AND DISCUSSION

The companies chosen to be investigated in the paper were from a broad range of countries (N=19). Among them, most companies (80,2%) were located in: Germany, Denmark, USA, Sweden, Switzerland, Italy and Finland. Some companies came from: Austria, France, UK, India, Iran, Japan, Australia, Morocco, Russia, Slovenia, Slovakia and Lithuania. They represented three types of industries: Machinery Industry (IND), Information Technology (IT) and Construction (CONS). Moreover, in our work, we focused on each of those groups separately according to the impact of Project Management maturity on the projects' costs. Furthermore, we conducted cross-industrial studies in each of the investigated maturity areas: (1) Human Resources, (2) Methods, (3) Environment and (4) Knowledge Management.

The construction branch (CONS) reported some influence of changing the maturity level up on the projects' outcome. However, the level of influence depended on the change type (1-2, 2-3, 3-4, 4-5). The highest average impact (3.6) was noticed in the changes in maturity of types 1-2 and 2-3 in the area of Human Resources (HR). It then decreased to 2.85 and 2.10 for types 3-4 and 4-5 respectively.

In the area of Methods (M), the impact reported the same level of 3.6 for change types of 1-2 and 3-4. It then also decreased to level 2.85 and 2.10 for types 3-4 and 4-5 accordingly.
In the Environment (E) and Knowledge Management (KM) areas, the results were the same and, for types 1-2 and 2-3, the impact on projects' costs was 2.85 and further declined to 2.10 (3-4), finally settling at level 1.5 (4-5).

The machinery industry branch (IND) reported slightly lower influences. However, a downward trend was also observed in all areas of maturity (HR, M, E and KM).

The average impact of 3.46 was noticed for maturity change type 1-2 and 2-3 in the Human Resources area (HR). An impact level of 2.74 and 2.02 was reported for change type of 3-4 and 4-5 respectively. In the methods area (M), the results were the same as for the Human Resources area.

Furthermore, in the areas of Environment (E) and Knowledge Management (KM), reported influences were at the same level. Furthermore, they showed an average value of 2.74 for 1-2 and 2-3 types of changes and, for 3-4 and 4-5, it decreased respectively from 2.02 to 1.46.

The Information Technology (IT) branch reported a different structure of influences than in the above-stated Machinery Industry (IND) and Construction (CONS). As opposed to IND and CONS, there were no significant differences in impacts between the four areas in IT. However, the impact level also reported a downward trend over the types of maturity changes. For the change types of 1-2 and 2-3, the average impact was 3.62 in Human Resources and (HR) and Methods (M), while, in Environment (E) and Knowledge Management (KM), it was 3.59. For 3-4 and 4-5, the impact decreased to 2.87 and 2.13 in the Human Resources and (HR) and Methods (M) areas while, in Environment (E) and Knowledge Management (KM), it declined to 2.85 and 2.13 respectively.

The cumulative data chart of the average influences of the changes resulting from one level up in maturity, in specific areas, on project costs is shown in table 1.

Table 1. The average influences of the change in maturity on project costs; (HR) Human Resources, (M) Methods, (E) Environment, (KM) Knowledge Management.

Group Statistics						
BRANCH	**Maturity change**	**N**	**HR**	**M**	**E**	**KM**
CONS	1-2	48	3.6	3.6	2.85	2.85
	2-3	48	3.6	3.6	2.85	2.85
	3-4	48	2.85	2.85	2.1	2.1
	4-5	48	2.1	2.1	1.5	1.5
			HR	M	E	KM
IND	1-2	107	3.46	3.46	2.74	2.74
	2-3	107	3.46	3.46	2.74	2.74
	3-4	107	2.74	2.74	2.02	2.02
	4-5	107	2.02	2.02	1.46	1.46
			HR	M	E	KM
IT	1-2	39	3.62	3.62	3.59	3.59
	2-3	39	3.62	3.62	3.59	3.59
	3-4	39	2.87	2.87	2.85	2.85
	4-5	39	2.13	2.13	2.13	2.13

The main purpose of this article was to investigate potential influences of Project Management Maturity change on the projects' costs. We pointed out some dependencies in relation to: (1) branch, (2) area of maturity and (3) type of maturity change. That was, we believe, the first step toward the more advanced data analysis, including factor analysis, in order to determine the correlations between the specific factors and recognize their groups.

CONCLUSIONS

The issues discussed in this paper were to answer the research question whether an improvement in maturity reflects in an improvement in projects' outcomes. The presented results of the research showed that an influence on costs (one of the project outcomes) exists. However, we recognized that the influence varies: (1) among the industries, (2) in specific maturity areas and (3) in relation to the type of maturity change.

We discovered some similarities between the Construction and Machinery industries. Their results were alike regarding (1) level of influence in specific maturity areas (Human Resources, Methods, Environment and Knowledge Management) and (2) level of influence caused by different types of change of maturity (from level 1 to level 2 (1-2), from level 2 to level 3 (2-3), from level 3 to level 4 (3-4) and from level 4 to level 5 (4-5)). Both branches reported similar influence levels in the Human Resources & Methods areas and Environment & Knowledge Management areas.

While the Information Technology industry reported only the influence caused by different types of change of maturity. There were no significant differences in the influence in specific maturity areas.

It is remarkable that all branches reported a drop in influence with the type of change in maturity. The biggest influence was always reported for the maturity change 1-2 and 2-3 and then it decreased through 3-4 to 4-5, irrespective of the specific maturity area. This observation leads to the conclusion that the efforts in increasing maturity levels from *initial* to s*tandardized*, and from s*tandardized* to *appliance,* is of the highest potential average impact on the projects' costs reduction (up to 30%). Further efforts to improve maturity from *appliance* to s*ystem management* and from s*ystem management* to *self-improvement* result in a lower average potential impact on costs reduction (up to 20%).

ABSTRACT

Business model – nowadays, in other sectors a widely used managerial practice for designing, comparing, and analysing the value creation logic of an organization – is a less discussed and researched concept in the field of construction. Current business model literature sees the concept as an essential part of successful business as its main purpose is to separate a company from the others and to give it an advantage in regard to its competitors. A business model defines the way company operates, how it creates value for its customers and how it captures value from its operations to make profit. Thus it forces managers to think about their business and how it functions as a whole. Recent developments in this field of research have also led to visualizing business models, resulting a better understanding of different business logics and a position where business models are used as an effective management tool to communicate and execute strategy.

The aim of this research is to explore the way how construction managers understand and use business models. Research is based on ten semi-structured interviews conducted in Northern Finland between February and March 2013. Respondents have a vast amount of experience from the construction business and act in chief executive or regional manager positions in their companies which size varied from small to large. In addition, company websites and other publicly available materials are used in formulating an understanding about the logics according to which these construction companies operate.

According to the results, construction managers understand business models very differently than what is accustomed in other sectors or within the academia. The main difference is that they relate these models to different project delivery and contract types such as housing development, design-build, and design-bid-build. The outcome of business model analysis is thus more a certain figure describing a desired level for return on investment rather than an analysis of what the actual customer needs are and how value could be created for the

customers. Another finding is that the most of the prevailing business models in construction have no significant differences which results in a fierce price competition where companies provide exactly the same value through mostly uniform activities and structures.
The results have several implications for both theory and practice. First of all, research in the field of construction business models is under developed and the current theory is unable to guide and inspire the construction managers, who operate mainly in local old-fashioned business where market volatility is remarkable, to challenge their prevailing business models Another theoretical implication is the concept's connection with different project delivery and contract types. Practical implications are provided by elaborating the theoretical viewpoint of business models and presenting examples of how different business logics can prove valuable also in construction. The research is valuable both for researchers, who should find new avenues for future research from the study, and for practitioners, who want to challenge the traditional business models in construction.

ABSTRACT

Introduction: *Changeability of environment causes that companies are more often vulnerable to functioning in a crisis. Managers around the world identify liquidity management as the primary driver of their decisions. In the turbulent environment in times of financial crisis, liquidity becomes more difficult but also more important. Especially since the crisis leads to erosion of liquidity and even insolvency. Many researches examine the phenomenon of the lack of liquidity taking into consideration different perspective. Therefore, it is important to study the phenomenon of insolvency, determinants that shape it as well as seek opportunities to reduce the risk of this problem.*

Research methodology: *The aim of the study was to identify the determinants that affect the risk of insolvency of companies in Poland, Czech Republic and Slovakia in the conditions of instability of the economies in these countries. Panel data analysis was carried out – panels balanced in 2006-2010. The study involved 256 companies from Poland, 388 from Czech Republic and 187 from Slovakia. In the first stage of the research panel model was developed for Poland using fixed-effects panel analysis. Fixed-effects panel analysis in the following form was used:*

$$y_{it} = x_{it}\beta + u_i + \varepsilon_{it}$$

where u_i *- individual effect,*

ε_{it} *- pure random error.*

In the fixed-effects panel model fixed individual effects are eliminated by averaging the model against time (t_{index}*). Explanatory variable was shareholders funds, among the variables under consideration were 15 variables (metrics and financial ratios), which underwent initial substantive and statistical verification. The starting point of the analysis were shareholders funds, because under conditions of financial instability, there are shareholders funds that protect businesses against the risk of insolvency. In the second stage of the study variables specific for Polish companies were analyzed and compared with data from Czech and Slovak companies, using non-parametric Kolmogorov-Smirnov tests. An interesting research problem is the fact whether the companies in Central Europe show similarities in the variables that determine the level of shareholders funds and if the same actions (or*

similar) preventing the threat of insolvency can be recommended to companies from different countries.

The results of literature research: *The identified factors can be divided into two groups: variables having nature of assets/equity and cost related variables. The results of the model allowed to confirm statements known from finance literature that an important factor in supporting the operation of enterprises in a long time are loans and they do not necessarily have to be criticized (especially in terms of the costs associated with the use of this source of capital). Long-term loans may in fact be the one factor that not only allows the company to continue, but also allows the development to a greater extent than it would be possible only on the basis of equity. The variable that assists in this process are tangible fixed assets, which also positively influence the level of shareholders funds and therefore protect Polish companies against the threat of becoming insolvent.*

Variables negatively affecting levels of shareholders funds in Polish enterprises in 2006-2010 were material costs and depreciation. From the point of view of the stability of the financial situation of enterprises and opportunities to reduce the risk of insolvency these two variables should be particularly closely monitored by management. It has its source among others in overinvesting in some of Polish companies and limited possibilities of full capacity utilization during stagnation of the economy.

The model was subject to substantive and formal verification and it was found it was valid. In the second stage of the research a comparative analysis of businesses in Poland Czech Republic and Slovakia will be carried out, conclusions will be drawn regarding the companies analyzed in these three countries, as well as the findings of the research will be formulated. The paper will also include recommendations for entrepreneurs in Poland, Czech Republic and Slovakia.

INTRODUCTION

Changeability of environment causes that companies are more often vulnerable to functioning in a crisis. Managers around the world identify liquidity management as the primary driver of their decisions. In the turbulent environment in times of financial crisis, liquidity management becomes more difficult but also more important. Especially since the crisis leads to erosion of liquidity and even insolvency. Many researches examine the phenomenon of the lack of liquidity taking into consideration different perspective. Therefore, it is important to study the phenomenon of insolvency, determinants that shape it as well as seek opportunities to reduce the risk of this problem.

Since 2007, in economic literature on finance, significant attention has been paid to the changes and effects of the macroeconomic environment on business failure and company insolvency. Indeed, in times of crisis, the number of unsuccessful companies is higher, than in times of economic prosperity.

The crisis from 2007-2008 affected mostly micro small and medium companies, which faced financial spiral downturn that often drove them to bankruptcy. Due to the fact, that current crisis increased number of bankruptcies and insolvencies[1], financial management is gaining importance in the context of preventing or diminishing its impact. Therefore, the study of determinants influencing this phenomenon is valuable. The more extensive analysis and knowledge of the determinants shaping insolvency, the more likely possibility of eliminating it, which also matters for the health of whole economy.

RESEARCH METHODOLOGY

The aim of the study was to identify the determinants that affect the risk of insolvency of companies in Poland, Czech Republic and Slovakia in the conditions of instability of the economies in these countries. Panel data analysis was carried out – panels balanced in 2006-2010. The study involved 256 (panel 1287) companies from Poland, 388 (panel 1940) from Czech Republic and 187 (panel 935) from Slovakia. In the first stage of the research panel model was developed for Poland using fixed-effects panel analysis. Fixed-effects panel analysis in the following form was used:

$$y_{it} = x_{it}\beta + u_i + \varepsilon_{it}$$

where y_{it} – endogenous variable,

x_{it} – exogenous variable (generally a vector of exogenous variables),

u_i – individual effect,

ε_{it} – pure random error (Kufel 2007).

In the fixed-effects panel model fixed individual effects are eliminated by averaging the model against time (t index). Explanatory variable was shareholders funds, among the variables under consideration were variables: metrics and financial ratios, which underwent initial substantive and statistical verification. In addition, variability in the data over time (dt_2-dt_5) has been also included. The starting point of the analysis were shareholders funds, because under conditions of financial instability, there are shareholders funds that protect businesses against the risk of insolvency. In the second stage of the study variables specific for Polish companies were analyzed and compared with data from Czech Republic and Slovak companies, using Kruskal-Wallis tests. An interesting research problem is the fact whether the companies in Central Europe show similarities in the variables that determine the level of shareholders funds and if the same actions (or similar) preventing the threat of insolvency can be recommended to companies from different countries.

Determinants of insolvency – literature review

Generally, solvency means ability to pay current debt. The ability to pay debt is conditioned by assets and capital structure. Leverage is defined as the sensitivity of the value of equity ownership with respect to changes in the underlying value of the firm. Leverage ratios are frequently independent variables. Leverage ratios are also the dependent variable in the empirical capital structure literature. This literature tries to explain variations in corporate

[1] Interesting results and the extent of phenomenon presents: BUSINESS DYNAMICS:START-UPS, BUSINESS TRANSFERS AND BANKRUPTCY 2011 published by European Commission.

leverage, both in the cross section of capital structure (i.e. why some companies have high leverage) and in the time series (how capital structures evolve). In the theory of capital structure, one common hypothesis derives directly from the equity-sensitivity channel: a company with more leverage has both higher powered incentives and (usually) a higher probability of financial distress (Welch 2011).

It should be taken into consideration, that, according to the tradeoff theory, the capital structure literature finds a negative relationship between profitability and leverage. Branch (2000) and Campbell and Frost (2007) argue that when a company is in financial distress, managers have a fiduciary duty to protect the rights of creditors as well as duties to shareholders. Therefore, in a financially distressed company, we assume that the payoff for the manager depends on both the value of equity and debt.

Also it is important to take into account the impact of financial flexibility on capital structure. The literature presents a vast array of research on insolvency, thus pointing to a number of different, sometimes conflicting factors that determine it.

According to assets liquidity in terms of distress companies, interesting findings are presented by Shleifer and Vishny (1992). They argue that when companies have trouble meeting debt payments and sell assets, the highest valuation potential buyers of these assets are likely to be other firms in the same industry. But with the possibility of a contagion effect, these firms themselves are likely to have trouble meeting their debt payments. Bhagat et al. (2005) considered decision of distress companies related to cash flow and financial results. They found negative investment-cash flow sensitivity for distressed firms with operating losses and a positive sensitivity for all other firms. At the same time, they document that the negative cash flow sensitivity is generated by distressed firms with operating losses that invest more than the previous years (in : Flagg, Kudrimoti, Margetis 2011). It means, that due to the trend toward declining cash flow, these companies make decisions to increase their investments (Flagg, Kudrimoti, Margetis 2011).

Researches carried by Altman (1984), Alderson and Betker (1995), Andrade and Kaplan (1998), Molina (2005), point out, that management of trade receivables, given its importance for firms' assets, has the potential to play important role when firms encounter financial problems (especially according to estimation of the costs of financial distress, in some cases explicitly recognizing the importance of the relations with clients for capital structure decisions and for the costs of financial distress (Titman 1984, Opler, Titman 1994). (Molina, Preve 2009).

Preve and Molina (Molina, Preve 2009) undertook the study to clarify the trade receivable policy, depending on the stage of financial distress proved. They document that, firms in financial distress tend to increase the use of trade receivables when they start facing profitability problems, usually in a prefinancial distress situation and provide fewer trade receivables to their clients when they face cash flow problems and enter full financial distress. According to financial condition of companies in financial distress, they investigated the effect of decrease in trade receivables. The results were consistent with those presented in the literature, but they add to this body of knowledge by demonstrating that the drop is significantly larger when there is a reduction in trade receivables (Molina, Preve 2009).

Long-term solvency is concerned with two important elements: capital structure and earning power. “Capital structure refers to the sources of financing for a company. Financing can range from relatively permanent equity capital to more risky or temporary short-term financing resources” (Wild et al. 2007 in Bardia 2012).

The issue of equity returns in terms of financial distress, as well as default probability is presented by Avramov et al. (2007). They indicate that profits of momentum strategies that buy “winners” and sell “losers” are remarkably concentrated among a small subset of firms with low credit ratings, which adds a new dimension to the complex relationship between financial distress and cross-sectional properties of equity returns. Thus, the hump-shaped relationship between expected returns and default probability is capable of simultaneously explaining two known empirical regularities: the inverse relationship between expected returns and default probability (Dichev (1998), Campbell et al. (2008), Garlappi et al. (2008), and George and Hwang (2010)), and the concentration of momentum profits in low credit quality stocks (Avramov et al. (2007)) (Chou at al 2010).

Adopting the general determinants influencing the threat of insolvency can be replaced (Damodaran 2009 and others):
1. **Stagnant or declining revenues**: one of the first sign of a company in decline is inability to increase revenues over extended periods, even if a company operates in normal economical circumstances . Flat revenues or revenues that grow at less than the inflation rate indicate operating weakness.
2. **Shrinking or negative margins**: together with stagnant revenues at declining firms shrinking operating margins can be also observed, which is partly due deteriorating pricing power and partly because they decrease prices to preserve revenues from further drop. Instead of getting better, their financial condition is worsening. This results together in deteriorating or negative operating income at these firms, with occasional increases in profits generated by asset sales or one-off profits.
3. **Asset divestitures**: the deterioration of the financial situation of the company, including in particular the lack of liquidity makes it necessary to raise extra cash. Assets divestiture can help companies to recover and improve (increase) the level of liquid assets). If a declining firm has significant debts, it will be more determined to sell assets to avoid default or to pay down debt.
4. **Big payouts** – dividends and stock buybacks: Firms with problems don’t have typically investments that generate value, existing assets that may can generate positive cashflows and disposal of assets that result in cash inflows. In financial distress, when there is lack of cash (also no positive financial results), sometimes companies instead of paying dividends, they prefer to offer stock.
5. **Financial leverage** – the more debt in financial structure, the higher risk of default. Having stagnant and falling earnings from existing assets and little potential for earnings growth, many declining firms face difficult debt burdens. Such situation creates a risk of gridlock payment, which entails increased distrust form stakeholders point of view. At the same time, capital providers at least demand more collateral, thereby creating even the ground for bankruptcy.

For above reasons, to explain the phenomenon of default in our study, we used an independent variable: equity. Our findings show, that there is an interesting combination of factors defining independent variable.

RESULTS OF EMPIRICAL RESEARCH

The identified factors can be divided into two groups: variables having nature of assets/equity and cost related variables. The results of the model allowed to confirm statements known from finance literature that an important factor in supporting the operation of enterprises in a long time are loans and they do not necessarily have to be criticized (especially in terms of the costs associated with the use of this source of capital). Long-term loans may in fact be the one factor that not only allows the company to continue, but also allows the development to a greater extent than it would be possible only on the basis of equity. The variable that assists in this process are tangible fixed assets, which also positively influence the level of shareholders funds and therefore protect Polish companies against the threat of becoming insolvent.

Variables negatively affecting levels of shareholders funds in Polish enterprises in 2006-2010 were material costs and depreciation. From the point of view of the stability of the financial situation of enterprises and opportunities to reduce the risk of insolvency these two variables should be particularly closely monitored by management. It has its source among others in overinvesting in some of Polish companies and limited possibilities of full capacity utilization during stagnation of the economy. In addition, it should be kept in mind that depreciation is one of those cost factors that in case of companies heavily equipped with fixed assets can greatly affect financial result, thus directly impacting level of retained earnings and thus equity. On the other hand, in innovative economy, it is spot-on investments may allow companies not only exist on the market in financial crisis or stagnation of the economy but may also help to achieve a competitive advantage and, therefore, growth. It is not recommended, therefore reducing the level of depreciation (e.g. at the expense of investments), but a critical analysis of the actual investment needs of enterprises. The situation is similar in case of the costs of raw materials for production. As an important component of costs they have clear influence on the reduction of the net financial result and, therefore, retained earnings (which in turn reduces the level of equity). On the other hand, the search for a niche market in the area of high (or so far offered) quality requires ensuring good quality (or so far offered) raw materials for production. It is recommended, therefore, a critical analysis of costs of raw materials and exploring the possibilities of reducing such by eliminating losses, negotiating prices and terms of delivery.

* significant at the 10 percent level, ** significant at the 5 percent level, *** significant at the 1 percent level.

Source: own work.

The model was subject to substantive and formal verification and it was found it was valid. In view of the high level of coefficient of determination R^2, critical analysis of model has been conducted looking for a explanatory variable / variables that would be a duplication of data of dependent variable. Not found to occur such variables. Verification elimination of variables: I_Other_shareholders_funds_th_EUR and I_Full_financial_expense, resulted only in a

reduction in the level of Coefficient of determination R^2 only to a level significantly above 0.98, and also resulted in a significant deterioration of model parameters in the normal distribution of residuals. It was therefore concluded that these variables are not factors artificially enhancing model, but their absence causes deterioration of the quality of the model. In the second stage of the research a comparative analysis of businesses in Poland Czech Republic and Slovakia will be carried with the use of multiple comparisons (Kruskal-Wallis test).

Table 2. shows the results of the multiple comparisons - Kruskal-Wallis test. Null hypothesis has been formulated: variables specific to the Polish model do not differ from the corresponding variables characterizing the financial situation of small and medium-sized enterprises in Czech Republic and Slovakia. It was decided that the variables specific to Polish companies (at least some of them) may be similar in enterprises in Czech Republic and Slovakia (due to a similar geographical location, a similar level of economic development, and also bearing in mind historical changes in these countries).

Table 2. Results of multiple comparison - Kruskal-Wallis test for selected variables of private sector companies in Poland, the Czech Republic and Slovakia

Variable	Companies - Poland	Companies - Czech Republic	Companies - Slovakia
Tangible fixed assets thous. EUR	Yes	Yes	Yes
Other shareholders funds thous. EUR	Yes	Yes	Yes
Long term debt thous. EUR	Yes	Yes	Yes
Creditors thous. EUR	**No**	**No**	Yes
Net current assets thous. EUR	Yes	Yes	Yes
Number of employees	Yes	Yes	Yes
Full financial expense	Yes	Yes	Yes
Taxation thous. EUR	Yes	Yes	Yes
Material costs thous. EUR	Yes	Yes	Yes
Costs of employees thous. EUR	Yes	Yes	Yes
Depreciation thous. EUR	Yes	Yes	Yes
Interest paid thous. EUR	**No**	**No**	Yes

Source: own work.

The analyzes conducted lead to the conclusion that in comparable countries, there is a statistically significant variation of selected variables in the period 2006-2010 and therefore the null hypothesis should be rejected. Only two variables: Creditors thous. EUR and Interest paid showed no significant differences between firms engaged in economic activities in the two countries: Poland and the Czech Republic. However, there was no similarity between the variables in relation to Slovak companies. Therefore, it should be noted that despite some similar features for small and medium-sized enterprises operating in Poland, the Czech Republic and Slovakia, individualized analysis and separate models should be developed for each country. Therefore, analysis started in this study will form the basis for further research distressed entities of private sector in Czech Republic and Slovakia. The preliminary results of model of insolvency risk of Czech companies show that in addition to the variables specific to the Polish model (Table 1), a statistically significant variable is the cash flow (th

EUR). These studies, however, require further deepening, and in this study they will not be continued.

FINDINGS OF RESEARCH

Given the need to identify risk factors for private sector insolvency it was found that in addition to the variables characterizing the capital structure, particular attention should be paid to the variable cost, such as depreciation and cost of raw materials. It is important also to perform a critical review of existing and planned investments, costs incurred for production, as well as exploring the possibilities of reducing them (through the elimination of losses, negotiating prices and terms of delivery).

CONCLUSIONS

Economic instability of economies in many countries indicates the need to look for risk factors for private sector insolvency. Despite some close historical and geographical circumstances, it is not obvious that the same factors and to the same extent, influence the risk of insolvency of companies in Poland, Czech Republic and Slovakia. The importance of this threat of insolvency in private sector is so high that it requires further, in-depth research that will be continued.

ACKNOWLEDGEMENT

This research is a part of project financed by the National Science Centre granted on the basis of the decision DEC-2011/03/B/HS4/05503

THE SELECTION OF PROJECT IN RAPID ENVIRONMENT'S INDUSTRY USING ZERO BASED BUDGET

Supachart Iamratanakul, Kasetsart University, Thailand
supachart9@gmail.com

ABSTRACT

Purpose: *The strategic selection of projects deals with the determination of a strategic fit and prioritization. The impact of the project selection process obviously shows on the future profits and growth of an organization. Since the organization is much relied on that growth, this study is initiated to present the case study that the projects can set the plan to prioritize and allocate the resource of an organization.*
Design/methodology/approach: *The budgeting method i.e. "the Zero Based Budget (ZBB)" can be a tool to prioritize projects and allocate those scare resources to the project at the top list.*
Findings: *The article shows the case study of a company from a rapid environment's industry that needs fast development in their projects. The case provide lesson learn that a technology company should practice the six steps process to maximize their project contributions and deliver results using all available resources.*
Originality/value: *The article shows the key to success for practicing good prioritization for project management at high technology companies. The practical guidelines of Zero Based Budget (ZBB) are also useful for selecting projects.*

Keywords: project selection; strategic fit; prioritization; project management; Zero Based Budget (ZBB)
Classifications: Research paper

INTRODUCTION

Cindy has worked at Betel for 18 years. She has served in a variety of roles from individual contributor to senior manager. She has worked in three geographies and is now based in U.S. Betel is a giant company in a high tech industry that needs rapid development in its projects. Cindy realizes that there has always been more work to do than time to do it. This is not a new problem. Every employee has the responsibility to prioritize their projects, and more importantly, levels set and get agreement on those priorities with their managers and stakeholders on a regular basis. The projects at the top of priority list are selected to carry out before projects at the bottom of the priority list.

Therefore, which tool that Betel can use to prioritize its project? How Betel can use that tool? Why is it important? These are questions that Cindy wants to test out in her company. She also wants to make sure that the projects at the top list are selected and resources are not waste with low priorities' projects.

BACKGROUND

Souder, Mandakovic, and Gupta (Gupta and Mandakovic, 1992; Souder and Mandakovic, 1986) introduce the approaches in project selection into two categories: environmental factors in an organization and analytical models. The first category, environmental factors in an organization, is composed of systems approach for the decision making process in an organization, behavioral aspects in motivations, aspirations, and attitudes toward risk of individual managers, and organizational goals and strategies that are combined with R&D project selection. The second category, analytical models, is mostly studied by operation research analysts. They are included checklists technique, economic indexes, and portfolio models. The portfolio models are divided into linear programming, non-linear programming, decision theory, network theory, dynamic programming, goal programming, integer programming, and simulation.

The environmental factors in an organization are discussed as follows:

- Systems approach: The studies of systems approach for the decision making process in an organization are based on the idea that a project comes from any department and at any level within an organization. This idea is viewed organization as a hierarchical unit. The study by Winkofsky, Baker, and Sweeney (Winkofsky et al., 1981) is shown a comprehensive approach to a decision process model of R&D resource allocation in hierarchical organizations. Kocaoglu (Kocaoglu, 1983) studies the individual and organizational aspects through a hierarchical decision process. His study also develops a hierarchical model with measurement of subjective values via constant-sum comparison. The model can apply to make decisions in many management situations such as post-program evaluation using an expert consensus, ongoing program evaluation, goal formation, capital expenditure, resource allocations, project selection, and project performance evaluation. Souder (Souder, 1978) studies how the selection of models in project evaluation affects organization setting in different situation. His study also describes the "Q-Sort (QS) /Nominal Interacting (NI)" process for project evaluation. The QS/NI process uses psychometric methods and controlled group interaction to meet organization and behavioral needs before any project evaluation model can be used effectively.
- Behavioral aspects: There are researchers conducting this study such as Rubenstein & Schroeder (Rubenstein and Schroder, 1977) and Schwartz & Vertinsky (Schwartz and Vertinsky, 1977). The study of behavioral aspects is focused on how the personal, organizational and other variables affect the probabilistic assessment of technical success for R&D projects. The relationship between the characteristics of executives such as position and function, the attributes of the organization, and the trade-offs in forming judgments is another behavioral aspect in R&D project selection.
- Organizational goals and strategies: The studies in this type of environmental factors are concerned the fact that R&D project selection may match and support the strategy of a business or a corporation. R&D program is considered to support the strength in the core technology of the enterprise and the funding for R&D may be produced the expected results in a case study of Allied corporation (Allio and Sheehan, 1984). Curd (Curd, 1982) also studies how R&D priorities can be matched with corporate strategy in a large textile producer. Another study by Hambrick (Hambrick et al., 1983) investigates determinants of R&D decisions in individual business units.

The analytical models are mainly classified into checklists, economic indexes, and portfolio models. Each of these models is described below.

- Checklists: Projects is checked with a given criteria to evaluate each project. The score on criteria of each project formulate the total score for each project respected to relative importance weight of each criterion. The example of a checklist model is studied by Becker (Becker, 1980). A checklist model or stating in another way as a quantitative scoring model is formulated as

$$T(j) = S(1, j) * W(1) + S(2, j) * W(2) + ... + S(M, j) * W(M)$$

where;

$T(j)$ is the total score for each project j
$S(i, j)$ is score of criterion I for project j
$W(i)$ is relative importance weight of criterion i

In the above model, assume that there are N projects to be evaluated with M criteria and each j^{th} is scored on every i^{th} criterion.

In addition to Becker's checklist model, there are other studies on this type of models such as Cooper (Cooper, 1978), Glazebrook (Glazebrook, 1976; Glazebrook, 1978), Krawiec (Krawiec, 1974), Merrifield (Merrifield, 1981), Paolini and Glazer (Paolini and Glaser, 1977), and Plebani and Jain (Plebani and Jain, 1981).

- Economic indexes: This approach is expressed in terms of economic factors such as the monetary value of a project, its probability of success, etc. to score and rank projects for index calculation. The instance of this approach is proposed by Ansoff (Ansoff, 1962). The economic index for scoring and ranking projects is as follows:

$$I(j) = \frac{(R \times D \times P \times (T + B) \times E)}{C}$$

Where:

I = Index
R = Probability of research success
D = Probability of development success
P = Probability of market success
T = Technical merit
B = Business merit
E = Present estimated value of earnings
C = Total required investment

Gupta and Mandakovic (Gupta and Mandakovic, 1992) considers the index model in the following prescription.

$$I(j) = P \times V$$

Where:

I = Index
P = Estimated probability of success of project j
V = Financial expression of value of project j, if successful

However, it can be formulated in different way to calculate the index for ranking projects. The formulation is

$$I(j) = P \times V + (1 - P) \times F$$

Where:

I = Index
P = Estimated probability of success of project j
V = Financial expression of value of project j, if it is success
F = Financial expression of value of project j, if it fail

The discussion of strength and weakness of two indexes above is also presented in the study by Gupta and Mandakovic (Gupta and Mandakovic, 1992).

- Portfolio models: This approach for selecting projects is based on the mathematical programming, which is to optimize objective function, subject to constraints and limited environments of the organization. Portfolio models can be divided into eight methodologies: linear programming, network theory, dynamic programming, integer programming, simulation, non-linear programming, decision theory, and goal programming. The general form of a portfolio model is:

$$\text{Maximize/Minimize} \quad \sum_j V(j)$$

Subject to:

$$\sum_j E(j) \le B$$

Where E(j) is a project expenditure, B is the budget for j = 1,2,…, N candidate projects for funding, and V(j) is the value of each project.

For other methodologies in portfolio models, they are particular cases of the general form of the equations above. Eight methodologies of the portfolio models are similar as the mathematical programming approaches in table 2-3. Thus, this section will be briefly presented the explanation of the models, which is not intended to duplication effort of study, but rather to present another way of explanation of those models.

1. linear programming (LP): LP can be re-written from the general form of a portfolio model as:

$$\text{Maximize/Minimize} \quad \sum_j V(j) * X(j)$$

Subject to:

$$\sum_j E(j) * X(j) \le B$$

$$X(j) \ge 0$$

Where X(j) is a decision variable for selecting project j. E(j) and V(j) are as defined in the above equations. The objective function is usually an expected value in financial or in cardinal measure terms. The constraint can be laboratory capacities, man-hours at a certain degree of skill, etc. The applications of LP are examined by Gear (Gear, 1974), Allen and Johnson (Allen and Johnson, 1971), and Bell and Read (Bell and Read, 1970).

2. Integer programming (IP): IP studied by Weintgarner (Weintgartner, 1966) can be re-written from the general form of a portfolio model as:

$$\text{Maximize/Minimize} \quad \sum_j V(j) * X(j)$$

Subject to:

$$\sum_j A(L, j) * X(j) \le B(L)$$

$$X(j) = 0 \text{ or } 1$$

Where:

$V(j)$ = Net present value of project j
$A(L, j)$ = Cost of project j in period L
B(L) = L^{th} period budget

$$X(j) = \begin{cases} 0, \text{ if project j is rejected} \\ 1, \text{ if project j is accepted} \end{cases}$$

This model determines the budget allocation to projects during a certain number of periods and select which projects should be supported.

3. Goal programming (GP): GP in R&D project selection is modeled to address the problem of multiple and conflicting goals. The GP studied by Baker (Baker, 1974), Keown et, al. (Keown et al., 1979) and Taylor et, al. (Taylor et al., 1982) is a model with multiple goals and use in a decision that has multiple criteria with no common, underlying measures. The application of goal programming to project selection is to satisfy goals in a sequential and/or simultaneous manner. GP is also formulated in non-linear zero one goal programming to cope with the decision that the relationship of resource allocated to a project and the outcomes of project success is not linear. The non-linear model selects projects and allocates researchers to projects with the purpose of satisfying a prioritized goal structure.
4. Non-Linear programming (NLP): NLP in R&D project selection is complex in mathematical expression. As a result, it lacks of users to apply NLP models in practices. The data that is required for the models is also not manageable because of its complexity of the model. The study of NLP in R&D process is conducted by Daubin (Daubin, 1958), Reisman (Reisman, 1965), Reiter (Reiter, 1963), and Sharpe (Sharpe, 1963).
5. Dynamic programming (DP): DP considers the sequential nature of the decision in R&D. The first study for R&D project selection using DP is conducted by Hess (Hess, 1962). The further DP models in R&D project selection are expanded from the Hess's model, for instance, the studies by Aldrich and Morton (Aldrich and Morton, 1975), Atkinson and Bobis (Atkinson and Bobis, 1969), and Rosen and Souder (Rosen and Souder, 1965). However, there are other studies that are not based directly by Hess's model and focused on application. For instance, the studies by Cord (Cord, 1964), Dean and Hauser (Dean and Hauser, 1967), are proposed their approaches of DP for selecting projects and Bobis et al. (Bobis et al., 1971) reports an actual application of a related model.
6. Network theory: The studies of network theory in R&D project selection are conducted by Marschak (Marschak, 1963) and Nelson (Nelson, 1961) through

PERT and by Baker, et al.[Baker, 1976 #102] through algorithms applied to R&D area.

7. Decision theory: This theory is developed to evaluate the overall utility of a given project, or set of projects. It is studied under risk analysis such as the work of Moore and Baker [Moore, 1969 #112] and under utility models such as the work of Souder . It is also evaluated projects by applying decision tree analysis such as the research accomplished by Flinn and Turban, and Hespos and Strassman.
8. Simulation: Simulation is a technique for selecting R&D project in a dynamic organization. However, its limitation is prohibited of its practice when an organization does not have a well established standard and flow of information. The study of simulation in R&D project selection can be found in Augood, and Gaver and Srinivasan.

ZERO BASED BUDGETS

Zero Based Budget (ZBB) is the principal tool for prioritizing projects at Betel. Cindy realized the other day that most people at Betel don't actually know what the term ZBB means any more. Everyone Cindy listen to seems to use the term ZBB as if it meant "I've just decided to stop doing this."

Or more likely, "I've got way too much on my plate, so I've ZBB'd this." Cindy decided to test out her theory. She asked a couple of colleagues what "ZBB" meant. The most common answer was "well you just stop doing something." (The "duh" was unstated.)

But the real head scratching came when Cindy asked the follow-on question "how do you ZBB something?" It has become clear that sometime in our recent history we have lost the recipe on how to ZBB. "ZBB" has morphed into a verb and a buzzword. And if no one knows how to ZBB, Betel have a big problem.

Zero Based Budget (ZBB) is a method of budgeting for projects in which all expenditures must be justified each new period, as opposed to only explaining the amounts requested in excess of the previous period's funding. ZBB uses as a planning tool to list out priorities, cost those projects, and identify which projects will receive funding and which will not. For example, if an organization used ZBB, each department would have to justify its funding every year. That is, funding would have a base at zero. A department would have to show why its funding efficiently helps the organization toward its goals.

ZBB reverses the working process of traditional budgeting. In traditional incremental budgeting, departmental managers need to justify only increases over the previous year budget. This means what has been already spent is automatically sanctioned. In case of ZBB, no reference is made to the previous level of expenditure. Every department function is reviewed comprehensively and all expenditures rather than only increases are approved. ZBB is a technique, by which the budget request has to be justified in complete detail by each division manager starting from the Zero-base. The Zero-base is indifferent to whether the total budget is increasing or decreasing.

The term "Zero-Based Budgeting" is sometimes used in personal finance to describe the practice of budgeting every dollar of income that you receive, and then adjusting some part of the budget downward for every other part that needs to be adjusted upward. It would be more technically correct to refer to this practice as "Active Balanced Budgeting," but personal finance tends to be judged by its effectiveness, rather than by the accuracy of the terminology.

In a broad sense, ZBB is composed of two elements: a process and a document. The process is a resource management tool used at all levels to allocate available resources to a prioritized list of projects. Helps managers define a realistic set of deliverables when the amount of work exceeds the resources available. The document is a list of projects and/or activities that are prioritized and allocated some level of resource (e.g. support now, postpone, delegate/reassign, or drop completely).

Why is ZBB important?

After Cindy reviewed ZBB (a tool in which Betel uses to prioritize its projects), she starts thinking about the reasons to convey her employee to belief the importance of ZBB. If Betel does not use ZBB, Betel will be inefficient in an overall use of time and resources. An alignment with project managers and their stakeholders is also missing. Without ZBB, it can cause poor performance and moral of the team. The advantage and disadvantage of ZBB can make Cindy's team to understand more on ZBB's technique. (See table 1 below)

TABLE 1 Advantage and Disadvantage of Zero Based Budget

Advantages of Zero-Base Budgeting	Disadvantages of Zero-Base Budgeting
1. Results in efficient allocation of resources as it is based on needs and benefits and forces cost centers to identify their mission and their relationship to overall goals.	1. Difficult to define decision units and decision packages, as it is very time-consuming and exhaustive.
2. Drives managers to find out cost effective ways to improve operations and Detects inflated budgets.	2. Forced to justify every detail related to expenditure. The R&D department is threatened whereas the production department benefits.
3. Useful for service departments where the output is difficult to identify and increases staff motivation by providing greater initiative and responsibility in decision-making.	3. Necessary to train managers. ZBB should be clearly understood by managers at various levels otherwise they cannot be successfully implemented. Difficult to administer and communicate the budgeting because more managers are involved in the process.
4. Increases communication and coordination within the organization.	4. In a large organization, the volume of forms may be so large that no one person could read it all. Compressing the information down to a usable size might remove critically important details.
5. Identifies and eliminates wastage and obsolete operations and identifies opportunities for outsourcing.	5. Honesty of the managers must be reliable and uniform. Any manager that is prone to exaggeration might skew the results.

Guidelines to review and rank projects with ZBB

Cindy realizes that Betel should have a guideline to use ZBB. She called for the meeting with her team (Laura, Michael, and Stacey) and brainstorming to find the nature of philosophy and practice for ZBB.

Cindy: "Today, I like to brainstorm for a guideline to use ZBB. I believe we are all known what ZBB is, why ZBB is important, and what advantage and disadvantage of ZBB are. Michael, what is your perspective on ZBB? Please, speak up."

Michael: "It is accounting oriented without any specific output input linkages, presented in the form of a departmental budget the funds being allocated to certain aggregated budget heads rather than to certain specific activities/ programs."

Cindy: "That is one thing for ZBB that we can think of. Well, other perspectives for ZBB?"

Stacey: "I think It is an 'aggregated expenditure budget', it does not provide to the top management any basis for restricting expenditure, in case of affordability, it prevents its total funding. Hence the arbitrary across the board cuts affecting high and low priority tasks equally."

Cindy: "That is a good one. Laura, what do you think about ZBB?"

Laura: "It is an extrapolation of the last year's budget by: a.) incrementing it for an assumed rate of inflation, b). providing for wages and salaries increases, c). adding new projects/programs or activities, d). realistic submissions-imprudent if not foolish -also get the inevitable cuts, and get less than necessary, e). across-the-board cuts are made again Clever not what they wanted, and f). cleverer learn their lesion and deliberately inflate their budget submission in future."

Cindy: "Wow, that is a wonderful answer. ZBB also accepts status quo as the fate-accomplish all the activities- old and new -that have been included in the next year's budget. The budget should be equally essential in achieving the objectives, and currently being performed in the most cost-effective manner."

After the brainstorm meeting, Cindy concludes the 6 steps process for setting ZBB.

Six Steps process for ZBB

The process for ZBB includes six steps. There are 1). understand organizational and department objectives, 2). develop key deliverables that support objectives, 3). prioritize key deliverables, 4). allocate resources and draw ZBB line, 5). agree & align with managers and stakeholders, and 6). execute to plan and make appropriate adjustments. The communication has to be conduct throughout the process.

Step 1: understand organizational and department objectives. It attempts to find the intersection of opportunity and capability. It is also to understand (1) where the business and

org are going, (2) what needs to be done, and (3) your capabilities to meet the needs and add value.

Step 2: develop key deliverables that support objectives. It collects input from management, team-members, and stakeholders. Without fresh input, the group relies on inertia & carry-overs from previous periods. Result is misalignment, low ROI activities, and wasted effort. The deliverables should write concisely and state business impacts. For example, the deliverables are "SMART" (Specific, Measurable, Achievable, Realistic, and Timely). It is also need to define success metric and key result."

Step 3: prioritize key deliverables. This step is to identify the highest priority items to maximize impact, given scope of job and available resource. Key elements of the prioritization process are 1). understand tradeoffs between "urgent" and "important," 2). use help-methods e.g. ABC prioritization, SSM (Start, Stop, Maintain), Pareto Principle (80:20 rule), 3). understand value to Betel for each deliverable, e.g. What will happen if the item gets pushed or dropped? Can the deliverable be scaled back to consume less resource? and 4). consult with management & stakeholders throughout.

Step 4: allocate resources and draw ZBB line. This step is to propose items below ZBB's line. (See table 2) It should escalate and get help if there are unacceptable business consequences of ZBB'ing.

Table 2 Propose items and draw ZBB line

Key Deliverable	Priority	Resource Required	Interdepen-dencies	Consequence of ZBB'ing	Commit Date	Status
XXX	A				Weekly	On track
YYY	A				Ongoing	On track
ZZZ	A				WW21	On track
ABC	B				WW25	On track
123	B		ZBB Line		EOQ	At risk
456	B				ZBB	Dropped
789	C				ZBB	Pushed

Step 5: agree & align with managers and stakeholders. The ZBB process does not work without this step. It needs to communicate often with your stakeholders (manager, business partners, internal customers, peer functions, your team, etc…). The communication process should include: a). what is "above the line" AND what you propose to ZBB, b). opportunities for stakeholders to influence your ZBB, c).negotiation on priorities and due dates, and d). escalation of any items "at risk" due to lack of resources. It should ensure that you get co-ownership with your management (you succeed or fail together).

Step 6: execute to plan and make appropriate adjustments. This step focuses on execution e.g. 1). plan out your quarter, week, and day, 2). leave some buffer time for unexpected requests, 3).practice good time management – discipline yourself to work on the most important items first (vs. the easiest, etc…). It is flexible and makes appropriate adjustments. For example, it recognizes that we work in a dynamic business environment. New items will appear and organizational priorities will change. Your ZBB process needs to be dynamic. It regularly renegotiates your ZBB list and due dates with management & stakeholders. It is also needed to regularly reprioritize: assess new requests versus current list.

CONCLUSION

In school, and in some other places Cindy have worked, assignments were given out in a more "measured" way. The expectation was that everything you were given would get done. Or else. At Betel, not so. Your manager or your customers will keep piling things onto your plate until you never leave work.

Remember: ZBB is about maximizing your contribution and delivering results using all available resources. Practicing good prioritization & ZBB is key for the success of Betel and your success at Betel. You should practice the 6 step process: 1). understand the big picture, 2). write SMART deliverables that have clear value-add, 3).use a proactive & methodical approach to prioritizing, 4). allocate resources with focus on impact and quality, 5). agree and align with managers and stakeholders, and 6). execute and adjust along the way. You should also communicate early and often.

There are lots of other things that are critical to success at Betel: talent, brains, hard work (and luck). But in Cindy's experience, figuring out ZBB is number one. Take control of your own ZBB – if you don't, nobody else will!

QUESTIONS

1. What is ZBB? Why is ZBB important?
2. Construct a 1 sentence goal for you or your team representing what you would like to take away from this case. e.g. "**My (our) ZBB goal is to…**"
3. What are 3 actions that you are going to take in the next 2 weeks based on steps 1-3 of ZBB process?
4. What are some of the key elements of the prioritization process using ZBB?
5. What are the consequences of NOT setting good priorities up front?
6. What are advantages and disadvantages of ZBB?
7. How ZBB is used? Explain its process.
8. What are 3 actions that you are going to take in the next 2 weeks based on steps 4-6 of ZBB process?
9. What will you discuss with your manager in the next 2 weeks on your key learning from this case?
10. What do you plan to do differently as a result?

ACKNOWLEDGEMENT

The authors would like to thank Faculty of Business Administration at Kasetsart University for financial support in this research. We also would like to acknowledge our thanks to the anonymous reviewers for their valuable comments.

ABSTRACT

Purpose *– The aim of this paper is to compare the critical issues (quality, cost, flexibility, competitiveness, resource utilization and innovation) of sourcing in manufacturing, service and R&D companies in order to explore the most crucial characteristics of R&D supply chain to define the most efficient strategy to source R&D.*
Design/methodology/approach *– The research was conducted with a qualitative approach through a literature analysis.*
Findings *– The final result is a comparison of the factors in manufacturing, service and R&D sourcing, to find out the framework to further analyze sourcing in R&D.*
Originality/value *– This research contributes to modifying the methods and strategies of sourcing in R&D sector, which have been used in manufacturing and services logistics.*

Keywords: Sourcing, R&D, supply chain
Paper type: Research paper

INTRODUCTION

Nowadays in competitive atmosphere of industries, all the companies try to produce the best product to gain customer satisfaction and market share. Companies which could survive in the *fiercely competitive marketplace must* work in accurate way, at accurate time and accurate place at all parts of their value chain. The efficiency and supreme productivity should come from all individual parts of the supply chain in order to match and control whole supply chain. Moreover, organizations have to use the most appropriate directions and procedures which come from proper strategies.

Moreover numerous researchers have investigated about different features of different supply chains. Some studies considered the manufacturing supply network characteristics (Feurer and

Chaharbaghi, 1994; Beaman, 1999; Harrison and Van Hoek, 2011), some of them focused on the service sector supply chain structures and influential factors (Fitzgerarld et al., 1991; Ellaram et al., 2004; Lehtonen and Salonen, 2006; Safizadeh, 2008). Additionally in last decades researchers are becoming more interested in R&D sector due to its essential role in competitiveness of organizations. There are various studies tried to point out its significant factors (Menke, 1991; Cooper and Kleinschmidt, 1994; Hagdoorn, 2002). Moreover there are some studies tried to modify manufacturing and service supply chain management models into the R&D supply network circumstance (e.g., Prajogo and Sohal, 2001).

According to the previous studies, it can be seen that there are many methods and procedures have been modified from manufacturing supply chain management to services sourcing network and most studies focused on manufacturing supply chain and services sourcing rather than on R&D sourcing. Moreover there is no research which tries to investigate the differences and similarities of R&D, manufacturing and services sourcing. Therefore this research tries to address this gap by investigating the significant factors of manufacturing and service supply networks in order to compare with R&D supply chain.

The purpose of the paper is to compare the critical issues of sourcing in manufacturing, service with R&D companies. In order to meet the objective of this study, the following research questions need to be answered:
RQ: What are the main differences and similarities of souring for tangible manufacturing and intangible services compared to R&D sourcing?

THE LOGIC OF THE PAPER

As mentioned in the introduction part, the purpose of the paper is to compare R&D sourcing with manufacturing and services supply chains. The manufacturing and services supply chains are more studied in the literature, thus their main characteristics are studied and compared to match with the same factors in R&D sourcing. To ease the comparing process and have a comprehensive insight, the supply chains are seen as systems with input, output and processor. Due to the effective role of inputs and products of each supply chains to make them different with each other, inputs and outputs of each of the systems_ manufacturing, services and R&D supply chains, are defined and compered in the 3rd chapter.

As the wideness of processor factors, some more bold issues should be compared in the processor part. Thus the performance dimensions of Fitzgerarld et al (1991): quality, cost, flexibility, competitiveness and resource utilization are seen as the most crucial issues in the area and compared in the 4th chapter. There are various other critical factors in supply chain, which could not be described in the paper. So the study as a scope belongs to only some factors that are considered as significant issues in sourcing. The logic of the comparison between the mentioned criteria was finding out the boldest similarities and differences from literatures in general view points. It is tried to find out the most common factors which could be belonged to all the industries but if there is any special example from special industries they are mentioned in the text. More over all the factors are seen from buyers view point.

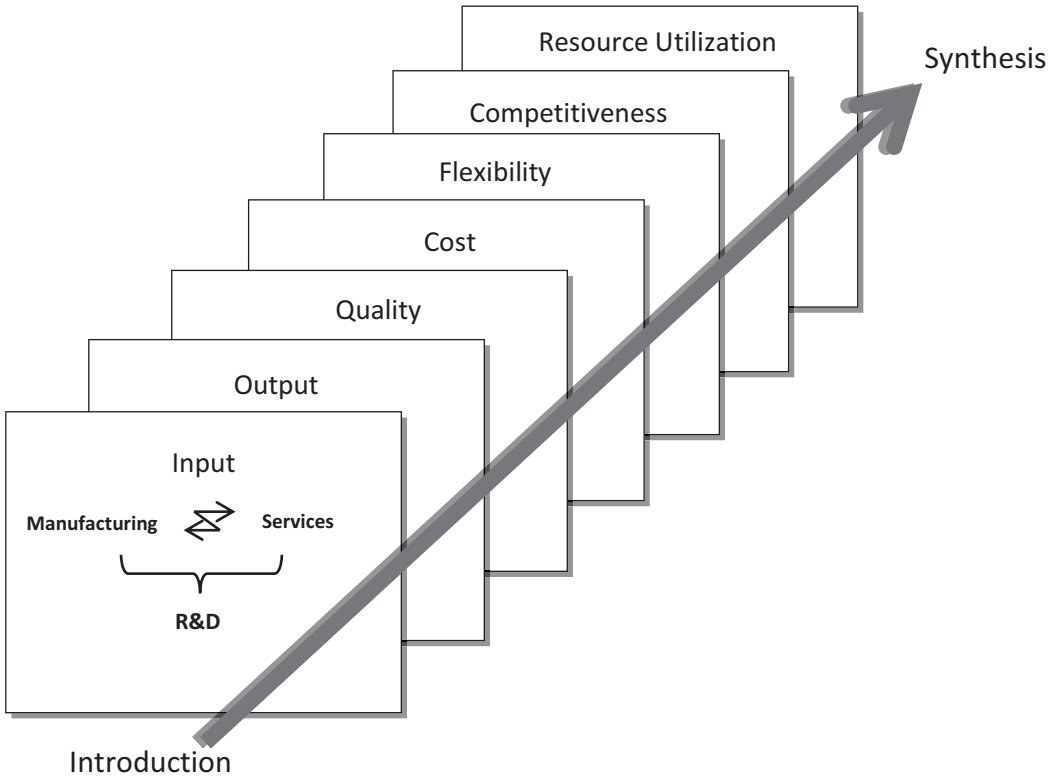

Fig. 1. Logic of the paper

1 Inputs and Outputs

Inputs are material, information, permissions and all properties which used in a process to gain required output which called product. The purpose of supply chain network players in any sector is to deliver products to customer. The characteristics of product determine the characteristics of supply chain and all of its drivers and activities

1.1 Manufacturing Supply chain

As Heshmati (2003) mentions inputs in manufacturing sector are material, capital, labor and energy to pass proper processes through add-value network, to be converted into outputs, which could be known either as physical objects or monetary values. Additionally, various authors try to classify the outputs of manufacturing by different features; as an example, Huang et al. (2002) classify the products in manufacturing sector to obtain appropriate supply chain management strategy; they introduce three groups of products: Functional, Innovative and Hybrid products. It is necessary to mention that the classification of products could be done by different industries and various purposes.

1.2 Services Supply Chain

Categorizing inputs in service companies is more or less the same as manufacturing companies, as Siegel and Grilichez (1992) represent, inputs of services companies are capital, labor, material, energy, exactly like manufacturing, moreover they add purchase of services besides the inputs of manufacturing sector. Heshmati (2003) points out that the costs which the company efforts for development could be known as an input. Classifying and evaluating inputs is totally easier than calculating and categorizing outputs, cause outputs of services sector include wide range of activities and products.

Lööf and Heshmati (2002) emphasize on the role of employees and assume that the output of service sector could be measured by value added per personnel, but the researches which study more detailed in various industries, illustrate more specific definitions, for example output of an educational institute is seen as registered student and for medical care centers the number of outpatients which checked in and inpatients which checked out are identified as outputs of the system (Rosko, 2001).

1.3 R&D Supply Chain

In current situation that the product life cycle is continuously becoming shorter, proper R&D and fast development could be the success factor of a company. Therefore, R&D process needs some supplementary inputs in compare with the service and manufacturing sectors, in R&D sector, in addition to labor and material the company needs specific data, information and knowledge. Labor is known as the people who participate in the process of research and development which could be referred to technicians and employees who are participating in prototype creation as well, material is the most obvious input of the processes which is needed for simulation, tests and prototype creation phase, but the knowledge, data and information is the base part of R&D inputs.

2 Performance dimensions of Supply chain comparison

2.1 Quality

Obviously the first priority of every company should be quality. There have been lots of companies which preferred cost reduction than quality, although studies depicted the outcome have been revenue reduction, one of the famous examples of this strategy is Toyota behavior which Cole (2011) investigated its reasons and characteristics. The quality is not only the right characteristics of product but the right activity of whole supply network. Therefore some researchers produce concept of SCQM (Supply Chain Quality Management) to transfer the process of quality evolution through all parts of supply chain (Carmignani, 2009). Moreover, Malhotra and Robinson (2005) suggest that quality approaches like ISO 9001 (2000) should assure quality from inside supply chain instead of separated methods to control supply chain and quality.

2.1.1 Quality in Manufacturing Supply Chain

To modify the old quality management system into SCQM, the companies should build a quality assurance system for the supply chain as a unify network, for instance Kuei et al. (2008) describe four steps for implementing SCQM in companies, Furthermore, Fish (2011) recommends some supportive activities to shift from traditional quality management in the supply chain into SCQM, which could promote the effectiveness of the efforts and ease the implementation of the approach.

2.1.2 Quality in Service sector supply chain

Bolton and Drew (1991) define service quality as the ratio of customer perception and company performance which is different from customer satisfaction. Lots of studies have done to find out the factors of service quality with various methods, Grönroos (1988) represents the customer observation of companies' activities into two groups: functional and technical. Parasuraman et al. (1985) study 22 factors which considered as effective elements of the quality of service and represent empathy, assurance, responsiveness, tangibles and reliability as the elements of customer perceptions of service quality and introduce SERVQUAL model.

Haywood-Farmer (1988) classifies possible factors which could be effective in the customers feedback from the services into: physical, behaviors of personnel and professional judgments; additionally furthermore, some other researchers like Santos (2003) and Dabholkar (1996) specify in particular industries for defining service quality factors and define models for e-commerce and self-service technologies.

Most of the researches have done only to measure and evolve technology in companies scale; although from supply chain management view point when the whole parts of chain are included in the quality assessment the process is more effective (Nix, 2001; Seth et al., 2005). Therefore researchers in the supply chain management field try to define service quality from network scale insight. In accordance with the definition of service quality the service quality in supply chain is defined as ratio of expectation to performance of each network player and whole add-value network (Seth et al, 2006).

Even though most of the studies in the area do not include requirements to harmonizing whole supply chain, the studies are illustrated that service quality programs lead to better performance of whole supply chain (Mentzer et al., 2000; Stanly & Wisner, 2002). Therefore Seth et al. (2006) try to modify service quality models to unify the whole network players in quality assurance programs by extending SERVQUAL model of Parasuraman et al. (1985), which is used by other researchers in empirical studies in various service companies like educational institute (Jacksen et al., 2011), health care centers (Fantazy et al., 2010) and management consultant (Giannakis, 2011).

Dale et al. (1997) demonstrate the differences between quality management in service provider organizations and manufacturing companies. They find out that quality in services sector is very

human factor centric, the behavior of personnel _ away from the technical performance of the service, could promote customer satisfaction or demote it.

2.1.3 Quality in R&D Supply chain

Menke (1991) mentions success factor of R&D as: working on the right project by proper people and appropriate process, so the framework which could illustrate "right" project, "proper" people and "appropriate" process is constructing quality. Subsequently he classifies the quality assessment stages. the first level is evaluation feasibility of the project according to market area, strategy of the company and lots of other statistical and qualitative data; which could be gained from strategy table, influence diagram, new product revenue forecast, sensitivity analysis and decision trees as suitable approaches for evaluation and prioritization of various R&D projects.

For the second and third stages of quality assurance, due to the similarity of these processes into manufacturing and services sectors, the approaches which have been implemented successfully in those sectors are mostly modified by various authors. For instance (Prajogo and Sohal, 2001) modify TQM for R&D sector, which is one of the most popular quality approaches in manufacturing and had been modified for service provider organizations too. In addition, Benner and Tushman (2003) argue that with mixture of process management and customer focus approach, company could make a quality structure that the process management approaches guarantee the quality part of processes and customer focus approaches carry the effectiveness of voice of customer in development and innovation process.

2.2 Cost

Simchi-Levi et al. (2007) classify cost as one of the features which customer evaluates each company's products with. Therefore, lower price is one of comprehensive competitive strategies and cost reduction is a factor which even in luxurious products is considered besides keeping high quality of products, to increase profitability of the company.

2.2.1 Cost in manufacturing supply chain

Beaman (1998) who studied about the performance of supply chain considers 4 approaches to promote profitability of a supply chain: minimizing costs, minimizing average inventory level, minimizing obsolete inventory and maximizing profit. Furthermore, other researches go beyond the details and suggest some methods to reduce costs, Camm et al. (1997) believe that the distribution centers allocation optimization and lower costs of transportation lead to less total costs. Moreover they give a stochastic based method to make efficient the numbers and locations of distribution centers; likewise, Lee and Feitzinger (1995) besides evaluating the number of distribution centers, calculate wide range of activities costs in supply chain from set up costs to inventory costs, to form whole integrated channel, cost efficiently.

From various viewpoints in supply chain studies, inventory level and allocation are crucial factors; Pyke and Cohen (1994) investigated about the inventory cost efficiency, they compute replenishments size and time, orders characteristics and amount of products in each batch to

prevent delays. Besides Lee et al. (1993) try to reduce inventory levels by production allocation. Furthermore, Altiok and Ranjan (1995) model attempts to lessen the inventory level by forecasting time and number of orders accurately. Towill and Del Vecchio (1994) by modifying filter model endeavor to minimize the number of inventories and their costs. Moreover, Ishii et al. (1988) suggest a method to reduce the inventories by identifying and eliminating obsolete products from them.

Several researches define models to cover all supply chain players in a unified cost efficient program. As Cohen and Lee (1988) create a model to increase supply chain profitability. According to their model all parts of supply chain are under control restrictedly. Besides, Jonrinaldi and Zhang (2013) optimize costs of whole supply chain with less restriction according to the demand forecast and products life cycle. Also Tzafestas and Kapsiotis (1994) introduce a procedure to improve entire network activities, thus they recommend three various approaches to evaluate supply chain players.

2.2.2 Cost in Service Sector Supply Chain

As described before, one of the customer preferences is lower cost in gaining appropriate services; simultaneously the company's target is to achieve both customer satisfaction and more profit. As Johnston and Glark (2008) represent high quality service delivery leads to absorbing more customers which brings better financial performance for the company. Therefore managers try to make supply chain efficient to provide high quality services with lower cost.
Frei (2006) recognizes various strategies to reduce cost beside keeping customer satisfied, he suggests some tips to make efficient supply chain as labor allocating view point, for instance: using cheap labor and outsourcing some activities to other countries with lower cost labors, try to automate the process as much as possible to eliminate human factors failure and make maintenance line cheaper, outsource customer contacts, ease tough processes in a way that they need less skilled employees. Although the entire decision making should be done carefully with all aspects and costs consideration, for example outsourcing labor could have some hidden cost for the company which should be taken into account (Ellaram et al., 2004).

2.2.3 Cost in R&D Supply Chain

In the beginning of every R&D project, one the most crucial concerns of stakeholders is the financial performance of the project result and suitability of the developed or innovative product with the situation of market, at the release time. Therefore a significant part of R&D project is financial estimation. Apparently known estimation methods for expected sale, revenue and other financial values are inadequate for a complete consideration of a R&D project. It is necessary to notify qualitative variables as well, these variables are illustrated situation of company, market and environment impressions against the new product release.

Additionally always there have been trade-offs between low cost innovation with high revenue, and costly researches to find out new infrastructures and build innovative products. Moreover time is another factor which makes R&D projects costly; as Dunk and Kilgore (2001) represent high competition on cost in short term projects, rather than innovation. Furthermore, Thoma and

O'Sullivan (2011) compare costly innovations in car industries of Germany and low cost built production lines in china.

Totally costs of R&D projects which gain from quantitative procedures like NPV (Net Present Value) and qualitative models like game theory lighten up the potential and future of each idea and project that the company should decide whether the potential goals, revenues, built infrastructures are in line with the company's strategies and invest on them.

2.3 Flexibility

Flexibility is capability of system to adjust with the changes which is made by the customer requirements, suppliers' feedings and any other environmental or internal factors, quickly and efficiently (Beaman, 1999). In accordance with the available uncertainty in all industries one of the success factors of any supply chain is high flexibility. Thus if the company wants to stay in competitive market should increase the flexibility as much as the level of uncertainty. Demand fluctuation, technology uncertainty, environmental problems like economic problems, contractual collapse in external sourcing and even natural contingencies like earthquake and tsunami can lead to high uncertainty in various occasions for manufacturers and manufacturer cannot remain in the market place without high level of flexibility.

2.3.1 Flexibility in manufacturing supply chain

Researches try to find out different kinds of flexibilities to gain the elements of them and solve the problem by finding its compositions. Hence, Slack (1991) identifies two different flexibilities in the manufacturing sector; Range flexibility which is the tolerance area that the operation can be adapted with changes, and respond flexibility, the value of changing operational direction (time, cost or both), it is necessary to mention that the extension of operational changes (range flexibility) is limited but it should be adjusted with level of uncertainty, which exist in the market circumstance.

In addition D'Souza and Williams (2000) represent volume, variety, process and material flexibilities as compounds of manufacturing supply chain flexibilities, that each of them has two subgroups of range and mobility. There are various categorizing of flexibilities from different viewpoints, for example Slack (1991) determines four distinct types of flexibilities in manufacturing network; volume, delivery, mix and new products flexibilities, which are represented to ease the classification of duties for finding out the gaps and increase flexibilities. Another interesting classification of flexibilities belongs to Koste and Malhorate (1999) that have a hierarchical approach and study all part of the supply chain which begins with the strategic flexibility and continues to individual personnel and contractors.

Subsequently, lots of investigations have done to determine the effective factors on flexibility and its measurement; Christopher (1992) describes flexibility measuring dimensions, as regular set up and product development time, economy of scope and the number of inventories. Moreover, Slack(1983) mentions that flexibility measurement is complicated due to various dimensions and facts _actually and potentially, that flexibility could be influenced by. Sethi &

Sethi (1990) realize 15 various dimensions of flexibility in manufacturing sector which encompass marketing, human factor and manufacturing criteria.

2.3.2 Flexibility in service sector supply chain

Any fluctuation in entering input or demanding output and technology of system cause uncertainty which leads to lower level of performance in absence of flexibility. Logically when high uncertainty situation occurs (e.g. variation in demand) the company would look for increasing numbers or variation of resources which not only is costly but also if the fluctuation would be temporary the company encounter useless provided inputs, therefore the company have to find out models to control such kinds of changeable conditions that is the concept of flexibility (Iravani et al. 2005).

But flexibility in services is even more complicated, the employees always are in close interaction with customers and one of the customer satisfaction factors is the officers behaviors which is almost unique for every customer, therefore in services companies customization is very common which is one of uncertainty factors (Aranda, 2003), thus flexibility known as high potential of company in customization (Iravani et al. 2005).

Different researches tried to find out different models for improving flexibility of companies in service sector, some researches emphasize on the resource or labor allocation and for each task or demand introduce two or more employee to reinforce the demand variations (Iravani et al, 2005) or some others study on the companies which provide product and services in the same time or provide service by using technological devices, prefer to use higher technological devices to evolve flexibility. Although Gupta and Somers (1996) believe that technology development does not cause better market share and competitive paramount. Therefore for gaining better flexibility in service supply chain, whole the adding value network should be flexible; as Chambers (1992) represents, the flexibility of supply chain is not possible without flexibility of all parts of the network.

Furthermore all parts of network should be prepared to adapt with environmental variations to guarantee the whole chains flexibility. Suarez et al. (1996) describe that from the design and introduction phase to the end of product life cycle, all the activities and duties should be flexible. Furthermore, resource management in addition to demand quality and quantity evaluation, should be adapted with all the variability and uncertainties which could happen, to prevent unutilized components and human factors or lack of resources.

2.3.3 Flexibility in R&D supply chain

Existence of uncertainty in all R&D projects is obvious, and negative effect of high uncertainty situation on the revenue of R&D projects is apparent as well. Therefore the whole chain structure should be flexible enough to triumph against at least some amounts of uncertainties. Furthermore it is necessary to mention that, due to some characteristics of R&D sector like output which is

almost vague in some R&D projects, lead time that could be floating and market situation in product introduction time which could be unknown, flexibility management in R&D is more complicated in compare with manufacturing and service sectors. Moreover, due to all unstable situations which named above the tolerance of flexibility in R&D should be wider.

Flexibility in R&D sector contains wide concept during various stages of development projects, which the project managers should decide whether to change the directions and plans. As mentioned, first phase of a R&D project is the evaluation or planning phase, that the company decides which idea could be more productive and efficient in accordance with the current information from customer demand, competitors' situation and market but in case of unstable condition, big fluctuations could destroy all plans of project. Moreover the whole chain structure should be prepared and flexible enough to react against the changes those are harmful or even useful for projects (Santiago & Vakili, 2005).

For the first phase of evaluation and concept studies, there are lots of models to evaluate various aspects of R&D potential projects like NPV (Net Present Value) or others which mentioned in the quality part, but most of them study current situation of company and disregard the uncertainty of the environment (Huchzemier & Loch, 2001). Schwartz and Trigeorgis (1997) adapted Real option theory which mostly used in corporate finance, to make the R&D projects more flexible by evaluating the process and effective environmental factors in each stage of the project. He gave 5 options in each stage to harness uncertainty like defer and abandonment.
Then Huchzemier & Loch (2001) expand his theory which contains more uncertainty factors in R&D like budget fluctuation, lead time delay, product characteristics and performance in addition to market factors, to make it more applicable in R&D flexibility measurement. Furthermore sequential model of Roberts & Weitzman (1981) is another effort to identify a method to restrain uncertainty in research and development projects.

2.4 Competitiveness

Recently, in the speedy developing technology area which leads to increasing customer requirements and shortening product life cycle, one of the most crucial considerations of managers and firms stakeholders is remained in the market and competition of industries by promoting competitiveness of their products and processes. Some authors like Cleveland et al. (1989), Kim and Arnold (1993) and Vickery et al. (1991), recognize strategy as the factor to remain in the competition between companies in industry and only mention competitiveness as a way to find out the level of production harmonization with strategic goals.
Feurer and Chaharbaghi (1994) define competitiveness as not only potential of knowledgeable employees and technological equipment to keep production activities synchronized with the strategic targets, but also capability of the company to manufacture and modify the manufacturing system with changing competitive environment. Away from various definitions details, all of them imply that competitiveness is a characteristic to stay in the market by having qualified products and capabilities, from customer viewpoints and following the strategic directions.

2.4.1 Competitiveness in manufacturing supply chain:

As the definitions are different, various studies distinguish various factors and criteria for this concept although they are similar and some of them are just repeated. Arze and Svensson (1997) emphasize on the level of equipment technological potentials and employee's knowledge on the degree of competitiveness; El Mhamedi and Binder (1992) argue about human factors effectiveness too. In addition, Gardiner and Gardiner (1997) constitute systematic management as another driver of the concept.

Consequently, researchers attempt to create methods and calculate the competitiveness of a manufacturing organization, for instance Feurer and Chaharbaghi (1994) consider people, technology, shareholders value, financial strength and customer value as the factors which the competitiveness could be evaluated by measuring their performance and mention that a sustainable competitiveness would be happened in the balance of all the factors.

Moreover, Chiang Kao and Shiang-Tai Liu (1999) assume that two dimensions of technology and management, that each of them contains various sub factors, are the base drivers of competitiveness. In accordance with the fact that some factors are not qualitative to be mentioned in mathematical statistics, they try to model competitiveness and all the drivers by fuzzy. They identify equipment quality and quantity, employees' knowledge and its appropriation to the level of automation, control level and technological capabilities as the sub factors of technology and try to convert the qualitative variations into fuzzy specifications. Furthermore they used from Amrine et al. (1993) description of effective components management.

2.4.2 Competitiveness in service sector supply chain

Porter (2000) besides defining service competition as a dynamic concept, which try to promote service strategies by innovation and development, argues that location is an effective factor in the service competitiveness that leads to increase productivity. So (2000) describes time and price as the most effective factors in competitiveness of service companies, moreover he emphasizes that time accuracy leads to more customer satisfaction. Moreover, Allon and Federguen (2007) classify competitiveness factors of service sector: price, time and other attributes. The last dimension which they describe is "other attributes" which refer to technical quality of company's core business that is the reason which customer is looking for the services.
Due to variation of "other attributes" factors in various industries, the researchers define "full price" concept, to find out unified structures for all the services companies competitiveness, which argue about competitiveness by functionalizing price and time with the assumption of the same rate of other attributes in all the services companies. Thus time and cost are implicit functions of each other from customer viewpoint. Additionally Carmonel et al. (1994) depict "full price" function is nonlinear. Moreover, Allon and Federguen (2007) according to constant level of "other attribute" in all the service provider companies, distinguish three various strategies for increasing competitiveness, first is improving capability to reduce both time and cost, second is trying to decrease customer waiting time and the third is price reduction strategy.

Apparently, core business of service provider organizations is the key point of competition. As mentioned, for evolving quality of service and product of the company the enterprise needs to have high technology development and innovation in the services and products but due to variation in the services core businesses and close relation between customer and employees situation and psychological factors, competitiveness in services is more complex in compare with manufacturing sector's competitiveness. Still, as described above price and quality are crucial competitive factors.

2.4.3 Competitiveness in R&D supply chain

Apparently, R&D known as the most fundamental company's solution to remain in the market competition and promoting its competitiveness features. In addition, the company identifies its competitive strategies to shape R&D and follow the plans, therefore all details of R&D projects are influenced by the company's competitive strategy from innovative topic selection and the projects budget to scheduling, in accordance with the companies capabilities (Cooper & Kleinschmidt, 1994). The competitive strategies could be seen from various aspects, moreover companies define different kinds of competitive strategies in various industries and environment, thus researchers have classified the competitive strategies from diverse insights, that each of them leads to gain special goals. Strategy could be identified as one of the success factors of R&D projects. Two various categorization of competitive strategy for R&D are describe below that first one is comprehensive for all industries and the second one is given especially for high tech industries.

Ulrich and Eppinger (2008) suggest a classification for competitive strategy which is applicable in various ranges of industries. They describe that companies could emphasize on technological development to introduce pure new technological products based on new technologies in industry, the most visible example in this area is the introduction of ipad by Apple company which is applicable by various customer segments (Wang et al., 2012).
Moreover, as the cost efficiency is one of competition features in various industries, they introduce cost leadership as another competitive strategy of a company which R&D projects try to make efficient processes by standardization, increase the economy of scale, develop production process and process planning to reduce production costs and offer cheaper high quality products or services to the customers, the known example of such development is Wal-Mart company distribution system (Harisson & Van Hoek, 2011).

The third competition strategy is finding out up-to-date customer requirements and keeping the products align with customer satisfaction level, by study voice of customer deeply, such customer focused methods mostly lead to developing new product lines and trying to implement total customer solution strategy, which bring customer loyalty for the company; It is necessary to mention that this method could be applied only for one or two customer segmentations.

In addition, imitative strategy is described as another competition plan which contains studying competitors' behaviors intensely to obtain their market share rate, customer perceptions, advantages, disadvantages and develop their successful or innovative product immediately. Important feature in this competitive strategy is performing the process rapidly before the satiate

of the market form the product. Furthermore the company should try to use its own innovative ideas in the product to not copying the product; the known example of Samsung tablets against apple ipads could illustrate this competitive strategy obviously (Sener & Davis, 2008).

Subsequently, Liao and Cheung (2002) classify competitive strategies in high tech industries with a customer segmentation focus and marketing insight, into five various strategies: first high added value, which company trying to develop a high value product which could be used widely in the industry and has high commercial value for almost all customer segments. Second is focus on one segment of customers and produce high value added product for them. Third is overall cost leadership as described in Ulrich and Eppinger's (2008) classification that the target of development is to reduce cost of products by various methods for all customer segments. The fourth competitive strategy is to differentiate the product; that the R&D team is seeking to acquire pure innovative idea to absorb almost all customer segmentations, and the last strategy which they describe is to develop innovative product for special customer segmentation.

2.5 Resource Utilization

Resource utilization is the level of used resources capacity like space, labor time and equipment, which illustrates how much the company currently used from its resources potential capabilities and how much of resource capacity is unused (Klassen & Mentor, 2007).

2.5.1 Resource utilization in manufacturing supply chain

Totally the amount of utilization should not be near 100% because it decreases the flexibility of a company; even repeated short term amount of high utilization rate known as a notification of low capacity of a company to keep the capability of resisting against uncertainties (olhager & Johansson, 2012). There are various models for capacity planning like waiting line, simulation and decision trees (Olhager et al., 2001). Consequently, ERP, MRP, BOM and all other resource planning methods and software are useful in this area for supply chain to keep the resource utilization in a balance which leads to neither unused resources nor low flexibilities against uncertainties.

2.5.2 Resource utilization in service sector supply chain

Resource utilization and planning structure in service is more or less the same as manufacturing most of the methods and software which used in manufacturing are modified for services, with some differences, in manufacturing the products according to the forecast should be on shelf or in inventories, whereas in service companies, the forecasts results should be practiced in the capacity of the company. Therefore lots of other concepts have different definition in service companies. All the ERP and MPS systems that were based on the BOM, in service sector are depend on Bill of Resources (BOS), furthermore, in service the role of human factor is very crucial so all the predictions should be done to cover human factors failures, like absence, holiday and other, additionally the utilization planners are mentioned that capacity utilization of human factors could be 100% rarely, and the quality would reduce with more utilization.

2.5.3 Resource utilization in R&D supply chain

Restricted amount of material, time, equipment and human resource, against high number of R&D projects make the companies to allocate resources efficiently, to maximize their utilization and have optimal number of high prioritized innovative projects in progress. Hendriks et al. (1999) emphasize on having unified resource and project pool in the environment to have more R&D projects with less costs.

Wheelwright and Clark (1992) try to allocate resources by "Aggregate Planning" from studying various aspects of project planning and resource allocation. Furthermore some other authors try to create methods to optimal number of in progress projects and their schedule, Platje et al. (1994) study single projects in a unified system of portfolios by "rough-cut-project-and-portfolio-planning" to optimize the number of portfolios based on available resources, moreover, Pillai and Tiwari (1995) suggest a long term procedure for prioritizing the portfolios by the strategic goals of the company, and put less significant projects in the future schedule of R&D teams.

Sometimes the company have to be enough flexible to redirect in accordance with the market fluctuation or competitors behaviors. Therefore, as Hendriks et al. (1999) suggest a model with short, medium and long term resource allocation planning that all these different schedule plans would related to each other by "resource dedication profile " and "project scatter factor", which illustrate situation of resources and projects during time.

3 Synthesis

Table 1. Comparison of R&D sourcing with manufacturing and services supply chains

	Manufacturing	**Services**	**R&D**
input	Capital, material, know-how and labor	capital, material, know-how, the role of labor could be more crucial	Capital, material, labor, but the role of knowledge and information is more critical
output	Finished products, physical or monetary values (like software)	services or additional service to manufactured products	new or developed product, process or activity
Quality	specified in the design of the product or known by quality management approaches	known from customer perceptions and customer expectations and service quality control approaches like SERVQUAL	Quality of concepts should be evaluated by companies policies, market conditions and the process of R&D should access with

	Manufacturing	Services	R&D
			modified Quality Control methods
Cost	cost reduction by efficient production, distribution and optimization whole supply chain	cheap labor, geographical allocation, technological equipment could reduce cost	Totally depends on the contract and strategies, concept and its revenue, which estimated by some methods before and after the beginning of project
Flexibility	Volume, delivery, mix, new product, range respond, flexibilities, some methods like JIT or other strategies like outsourcing could promote it	by allocating human factor and accurate capacity forecasting try to increase flexibility	flexibility of R&D project could be assured by continues evaluation of the project and market situation to continue, modify or abandon the project and avoiding more lost
competitiveness	manufacturing new technologies and best quality or cheap products with acceptable quality or both	more innovative, cheaper services, total customer solution, better employees behavior	technological capabilities, internal infrastructure and knowhow, customer potential and actual needs and market situation
resource utilization	utilization capacity should be synchronized with the production capacity; resource planning with ERP and MPS data bases	utilization capacity calculated with special recognition to the human factors potential; resource planning methods of manufacturing are modified for services	Projects should be prioritized according to the strategy of company, resource planning could be done by shifting or eliminating some project which company does not have enough resources for them.

The syntheses of all the described criteria are shown in table 2. As considered, in manufacturing sector inputs are material, capital, labor and know how. In services supply chain, the inputs are mostly the same with high effectiveness of labors due to more direct connection with customers. Moreover, in R&D supply chain, the inputs are the same with high emphasize on knowledge and information with was known as know-how in those supply chains.

Outputs of manufacturing companies are mostly finished product, not in meaning of ready to use but in the way that the product does not need any other work, although in case of after sale services the chain should be considered as a service supply chain. The outputs of service providers are the activities which are given to customers whether beside manufactured products or without any. In addition the outputs of R&D projects could be divided into two groups of totally new and developed products or services.

Quality is a concept which is defined in the design specification of products and could be assured by Quality management approaches in manufacturing sector. In service sector, quality more than the technical specification, depend on the customer perceptions and expectations which include employees' behavior as well and could be evaluated by some approaches like SERVQUAL. For R&D supply chain, the quality should be evaluated from the first phase of concept selection by strategies and policies of the company and should be followed in other steps as well.

Cost reduction could happen in manufacturing industry is known mostly by existence of efficiency in whole supply chain especially inventories and distribution centers or using from cheaper materials and labors, while in services geographical allocation, cheap labors and technological equipment. Moreover Cost efficiency in R&D project depends on the contracts and strategies of companies in addition to the estimated time and revenue of the projects.

Flexibility could be divided into various classifications to ease to promote by different methods like JIT. In service companies appropriate resource allocation and accurate capacity forecast could increase it. While in R&D supply chains, the project members should evaluate the project and market situations to continue, modify or abandon the project and avoid from more loos of the company.

Competitiveness strategies in manufacturing supply chain is mostly based on the cost, technology or both, therefore the company should represent the best quality, the cheapest product or combination of both. The situation in service company is more or less the same plus the bold role of employees and human factors behavior which could be paramount of a service provider, additionally in R&D sector the company could compete by best technological capabilities, cost leader ship strategy or customer focused developed product although combination of these strategies are possible as well.

Resource utilization and allocation are calculated by almost the same methods in manufacturing and services supply chains, but in R&D the projects should be prioritized be the strategic plans of the company.

CONCLUSION

In accordance with the mentioned difference and similarities of various sourcing networks, some approaches have been modified from one sectors supply chain to the other, while for more

accurate structures, more specifications should be studies. The usage of the study is mostly in those mentioned issued which give a brief landscape from different sectors supply chains.

Table. 1 could be the answer of research question in investigated criteria, inputs and outputs of R&D are almost the same as services and manufacturing with the difference of knowledge and date critical role in the R&D add value network. Quality in R&D should be defined from the first phase of concept selection and it should be assured during the other phases the same as two other sectors sourcing quality assurance approaches, although the whole concept of the project should be under continues evaluation.

Cost efficiency is more complex in R&D supply chain due to vague result of the process and the market situation in the future. Additionally the processes should be under assessment in all parts of the processes to keep the flexibility and avoid from loos in case of bad market situation or wrong direction of the R&D supply network players.

R&D is one of competitiveness tools in case of accuracy, the classification of high quality and low cost are the aim of R&D projects by using from innovation, supreme technologies or creative logistic methods for cost reduction. Resource allocation is defined the same in R&D sector and manufacturing and service companies with the difference on the prioritization policies which the company should define according to its strategies and market situation.

A CONCEPTUAL MODEL OF CORPORATE ENTREPRENEURSHIP IN BANKING INDUSTRY

Bobby Boon-Hui Chai, Faculty of Business & Finance, Universiti Tunku Abdul Rahman (UTAR) Malaysia
bobbybhchua@gmail.com

Harry Entebang, Faculty of Economics & Business, Universiti Malaysia Sarawak (UNIMAS), Malaysia

ABSTRACT

***Purpose**: The rapid growth of global economies, changes in technology, market competition and ever changing business environment have caused the banks to struggle for profitability, growth and performance.*
With the intense competition among banks in the industry, it is imperative for them to have superior performance, and the banks have attempted to implement and use various initiatives such as: TQM, BPR, SP, Six Sigma, Balanced Scorecard, ABM. However, banks being the backbone of any economy and its importance for the future growth and development of the country. Thereby, the performance of the bank is of a major concern, and with this in mind the scholars have argued that there is a strong relationship between corporate entrepreneurship (CE) and bank performance. Therefore, corporate entrepreneurship with innovative products, strategic renewal and quality services will provide the banks with competitive advantages in the organization, sustaining them in their business challenges and survival in the market place with greater performance.
***Design/methodology/approach:** Conceptual paper*
***Findings and implications:** Conceptual paper*
***Originality/value**: The study is important to decision maker in the banking industry*

Keywords: Bank, Performance, Corporate Entrepreneurship

INTRODUCTION

The bank by definition is a financial intermediary that accepts and channels deposits into loan activities and their objective is to connect the customers with capital deficits to customers with capital surpluses.

The rapid changes in technology, increase in globalization and market competition have caused organizations to struggle for profitability and growth.

The consumer's choice on products and competitive strategy among the banks are almost the same as there is no corporate innovation, the study also revealed that referral from friends or family is very important to the customer.

In order to survive and prosper in the banking industry, the banks need to become more entrepreneurial (Lumpkin and Dess 1996; Thornberry 2001). Entrepreneurial firms/organizations tend to do better than those that are less entrepreneurial (Miller, 1983). This study proposes that a corporate entrepreneurship firm may affect its innovation performance.

LITERATURE REVIEW

Entrepreneurship can be defined as important steps in promoting and keeping the business to have a competitive advantages in their respective business or related industry (Covin & Miles, 1999), and hence it will improve its overall effectiveness and performance.

In order to enhance the performance of the banking industry, the banks should incorporate corporate entrepreneurship in the banking industry as it plays a very key role in the economy of both in the developed world as well as in developing economies. Thus, understanding corporate entrepreneurship in the banking industry should not be ignored. It is noted that past empirical work has extensively examined the corporate entrepreneurship on firms' financial performance.

With the understanding of "What is corporate entrepreneurship (Zahra, 1993)", and with the above reasons, this proposal thus aims to lead towards a study in supporting the main objective: to examine the enhancement of corporate entrepreneurship strategy and organizational performance for banking industry.

Corporate entrepreneurship or intrapreneurship refers to entrepreneurial activities within existing business organizations (Schollhammer, 1982). Likewise, Zahra (1995) views Corporate Entrepreneurship as the sum of a company's innovation, renewal, and venturing activities.

CE is further defined as the process whereby an individual or a group of individuals, in association with an existing organisation, create a new organisation or instigate renewal or innovation within that organisation (Sharma & Chrisman, 1999).

In this paper, we define CE as strategic organisational innovation, strategic renewal and corporate venturing initiatives or activities and its environment to achieved bank performance.

PROPOSITION DEVELOPMENT

In order to achieve the proposed objectives, the following hypotheses were developed for testing;

- P1 That corporate entrepreneurship will be positively associated with innovation performance in banks

- P2 That external corporate entrepreneurship factors will moderate the relationship between corporate environment and innovation performance in banks

Innovation

The success and survival of entrepreneurs are further enhance by their innovation in their product and process innovation (Huang & Wang, 2011). Corporate entrepreneurship has demonstrated in terms of innovation, strategic renewal & corporate venturing (Zahra, 1993). Innovation is key to competitive advantage (Zahra 1991 & 1993)

Corporate Venturing

As a safety precaution and for the growth of corporation. It is vital that the corporation has to further improve their overall corporate entrepreneurship strategy by upgrading their operational capability and to seek opportunities in corporate venturing as it has to compete in different corporate environment, and also to implement effective activities in order to face the highly successful corporation (Ferreira, J. 2002).

Environment

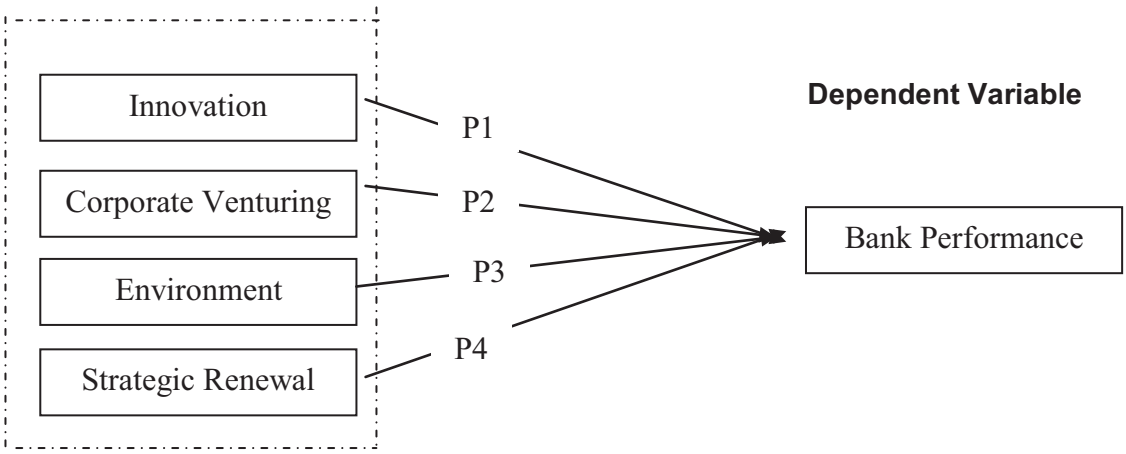
The hostility of the environment is one of the most dangerous external forces that affect firms' entrepreneurial performance (Covin & Slevin, 1991a; Zahra, 1991). Past studies had shown that hostility can have a significant impact on the CE-performance (Zahra & Covin, 1995). Changes in industry, intense regulation, fierce rivalry among competitors (Werner, Brouthers & Brouthers, 1996); competitive market, and product-related uncertainties (Dess & Beard, 1984).

Strategic Renewal

The process that attribute to the outcomes by driving and transforming the bank to survive and sustained in the long term through their creativity by identifying new venture.
(Agarwal R. and , Helfat 2009*)*

PROPOSED MODEL OF CORPORATE ENTREPRENEURSHIP FOR BANKING INDUSTRY

In order to examine the relationship between Innovation, Corporate Venturing, Environment and Strategic Renewal with Bank Performance, Covin & Slevin (1991a) had shown that the characteristics of a good model should show the performance of bank as the ultimate dependent variable, the independent variables are clearly defined. Therefore, the relationship between independence variables and dependent variable can be shown in the conceptual model as follows:



IMPLICATIONS, LIMITATION & FUTURE STUDIES

The key aspects of Corporate Entrepreneurship and the effects are of great magnitudes to the corporate performance.

Top management support has been found to have a positive relationship with new product performance and the empowerment of employees that facilitate and promote entrepreneurial behavior, that provide innovative ideas and the resources towards achieving good financial performance in banking industry.

The limitations were noted because the results and the findings of the present study were from main branches of the banks. Therefore, this may limit the generalisability of this study.

Corporate Entrepreneurship not only contributes to companies' financial performance but also innovation activities i.e. non-financial performance of a firm

Future study may also examine, the effects of Corporate Entrepreneurship on the financial performance of banks and also the effects of Corporate Entrepreneurship initiatives on the financial performance of banks.

The study is believed to be able to contribute significantly to the Corporate Entrepreneurship of research literature, by helping quality practitioners and academicians to better understand the relationship between Corporate Entrepreneurship, corporation performance among banking industry in structural relationships.

CONCLUSION

In summary, this paper attempts to enhance the performance by conducting a thorough finding of the corporate strategy between corporate entrepreneurship and banking industry. The management may learn that the ability to exert proactiveness, innovativeness and risk-taking behaviour would determine the extent of which their organisations will pursue innovation initiatives/activities. The banks may observe that the dimension of the external organisational factors will be strong and significant to their innovative activities.

ABSTRACT

The banks are motivated to leverage their m-banking activities with the advancement of mobile technologies and the high mobile penetration rate. Despite the availability of the m-banking services, many consumers still posses the attitude of 'wait-and-see' which resulted to unsatisfactory adoption rate. Hence, this paper aims to extend the Unified Theory of Acceptance and Use of Technology (UTAUT) model to better understand what drives Malaysian consumers to adopt m-banking services. The conceptual model also provide better strategic insights for commercial banks, service developers, mobile manufacturers, and others to yield higher acceptance of m-banking.

Keywords: M-Banking, Adoption, Unified Theory of Acceptance and Use of Technology (UTAUT), Malaysia

INTRODUCTION

Gone were those days, where banking transactions traditionally only performed via bank branches, Automated-Teller Machine (ATM), telephone and online platforms. With the convergence of internet, wireless technologies, and mobile advancement, the new form of banking has emerged, namely, mobile banking. Mobile banking is defined as a channel whereby the customer interacts with bank using mobile device (i.e., mobile phone and Personal Digital Assistant) (Barnes & Corbitt, 2003). Along with the different sectors, banking sector is the leading sector in utilizing both internet and mobile technology in delivering its services (Laukanen, 2007).

Considering the high mobile penetration rate, Pousttchi & Schurig (2004) foresee that m-banking will appear as the most typical applications in m-commerce. However, the current acceptance of m-banking still remains at infancy stage (Sulaiman et al., 2007, Donner & Tellez, 2008, Cheah et al., 2011). Kleijnen et al. (2007) also stated that the m-banking usage is still far from meeting the industry expectation. To further support this, Bank Negara Malaysia (2012) has reported that only a slight increase of 1.7 penetration rate of m-banking

among the mobile subscribers from year 2011 to 2012. Thus, it is not surprising that examining the acceptance and rejection of innovation has emerged as one of the most emphasized areas in innovation research.

Many studies has been conducted to examine the adoption of m-banking (Cheah et al., 2011; Zhou et al., 2010; Sulaiman et al., 2007) through various models such as Technology Acceptance Model (TAM) (Cheah et al., 2011), integrated model of Task-Technology-Fit and Unified Theory of Acceptance and Use of Technology (UTAUT), and Innovation Diffusion Theory (IDT). Puschel et al. (2010) commented that different IS models used will produce different results which make it difficult for scholars to compare the findings. As UTAUT explains 70% of the variance in explaining users' intention (Venkatesh et al., 2003), thus, the study aims to further extend UTAUT model with the inclusion of two additional, namely, trust and perceived value (PV). The paper begins with the introduction, followed by the proposed conceptual research framework and hypothesis development. Lastly, the paper ends with the conclusion and implications.

LITERATURE REVIEW

Unified theory of Acceptance and Use of Technology (UTAUT)

Drawing from TAM, UTAUT was proposed by Venkatesh et al. (2003). Based on the model, both user adoption and usage of IT are affected by four constructs, namely, performance expectancy (PE), effort expectancy (EE), social influence (SI), and facilitating conditions (FC). UTAUT was built after the reviewing the eight renowned IS theories consisting the Technology Acceptance Model (TAM), Theory of Reasoned Action (TRA), Theory of Planned Behavior (TPB), the Innovation Diffusion Theory (IDT), the Motivational Model, the PC Utilization Model, the Social Cognitive Theory (SCT), and the integrated model of technology acceptance and planned behavior. Even though the UTAUT model has not been widely adopted in comparison with the other IS models such as TAM (Zhou et al., 2010), but it has gradually drawn several researchers' attention such as Chong (2012) and Gruzd et al., (2012) to adopt the model to investigate adoption of mobile innovations.

UTAUT

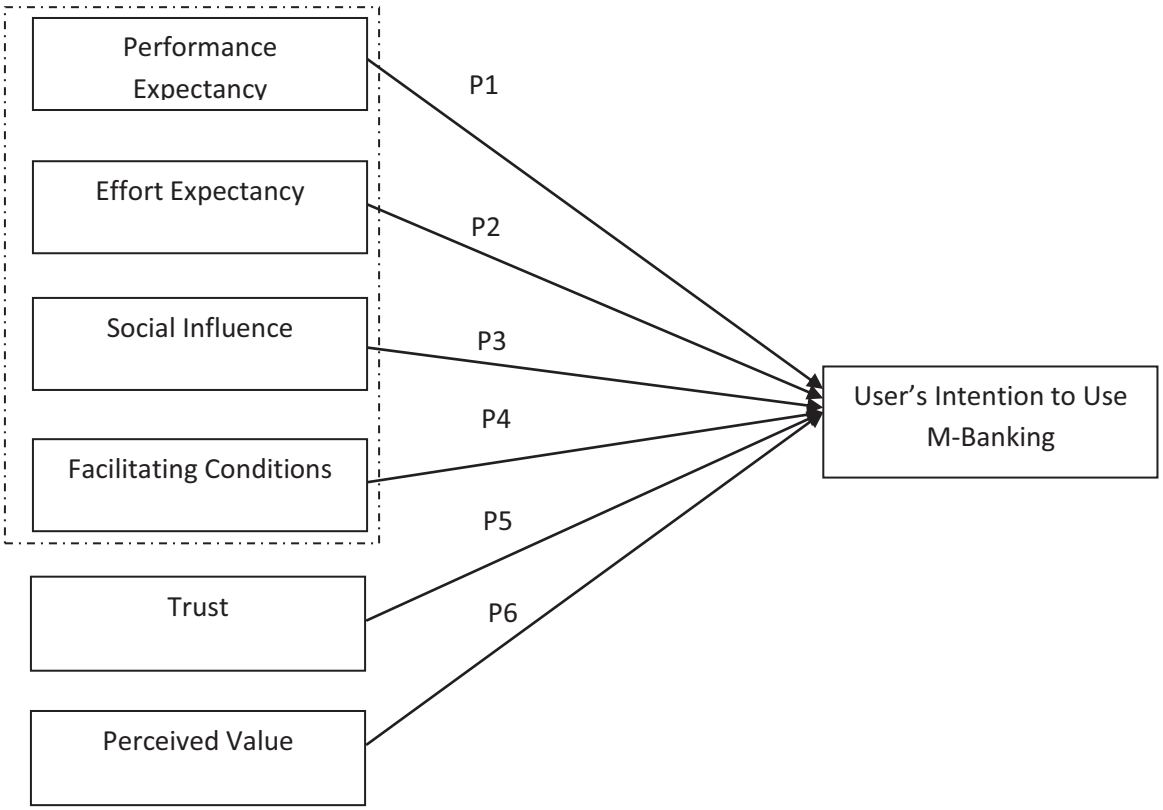

Figure 1: Conceptual Research Framework extent

Hypothesis Development

Performance expectancy (PE) refers to the degree of utilizing an information system (IS) which will provide benefits to the users. PE is conceptually similar to the construct of perceived usefulness and relative advantage from TAM and Innovation Diffusion Technology (IDT) respectively (Venkatesh et al., 2003). Acknowledging the similarity, Brown et al. (2003) denoted that the higher the perceived relative advantages, the greater behavioral intention to adopt m-banking. Effort expectancy (EE) refers to the extent of ease associated with the use of IS. The construct is parallel to perceived ease of use of TAM and complexity of IDT (Venkatesh et al., 2003). In the case of m-banking, users will more likely to use m-banking service if using the service is free from effort and easy to use. Recognizing the important of social influence (SI), Pederson & Ling (2002) indicated that the construct cannot be simply ignored in any innovation adoption studies. Similar to the construct of subjective norm of TRA, SI refers to the extent to which users perceived the importance of others like family & friends' believe that they should utilize the IS (Venkatesh et al., 2003). This simply implies that the social pressures would drive the individual to adopt m-banking services. Facilitating condition (FC) refers to the consumers' perceptions to the resources and support which individuals received when using IS. Zhou et al. (2010) indicated that the users will only adopt m-banking services if they have both financial resources and operational skills. Drawing from the review of literatures, we formulated the following propositions:

P1: PE has positive significant relationship towards Malaysian's m-banking adoption.
P2: EE has positive significant relationship towards Malaysian's m-banking adoption.
P3: SI has positive significant relationship towards Malaysian's m-banking adoption.
P4: FC has positive significant relationship towards Malaysian's m-banking adoption.

In the mobile environment, trust plays a critical role as it involves high degree of uncertainties and risks (Lin et al., 2012). Furthermore, personal information such as contacts is usually stored in users' mobile devices which may lead to relatively high security and privacy risks. Kim & Prabhakar (2004) further supported that the trust has significant influence towards new technologies adoption. Perceived value (PV) is defined as the user's overall perception of m-commerce according to the considerations of the benefits and scarifies needed to acquire and/or use it (Kim, 2007). Chong (2013) through the survey conducted from 140 respondents in China as found that the PV is the critical factor of m-commerce adoption. Hence, the following propositions are postulated:

P5: SI has positive significant relationship towards Malaysian's m-banking adoption.
P6: FC has positive significant relationship towards Malaysian's m-banking adoption.

CONCLUSION AND IMPLICATIONS

The conceptual paper of extended UTAUT examined the determinants of m-banking adoption by adding constructs such as trust and PV. There are several impacts identified from this study which are derived from the original UTAUT model, but this study has also further extended into the perspective of consumers' information system adoption. As such, it provides better understanding on what drives the user's m-banking adoption. Secondly, this study has investigated the adoption of m-banking in developing country, particularly, Malaysia. As mobile devices is relatively important in Malaysian's routines in comparison to North America and Europe as mobile devices play a significant role in Malaysian's routines as compare to North America and Europe (Boer and Boer, 2009), hence, the paper will be beneficial to banks, system engineers, and other service providers in formulating and implementing strategic move to boost the use of m-banking in Malaysia.

ABSTRACT

Purpose: *This paper tries to find operative competitive advantage. The results of this paper help small and medium size enterprises (SMEs) which are striving to export. In fact, this paper introduces a new technique which applies critical factor analysis, risk and opportunities analysis to measure and propose resource allocation for companies in couple of next years.*
Research questions: *In this paper two questions are answered: 1. How to evaluate Knowledge and Technology (K/T) effect on operative Sustainable Competitive Advantages (SCA)?. 2. How the results from calculation Critical Factor Indexes (CFIs), SCA level and K/T are evaluated?*
Design/Methodology/approach: *This research is based on 7 case studies from Oulu South region of Finland. The cases were selected from manufacturing industry including cases focusing on manufacturing of wood product, machinery and equipment, and instruments and appliances. In this research paper, the effect of technology and knowledge on SCA risk level is investigated. In other words, here this question is answered: what would be the effect of T/K calculation on (Balanced) Critical Factor Index changes.*
Findings: *The effect of Knowledge/Technology(K/T) on (Balanced) Critical Factor Index changes depending on the proportions allocated among the different technological levels (Basic, Core or Spearhead) for each attribute separately. Therefore, the effect of K/T may be analyzed by taking the dominating technology and the resource allocation into consideration for each attribute respectively.*

Research limitations/implications: *in this research paper, 7 case studies are investigated. For 6 of them, at least 2 respondents are interviewed. However in one case, there is only one respondent. So in this case, the calculation of CFI factor is not possible. Moreover, as the number of respondents of each case is not big, so it is not possible to eliminate the effect of standard deviation in calculation of CFIs factor.*
Practical implications: *This research helps firms to take balance in resource allocation for each attribute in changing environments on the basis of different level of technology (Basic, Core or Spearhead).*

Key words: Sense and response methodology, Sustainable competitive advantage (SCA) model, Risk level, knowledge and technology (K/T), Oulu South region, Small- and medium –sized enterprise (SME).

Originality/Value: this paper presents the 'first in the world' case study on operative sustainable competitive advantage and corresponding risk levels by taking into account technology and knowledge effects for 7 SME companies.

INTRODUCTION

The world is changing every day and this unstable situation influences on business in huge scale. Among this turbulent environment, operation strategy is one of the most essential tools which can helps manages to save their position or even get more share in global market. According to Si, Takala and Liu (2010),"The future competitiveness of manufacturing operations under dynamic and complex business situations relies on forward-thinking strategies". In fact, companies should have multifocused strategy at the same time and try to consider competitive priorities consist of time, quality, cost and flexibility according to market analysis.

Sustainable competitive advantages (SCA) notion was defined by Porter 1985 for the first time and it has evolved slowly from then. In 1991, Barney completed it as: A firm is said to have a sustained competitive advantage when it is implementing a value creating strategy and when these other firms are unable to duplicate the benefits of this strategy".

Later in 2001 Barney developed his definition and introduced SCA as a resource base theory. The core concept behind resource based strategy is that if a firm is to achieve a state of SCA, it must acquire and control valuable, rare, inimitable, and nonsubstitutable resources.
Marone (1989) believes that considering technology provides some opportunity for firm in the process of decision making and setting strategy for future. So Knowledge and Technology is included in sense and respond questionnaire to calculation SCA levels.

In this paper the effect of K/T factor on SCA level is investigated. The paper tries to answer two questions: 1. How to evaluate K/T effect to operative SCA?. 2. How the results from calculation CFIs, SCA risk level and K/T are evaluated?
In order to answer the questions, seven case companies from Oulu region of Finland are investigated, from each case company; at least 2 respondents are interviewed. Only in one case company (C), one respondent is interviewed.

This paper introduces a short literature review to the topic and some background information about the case companies. In the next part, general results of including K/T factor on SCA risk level are presented. Then the results of weak market test (WMT) are presented to show how this model meets reality. In next stage, Company E which shows good condition according to WMT is investigated in detail. Finally, discussion about the question and conclusion come.

THEORY BACKGROUND

1. Manufacturing strategy:

Quinn (1980) defines strategy as "the pattern or plan that integrates an organization's major goals, policies and action sequences into a cohesive whole". A well-formulated strategy helps marshal and allocates an organization's resources into a unique and viable posture based upon its relative internal competences and shortcomings, anticipated changes in the environment, and contingent moves by intelligent opponents. From then, the concept of strategy evolved in such a way that nowadays this concept; also include a corporate social responsibility and new models of leadership (Grant, 2005).

It should be mentioned here that there is a significant different between corporate strategy and business strategy. In fact, corporate strategy means overall business portfolio, acquisitions, divestments, joint ventures and major reorganizations while business strategy defines single business or product line strategy. The following picture shows the differences between these two concepts (Daft, 1986: 476-477):

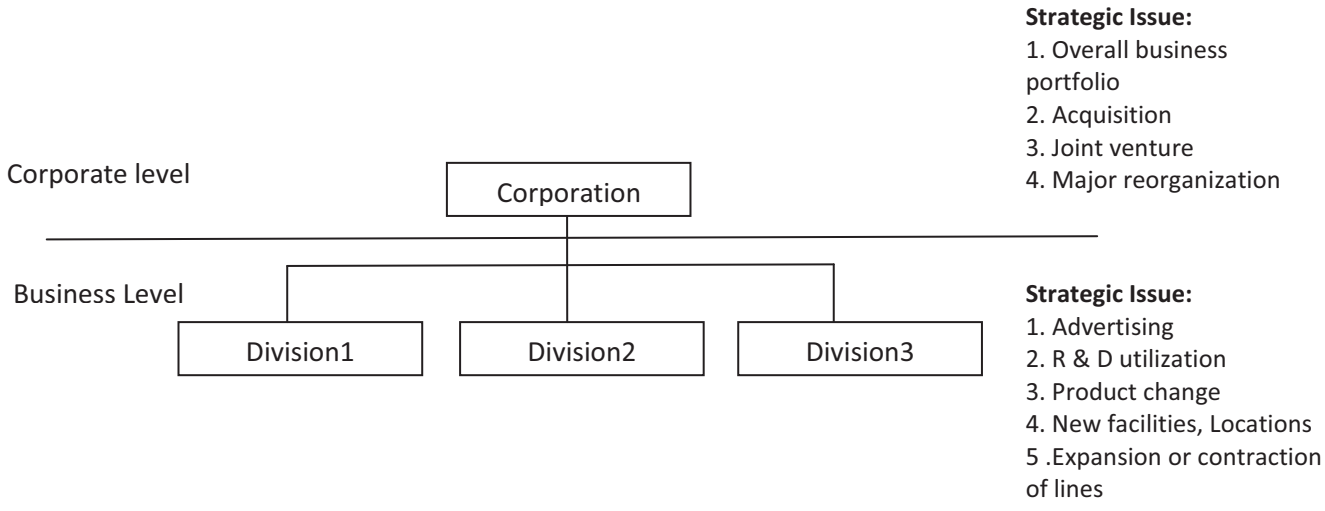

Figure1.Hierarchy of corporate and business level strategies (Daft, 1986: 477)

A long with the strategy definitions, several archetypes or topologies have been proposed to define the decisions and directions that managers implement in their organizations.
On of the most famous strategy topology is defined by Michael Porter in year 1980. In his model, he defines three generic enterprise strategies as (Porter, 1980: 34-40):

- Overall cost leader ship
- Differentiation
- Segmentation

Another famous strategy topology is defied by Miles and Snow. Miles and Snow´s competitive strategies divide the business strategies on to four groups (Daft, 2009):

- Defender: concentrates in a mature product or market operation. This strategy focus on efficiently and prefer not to take risk . in this type of strategy company tries to strengthen efficiency and maintain their current costumers.
- Prospector strategy: looks forward to new opportunities in market. This strategy is dynamic and tries to innovate in processes and take risk. Besides, this type of strategy focus to lead it's industry.
- Analyzer strategy: is placed between the defender and prospector strategy and tries to conserve a steady state in market.
- Reactor strategy: is no-strategy and happens in absence of defined goals and objectives. In this type of strategy, decisions are taken to respond immediate problems as there is no sense of direction.

According to Daft (1986: 480) the choice between these alternatives depends on the current product life cycle and how does the management interpret the external environment. There are three main problems, which drives the companies to make decisions among these possibilities: Entrepreneurial, engineering, and administrative problems (Daft 1986: 481). Differences between these different company types are listed in the table below:

Table 1.Strategy types: (Daft 1986: 481, Miles, Snow, Meyer & Coleman Jr., 1978: 557-558).

Characteristic	**Defender**	**Analyzer**	**Prospector**	**Reactor**
Environment	Stable	Moderately Changing	Dynamic, Growing	Any condition
Strategy	Seal Off share of market Protect tuff. Advertise to hold customer	Maintain market but innovative at edges. Locate opportunities for expansion while protecting current position	Find and exploit new market opportunities. Scan environments. Take risk.	Not clear strategy . React to specific condition. Drift.
Internal characteristic	Efficient production. Retrench	Efficient production yet flexibility for	Flexible production. Innovation and	Now clear organization approach.

Characteristic	Defender	Analyzer	Prospector	Reactor
	tough control. Centralized mechanistic	new lines. Tight control over current activities. Looser for new lines.	coordination. Expansion. Centralized organic.	Depends on current needs.

Madu el al (1996) introduced a technology path for different technology level. This model is completed by Takala later. The idea behind this model is that when a company starts to sell its product. It moves from Technology specialist to commodity product, collaboration partner and problem solver step by step. This concept shows in following picture (Takala, Hirvela¨ and Liu):

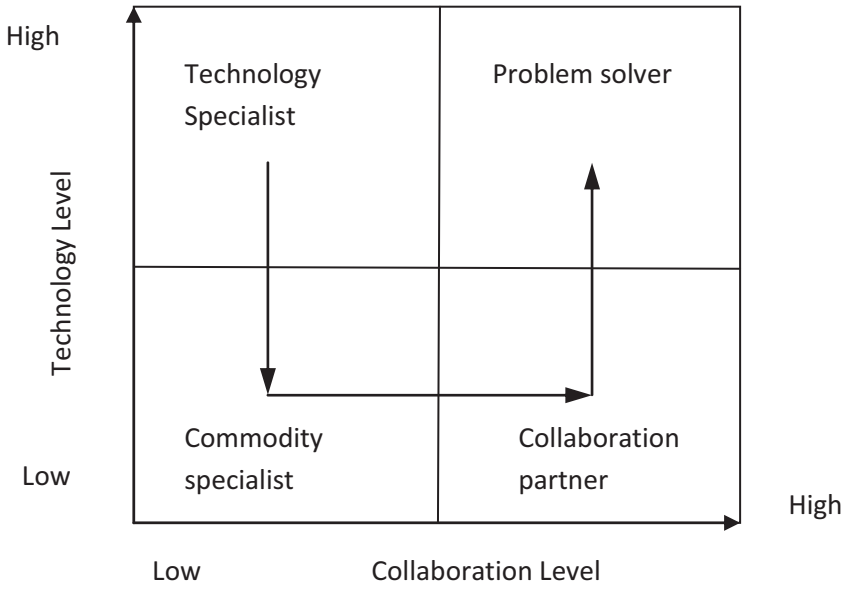

Figure2.Technology path: modified from et al. (1996)

A manufacturing strategy based on a business strategy includes three objectives: competitive priorities, manufacturing objectives and action plans. In other words, first competitive priorities for a company are defined. Then, regarding to competitive priority manufacturing strategy are defined. Finally in last step, suitable action plan to achieve strategic goal is defined and implemented. The following picture shows this process model (Kim and Arnold. 1996):

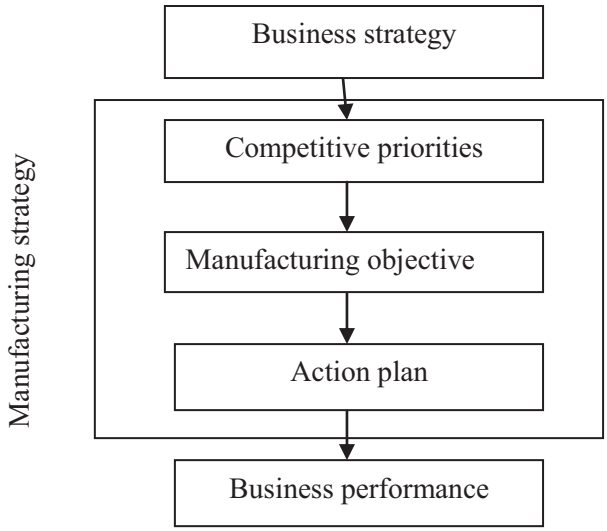

Figure3.Process model of manufacturing strategy, Kim and Arnold(1996)

2. Resources based view of the firm:

Barney et al(2001), suggest sustainable competitive advantages as a resource- based strategy. The core concept behind resource based strategy is that if a firm is to achieve a state of SCA, it must acquire and control valuable, rare, inimitable, and nonsubstitutable resources. Moreover, this firm should have an organization can absorb and apply them (Jeroen Kraaijenbrink, J.-C. Spender and Aard J. Groen,2010). It should be emphasized here that technology as know-how, is a relevant part of resource based strategy (Braun, 1998; Takala, 1997).

Wernerfelt (1984), suggests that analyzing a firm from the resource side has more benefit rather than from the product side.In fact, he believes that the resources and the product should be taken to account at the same time and finding optimal product market activities is possible by specifying a resource profile for a firm.

METHODS

1. AHP, questionnaires, data collection and analysis

According to Saaty 1980,"The Analytic Hierarchy Process (AHP) method is a multi-attribute decision instrument that allows considering quantitative, qualitative measures and making tradeoffs"(Yang Liu and Josu Takala).

The data of case company are collected by asking managers or people from managements group to answer the questionnaires from different departments. The interviewees are normally decision makers and middle management groups in the case company, who understand the operations of the company, and the number of informants is dependent on the size of the case company. The interviewed high competence experts should be representative to know well the operations of the studied case company.

2. CFIs, Sense and respond

The sense & respond model is used to help in dynamic decision-making to describe, evaluate, benchmark and optimize lower level resource allocations to meet the performance requirements in all the interest groups inside and outside the organization and in turn to improve higher level strategies. The critical factor index (CFI) method is a measurement tool to indicate which attribute of a process is critical and which is not, based on the experience and expectations of the interviewees. The S&R model has gone through three stages of development, which are called CFI model, BCFI model, and SCFI model.

3. Manufacturing strategy

The analytical models for manufacturing strategy are used to calculate the operational competitiveness indexes of companies in different competitive groups, namely prospector, analyzer and defender. The manufacturing strategy index (MSI) is modeled based on the multi criteria priority weights of Q (Quality), C (Cost), T (Time/delivery) and F (Flexibility), as function $MSI = f_{MSI}(Q, C, T, F)$.

Figure 5 shows different position of a firm considering operation strategy. In this picture, prospectors are constantly seeking for new market and product innovations. They create instability in the market. Prospectors are concentrating in quality so they are not as cost-effective as defenders. Analyzers work both static and dynamic markets. In static markets they seek to operate as cost-effective as possible and in dynamic markets they are observing their competitors and try to adapt most promising ideas. Defenders work at narrow market areas and they have narrow product portfolio. Defenders are concentrated to intensify their existing processes and they don't seek new product and market innovations.

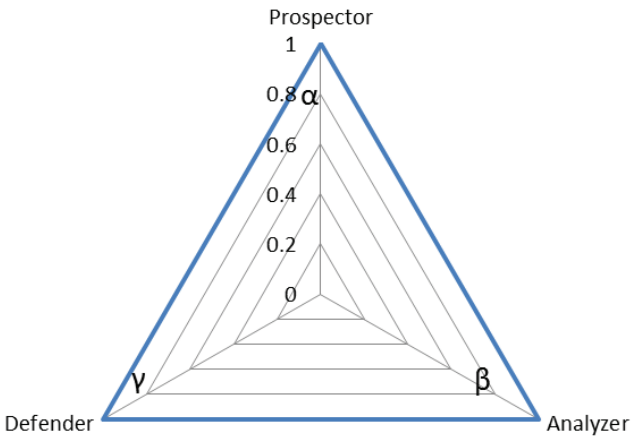

Figure4: Manufacturing strategy

4. SCA, MAPE, RMSE, MAD

Sustainable competitive advantage (SCA) is the measurement of risk level for that the operation strategy should be improved to sustain the operation competitiveness during the period considered. There are three indexes, which are MAPE, RMSE and MAD, to measure the risk level of the operation strategy for sustainable competitive advantages in this paper.

5. Technology Rankings, BCFI K/T

Knowledge/Technology requirement section has been added to the Sense and Response questionnaire to gather information about the companies' knowledge/technology rankings. Basic technology is referring to technologies commonly used and that can be purchased or outsourced, Core technology is referring to company's current competitive technologies and Spearhead technology is referring to the technologies focused on the future. Each attribute in the list is numbered and analyzed in graphs with respect to the order. The importance of different technological levels (Basic, Core or Spearhead), in technology-based businesses, affects a lot the strategy implementation by the knowledge required, and supports the company's success in the competitive category chosen. The attributes are assigned to one of the multiple key categories of RAL model Quality (Q), Cost (C), Time/Delivery (T) and Flexibility (F), depending on their most significant effect.

CASE INTRODUCTION

Oulu South region:

Oulu South Area is located in Northern Ostrobothnia in the southern part of the province of Oulu. It has three sub-region area of cooperation. The area includes a total of 14 municipalities with a total population of just under 90 000, or about a quarter of the Northern Ostrobothnia population. In 2001, Oulu Southern Regional Ministry of the Interior approved the regional center program three sub-region network-type cooperation area. The region's development strategy has been prepared in Oulu South 2015 agreement. The contract shall be entered in the main area of development in 2007-2015.

Oulu South is one of the main agricultural areas - the area can be characterized as an industrialized in rural areas, because the region offers a significant extent, the manufacturing industry jobs. The largest industries are agriculture, metals, wood products industry, and information and communication technology (ICT). The regional unemployment rate is among the lowest in northern Finland and the age structure of the population is young. This differentiates from other Finnish Oulu Southern rural areas. Oulu South is a business-friendly area where currently about 4,600 active companies. Of these, about 95% of companies are micro-enterprises.

RESULTS

1. The result of including K/T factor on SCA risk Level

The following tables shows how calculating K/T factor effect on SCA risk level:

1.1 SCA risk level in past without K/T:

Table 2.SCA risk level for Oulu South region (Past)

Past	A			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.95	0.88	0.87	
RMSE	0.96	0.92	0.92	
MAD	0.97	0.94	0.94	

Past	B			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.95	0.88	0.87	
RMSE	0.96	0.92	0.92	
MAD	0.97	0.94	0.94	

Past	C			
	CFI	BCFI	SCFI	BCFI T/K
MAPE		0.94	0.92	
RMSE		0.96	0.95	
MAD		0.97	0.96	

Past	D			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	1.00	0.95	0.91	
RMSE	1.00	0.97	0.94	
MAD	1.00	0.97	0.95	

Past	E			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.90	0.87	0.90	
RMSE	0.94	0.92	0.94	
MAD	0.95	0.93	0.95	

Past	F			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.98	0.91	0.92	
RMSE	0.99	0.94	0.95	
MAD	0.99	0.95	0.96	

Past	G			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.90	0.88	0.89	
RMSE	0.94	0.92	0.92	
MAD	0.95	0.94	0.94	

According to the above table, almost all the risk levels are less than 0.10 which means that the company operation strategy is sustainable. Only in three cases (one from case A, one from Case B and two from Case G) risk level is a little more than 0.10 which is not significant considering all the good results.

1.2. SCA risk level in future considering K/T

The following tables show the effect of K/T calculation on SCA risk level in future:

Table 3.SCA risk level for Oulu south region considering K/T (Future)

Future	A			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.88	0.98	0.98	0.80
RMSE	0.93	0.99	0.99	0.88
MAD	0.94	0.99	0.99	0.90

Future	B			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.88	0.98	0.98	0.80
RMSE	0.93	0.99	0.99	0.88
MAD	0.94	0.99	0.99	0.90

Future	C			
	CFI	BCFI	SCFI	BCFI T/K
MAPE		0.94	0.93	0.94
RMSE		0.96	0.95	0.96
MAD		0.97	0.96	0.97

Future	D			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.96	0.91	0.95	0.90
RMSE	0.97	0.95	0.97	0.94
MAD	0.98	0.96	0.97	0.95

Future	E			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.88	0.88	0.84	0.83
RMSE	0.93	0.93	0.90	0.90
MAD	0.94	0.94	0.92	0.92

Future	F			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.83	0.97	0.97	0.94
RMSE	0.90	0.98	0.98	0.96
MAD	0.91	0.98	0.99	0.97

Future	G			
	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.76	0.79	0.79	0.81
RMSE	0.85	0.87	0.87	0.88
MAD	0.89	0.90	0.90	0.91

According to all the tables above, calculating K/T affects the risk levels. Means that considering K/T factor dose not reduce SCA risk level. In more details, in four cases company contain A, B, D and F the SCA risk level increased after adding K/T factors. In C and G Company the risk level decreased but it is not significant and In case E, SCA risk level stays almost unchanged after adding K/T factor.

1.3. Weak Market Test (WMT):

In order to understand how the calculated results meet the reality the weak market test (WMT) is conducted by interview managers from each company. This new interview is conducted by phone or face to face meeting.

Table4. The results of WMT

	Company Name:	Main Activity/ Industry	Informants	Interview by: phone/Meeting	WMT results with all the results of MSI, DEA, S&R, SCA
1	G	Automation for Mechanical wood industry Civil engineering	Managers	Phone	As expected, OP management too dependent on Manager. Justifies their pre - understanding in a useful manner
2	C	Sawmill	Manager and two persons from management group	Meeting	As expected, very exact result and something new. Verifies the roots of decision making capabilities.
3	F	Mechanical wood products	Manager	Meeting	Accepted
4	E	Manufacturing of sports goods	Manager	Phone	Extremely good, fit of the findings within Operations strategy and sustainable competitive advantage
5	B	Electronics and software	Manager	Meeting	No contradiction with the situation in the operative level Uncertainty and Challenge with the General strategy and ownership

Unfourtuanly, we could not interview the managers from A and D company in this step so the results of WMT is not available.

2. The results of CFIs and T/K calculation for Company E in detail:

In following parts, the results of company E which shows a good condition according to weak market test is explained in detail:

2.1. Expectation VS Experience:

It demonstrates the comparison between the experiences and expectations of the respondents in Figure 5. According to this figure, the average of expectation is more than the average of experience and it means that the company plans to improve the level of different criteria for future.

Figure 5: Detection of the attributes for future competitiveness

2.2. Critical Factor Index (CFIs), Operation Priorities

There are three different colors defined for the resource allocation of the attributes: red, yellow and green, which represent whether an attribute is under resourced, over resourced or balanced. Here the resource allocation of the attributes is considered to be ideal if it is equally distributed. The whole resource is counted to be 100% and it is divided to the total number of attributes. By this division the average resource level is defined. An attribute is counted to be balanced and takes the green color if CFIs value is between the range of 1/3 and 2/3 of average resource level. For the rest, any attribute which has a lower CFIs value than 1/3 of average resource level is counted to be under resourced and takes the red color, and any attribute which has higher CFIs value than 2/3 of average resource level is counted to be over resourced and takes the yellow color (Liu et al, 2012).

Figure 6, shows critical factor index in terms of CFI for future. According to this bar chart, only four attributes are balance resource (the black ones) and sixteen attributes are critical resource (over resources or under resources) in CFI (OP) figure.

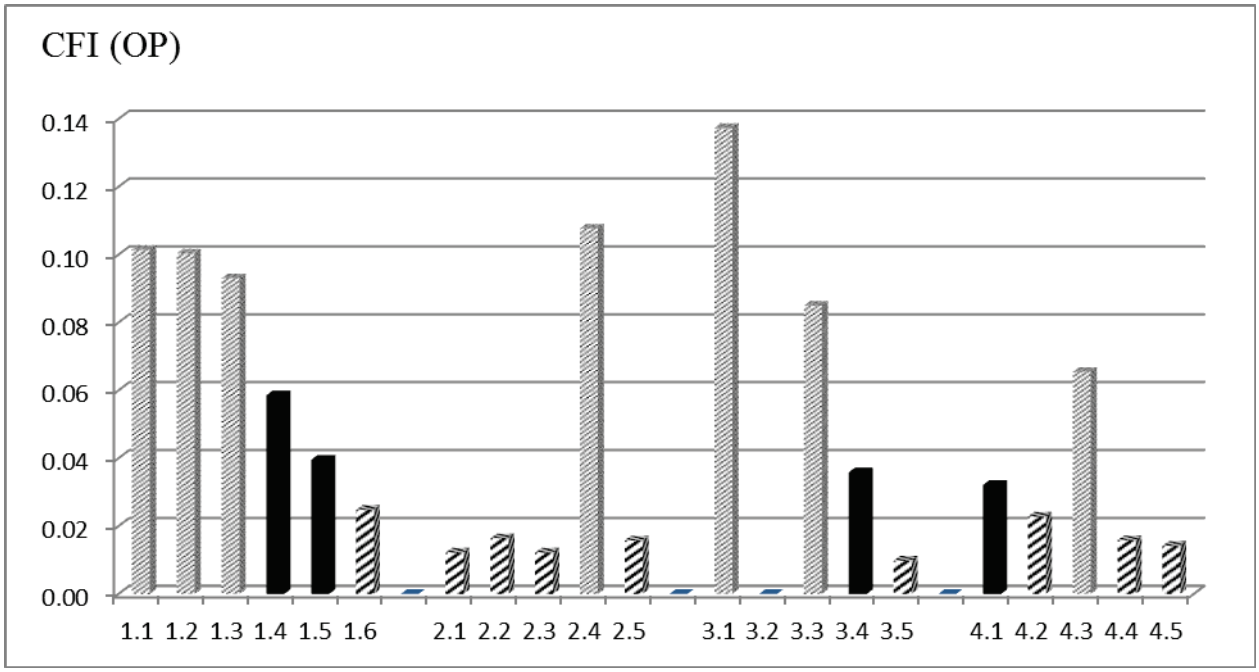

Figure 6: Critical Factors (Operations Priorities)

Next figure shows critical attribute in terms of BCFI. Bar chart shows that three attributes are over (bars with lighter color) and four attributes are under resource (bars with stranger color) in BCFI (OP) figure.

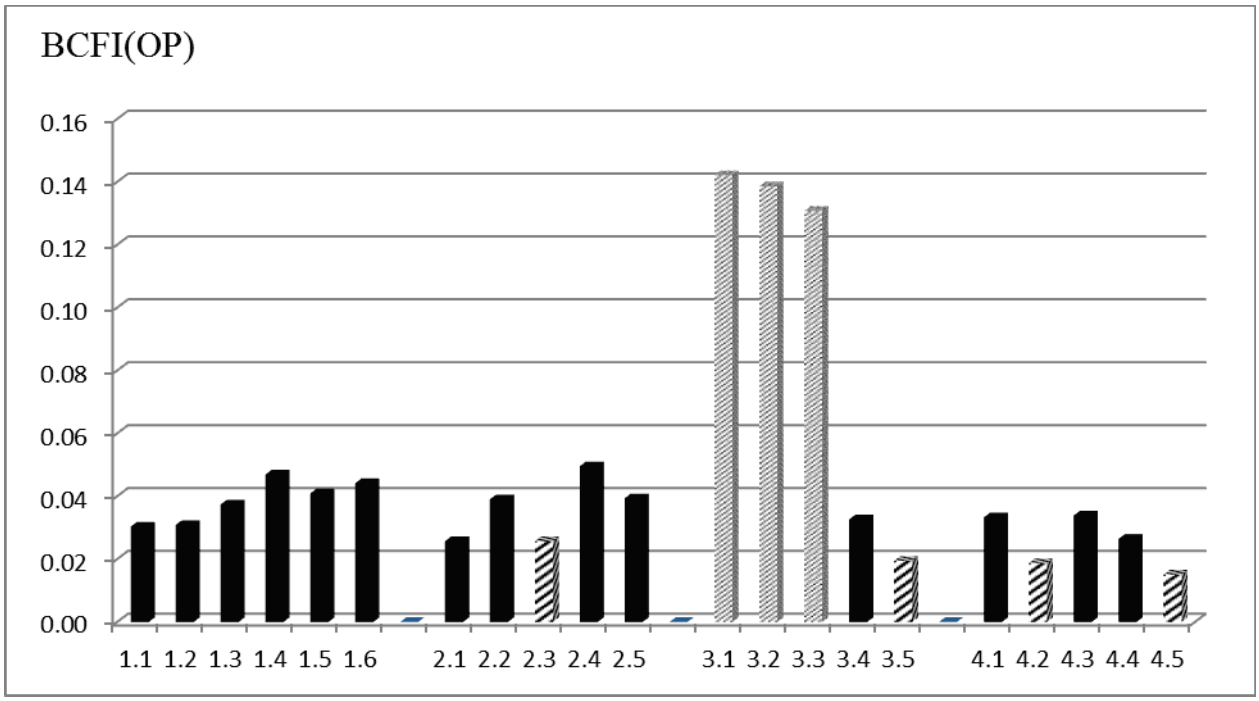

Figure 7. Balanced Critical Factors (Operations Priorities)

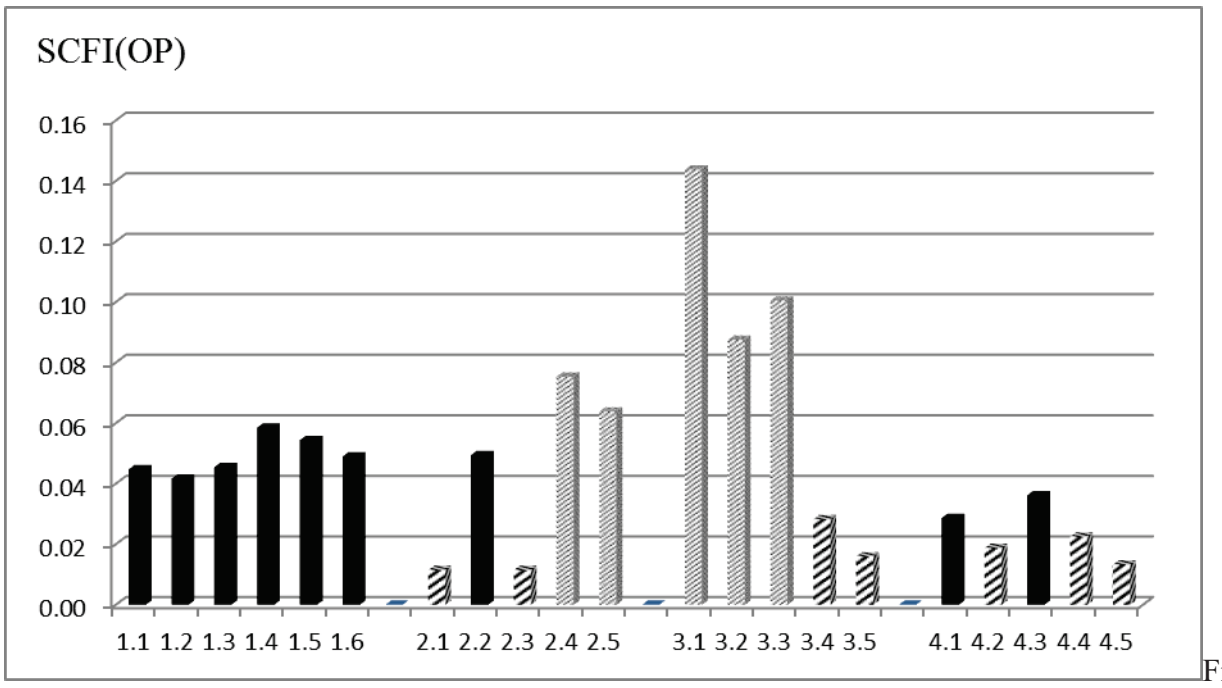
Figure 8, shows critical attribute in terms of SCFI calculation. It shows that five attributes are over and seven attributes are under resource in SCFI (OP) figure.



Fig

Figure 8. Scaled Critical Factors (Operations Priorities)

2.3. SCA calculation

In table 5, the PAD (prospector, Analyzer, Defender) values for both past and future competitive strategy are calculated based on CFI. In past strategy, the PAD value for prospector is 0.89, for analyzer is 0.93 and for defender is 0.92. In future strategy, the PAD value for prospector is 0.89, for analyzer is 0.94 and for defender is 0.91.

Tabale5.SCA value (CFI)

	prospector	Analyzer	Defender
Past	0.89	0.93	0.92
Future	0.89	0.94	0.91

In table 6, PAD values for both past and future competitive strategy are shown based on BCFI. In past strategy, the PAD value for prospector is 0.90, for analyzer is 0.96 and for defender is 0.92. In future strategy, the PAD value for prospector is 0.91, for analyzer is 0.95 and the angle for defender is 0.91.

Table6. SCA values (BCFI)

	prospector	Analyzer	Defender
Past	0.90	0.96	0.92
Future	0.91	0.95	0.91

In table 7, PAD values for both past and future competitive strategy are shown on the basis of SCFI. In past strategy, PAD value for prospector is 0.89, for analyzer is 0.94 and for defender is 0.92. In future strategy, the PAD value for prospector is 0.90, for analyzer is 0.98 and for defender is 0.91.

Table7. SCA values (SCFI)

	prospector	Analyzer	Defender
Past	0.89	0.94	0.92
Future	0.90	0.98	0.91

In Table 8, the SCA risk level (for past and without the effect of K/T) is measured by the MAPE, RMSE and MAD based on the CFI, BCFI and SCFI.

Table 8: SCA Risk Level (past)

	CFI	BCFI	SCFI
MAPE	0,90	0,87	0,90
RMSE	0,94	0,92	0,94
MAD	0,95	0,93	0,95

In Table 9, the SCA risk level (for future and including the effect of K/T) is measured by the MAPE, RMSE and MAD based on the CFI, BCFI and SCFI.

Table 9: SCA Risk Level (Future)

	CFI	BCFI	SCFI	BCFI T/K
MAPE	0.88	0.88	0.84	0.83
RMSE	0.93	0.93	0.90	0.90
MAD	0.94	0.94	0.92	0.92

2.3. Knowledge and Technology (K/T) effect:

In general the company's current competitive technologies (Core Technology) seem to be around 40%, the technologies commonly used (Basic Technology) are around 40% and the technologies focused on the future (Spearhead Technology) are around 20% for most of the attributes (Figure 10). From technology rankings point of view the company is found to be competitive one and aims to follow a positive slope in case of technology as it is aiming to improve it in future case.

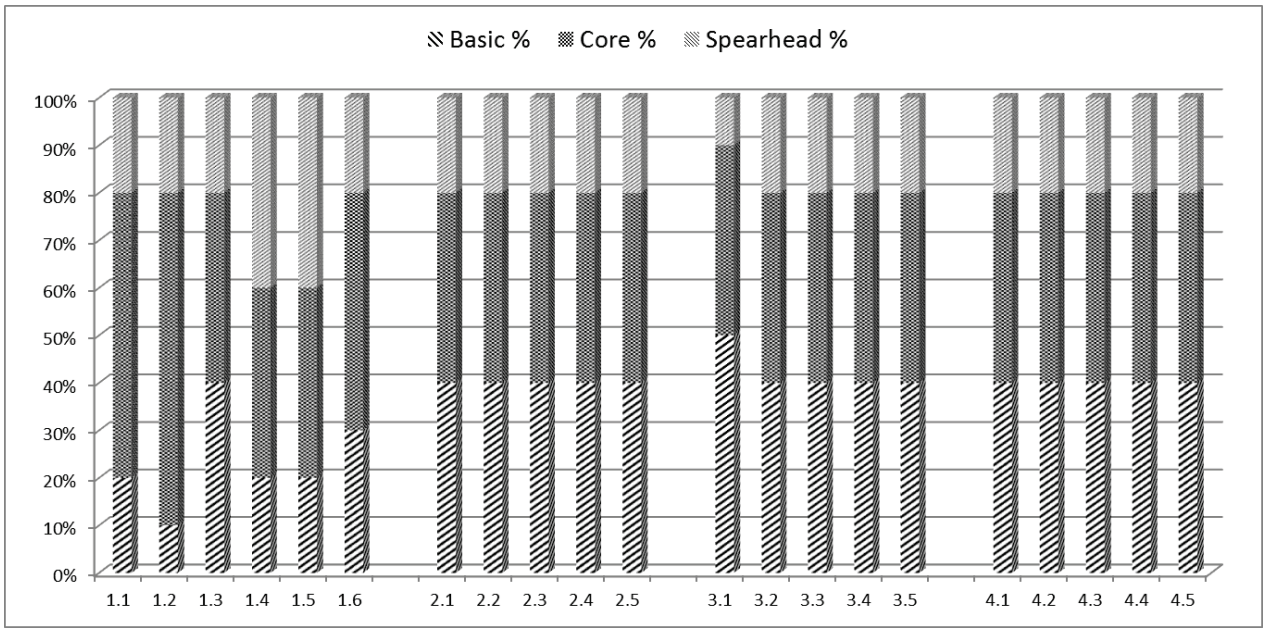


Figure 9: Technology and Knowledge

In Figure 10, the red bars represent the knowledge/technology based BCFI values and other bars stand for traditional BCFI values. From the technology point of view, the attributes number 2.2, 2.4, 2.5, 3.1, 3.2, 3.3, 3.4 seen to be over resourced in terms of BCFI TK, these attributes are observed to be less critical compared to BFCI values, for some attributes are more critical.

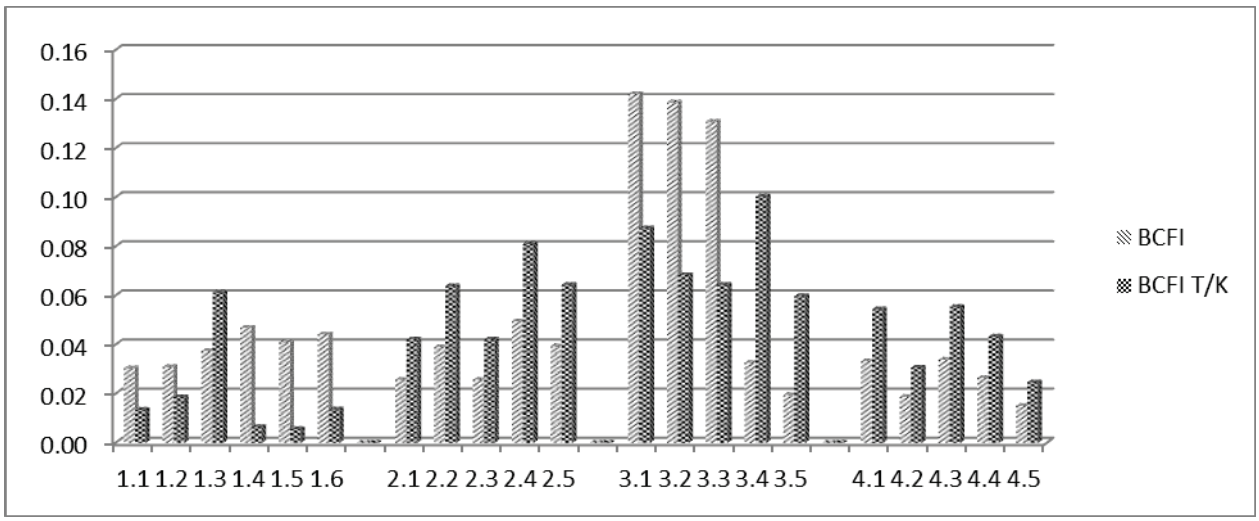

Figure10: BCFI and BCFI T/K

DISCUSSION

In this paper seven case companies from Oulu South region of Finland are investigated to answer two questions:

First question seeks to find the effect of K/T factor on SCA risk level. Investigation these seven case companies' shows that including K/T factor dose not decrease the SCA risk level in general. In fact, including K/T calculation enhances the risk level only in case C and G just a bit. But this amount of enhancement is not significant. In only one case (E) SCA risk level stays almost unchanged after adding K/T factor and for the rest of cases consist of A,B, D and F risk level increased after adding K/T factors .

Second question focus on evaluation of CFIs calculation, SCA level and K/T factor. To answer this question one case company (E) which shows good condition according to WMT (and results of calculation meet the reality well), is investigated in detail. The following results are obtained: first: investigation of case E shows that including K/T in BCFI calculation, does not guide attribute to more or less critical places in general. In other words, for some attribute BCFI K/T shows more critical position compared to BCFI and for some of them BCFI K/T shows less critical position compared to BCFI(no specific direction). Second: the strategy of case E is sustainable. In other words, there is not any significant difference between the result of SCA level in past and future and all of the SCA levels show the position of Analyzer for company E in past and future. This result can be very useful for managers and shows them if in future the company wants to get the position of prospector and lead the market they need and should to invest on the resources which are related to quality otherwise in best condition they can only save this current position for future.

CONCLUSION

The study of sustainable competitive advantage is essential – it uses the Sensing and Responding methodology to finding critical factors in experiences and expectations. The study presents methodology which evaluates the effect of K/T to SCA risk level by taking resource allocation to consideration. Moreover this methodology ensures that the various resources of the organization are operating in accordance with common strategy. The value of the methodology is in its ability to make the structure of the organizations and strategies transparent for developing actions. General finding of the development work is an importance of information technology for the target organization and transformational leadership for proactive preparedness.

In summary, the results of weak market test for 5 companies show that in general, this model is applicable in real business world and the outcomes are not far away from mangers exception but in order to validate and test formula for strategic decision making process, more studies and investigation is necessary and this model is still in initial stages.

APPENDIX

1.The models of CFI, BCFI and SCFI

Name	Model
CFI	$CFI = \frac{Std\{\exp erience\} \times Std\{\exp ectation\}}{\mathrm{Im}\, por\tan ce\ index \times Gap\ index \times Development\ index}$ (1)
BCFI	$BCFI = \frac{SD\{\exp erience\} \times SD\{\exp ectation\} \times Performance\ index}{\mathrm{Im}\, por\tan ce\ index \times Gap\ index \times Development\ index}$ (2)
SCFI	$SCFI = \frac{\sqrt{\frac{1}{n}\sum_{i=1}^{n}[\exp erience(i)-1]^2} \times \sqrt{\frac{1}{n}\sum_{i=1}^{n}[\exp ectation(i)-1]^2} \times Performance\ index}{\mathrm{Im}\, por\tan ce\ index \times Gap\ index \times Development\ index}$ (3)

Parameters:

$$\mathrm{Im}\, por\tan ce\ index = \frac{Average(\exp ectation)}{10};$$

$$Gap\ index = \left|\frac{Average(\exp erience) - Average(\exp ectation)}{10}\right|;$$

$$Development\ index = |0.9 \times (better - worse) - 1|;$$

$$Performance\ index = \frac{Average(\exp erience)}{10};$$

$$SD(\exp erience) = \frac{Std(\exp erience)}{10} + 1;$$

$$SD(\exp ectation) = \frac{Std(\exp ectation)}{10} + 1.$$

2. Calculation of MSI factors:

The equations to calculate normalized weights of core factors are as follows:

$$Q' = \frac{Q}{Q+C+T} \quad (4)$$

$$C' = \frac{C}{Q+C+T} \quad (5)$$

$$T' = \frac{T}{Q+C+T} \quad (6)$$

$$F' = \frac{F}{Q+C+T+F} \quad (7)$$

$$Q = Quality; C = Cost; T = Time/delivery; F = Flexibility.$$

3.The analytical models to calculate the manufacturing strategy indexes of operational competitiveness in each group :

The MSI model for prospector group:

$$MSI_p = 1-(1-Q^{'1/3})(1-0.9T^{'})(1-0.9C^{'})F^{'1/3} \quad (8)$$

The MSI model for analyzer group:

$$MSI_A = 1-(1-F^{'})\left|(0.95Q^{'}-0.285)(0.95T^{'}-0.285)(0.95C^{'}-0.285)\right|^{1/3} \quad (9)$$

The MSI model for defender group:

$$MSI_D = 1-(1-C^{'1/3})(1-0.9T^{'})(1-0.9Q^{'})F^{'1/3} \quad (10)$$

4. Calculation of risk level: Models of MAPE, RMSE and MAD

The equations to calculate risk level are as follows:

Name	Models
MAPE	$MAPE = 1-\sum_{i=1}^{n}\left\|(BS_i - BR_i)/BS_i\right\|$ (15)
RMSE	$RMSE = 1-\sqrt{\sum_{i=1}^{n}[(BS_i - BR_i)/BS_i]^2}$ (16)
MAD	$MAD = 1-\max\left((BS_i - BR_i)/BR_i\right)$ (17)

5. Knowledge and Technology Calculation

$$IMPL\ Basic = \frac{std\ \{Basic\ Technology(\%)\}}{avg\ \{Basic\ technology(\%)\}} \quad (18)$$

$$IMPL\ Core = \frac{std\ \{Core\ Technology(\%)\}}{avg\ \{Core\ technology(\%)\}} \quad (19)$$

$$IMPL\ Spearhead = \frac{std\ \{Spearhead\ Technology(\%)\}}{avg\ \{Spearhead\ technology(\%)\}} \quad (20)$$

$$Technology\ IMPL = \sqrt{\sum(IMPL\ Basic^2 + IMPL\ Core^2 + IMPL\ Spearhead^2)} \quad (21)$$

6. The Criteria used in Questionnaire for Sense and respond method:

	ATTRIBUTES	
	Knowledge & Technology Management	
1.1	Training and development of the company's personnel	← Flexibility
1.2	Innovativeness and performance of research and development	← Cost
1.3	Communication between different departments and hierarchy levels	← Time
1.4	Adaptation to knowledge and technology	← Flexibility
1.5	Knowledge and technology diffusion	← Cost
1.6	Design and planning of the processes and products	← Time
	Processes & Work flows	
2.1	Short and prompt lead-times in order-fulfillment process	← Flexibility
2.2	Reduction of unprofitable time in processes	← Cost
2.3	On-time deliveries to customer	← Quality
2.4	Control and optimization of all types of inventories	← Quality
2.5	Adaptiveness of changes in demands and in order backlog	← Flexibility
	Organizational systems	
3.1	Leadership and management systems of the company	← Cost
3.2	Quality control of products, processes and operations	← Quality
3.3	Well defined responsibilities and tasks for each operation	← Flexibility
3.4	Utilizing different types of organizing systems	← Flexibility
3.5	Code of conduct and security of data and information	← Cost
	Information systems	
4.1	Information systems support the business processes	← Time
4.2	Visibility of information in information systems	← Time
4.3	Availability of information in information systems	← Time
4.4	Quality & reliability of information in information systems	← Quality
4.5	Usability and functionality of information systems	← Quality

ABSTRACT

This paper applies a multivariate GARCH model to analyze the interdependence among gold, stocks and bonds price. Besides, we also examine the relationship between gold and oil price to see if gold could store value during financial crisis term. The empirical results show that gold is a feedback hedge for stocks for the full sample period. Hence, gold is a good diversification instrument for stock investment. About the correlation between gold and oil price, this paper finds that gold possesses store-value function. During the financial crisis period, gold is a safe haven for bonds only when the innovations flow from gold to bond market. On the relationship between oil price and gold, it is found that gold is no longer a fine product to resist inflation. Although the direction and duration are not identical, the impulse responses among gold, stock and bond markets are short-lived. Briefly, there exists some kind of relatedness between gold and stocks and gold and bonds. Generally, gold is a suitable tool to hedge against the stock market; whilst during financial crisis span, gold is not a safe haven for stocks.

Keywords: Gold; Stock; Bond; Multivariate GARCH model.

INTRODUCTION

Owing to the rising oil prices and weak dollar, the quotation of gold rises steadily. In addition to gold's ability to oppose to inflation, the increasing demand for gold from emerging market, the function of gold to serve as reserves in monetary issue and the hedging necessity in the financial market also promote the price of gold. Furthermore, the particular qualities of gold make it different from other commodity, such as gold can be stored eternally and it has negligible impacts from weather changes (Lin, Chiang and Chen, 2008). Accordingly, gold possesses an unquestionable position all the time, no matter in the period of gold standard or in modern times in which gold could be a good store or protection of value along with counter-cyclical investment vehicle under political and economic uncertainty.

Charles de Gaulle has ever said, "There can be no other criterion, no other standard than gold. Gold has no nationality and is externally and universally accepted as the unalterable fiduciary value par excellence". As a consequence, gold has long been a hedge instrument against price fluctuation in other financial products. Especially for some investors, the investment in gold is regarded as a good hedge or safe haven in opposition to the movements in stock or bond markets. However, if the interrelations among stock, bond and gold change, the response to information may not be the same as before. That is, the hedging or safe haven role played by gold might disappear. Therefore, understanding the nature of the interdependence among different classes of assets, such as stock, bond and gold, is important for investors' portfolio choices.

Despite there have been many existing literature associated with gold, they are mainly tended to concentrate on the macroeconomic influences on gold market (Christie-David, Chaudhry and Koch, 2000; Cai, Cheung and Wong, 2001; Tully and Lucey, 2007), the causality relationships between gold and stock market (Smith, 2001; Mishra, Das and Mishra, 2010), the determinants of gold price (Levin and Wright, 2006; Elfakhani, Baalbaki and Rizk, 2009) and the functions of gold as safe havens (Upper, 2000; Kaul and Sapp, 2007). Even though Capie, Mills and Wood (2005) have analyzed the role of gold as a hedge, their research is limited to investigate the condition of gold against the U.S. dollar. That is, they only consider the role of gold as a hedge for exchange rate risk.

It is not until recently that Baru and Lucey (2010) have examined the position of gold as a hedge or a safe haven for stocks and bonds in bull and bear markets, whilst they only check the impacts of stocks and bonds on gold, none the reverse. However, to the best of our knowledge, the fluctuations of financial markets are interactive (Cheung and Mak, 1992; Ibrahim, 2006; Iwatsubo and Inagaki, 2007). Namely, the variations among gold, stocks and bonds might be related (as described in Figure 1). Accordingly, the role of gold could no longer be a hedge or safe haven; that is, gold may be none of them (Sumner, Johnson and Soenen, 2010). But seldom paper has analyzed the interrelation among the previous three financial products so far.
Besides, from Figure 1, we can also see that there seems to have some kind of relatedness between oil price and gold price/stocks/bonds. When global financial crisis in 2008 being

used as a partition point, it shows that the price of oil shows a stable rising trend before 2008, and attains a peak in July 3 2008. But since then, oil price has nosedived and fell to the low band in 19 December 2008. During this six-month period, the oil price plummeted by 77%. At the same time, the prices of stocks and gold also decrease, whilst those of bonds index are the reverse. We therefore suggest that the fluctuations of oil prices have impacts on that of gold, stocks and bonds.

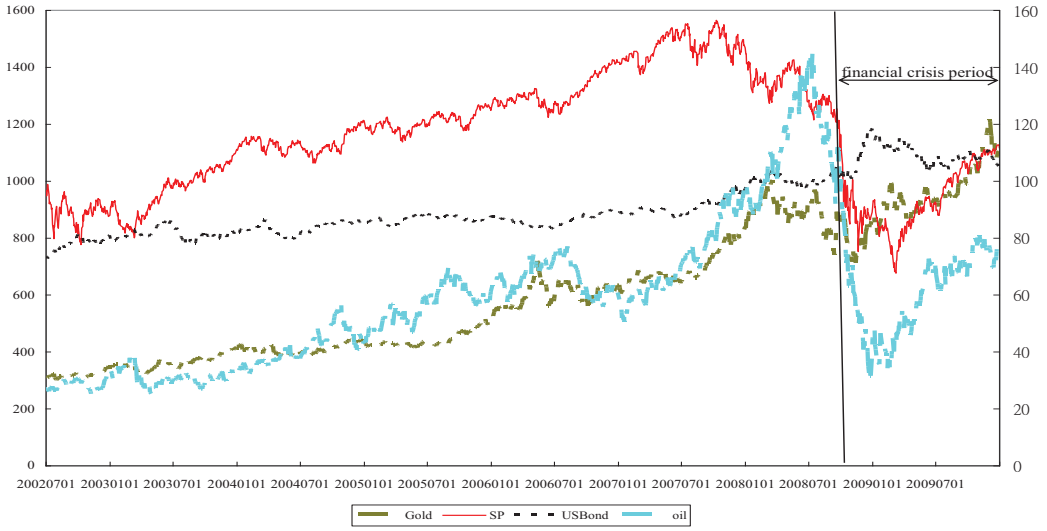

Figure 1 Daily price trend on the stock, bond, gold and oil, July 2002-December, 2009.

Of course, the burst out of subprime mortgage crisis, that is, the bankruptcy of Lehman Brothers Holdings Inc. declared on September 15 2008, may have altered the structure of financial market and have spillover influences on financial products. That is, in addition to stocks, bonds and gold price could also be affected by the subprime mortgage crisis.

Accordingly, the main purpose of this paper is to employ a multivariate GARCH Baba-Engle-Kraft-Kroner (BEKK) model defined in Engle and Kroner (1995) to examine the interrelationship among stocks, bonds and gold along with the role differences played by gold in full sample and subsample period (post-subprime mortgage crisis). In other words, this paper would to analyze whether investors would flee from stocks and bonds investment and get into gold products when stock and bond market exhibits severe losses (Gulko, 2002; Hartmann, Straetmans, and de Vries, 2004; and Baur and Lucey, 2009). In this way, we could learn if gold serves as a good hedge or safe haven instrument when the financial market reverses.

Our empirical results show that gold is a feedback hedge for stocks for the full sample of data. However, the hedge relationship between gold and bonds is unidirectional. Gold can store value only in normal financial market. During the financial crisis period, gold is a good safe haven for bonds, not for stocks. But gold no longer owns the ability to store value. Besides, even if the way, degree and duration are not similar, the impulse responses among gold, stocks and bonds markets are short-term. Generally, gold is a suitable tool to hedge against the stock market; whilst throughtout the financial crisis period, gold is not a safe haven.

The remainder of this paper is organized as follows. Descriptions of the related data and the empirical methodology adopted for this study are provided in Section 2, followed in the penultimate section by presentation of our empirical results. Finally, the conclusions drawn from this study are summarized in the closing section.

DATA AND METHODOLOGY

Data

The analyses of interrelation among stock, bond and gold price along with the influences of oil price and subprime mortgage crisis are based upon the daily closing price of S&P 500 stock index, New York gold market (USD/ounce), West Texas intermediate crude oil (USD/barrel) and U.S. bond index. The former three data are obtained from the Taiwan Economic Journal (TEJ), and the last one is obtained for Bloomberg. The sample period for the study covers seven and half years, from July 1, 2002 to December 31, 2009, with a total sample of 1,838 observations. Besides, we define the subprime financial crisis period as the span from September 16, 2008 to December 31, 2009, including 314 observations. All the analysis is conducted on return data.[4]

Methodology

1. Multivariate GARCH Model

As the main purpose of this paper is focused on the dynamic relationship among stock, bond and gold along with the exogenous effects from oil price and subprime mortgage crisis, we apply a multivariate GARCH model to analyze their correlation and related impacts. An important preliminary step in model building is the selection of the lag order. In order to eliminate the autocorrelation of residual, we use some commonly used lag-order selection criteria to choose the lag order, such as AIC (Akaike Information Creteria).

$$AIC = -2\left(\frac{Log L}{T}\right) = \frac{2k}{T} \tag{1}$$

Base on AIC, the lag order we chosen is 2 for the three series in the study. Because the data we used are daily data, the result is reasonable. The empirical model can be constructed as follows.

$$\begin{aligned} G_t = {} & \beta_{G0} + \sum_{k=1}^{2}\beta_{G1k}G_{t-k} + \sum_{k=1}^{2}\beta_{G2k}S_{t-k} + \sum_{k=1}^{2}\beta_{G3k}B_{t-k} + \sum_{k=1}^{2}\beta_{G4k}O_{t-k} + \\ & D\times\left(\gamma_{G0} + \sum_{k=1}^{2}\gamma_{G1k}G_{t-k} + \sum_{k=1}^{2}\gamma_{G2k}S_{t-k} + \sum_{k=1}^{2}\gamma_{G3k}B_{t-k} + \sum_{k=1}^{2}\gamma_{G4k}O_{t-k}\right) + \varepsilon_{G,t} \end{aligned} \tag{2}$$

[4] Unit root tests are conducted for stock, bond, gold and oil series. As the results show that the four series have unit roots, we use first-order difference (return) to implement our empirical study. To save space, related results are not shown here. All results are available on request.

$$S_t = \beta_{S0} + \sum_{k=1}^{2}\beta_{S2k}S_{t-k} + \sum_{k=1}^{2}\beta_{S1k}G_{t-k} + \sum_{k=1}^{2}\beta_{S3k}B_{t-k} + \sum_{k=1}^{2}\beta_{S4k}O_{t-k} + D\times\left(\gamma_{S0} + \sum_{k=1}^{2}\gamma_{S2k}S_{t-k} + \sum_{k=1}^{2}\gamma_{S1k}G_{t-k} + \sum_{k=1}^{2}\gamma_{S3k}B_{t-k} + \sum_{k=1}^{2}\gamma_{S4k}O_{t-k}\right) + \varepsilon_{S,t} \quad (3)$$

$$B_t = \beta_{B0} + \sum_{k=1}^{2}\beta_{B3k}B_{t-k} + \sum_{k=1}^{2}\beta_{B1k}G_{t-k} + \sum_{k=1}^{2}\beta_{B2k}S_{t-k} + \sum_{k=1}^{2}\beta_{B4k}O_{t-k} + D\times\left(\gamma_{B0} + \sum_{k=1}^{2}\gamma_{B3k}B_{t-k} + \sum_{k=1}^{2}\gamma_{B1k}G_{t-k} + \sum_{k=1}^{2}\gamma_{B2k}S_{t-k} + \sum_{k=1}^{2}\gamma_{B4k}O_{t-k}\right) + \varepsilon_{B,t} \quad (4)$$

$$\begin{bmatrix}\varepsilon_{G,t}\\ \varepsilon_{S,t}\\ \varepsilon_{B,t}\end{bmatrix}\Big|\,\Omega_{t-1} \sim N(0, H_t) \quad (5)$$

$$H_t = \begin{bmatrix} h_{GG,t} & h_{GS,t} & h_{GB,t}\\ h_{SG,t} & h_{SS,t} & h_{SB,t}\\ h_{BG,t} & h_{BS,t} & h_{BB,t}\end{bmatrix} \quad (6)$$

where G_t, S_t, B_t and O_t denote the returns of gold, S&P 500 index, U.S. bond index and West Texas crude oil at time t, respectively. D is a dummy variable, representing the occurrence of subprime mortgage crisis. If the date is after September 15, 2008, then D is 1; otherwise zero. ε_T is the error term, H_t is defined as the covariance matrix, Ω_{t-1} represents the information set at period $t-1$. The individual factors in the covariance matrix are stated as below.

$$h_{GG,t} = c_{11}^2 + a_{111}^2\varepsilon_{G,t-1}^2 + g_{111}^2 h_{GG,t-1} \quad (7)$$

$$h_{GS,t} = c_{11}c_{12} + a_{111}a_{122}\varepsilon_{G,t-1}\varepsilon_{S,t-1} + g_{111}g_{122}h_{GS,t-1} \quad (8)$$

$$h_{GB,t} = c_{11}c_{13} + a_{111}a_{133}\varepsilon_{G,t-1}\varepsilon_{B,t-1} + g_{111}g_{133}h_{GB,t-1} \quad (9)$$

$$h_{SS,t} = c_{12}^2 + c_{22}^2 + \left(a_{122}^2 + a_{222}^2\right)\varepsilon_{S,t-1}^2 + \left(g_{122}^2 + g_{222}^2\right)h_{SS,t-1} \quad (10)$$

$$h_{SB,t} = c_{12}c_{23} + c_{22}c_{23} + \left(a_{122}a_{133} + a_{222}a_{233}\right)\varepsilon_{S,t-1}\varepsilon_{B,t-1} + \left(g_{122}g_{133} + g_{222}g_{233}\right)h_{SB,t-1} \quad (11)$$

$$h_{BB,t} = c_{13}^2 + c_{23}^2 + c_{33}^2 + \left(a_{133}^2 + a_{233}^2 + a_{333}^2\right)\varepsilon_{B,t-1}^2 + \left(g_{133}^2 + g_{233}^2 + g_{333}^2\right)h_{BB,t-1} \quad (12)$$

In the above equations, equation (2) to (4) are the mean equations, and equation (7) to equation (12) are the variance equations, respectively. When the estimated coefficients c_{ij}, a_{ijk} and g_{ijk} are significant, it indicates that taking heteroscedasticity into consideration is well done in this paper.

The advantage of this model is that all of the elements in each covariance matrix are the function of its historical data, so the model can be regarded as a positive definite diagonalized vech type. This study uses normal distribution and maximization likelihood estimation (MLE) to estimate the parameters in the model. The logarithmic likelihood function is defined as follows.

$$L(\theta) = -\frac{1}{2}\sum_{t=1}^{T}\left(\ln|H_t| + \varepsilon_t' H_t^{-1}\varepsilon_t\right) \quad (12)$$

where θ represents the parameter vectors needed to be estimated; T is the number of observations.

2. Impulse Response Function (IRF)

An impulse response refers to the reaction of any dynamic system in response to some external change. This paper uses nonlinear GARCH-IRF equation to analyze the impulse response between variables. This method covers the characteristics of volatility varying with time, which can better correspond to the properties of financial assets. Accordingly, by applying nonlinear GARCH-IRF equation to assay the individual shock from the fluctuations of stock, bond and gold markets**,** we can observe the variation and reaction speed of the impulse response in each series and then make correct investment decision.

EMPIRICAL RESULTS

Basic Statistics

The summary descriptive statistics for the daily logarithmic returns of gold, S&P 500 index and bond index over the seven-half-year sample period are presented in Table 1, from which we can see that the mean daily return is found to the highest (lowest) for the gold (S&P 500 index).

Amongst the three indices, the standard deviation of the return is found to be the highest for S&P 500 index. That is, stocks are generally more risky than gold and bonds. Unexpectedly, gold appears relatively risky than bonds in terms of standard deviation, minimum and maximum values. Besides, all of the indices exhibit large kurtosis, and the Jarque-Bera tests for normality revealing that the returns of the three series are non-normal distributed. Therefore, according to the results of the skewness, kurtosis and Jarque-Bera tests, the return distributions of gold, stock index and bond index are more fat-tailed and high-peaked than normal distribution, consistent with the ARCH effect.

Table 1 Summary statistics of the returns of Gold, S&P 500 index and U.S. bond index

Variables	Mean	Standard deviation	Skewness	Kurtosis	Maximum	Minimum	Jarque-Bera	Q(50)
Gold	0.0680	1.2676	-0.2566***	3.8332***	7.7968	-7.8934	1144.8017***	90.199***
S&P 500	0.0077	1.4186	-0.2258***	8.7617***	10.2457	-9.4695	5891.5417***	129.591***
U.S. Bond	0.0200	0.5260	0.0908	3.3546***	3.9281	-2.8228	863.8640***	69.423***

Note: 1. *** represent 1% significant level.
2. The kurtosis examined here is excess kurtosis, which equals to the original kurtosis minus 3.
3. Q (50) is the Q-statistic of the Ljung-Box test.

ARCH effect

Many empirical results, such as Bollerslev (1986), Colm and Patton (2000) and Wang and Wang (2001), all documented that, GARCH (1, 1) model can provide a good fit for the time series data. Accordingly, in this study, the returns of S&P 500 index, bond index and gold will be dealt with via GARCH (1, 1) process.

Before estimating the parameters of GARCH (1, 1) model, we need to test if ARCH effect exists in the residuals resulted from fitting for the model. Consequently, we apply LM test (Lagrange Multiplier test) to examine if ARCH effect exists. If ARCH effect indeed is present, then it is appropriate to match the volatility with GARCH model in this paper. The results in Table 2 show that ARCH effect does exist in the three series.

Table 2 ARCH effect test for the S&P 500 index, U.S. bond index and Gold

Variables	Gold	S&P 500	U.S. Bond
LM test	143.6410***	533.4720***	89.6986***

Note: *** represent 1% significant level.

Empirical analysis of multivariate GARCH model

This paper employs a multivariate GARCH (1, 1)[5] model to explore the relationship among gold, stocks and bonds along with the role acted by gold. In the following, we abide by the definitions of Baur and Lucey (2010) to investigate if gold could serve as a good hedge or safe haven instrument when the financial market reverses. Accordingly, a hedge is defined as gold return that is uncorrelated or negatively correlated with S&P 500 stock return and U.S. bond return; in contrast, a **s**afe haven is described as gold return that is uncorrelated or negatively correlated with S&P 500 stock return and U.S. bond return in times of market stress or turmoil. In addition, as Harmston (1998) has indicated that gold has maintained its value in terms of real purchasing power worldwide in the very long run. Despite price fluctuations, gold has consistently reverted to its historic purchasing power parity with other commodities and intermediate products. That is, gold has been an effective vehicle to store value. Therefore, this paper defines that gold can be as a store of value when the return of gold is positively correlated with oil return. The related empirical results are presented as follows.

1. Sum tests

The empirical results in Panel B of Table 3 show the outcomes of sum test during the whole sample period. It is found that except for the insiginificant impact of gold and bond return on the stock return, others display siginificant causal relationships. Especially, there is a bidirectional causality between gold and bond market, in spite of the marginal significane of

5 When selecting the values for p and q, it is typical to set both parameters equal to 1, and uses a GARCH (1,1) model to proceed empirical analysis. While increasing p and q will invariably increase the fit to in-sample data, as the various models are nested, the advantages gained are minimal and can lead to over specification.

gold on bond return. This means that the spillover effects from gold and bond market to the stock market are weak; oppositely, both gold and bond markets have interaction with each other. This is, stock market seems to act a leading role during our sample period. Finally, crude oil price only has significant impact on gold market.

Panel C in Table 3 is the result of sum test for the financial crisis period. Not surprising, the findings are different from those for the whole sample period. In this term, there are no impacts of stock and bond returns on gold return, but the spillover effects from the gold market to stock and bond market are significant and stronger than non-financial crisis period. Thus it can be seen that the character played by gold is more evident than before. Lastly, the impacts of crude oil price on the three markets are insignificant.

Form the sum test results, we believe that gold and stock along with bond returns may be correlated, that is, gold can be helpful in predicting, to some degree, the stock and bond market trend, inconsistent with the result of Sumner, Johnson and Soenen (2010).

2. The results for total sample period

Table 3 and Table 4 show the results for the mean equation and variance equation in the multivariate GARCH (1, 1) model. The β_G coefficients in the first column of Panel A in Table 3 exhibit the influence of all related variables on the gold return. With regard to the impact of stock return, it is found that β_{G21} is insignificant, showing that there is no impact of lag 1 stock return on gold return; however, lag 2 stock return, β_{G22} (0.0854), has significantly positive effect on gold return. Therefore, gold could be a hedge for stock only in lag 1 period. As for the influence in terms of bond returns, the significant positive coefficients of β_{G31} (0.2770) and β_{G32} (0.2126) indicates that when the bond price falls, the gold price also decreases. In other words, gold may not be a good hedge for bond. In addition, the positive coefficient of β_{G41} (0.1062) and β_{G42} (0.0258) discloses that ascending oil price could also promote the increase in gold price, implying that gold seems to function well in resisting inflation and store value during our sample periods. This finding is consistent with that of Harmston (1998).

The β_S coefficients in the second column of Panel A in Table 3 show the impacts of associated variables on the stock return. The effects of β_{S21} (-0.0880) is significantly negative, revealing that the stock return could be affected by its own lag return. That is, stock return possesses mean-reversion characteristic. Besides, the influences of gold returns on stock returns are insignificant, consistent with the issue that gold is a good hedge for stock, agreeing with the outcome of Baur and Lucey (2010). Further, both of the bond return and oil return have no significant impacts on stock return. This result corresponds to the sum test that stock market plays a leading part during our whole sample period.

The β_B coefficients in the third column of Panel A in Table 3 present the affects of variables on the bond return. Just as the results in the stock return, bond return could also be affected by its own lag return. The significance of β_{B32} (-0.0686) shows that mean-revision phenomenon also exists in the bond market. Moreover, β_{B11} and β_{B12} are both

insignificant, showing that there are no impacts of gold returns on the bond return. Hence, gold is a good hedge for bond. Besides, lag stock return, β_{B21} and β_{B22} has negative impact on the bond return. Hence, bond is also a good hedge for stock market, just like the role of gold. In addition, oil return has no impact on bond return.

Combined with the results of sum test for the whole sample period, this paper finds that gold is a feedback hedge for stock, consistent with the finding of Baur and Lucey (2010); namely, hedge occurs in the bidirection between gold and S&P 500 markets. This result makes gold present diversification benefits for stock investment. However, as to the hedge relationship between gold and bond, it is only unidirectional. That is, when the innovations flow from gold to bond market, the hedge effects just exist; otherwise, the situation reverses. If it the case, because gold and bond price move together, gold is no longer a good hedge for bond. Notably, bond is also a good hedge for stock during our total sample period. As to the relationship between gold and crude oil, the results indicate that gold possesses the function to counter inflation and store value, supporting the finding of Harmston (1998).

3. The results during the financial crisis period

Just as the above mentioned, $\beta_G + \gamma_G$ coefficients in the first column of Panel A in Table 3 show the effects of correlative variables on the gold return. As to the impact of stock return, we find that $\beta_{G21} + \gamma_{G21}$ (0.1227) is significant, whilst $\beta_{G22} + \gamma_{G22}$ (-0.0270) is insignificant, showing that gold is a safe haven for stock only in lag 2. Regarding the effect of bond return, the coefficient estimates is significant in lag 1 ($\beta_{G31} + \gamma_{G31}$=0.6217), while insignificant in lag 2 ($\beta_{G32} + \gamma_{G32}$=-0.2635). This result indicates that gold is also a safe haven for bond in lag 2. That is, gold could be a good safe haven instrument against stock and bond only in lag 2 during financial crisis period. Finally, the insignificance of $\beta_{G41} + \gamma_{G41}$ (0.0378) and $\beta_{G42} + \gamma_{G42}$ (-0.0084) seem to point out that oil return has no crucial impact on gold return during financial crisis period. That is, gold can't work well to store value in this period. Apparently, the effects of stock, bond and oil returns on gold return are different from the whole sample period.

$\beta_S + \gamma_S$ coefficients in the second column of Panel A in Table 3 display the influence of all variables on the stock return. First, as to the impact of gold return, $\beta_{S11} + \gamma_{S11}$ (0.1698) and $\beta_{S12} + \gamma_{S12}$ (0.1987) are both significant positive. Namely, there is a positive relationship between gold and stock index. Hence, gold is not a safe haven for stock, inconsistent with the finding of Baur and Lucey (2010). In term of bond returns, $\beta_{S31} + \gamma_{S31}$ is insignificant; whilst $\beta_{S32} + \gamma_{S32}$ (-0.5872) is significantly negative. These outcomes show that when the financial market suffers drastic danger, the invstors would prefer bonds to stocks, similar to the whole sample period. That is, as there exists tremendous downside risk in the financial market during finanicial crisis period, gold is no longer to be a good safe haven for stocks. Relatively, bonds seems to serve good for stocks. Finally, $\beta_{S41} + \gamma_{S41}$ and $\beta_{S42} + \gamma_{S42}$ are both insignificant, presenting that oil returns have no impacts on the stock return and these results are the same as the whole sample span.

$\beta_B + \gamma_B$ coefficients in the third column of Panel A in Table 3 are the impacts of related variables on the bond return. First, with regard to the impact of gold return, $\beta_{B11} + \gamma_{B11}$(-0.0546) and $\beta_{B12} + \gamma_{B12}$(-0.0615) are significant negative, showing that gold is a good safe haven for bond. Second, as for the influence of stock returns, it is found

that $\beta_{B21}+\gamma_{B21}$ (0.0562) and $\beta_{B22}+\gamma_{B22}$ (0.0778) are both significantly positive, indicating that when the stock returns decrease, the bond returns also reduce during financial crisis period. Namely, there is bidirectional causal relationship between stock and bond returns, which is inconsistent with those of the total sample period. Finally, $\beta_{B41}+\gamma_{B41}$ and $\beta_{B42}+\gamma_{B42}$ are both insignificant, again exhibiting that oil return has no effects on the bond return, similar to that of the whole sample term.

Integrated with the outcomes of sum test for the financial crisis period, it shows that gold is a good safe haven for bond, and the influence of gold on bond is even stronger than before, a result disagreeing with that of Baur and Lucey (2010). Similar to the results in whole sample period, gold could be a safe heaven only when the innovations flow from gold to bond market, not the reverse. As to the impact of crude oil price on gold, the results show that gold no longer possesses the effect to resist inflation and store value.

In brief, there exists some kind of relatedness between gold and stocks and gold and bonds, no matter unidirectional or bidirectional. Moreover, it is addressed that the safe haven role played by gold against bond is more evident during financial tsunami. Besides, the move in oil price can only positively impact that of gold price in total sample period; whilst in financial crunch term, oil price is almost unable to influence that of gold. Namely, gold is a good vehicle to store value and oppose to inflation only in normal financial market.

Conditional variance

Table 4 shows the empirical results of conditional variance in multivariate GARCH (1,1) model. It can be seen that most of c_{ij}、a_{ijk} and g_{ijk} coefficients in Table 4 are significant, indicating that when studying related issues, time-varying variance must be taken into consideration. Further, due to the insignificance of $Q(5)$ and $Q^2(5)$, showing the adequency of this model.

Table 4 The conditional variance of multivariate GARCH model among Gold, S&P 500 index and U.S. bond index

Impulse response analysis

Although the causality tests can provide the evidence in direction of causality, it is unfortunately that these results still can't reveal the intertemporal dynamic effects among gold, stocks and bond. However, the intertemporal dynamic information can be displayed via impulse response analysis. Because according to the style of impulse response, we can judge the lasting time, direction and magnitude of innovation.

Figure 2 to 4 present the 24-period responses of, respectively, gold, stock and bond price to shocks in other variables using the full sample span. The results are generally intuitive. First, as to the impulse from the gold market, we note that one unit impulse from gold market on gold return has a maximum positive value (1.2059) in period 0. In period 1, the response turns into negative value (-0.0451). Then the impulse response shows a decay to zero after period 3. Besides, one unit impulse from gold market on stock return attains its highest value (-0.1099) in period 2. After that, the impact gradually decreases. In addition, one unit impulse from gold market on bond return reaches its highest value (0.0250) in period 2. From then, the impact progressively decreases to zero.

Second, with regard to the impulse from the stock market, it is found that one unit impulse from stock market on gold return reached its highest value (0.0820) in period 2. Then the impulse effect is weaker and decays to zero afterward. Moreover, one unit impulse from stock market on stock return attains its highest value (1.3589) in period 0. Since that, the impact also decreases to zero slowly. Further, one unit impulse from stock market on bond return is the highest (-0.1694) in period 0. The impact also diminishs to to zero bit by bit.

Third, regarding the impulse from the bond market, the figure tells that one unit impulse from bond market on gold return has maximum positive reaction (0.1323) in period 2. Then the impulse response shows a decay to zero after period 2. Basides, the impacts of impulse from bond market to stock return are smaller than others. Surpringly, the impulse from bond market on bond return has a maximum value of 0.4901 in period 0. Then the impulse response shows a decay to zero afterward.

Joined the results of impulse response among gold, stocks and bond, this paper finds that the greatest impulse response in period 0 occur in the situation when the innovation arises from themselves market. Second, the impulse responses of individual market return on the other two market returns almost have persistence of at most 2 periods and then decays after the period, although their direction, extent and duration are not similar. Third, the impact of impulse response disappear quickly. Therefore, this paper documents that there are short-term impulse responses among gold, stock and bond markets but no long-term effects.

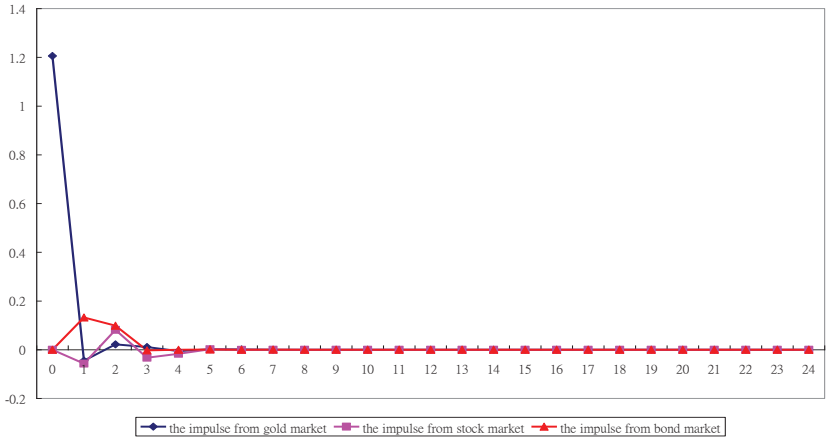

Figure 2. The impulse response of gold return

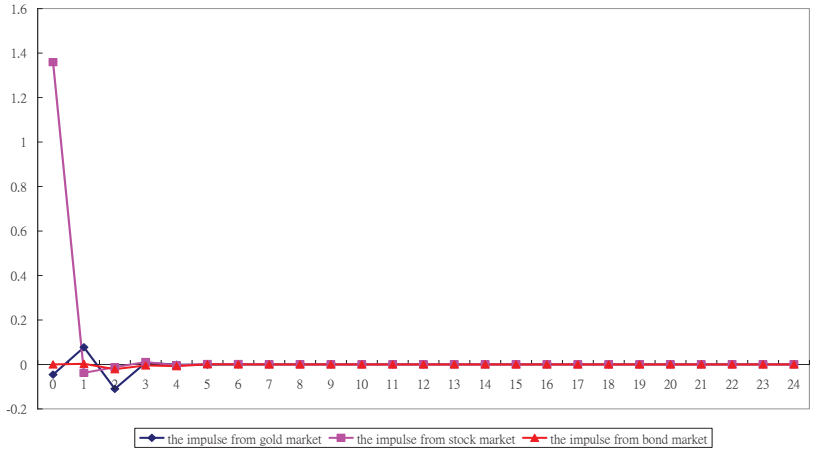

Figure 3. The impulse response of stock return

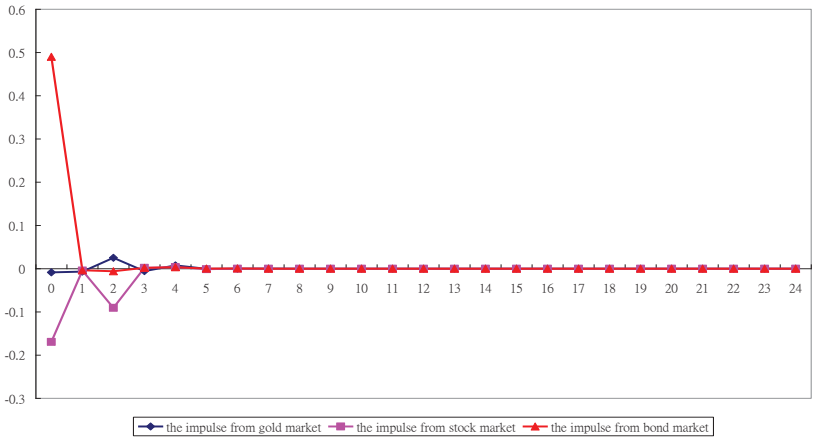

Figure 4. The impulse response of bond return

CONCLUSION

The bankruptcy of Lehman Brothers Co. in September 2008 leads to a global financial crisis and generates serious impacts on the world economy. For a long time, stocks and bonds in general have been the major assets for investment purposes. Instead, gold has often been regarded as a safe hedge or counter-cyclical investment vehicle. To explore the possible variation in financial market, this paper employs a multivariate GARCH Baba-Engle-Kraft-Kroner (BEKK) model to analyze the interdependence among gold, stock and bond price during whole sample period and financial crisis period. Besides, we further check the relationship between gold and oil price to see if gold could function well to store value in our sample span. In this way, we can not only learn the role that gold acts, a hedge, safe haven or nothing, but also how well that gold operates to preserve value. In addition, by the analysis of impulse response, this paper could also observe the direction, extent and duration of impulse response among gold, stock and bond returns.

The empirical results show several findings among them. For the full sample of data examined, this paper shows that gold is a feedback hedge for stock, hedge occurs in the bidirection between gold and S&P 500 markets. Therefore, gold could present diversification advantage for stock investment. But the hedge relationship between gold and bond is only unidirectional. As to the association between gold and oil price, it is found that gold possesses the function to store value, supporting the finding of Harmston (1998). During the financial crisis period, it is showed that gold is a good safe haven for bond only when the innovations flow from gold to bond market, not the reverse. Besides, whenever there is enormous downside risk in the financial market, such as the financial crisis term, gold is no longer a safe haven for stocks. On the contrary, bonds could function well for stocks. With regard to the impact of oil price on gold, the results propose that gold no longer owns the ability to store value.

In adddition, even though the way, degree and duration are not the same, this paper proposes that the impulse responses of individual market return on the other two market returns have persistence of at most 2 periods and decay quickly. Therefore, it is documented that the impulse responses among gold, stock and bond markets are short-lived, not long-term.

In brief, there exists some kind of relatedness between gold and stocks and gold and bonds, no matter unidirectional or bidirectional. Generally, gold is a suitable tool to hedge against the stock market; whilst when financial crisis occurs, gold and stock price usually shift in the same direction. Hence, gold is not certainly a safe haven. Besides, the move in oil price can only positively effect that of gold price in total sample period; in financial crunch term, oil price is unable to influence that of gold. Namely, gold is a good vehicle to store value and oppose to inflation only in normal financial market.

WARRANT SEOS IN AN EMERGING MARKET: EVIDENCE FROM THAILAND

Dr. Polwat Lerskullawat, Faculty of Business Administration, Kasetsart University, Bangkok 10900, Thailand,
fbuspwl@ku.ac.th

ABSTRACT

Eckbo et al. (2006) point out that Seasoned Equity Offering (SEO) companies need to concern for flotation costs, both of direct and indirect, when issuing newly shares. Previous literatures (i.e. Burton et al., 1999; Masulis and Shivakumar, 2002; Corwin, 2003; and Walker and Yost, 2007), considered mainly stock price reaction and underpricing mostly in the U.S. and other developed markets. In contrast, there is paucity of literature on SEOs in Asian markets. The purpose of this paper is to extend our empirical works on Seasoned Equity Offering (SEO) in Thailand, particularly on the areas of stock price reaction and the post-issuing performance. Instead of common stock offerings, we identified 47 firms (of 173 SEO companies) issuing newly shares via warrants between 1999 and 2006. We found that there is a negative reaction of stock prices to SEO announcements. This outcome is consistent to our prior research on common stock issuing companies. With warrant issuing, the SEO firms are impacted by the offering dilution, in comparison with those issuing via common stocks. As these preliminary consequences in the first context, we propose to pay more attention in order to examine the post-issuing performance of warrant SEO firms.

Keywords: Warrants, SEO, Stock Price Reaction, Thailand, Event Study

INTRODUCTION

Since equity offerings (via common stocks) lead to the possibility of the occurrence of dilution, issuing firms can reduce this danger by issuing warrants, giving shareholders the right to buy stocks back when they believe that it is the right time (exercise warrants). Regarding our SEO sample of 173 Thai companies during the period 1999 to 2006, more than 25% of these firms issued new shares by warrants, instead of common stocks. Warrants, together with right issuing and private placement, are one of the three popular issuing methods, and several listed companies on the Stock Exchange of Thailand (hereafter: SET) have recently shown a preference for these.

Eckbo et al. (2006) indicate that although there is no resolution on the issue of a security announcement (which remains inconclusive in the area of an expected flotation cost), a decline in the issue price may be the outcome of a typical negative announcement effect. Nevertheless, the arguments of much literature in this area (e.g. Asquith and Mullins, 1986; Denis, 1994; Corwin, 2003; Walker and Yost, 2007) focus on common stock offering in developed markets. Hence, we propose to investigate something different: warrant SEOs in an emerging market (Thailand). Our study can claim to be the first paper to examine a relevant period in this area in the ASEAN region, with a focus on Thailand. This leads to our motivation to have more knowledge of whether evidence of the common stock issuing firms is consistent in warrant issuing companies.

The paper is organised as follows: section 2 will discuss the relevant literature and hypotheses. Section 3 will clarify the data and methodology, followed by the empirical results in section 4. The investigation is concluded in section 5.

LITERATURE REVIEW AND HYPOTHESES

Literature on Warrant Issuing

Two similar securities can be utilised for issuing new shares apart from common stocks. These are warrants and convertible bonds. Several studies in this area, especially in developed markets (e.g. the U.S.), mainly focus on convertible bonds, as they can be publicly issued, cannot be sold separately and can be issued with other securities. We begin with the study by Singh et al. (1991), who compare underwritten and non-underwritten convertible bond calls that have an effect on stock price. Their results demonstrate that a small portion of the negative average stock price reaction to underwritten calls can only be explained by the direct costs of using underwriters (Singh et al., 1991, p.193). Stein (1992) shows that some factors regarding convertible issues are consistent with the theory: i.e., the negative announcement effect is normally caused by issuing convertible bonds rather than equities.

The utilisation of warrants in initial public offerings (IPOs), Dunbar (1995, p.76) shows that when warrants are issued to compensate an underwriter, the offering costs are effected negatively and lead to a minimisation of costs. A similar examination made by Chemmanur and Fulghieri (1997) shows that the firm insider is allowed to obtain underpricing in order to reduce the costs of maintaining equity after a risky IPO. Subsequently, warrants are included in the issue package. Due to the lower coupon rate, Billingsley and Smith (1996) argue that convertible bonds are chosen when the potential dilution increases and there is a negative reaction from stockholders. According to blue sky regulation, Ng and Smith (1996, p.380) clarify that when firms have high return volatility, a high rate of expected stock price appreciation and substantial growth opportunity, it may be pointless to utilise warrants.

Lewis et al. (1998) examine how convertible bonds are designed by a firm's managers. Their paper shows that the shorter the call protection period, the more managers gain the private information. Moreover, there are reductions in the expected costs of financial distress and the high negative common stock announcement effects when issuing convertible bonds (Lewis et al., 1998, p.39). Mayer (1998) suggests that a sequential financing problem can be resolved by applying the convertible feature. In addition, the exercise of real investment options should be financed in order to complete the convertible bond contract (Mayer, 1998, p.101). Examining the hypothesis of sweetens debt issues; Mann et al. (1999) indicate that the choice of convertible debt has no relationship with the level of volatility in the equity market. In addition, convertible debt is more preferable when there is an increase in interest rates and when there is a bull market (Mann et al., 1999, p.105).

Concerning examination of the signalling hypothesis, Ederington and Goh (2001, pp.470-471) reject this because: (1) there is an accumulation of equity in the accounts of calling firm managers and (2) an increase in purchasing surrounding the calling months. Lewis et al. (2001, p.466) examine all domestic convertible debt in the U.S. between 1979 and 1990, and claim in their findings that convertible debt is preferred by issuers to common stocks when

there is a better cash flow operating performance. Utilising the Buy-and-Hold Returns and calendar time portfolio approaches, Brick et al. (2004) find no strong evidence to support the asymmetric information and liquidity hypotheses for announcement of a conversion-forcing call. This implies that the negative reaction to this announcement is caused by different factors and is something of a puzzle (Brick et al., 2004, pp.20-21). Korkeamaki and Moore (2004, p.404) indicate that when convertibles are issued with weaker call protection, there will be subsequent capital expenditures of those firms after the issuance. Firms with lower levels of capital investment after the issuance of convertibles also have a longer call protection period (Korkeamaki and Moore, 2004, p.404).

Motivations and Hypotheses

We have been motivated to examine SEO stock price reactions with warrant issuing and, subsequently, their post-issuing performance for three reasons. First, a paucity of research on emerging markets is the main gap identified in our literature review. Second, we employ a different database, leading to a difference in institutional background (Lerskullawat, 2012, p.120[1]). Finally, we expand our study to an area which, according to our literature review, no research has focused on; namely, warrant issuing in the case of Thailand with more recent data from between 1999 and 2006.

The existing studies of Thailand (e.g. Jirasetthakulchai, 2000; Lertsupongkit, 2002; Vithessonthi, 2008; Lerskullawat, 2012) specifically focus on common stock offering and use an older data period than our research[2]. Since there was a substantial rise in the number of SEOs in Thailand between 1999 and 2006, with more than 25 per cent of these firms issuing new shares with warrants, it is interesting to investigate the SEO stock price reactions to warrant issuing and whether the conclusions are similar to works on common stock offerings (which react negatively to SEO announcements). Although Thailand has different institutional backgrounds compared to other markets (e.g. small size, dependent on external and technical factors, and with a high number of individual investors), its differences should not lead to an expectation of any specific results in the area of SEO stock price reaction and offering dilution (Lerskullawat, 2012, p.121). Therefore, our hypotheses will be developed following the previous research as:

$H_{0,1}$: There is a negative impact of security prices on the SEO announcement with warrant issuing.

$H_{0,2}$: There is a negative sign of the percentage of average offering dilution.

The literature review demonstrates that the majority of studies focus on the issuance of convertible bonds, rather than warrants, in the U.S. market. It is clear that no research (based on our review) has considered emerging markets. Consequently, it is interesting to study whether an examination of emerging markets is consistent with those of developed ones. However, in Thailand warrant issuing is a more popular issuing method than convertible bonds if companies prefer to issue new shares in a different way than common stock issuing methods (namely, rights issuing, private placement, stock dividend and public offering). This is because companies issuing bonds in Thailand need to pass a credit rating process, which takes a long time to complete. If the company receives a low rating, the interest rate will be

[1] The institutional backgroud in Thailand in this case is based on the period from 1997 to 2007.
[2] The work by Lerskullawat (2012) is excluded from this case.

high. This leads to the possibility of junk bonds. In contrast, in the process of issuing warrants in Thailand it is unnecessary to pass the credit rating and the process is also similar to common stock issuing[3]. Thus, warrants are frequently chosen by SEO firms instead of issuing via common stocks.

For the above reasons, we will examine stock price reaction and offering dilution with the sample of warrant issuing in Thailand between 1999 and 2006.

DATA AND METHODOLOGY

Data Descriptive

Applying the same data set as Lerskullawat (2012), we have obtained our SEO data mainly from the SET fact books and SET database (SETSMART) relating to the period from 1999 to 2006. The financial statements and financial ratios were obtained from Thomson One Banker. The initial sample from these sources comprises 251 non-financial firms with 1,910 SEOs. We exclude financial companies (including banks and insurance firms) because of the differences in their asset structures. Among these 251 firms, we follow the data organisation in Seiler (2004), who utilised the event window to 15 days before and after the event – the SEO announcement date refers to day 0. For the estimation period, Seiler (2004) employs 100 days before the event window. In order to arrange our initial data to cover a longer period around the event date, we extend the 100 days of the estimation period after the event window. Consequently, our focused event study period is 115 days.

Any firms that contain SP or suspension signs and unavailable data for trading information (i.e. closed prices) are also excluded from our sample. To avoid any overlapping in our sample, we use the first SEO of each company. As a result, we have a final sample consisting of 173 companies. Unlike Lerskullawat (2012), we utilised a sample of 47 warrant offering companies during our study period 1999 to 2006. Although the sample of 47 firms is obviously small in comparison with the existing research on developed markets (such as the 863 firms of D'Mello et al., 2003 and the 438 of Walker and Yost, 2007), it is consistent with the number used for Thailand and other emerging markets. Some examples of this literature are Salamudin et al. (1999), Prangthawat (2002), Lertsupongkit (2002) and Marisetty et al. (2008).

Methodology

In order to compare the empirical consequences between the firms issuing common stocks and those issuing warrants, we make the same considerations stated in previous work (e.g. Asquith and Mullins, 1986; Salamudin et al., 1999; Lertsupongkit, 2002; Vithessonthi, 2008), which are the announcement effect and offering dilution.

1. SEO Stock Price Reaction

Methodologies such as market model, event study frameworks, a normal student t-test, ordinary least square (OLS), cross-sectional analysis and the capital asset pricing model

[3] See Lerskullawat (2012, pp.69-105).

(CAPM) are the key ones employed in much of the literature of more recent years; for example, Teoh et al. (1998b), Gajewski and Ginglinger (2002), Aktas et al. (2007) and Brown et al. (2009). Not only these studies which focus on the developed markets, the research in emerging markets and in Thailand are among the studies applying these key methodologies in their estimations (e.g. Bartholdy et al., 2005; Vithessonti, 2008).

We obtain the calculation of abnormal returns (ARs, hereafter) because the ARs are adjusted with the beta of each security (Lerskullawat, 2012).

$$AR_{it} = R_{it} - E(\widetilde{R}_{it}) \qquad (1)$$

where t = day measured relative to the event;

AR_{it} = abnormal return to security i for day t;

R_{it} = return on security i during day t; and

$E(\widetilde{R}_{it})$ = expected rate of return on security i for day t

$E(\widetilde{R}_{it})$ is estimated by the market model, as suggested by MacKinlay (1997)[4]. As a consequence, equation 1 can be rewritten as:

$$AR_{it} = R_{it} - \alpha_{it} - \beta_{it}(R_{mt}) \qquad (2)$$

where R_{mt} = market return on day t (in our case defined as return on the SET index, which is the main composite index in the SET)

α_i = intercept

β_i = the OLS estimators of the market model parameters, calculated in the estimation period.

Since equation 1 is defined, it leads to the measurement of cumulative abnormal return (CAR, hereafter) displayed as:

$$CAR_{i(t_1,t_2)} = \sum_{t=t_1}^{t_2} AR_{it} \qquad (3)^5$$

where t_1 and t_2 are the days between the event window.

We use an event window of 15 days before and after the event, employing day 0 as an event date. Seiler (2004) suggests that, with extremely certain events with little possibility of leakage of information, as little as a plus and minus event window, e.g. ±10 days, can be used. Since there are many speculators and the characteristics of the market in Thailand are helpful for insider trading, a leakage of information might occur. Consequently, it could be worth covering this leakage. In order to pursue this, we extended the event window up to 15 days, as indicated.

We define the offering dilution on the basis of a suggestion by Asquith and Mullins (1986). This defines the discounting of stock prices after issuing, in terms of market capitalisation:

[4] MacKinlay (1997) demonstrates four possible models for measuring normal performance: (1) Constant mean return model – referred to as the simplest model, (2) Market model, (3) Statistical model and (4) Economic model: e.g. CAPM (Capital Asset Pricing Model) and APT (Arbitrage Pricing Model).

[5] The calculation of CAR is based on MacKinlay (1997, p.21).

$$OfferingDilution(\%) = \left(\frac{MktCap_0 - MktCap_{+1}}{MktCap_{+1}} \right) \times 100 \quad (4)$$

where $MktCap_0$ = Market Capitalisation on day of announcement

$MktCap_{+1}$ = Market Capitalisation on the day after announcement.

We claim that our investigation of warrant issuing firms is an expansion of the existing research on common stock offering firms (i.e. Lerskullawat, 2012). Since no evidence of SEO (with warrants) is found in our literature review, our findings could allow us to carry out an examination of SEO in Thailand for one of the most popular issuing method, which is frequently applied in the market.

EMPIRICAL RESULTS

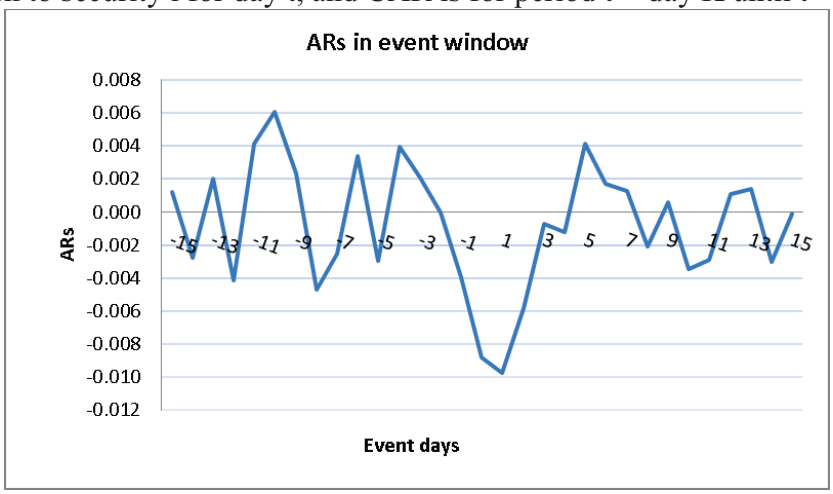
Stock Price Reaction to SEO Announcement

CARs begin to decline substantially in around five days prior to the announcement date (around day -15 to day -10), until the end of our event window. A sharp fall in CARs is clearly seen during the three days before and after the announcement (day 0). However, CARs at the beginning of the event window appear to fluctuate slightly, as demonstrated in Figure 1.

The two-day announcement abnormal returns are statistically significant at a 10% level of confidence, with t-values of -1.74420 on day 0 and -1.68517 on day +1 (see Table 1). These explain why stock prices react negatively to the SEO announcement when the companies use warrants as their issuing method. These outcomes are also consistent with the prior investigation by Lerskullawat (2012) and our hypothesis (Hypothesis 1, see section 2.2) that there is a negative reaction of stock prices to an SEO announcement. Moreover, this evidence shows similar aspects to the existing research on both developed and emerging markets (e.g. Lertsupongkit, 2002; Walker and Yost, 2007). Even though those works on emerging markets (such as Jirasetthakulchai, 2000; Mishra, 2007) are particularly focused on other events, their findings reveal negative reactions to the published information (namely, dividend announcements and stock splits), which is the same as our SEO announcements.

Figure 1: Graphs of abnormal returns and cumulative abnormal returns in event windows

The line graphs show abnormal returns (ARs) and Cumulative Abnormal Returns (CARs) for each relative day during the event window. ARs are calculated by the market model: $AR_{it} = R_{it} - \alpha_{it} - \beta_{it}(R_{mt})$; where R_{it} is the return on security i for day t, and R_{mt} is the return on market. The CARs are calculated by the equation: $CAR_{i,K,L} = \sum_{t=K}^{L} AR_{it}$; where AR_{it} refers to abnormal return to security i for day t, and CAR is for period t = day K until t = day L



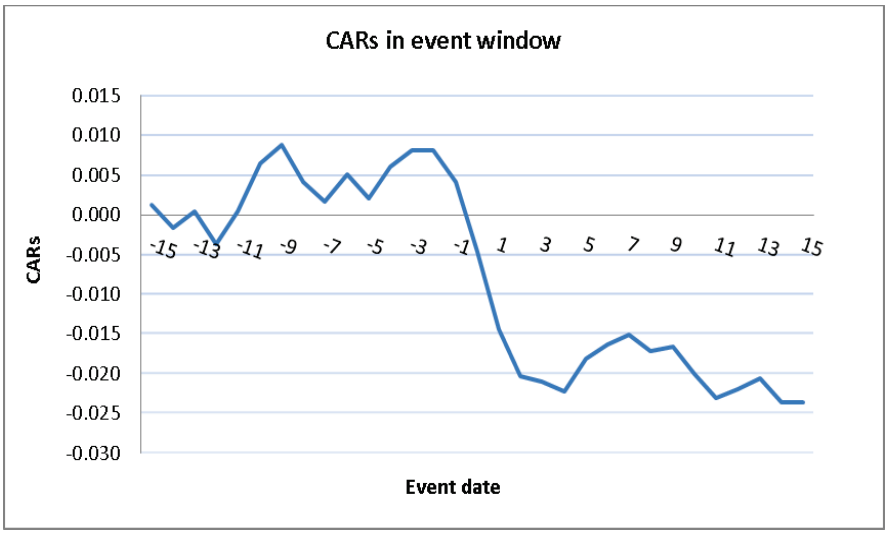


Table 1: Mean abnormal returns surrounding the warrant SEO announcement
The table shows the mean abnormal returns during the event window 15 days before and after the announcement for the total sample of 47 warrant issuing firms. Day 0 refers to the announcement date. The abnormal return (AR) is calculated by the market model: $AR_{it} = R_{it} - \alpha_{it} - \beta_{it}(R_m)$, where R_{it} is return on security i for day t, α_{it} is intercept, β_{it} is the OLS estimators of the market model parameter and R_{mt} is market return on day t (SET index in our case). The t-statistics (t-ratio) are calculated as: $t = \frac{AR_{it}}{S_{AR}/\sqrt{n}}$, where n = sample size, and S_{AR} = standard deviation of AR_{it}.

* Significant at 10% level, ** Significant at 5% level, *** Significant at 1% level

Unlike the outcomes of stock price reaction in non-warrant issuing firms (see, for instance, Lerskullawat, 2012), our results in Table 1 show no sign of information leakage prior to the SEO announcement. This is supported by the fact that there are no significant t-values during the pre-event window. Furthermore, our findings are mainly consistent with the previous research on Thailand by Lertsupongkit (2002) and Vithessonthi (2008), in that there is no leakage of information during the event window of SEO announcements. To be more specific, while we report no evidence of leakage information, which is consistent with Vithessonthi (2008), we demonstrate the results of negative stock price reaction to the SEO announcement, which is consistent with the study by Lertsupongkit (2002). Nevertheless, in order to confirm our results of leakage information, Elton et al. (2003) and Seiler (2004) suggest expanding the event window to cover the leakage period in the event study framework. Should we have no evidence of leakage information, we can confirm that the news of warrant issuing are fully published to the public. We thus consider extending our event window by another 15 days to cover the leakage period. Consequently, we have a new event window for our robustness of CARs of 30 days before and after the event date (a 61-day event window).

Robustness of CARs

The outcomes reveal that there are two significant t-statistics on the event dates of -22 and -23 at 10% (see Table 2). These show that evidence of warrant issuing leaks to inside investors prior to the announcement when the event window is extended. Moreover, the t-statistic values are significant on the two-day announcement abnormal returns at 10% (-1.69952 on day 0 and -1.82264 on day 1) – see Table 2. Hence, Hypothesis 1 remains consistent even in the 61-day event window. The CARs graphs fluctuate during the full event window period, showing a sharp rise after the announcement date (see Figure 2). Furthermore, the ARs are not equal to zero in our 61-day event window, allowing investors to obtain them. Therefore, investors are able to use inside information to invest when the SEO firms issue via warrants. This also makes the CARs graphs are slightly different from the CARs graphs of 31-day event window.

In addition, the results in our robustness 61-day event window show a contrast in our previous outcomes regarding leakage information. In other words, we find statistical confirmation that information is leaked prior to the announcement of warrant SEOs when we examine the larger event window (i.e. ±30 days). These cause the t-statistics to be significant around day -22 and day -23 (see Table 2). There could be two reasons to explain how investors can gain abnormal returns before the SEO announcement. The first is the other external factors which impact on stock prices and the second is that the information is leaked prior to the announcement. External factors can include interest rates, exchange rates, unforeseen situations (e.g. political riots and strikes) and the economic figures (i.e. GDP and growth rate announced by the Bank of Thailand), as well as the global situation. Supporting this, the Kasikorn Research Centre (2002)[6] points out that the movements of the major indices (for example, the Dow Jones Index: DJIA) can have an impact on the SET, although there are low correlations between the SET and these major indices, including other markets in the region (except the Japanese and Korean). As a consequence, Lerskullawat (2012)

[6] Kasikorn Research Centre (2002). **SET Index and the Risk of Recession (**in Thai). Vol. 8 Issue 1345, available from the CD-Rom of Kasikorn Research Centre [Access on 25 April 2013].

suggests that a small event window (i.e. ±15 days and ±10 days) is preferable for close consideration and examination of SEO announcements and information leakage in Thailand.

Table 2: Robustness results of 61 day event window

The table shows the mean abnormal returns (mean ARs) during the event window 30 days before and after the announcement (61 day event window) for warrant issuing firms. Day 0 refers to the announcement date. The abnormal return (AR) is calculated by the market model: $AR_{it} = R_{it} - \alpha_{it} - \beta_{it}(R_m)$, where R_{it} is return on security i for day t, α_{it} is intercept, β_{it} is the OLS estimators of the market model parameter and R_{mt} is market return on day t (SET index in our case). The t-statistics (t-ratio) are calculated as: $t = \frac{AR_{it}}{S_{AR}/\sqrt{n}}$, where $n =$ sample size, and $S_{AR} =$ standard deviation of AR_{it} . (*) Significant at 10% level, (**) Significant at 5% level, (***) Significant at 1% level

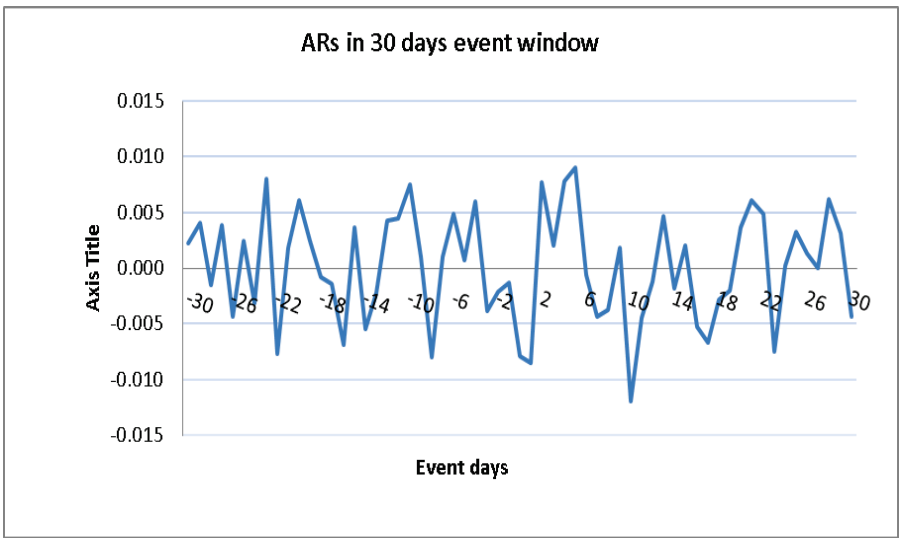
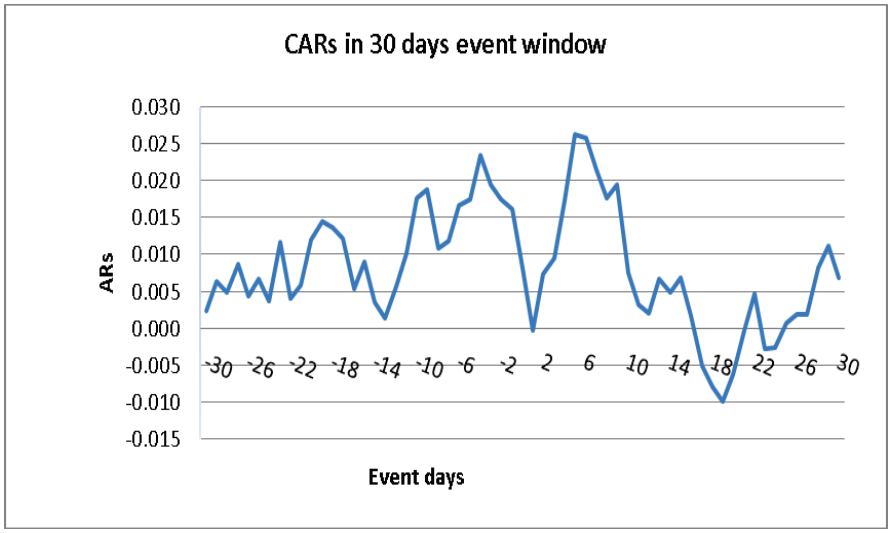
Figure 2: Graphs of abnormal returns and cumulative abnormal returns in the robustness event window

The line graphs show abnormal returns (ARs) and Cumulative Abnormal Returns (CARs) for each relative day during the event window. The event window is defined as 30 days before and after the event date. ARs are calculated by the market model: $AR_{it} = R_{it} - \alpha_{it} - \beta_{it}(R_{mt})$; where R_{it} is the return on security i for day t, and R_{mt} is the return on market. The CARs are calculated by the equation: $CAR_{i,K,L} = \sum_{t=K}^{L} AR_{it}$; where AR_{it} refers to abnormal return to security i for day t, and CAR is for period t = day K until t = day L.





Offering Dilution

Concerning offering dilution, the value of the firm on announcement day changes by approximately 0.87%, with the minimum percentage of offering dilution by -12.35% (see Table 2). This means that shareholders of warrant issuing firms could lose a maximum of 12.35% in current market values. Furthermore, this 12.35% loss in market value is much less

than the possible maximum loss in the case of common stock offering firms (total sample), which is 22.83% (see Lerskullawat, 2012, p.173). This shows that warrant issuing could help reduce offering dilution during the SEOs. Consequently, our hypothesis of negative average offering dilution (Hypothesis 2, see section 2.2) is rejected. This also implies that the equity value when the issue is announced is less than the post-announcement equity value, indicated by a positive average offering dilution. Therefore, our evidence is certainly inconsistent with Hypothesis 2, in that the average offering dilution is negative. According to the evidence of non-warrant issuing firms (see Lerskullawat, 2012, p.141), the characteristics of the Thai capital market are different from those of developed markets (e.g. Asquith and Mullin, 1986). An example of this can be seen in the method of issuing in Thailand during our study period of 1999 to 2006. While the existing literature concerns SEO samples with public offering, Thai SEO data refer mostly to the issuing of new shares to existing shareholders. Consequently, issuing methods such as rights issuing, private placements and warrants issuing, are widely used, rather than public offering.

Table 3: Offering dilution of warrant issuing firms
The table shows the offering dilution of warrant issuing during the event window. The percentage of the dilution column is defined as the ratio of the change in equity value (market capitalisation) on the day of announcement (day 0) to equity value on day +1.

Dilution (%)	Number of Firms	Average Dilution in the Range	Cumulative (%)
0 <	19	6.23	6.23
(-10) < ≤ 0	27	-1.30	4.93
(-20) < ≤ (-10)	1	-10.19	-5.26
(-30) < ≤ (-20)	0	0.00	-5.26
(-40) < ≤ (-30)	0	0.00	-5.26
(-50) < ≤ (-40)	0	0.00	-5.26
(-60) < ≤ (-50)	0	0.00	-5.26
(-70) < ≤ (-60)	0	0.00	-5.26
(-80) < ≤ (-70)	0	0.00	-5.26
(-90) < ≤ (-80)	0	0.00	-5.26
(-100) < ≤ (-90)	0	0.00	-5.26
TOTAL	**47**		
Average Offering Dilution	0.00866 (0.86600%)		
Median (%)	0.00		
Maximum (%)	25.00		
Minimum (%)	-22.83		

CONCLUSION

Even though our initial expectation was that there would be a substantial difference in the way warrant issuing companies perform following the same procedures as in common stock cases, those results report similarly to our estimations. In the stock price reaction, there is a negative response of warrant issuing SEO firms on the announcement date. This is consistent with our previous study on common stock offering firms in Thailand (see Lerskullawat, 2012). However, our evidence indicates that offering dilution leads to differences in the outcomes between SEO warrant issuing firms and those issuing via common stocks. Thus, issuing new shares via warrants appears to be less risky compared with non-warrant issuing (total sample), and reduces the offering dilution.

For more in-depth analysis, we intend to examine the post-issuing performance of these warrant SEO firms. Several studies (e.g. Spiess and Affleck-Graves, 1995; Barber and Lyon, 1997; Hertzel et al., 2002; Kothari and Warner, 2006) suggest variety of methodology for measuring the post-issued SEOs' performance. The popular methodologies, such as the Buy-and-Hold Return (BHR) approach, will be considered first for application in our investigations.

ABSTRACT

Purpose: *Rapid productisation (RP) is a new concept originating from practical challenges. RP is a process of quickly supplementing a company's product or service offering to meet unexpected customer needs. The objective of this study is to describe how an RP is used and experienced in small- and medium-sized companies (SMEs) and how the use of RP is justified in SMEs located in North America.*
Methodology: *This holistic multiple case study opens the RP concept by clarification of business case objectives set to start RP, analysis of RP challenges, and description of business justifications used for RP in the case of SMEs.*
Findings: *This study provides an introduction to the RP practises of the case companies and describes the main objectives for RP, the key challenges faced, and a deeper analysis of the business justifications used for RP. As a rule of thumb, RP is justified if it creates new business.*
Research limitations: *RP is a new concept and is not widely used. This was a clear challenge during the study. The interviewees mainly viewed RP as a more rapid way to execute the normal productisation process, resulting in time savings.*
Practical implications: *This multiple case functions as a benchmark for SME managers, intermediaries, and researchers. Our findings provide support for the managers of SMEs considering RP as one option in revenue making.*
Originality: *RP is a new concept originating from practical challenges and requires closer attention from the academic community. The academic community can provide fresh perspectives to new product development.*
Classification: *Case study*

Keywords: Rapid productisation, justification, business case, decision making, small-and medium-sized enterprises.

INTRODUCTION

Product development can be defined as the transformation of a market opportunity into a product available for sale (Krishnan and Ulrich, 2001). This is often considered as a long process with multiple checkpoints (e.g. Cooper, 2001). Based on an extensive literature review, Krishnan and Ulrich (2001) organised product development decisions into two broad categories: (1) decisions within a development project (including concept development, supply chain design, product design, and production ramp-up and launch) and (2) decisions in setting up a development project (including product strategy and planning, product development organisation, and project management). These categories of decisions are applicable to rapid productisation (RP); however, time is a critical factor in RP, and many of the methods used for decision making in the traditional product development process do not apply or need to be simplified. This study addresses decision making in setting up a development project. In particular, we focus on decisions related to business justifications of RP in small- and medium -sized companies (SMEs).

SMEs are often associated with a country's higher economic growth (Reynolds, 1997; Robson and Bennett, 2000). Beck et al. (2005) studied the relationship between the size of the SME sector and economic growth in 45 countries. They found that the share of SME employment in total manufacturing employment is associated with a higher rate of gross domestic product (GDP) per capita growth. Ayyagari et al. (2007) analysed the relationship between the relative size of the SME sector to total employment in manufacturing and GDP across 76 countries. By presenting comprehensive statistics utilising a cut-off of 250 employees, they showed that on average in these countries, the SMEs' contribution to the labour force constitutes 54% of the economy. The impact of SMEs on employment is therefore globally significant.

On one hand, SMEs are an important and integral part of every country's economy, the fastest growing sector of many economies, more flexible and adaptable in terms of structure, and having a faster speed of response than larger organizations. (Tagliavini *et al.,* 2001). In particular, the existence of a large SME sector does not directly cause economic growth but should be considered as one characteristic of a successful economy. On the other hand, SMEs typically have fewer financial resources, lower technical expertise, and more limited management skills than large companies (Blili and Raymond, 1993). These limitations affect decision making related to product development and productisation in the broader sense.

The term *small- and medium-sized enterprise* varies in meaning depending on context. In the US context, for example, the meaning of SME depends on the industry. In some industries, an SME is a company having less than 500 employees. In Europe, the SME is defined as a company having less than 250 employees. This variance needs to be taken into account when analysing SME-related literature. Ayyagari et al. (2007) covered this topic in a globally focused statistical study on SMEs:

> The term SME covers a wide range of definitions and measures, varying from country to country and varying between sources reporting SME statistics. Some of the commonly used criteria are the number of employees, total net assets, sales, and investment level. However, the most common basis for definition is employment, and here again, there is variation in defining the upper and lower size limit of an SME.

> Despite this variance a large number of sources define an SME to have a cut-off of 250 employees (Ayyagari *et al.,* 2007 p. 416).

In our study, we use the European definition. Within the SME category, the European Union defines medium-sized firms as having 50–249 employees, small firms as having 10–49 employees, and micro-firms as having 1–9 employees (Storey, 2003).

Innovation plays a key role in the long-term success for many companies. Customer-oriented companies are constantly challenged by the markets to keep their offering timely and responsive to the customer needs (Alam, 2002). Respectively, new service and new product development have been widely studied disciplines in academic research during the last three decades (Johne and Storey, 1998; Trott, 2002).

In many businesses the final offering is agreed in sales negotiations with the customer. Usually the product is created with a sales configuration tool or is bundled from a predefined set of components (Hvam *et al.,* 2008). Obviously a sales negotiation can lead to a situation where the customer's demands cannot be fulfilled. This usually ends the sales negotiations and the customer leaves without a deal. According to Jaakkola (2011), RP refers to those practices necessary to rapidly generate a manageable and exchangeable service offering. Little research has been carried out in the rapid response to customer requirements during the sales contact by complementing or altering the offering. Many managers and practitioners in SMEs have indicated that this kind of "rapid productisation" is a common but informal and disorganized process in practice. In addition, better management of the process would be beneficial.

Building a proper business case is key to successful decision making related to RP. Multiple methods are offered for the analysis of the business case in traditional product development; however, many of the proposed tools are too complex to be effectively used in a sales situation where decision making needs to be fast. Kinnunen et al. (2011) stated that a business case is for analysing ideas that come through a company's new product development (NPD) process to commit NPD resources to the right projects. The actions for building the traditional business case often include analysis of user needs, competitive analysis, market analysis, technical assessment, concept testing, financial/business analysis, and action plans (Cooper, 2001). Reviewing the details of user needs and analysis (including, e.g., in-depth market research) would take too much time in the sales negotiations and in the time frame available for RP, which requires more flexible and agile methods for business analysis. Moreover, a proper business case to justify an investment should include a business and economic rationale for the investment, a definition of the investment and its feasibility, a financial model quantifying and valuing the benefits and costs of the investment, and a plan for delivering business and financial value (BCP, 2006). It is not clear how these goals can be met in the sales situation as is often necessary for RP.

The aim of this study is to define business justifications for RP and to provide practical guidelines for managers of small business. The research questions of this study are as follows:

RQ1: *What are the business case objectives to start RP?*
RQ2: *What are the RP challenges of companies?*
RQ3: *What are the justifications for RP?*

The concept for productisation used in this study has been aligned from the case companies and provides a frame for analysis. Cases are described in detail using a framework for structuring empirical data. Our research questions evolved from the practical challenges faced by both the case company and the industry in general and are considered to be relevant for any organization interested in RP.

METHODS

This retrospective multiple case study uses a holistic research strategy (Saunders *et al.,* 2007; Yin, 2003). We divided the research process into three phases: case study design, single-case data collection, and analysis and cross-case analysis (Figure 1).

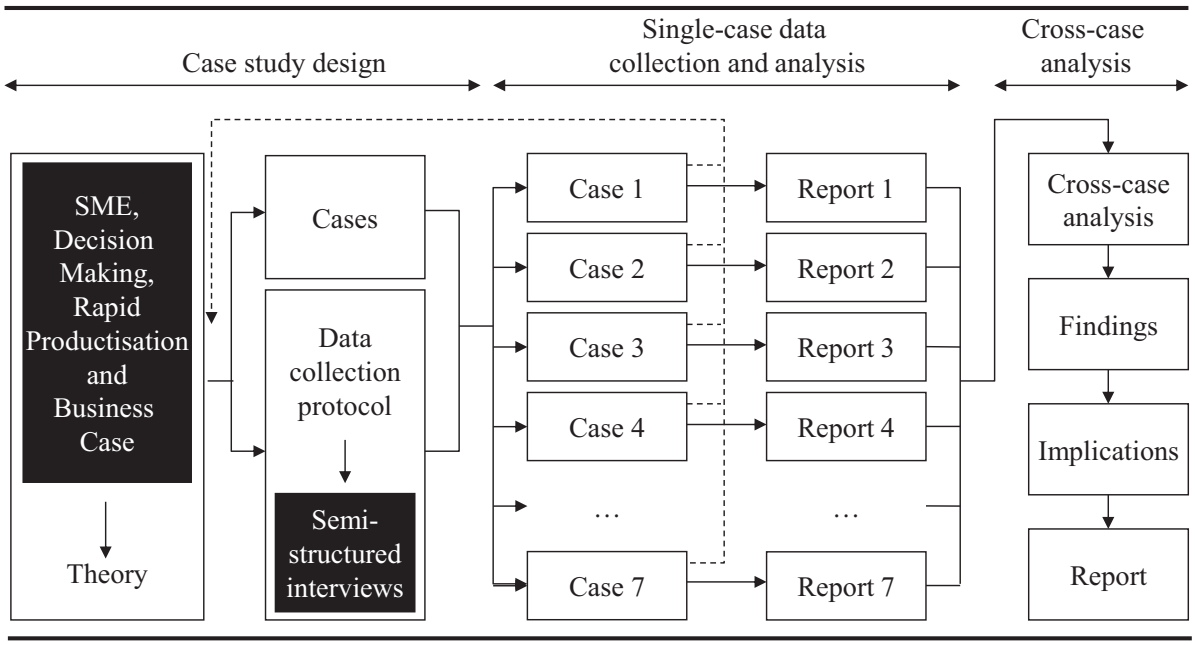

Figure 1. The research process

Qualitative research refers to any type of research that produces findings that are not results of statistical or other means of quantification (Corbin and Strauss, 2007). However, multiple data collection techniques can be employed in case studies and are likely to be used in combination with one another (Saunders *et al.,* 2007, p. 139). Moreover, both qualitative and quantitative evidence can be shown in a case study (Yin, 2003); in fact, Yin (2003) encouraged using both techniques. In line with Yin's (2003) guidelines, we collected a combination of qualitative and quantitative evidence, with the main focus on qualitative analysis. At the data collection phase, qualitative techniques may include focus groups, individual depth interviews, and case studies (Cooper and Schindler, 2010). During analyses, the qualitative researcher often uses the content analysis of written or recorded materials. Qualitative research aims at providing an in-depth understanding about the situation in hand (Cooper and Schindler, 2010).

The data was drawn from semi-structured interviews designed to gather information about the upstream supply chain in rapid productisation in US industries. Interviews were constructed to allow the interviewees to explain and clarify the case and topics as entities. Interviews

were conducted in seven heterogeneous companies to obtain a wider view on the subject studied (Table 1). These companies were able to provide comprehensive study material and the extent of the phenomenon of RP.

The companies' advanced practices and advanced product development processes can be used to compare other participating companies. The topics that were company specific are not reported. Altogether, the study included 11 interviews (Table 2). The interviewed industry experts were carefully selected based on their professional background and expertise. The selected participants hold positions related to productisation. Their experience and current interest ensured high motivation and relevant knowledge about the topics discussed. The questionnaire was sent early enough to enable the interviewees to review it in advance. The interviews were recorded and transcribed and lasted up to 2 hours each.

NVivo®, QSR International Pty Ltd, Australia made software was used in organizing and analysing the interview content and for criteria categorization. For each company, we conducted a within-case analysis and classified the cases according to the following categories: RP, business case for RP, and RP challenges. Company characteristics are presented in Table 1.

Table 1. Case company characteristics

Case	No. of interviews	Role of the interviewee	Area of business
A	1	CEO	Electronics manufacturing
B	1	CEO	Software solutions and equipment manufacturing
C	1	CEO	Telecommunication
D	2	CEO and Director of Marketing	Software solutions and consumer goods
E	2	CEO and Manager of Product Development	Software solutions
F	2	CEO and President of Sales/Marketing	Software solutions
G	2	CEO and Bio Technology Consultant	Biotechnology

RESULTS

The study was carried out in a multiple case study that incorporated electronics manufacturing to biotechnology SME companies located in North America. The companies are referred to as A, B, C, D, E, F, and G (Table 2).

Table 2. Case company information

Case	Founded	No. of employees	Current total sales ($ Milj.)	Current value of assets ($ Milj.)
A	1971	37	12.00	10.00
B	1995	30	5.70	2.50
C	1999	25	sensitive	sensitive
D	2009	18	2.00	6.00
E	2003	15	0.50	0. 39
F	2009	11	1.30	2.90
G	2009	7	0.10	4.50

Rapid Productisation

Company **A**, an electronics manufacturing company located in Washington, aims to minimise interference with the standard product by using the same housing, plugs, or connectors. The benefit is that the company can optimise its ability to buy parts in volume, although perhaps at a lower volume, based on the business case. The project manager plays a key role during the RP process and is very involved throughout the process rather than a commodity salesperson that looks for a customer, takes an order, and moves on. RP also requires a more involved sales and purchase integration process. The drawback is the company needs to have more people internally, which would then change its structure from being 'lean and mean'.

Company **B** is a software solutions and equipment manufacturer located in California. A need for RP with a request to change the product roadmap pops up regularly when the research and development (R&D) section is working on a new product development case. One reason why there are so many new requirements coming from customers is that company B is in a relatively early developmental stage. The product roadmap released to the market may have a reduced functional subset and does not fully satisfy customers, which is why customers return to the company for a specific derivation. The company needs to make a decision whether to rapidly develop and productise a solution for the customer or put it into a proposal for future development. Company B tries to avoid developing a solution for only one customer. RP requires an extra effort because usually the solution needs to fit into the long-term strategy for the company. By doing RP lower level of investment might reduce the development cost to that of NPD, but might not necessarily be less.

Company **C**, a telecommunications company located in Maryland, has been incorporating RP for several years, and this causes challenges in the sales situation. Company C's business is as a small-volume, highly customised industry. RP enables the company to be predictable and to give the customer proper feedback. Historically, if the customer was willing to buy, the company was willing to invent it, and this is how the company developed its product line. Currently the company's product line offers better conditions, and the company has done sufficient development to ensure the product line can satisfy most customers immediately. The company is now shifting towards stronger prioritisation in product development and are examining whether there are other sales opportunities.

Company **D** is a software solutions and consumer goods company located in California. Sales face a need for RP basically every week. The situation is challenging to sales, and employees

probably do not manage it as well as they should. First, many customers ask for the same things. In these situations the sales group is able to provide a response because the company is familiar with the question. From the interview:

> *"I think if you do your work upfront and you need to make self-question does it fit* into *our business model. Are the bulk of the customers wanting it or willing to commit to buying it? And then, what's the longevity of the product? Is it a one-time product or is it something that can be offered over and over and over through time? You reduce a lot of your challenges and your risks because you've done your work upfront, which doesn't take that much time, in an effort to better ensure success".*

However, for a new request where RP is required, they really cannot give a reliable response for at least three reasons: in a typical sales–engineering relationship, sales tend to overpromise and engineering subsequently under delivers. It endangers the business when sales overpromise deadlines and promise certain customers that they can skip a line. From a sales' perspective, it is all about understanding the customer's thoughts and the company's business. Usually the sales person just goes to the marketing team and asks for these new features. In the case where the feature is necessary, it gets advanced on a schedule and other things are moved down; however, if it is a feature that is nice but not essential, it is placed on the wish list.

Company **E** is a software solutions company located in California. The company has not had a single customer that is has paid to build one particular product. Instead they have multiple customers who are interested in similar things. If RP is used for one customer, it requires customer integration on the company's sales cycle. Even when produced initially for one customer, a product should be useable by other customers. It is typical that a customer is interested in the standard product but wants to see a proof of concept application in the demo that requires the company to build a fast add-on. To do this requires a live demonstration in a configuration using data the customer is interested in. The decision to do or not to do RP depends on the amount of work needed. Sales have an important role and have to define and describe what it is the customer is asking for. From the interview:

> *"Because sales is always spinning around different crazy stuff development has to stay focused and disciplined to get things done, otherwise they'd be moving around and they'd never finish".*

It is important that a definition of scope is very clear in the case of RP. In the business culture, the sales staff have to be sure they are dealing with people that have the authority to make the decisions. It is important that a customer knows what they want. When the company has a good team to work with and the team has a good dialogue with the customer, it is very constructive, making it safe for the company to do RP.

Company **F**, a software solutions company located in California, historically did more RP. Its situation has changed, and currently the company gets more requests for its products, which are equal to market standards and getting more advanced. When the company first started operating, it often needed to provide RP to win clients, but now RP is used more as an enhancement. The company seeks to increase agility just by constantly adding features. A basic software release cycle is 1 to 2 weeks, and the company has a 60- to 90-day release cycle once a year to develop effort-intensive functionality. An ability to balance the work load of development is crucial. It is not good for business if all on-going development needs

to stop to address an RP; this happened once and everything else was delayed by 6 weeks. Company F is going to change that in the future. The company's target is to save part of the business for RP and the rest of the business for its core direction.

Company **G**, a biotechnology company located in California, was interviewed at the time when RP was needed. The company has the ability to deviate from their platform portfolio, and this has been done several times. From the company's perspective, it is important to meet the needs of customers and it is something the company is able to do. From the interview regarding how to be agile:

> *"You know nothing big, fancy, no 10,000 dollar market research studies, just an airplane trip to Atlanta to meet people over a cup of coffee."*

Making fast decisions and quickly developing a new business plan are things that small companies can usually do better than large companies. A request from a customer for an RP in sales is a common topic and in many cases RP can be done. The company has received more and more product portfolio-related questions "...*can you have that or this*…", and this has been a recurring event over the past 2 years. It a clear indication for RP and highlights the missing part in a company's normal offering. The sales situation is all about listening to a customer and then reprioritising the requests. In a small company like G, one of the key management responsibilities is to constantly evaluate how much effort an RP requires versus other development—balancing on-going work and at the same time maintaining opportunities to have flexibility with RP. Management needs to ensure that development is not stuck and prioritisation is constantly being re-evaluated.

Business Case Objectives for Rapid Productisation

In *Company* **A**, the basic business purpose is to make a profit. The company makes money by making products and thus do not sell engineering time. Business justifications for RP are to build a product that will sell and either make a large profit or potentially develop a new market. The justification for building a new design is to be a stepping stone to something else. If the customer preferences can be met, the company can justify a marginal fiscal performance on their first orders because they assume it will attract future customers, which could then place the company in a new market or give the company something new to develop in the long term. Company A is always looking for something new.

Company **B**, as an early stage company, views the ability of a customer to pay to enhance their product in a way that the company would eventually do, as optimum. A core business case for RP is having a better product that will grow the company in the future. This is an incredibly strong driver for doing RP even if it is disruptive to the organisation in the short term. When a customer inserts itself into the RP process by having a short-term need that drives revenue, the company tends to be responsive because from the company's perspective, R&D will be free. This is important. At present, it not only helps Company B to accelerate revenue but also helps accelerate product development, which is a win–win–win situation—a win for sales, for product development, and for the end customer who gets something that is needed.

In *Company* **C**, the Chief Financial Officer would prefer a world where there are always customer requirements, customer orders, and the engineer is only working on something that

the customer is willing to pay for. In the early years of Company C, this was not the case. The main reason to start RP is a business case that will guarantee enough sales, feasible technology to justify an engineering effort, and appropriate prioritisation. RP is a qualitative weighing of nonrecurring engineering effort versus potential sales.

In *Company* **D**, RP should fit a business strategy. Company service builds on the affinity of their buying network. The network can been seen as a scalable layer that accelerates business. RP has to meet financial goals and be profitable. Simply, the company needs to be able to make a profit from RP. The business case for RP will be met when a new product incrementally increases sales and not just splits sales.

In *Company* **E**, the business cases to start RP are: a reasonable scope, no technical risk to build a product, resources will be available, doable schedule, and the promise given to the customer can be met. Company E is small, and one of the problems with RP is the need to maximise an opportunity cost. When the work has been done, it is essential to leverage effort into a new product line or complement the product line the company is already investing in. To keep it simple, if there is a customer willing to purchase the product, the best business case the company can get is being able to sell the product.

There are two business cases for RP in *Company* **F**. The first is what the revenue for a client is and this has to be more than $10,000 per year. The second is the question, is it a solution that the company can apply to all their other clients as well to make a greater profit? The main target from RP is to get something for a product portfolio and something that the company can universally use for all their clients. Otherwise, the company tells customers they need to find a third-party developer. The client has to have available resources and must be dedicated to a successful program once the company has built the product.

Company **G** has no formal processes because the company and its market are relative small. The company uses unformed processes and relies on market forecasts. The company likes to keep things simple. The business case for RP is a positive return on investment. The business case to start RP requires that there are enough sales, feasible technology to justify an engineering effort, and it is prioritised appropriately. Small companies need their revenue sooner rather than later. The company has to survive on RP development because it generally does not have three or four projects that are on-going.

Rapid Productisation Challenges

When using RP, *Company* **A** tries to find a product that fits a wider market. RP cannot be used to build a totally new product. As an example, total product development time for a tactical communications product ranges from 12 months to 14 months. One version of the product range is the way the company can make the best profit. If there is a need to make 14 versions of the product and to sell it to 14 different clients, there are risks that the package or features will not be set correctly. If use of RP requires third-party vendors, it is essential to know the person the company is going to deal with. From an interview with a purchase manager about the CEO's response to possible vendor use: *'Oh, I don't want to use that vendor because they will be a risk for us. Can't you use anybody else?'*

Company **B** is working on a software as a service model. They would not do RP just for revenue but want the visibility that comes with enhancing a product. Upstream supply chain management needs extra attention. From an interview:

> *"Upstream supply chain is typically less able to respond than we are, and they are typically less motivated to respond than we are. And that has to do with I think the whole small versus large company thing because we are typically sourcing from larger companies than ourselves".*

If a customer really wants something that is going to impact the experience of the rest of the user community, it obviously carries much more expense from development. One-off or bespoke services is different. When the company does RP, it is a disruption, which is why a product should support the customer, make it better overall, and leave no negative impact to the customer experience. Parallel RP and NDP is difficult for a relatively small company.

For *Company* **C** the main reasons not to do RP are mainly related to different technically feasible challenges or capacity shortage in the product line, even when the customer is willing to buy a product. One solution to solve capacity shortage is outsourcing resources. From an interview:

> *"...we have in fact done some of that in the past when we're just really busy. It's a way to add bandwidth without having to add to the payroll".*

In *Company* **D**, the cost of developing is prohibitive and starts to impact the company's regular business. They have to take people off from developing and selling to do on-going projects. At the moment the company does not have enough manpower to support RP. If there are five things a customer wants facts for, three of them are ones that the company can do well. The other two customers requests will be put on the list for future development.

Company **E** can earn acceptable profits from RP in terms of pricing and profitability. Problems occur if the products are just one-off instead of products that the company can sell to a number of customers. RP in the company's market place requires having a lot of employees, which is the main reason the company is not able to do many one-off products.

Company **F** will never build anything that only one client would own. There is also the need to have them 'right client' for RP. From the interview:

> *"Some of our clients will pick bad developers and they screw things up. And they'll pay us to fix them".*

The client should also have existing customers available for the product.

The main limiting factor for RP in *Company* **G** is how to set correct priorities to manage development. From the development perspective, RP requires that everything goes smoothly. When problems occur, these have to be solved fast. RP is not a typical research project.

ANALYSIS AND DISCUSSION

As a result of this study, the justification for RP in the case companies was described based on the interview data. The interviewed case companies commonly ended up either spinning off a new product or enhancing the existing product based on a customer's needs. When there is the need to modify products to meet only one customer's requirements, there has to be a

revenue opportunity, which requires that the product functionality later becomes a part of the product/service portfolio available for other customers. Portfolio management practises should be in use to support RP. A formal process for reviewing and handling customer's requests received from RP is essential. A summary of RP is presented in Table 3.

Table 3. Summary of rapid productisation

Role of sales (salesperson) is critical
Way to resolve situation when current product roadmap does not satisfy customer
Challenge situation in sales and important that the customers know what they want
Way to win clients and meet needs of customers
Sales and R&D integration
Used more in company's early stage phase
Target to have a portfolio-wide solution not a single customer
Could be needed basically every day
Requires ability to make fast decisions and prioritisation re-evaluation
Quick development of new business plan
Right balance between RP, core business, and effort

As an answer to RQ1, before starting RP a company needs to do more market research and not just react to something that sounds good. Before creating something, a company wants to be able to leverage it across the entire platform. According to interviewees, the basic financial justification of an RP project is based on evaluated income from the project. However, situations where this is not the case were mentioned. For example, an actual feature has already been promised or the deal is somehow secure if the customer requirement can be met. One interviewee even mentioned that some projects are justified primarily based on intuitive decisions about profitability. It was also pointed out that these projects must have full support from top management. Table 4 summaries the objectives for the RP business case.

Table 4. Objectives for RP business cases

Build a sellable product to make money
Reach new markets or product segments
Core for long-term development and growth of business in near future
Accelerates product development
Prioritisation can be made without compromising the existing roadmap
Fits a business strategy and supported by management
Business opportunity upsurge for financial goals and revenue
Incrementally grows sales and not just splits sales
Promise given to the customer can be met

To address RQ2, a sudden need for RP in sales is a challenging task for sales people. It endangers the business if sales overpromise deadlines and promise certain customers that they can skip a line without better knowledge of what is needed. Challenge areas for RP from management are: 1) a relationship between sales and engineering, 2) sales not overpromises and/or overestimates requirements, and 3) engineering will not under deliver. Sales has to ensure they are dealing with people that have the authority to make the decisions. It is

important that a customer knows what he or she wants. It is best when a customer has some technical knowledge in an area under sales negotiations.

When RP is targeted to more than one customer it will require an extra effort because the solution needs to fit into the longer term strategy for the company. An essential issue for RP is that sales, development, and management know how the customer's request for the product/service fits within the objectives and scope of the company's strategy. Table 5 summaries the RP challenges of the case companies.

Table 5. Summary of rapid productisation challenges

Fit for wider markets and product portfolio compatibility
Not for totally new products or use of new technology
Prioritisation between RP and NPD
One-off products could increase unnecessary product variety
Upstream supply chain and third-party vendor management

To address RQ3, the business is not feasible if all on-going development needs to stop for tackling RP. This happened with one case company and other work was delayed for 6 weeks. The company is going to change this in the future. The company target will be save part of the business for RP and the rest of the business for the core direction. Are the financial benefits so big that the project is worth doing even if partner companies must be used? Is the project a possible entry to a new customer segment or market area or even a new single customer that is big enough? One key point to address is also whether the project would help the company in differentiation from competitors. The company should also be able to test the solutions early on. RP is justified if it creates new business. The analysis is always made beforehand based on the business justifications and resources the company has available. Justifications for RP are presented in Table 6.

Table 6. Justifications for rapid productisation

A reasonable scope and line with company strategy
No technical risk to build a product or service
Resources and needed knowledge are available
Doable schedule and promise given to the customer can be kept
Work is added with equal revenue
As a company grows and matures, each new sale is not as important
A new product will incrementally grow sales and not just split sales

CONCLUSIONS

It is essential when using RP that the RP process is dynamic and all advantages of existing frameworks are fully integrated. Responsibilities between sales and R&D need to be clear. After starting RP, conversations between sales and R&D need to be smooth and objective. In the company everyone should be on the same page. Well-executed portfolio management in cooperation with RP is one way to minimise unnecessary growth of product variety.

Use of third-party vendors to support a resource shortage need to carefully examined because vendors could be less motivated to respond and it might cause challenges in a later phase. Being able to keep a promise given to customers is a must for RP. Company has the ability to lose the trust of a customer only once.

Using RP does not mean that product development costs are automatically small. Cost of development might be the same as NPD and not necessarily be less. RP requires sufficient sales potential and should be technologically feasible. It must be able to justify the engineering effort and be able to prioritise appropriately. RP is a qualitative weighing of nonrecurring engineering effort versus potential sales.

Managerial implications

One proposal for how management could solve the challenge in sales negotiations is to explain to sales people where the company's market is compared to the full market place. Sales should increasingly look at not just whether there is one sale but could there be several sales opportunities.

Has the company capacity to spare for the project? In small companies one of the key things management needs to do is constantly evaluate how much effort could be put to RP versus other development (i.e., NPD). Management needs to balance on-going work and at the same time maintain flexibility for RP opportunities. Management needs to ensure that development is not stuck and prioritisation is being re-evaluated.

Limitations

This study has focused on small business use of RP. Addressing some of the limitations of this study should stimulate further research. First, the number of interviewed companies is limited; a deeper analysis is needed to broadly cover the studied topic. Secondly, our study focuses on small companies. The next step would be to study what might be justifications for RP in large companies. Third, it would be interesting to examine in more depth how new companies can utilise and take advantage of RP to boost companies' early growth.

ABSTRACT

This paper tries to explore the interaction of institutional arrangement, technological innovation and application evolution underlying the impressive growth of China's computing infrastructure. Drawing upon the actor-network theory, we construct a framework to explain how the elements identified forge the evolution of the sector. Our study hopes to provide the analytical lens and explanatory power to probe this growth process under the emerging contexts. We conduct an in-depth case study on the growth of China's emerging computing infrastructure to justify the framework. Chinese government has been deeply involved in the development of the computing infrastructures including the systems of supercomputing and cloud computing to build a nationwide computing backbone network. In the resent emerging of cloud computing, the networks which involved in much more diversified actors with heterogeneous interests are shaping under a more open setting. However, the facility-oriented strategies by the dominant state-owned players still exert great challenge to the cloud computing development which needs sustainable benefits generated from the infrastructure. Our paper tries to provide a systematic understanding on the growth of China's emerging computing infrastructure and offer some important insights to the emerging industries in other large emerging countries.

Keywords: Actor-network theory; China; Computing infrastructure; Cloud computing; Emerging information technology; Supercomputing;

INTRODUCTION

In the past decade, the IT infrastructure has gradually become the backbone for the knowledge intensive development in the large emerging economies like China. In today's data intensive world, IT infrastructure has also served as an important driver for the technological, industrial economical and social transformation. Failures to design such infrastructures are more common incurring huge losses in foregone investments, opportunity costs, and political and social problem (Hanseth & Lyytinen, 2010).

The rapid development of China's computing infrastructure in recent years has attracted great attention from the academia, business and politician internationally. Even American president highlights the rising of China's supercomputer infrastructure in terms of calculation speed and facility quantity which address both economic growth and scientific standing.[1] This emerging context which characterized by booming economy, transforming industries and growing technology brings new opportunities to the application of the computing. As the world's largest internet, computer, and mobile market, China owns great potential of computing application compared with other developing countries. Chinese government has been deeply involved in the development of the computing infrastructures including the systems of supercomputing and cloud computing to build a nationwide computing backbone network. Super-computing receive large amount of government support in the national "12th Five-year Plan", cloud computing was considered as one of the strategic emerging industries for China to re-motivate the economic slow-down after the financial crisis[7]. Since 2009, the enthusiasm of China's government for the cloud computing triggering the surge of nationwide investment even excesses the expectation of the industry itself.

When new technological innovation meets emerging context, the two uncertainties collide and complex the process of the computing infrastructure development. Then there maybe an urgent need for the research linking the transformation of the giant computing infrastructure to the particular social, economic, political and institutional contexts in the large emerging country. Using the actor network as an analytical lens, this paper aims for a deeper understanding of the key aspects of China's emerging computing infrastructure in a more open world.

Our paper is organized as follows: in the section of literature review, previous literature related to our research was classified and further analyzed. In the section of framework and methodology, we draw upon the ANT theory to primarily develop a conceptual framework for analyzing the growth of the modern computing infrastructure. Data collection method is also elaborated. In the section of case study of computing infrastructure, in-depth case studies of supercomputing and cloud computing in China were conducted to justify our framework. The last section is devoted to further substantiating this framework with the empirical study and this paper concludes with the discussion on further possible research direction.

LITERATURE REVIEW

The actor-network theory has gained increased attention from the researchers trying to extend its applications beyond technology adoption and design to broader areas (Walsham, 1997). A key feature of actor-network theory is that the actors include both human beings and non-human actors (such as a technology), together composing a network to be studied (Callon, 1991; Latour, 1996). It encourages the researchers to disclose the interplay of the market transformation and its social system. Actor-network theory examines the motivations and actions of human actors that enroll themselves into a network and align their interests around specific non-human artifacts. Yet, actor enrolment and interest alignment alone cannot fully explain the mechanism of a change. Then a holistic approach combined technology, market and institution needed be explored to examine the growth of an industry. "Inscription" and "translation" are key concepts

for understanding the interest alignment to form an actor-network. An inscription is a form of anticipated characteristics which actors, in one way or another, try to build into an artifact (Callon, 1991). Translation implies that an actor reinterprets or appropriates the interests of other human actors and the interests embedded in non-human actors according to one's own, and has these interests represented in the inscription. The actors' interests are flexible and can be translated, enabling the interest alignment and the maintenance of an actor-network.

The process of infrastructure innovation and adoption

The development of infrastructure is not only depends on the "technology-push" and "infrastructure innovation", it also needs "innovation adoption" and "business model" to exploit the potential of existing infrastructure. There are multiple definitions about the infrastructure. The emergence and extension of the infrastructure lowers the knowledge threshold to adoption and reduces the complexity of the technologies to the users (Gao, 2007). It decreases the adoption risks and creates user favouritism towards the technologies. It also guarantees the stability of the promoted technologies, triggers learning and thereby reduces costs (Attewell, 1992). Focusing on the domain of computing infrastructure, Foster & Kesselman (2004) identify it can create a universal source of pervasive and dependable computing power that supports dramatically new classes of applications. The computing infrastructure can accelerate and foster the adoption of innovations, so enterprises prioritize infrastructure to promote innovations and unlock new sources of value (Aymerich & Fenu, 2008).

Previous literature has provided a number of important insights, ranging from the motivations and factors that influence innovation adoption to the outcomes and processes of its diffusion (Cooper & Zumd 1990, Cool et al. 1997, Damsgaard & Lyytinen 2001). The situation of user adoption of technologies and services influences the innovation of infrastructure, and requires the infrastructure enabling the provision of new, appropriate services (Abbate, 1999). According to Christensen and Knudsen (2010), business model is critical to enabling innovation adoption. And it is introduced as part of framework for thinking about systemic change, which also includes enabling technology and a careful market adoption strategy (Christensen& Knudsen, 2010). Business model is also referred to as the conceptualization and adoption of new ways of conducting economic exchanges among transaction participants (Zott & Amit, 2008), which greatly influence the innovation and adoption of a technology.

Open the black box of social network

The development and adoption of the emerging technology depends on the coordination and negotiation of different actors within the social system. For example, Muller-Veerse (2000) considers government agency, intra-governmental organizations, equipment vendors, network operators and content providers play their different roles in promoting innovation. Tilson and Lyytinen (2004) identified services designers need to understand the complex needs of all stakeholders in the overall social system. Gao (2007) defines the users, providers of mobile services and other relevant institutions as three groups of actors that represent the social interests in mobile telecommunications market. As the openness nature of cloud computing, Edwards et al. (2007) implies that social and technical diversity and heterogeneity will increase along with

the evolution of technology.

Interaction between social and technological systems

ANT adopts a socio-technical perspective into the design and analysis of technological systems in which the world is viewed as being comprised of networks of technical and social actors (Sarker & Sidorova, 2006). The central argument of actor-network is that successful networks of aligned interests are created through the enrolment of a sufficient body of actors that inscribe their interests into the network (Walsham & Sahay, 1999). A key feature of this theory is that actors are taken to include both human beings and nonhuman actors (or artifacts), such as a technology, which together compose one network (Callon, 1991). Gao& Damsgaard (2007) define mobile telecommunications market as the non-human artifact and its players consisting of social system as human actors, they use actor-network theory to analyze the social-technological evolutionary process of mobile telecommunication market innovation. Social structure and technological architecture co-evolve as technical problems are solved, and the services and products are adopted in the social domain (Tuomi, 2002).

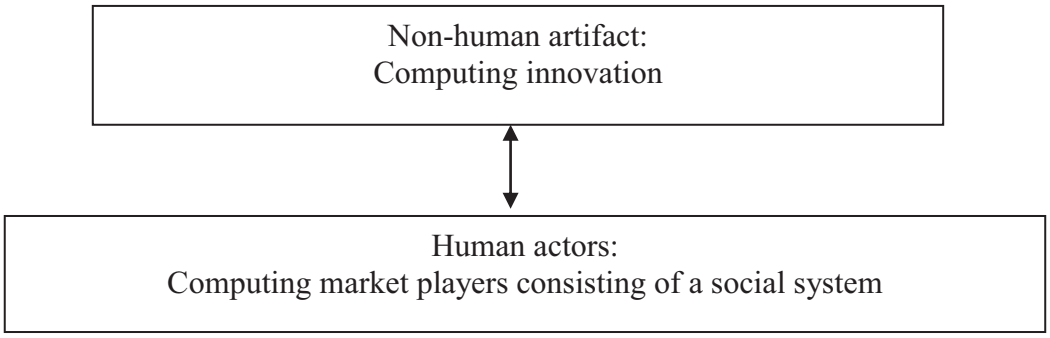

Figure 1: The preliminary framework of actor-network analysis

Literature review of computing infrastructure

There are several researches focus on the development of computing infrastructure from the perspective of technology, business, prizing, adoption and security in the developed countries (Shirley&Carol，2011). Vouk& Sills et al. (2010) exploit the integration of high-performance computing into cloud computing services from the technological perspective, they discuss a very successful production level architecture and policy framework for supporting HPC services within a more general cloud computing infrastructure. Wei (2009) identify that cloud computing makes super-computing power via the Internet free flow became possible while there still exist obstacle in fully integrated super-computing power into cloud computing. There are also some literatures concentrate on cloud computing from either technological or organizational perspective. Although some commentators categorize cloud computing services somewhat differently, the most common approach segregates services into three-part taxonomy (Foster et al., 2008; Vaquero et al., 2009; Mell & Grance, 2009). It means that the cloud computing can provide services at different layers of the resource stack, namely IAAS (infrastructure as a service), PAAS (platform as a service) and SAAS (software as a service). Some literatures also

address the merits of cloud computing in terms of reducing costs, aggregating demand, increasing reliability and transforming capital expenditures into operating expenditures (Weinhardt, et al, 2009; Leimeister, et al., 2010; Koehler and Anandasivam, 2010).

Despite there are researches focus on technology, business, prizing, adoption and security of computing infrastructure, few studies link the institutional arrangement with technological innovation especially under the context of emerging countries. And computing infrastructure is a kind of socio-technical system involving both technical and social elements and their interactive relationships. Through the lens of actor network theory, this paper tries to explore the interaction between technology, market and institution related to China's emerging computing infrastructure and then hope to provide some theoretical and empirical insights to other emerging countries.

FRAMEWORK AND METHODOLOGY

Based on the literature and analysis in the above sections, we propose an analytical framework to examine the socio-technological mechanism for the computing infrastructure innovation, as shown in Figure 2.

In terms of the business firms involved in cloud computing, here we define four types of actors including system providers, service providers, institution and users to represent the interest in our social network. In identifying these elements, it is necessary to consider whose interests these human candidates represent (Walsham, 1997). System providers mainly concentrate on the computing facilities and terminal while the service provider concentrates on creating, configuring, operating and distributing services for the users.

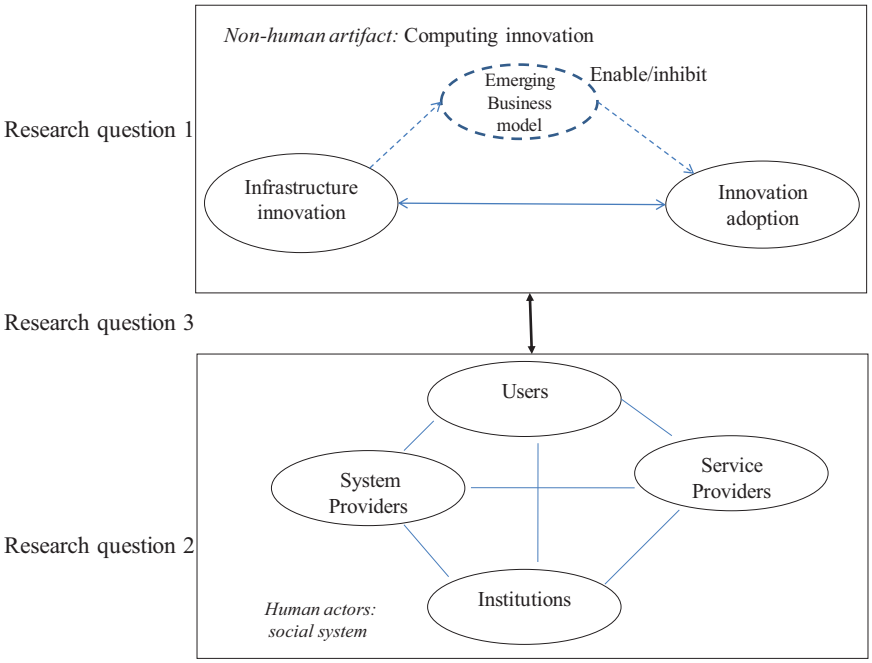

Figure 2: A framework for analyzing computing market innovation

As depicted in the framework, the research questions we try to explore and exploit are as follow: Question 1: How do the infrastructure innovation, business model and innovation adoption co-evolution?

Question 2: What actors are enrolled into the social system in the development of supercomputing and cloud computing?

What are the characteristics of their interactions in the social system? What are their roles in computing innovation?

Question 3: How does the social system determine the innovation, and in return how does the innovation situation influence the properties of the social system?

We have conducted a case study of China to justify our framework. Specifically, we draw upon our framework to give a systematic analysis on the development initiatives of the supercomputing and cloud computing which promote computing market innovation. In line with our framework, the case study argues that it is the status of the interplay between the innovation and its social system that determine the successful or failed diffusion of a specific technology.

DATA COLLECTION

Carrying out a longitudinal study on the transformation of China's computing infrastructure requires capturing changes in information technology and the market, analyzing the dynamic contexts within which the transformation takes place, and exploring key stakeholders' perceptions of the market change (Walsham, 1995). The authors of this paper first engaged in the field observations (Yin, 1994). Second, from October 2010 to December 2012, more than thirty interviews were conducted in the main players including major system vendors, research institutions, public authorities, and operators in Chinese computing market. Finally, to identify the order of critical events within the computing infrastructure development in China, the authors used archival documents, including news reports in official newspapers, speeches of ministers and national leaders, and the annual reports of computing infrastructure development in China published by MII, MOST and MIIT.

The data collected by these different means were cross-validated before use (Strauss and Corbin, 1998). We engaged in two types of dialogical reasoning while interpreting the collected data. During the discussion between the authors, we triangulated the data from one perspective that had a deeper Chinese background. And from another perspective, we analyzed it from the view point of several outsiders generally entrenched in policies and businesses. This dialogical perspective also allowed us to engage in discussion with the practitioners who acted in the Chinese context (Monterio and Hepso, 2002).

Case Study of China's Computing Infrastructure

China was confronting more pressure from global market after joining in WTO and was trying to alter their current business models from low-cost, low-margin to an orientation that supports innovation and collaboration along the global value chain. There are also the increasingly needs for data storage, data processing and data computing to speed the economic transformation of the millions of SMEs in China. Effective design for such service capability to support the transformation by exploiting the existing computing infrastructure becomes critical to China.

Table1, 2 and 3 condensed the analysis of our case study to verify the framework. We will elaborate them in this section.

Table 1: Computing innovation

	Super computing	Cloud computing
Infrastructure Innovation	There is a rapid development of China's super computer both in terms of quality and quantity	Supported by broadband networks, the high-efficiency and green data-processing center as well as large-scale distributed storage and computing capacity supports various businesses.
Innovation	The innovation adoption was	The adoption of cloud computing

	Super computing	Cloud computing
Adoption	limited to the macro project in the domain of energy, climate and others. Only few large enterprises can get access to these computing resources.	follow a service oriented strategy, which involve a collection of users various from large enterprise, SMEs, government to individual.
Business model	Lacking of Effective business model	Business model is imperative to enable the transformation from technology innovation to innovation adoption in cloud computing.
Dynamics	Facility oriented	Service oriented

Table 2: Comparison of social system between supercomputing and cloud computing

	Super computing	Cloud computing
Institutional intervention	Intervening in the technology innovation and adoption directly follow the performance-based paradigm	Intervening in the deployment of infrastructure rather than innovation adoption.
System providers	The public universities, institutes and state-owned companies like NUDT (National University of Defense Technology), CAS (Chinese Academy of Sciences) and Sugon.	The domestic equipment provider such as, Lenovo, Sugon and Huawei, the transnational equipment manufacturers such as IBM, EMC and Intel
Service providers	Specific supercomputing center	The domestic internet companies represented by Sina, Tencent and Alibaba, telecom operator such as China telecom, China unicom and China mobile as well as the cloud computing centers that collaborate with local governments.
Users	Academic institutes, Large state- owned enterprise,	Large enterprises, SMEs, government, academic institutions, universities, public agencies and individuals

	Super computing	Cloud computing
Institutional intervention	Intervening in the technology innovation and adoption directly and following the performance-based paradigm	Compare with intervention in the deployment of infrastructure the stimulation in innovation adoption has relative lagged behind.
Interrelation between service providers, system providers, users and institution (interest mechanisms)	Both service providers and system providers were directly initiated and guided by government, users concentrate on the macro projects in the domain of energy, climate and others.	Government push the wide application of cloud computing. The emerging business model which involved in large range of enterprise, individual and institute (suppliers and users) serves as the engine of cloud computing.

Table 3: Research questions addressed

Question 1	➢ China's supercomputing capacity mainly adopted in the domain of energy, climate and others. Both the technological innovation (the development of super-computer and the establishment of supercomputing centre) and service adoption are promoted by the institutional intervention, while the effective business model was lacking to bridge the gap between infrastructure innovation and innovation adoption. ➢ Cloud computing can provide broad spectrum service to heterogeneous users like large enterprise, SMEs, government, individual, and among others. China's quick development of broadband networks and related computing facilities motivates the adoption of cloud computing by domestic users. Emerging business model enable the wide innovation adoption of cloud computing and self-reinforcing development of the computing market.
Question2	➢ In supercomputing, China's government follows facility oriented strategy to directly intervene into the development process of super computers, the operation of supercomputing centers and the application of computing capacity by system providers, service providers and users respectively. China's highly specified system providers supply super computer and related facilitates to or cooperate with the service providers. Service providers tailored the facilities by the approach of directional bidding among domestic system providers which is administrated by the

	government procurement. These supercomputing service providers provide computing service to the national institutions according to government's guidance.
	➢ In cloud computing, central and local government's investment incentives play a critical role in enhancing the dynamics of system providers and service providers. By the end of 2011, nearly 20 metropolitan governments announced large cloud computing and data center investments and projects. It demands more coordinated response from governmental agencies. System provider need to ensure the scalability, flexibility and reliability of the computing facilities, and optimal the facilities' cost and maintenance expenditure to enhance their attractiveness for service providers. New service capabilities of the service providers could be tried out by tackling a new problem with enough complementary capabilities or new applications.
Question3	➢ In supercomputing, both the technology innovation and adoption were greatly stimulated by the institutional intervention of Chinese government. For example, the Tianhe1A and Dawning Nebulae are mainly supported by national 863 projects. These established computing infrastructures are serving for the national researching and engineering projects, which are dominated by the state owned institutions.
	➢ Chinese central and local governments have tried to address the infrastructure innovation and innovation adoption by encouraging capital investment of domestic service providers. The establishment and maintenance of reliable computing infrastructure also stimulated the engagement of relative actors from different sectors.

The development of supercomputing (from 1989)

1. From technology innovation to innovation adoption

The development of Chinese supercomputing follow a top-down and facility oriented strategy. The development of supercomputing was motivated by government's initiative to stimulate the rapid development of pillar industry and ensure the sovereignty and security of the country. In 1989, the State Planning Commission, the State Science and Technology Commission and the World Bank jointly launched a project to develop networking and supercomputer facilities including three supercomputer centers in China (Fan, 2001). China gradually accumulated technological capability and research expertise under government's facility oriented strategy. Then the first decade of the 21st century witnessed the dramatic progress of supercomputing in

China, the computing peak speed of the fastest supercomputer climb from 51st in June 2003 to 5th during 2005 in the top 500 list[9]. By mid-2010, China's supercomputer Nebulae had reached the 2nd spot and a Chinese supercomputer, the Tianhe-1A, from the National Supercomputing Center in Tianjin briefly became the world's fastest at the end of 2010(Jonathan, 2010). As for China, the race to build the fastest supercomputer in the world has become a source of national pride to some extent.

Although there has been a rapid development of China's super computers in terms of theoretical peak speed, the innovation adoption was limited to the macro projects in the domain of energy, climate or scientific. Generally they are targeted to small groups of public institutions, who were interested in accessing powerful and expensive computing resources. Few large firms can get limited access to these computing resources and the computing potential is far from being fully utilized.

As one director of National Supercomputing center[10] said in an interview:

"Currently, we tend to purchase the supercomputer equipment from the domestic providers like Sugon or Lenovo other than foreign firms. The speed performance of domestic products can meet our operation requirement since the architecture of the supercomputer become mature. As for our customers, the academic computation demands mainly come from large domestic research institutes, only few large state-owned enterprises in oil or aviation sectors need supercomputing service. Actually, our computing service charge only covers the electricity cost. The investment and maintenance cost of our machines mostly come from the government, and we have very limited initiative to explore the new market. "

Both the technological innovation and innovation adoption are promoted by the direct institutional intervention, while the effective business model was lacking to bridge the gap between them. Address government intervention and neglect business model forming cannot ensure the sustainable and self-reinforce development of supercomputing industry.

2. Social system

Supercomputing industry involves in a small number of actors that is designated by government. The powerful computing systems owned by the government are valued for their ability to solve mission tasks for national interests in areas like climate, energy, finance, science and defense. This industry operates as a stand-alone system rather than a scalable and shared user re-configurable resource (Vouk et al., 2010). Government support the emerging and recent development of supercomputing through national programs. From the late 1990s, China launched one research program named "national HPC environment". From 2001 to 2005, the mega project about high performance computer and core software was started. In the late 2000s, MOST (Ministry of Science and Technology) founded the "Mega 863" project concentrate on "High performance computer and grid service environment" which aims to develop the high performance computer capable of carrying out thousand trillion level calculations a second and established the high performance computer capable of carrying out 300 trillion calculations a

second. Supported by the "national 863 project", National University of Defense Technology (NUDT) research and developed Tianhe1A which ranked the world first in October 2010. The government has followed the facility-oriented strategy to directly intervene into the development and operation process of super computers by system providers and service providers respectively. After the development of domestic supercomputer, several supercomputing centers are being built in Changsha, Shenzhen and Beijing. These Chinese systems are depending on chips made by the American companies like Intel and Nvidia while the key interconnect, or networking technology, developed by Chinese researchers(Ashlee,2010).

Table 4 depicts the 'China Top10 List of Super Computer in 2011', we can observe that the leading system providers for supercomputing are mainly domestic actors like NUDT, NPCETR [11] or Sugon, which supplies the supercomputers and related facilitates. They have established the stable interest alignment with the national supercomputing centers which provide the computing service to the targeted limited national institution users. These computing users concern more about the computing speed and technological capability. Other foreign system providers like IBM choose to supply their products to the business users.

Table 4: China Top10 List of Super Computer in 2011

Rank	Vendor	Country original	System	Installation Location	Service area	Linpack (Gflops)
1	NUDT	China	TianHe OneA	National Supercomputer Center in Tianjin	Scientific Computing /Industry	2566000
2	NPCETR	China	SunwayBlueLight	National Supercomputer Center in Jinan	Scientific Computing /Industry	795900
3	NUDT	China	TianHe OneA-HN	National Supercomputer Center in Changsha	Scientific Computing /Education	771700

3. Interaction of computing innovation and social system

Both the technology innovation and development of supercomputing were greatly stimulated by direct institutional intervention of the government. China's supercomputing industry is strongly motivated by the government's pursuing of technology breakthroughs with a technologically elegant innovation in one great leap. These established computing infrastructures are mainly serving the national science programs in the domains of energy, climate, astronomy, geography and medicine, which are dominated by the state owned institutions. However, these computing infrastructures couldn't be fully exploited and contribute to the social and economic development directly. Only the limited public users can access such expensive and centralized computing resources. Then the infrastructure designers, developers and users couldn't be effectively intertwined to build strong interest communities for the infrastructure.

Emergence of cloud computing (from early 2009)

Since 2009, the advent of cloud computing has somewhat changed the traditional supercomputing landscape in China. Cloud Computing is more considered as an IT deployment model than a pure technological breakthrough, where resources, in terms of infrastructure, applications and data are deployed via the internet as a distributed service by one or several service providers. These services are scalable on demand and can be priced on a pay-per-use basis and the cloud computing utilizes on-demand network access as a means to connect the user to a shared pool of resources (e.g., networks, servers, storage, applications, and services) based

in the cloud (Shirley & Carol, 2011). This new paradigm is regarded as a solution for reducing IT investment costs, minimizing management effort, and improving business process (Armbrust et al. 2010).

Affected by the worldwide financial crisis in 2008, China suffered a sharp reduction her export and manufacturing sectors. In the effort to resist this recession, China was forced to transform its developmental engine from low cost based manufacturing and assembling sectors to knowledge intensive sectors. However, the computing facilities supporting millions of SMEs are still quite weak. The emerging cloud computing model based on the growing computing infrastructure becomes an attempt to enhance the competence of the Chinese firms under the global fierce competition.

1.Computing innovation

Since 2009, a significant change emerged in terms of the business models and service patterns of computing architecture in China. As an service oriented innovation, cloud computing emphasize more on the reconfiguration of market and industrial structure rather than just concentrate on the disruptive technology advancement. Main cloud computing service and solutions are based on utilizing existing IT technology and infrastructure, which greatly speed the constructing of the industrial value chain. By utilizing cloud computing, large amount of SMEs can exploit the potential of their obsolete computers or other computing facilities in the future. Since the early 2000s, the large internet companies such as Alibaba, Baidu and Shanda start to provide cloud based services like SaaS solutions. A lot of SMEs benefit from this internet-based computing services like e-commerce data mining, a big data processing and data customization.

Stimulated by the increasing needs of knowledge and information based industrial transformation, China attached great importance to the establishment and maintenance of supporting infrastructure like broadband network. After several decades of development, China's network user scale ranked first in the world and maintained high growth rate. As of December 2010, China had 457 million internet users and 126.34 million broadband subscribers [3]. Although there were large number of broadband network users, the statistics show China's broadband network penetration rate was 9.49% percent in 2010(MIIT).

As the low penetration rate of the broadband network and the unbalanced development of networks in different areas restrain the development of cloud computing in China, incumbent telecommunication operators become a central actor for the cloud computing under such contexts. Since 2009, China Mobile, China Telecom and China Unicom began to launch their cloud computing research and development centers under the support of provincial and cities' governments. Their most IDCs (Internet Data Center) can be extended from providing original server hosting and renting function to support data storage, processing and service supporting various Internet and e-commerce businesses. In 2010, these telecommunication giants enlarge their investment breadth to extend and rebuild the IDCs into cloud computing centers. For example, China Mobile established its international information harbor especially concentrate on IDC centers in Beijing. China Unicom's IDC center and cloud computing operation center was

positioned in Shanghai, which will invest 500 million in the next five years.

Table 5 : The capital investment of Chinese telecom operators to IDCs from 2009 to 2010

	2009	2010
China telecom (million)	69.81	109.86
China Unicom (million)	46.22	75.74
China Mobile (million)	14.18	24.47

Source: Cloud computing market report of CCIDC consulting(2010)

Compared with supercomputing segment, the system providers in cloud computing sector need not to concern about over-provisioning for a service with least popularity, thus wasting costly resources, or under-provisioning for one that becomes wildly popular, thus missing potential markets and revenue (Michael et al.,2010). The virtualization, one of the core enabling technologies for cloud computing allows the computing power of a single machine to be subdivided into a number of smaller virtual machines which will ensure the ubiquitous and unlimited providing of computing utility for the business application. The increasingly diversified demand which exploit the innovation potential and motivate the infrastructure deployment.
Users can also benefit from cloud computing by purchasing software, storage and computing power on a pay-as-needed basis. The successful adoption of cloud computing need a kind of service-oriented strategy, which involve a collection of users like large enterprises, SMEs, government agencies and individual. Recently, Most of the business models adopted by domestic service providers are transplanted horizontally from large MNCs in the similar business domain with minor localized modification. So the emerging business model which is tailored to China's context is imperative to enable service adoption.

By the end of 2011, nearly 20 metropolitan governments such as Beijing, Chongqing, Shandong, Shanghai and others have announced large cloud computing and data center investments and projects. These local governments are targeting to the great needs for local economic upgrading. By September 2011, China has invested about £98 billion in cloud computing to build the data hub in Asia[2]. The system providers and service providers also actively involved in this investment surge to capture more business value.

As one senior official of local government said in our interview:
"We consider our cloud computing center which equipped with thousands of computer servers as a high-end image for local industry upgrading. The cloud computing is the next generation IT technology, and it seems to create a 'high-tech' investment environment and infrastructure like high-speed railway. You know, we must compete with other large cities in China in the 'emerging industries'. Those large telecommunication operators also hope to collaborate with us as they hope to capture more business value from the customers by exploiting their existing network and data centers if the whole cloud computing industries really take shape. Those large domestic system vendors also hope to sell their computing servers or other equipments to us

under the grand cloud computing plan.

We tend to cooperate with these large state-owned firms as they can attract more policy supports and national programs from the central government. Furthermore, we consider' cloud computing' as a strategic platform to stimulate the quick growth of our electronics hardware and software industries even the cloud computing itself could not earn money in the future . "

Table 6: Investment activities and main partners of local governments in cloud computing

City	Established time	Development visions announced	Main Partners
Wuxi	Feb. 2009	Cloud Valley of China	IBM, Sugon
Chengdu	Dec.2009	Cloud computing centre in middle west, Supercomputing centre in Chengdu	CAS; Sugon
Shanghai	Aug.2010	Asia-Pacific cloud computing centre	China Telecom, Shanghai Supercomputing center
Shenzhen	Sep. 2010	Cloud computing centre of Yangtze Delta	Sugon
Beijing	Oct. 2010	Cloud computing industrial centre in the world	Sugon, China Telecom
Tianjin	Oct. 2010	National leading cloud computing centre	HP
Ha'erbin	Nov. 2010	Chinese cloud valley， Data-centre city	China Mobile, Inspur
Foshan	Feb. 2011	Cloud computing centre of Guangdong province	China Telecom
Ningbo	April.2011	Cloud computing application centre	China Telecom
Chongqing	Mar.2011	International off-shore cloud computing trial district	CAS, Sugon
Dongguan	Mar. 2011	Innovation and cultivation centre of Cloud computing	CAS
Qingdao	May 2011	Data centre of northern China	China Unicom

City	Established time	Development visions announced	Main Partners
Hangzhou	May 2011	National developmental and training platform of cloud computing	Microsoft
Suhzou	July 2011	National cloud computing platform	SIP International Science Park Development Co. Ltd; Tsinghua University
Jinan	Aug. 2011	High-tech park computing centre in China	Inspur corporationu
Nanjing	Aug. 2011	National base of cloud computing	Sugon
Hefei	Nov. 2011	Cloud computing application platform	Inspur corporationu
Huhehaote	Nov. 2011	Largest data center for cloud computing in China	China Telecom, China Mobile
Xi'an	Dec. 2011	National cloud computing application platform	China Telecom,

2. Social system

The actors identified in the social system are the system provider, service providers, users and institution. These actors can represent the interest inscription and transcription of the whole social system. Compared with supercomputing, cloud computing enroll much broader interest of different sectors. The system providers in China composed of foreign equipment providers, domestic equipment providers and SMEs, The service providers include the domestic internet companies and telecom operators as well as some cloud computing centers built by local governments. In terms of social system, the networks of much more diversified actors with heterogeneous interests are becoming to shape for the could computing. Internet firms and traditional telecommunication operators are also engage in cloud computing as service providers. which have missed the supercomputing development. These actors formulate diverse convergence strategies to pursue their own interests, they also interact with other actors to make the network possible. They still haven't been intertwined to develop the necessary communities.

The service providers of cloud computing required the reliable, efficient, and secure equipments from the system providers. New service capabilities of the service providers could be tried out

whenever the users with problem and enough complementary capabilities could leverage upon the new application. And the cloud users are diversified in large enterprises, SMEs, government, academic institutions, universities, public agencies to individuals. The institutional intervention is necessary to mobilize resources, to create economies of scale, or subsidize innovation (King et al., 1994). After the financial crisis, the central and local governments in China are eager to upgrade the giant low-cost based industry. Centre and local government's investment incentives play a critical role in enhancing the dynamics of system providers and service providers.

In late 2010, the Chinese government announced their 12th Five Year Development Plan outlining their plans for social and economic development for 2011-2015, and designating 'next-generation information technology' as one of seven 'Strategic Emerging Industries'. These industries will receive special investment and development to create the basis of China's long-term economic growth and home-grown innovation. Cloud Computing was highlighted as one of the key investment areas within next generation IT by government for development of new digital technology and infrastructure.

More and more metropolitan cities in China are trying to build up the cloud datacenters and establish the cloud platform to improve the local investment environment. The local government is expected to adopt more aggressive measures to introduce more service provider and system provider to leverage the infrastructure. In October 2010, the trial projects for cloud computing services are decided to be launched in Beijing, Shanghai, Shenzhen, Hangzhou and Wuxi [4]. Cloud computing has then come into the trial and implementation phase in China. China also established two major cloud computing technology industrial parks in Beijing and Shanghai, attracting billions of investment.

In October 2011, the central government provided the development subsidiary for the domestic technology companies including the Alibaba and Baidu by providing assistance in research, planning, and guiding their technology and product roadmaps to make them more competitive in local and global markets against the international players. Given the enormous market potential in the long term, many international service providers hope to entry China's cloud computing market with different partnerships. For example, Microsoft has announced partnership with China Mobile on Cloud solutions and SAP has announced partnerships with China Telecom to provide cloud applications in China.

Given the promotion and investment by the central and local government, the security and standard emerged as a prominent obstacle stumble the widely adoption of cloud computing. And in most cases, the government is still absent in administrating the standardization, security and privacy of data. For the vast personally identifiable information as well as financial information, cloud data security has become the largest concern. Government need to make regulations to intervene the cloud-based solutions and assure these institutions that their data are being handled in a way that preserves confidentiality by giving users greater ability to control the manner in which their traffic passes through the access networks.

Considering the emerging and transforming context of China's economy, service providers can enhancing the data storage and process efficiency of diversified users by exploited the potential of cloud computing. For large company users, the service providers can mitigate the need to establish and maintain server and storage capacity by these companies. As for most SMEs, they often lack enough computing resources supporting business applications. The computing service from service providers which needs no upfront investment will allow the SMEs access the vast computing resources with the affordable prices. Cloud computing has great market potential because China possess large amount of SMEs with poor IT facilities and applications. By providing the computing services to heterogeneous users simultaneously, service providers aggregating users' demand and reduce the decentralization which helps achieve higher utilization rates than individual enterprises achieve on their own.

3. Interaction of computing market and social system

China's knowledge intensive and information oriented development stimulate almost the entire industry participants, enterprises and users to confront this emerging market innovation. Both the Chinese government and industries realized that China is now behind leading MNCs in leveraging the existing computing resources. Many service capabilities have been established when the market needs have been recognized by the service and system providers.

The networks of aligned interests for cloud computing in China are still in the initial shaping stage. The infrastructure developers and users need to be the innovators for service capabilities and organizers for the interest alignment. The central and local governments have tried ambitiously to address the infrastructure innovation and innovation adoption. The cloud computing also demands more coordinated response from the institutional system other than direct investment. Government also supports infrastructure buildinglike broadband network which are imperative to innovative products or processes.

The computing infrastructure in China: past, present and future

In 1989, a program to develop networking and supercomputer facilities including three supercomputer centers was launched in China. Afterwards, China's technology and application capability of supercomputing was accelerated gradually. The national 863 program greatly stimulate the capability enhancement of supercomputing and enable China's super computer took off after 2000. Tianhe-1A and Dawning Nebulae even ranked among the world's fastest super-computers in 2010. However, these super computing resources mainly cater to the need of national institutions in the domain of energy, climate and others. Though China's computing infrastructure has grown over the years enormously in terms of new services and capacities, a proactive business model was still lacking and the supercomputing technology met great difficulties in finding mainstream business application.

Since early 2009, the initial deployment and application of cloud computing began to emerge in China. Motivated by the central and local government, the cloud computing was developed rapidly by various actors. The cloud computing provides the service for the heterogeneous users from large enterprises, SMEs, government to individuals. This diversified demand is

different to be met by supercomputing which only need to provide specific high speed computing resources to the limited public users. At current stage, supercomputing and cloud computing serve their users respectively in China. And some large enterprises are transforming their computing demand from supercomputing to cloud computing for their relative low requirement of computing speed.

There is a trend of sector confluence are in computing industry. After the broadband network developed and the flexibility of supercomputer enlarged to a certain extent, some existing supercomputing facilities can evolve into the basic infrastructure of cloud computing which will provide broader service to the more diversified users.

Although the need is limited in the beginning stage of cloud computing, more market application will be discovered later when new service capabilities of the actors start to grow. And more actors can be attracted to try some of the novel characteristics of the cloud-based application. The system providers and service providers also need work together to configure application capabilities for the sustainable development. Thus the computing infrastructure in China can provide a much more ubiquitous, fast and reliable service to its users.

Table 7 : Milestone of computing infrastructure in China

Time	Events
Aug. 1989	The State Planning Commission, the State Science and Technology Commission and the World Bank jointly launched a project to develop network and supercomputer facilities including three supercomputer centers in China
May 1990	The computer network center of Chinese Academy of Science was founded
Apr.1994	China's computing and network facilities connected to American internet, which marks the establishment of first international connection internet in China
Apr. 1995	The establishment of supercomputing centre of Chinese Academy of Sciences
Dec. 2000	The establishment of Shanghai Supercomputing Center
Feb. 2006	Supercomputer development was highlighted into “National Guideline on Medium-and Long-Term Program for Science and Technology Development of China(2006-2020) ”
Nov. 2008	Chinese super computer named “Magic Cube” ranked 10th in the international top 500 supercomputer

Time	Events
Sept.2009	Alibaba establish the sub-company specialized in cloud computing
Dec. 2009	Chengdu supercomputing center was founded as the commercialized computing centre for cloud computing.
Otc.2010	Tianhe-1A supercomputer reach the top spot in the world
Otc.2010	MIIT (Ministry Of Information And Industry Technology) and NDRC (National Development and Reform Commission) issued a circular regarding cloud computing services innovation trials and announced five cities for conducting trial cloud computing service.
Otc.2011	NDRC established the special funding which including 660 million RMB investment to support the companies engaged in pilot cloud computing projects in five trial cities.
Until the end of 2011	Nearly 20 metropolitan governments have announced the large cloud computing and data center investments and projects

DISCUSSION, LIMITATION AND CONCLUSION

Today's computing infrastructure involves higher complexity that extends beyond what can be addressed by traditional supercomputing approaches. As China's computing infrastructure is still rapidly growing, we should explore it from a dynamic perspective. Through the lens of actor network theory, we explore the social-technological evolution across the institutional arrangement, technological innovation and application evolution of China's computing infrastructure. Here we define four types of actors in the social system to represent the different interest communities. The framework was constructed to explain how the interactions among the actors identified forge the growth of the infrastructure.

We then conduct an in-depth case study of computing infrastructure in China to justify our framework. The case study demonstrates that, our analytical model offers a higher explanatory power compared with a traditional innovation, adoption or business model theory. China's economic and political environment determined the growth characteristics of her computing infrastructure. We find that computing infrastructure is not intentionally built but emerging in nature and continuously growing. The infrastructure innovation, business model and innovation adoption co-depend during the growth process. Therefore, the capabilities of involved actors were enforced to exploit potential of the established computing infrastructures.

Initially, the performance-driven supercomputing becomes the prominent component of China's computing infrastructure. The development of supercomputing in China follows a relatively closed paradigm. As it enrolled few large state-owned enterprises and the interest translation and inscription is relative clearly. This closed paradigm can efficiently coordinate the interests among limited actors in social system and stimulate the facility oriented and performance driven development of domestic supercomputers.

The increased processing power and higher transmission and storage capacity have made it possible to build the computing infrastructure with higher flexibility for the more diversified users in China. As Lyytinen and Yoo (2002) identifies, ubiquitous computing will come of age and the challenge of developing ubiquitous services will shift from demonstrating the basic concept to integrate it into the existing computing infrastructure and build widely innovative mass-scale applications that will continue the computing growth.

The emergence of the cloud computing began to reconfigure the structure of the computing infrastructure. Under a highly open setting, cloud computing enrolled much more diversified players originally in different sectors which enhance the complexity of interest capture and transformation among the different actors. As cloud computing is a mix of resources and services that have profound economic and social impacts. Then organizing and connecting the heterogeneous actors with diversified interests are critical for the sustainable growth of the computing infrastructure. The computing infrastructure will grow adaptively and re-organize constantly with new connections between different actor communities. Chinese central and local governments also used preferential policies to support the emerging cloud computing in constructing a broad and flexible computing infrastructure for the industrial upgrading.

However, China still adopts the facility-oriented strategies in cloud computing development while the appropriate business model forming becomes somewhat overlooked. Given the premature developing stage of Chinese knowledge intensive and information oriented industries' transformation, the interest alignment within the actor network couldn't be achieved with the pure facility-expansion paradigm. In this case, demand for computing market heavily depended on the incentives that policies created and there also existed the possibility that public spending crowds-out private investment (Goolsbee, 1998). However, as the investments that took longer to pay off, the uncertainty in market expectations may have dampened the potential incentives of social capital.

When linking the institutional arrangement, technological innovation and application evolution to explore the evolution of sector in emerging context, institutional arrangement plays a critical role. This facility-based and mission oriented policy paradigm will encourage the involved firms to pursue technology breakthroughs with a technologically elegant innovation in one great leap or leapfrog (Spencer and Murtha, 2005). However, the direct intervention in the infrastructure innovation and innovation adoption will limit the actors in social system. Lacking of efficient business model affects the sustainable growth of China's computing infrastructure. Therefore, Service oriented policy paradigm should be adopted, as the diffusion of certain new technologies in the market is the result both from the providers' push and the users' pull, subject to the influence of different institutions (King, 1994). This service -oriented strategy

concentrates on acquisition, diffusion and assimilation of technologies existed in the relative sectors and enrolls much broader actors in the social system.

Considering the special institutional context of China, in order to maximize the potential benefits of cloud computing, government needs to establish the legal and regulatory framework that promoting innovation, stimulating the construction of infrastructure to guarantee the privacy, security and safety of data. The innovative computing services demands that technological, business and social concerns be integrated effectively into the overall design. More attentions need to be paid to manage the critical relationships with regulators, correct timing, and effective and continuous meshing of the concerns for the data security, privacy and standardization. However, the frequent changes of the policies in China made potential market demand volatile. A predictable and transparent policy regime will decrease the uncertainties of the institution and motivate this sector by attracting more actors home and abroad into the social system. The policies about data security and service standardization also need to be consistent with the local, regional, and national levels can also stimulate the incentives of market players.

As the computing infrastructure of China is still in its infancy, more research needed to be conducted to beyond Chinese context. Our model may be used to examine and compare computing infrastructure in different emerging countries.

Mu-Chung Chen, epartment of Information Management, National Yunlin University of Science and Technology, Douliou, Taiwan

ABSTRACT

Purpose - *To address this important issue in supply chains, this paper presents a research model to examine the factors influencing the innovation performance and implementation in electronic supply chains.*
Methodology– *We analyze data collected from 252 of the top 1000 Taiwanese manufacturing firms in 2011 listed by Business Weekly. Our research model comprises two research hypotheses with three constructs, including institutional orientation, relational benefits and innovation performance. The hypotheses are tested via an empirical study of electronic supply chains.*
Findings - *The findings demonstrate that electronic supply chain members should reinforce their relational benefits and institutional view of relational governance so as to improve their innovation performance for achieving competitive advantage of electronic supply chains*
Value - *Our results show that relational benefits improving the positive effect of institutional orientation on innovation performance.*

Keywords: institutional orientation, relational benefits, innovation performance

INTRODUCTION

Inter-organizational relationships are established, maintained and enhanced to achieve competitive advantages for all parties involved (Cheng, 2011). In an electronic supply chain, different types of relationships are formed based on the type of collaboration, from close collaborative product development to simple buy-and-sell interaction. A supplier partnership in the electronic supply chains implies the agreement between a manufacturing firm and its suppliers or subcontractors. It includes sharing risks and benefits that come along with the relationship. The buyer-seller relationships, for its part, reflect strategic relationships among independent firms. Both partners in a relationship tend to collaborate together if they perceive cooperation with each other will bring benefits or value.

Inter-organizational innovation performance has increasingly become key determinants of electronic supply chains' competitive advantages (Wang, Yeung, and Zhang 2011). The performance of an organization in inter-organizational relationships such as electronic supply chains for achieving its business goals often depends on the innovation performance that it develops and implements with its partners (Azadegan 2011). Inter-organizational innovation performance within an electronic supply chain has thus become a common practice, because it enhances the competitive advantage of the electronic supply chain as a whole.

To take full advantage of innovation performance, manufacturers must understand the factors influencing inter-organizational innovation performance. Existing research on this important issue has paid little attention to the causes of the innovation performance in an inter-organizational context (Petersen, Handfield, and Ragatz 2005; Wang, Yeung, and Zhang 2011). In particular, no study has examined how the interactive factors of inter-organizational relationships affect innovation performance and these relationships. To achieve the benefits of inter-organizational innovation performance, it is important in the maintenance of good relationships.

To verify this new research model, we first examine how the institutional orientation of a company affects its attitude toward inter-organizational innovation performance. Then, we look into how factors of relational and institutional view affect the connection between institutional orientation and inter-organizational innovation performance. Specifically, we examine how relational benefits affect the interaction between institutional orientation and innovation performance.

In the following sections, Section 2 presents theoretical framework and hypothesis development. The data collection method and research design are described in Section 3, and the study findings are presented in Section 4. Finally, Section 5 provides a discussion of the results, and Section 6 concludes the paper and offers directions for future research.

THEORETICAL FRAMEWORK AND HYPOTHESIS DEVELOPMENT

Institutional Orientation

In an electronic supply chain, a strong institutional orientation means that the willingness of a firm to build and to maintain positive relationships with its partners is enhanced (Dwyer, Schurr, and Oh 1987; McFarland, Bloodgood, and Payan 2008). The firm will choose to conform to the "rules of the game" to avoid being locked out of cooperative relationships

and to ensure access to relational resources (DiMaggio and Powell 1983; Tolbert 1985; North 1990; Liang *et al.* 2007; Cheng 2011). With collaborations between partners will boost the innovation performance (Wang, Yeung, and Zhang 2011). Thus, it is reasonable to propose that the higher the institutional orientation between partners improve inter-organizational innovation performance. It is thus hypothesized that:

Hypothesis 1: Institutional orientation is positively related to innovation performance

Relational Benefit

The critical role of relational benefits is always a top priority when a company decides whether or not to form partnerships with others. They are crucial in determining the level of commitment to product profitability, customer satisfaction, and market share. Similarly, when the relational benefits provided by one company are greater than those provided by others, customer loyalty improves. The willingness of customers to build and maintain long and positive relationships with the company is subsequently enhanced (Gwinner, Gremler, and Bitner 1998). Therefore, relational benefits between partners are so substantial that can affect relationship effectiveness in electronic supply chains. Thus, the higher the relational benefits between partners increase the effect of institutional orientation on innovation performance. Therefore, It is hypothesized that:

Hypothesis 2: The association between institutional orientation and innovation performance is moderated by relational benefits such that the association is significantly stronger when a high level of relational benefits is present.

RESEARCH METHOD

To develop the survey instrument, pools of items are identifies from this literature in order to measure the constructs of this research model. All measures of this survey instrument were developed from the literature. The expressions of these items are adjusted, where appropriate, to the context of marine transportation logistics. The items measured on a seven-point Likert scale, ranging from ‘strongly disagree’ (1) to ‘strongly agree’ (7).

In order to improve content and appearance of the 12-item questionnaire, a pre-test of it was performed on a sample comprising three academic researchers and five Ph.D. Students. The empirical study aims at top 1000 manufactory enterprises selected from directories of 2011 Business Weekly top 1000 firms in Taiwan. This resulted in 252 effective responses and a

total response rate of 25.2%. A Chi-square analysis of the industry distribution of the respondents showed no difference from the industry distribution of all the firms used in the survey. This suggested no non-response bias in the returned questionnaires.

RESEARCH RESULTS

Structural equation modeling (SEM) with LISREL 8.54 (Joreskog and Sorbom 1993) was used to test and analyze the hypothesized relationships of the research model. SEM aims to simultaneously examine the inter-related relationships among a set of posited constructs, with each construct being measured by one or more observed item(s) (measures). SEM involves the analysis of two models: a measurement (or confirmatory factor analysis) model and a structural model (Anderson and Gerbing 1988). The measurement model specifies the relationships between the observed measures and their underlying constructs, which allowed to inter-correlate, and the structural model specifies the posited causal relationships among the constructs.

Institutional orientation is positively associated with innovation performance. relational benefits is positively associated with the effect of institutional orientation on innovation performance. The overall fit of the structural model is acceptable, since all measures of fit reach an acceptable level (χ^2 = 209.128, df = 112, $p < 0.01$; GFI = 0.911; AGFI = 0.862; CFI = 0.915; NFI =0.909; RMSEA=0.046). The result shows that institutional orientation (H1: γ = 0.182, t = 3.902, p < 0.001) is significantly associated with innovation performance, and its interactions with relational benefits (H2: γ = 0.421, t = 4.018, p < 0.001) is significantly associated with innovation performance.

DISCUSSION AND CONCLUSION

Conforming to the hypothesis, institutional orientation has the strongest positive influence on inter-organizational innovation performance. This finding is consistent with Bello, Lohtia, and Sangtani (2004). In Taiwan's electronic supply chains, this factor plays the most significant role in undermining inter-organizational innovation performance. Institutional orientation means there are formally through rules or laws, or informally through certain cultural expectations between electronic supply chain members. Violating these rules may bring a firm's legitimacy into question and jeopardize its access to scarce resources and social support (DiMaggio and Powell 1983; Tolbert 1985; Liang *et al.* 2007). Thus, institutional orientation can impact partners' ability to process rationalize, and exercise discretion in inter-organizational innovation performance.

We also find that the association between institutional orientation and innovation performance is positively moderated by relational benefits, consistent with the finding of Petersen, Handfield, and Ragatz (2005) and Wang, Yeung, and Zhang (2011) that a good relationship increases inter-organizational innovation performance. It is not surprising that relational benefits constitute the greatest contributing factor, and, not unexpectedly, a Taiwan's manufacturing firms will form inter-organizational relationships only when it can benefit from the relationship. For example, one party from the cooperation relationship could be the net-gainer at any one time. Therefore, there would be no cut-and-run because the party perceives that only through continuity of collaboration can gains be achieved in the future (Dodgson 1993). This indicates that organizations tend to collaborate together if they perceive cooperation with each other will bring benefits and good performance.

It is of strategic importance for an organization to understand the factors influencing the performance of innovation developed and implemented with its partners in an inter-organizational relationship such as electronic supply chains. In this study, we find that the institutional orientation is positively associated with innovation performance. We also find that relational benefits between electronic supply chain members increase the willingness of partners to enhance their relationships to improve the performance of innovation. When both sides in an electronic supply chain perceive cooperation with each other will bring benefits, organizations tend to increase the closeness of the relationship. The findings of the study provide practical insights in understanding how enhanced inter-organizational relationship benefits can help enhance inter-organizational innovation performance.

ACKNOWLEDGEMENTS

E-BUSINESS ANALYSIS OF REAL ESTATE COMPANIES

Delvin Grant, DePaul University, USA
Email: dgrant2@depaul.edu

Emna Cherif, DePaul University, USA
Email: emcherif@gmail.com

ABSTRACT

We analyzed the e-business websites of Realestate.yahoo.com, Realtor.com, and Zillow.com. We looked at the similarities and differences between them and how e-business components help differentiate one company from another and the role this plays in contributing to their success. We looked at which business model components, such as value proposition, target customers, distribution channels, and revenue streams, are important. The type of e-business models each company used and the ones that are more successful were investigated. We discovered some similarities and differences; some differences were the use of revenue streams for generating multiple sources of revenue, the type of e-business models used and the role they play in executing the e-business strategy.

Keywords: Canvas Framework, Real Estate, Business Models, e-business, Analysis

INTRODUCTION

The internet's ability to provide access to information has improved real estate communications and business (Aalberts and Townsend, 2002). Business models represent the business logic of companies. They are executed by company websites and are important to the success of companies. E-business models represent the rationale of how companies create, deliver, and capture value (Linder and Cantrell, 2000). By understanding them, companies identify opportunities to improve the business (Osterwalder, 2004), so it is important to understand their role. The internet has changed the real estate business but the importance of e-business could be further developed Our principal research objective is to investigate the role that e-business models play in real estate. In pursuit of this objective, we look at the similarities and differences among e-business models and how they affect company success. We investigate the importance of four business model components--value proposition, target customer, distribution channel, and revenue streams--using Canvas Framework (Osterwalder, 2010). We also looked at the type of e-business models used by each company. The contributions of this work are 1) identification of the components of e-business models of industry leaders, which serve as benchmarks for competitors; 2) demonstrating that the use of e-business model components helps companies understand which ones contribute to company success; 3) elucidating the role that e-business components play in attracting customers; and 4) helping companies understand which type of e-business models works best.

The paper is organized as follows. Section 2 reviews definitions of e-business models, section 3 defines the types of e-business models and section 4 analyzes three e-business models. The paper ends with a discussion in section 5.

E-BUSINESS MODEL DEFINITIONS

The internet has enabled new ways to deliver customer value by using e-business models that change how companies operate. E-business enables traditional businesses to evolve to a hybrid brick-and-mortar/online model. E-business is an approach to expand traditional business models, increase markets, and grow revenue. Several definitions of e-business exist (Cagnina and Poian, 2009; Rappa, 2004; Osterwalder, 2010; Methlie and Pedersen, 2007). Timmers (1998) defines eleven generic e-business models, from e-shops and e-procurement to trust and other third-party services. Tapscott et al. (2000) propose a network-and-value-centered taxonomy with five types of value networks called "business webs," which differ in their degree of economic control and value integration. Weill et al. (2001) describe eight so-called "atomic" e-business models; each describes different ways of conducting business electronically. E-business initiatives are represented by pure atomic business models or by combining them. Applegate (2001) introduces six e-business models: focused distributors, portals, producers, infrastructure distributors, infrastructure portals, and infrastructure producers. Dubosson-Torbay et al. (2002) identify the principal dimensions--user's role, interaction pattern, nature of the offering, pricing system, level of customization, and economic control--for classifying e-business models. Rappa (2001) describes companies by their value proposition and ways of generating revenue. His classification has nine categories of e-business models: brokerage model, advertising model, infomediary model, merchant model, manufacturer model, affiliate model, community model, subscription model and utility model.

E-business models are comprised of a set of components so we need to choose the appropriate application framework to define the relationship between them. The growth of e-business has raised interest in transforming traditional business models to exploit opportunities through innovation (Pateli and Giaglis, 2003). The internet has changed the idea of a business model and this has practical implications for companies. Consequently, companies need to redefine customer value propositions, and their business model. Enhancing customer experience helps to reshape customer value propositions (Berman and Bell, 2011). Creating new digital capabilities helps to refine the operating model by leveraging information to manage organizations, and integrating and optimizing digital and physical components (Berman and Bell, 2011). Effective use of e-business models depends on the economic environment, market and industry conditions, and the internal and external factors of organizations. Internal and external factors affect the need for business model change. Internal functions include product/service innovation, performance and the availability of resources (Giesen, et al., 2009). Product and service innovation is a key driver of new e-business models, especially for companies introducing to the market new products or services that require new skills, and capabilities and processes that lead to new value propositions.

Financial performance and the availability of key resources are both drivers and enablers of business model innovation. For the e-business real estate industry, introducing new services such as mobile device applications and online property value analysis are considered internal factors. External factors include new entrants, competitors, customer preferences, customer segments, technology, regulatory/legal, and the business environment. When customer preferences for goods and services change, they force changes to the customer value proposition and the e-business model.

TYPES OF E-BUSINESS MODELS

There are four primary types of e-business models: web-advertising model, brokerage business model, virtual value-chain model and the diversified model. Web-advertising is an extension of the traditional media broadcast model where the broadcaster is a website that provides free content and services such as email, IM, and blogs, mixed with advertising messages in the form of banner ads. One of the most sophisticated forms of internet advertising is Google ad. Banner ads are a major source of revenue for broadcasters. The website platform is designed to attract users with free content, products, or services; it generates revenue by selling space to advertisers and is a popular and rapidly growing advertising model (Jansen and Schuster, 2001; Jansen and Mullen, 2008). Realestate.yahoo.com, Realtor.com, and Zillow.com use this model. The brokerage model brings brokers, sellers, and buyers together to do business. The broker charges a fee to at least one party involved in the transaction. Brokers connect consumers with retailers, businesses with each other and consumers with each other. In real estate, e-business companies enable the search for properties and provide brokerage services. Companies that use the brokerage model make money from commissions and service fees. The payment of commissions to brokerages is contingent upon finding satisfactory buyers, successful negotiations of purchase contracts between buyers and sellers, the settlement of transactions, and the exchange of monies between buyers and sellers. In this model, the median commission charged to sellers by listing agents is 6% of the purchase price and is shared between sellers. The virtual value-chain supports the traditional value chain and it has changed the way businesses operate (Rayport and Sviokla, 1995). The traditional value chain uses information for support but the virtual value-chain uses information as a value-creating opportunity where products and services are in the form of digital information delivered through information-based channels. The three sites under study use that model. The diversified model helps companies to expand their core business to related products and services. In this model, a parent company owns the network and the diversified model provides internally integrated product-service mix. The model has several merits, one of which is that it enables companies to reduce reliance on core products and spread their risk by moving into other markets and offering combined product-service packages. It offers opportunities to develop powerful brands and to acquire better corporate image. One drawback is that it requires more investment in new technology, as well as major cultural changes for providing diversified product/services instead of a single product/service. Diversifying the business introduces additional risks and this may explain why it is not used by any of the three sites.

ANALYSIS OF E-BUSINESS MODELS

We compare the business models of the top three e-business sites using Canvas Framework. We determined the popularity of the sites by the amount of business they generate and the percentage of visitors they attract (Top 20 real estate websites, 2012). We selected the sites because of their popularity and position in the industry (Ebiz/mba, 2012). They are representative of real estate sites that exhibit the core services such as mobile applications, advanced property searches, map interfaces, home alerts, demographics data, MLS listings, property listing prices, ability to contact agents, location searches, ability to save searches, advice forums, new property listings, and property value analysis. The sample includes sites that use web-advertising, virtual value-chain, or the brokerage model. Realtor.com has the ability to list properties worldwide.

The data in table 1 were collected in several ways. First, we performed online feature analysis of three sites by logging into them to discover the various features available to users and to assess their capability and user friendliness. Second, we analyzed business and technical reports (Zillow.com, 2012).

Table 1: Business Models Comparison

	Zillow.com	**Realtor.com**	**Realestate.yahoo.com Yahoo.com**
Value Propo-sition	**Newness**: The users have the possibility to appraise the property values based on undisclosed factors using a proprietary algorithm called the "Zestimate."	**Newness:** DocuSign, the electronic signature provider, makes available DocuSign for Realtors. Realtor.com launched the international version of the web site.	**Newness:** Realestate.yahoo.com Yahoo real estate displays predominantly on the home page the user location once the client visits the website.
	Usability & Performance of Services: Zillow Mobile applications are easy to use and provide real estate data and information to users quickly and efficiently.	**Usability & Performance** Realtor.com makes ongoing and frequent changes to improve its performance.	**Usability & Performance** The Yahoo real estate website actual search process is simple and straightforward.

	Zillow.com	Realtor.com	Realestate.yahoo.com Yahoo.com
	Customization: This website provides these features: establish an account, login, MLS listing, listing price, find an agent, location aware search, saved search, advanced search, advice forum, new listing, mobile device application, home alerts, value analytics, map interface and demographics.	**Customization:** This website provides these features: establish an account, login, MLS listing, listing price, find an agent, location aware search, saved search, advanced search, advice forum, new listing, mobile device application, home alerts, map interface.	**Customization:** This website provides these features: establish an account, login, MLS listing, listing price, find an agent, location aware search, saved search, advanced search, advice forum, new listing, home alerts, value analytics, map interface and demographics. Realestate.yahoo.com Yahoo real estate does not have the mobile device application.
	Design: The website has superior design.	**Design:** The website has superior design.	**Design:** The website has superior design.

Partnership	**Acquisition of particular resources and activities:** YahooReal Estate: partnership. Zillow Mortgage Marketplace has Distribution Partnership with Redfin.Mortgage Concepts, LLC. AmeriSave partnership.	**Acquisition of particular resources and activities:** The National Association of Realtors launched a partnership with Olinger Group.	**Acquisition of particular resources and activities:** Yahoo Real Estate and Zillow have entered into a partnership that will place targeted ads that real estate agents and brokers purchase from Zillow in property search results on both sites.
Revenue Streams	**Advertising:** The website makes money from broker, agent and bank ads.	**Advertising:** The realtor pays monthly fees to Realtor.com to get his/her name to show up on top 10% of the time in a rotation.	**Advertising**: Yahoo real estate sells display advertising on the website to new home builders, real estate agents and brokers. Yahoo has advertising partnership with Zillow; all showcase ads and featured listings ads purchased through Zillow will automatically appear on both Zillow and Yahoo Real Estate.

	Zillow.com	Realtor.com	Realestate.yahoo.com Yahoo.com
		Brokerage: The revenue of this website relies on the percentage of the transaction commission for generating leads.	
Cost structure	Platform development & management	Platform development & management	Platform development & management

The newness dimension of the value proposition component is widely used by the sites. Zillow.com has a new and interesting property estimate algorithm called Zestimate which provides Zillow users with home value estimates that are calculated on a range of publicly available information, including sales of comparable houses in a neighborhood. The new feature for Realtor.com is DocuSign, allowing National Association of Realtors (NAR) members to sign documents anytime, anywhere on any device using the DocuSign for Realtors for free with unlimited signers and unlimited file storage. The NAR launched the Realtor.com International web site, which makes available to buyers across the globe millions of for-sale property listings on Realtor.com. Third party content providers feed residential property data to sites. For Realestate.yahoo.com, the new feature is the capability to display the users' location on the website. Regarding usability and performance dimension of the value proposition, the mobile device application in Zillow.com is helpful and user friendly. The elegance of the graphical user interface is helpful, and provides data and information quickly and efficiently. Search result pages have average sales prices in each city and provide a list of buyer agents and a button to call them directly. Realtor.com continues to improve lead capture, increase exposure for company and listings, and improve the overall web site experience for real estate buyers and sellers. Realestate.yahoo.com offers an easy home search service and useful tools that provide easy access to millions of property listings, a mortgage calculator, and market snapshot information. Regarding the customization dimension of the value proposition, internet sites offer a bundle of services to users that are provided by third-party providers. This shows that internet sites may use virtual value-chain business models.

Realtor.com has a mobile application that has different usage modes. The Realtor.com iPad app allows consumers to communicate with company realtors via the internet. Realestate.yahoo.com does not have a mobile device application. Regarding the website design dimension of the value proposition, the Mobile Widget of Realtor.com is slated to be removed. The Real Estate News and Advice will be temporarily removed and the number of searchable neighborhoods on Realtor.com will increase significantly. In comparison, Zillow.com and Realestate.yahoo.com have elegant designs compared to Realtor.com. The target customer component is identical for all the sites and includes buyers, sellers, house owners, brokers, agents, and banks. Regarding the distribution channel component, websites enable communication with customers to deliver value propositions, such as sales, and online advertisements. Regarding the advertising dimension of

the revenue stream component, some websites use the web-advertising model to make money from agents, brokers and mortgage bank ads. Agents and brokers buy local advertisements and they pay to display property listings and contact information such as agent name, property address, and property price. The three sites use a web-advertising strategy. Zillow.com generates revenue by selling advertising and which enables Zillow to offer free service to users. The revenue is used to build new internet services. Zillow also enables brokers and agents to purchase featured listings that appear by default at the top of a customer's property search results. It allows agents and brokers to purchase showcase ads in desired ZIP codes. Zillow's current mobile platform provides opportunities to deliver value to advertisers through its location-based advertising options. Realtor.com, affiliated with the National Association of Realtors, enables agents to buy advertising on the spot. Agents have various options to market featured homes to affluent clients or to advertise their services in banner ads based on locality. Pricing for realtors who choose to enhance their property and personal advertising is based on the advertising industry standard, the cost per thousand consumers reached by the advertisement. Advertising on the site is subject to tight controls, including ads from other realtors. Regarding the paid subscription dimension of the revenue stream component, the partnership between Realestate.yahoo.com and Zillow.com creates the largest real estate network on the internet, enabling real estate agents to advertise locally on Yahoo. Homebuyers have access to more local listings on Yahoo Real Estate, along with more photographs. Zillow serves as the exclusive provider of for-sale property listings information on Yahoo Real Estate. Yahoo will continue to control the appearance of for-sale listings and maintain separate databases for foreclosures, newly constructed homes, and rentals. It's not the first time Realestate.yahoo.com has partnered with other companies to provide for-sale property listings content. Yahoo and Prudential Real Estate entered into an exclusive agreement in 2004 for Prudential to provide for-sale listings information, but that arrangement ended in 2008.

CONCLUSION

For companies to change, improve, and innovate e-business models, they must understand them. To aid this understanding, we analyzed the top three e-business models of Zillow.com, Realtor.com, and Realestate.yahoo.com. The analysis includes the value proposition, target customer, distribution channels, and revenue stream e-business components. Canvas Framework consists of nine components but we focused on four due to the paper restrictions. The e-business models of the three companies exhibit similarities, differences, and common features. Similarities include online searches of real property, ability to contact agents and list real property, ability to target sellers, buyers, and agents, ability to advertise, enable personal and automated services, and establish relationships with business partners. The target customer is similar across the three companies and distribution channels are identical. Companies add new features and services to attract customers by differentiating themselves from competitors. Differences exist with regard to the newness feature of the value proposition. Zillow's new service, the ability to perform online property appraisal, increases efficiency, provides convenience, and increases the value proposition of customers. Traditional property appraisal is time consuming and inconvenient as customers have to identify appraisers, schedule appraisal appointments, and be available for the appraisal. This delays the buying and selling of properties and reduces product turnover and revenue. Real estate transactions require in-person signatures

so Realtor enables electronic signatures, a value added service for customers. Estimating property values requires agents who compare the target property to similar properties in the neighborhood. More revenue streams leads to increased revenues so companies with single income streams benefit from acquiring new streams of income. We found that e-business model differentiation plays an important role in the success of companies. Various distribution channels are used to reach customers. The resources used to reach, create and deliver value to customers are a combination of products, services and technologies including mobile applications. A major factor in creating value for customers is through the convenient access to information and services related to real estate. This includes access to agents, property information, location data, access to financiers, and mortgage analysis. Companies that combine the advertising and the value-chain model rank higher (Top 20 real estate websites, 2012).

Studies indicate that Realestate.yahoo.com, Realtor.com, and Zillow battle for the leadership position in the industry (Inman news, 2012; Property Portal Watch, 2011). In 2011, Realestate.yahoo was rated number one in market share while Realtor was number two, but in June 2012, Zillow was number one. All three sites have no paid subscriptions, do not rely on brokers and agents, and do not use brokerage except for Realtor. This suggests that the absence of paid subscriptions, brokers, agents, and brokerage do not significantly affect company performance, since the top contender in 2011 and 2012 had none. Based on our study, a successful e-business model does not have to include them all. The top three performing sites Realestate.yahoo.com, Realtor.com, and Zillow.com use the web-advertising model, which is the most successful model with respect to market share and revenue. In addition to using the web-advertising model, Realtor.com uses the brokerage model. Given that Zillow and Realestate.yahoo do not use the brokerage model suggests that it does not lead to competitive advantage. The three companies use the virtual value-chain, as many products and services are digitized and available online. The use of the internet implies the use of the value-chain model. None of the three sites uses the diversified business model. The three sites use hybrid internet models. The Realtor.com e-business model uses web-advertising, brokerage, and virtual value-chain while Zillow and Yahoo use web-advertising and the virtual value-chain.

The adoption and the development of e-business models do matter with respect to the various types of enterprises such as public agencies, for-profit private or public firms, and SMEs. Real estate companies are considered for-profit firms that are privately or publicly owned and would be classified as small, medium enterprises (SMEs). Public agencies differ significantly from private or public firms in their mission and objectives. Public agencies focus primarily on the social good and are seldom motivated by profit. However, for-profit firms are motivated by profit since they have an obligation to create shareholder wealth. Therefore, the type of e-business model companies develop or adopt should be congruent with the company mission and objectives. Our study indicates that the web-advertising model is appropriate for generating revenue and companies that are motivated by maximizing revenue and profit prefer it. It should not matter if the company is a for-profit private or public firm or a SME but it does matter if it is a public agency. Public agencies that are not motivated by maximizing profit tend to emphasize the sharing of services and information, to improve the social good of communities. Public agencies would consider the virtual value-chain or the diversified model appropriate choices. The virtual value-chain model is ideal for extending the enterprise beyond the confines of brick

and mortar by providing services and information to a much larger audience. The diversified model is ideal for public agencies that seek to leverage the synergies that exist among various product and service offerings. Therefore, Federal, local and not-for-profit agencies may find the diversified model useful. In some situations, it may be viable to develop or adopt a hybrid e-business model that combines the virtual value-chain and the diversified model. This decision will depend on the mission and objectives that companies seek to fulfill. If they seek to exploit the natural synergies that exist among various products and services while targeting a larger audience, then we recommend a hybrid model.

This study is valuable because it identifies some of the primary components of e-business models, which help competitors assess the similarities and differences between e-business model components. The assessment elucidates the strengths and weaknesses of e-business models, which help companies to improve performance and customer experience. E-business models help in the execution of business strategy and are extensions of the traditional business, so this information is useful to alignment the e-business model with the business strategy. By understanding the important components of e-business models, companies are equipped to focus on specific components. Since the real estate industry is experiencing hardship, knowledge and insight gained from this work help companies improve their competitiveness.

This research has several limitations. First, the page restriction forced us to ignore five e-business components. We also ignored some dimensions of the four components we discussed. For example, we ignored the information brokerage dimension of the revenue stream component and several dimensions of the value proposition, so a larger study should include them. It would be interesting to see how their inclusion changes the findings. Canvas Framework does not emphasize model management, continuous improvement, or business model governance, so we recommend expanding the study to include them. We recommend expanding the number of e-business websites to further investigate new findings.

ABSTRACT

Stock market interdependence has strong implication for risk diversification. Recent empirical evidence suggests that correlations between international stock markets increase during period of financial turmoil. This paper investigates the development of stock market integration in East Asia using Dynamic Conditional Correlation GARCH (DCC-GARCH) model of Engle (2002). Weekly data from January 1991 to December 2011 are used in this study. The results show that there are time-varying patterns in both volatility and correlation among the East Asian stock markets. Further, the significant evidence of positive trend in the cross-country conditional correlations is found. Particularly, such correlations increase during the periods of high market volatilities when risk diversification is needed most. These show that the East Asian stock markets are more integrated during the past decade. Therefore, regulators, prospect investors, and fund managers should pay attention in volatility transmission between markets together with the limitations of international diversification during financial crisis.

Keywords: Financial interdependence, East Asian Economies, DCC-GARCH.

INTRODUCTION

During the past few decades, the progress of financial liberalization has been intensifying around the world. Meanwhile, the concept of international diversification of investment in stock markets has spawned a considerable volume of scholarly literatures. Many research papers, e.g. Levy and Sarnat (1970), Solnik (1974), illustrated the diversification benefits derived from the low correlations among the international stock markets. However, once Erb, et al. (1994) and Longin and Solnik (1995) re-examined this issue, they found that the degree of cross-correlation in stock markets were remarkably varying over time. Some researches, e.g. Ang and Bekaert (2002), further found that correlations are intensifying during the period of recession.[3] Consequently, a growing body of literature specifically on the dynamic behavior of stock market interdependence

[1] Lecturer, Kasetsart Business School, Kasetsart University

[3] See Goetzmann, et al. (2005) for review of literature and historical data on the benefits of international portfolio.

is emerging. Even though dynamic correlations in stock returns are well documented, the existing literatures mainly focus on stock markets in the OCED countries.

Therefore, in this paper, the financial interdependence among the East Asian stock markets is explored because of their increasing role in the global financial market. There are two objectives in this study. First, we explore the dynamic measurement of cross-countries correlation and compute the time-varying cross-countries correlations among the East Asia stock markets. The Dynamic Conditional Correlation (DCC) – GARCH model of Engle (2002) are used in this study followed recent studies, e.g. Jacob and Karagozoglu (2009), Gupta and Donleavy (2009), You and Daigler (2010), to measure dynamic behavior in cross-countries correlations. Second, we check for the presence of long-run trend in degree of these time-varying cross-country correlation series using the trend regressions.

The rest of this paper is organized as follows. The econometric methodology is presented in Section 2. Section 3 provides descriptive statistics while Section 4 reports the empirical results. The last section not only concludes the main findings but also discusses the policy implications.

ECONOMETRIC METHODOLOGY

In this paper, the DCC-GARCH model proposed by Engle (2002) is employed to generate time-varying correlation among the East Asian stock markets. This method follows the multivariate GARCH approach to estimate mean and variance equations for a set of variables using the system of equation. Therefore, conditional variance for each series and covariance between series can be estimated simultaneously. The estimation method of the DCC-GARCH model is briefly discussed as follows.

Let $\boldsymbol{y_t}$ is a vector of *n*-time series variables:$\boldsymbol{y_t} = [y_{1t} \dots y_{nt}]'$,$\boldsymbol{\mu}$is a vector of conditional mean of y_t:$\boldsymbol{\mu} = [\mu_1 \dots \mu_n]'$, and $\mathbf{u}_t$ represent shock variables that can be derived from residuals of mean equation. The mean equation is written as

$$\boldsymbol{y_t} = \boldsymbol{\mu} + \mathbf{u}_t. \tag{1}$$

And the matrix of conditional variance and covariance, $\mathbf{H}_t$, is then defined as:

$$\mathbf{H}_t = \mathbf{D}_t\mathbf{R}_t\mathbf{D}_t, \tag{2}$$

where $\mathbf{D}_t$ is a diagonal matrix of time-varying standard deviations estimated from univariate GARCH models and $\mathbf{R}_t$ is a matrix containing conditional correlation of $\mathbf{u}_t(\rho_{i,j,t})$. Therefore, the $\mathbf{D}_t$ matrix is defined as

$$\mathbf{D}_t = \mathrm{diag}\left(\mathrm{h}_{11,t}^{1/2} \ \dots \ \mathrm{h}_{nn,t}^{1/2}\right). \tag{3}$$

In this paper, the elements in $\mathbf{D}_t$ is set up as the univariate GARCH(1,1) processes as follow

$$h_{it} = \omega_i + \alpha_i u_{it-1}^2 + \beta_i h_{it-1}. \quad (4)$$

While the conditional correlation matrix, $\mathbf{R}_t$, which consists of the component of DCC structure, is constructed as

$$\mathbf{R}_t = \text{diag}\left(q_{11,t}^{\frac{1}{2}} \dots q_{nn,t}^{\frac{1}{2}}\right) \mathbf{Q}_t \text{diag}\left(q_{11,t}^{\frac{1}{2}} \dots q_{nn,t}^{\frac{1}{2}}\right), \quad (5)$$

where $\mathbf{Q_t}$ is the conditional variance-covariance variables for each series. Specifically,

$$\mathbf{Q_t} = (1 - a - b)\overline{\boldsymbol{Q}} + a\mathbf{u_{t-1}}\mathbf{u'_{t-1}} + b\mathbf{Q_{t-1}} \;;\; a + b < 1. \quad (6)$$

From above equations, the conditional variance ($q_{i,i,t}$) and covariance ($q_{i,j,t}$) series can be estimated. Consequently, conditional correlations ($\rho_{i,j,t}$) are calculated from the following equation,

$$\rho_{i,j,t} = \frac{q_{i,j,t}}{\sqrt{q_{i,i,t}} \cdot \sqrt{q_{j,j,t}}}. \quad (7)$$

These dynamic conditional correlations ($\rho_{i,j,t}$) are then used as alternative measurements to determine the co-movement between business cycles and provide information on how conditional correlations are changing over time.

DATA

This study covers eight stock markets in East Asia (or ASEAN5+3) — Japan, South Korea, Singapore, Thailand, Malaysia, the Philippines, Indonesia, and China. Moreover, the United States is included in order to represent the major world economy. The stock returns series are calculated from weekly market index during January 1991 to December 2011. All data is collected from Datastream and the stock returns series are plotted in Figure 1.

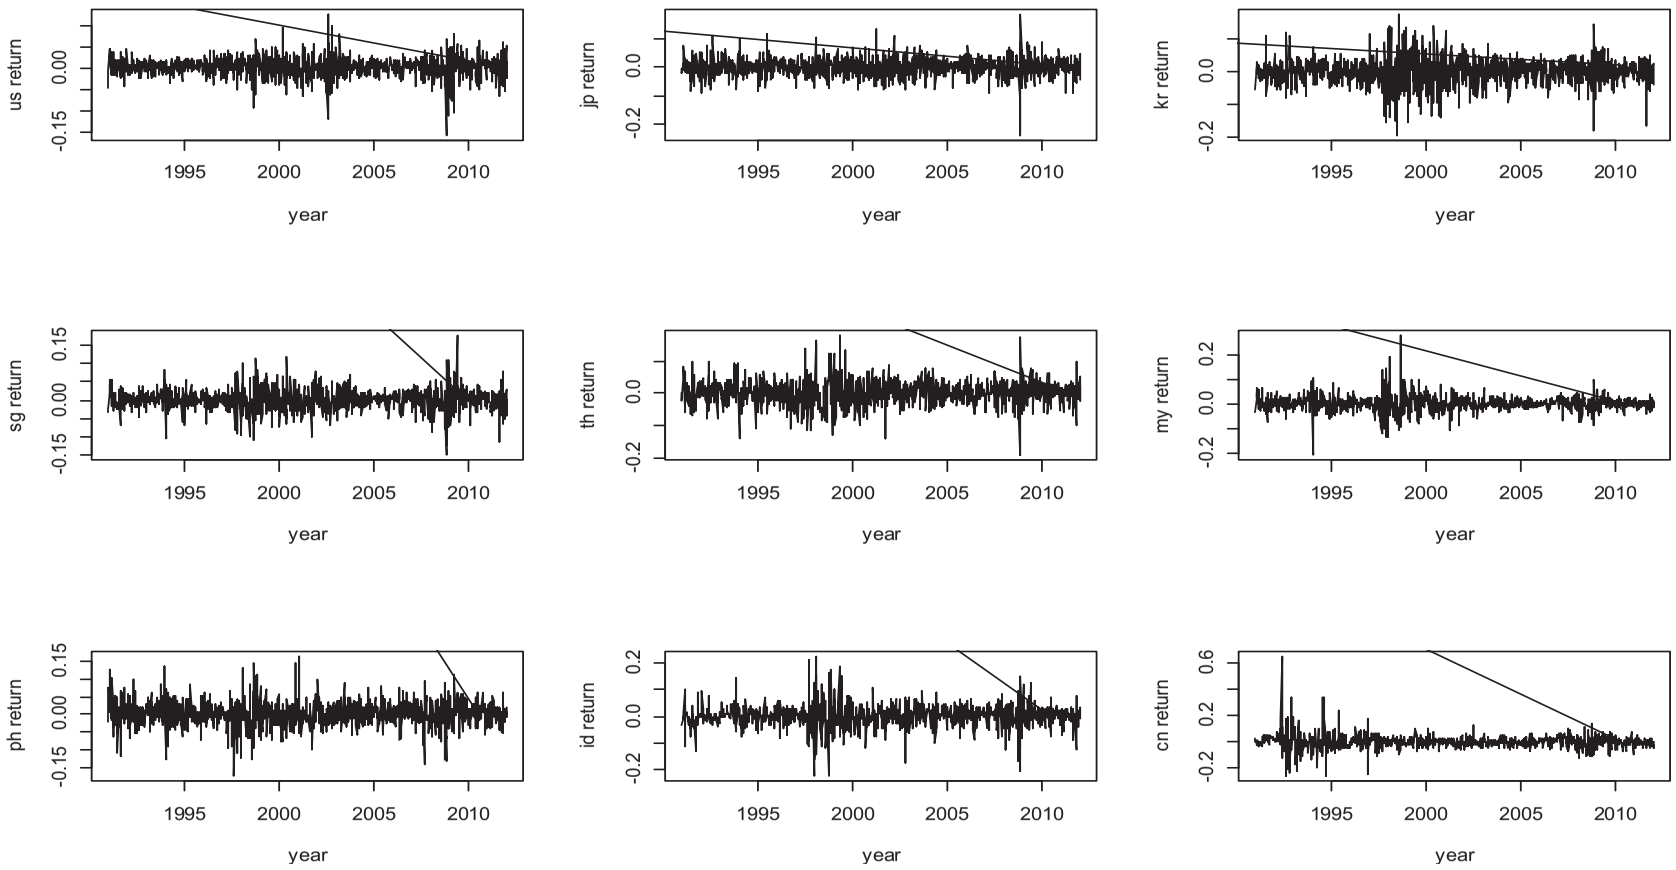

Figure 1 Country Stock Returns

Note: Weekly data; January 1991 – December 2011.
us = United States, jp = Japan, kr = Korea, sg = Singapore, th = Thailand, my = Malaysia, ph = Philippines, id = Indonesia, and cn = China.

Descriptive Statistics

Table 1 presents the statistical properties of the weekly stock returns from eight East Asia countries and the United States. As can be seen, over the sample period, China has the highest weekly stock returns at 0.3 percent while Japan has the negative weekly stock returns at -0.1 percent. Among others, China stock market is the most volatile with standard deviation of 5.5 percent followed by Indonesia and South Korea. The stock returns distribution over time is negatively skewed for all markets except China's. In addition, the stock returns are characterized by a statistically significant kurtosis suggesting that the stock returns have a fatter tail and a higher peak compared with a normal distribution.

Table 1 Descriptive Statistics, Unit Root Test, and Heteroscedasticity Test of the Stock Returns

	Min	Max	Mean	S.D.	Skewness	Excess Kurtosis	ADF-test	$Q^2(k)$
United States	-0.158	0.124	0.001	0.024	-0.569	4.459	-36.555 (0.000)	120.53 (0.000)
Japan	-0.235	0.180	-0.001	0.034	-0.428	4.761	-35.130 (0.000)	360.19 (0.000)
Korea	-0.192	0.173	0.001	0.042	-0.250	2.264	-33.995 (0.000)	165.89 (0.000)
Singapore	-0.150	0.176	0.001	0.030	-0.085	3.178	-32.013 (0.000)	150.56 (0.000)
Thailand	-0.192	0.178	0.000	0.039	-0.031	2.204	-16.125 (0.000)	114.22 (0.000)
Malaysia	-0.209	0.280	0.001	0.032	0.374	9.915	-17.378 (0.000)	157.11 (0.000)
Philippines	-0.171	0.163	0.002	0.036	-0.044	2.310	-31.458 (0.000)	70.508 (0.000)
Indonesia	-0.222	0.226	0.002	0.042	-0.132	5.063	-36.171 (0.000)	227.86 (0.000)
China	-0.259	0.660	0.003	0.055	1.978	24.749	-29.942 (0.000)	47.115 (0.000)

Note: Numbers of lag (k) = 4 for weekly stock returns. The figure in parenthesis represents the *p*-value.

The unit root property is checked by Augmented Dicker Fuller (ADF test). The results show the stock returns series do not contain unit root process. In other words, all series are stationary process. In addition, the Ljung-Box Q statistics of squares residual reveal that there is volatility clustering in every stock returns data. Unlike the stock returns, the conditional heteroscedasticity is found in the United States, Japan, Singapore, Thailand, and China.

Unconditional (Static) Cross-Country Correlations

In this section, the unconditional correlation coefficients are calculated for each pair of countries in our dataset. These statistics provide a basic indicator for financial interdependence. We first compute cross-country correlations using the whole dataset. Next, the whole sample is seperated into 3 sub-sample periods. The first period, 1991 to 1996 is referred to the Asian growth period while the second period, 1997 – 2005, dates the Asian financial crisis. Lastly, the recovering and increasing integration period starts from 2006 onwards.

The unconditional cross-country correlations are then measured in each sub-sample period and they are presented in Tables 2. As can be seen in Tables 2, the unconditional cross-country correlations are not stable over sample period and they are more integrated with each other during the last decade. However, the dynamic nature of cross-country correlation should be considered besides the static one. Therefore, the next section will present the dynamic interdependence in the East Asian which estimated from DCC-GARCH as well as the results of trend regression analysis.

Table 2 Cross-Country Correlations of Stock Returns (Weekly data)

Time Periods	US	JP	KR	SG	TH	MY	PH	ID	CN
	Correlations with United States

Notes: The first time period; 1991 – 1996 refers to Asian growth period, the period 1997 – 2005 represents the Asian economic crisis, and the period after 2006 refers to the increasing integration period. Each figure represents the average correlation of weekly stock returns in each sub-period.

EMPIRICAL RESULTS

The DCC-GARCH(1,1) models are estimated using the output growths and stock returns in eight East Asian countries and the United States. The estimation results are shown in Table 3.
The first row reports the mean estimation while the next three rows provide the estimated coefficients of univariate GARCH(1,1) for each of variance equation. The last two rows show the estimation of the DCC(1,1) parameters. Overall, the results show that most of the estimated parametersof the DCC-GARCH models are statistically significant. The conditional cross-countries correlations of stock returns are generated through DCC-GARCH model and they are plotted in Appendix. Obviously, the diagrams reveal that there are significant variations in the cross-country correlation pattern and also significant peaks in some period.

As can be seen in Table 4 and Appendix, the results show the cross-correlation series are unstable and fluctuated over time. In most case, the highest cross-country correlations are found during the period of the Global Financial Crisis in 2007 - 2008. The stock returns in Thailand, Malaysia and Singapore seem to have highest correlation with other countries in the regions. The lowest degree of cross-country correlations is observed in case of China and Indonesia. Considering the change in this correlation though time, we observed that the level in conditional cross-country correlations is increasing, especially after 2005.

Table 3 DCC-GARCH (1,1) Estimations

Coefficients	United States	Japan	Korea	Singapore	Thailand	Malaysia	Philippines	Indonesia	China
	DCC-GARCH (1,1) Estimations of Stock Returns								
μ	0.002 (0.001)	0.000 (0.001)	0.002 (0.001)	0.001 (0.001)	0.002 (0.001)	0.002 (0.001)	0.002 (0.001)	0.004 (0.001)	0.001 (0.001)
ω	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)	0.000 (0.000)

β	0.873 (0.029)	0.696 (0.137)	0.885 (0.031)	0.859 (0.053)	0.869 (0.058)	0.857 (0.052)	0.830 (0.053)	0.709 (0.197)	0.788 (0.064)
a	0.011 (0.002)								
b	0.978 (0.004)								

Note: The standard error of estimated coefficient is in parenthesis

Finally, we address the question that whether the cross-country (conditional) have tendency to increase over time or temporary rise during particular period. The trend regression is then estimated. Specifically, the conditional cross-country correlations ($\hat{\rho}_{i,j,t}$) are used as dependent variable and time trend ($Trend_t$) is used as explanatory variable. Equation (8) represents the trend regression and the estimation results are reported in Table 5.

$$\hat{\rho}_{i,j,t} = \gamma_{i,0} + \gamma_{i,1} Trend_t + v_t, \tag{8}$$

Table 4 Cross-Country Conditional Correlations of Stock Returns

	US	JP	KR	SG	TH	MY	PH	ID	CN
US	**1.000**	0.334	0.320	0.470	0.339	0.383	0.298	0.168	0.082

CONCLUSION AND POLICY IMPLICATION

This paper examines the dynamic pattern of co-movement among the stock markets in the East Asian economies. The Dynamic Conditional Correlation (DCC) – GARCH model is used to generate conditional cross-country correlations. Beside from the results that the cross-country correlations of stock return are time-varying, the trend regression analysis shows that the cross-country conditional correlations are increasing over time in every case.

Overall, we conclude the following policy implications from this study:-

i) Financial linkage within the East Asian region and with the global financial market is more linked and is continuously increasing. Therefore, regulators and prospect investors should pay attention in volatility transmission between markets rather than focus only domestic risk.

ii) The time-varying correlations usually rise significantly during the economic crisis when risk diversification is needed most. Hence, the East Asian countries should emphasize in preparing the cooperation mechanism, i.e. establishing emergency fund and/or setting up policy coordination with the aim to support or provide regional stability during economic crisis.

iii) The gain from international diversification within and outside the East Asian region decreases over time. Therefore, the domestic factors will be more important to attract capital flow in the region than the diversification gain.

ORGANIZATIONAL LEARNING: A MEDIATING FACTOR BETWEEN TECHNOLOGICAL INNOVATION AND TQM

[*]Voon-Hsien Lee, Universiti Tunku Abdul Rahman, Malaysia

ABSTRACT

Organizations nowadays are faced with many competitive obstacles due to the rapid change in technology. Both practitioners and management theorists have called for innovation to take place in production processes and production lines as well as in management practices. Total quality management, also famously known as TQM, has long been established as a major management practices adopted by organizations word wide. However, recently, organizational learning dimensions have also gained popularity in organizations. Furthermore, technological innovation has also gained considerable attention as vital in securing a sustainable competitive advantage in the business world.

This study investigates the relationship between TQM, organizational learning and technological innovation. A conceptual model was developed with the adoption of the six TQM practices from the Malcolm Baldrige National Quality Award (MBNQA) (i.e. leadership, strategic planning, human resource management, customer focus, process management, and information analysis) to test of its relationship with both organizational learning and technological innovation respectively. Furthermore, the study also proposes that organizational learning acts as a mediating variable between these six TQM practices with technological innovation.

The conceptual framework serves as a basic foundation to investigate the level of influence the six TQM constructs can have on both organizational learning and technological innovation respectively; and whether organizational learning mediates the relationship between TQM and technological innovation. This study proposes that the relationships between these three constructs are positive.

Data will be gathered from the managers working in the Malaysian ISO manufacturing firms, in which this provides the empirical data required. Multiple linear regression will be used to analyze the relationships between TQM and organizational learning; and TQM on technological innovation; while and Baron and Kenny three-step procedures will be used to analyze the role of

organizational learning being a mediating variable between TQM and technological innovation. One of the main limitations of this study is that the paper only focuses on the manufacturing firms, hence limiting the generalization to the manufacturing sector in Malaysia.

Theoretically, the proposed conceptual framework fills the current discrepancy and subsequent gap in knowledge as the present theoretical framework used in this study emphasizes on those TQM dimensions that are predominantly important to ascertain a high level of organizational learning and technological innovation among the local ISO firms in Malaysia. Hence, this study is believed to advance the TQM literature and to provide both quality management practitioners and academicians a deeper comprehension on the association between TQM practices, organizational learning and technological innovation. Furthermore, the establishment of the mediating relationships between the TQM constructs, organizational learning and technological innovation in this study is an essential distinction that previous studies have not identified.

Practically, this study revealed the significance of the TQM practices in which it reemphasizes the general belief that the TQM dimensions are positively and significantly linked with both organizational learning and technological innovation. This article also puts forth some valuable insights to help the managers of the Malaysian manufacturing ISO firms to recognize problem areas in their own firms and to carry out corrective actions. Furthermore, this present research study has also put forth the importance of organizational learning being the mediating factor between TQM practices and technological innovation. In other words, it is strongly believed that one effective way to stimulate technological innovation within a firm is to enhance the organizational learning behaviour among the employees through the effective implementation of the various TQM practices.

Keywords: Total quality management, organizational learning, technological innovation, Malaysia.

BIOGRAPHY

Voon-Hsien Lee is a Lecturer at the Faculty of Business and Finance, Universiti Tunku Abdul Rahman, Malaysia. She received both her Bachelor's and Master's degrees in Accounting from Monash University. She is currently pursuing her PhD in the area of Total Quality Management (TQM) at Universiti Tunku Abdul Rahman, Malaysia. Her current research interests include TQM, human resource management, and organizational learning.

Keng-Boon Ooi is a Professor and Deputy Vice Chancellor for Research and Quality Assurance, Linton University College, Malaysia. He is also a Singapore Internet Research Centre Associate with the Wee Kim Wee School of Communication and Information, Nanyang Technology University, Singapore. He has published over 70 articles in refereed journals.

Chee-Keong Choong is a Professor in the Faculty of Business and Finance, Universiti Tunku Abdul Rahman (UTAR), Malaysia. He received his PhD (Financial Economics) Degree from Universiti Putra Malaysia, Malaysia. Apart from teaching, he is actively involved in research in the areas of applied macroeconomics, managerial and financial economics.

Kee-Luen Wong is an Assistant Professor for the Faculty of Business and Finance, Universiti Tunku Abdul Rahman (UTAR), Malaysia. He was formerly the Head of Department (HoD) of the Department of Business before he stepped down to focus on research and publications. He received his Doctor of Education (EdD) degree from the University of Leicester, United Kingdom in 2009. His other academic qualifications are Advanced Diploma in Business Management (ADipBM), Postgraduate Diploma in Business Administration (PGDipBA) and Master of Business Administration (MBA), all from the University of Wales, United Kingdom. In 2012, he was awarded the Advanced Diploma in Management Accounting by the Chartered Institute of Management Accountants (CIMA).

DETERMINANTS ELECTRICITY DEMAND IN INDUSTRY AND HOUSEHOLDS

Štefan Bojnec, University of Primorska, Slovenia
Email: stefan.bojnec@fm-kp.si

Drago Papler, University of Primorska, Slovenia
Email: drago.papler@gmail.com

ABSTRACT

Purpose: *This paper investigates determinants of electricity demands by industrial enterprises and households during deregulation and liberalisation of electricity distribution markets with changing competition among electricity distribution enterprises.*
Methodology: *Demand function is employed using ordinary least square regression analysis on time-series data.*
Findings: *The electricity demand in industry is positively associated with real gross domestic product, real substitute prices for natural gas and real prices of fuel oil, but negatively with real price of electrical energy and with the dummy variable for electricity market liberalization. The electricity demand by households is positively associated with households' real income, real substitute prices for natural gas and for fuel oil, and with the dummy variable for market liberalization, but negatively with real price of electrical energy for higher tariff rate for households.*
Originality: *The electricity demand is explained by real price of electrical energy, real income, real prices of substitutes of electrical energy in consumption, and a dummy variable for electricity market liberalization and the Gini coefficient of market concentration. The electricity demand functions are estimated for industry and for households, respectively. The effect of market liberalization on electricity demand differs between industry and households because the electricity market liberalization for industry has also been in place for a longer period than for households.*

DEVELOPING CREDIT RATING INDICATORS OF CUSTOMERS FOR ELECTRONIC COMPANIES

Dr. Hsiao-Chen Chang*, Assistant Professor, Department of Leisure Business Management, Chungyu Institute of Technology

Dr. Kuang-Hsun Shih, Professor & Principal, Department of Financial & Economic Law, Toko University

Ming-Fang Lee, Doctoral Student, International Business Management, Chinese Culture University

Yi-Hsuan Chou, Graduate, International Business Management, Chinese Culture University

ABSTRACT

In the past, the electronic business made the research on its customers' credit situation through the financial institutions so as to decrease the risk of bad debt and the cost. However, even seemingly normal, the situation of bill and check exchange does not necessarily mean that the company's credit condition is really plausible. This research, on the bases of literature review and the factors used by the credit institutions to examine the customers, constructs the index for the electronic business to review its customers, taking the content of this enterprise's examination of its internal customers as an important reference. Analytic Network Process Method (ANP) is used to find the factors and dimensions for this index. The result of this research includes that "the characteristics of the industry" does not possess influence, while the "financial aspects" are apparently more influential than the "scale of the business." Among these factors, the "cash flow, profitability, and assets turnover ratio" are the key points. This research suggests that the construction of the index for examining credit situation still has to include the scale of business, because the structure of the enterprise is also central to the examination.

Keywords: Credit Index, Credit Rating Indicators, Analytic Network Process Method (ANP)

INTRODUCTION

The continuation of 2011 debt disaster in Europe causes the setbacks of the economics of European countries. The financial markets confront great challenges. Duff and Eining (2009), on the basis of 2007 financial tsunami, finds in his research that the situations of the management, of the global evaluation, and of the national control have influences on the credit evaluation results. The second disaster, according to the researcher, will result in enormous loss to the global industries. Conscious of this threat, the domestic financial organizations seek the defense mechanism and the solution, hoping to decrease the risks. The industries in our nation have small domestic marker, relying on exportation to expand this

market. Therefore, international economics take the significant position in our economical environment. When the financial disasters take place, the decline of the global economics encloses the management system of some enterprises with weak financial structure. In order to prevent the influence of the enclosed clients, establishing the evaluation system of credits stands as an important topic.

The electronic industries in Taiwan for now stand as the major exportation; therefore, talking the pivotal positions, their profits and importance demand attention. Affected by the changing prosperity, the Product Life Cycle (PLC) of electronic industry is short and thus easily to be eliminated. The amount and the price of the products will receive the impacts from the international markets. Furthermore, under the stress of globalization, establishing and managing the Credit Rating Index and the Financial Commitment to Performance are significant, since the electronic enterprises cannot retrieve the financial statements from the clients like the financial organizations and credit evaluation units do so as to evaluate and analyze the clients' credit situations and abilities of paying the debt.

Current the studies on the analyses and the establishing of Credit Rating Index are not many. For the clients as listed companies, because of being controlled by the Financial Supervisory Commission (FSC), the chance of their violating the contract is relatively low. However, having difficulties in receiving the financial statements, the enterprises must evaluate the credit situations of the clients on the basis of their check transactions (by consulting the financial units), the business performance, and the credit personnel's past experiences and judgments. In this evaluation, one would ignore the property background, the financial structure, the work experience and qualifications, and the ability to hold the asset. Under the global distress, the model of evaluating the risks of the small and medium industries in Taiwan must be established in order to develop a mechanism of managing the credit risks and to keep these enterprises profiting. Therefore, establishing the credit evaluation rating index serves as the topic of this research to find the key influence.

This research takes the examples from the electronic industries to analyze how a credit rating index could be developed as an objective standard for the financial organization and credit-evaluating units to establish a Credit Policy. According to the different results of the investigation, different credit limits could be granted to the different clients. In this model, the risks of bad debts could be avoided. The goals of this research are as following:

1. On the basis of the structures of electronic enterprises, taking the past literature and the methods of the credit-evaluating units as the references, this research is to establish a model for the electronic enterprises to evaluate the credit situations of their clients.
2. Om the basis of the financial and non-financial data of the electronic industries, this research analyzes the reasons why the small and medium enterprises would violate the contract. The result of this analysis is contributive to the establishing of credit rating index.
3. Calculating the credit rating index and the clients' credit risks, this research provides a principle and references for the electronic industries and the credit-evaluating unit.

LITERATURE REVIEW

The Introduction to the Electronic Industries

Taiwan electronic industries, with the high-quality human resource, the huge investment and flexible and fast integration of resources, take the central position in global electronic OEM system. Unlike traditional industries, the electronic industry holds the special position because of its short PLC, its unstable amount of stock and fund. With high risk, on the wave and with the intense investment, this industry must rely on huge fund to invest on the renewal of products. The structure of electronic industry, according to IEK, includes the material and the component factories in the mainstream, the equipment production, component model and the accessory factories in the middle reaches, and the service and the electronic OEM of a peculiar brand in the downstream (Lau, 2006). In addition, the products can be classified into eight categories: (1) consumer products and the components, (2) the computer equipment and components, (3) the communication equipment and components, (4) convey and control products, (5) the semiconductor products and components, (6) the cable and connector, (7) the monitor and storage equipment, (8) other products.

Credit Rating Index

Credit rating is an evaluating system for the various credit situations of a criticized organization. It is presented in simple signs. The evaluation is to understand whether the enterprise has a sound structure of finance and thus the ability to pay the debt, on the bases of leveling the debtor and analyzing the Default Risk. This evaluation reduces the imbalance of information and the cost of non-professional personnel collecting the data, so it achieves in the pre-caution. Most credit evaluations are related with the specific debt execution. The execution of the debt also considers the criticized side by its ability to pay the debt in the future. The method and model of this evaluation would take the prosperity of the market into consideration in the past. Following the financial changing and the risk management, especially when the evaluation of credit is to reflect the enterprise's transaction with a specific debt, an ideal evaluation should be independent from the prosperity cycling.

Chen, Chiang, Lai (2003) believe that credit evaluation is a system of background-checking evaluation, making use of statistics and setting up a leveling form. The factors for the leveling include the financial situation, the management ability, and the industry characteristics. Tsai Ming Shi states that the credit evaluation of an enterprise is a series of analyzing the enterprise's credit strength and of leveling (or scoring) the criticized company. Lin Chia Rong (2000) classifies the evaluation as Qualitative Model, which qualifies the evaluation into 5P and 5C principles: People, Purpose, Payment, Protection, and Perspective. 5C include Character, Capability, Capital, Collateral, and Condition.

The Relative Literature on the Financial Organizations' Credit Rating

Treacy and Carey (2000) points out that the banks in the US have designed the credit evaluation. The risks to be examined in this evaluation are reliable financial statements and analyses, the profiting, the total assets, the analysis of the enterprise and the enterprise positions, and the guarantee and the managements. Kim and Sohn (2008), processing data of

the Korean enterprises from 2000 to 2004 by multivariate analysis to build a credit rating index (according to the enterprises' characteristics, reserved profit, and the shareholder's rights), find that the high reserved profit causes the relatively high credit rating.

Chen (2005) researches on the small and medium enterprises in New Taipei City and comes to the factors of their credit situations: The more capital of the financial factor is there in an enterprise, the larger the management will be. The insufficient capital will result in the financial danger if the risk takes place in the enterprise. The result will cause the contract violation.

In the variables of the non-official terms, more enterprises to be connected with the banks indicate that the bank has not much confidence on the enterprises and thus is not willing to expand the loan credit. Therefore, the enterprise has to borrow the money from many banks and thus there is a higher chance for the enterprise to violate the contract.

The proportion of the enterprise's performance and the loan from the bank should be limited into 50%. More than this range, the violation of the contract is more possible. The asset from the stock sharer can also be classified as the profiting, affecting the violation of the contract. The higher this rate is, the more chance the client would violate this contract.

The Credit Rating Index of the Electronic Enterprises on Their Clients

The bad debt has great influence on the financial disaster in addition to the overall environment and the management. In current years the global electronic industries have been under the process of transformation, which also forces the Taiwan industries to change. Unlike the financial organizations, the electronic industries cannot retrieve the complete information of their clients. They can only get the information from the financial units to know whether the clients' credit situations are reliable and thus to build the credit rate index for a sound evaluation, for example, the time of credit, payment, and the limit of loan. The credit rate index stands as the internal documents in the enterprise; therefore, this evaluation is different from one enterprise to another. This research takes two enterprises and their clients as the examples. The transactions to be examined here are: (1) the type of management (company, cooperation, or solitary), (2) capitalization, (3) the performance last year, (4) the cost of transaction last year, (5) the supposed payment in the final term, (6) the year of business, (7) the place of business, (8) the relationships, (9) payments, (10) credit limit.

The credit rate index made by the electronic enterprise is focused mostly on the non-financial terms. To improve the financial index and eliminate the differences between the indexes made by different enterprises (which makes the data untrue), this research combines the data from the financial units, the credit-evaluation units and the current electronic enterprises to extract the proper index for the current electronic enterprise to evaluate their clients. This index serves as the principle and direction for the future.

METHODOLOGY

The ANP

The analytic hierarchy process (AHP), as proposed by Saaty (1980), has received widespread attention and been applied to problems as diverse as decision analysis, forecasting, strategy formulation, and prediction of voting behavior (Zahedi, 1986). Multi-criteria (MCRA) resource problems involve allocation of limited resources to different activities keeping in mind many conflict criteria. The AHP has emerged as a useful decision making technique for solving MCRA problems (Wedley, 1990) (Schoner and Wedley, 1989) and has been widely used in multiple criteria decision making (MCDM) to evaluate/select alternatives (Ou Yang et al., 2008). However, users of theAHP must assume that the information sources involved are non-interactive/independent which is not realistic in many real-world applications (Ou Yang et al., 2008). In order to solve this problem, Saaty (1996) proposed a new MCDM method, the ANP, to overcome the problems of inter-dependence and feedback between factors and the alternatives.

The ANP is a nonlinear structure, while the AHP is hierarchical and linear, with the goal at the top and alternatives at lower levels (Saaty, 1999, 2001, 2003). The ANP is an extension of the AHP; indeed, it is the general form of the AHP (Ou Yang et al., 2008), and ANP is presented as a potentially valuable method to support the selection of projects in research and development environments (Meade and Presley, 2002). ANP is a method able to analyze or assess relevant decision-making problems under complex inter-dependence relationships within the decision making and factors levels (Saaty, 1996, 2001, 2003; Meade and Sarkis, 1999). There have been many studies using ANP in selection, assessment, and sorting decision-making models of dependent relationships (Cheng and Li, 2005; Eddie et al., 2005; Wolfslehner et al., 2005;Wu and Lee, 2007; Yurdakul, 2003).

Moreover, the ANP has been successfully applied in many practical decision-making problems, such as project selection (Meade and Presley, 2002; Lee and Kim, 2000). Wu and Lee (2007) used the characteristics of ANP to assist in the assessment and selection of knowledge management strategies. When evaluating project problems, group opinions should be collected to determine the inter-dependence relationship among factors, which is very important in considering project problems (Lee and Kim, 2000). Application of the ANP method in the assessment of alternative programs considers problems of practical respects of inter-dependence relationships between various programs and factors and evaluates the selection results, in order to achieve the requirements of the program selection goals (Saaty, 1996, 2001, 2003). This research is to identify the fact that various strategies of credit rating indicators take place according to different motives. Therefore, the making of those strategies is not out of single motive, when the inner and outer motives are highly inter-dependent. This research, taking the vantage points of ANP, analyzes the models of the decision making of credit rating indicators, the result of which might have found the essential connection between the motives and the strategies. The ANP method contains two parts: (1) one is composed of control clusters of network and motives for inter-dependence relationship control; and (2) another is composed of the inter-dependent relationship network between the elements and the clusters (Saaty, 1996). Hence, different structural patterns can be established for ANP problems according to different problem types, and in a network structure, the

importance of factors determines the importance of alternative programs,which in turn affects the importance of factors.

In addition, the ANP method defines the scope of decision-making problems by the modeled planning groups. Based on the relevant fields, experts from related fields are invited to form decision-making groups of five to 15 people (Saaty, 1996). The ANP method has five steps and the details of the steps involved may be found in Ou Yang et al. (2008).

The operation of the credit rating indicators decision-making model established in this study is divided into four stages: (1) collection of experts and scholars for questionnaire design and survey data, construction of problem hierarchy, and inter-dependence model; (2) construction of pairwise comparison matrices and calculation of eigenvalues and eigenvectors; (3) construction of supermatrices; and (4) calculation of factors importance weights and evaluation of the most competitive credit rating indicators decision making (Saaty, 1996; Meade and Sarkis, 1999; Cheng and Li, 2005; Wu and Lee, 2007; Lin and Wu, 2008).

EMPIRICAL RESULTS

This research deals with the past researches on the financial organizations and the credit-evaluation units, inviting seven experts who had participated in the activities of credit evaluation and setting up the questionnaire in two periods. The first period is to design three dimensions and the relativeness not only of them but also of the dimensions and the factors. The initial questionnaire for the samples is compared with the most suitable dimension and the factors. The second period of questionnaire, on the basis of the first, analyzes what the experts believe as the best factors and dimensions for the credit rate index. The initial design of the 3 dimensions and the 18 factors are conducted into the 18 principles as the basis for this research, as shown in Table 1, The Clients' Credit Evaluation Principles.

Table 1 The Principles for the Client's Credit Evaluation

Dimension Major Principle	Factor Monor Principle		Definition
A. The Scale of the Enterprise	A1	Capital	The amount of the money the enterprise registers in the government.
	A2	The years	The years since the enterprise has been established.
	A3	The structure of the enterprise	Whether or not the enterprise has the subordinate branches.
	A4	The style of the enterprise's organization	The structure of the holdsharer: solitary, cooperation, or the connection.
	A5	The management of the leader	The leader's ability in dealing with the production, sales, human resource, research and the finance.
B. Financial structure	B1	The profiting capability	The capability of increasing the property and decreasing the debt.
	B2	The cash current	The flow of the cash into or out of the enterprise.
	B3	The level effect	The balance between the risk, debt and the assets.
	B4	The bridge loan of the stocked products	The sales of the stocked products in a peculiar period of time.
	B5	The bridge loan of the supposed payment	The supposed payments between the production and the receiving.
	B6	The loan to sales ratio	The proportion between the business performance and the loan.
C. The characteristic of the enterprise	C1	The management environment	The environmental factors the enterprise must face, which also influence other enterprises.
	C2	The competitiveness	In the market with competition, the enterprise must effectively provide the products and services so as to make the opportunity of profiting.
	C3	Major client	The value of the customer, different clients have different contribution to the enterprise's profiting.
	C4	The marketing of the products	Whether the products are produced under the considerations of the market requirement and the enterprise's situations
	C5	The potential of the product development	The performance of the products in the future.
	C6	The changing prosperity	The turbulence of the economic situation.
	C7	The inventiveness of the products	Whether the newly-invented products would be accepted and applied in the market.

The Initial Questionnaire for the Credit Evaluation

This research sifts out the initial dimensions and factors. The interviewed people have to be the supervisors of the electronic enterprises for at least 3 years, and the experts on the credit evaluation. The relative analysis of the factors and dimensions has the result that the experts believe that the C dimension (environment for the management) is not relative with the client's credit rate index in electronic industries. Therefore, this research rules out this dimension and holds the index A dimension (the scale of the enterprise) and the B dimension (financial structure) and their 11 factors. On the basis of these factors and dimensions received from the initial questionnaires, this research design the second phase of expert questionnaire.

The Weight of the Credit Rate Index and the Leveling Analysis

This research on the second phase of questionnaire proceeds the analysis of the interactions of the dimension and the factors, with the experts answers for the questionnaires. The qualifications for those experts are the experiences in the electronic enterprise as a supervisor for at least 3 years and the personal working in the credit evaluation, which are helpful to learn the interactions of the principles and the relative wrights. The client's credit rate index and the leveling analysis show that "the scale of the enterprise" and the "financial structure" form the index for the credit evaluation when compared with their relativeness.

The consistency of the questionnaire in this research examines the consistency of the answerers. When C.I. < 0.1, the answerers are inclined to be consistent, or they have to do the questionnaire again, or revise their answers. In addition, if the consistency is no more than 0.1, ($C.R. \leq 10\%$), which means that the analyzer's mistake is within the rational range when comapring the weights since the result has the consistency. (As shown in Table 2)

Table 2. The Credit Rate Index C.I.

Credit Rate Index		C.I.	R.I.	C.R
A1	The Capital	0.0898	1.12	0.0802
A2	The years	0.0884	1.24	0.0713
A3	The structure of the enterprise	0.0227	0.9	0.0252
A4	The styles of the organization	0.0656	1.24	0.0529
A5	The leader's management	0.0396	1.12	0.0354
B1	The profiting capability	0.0759	1.12	0.0678
B2	The cash current	0.0543	1.24	0.0438
B3	The level effect	0.0949	1.12	0.0847
B4	The bridge loan of the stocked products	0.0988	1.12	0.0882
B5	The bridge loan of the supposed payments	0.0884	1.12	0.0789
B6	The loan to sales ratio	0.0926	1.12	0.0827

The result of this research, according to the credit evaluation index, shows that the experts believe that the electronic enterprises evaluate the clients' credit situation with the dimension more of "financial structure" (the weight is 0.62709) than of the "scale of the enterprise" (the

weight is 0.37291). As for the factors, the sequence of the importance is the "cash current" (the weight is 0.19398), the "profiting capability" (the weight is 0.18119), the "payment" (the weight is 0.16492), the "the structure of the enterprise" (the weight is 0.11066), the "storage exchange" (the weight is 0.10468), the styles of the company and organization (the weight is 0.08018), the owner's leadership (the weight is 0.04513), the level rate (the weight is 0.02410), the capital (the weight is 0.03103), the management (the weight is 0.02410), and the years of business (the weight is 0.02119). As shown in Table 3, the weight more than 10% includes 5 factors. Except for the structure of the enterprise, which does not belong to the scale of the enterprise, the other four factors belong to the financial structure. Among them, the cash current, the profiting capability, and the payment are more than 15%.

Table 3. The weights of the factors in credit rate index

Factors		Dimensions	Weight	Proportion
B2	The cash current	Financial structure	0.19398	19.40%
B1	The profiting Capability	Financial structure	0.18119	18.20%
B5	The bridge loan of the supposed payments	Financial structure	0.16492	16.49%
A3	The structure of the enterprise	The scale of the enterprise	0.11066	11.07%
B4	The bridge loan of the stocked products	Financial structure	0.10468	10.47%
A4	The styles of the enterprise's organization	The scale of the enterprise	0.08018	8.02%
A5	The leader's management	The scale of the enterprise	0.04513	4.51%
B3	The lever effect	Financial structure	0.04294	4.30%
A1	The capital	The scale of the enterprise	0.03103	3.10%
B6	The loan to sales ratio	Financial structure	0.02410	2.41%
A2	The years	The scale of the enterprise	0.02119	2.12%
			Sum=1	100%

CONCLUSION AND IMPLICATION

This research takes the financial units and the credit evaluation organizations as the references to analyze the factors in the credit evaluation. With ANP questionnaire, and the interviewing with the experts, this research figures out the interactions of the principles through ANP Super Decisions. As the results have shown:

1. The financial structure is more than the scale of the enterprise: in the client's credit rate index, the financial structure is 0.62709, more than the scale of the enterprise, whish is 0.37291. Among them, the cash current, the profiting capabilities, and the payment exchange are more than the scales of the enterprise, more than the other factors by 50%.

2. The characteristic of the enterprise does not have much influence. The experts believe that in the proceeding of the credit evaluation, the environment, the competitiveness, the major client, the marketing of the product, the product potential, the changing of the prosperity, and the inventiveness of the product (all of which can be classified into the characteristics of the enterprise) do not have much affections. This result is different from what the credit evaluation organizations have anticipated.
3. Current credit evaluation, as The Banks of Associations of Republic of China has set up as SME Credit Scoring in 1987, should include the financial situation (40%), management (40%), the enterprise characteristic and expectations (20%). This research shows that this index is not proper for the electronic industry in Taiwan.

In the past, the electronic industries evaluate the clients' credit situations through the data provided by the financial organizations, ignoring the fact that even the client with normal check transaction is not necessarily in good credit situation and with good management. Especially in the electronic industry, the payment takes place after the exportation of the products instead of using promissory note. In addition, when the payment is lasted for more than 180 days, the contract is inclined to become a bad debt, creating greater risks for the industry. However, when the industry imitate the working of the financial organizations, the cost for the management would be increase.

Many enterprises are undergoing the management of groups. Sometimes the clients have the financial threats, with bad management and investment. So, in addition to the credit situation, the financial and non-financial terms of the enterprise should also be taken into consideration. The current credit index for the electronic industries in Taiwan tales the scale of the enterprise as the major concern, which stands not as the major dimension of this research. The possible reason is that the analyzing factors for the scale of the enterprise are easier to be retrieved with their statistic data. The enterprises apply this easy information as the major concern for the evaluation. In addition, in the research on the credit evaluation, most analyses on how the financial organizations evaluate the clients ignore the individual enterprise's applications of the credit rate index. The high cost of the eternal evaluation also cannot help the urgent need of information. In addition to reviewing the past literature, this research also includes the experts' opinion and the practical operation. It explores the evaluation of the credit condition to be applied in the management, creating the index with the correct prediction, contributive to the following research on similar topics.

SUPERVISION AND PROTECTION OF E-DATA IN SENSITIVE INFORMATION SYSTEMS

Red. prof. dr. sc. Vladimir Šimović, Media University, Croatia
simovic.vladimir@yahoo.com

Matija Varga, mag. inf. univ. spec. oec., Media University, Croatia
maavarga@gmail.com

Doc. dr. sc. Marin Milković, Media University, Croatia
dekan@velv.hr

ABSTRACT

The paper shows the possibilities and ways to protect e-data in sensitive information systems such as financial information system and health information system. Nowadays, when the health information system and financial information system are developed and contain large amounts of data in the database, it is necessary to pay great attention to computer security, computer security mechanisms which enable the protection of electronic data, e.g. patient's diseases and clients' financial transactions. The aim of the paper is to present the best way of protecting e-data in the database from malicious people, i.e. malicious users of these systems, and from the deterioration and obsolescence of data storage media with the data important for the organization itself by making recommendations and showing the ways of their protection. This paper, among other things, explains the reason for creating a code of ethics for medical and health IT professionals. The information collected by using the questionnaire is shown. On the basis of this information, it can be concluded that most organizations use scanners and cameras to digitize documents, which are then usually stored in .pdf, .doc, .docx, and xml formats. The results of the research, which was conducted during the period of three weeks in 2012 on the sample of seven organizations, show that there is no organization that does not have a general policy of preserving the material in electronic form. A recommendation for the organizations is made in the conclusion – to back up electronic databases more often, or as many times as possible in the shortest period of time possible. The research presented in this paper, when it comes to collaboration in the development of the programs intended for preservation, shows that the most common form of collaboration is of local character.

Key words: sensitive information systems, financial information system, health information system, electronic data protection, database, methods of saving records.

INTRODUCTION

The paper shows the possibilities and ways to protect e-data in sensitive information systems such as financial information system and health information system. Nowadays, when the health information system and financial information system are developed and contain large amounts of data in the database, it is necessary to pay great attention to computer security, computer security mechanisms which enable the protection of electronic data, e.g. patient's diseases and clients' financial transactions. It is necessary to direct the end users of these

information systems when using health information systems and financial information system to the benefits that such systems provide. The users of such systems should be warned and use preventive measures so as not to abuse or use such data for the acquisition of personal gain at the expense of other clients or patients. The data relating to the case history of a person must be kept secret over the long term. Continuous implementation of the methods of preserving electronic records in the database of health organizations is necessary.

The aim is to present the best way of protecting e-data in the database from malicious people, i.e. malicious users of these systems, and from the deterioration and obsolescence of data storage media with the data important for the organization itself by making recommendations and showing the ways of their protection.

Paper tasks

The tasks set on the topic of "Supervision and protection of e-data in sensitive information systems" are as follows: to point out the possible dangers and threats for clients and patients who make part of the financial and health information systems; to show the possibilities of protection of the patient's and the client's electronic data; to advise on how to use the financial and health information systems; to influence the users of the financial information system and health information system in order to reduce the sensitive data leakage to the closer public; to mention and present the process of migration and preservation of electronic records; to state the reason for creating a code of ethics for medical and health IT professionals; to describe which combination of signs an optimal or strong password which will protect the electronic information system should consist of; to present systems for the supervision and control of the data flow in these information systems. Other tasks of the paper are to explain why it is needed and necessary to evaluate the health information system; to explain why it is necessary to secure the health information system from data loss; to explain who can change the data; to explain how the data confidentiality is realized in the health information system; to explain the functioning of the public health information system and financial information system; and to research which methods, procedures, modes, record formats, input devices, output devices and input-output devices are used by the observed organizations for the preservation of physical documents and records, and electronic documents and records.

Research methods used

For the paper entitled "Supervision and Protection of e-data in sensitive information systems" the following research methods will be used: survey, direct observation method, observation method, analysis, i.e. the method of content analysis, modeling, and interview. In the research methods of the survey and the interview, a sample consists of seven organizations – three organizations are engaged in public activity, two of them are privately owned, and two are educational organizations. This paper will further explain the protection of e-data in the health information system and the financial information system. The process of research using surveys and interviews lasted three weeks and was conducted in 2012. During that time the data on these organizations was collected. The results of the questionnaire data processing are shown by using figures.

THE PROTECTION OF E-DATA IN THE FINANCIAL INFORMATION SYSTEM

People with bad intentions find crashing into the financial information system most interesting. This is because financial institutions have large sums of money in their accounts. However, as the most of the IT professionals who deal with security of information systems claim, an intrusion into the financial information system has not been recorded. Moreover, no case of crashing into the financial banking information system has been recorded. The financial information system is under attack daily, but there are no major difficulties or more serious consequences of malicious people's crashing attempts.

Frequent audits and testing the system's permeability ensure a continuous increase in the security level and implementing the measures to reduce IT risks. At the level of the banking system, there are authorities which collect data about the most common attacks and incidents, and accordingly inform all the participants and require improvement of the system. In Croatia, hacker attacks are not as frequent as in the USA, and one of the reasons is a different language area (Bonić, 2011).

SQL and electronic data protection

SQL is a commercial query language for working with a relational database. Relational databases provide the greatest flexibility in data decomposition, which ensures a great advantage in planning the data distribution on individual system nodes. The standard structured query language is the most popular, best known and most widely used language. It is used to manipulate and manage data contained in the database. SQL server is a product and is closely linked to other servers and layers in a typical IT environment, which is based on the foundations of companies whose databases are in the question. The server is now not only used to store information about users. SQL server is extremely important because the work itself becomes more economical and much easier with it. There are several ways of protection in the SQL Server environment. One way is to provide an additional layer of security for sensitive data. Another way is to follow the rules, standards and laws related to data protection. The third way is related to the protection of the server objects on which the confidential user information and passwords for accessing linked servers can be found. The fourth way is to provide a controlled mode to define privileges for those modules that contain the code. SQL Server 2008, for example, enables encryption of all the data in the database by encrypting the pages of files that contain the database.

When it comes to the processes for managing data integrity, they should ensure accuracy, correctness, completeness or integrity of data in the database. Data integrity on SQL Server can be achieved by using certain constraints and triggers. Constraints are rules that apply to relations. This constraint defines the values allowed to be entered into an appropriate relation and to which range. In many applications, the rules for the preservation of data integrity are defined. However, it is not enough just to define the rules for the preservation of data integrity in an application, i.e. the interface available to the user, but appropriate constraints at the database level should be defined so that invalid data is not entered. The types of data integrity are entity, domain and referential. Entity integrity ensures that each type in a relation can be uniquely identified by a column. It is provided in SQL by using an index which is used to verify the existence of duplicate values. Primary key and constraints which are needed for uniqueness are applied when securing the entity integrity. Primary key and unique

constraints are quite similar and ensure that duplicate record in a relation does not happen. The differences constraints when using a primary key and a unique are as follows: (1) a table can contain one primary key, but X unique constraints can be defined in the table; (2) primary key can not take the null value, while the unique constraint can be defined for the column where the null values are allowed; (3) unique constraint does not use non-clustered index, while primary key uses clustered index. Domain integrity refers to the determination of allowed values for each column of the table. The type of data to be applied to a column in a relation presents one of the ways to ensure the domain integrity. With the domain integrity, CHECK constraint enables the restriction of values allowed in a column based on a logical attribute. Restricting by a foreign key the values allowed in the column are defined, but based on the content of the primary key. Domain integrity can be achieved through procedures, too. Referential integrity ensures and implements foreign or external key and CHECK. CHECK constraints can reference a number of columns in the same relation using the corresponding logical attribute. CHECK constraint can be a part of the create table command or it can be added to an already existing table. After the CHECK constraint is added to an existing table with data, it is checked with regard to the condition defined by CHECK constraint. If in a certain column we have much data, adding the CHECK constraint for that table can last for a while. In SQL, there is a way to skip data check when creating the new CHECK constraint into the existing table. The skipping is done with NOCHECK option. The constraint with a foreign key references the primary key, usually in the second relation in order to preserve the relation (of the weak entity). Referential integrity can be ensured procedurally by using triggers. External key constraint implies the following rules: for each record in the Buyer table there must be the corresponding record in the table Remaining_Part_Document; for each record in the tables Seller and Mark_document there must be the corresponding record in the table Remaining_Part_Document. Entering customer records with incorrect type of identifiers can undermine constraints related to the primary key, and the result is usually an error. Records in the Remaining_Part_Document can be removed if they are referenced by the records in the tables Buyer, Seller and Mark_document. The primary key of the record related to the remaining part of the document cannot be updated if there are records relating to the buyer, seller and mark of the document that it is referenced by.

The constraint with external key may enable the operations of cascading updating and deleting in interrelated relations. The operation of cascading deleting of the record should be used with caution. Deleting a single record can lead to the deletion of a large number of dependent blocks based on a series of tables and relations that are interrelated with foreign or external keys. In SQL, there are four options of settings which are related to the execution of cascade updates and deletions of a foreign key: a SET NULL setting; a SET DEFAULT setting; a NO ACTION setting; and a CASCADE setting. DML triggers are also a means of preserving the data integrity. Triggers allow defining more complex rules to preserve the data integrity in relation to the methods of declarative defining of the integrity and require additional calculations. Triggers are used for preventing faulty commands such as insert, update, and delete, when displaying user-defined messages of an error occurrence and during cascading changes in related tables in a database which cannot be achieved by using the external key.

The protection from an unauthorized access to the e-database

Databases must be protected from an unauthorized access. In addition to physical protection, there is a software mode of protection, where the software is installed in the system for database management. It limits the work with the database, i.e. the work of users who have physical access to a computer or computer terminals. There are several ways to protect databases, such as user identification, various mechanisms of protection, and authority. When it comes to protecting the database by user identification, it is known that each database user has his or her own *username* and a *password* known only to them. The user must present a valid username and password in the system for database management, thus proving their identity. If the user fails to enter a user name and password that correspond to the list into the system for database management, the system for database management refuses to give permission to work with the database. A large number of the systems for database management can be controlled via the Internet. Database can also be accessed from the remote computer, which can be located anywhere in the world. This advantage is also a disadvantage because it opens another door for malicious people to get unauthorized access to certain data. How to protect the database which can be accessed on the Internet? Temporarily, it can be protected by turning off the network system capabilities for database management. Thus, only local users (developers) could access the database, i.e. local network clients. The access to the database may be allowed only to some external users, but only with the identification of the client using encrypted communications such as *ssl/ssh*, double keys, etc. As for the *views*, the user may be given the right to access only a certain part of the data. Other parts of the database are unavailable for a particular user.

Protecting the database by giving authorization defines what the user can do with the data from the database, which is at disposal. The authorization for the protection can be *read/select, update, insert* and *delete*. The database management system must "memorize", i.e. have a stored list of authorizations for every user and every relation from the specific views. If the user attempts to perform an activity he or she is not authorized of, the database management system will not perform it, but it will print out a warning that the user is not authorized to perform these activities. In most cases, a developer or database administrator is responsible for the protection of the database. Database administrator has a list of users, gives the possibilities of views, and regulates authorizations. Regular users do not have the possibility of regulating the authorities, but only the database administrator. The database should be properly supervised; the changes to the data should be analyzed according to the periods; and the actions of a person who wants to cause harm should be recorded. The functionality of the database management system can also be an indicator of its safety. Back ups or safety copies can also protect the data in the database. Nowadays, you can also use systems that automatically create a back up copy and system recovery, enable data archiving for more than five years, and eliminate the costs that are caused by human error associated with data storage. This type of protection provided by the systems for automatic back up and recovery system is better than backing up an entire database since the system returns only the data that have been changed.

The case of damaging the database and its recovery

With regard to the financial information system, numerous processes are present. The most common of them are purchase, sales, accounting, treasury, and travel warrants. Each of these

processes has its own sub-processes and activities at a lower level. The organizational structure of a certain organization is adapted to these functional areas, as well as jobs on the basis of which profits are generated. Damage to the database in the financial information system may arise due to the failure of the computer hardware (disc and other storage media) or due to an error in the systematic program support. The database may be damaged by the activity of malicious persons (called hackers), accidentally or unfortunately. Malicious people are most interested in the financial information system because e-money is present in this system.

Regardless of the causes and reasons of damage, the database must be returned in the condition of the preserved physical integrity. Under the database integrity we mean truthfulness and accuracy of information or data contained in the database. Problems with the integrity of the database in a broad sense cover all the protection measures whose aim is to prevent the entry of invalid data in the electronic database. Errors which occurred when entering or updating are responsible for the failure results in the base, while the software and system errors are the result of intentional input of invalid data to corrupt the database. The database is protected by constraints. Integrity rules present constraints of the database content for allowed conditions which provide mutual alignment of data of the database while entering, updating and deleting the data. Financial organizations work with the data available to them and in accordance with them, they make very important decisions. The consequences are serious if the data used in the finance department are not correct or have been changed by a malicious person or an attacker.

In order for the database to be restored, prior safety storing of the data from the base to a medium that is located outside the database is necessary. Therefore, the back up of the entire database is done periodically to a special medium, and all changes to the data in the database are recorded in the diary of changes (Varga *et al.*, 2007). On average, data back up from the base to a medium of a company is done by some companies every five days.

THE PROTECTION OF E-DATA IN THE HEALTH INFORMATION SYSTEM

Electronic data in the health information system should be protected from an unauthorized modification or alteration of data, destruction or disclosure of data by reading. When it comes to protecting electronic data in the health information system, family medicine doctors now have a problem with the applications which they use to access electronic data. Problems of applications for the health workers are as follows: (1) non-existence of compatibility between the licensed programs, which sometimes results in data loss during the transition to another application, i.e. a future information source. Doctors of family medicine and those who specialized in other fields today would need to participate more through their professional and expert associations in the evaluation of the quality of the programs (software) they work with. This could contribute to the quality of program functionality and it could be a guarantee that in the future, the program will be fully functional and applicable.

One of the tasks that users and maintainers of the health information system have is to assess system security, data integrity, protection and confidentiality of the data, with the purpose of a more efficient protection of the health information system and the increase of safety.

Electronic database access and the records in healthcare

In the electronic database of the health information system, the data can be accessed via the local workstation, i.e. using the terminal. Moreover, when we consider the application of the health information system, the data can be stored through the local workstation in the SQL e-database, which is located on the Windows 2008 Server. When the data is stored in the e-database, they can be accessed with a specific permission through different terminals, i.e. working places. When a physician works with a specific patient, he or she can access the data of the patient assigned to him, and the physician writes history on his computer, checks for previous diseases in the database, and stores and records the current condition of the patient in the database.

Some of the names of electronic records are as follows: EHR – electronic health record, EMR – electronic medical record, EPR – electronic personal record. The purpose of electronic records in health lies in the possibility of quick and reliable access to the data by health professionals. Such electronic records allow easy storage and the use of electronic data. Electronic health records enable easier function of monitoring the quality of work and administration. Records in electronic format enable faster and easier access to medical and clinical knowledge; they accelerate decision-making process; they indirectly facilitate communication with health insurance. Electronic records enable secure exchange of electronic data with other health organizations. For the physician, records in electronic form facilitate him or her getting to know the patient during his or her illness.

The ways of electronic data protection in health and recommendations for password setting

There are three basic ways of data protection in health: technical means of protection relating to the protection of computer hardware and software; legal means that relates to compliance with the Personal Data Protection Act, the Data Confidentiality Act, the Electronic Signature Act and the Telecommunications Act; and ethical means of data protection. Technical means of protection is ensured by the physical protection of the data carriers, by passwords, by network communication channels and encryption. In the health information system, ethical means of data protection is defined by IMIA (International Medical Informatics Association). Code of Ethics for medical and health informatics professionals must be clear, unambiguous and easily applicable in practice. Given that the IT field is in constant flux, the Code must be flexible to adjust to ongoing changes, without sacrificing the applicability of basic principles. The reason that the Code of Ethics for MHIPs is created instead of adjusting one of the codes designed for another group of IT professionals stands in the fact that MHIPs play a unique role in the planning and provision of health: a role which is distinct from that of other IT professionals working in different environments (International Medical Informatics Association, 2012).

With polyclinic activities, it is necessary to protect the doctor's reports, i.e. the data contained on it. Doctor's reports are protected in a way that each physician has his or her code or password, and can write or edit only their patients' reports, while they can only look at the others. Any physician can access the data in the database from any workstation or terminal. Administrators have far greater authority and rights. In certain application modules, administrators can access all the data and can provide or restrict authority or rights. Options

of a cardiologist in the observed information system (and the benefits) are as follows: (1) all the diagnostic laboratory reports are recorded in medical history or in a summarized discharge letter; (2) they have access to the previous reports of the same patient (archives); and (3) have Internet access (Inge and Mihalić, 2012). In the health information system, the data is protected by creating safety copy or back up daily. In the process of backing up, electronic data is stored on the server and three external storage media including: hard disk, DVD, and CD. To protect the electronic data effectively, anti-virus protection on the Internet is automatically updated. Since the patient data must not be lost in order to protect and secure the health information system, in addition to back up and anti-virus protection using firewall that filters communications packages and controls the traffic towards the local network and UPS (Uninterruptible Power Supply). UPS is an uninterruptible power supply system which is used in the health information system. The purpose of such a system is power supply of especially important information equipment with appropriate quality DC or AC voltage. It is widely known that the DC power systems are used to supply the most demanding consumers, which require an uninterrupted voltage, and in the case of power supply or additional aggregate supply failure.

When talking about the data integrity, in most departments only currently active physician can modify and print out their reports, while other reports can be only browsed. When one needs to print out a report, the printing can be done by the administrator. Administrator can print out any report.

In order to protect the health information system, it is necessary to ensure data confidentiality. Data confidentiality is ensured by passwords. In the health information system, it is strictly defined who is eligible to access a certain part of an electronic database, i.e. who has the authority to delete, create or update files and data stored in the file. Each physician must have a password to access a particular part of the application or a module. The password should be changed usually every month, and if necessary several times a month. An optimal password should be a minimum of seven characters. It is preferred for a password to contain a combination of uppercase and lowercase letters and numbers. It is by no means recommended to use first names, surnames, names of parents, children, date of birth, name of residence, street name, and the like for the password. It is not recommended to use for the password the same set of characters. Password change on the server or the application is done so that the user himself or herself changes the password. After the command for the password change is set, the user must first enter the current password, and after that the new password twice. In case the physician forgets the password, there is the administrator who will change it as needed. The password should not be written down on paper and put in a drawer in the office for security reasons and for the possibility that a third person comes to classified information about the patient.

When talking about a limited number of attempts to access the health computer system, the system must be adjusted to limit the number of possible accesses. If a user tries to access the health information system more than three times with a wrong password and username, the system must rejected them. The next desirable option to be set is the message of the last access to a particular part of the application or a particular module. The view of the last data access in the health information system should be provided in the form of dates, times, and names. Electronic data in the health information system can also be protected by locking the

passwords by the system administrator and by using stronger additional passwords or the dual password system.

Certain (reports) or the register in the health information system contain only numbers and never names (Inge and Mihalić, 2012).

The methods of preserving records in the health system – a case study

The owner of the data or databases in the health information system is the patient and his data should not be lost in any case. The patients' data must be permanently stored and archived. When it comes to archiving in the health information system, reports and discharge letters are automatically archived. If necessary, the data can be transferred from the old discharge letter to the new one. The information on the methods and ways of preserving electronic records and documents in the health information system for a longer period of time was collected using a survey called digitizing documents in the analogue form and the protection of e-documents (Stančić, 2005). The survey was filled in by an employee who is a part of the health information system and has sufficient experience in working with the observed information system.

Collecting the data by using survey and interview has led to following conclusions: the observed organization which uses the health information system (1) does not store materials or documents in digital form, but (1.1) is planning to store the materials and documents in electronic form. Based on the appointed secondary question 1.1.1., (what types of material and documents are planned to be stored by the company), the given answer was that the organization keeps records of all cases. The plan for the preservation of electronic documents of the observed organization is in the initial stage of construction (1.1.2.), and it plans to store the materials inside the organization itself (1.1.3.). In the question about the strategy of storing the materials and documents in electronic form, the interviewed employee says that the strategy is in the process of construction (1.1.4.) and that the construction of strategy for the preservation of materials and documents in electronic form is made with the help of external experts (1.1.5.). The observed organization intends to store the materials and documents which will originally appear in electronic form and to digitize existing materials and documents.

The key criterion that the observed organization considers as the main criterion for the selection of materials and documents for preservation is the legal obligation of their preservation. The interviewed and surveyed employee did not know (want) to answer the question of how much financial resources the observed organization is planning to invest into the system for the preservation of materials and documents in electronic form (1.1.8.).

The observed organization stores in the electronic form case files such as the documents of construction and adding on of a specific hospital. The organization's general preservation policy is in the process of developing a general conservation policy which includes the preservation of materials or documents in electronic form. The observed organization has a prescribed practice for (1) the transfer of preserved records from outdated formats into new formats of records (i.e. reformatting); (2) the update of the media (i.e., the replacement of depleted media with the new); (3) migration of records to a new type of media; and (4) emulation of outdated working environments or operating systems and other applications.

The observed organization has policies and defined programs for the preservation of materials and documents in digital form for a longer period of time. However, the problem is in the slow realization and implementation of activities for implementing the plan.

When it comes to collaboration, the observed organization has never cooperated with other companies or institutions to develop programs for the preservation of electronic records and documents. The employee who answered the questions and who is also the beneficiary of the health information system considers all electronic materials kept by the observed organization records. The observed organization has not been conducting any special preparations for the preservation of electronic materials which are considered records. The observed organization has not yet identified a problem, an obstacle or a threat to the integrity of electronic materials that might arise from the methods and techniques used.

Public health supervision system

Basic requirements for the public health supervision system are accuracy, timeliness, operability, originality and standardized quality. Accuracy refers to the continuous control and automaticity. Timeliness means the timely response of the public health supervision system without delay. Operability refers to data availability and flexibility in the creation of information. The public health information system includes the data from places where they occurred, for example from electronic health record and not from a special reporting form. Standardized quality includes a uniform terminology and international compliance (Kern, 2012).

RESEARCH ANALYSIS OF THE APPLICATION OF PROCEDURES FOR THE PRESERVATION OF ELECTRONIC MATERIALS AND DOCUMENTS

The questionnaire used in this paper is partly taken from the paper by Hrvoje Stančić entitled "Teorijski model postojanog očuvanja autentičnosti elektroničkih informacijskih objekata" ("Theoretical model of stable authentication preservation of electronic information objects") in order to collect data on organizations that are related to the preservation of electronic materials and documents. This study used a questionnaire consisting of 33 key questions. Besides these questions, the questionnaire contains a number of secondary questions. Each participant was an employee of the organization and it was clear already at the beginning that participants will not be in the position to answer every question. Mostly, the questions have been answered, except the questions about finances, due to the information sensitivity and value.

Table 1: Research analysis of the application of procedures for the preservation of electronic materials and documents

Questions and secondary questions	Answers: Organization 1	Organization 2	Organization 3	Organization 4	Organization 5	Organization 6	Organization 7
1. Does your organization preserve materials/documents in electronic form? (B)	No	Yes	Yes	Yes	Yes	Yes	Yes
1.1. Does your organization plan to preserve materials/documents permanently in electronic form?	Yes	-	Yes	Yes	Yes	Yes	Yes
1.1.1. What type of materials/documents do you plan to preserve?	Case files	-	All types of documents and materials which need to be preserved according to the Document Archiving Act.	All types of documents and materials which need to be preserved according to the Document Archiving Act and all other documents, order form, offer, book of products, concluded contracts, financial reports, etc.	Travel warrants, the decision on establishing the organization, statute, application letter	All types of documents and materials which need to be preserved according to the Document Archiving Act and all other documents. Register book, register, travel warrants, degrees and certificates on teacher training, i.e. file, files on school construction, attests, testing, services, school statutes, registries and files, contracts, formal decisions on weekly and yearly schedule of teacher's work obligations, decisions on setting up or breaking up working contracts, applications and notices of cancellation, etc.	All types of documents and materials which need to be preserved according to the Document Archiving Act and all other documents. Register book, register, travel warrants, degrees and certificates on teacher training, i.e. file, files on school construction, attests, testing, services, school statutes, registries and files, contracts, formal decisions on weekly and yearly schedule of teacher's work obligations, decisions on setting up or breaking up working contracts, applications and notices of cancellation, etc.
1.1.2. In which phase is the creation of the plan for the preservation of electronic documents?	In the beginning	-	In process.	We do not make plans for the preservation but we realize the preservation of documents in electronic	In the beginning phase since the organization is quite young.	We do not make plans for the preservation but we realize the preservation of documents in electronic	We do not make plans for the preservation but we realize the preservation of documents in electronic

Questions and secondary questions	Answers:						
	Organization 1	Organization 2	Organization 3	Organization 4	Organization 5	Organization 6	Organization 7
				form immediately.		form immediately.	form immediately.
1.1.3. Do you plan to keep materials/documents?	Inside the institution	-	Inside the institution	Of course, always.	Inside the institution	Inside the institution	Inside the institution
1.1.4. Do you have a developed strategy of preservation of materials/documents in electronic form inside your organization?	In construction	-	Yes, we do.	Yes, we do. You could say so.	In construction	Yes, we do. You could say so.	Yes, we do. You could say so.
1.1.5. The strategy of preservation of materials/documents in electronic forms has been/is being made:	Business secret	-	By ourselves inside the organization.	By ourselves inside the organization.	By ourselves inside the organization	By ourselves inside the organization.	By ourselves inside the organization.
1.1.6. Do you intend to keep materials/documents which are going to be originally created in electronic form?	Yes	-	Yes	Yes	Yes	Yes	Yes
1.1.7. Do you intend to digitize existing materials/documents?	Yes	-	Yes	Yes	Yes	Yes	Yes
1.1.7.1. Which of the following criteria will your organization consider main when choosing materials/documents for preservation?	Legal obligation of preservation	-	Legal obligation of preservation, saving space required for storage.	Legal obligation of preservation, saving space required for storage, historical, slow physical deterioration, improving access, commercial use of our own materials.	Historical / cultural importance, legal obligation of preservation, improving access, saving space required for storage.	Historical / cultural importance, legal obligation of preservation, improving access, saving space required for storage.	Historical / cultural importance, legal obligation of preservation, improving access, saving space required for storage.
1.1.8. What amount of finance resources is planned to be invested into the system for the preservation of materials/documents in electronic form?	Business secret (I do not know)	-	-	For now, it still cannot be estimated.	14000, 00 kuna	-	-
2. Describe which electronic material your organization preserves?	Case files and all the necessary documentation	CD	Disc, CD, microfilm.	All the documentation coming from the environment into our system and which goes out of the system into the environment.	More or less, all the material of the organization (order forms, maintenance plan, statute, members list, etc.)	Students lists with their personal data, their grades, contracts, registries, and all the documentation coming from the environment into our system in electronic form and which goes out of the system into the environment.	Students lists with their personal data, their grades, contracts, registries, and all the documentation coming from the environment into our system in electronic form and which goes out of the system into the environment.
3. Does your organization have a general preservation policy which includes the preservation of materials / documents in electronic	In the process of development	In the process of development	Yes. Preservation = obligational archiving according to	Yes. More or less all the documents coming into the company	In the process of development	In the process of development	In the process of development

Questions and	secondary questions	Answers: Organization 1	Organization 2	Organization 3	Organization 4	Organization 5	Organization 6	Organization 7
form?				the law.	and going out of it are stored in digital form and are preserved.			
4. Does your organization have a policy or prescribed practice for:	a) changing preserved records from outdated formats into new records (reformatting)	Yes	Yes	No	Policy? Yes	Yes	Yes	Yes
	b) refreshing the media (changing old media with new ones of the same type)	Yes	Yes	No	Policy? Yes	Yes	Yes	Yes
	c) migration of records on the new media type	Yes	Yes	Yes	Policy? Yes	Yes	Yes	Yes
	d) emulation of outdated work environments (operating systems and application)	Yes	Yes	No	Policy? Yes	Yes	Yes	Yes
	e) policy/ practice is in the process of development	In the process of development	I do not know	-	Policy is always in the process of development in that area	In the process of development	In the process of development	In the process of development
	f) something else	X	I do not know	-	-	X	-	-
5. Does your organization have a defined program or policy for the preservation of materials/documents in electronic form for a longer time period?		Yes	Yes	Yes	It is not clearly defined; however, the preservation of materials and documents is performed in electronic form.	No	No	No
5.1. In which year did the program/activity of preserving materials in electronic form start?		I do not know	1990	1995	From the beginning of digitalization of documents in the company.	2011	I do not know	I do not know

Questions and secondary questions	Answers:						
	Organization 1	Organization 2	Organization 3	Organization 4	Organization 5	Organization 6	Organization 7
				More precisely, from the time of the company establishment			
5.2. Is there any problem which influences the implementation of the program and activities?	Yes, slow implementation.	No	No	No	No	No	No
6. Do you use certain methods and/or techniques with the purpose of preserving materials in electronic form?	No	Yes	No	Yes	Yes	Yes	Yes
6.1. Generally describe the methods and/or techniques used for the preservation of materials in electronic form.	-	Materials which can be found on the server are protected against viruses, and materials are stored on several storage media.	-	Migration; changing file formats from one into another, depending primarily on the change of operating system and application program.	Photographing and scanning of the documents	Photographing and scanning of the documents and changing file formats from one into another. .XLS format into .XML format (program code).	Photographing and scanning of the documents, and changing file formats from one into another. XLS format into .XML format (program code).
6.2. If you do not preserve materials in electronic form, do you study/estimate certain methods and/or techniques as those which you might use in future?	Yes	No	No	We perform it	-	-	-
7. Have the other organizations or individuals collaborated (or collaborate or you plan collaboration) with your institution on the development of the preservation program?	Yes	No	Yes	No	No	No	No
7.1. Those were/are/will be:	All those who have experience in preserving electronic documents, graduated IT professionals, and other ICT experts.	-	Specialized agency	-	-	-	-
7.2. Is your collaboration (was/will be):	-	-	Of local character	.	-	Of local character	Of local character
8. Do you have some special preparations for the preservation of electronic materials you consider records (as different from the preservation of other electronic materials)?	Yes	Yes	No	Yes	Yes	No	No
8.1. If yes, please state which.	Preparing the medium for storage, and preparing appropriate input and output units.	Preparing the medium for storage (CD, USB)	-	Preparing the medium for storage (CD, DVD, USB memory, preparing the discs (internal and	Switching the records from the specific file on one storage medium to other data storage	-	-

Questions and	secondary questions	Answers: Organization 1	Organization 2	Organization 3	Organization 4	Organization 5	Organization 6	Organization 7
					external)).	medium.		
9. Has the program and/or the activity come to the point of testing or evaluation of any of the methods or techniques which you use?		No	No	No	No	Yes	-	-
9.1. If yes, what are the results/conclusions?		No	-	-	-	Good (Without a specific explanation)	-	-
9.2. Have you identified any problems, obstacles or threats for the integrity of electronic materials which would appear due to used methods or techniques?		No	-	No	-	No	No	No
10. Which of the following criteria are main criteria when choosing materials for the preservation? (C)		Legal obligation of preservation	Legal obligation of preservation and access improvement	-	Legal obligation of preservation and access improvement, and documentation which is necessary in future for tenders, i.e. the need for specific documents, etc.	Access improvement	Eased data access (availability)	Eased data access (availability)
11. Where do the materials you keep come from?		Mostly from the companies soliciting for tenders, and from governmental institutions.	From the parent body	-	From the parent body and from the environment.	From the parent body, and from other institutions (counties).	From the parent body, and from other institutions (counties, town, education and teacher training agency, etc.).	From the parent body, and from other institutions (counties, town, education and teacher training agency, etc.).
12. Which technique/method do you use for preservation? (D)		Archiving of all documents and storing the records of the archives on a CD. After a certain time, refreshing of the medium the important data is stored on is performed.	Storing the records of the archives on a CD.	-	Archiving of all documents and storing the records of the archives on a CD. After a certain time, refreshing of the medium the important data is stored on is performed.	Programming new software, i.e. improving the existing application, standardization of formats, migration, replication (records are copied without changes on the new generation media).	Standardization of formats, migration, replication (records are copied without changes on the new generation media).	Standardization of formats, migration, replication (records are copied without changes on the new generation media).
13. Which technique/method characteristics you use do you find good and why?		We consider it a good and useful solution to use the data registering program and JIT data finding for a certain case in	I do not know how to express myself.	-	-	The feature of preserving the object in its original form. Replication.	-	-

The expenses for the preservation of records are made by the storage space and energy used.	The expenses for the preservation of records are made by the storage space and energy used.
33. Which resources is the process of preservation funded from and how are they distributed?	Business secret (I do not know)	Business secret (I do not know)	-	Business secret (I do not know)	Business secret	-	-

Source: Created by the authors of the paper on the basis of data collected by questionnaire from the employees of relevant organizations and by the questionnaire from the paper by Stančić Hrvoje "Teorijski model postojanog očuvanja autentičnosti elektroničkih informacijskih objekata" ("Theoretical model of stable authentication preservation of electronic information objects"). Doctoral dissertation. Survey. Zagreb 2005.URL: http://bib.irb.hr/datoteka/244465.Ocuvanje_autenticnosti_e-informacijskih_objekata.pdf

On the basis of the table 1, we can see and compare the methods for the preservation of documents and materials, electronic documents and electronic materials which are used by the observed and surveyed organizations. Surveyed organizations are state-owned, privately owned and owned by the municipalities and towns. Employees who were surveyed have a university degree in economics (organization 1, 2 and 4), and in Information Technology (organizations 3, 5, 6, 7). The only problem that was present during the survey was finding experts in these organizations who have experience in long-term preservation of electronic materials and documents. Organization 1 is a part of the executive power in the Republic of Croatia, where the research was conducted. Organization 2 is a private company which specializes in import and distribution of fertilizers, agricultural products and feed additives. Organization 3 is an IT company for software development and troubleshooting of hardware for all types of computers. Organization 4 is a public organization owned by the municipalities and towns whose main activity is natural gas supply and distribution in a certain county. Organization 5 is an association which operates and performs activities in the field of finance and information technology for a longer period of time. Organizations 6 and 7 are educational organizations. On the basis of Table 1, the results of the research can be seen and it can be concluded that most organizations use a scanner and a camera to digitize documents; mostly, the digitized documents and electronic records are stored in .pdf, .doc, .docx, and .xml formats. When the safety of digitized documents and the possibility of the documents to be opened by malicious people is taken into account, it is best to store the digitized document in .odt format since the tools for opening documents and records in that format are less frequently used. The data collected from field studies indicate that representatives of the organizations that provided the data do not want to give in public the information on the amount of financial resources they would invest in the preservation of electronic materials and documents. The release of information from the plan of investing financial resources in the future is clearly not pleasant these days. Based on Table 1, the results of the company, i.e. observed organization, can easily be compared.

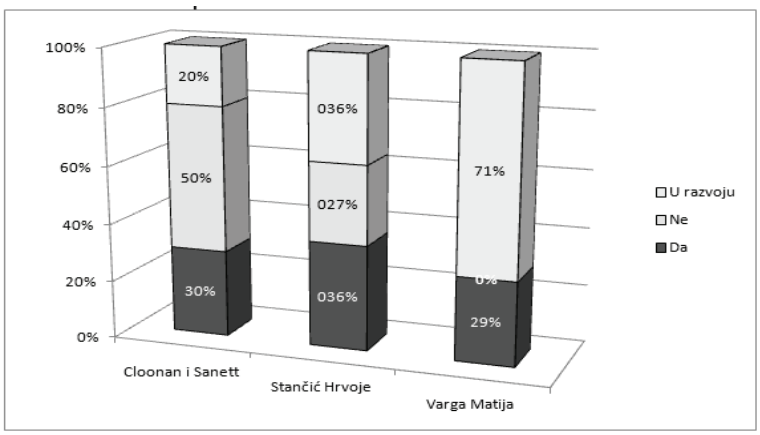

Figure 1: Does the institution have a general policy of preservation which includes the preservation of materials in electronic form?
Source: Created by the authors of the paper in MS Excel and on the basis of data collected by questionnaire from the employees of the observed organizations and the questionnaire created on the basis of the questionnaire from the paper by Stančić Hrvoje "Teorijski model postojanog očuvanja autentičnosti elektroničkih informacijskih objekata" ("Theoretical model of stable authentication preservation of electronic information objects"). Doctoral dissertation. Survey. Zagreb 2005. URL: http://bib.irb.hr/datoteka/244465.Ocuvanje_autenticnosti_e-informacijskih_objekata.pdf. Legend: In the process of development (U razvoju); No (Ne); Yes (Da); Cloonan and Sanett (Cloonan i Sanett)

Figure 1 indicates general preservation policy which includes the preservation of materials in electronic form. It is necessary to take into account that the time gap between the surveyed organizations and the conducted research between the first and the second case is five years, while the interval between the second and the last research presented in the first figure is 7 years. In the first case, in the figure 1, foreign institutions are the subject, while the other two figures show the results of local institutions or organizations. The research which was conducted over a period of one month and with a sample of 7 organizations, it is shown that there is no organization that has no general record and material preservation policy in electronic form.

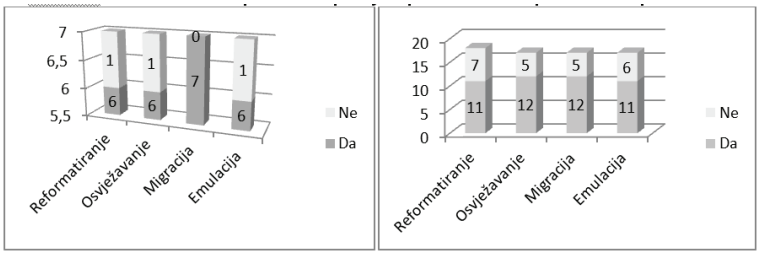

Figure 2: The existence of prescribed policy or practice for the preservation procedures
Source: Created by the authors of the paper in MS Excel and on the basis of data collected by questionnaire from the employees of the observed organizations and the questionnaire created on the basis of the questionnaire from the paper by Stančić Hrvoje "Teorijski model postojanog očuvanja autentičnosti elektroničkih informacijskih objekata" ("Theoretical model of stable authentication preservation of electronic information objects"). Doctoral dissertation. Survey. Zagreb 2005. URL: http://bib.irb.hr/datoteka/244465.Ocuvanje_autenticnosti_e-informacijskih_objekata.pdf
Legend: Reformatting (Reformatiranje); Refreshing (Osvježavanje); Migration (Migracija); Emulation (Emulacija); No (Ne); Yes (Da).

Figures 2 show the results of processing data collected on the basis of a questionnaire. We examined the existence of a policy or prescribed practice for switching the preserved records from outdated record formats into new ones (reformatting); refreshing the media (the replacement of depleted media with the new ones of the same type); migration of the records to the new media type; and emulation of outdated working environments (operating systems/programs). Of the seven surveyed institutions, seven of them responded to this question. All organizations are performing the migration process, which is shown in the left figure. If the collected research data from the research in the paper by Hrvoje Stančić and the research that took place in 2012 were combined, the size of the sample would increase to 18 organizations, and obtained results would be different (figure 2).

Table 2: The comparison of collaboration of organizations with other organizations

Type of collaboration	Cloonan and Sanett	Hrvoje Stančić	Matija Varga
International	11	3	0
On national level	10	4	0
Of local character	2	2	3
Of institutional type	0	5	0
Using the common space/equipment	1	0	0

Source: Created by the authors of the paper in MS Word and on the basis of data collected by questionnaire from the employees of the observed organizations and the questionnaire created on the basis of the questionnaire from the paper by Stančić Hrvoje "Teorijski model postojanog očuvanja autentičnosti elektroničkih informacijskih objekata" ("Theoretical model of stable authentication preservation of electronic information objects"). Doctoral dissertation. Survey. Zagreb 2005.(Modified)

Table 2 presents the comparison of results of three studies and shows the collaboration of the organizations with other organizations in the development of the preservation program. A five-year gap is between the first and the second research, and a seven-year gap between the second and the third research of the collaboration in the development of the preservation program. Based on the latest research, the most common form of collaboration in the observed organizations is of local character. Most of the observed organizations did not answer the question about collaboration between organizations, and three organizations have (will have) the collaboration of local character.

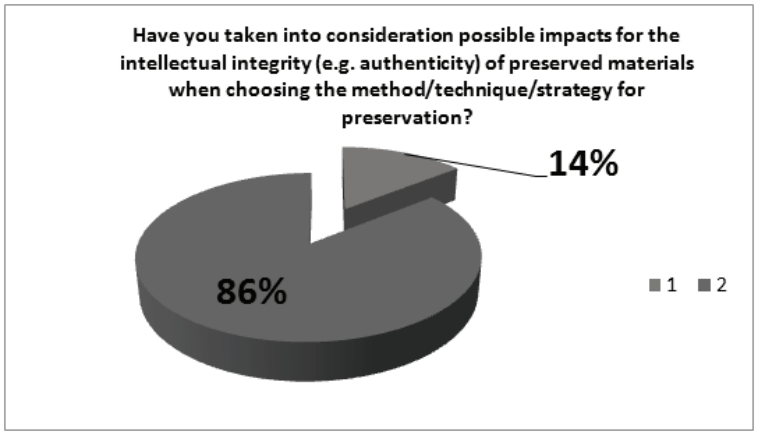

Figure 3: The influence on the intellectual integrity (e.g. authenticity) of the preserved electronic materials.
Source: Created by the authors of the paper in MS Word and on the basis of data collected by questionnaire from the employees of the observed organizations and the questionnaire created on the basis of the questionnaire from the paper by Stančić Hrvoje "Teorijski model postojanog očuvanja autentičnosti elektroničkih informacijskih objekata" ("Theoretical model of stable authentication preservation of electronic information objects"). Doctoral dissertation. Survey. Zagreb 2005. (Modified).

Figure 3 presents whether the organizations or employees, when selecting methods/techniques/strategies for preservation, have taken into account the possible impacts on intellectual integrity (authenticity) of preserved electronic materials. The question "Have you taken into consideration possible impacts for the intellectual integrity (e.g. authenticity) of preserved materials when choosing the method/technique/strategy for preservation?" the participants answered once with *yes* and six times with *no*.

CONCLUSION

The paper explains the reason for creating a Code of Ethics for Medical Health IT professionals. Based on the information collected by the questionnaire, it can be concluded that organizations mostly use cameras and scanners to digitize documents, and that the digitized document is usually stored in .pdf, .doc .docx and xml format. When the safety of digitized documents and the possibility of the documents to be opened by malicious people is taken into account, it is best to store the digitized document in .odt format since the tools for opening documents and records in that format, as well as the Linux operating system that supports Open Office, are less frequently used. The data collected from field studies indicate that representatives of the organizations that provided the data do not want to give in public the information on the amount of financial resources they would invest in the preservation of electronic materials and documents.

The results of the research, which was conducted during the period of three weeks in 2012 on the sample of seven organizations, show that there is no organization that does not have a general policy of preserving the material in electronic form. The recommendation for the observed organizations is to back up electronic databases more often, or as many times as possible in the shortest period of time possible. The research presented in this paper, when it comes to collaboration in the development of the programs intended for preservation, shows that the most common form of collaboration is of local character. Organizations, when selecting methods, techniques and strategies for the preservation of the records do not take into account possible impacts on intellectual integrity (e.g. authenticity) of preserved electronic materials (86% of the total number of surveyed representatives of the organizations), which is worrying or the participants did not understand the question well enough.

A NOVEL INFRASTRUCTURE FOR DATA SANITIZATION IN CLOUD COMPUTING (RESEARCH PAPER)

Cheng-Yuan Ku, National Chung Cheng University, Taiwan, ROC
E-mail: cooper.c.y.ku@gmail.com

Yu-Siang Chiu ,National Chung Cheng University, Taiwan, ROC
E-mail: fishfly1115@gmail.com

ABSTRACT

Purpose- *In this extended abstract, we propose a novel infrastructure in cloud computing environment which assures the data sanitization after the customers decide to delete them.*
Design- *A mechanism with monitoring agents is suggested to watch the data usage over entire life cycle and assure the data sanitization in the end.*
Findings- *Security analysis and performance analysis will be done after the complete infrastructure is decided. We expect this mechanism should fulfill the security and performance requirements for cloud computing users.*
Originality/Value- *The emerging cloud computing technology needs the assurance of various security requirements, otherwise most of customers/organizations do not dare to adopt it. Our research proposes an infrastructure to solve one of the security problems, i.e. data sanitization. As well known, only after the security requirements of cloud computing could be managed and guaranteed, the prospects of the cloud services are brightening.*

Keywords: cloud computing, cloud services, information security, data sanitization, trusted third party (TTP), agent

INTRODUCTION

In recent years, as cloud computing becomes more and more popular, it has gradually drawn many enterprises' attention. Ironically, one of the major factors which lead the development of cloud computing is the previous economic recession. Due to the keen business competition and tight budget, enterprises need to find any possible ways to reduce cost. According to the National Institute of Standards and Technology (NIST), cloud computing providers offer services with three fundamental models (Mell and Grance, 2011):

- Software as a Service (SaaS)
- Platform as a Service (PaaS)
- Infrastructure as a Service (IaaS)

Based on the individual need, enterprises can choose anyone, both or all of the above-mentioned methods to construct computing services for stakeholder. From the perspective of technology, cloud computing seems to be able to give a chance to divest infrastructure management of information systems and to enhance core competencies. However the potential security issues may hinder the cloud services from fast developing.

Even with the protecting mechanism in cloud, the attacker still can take various attack models to invade. Cloudburst virtual machine (VM) escape is an exploit method that enables

a guest-level virtual machine to attack its host (Kortchinsky, 2009). A method that prevents the VM escape has been proposed by security researchers (Ristenpart et al., 2009). In addition to the above-mentioned attack, one of the other major security considerations is data sanitization. Actually a deleted file only means the erased directory, not the file itself. This issue becomes even more complicate in cloud environment and still has no concrete solutions until now.

The trusted third party (TTP) and agent are two of the popular methods to solve many security issues. The TTP can act as a monitor and audit the performance of service providers for customers. An agent is generally developed to monitor network activity, collect information, act for a user or other program … and so on. For example, it can identify malicious network behavior that does not comply with the policy and send the alert to the managing center (Manzoor and Nefti, 2009). According to the published security guidance in cloud computing by Cloud Security Alliance (CSA) (CSA, 2011), there are two types of monitoring mode:

- Database Activity Monitoring (DAM)：Database Activity Monitor captures and records all Structured Query Language (SQL) activity in database in real time or near real time. The database monitoring server will generate alerts on policy violations.
- File Activity Monitoring (FAM)：FAM records how the customers access file and generate alerts on policy violations.

Until now, there are some solutions of new generation DAM which are based on kernel-level implementations and other intrusive approaches (Lombardi and Di Pietro, 2011; Shao et al., 2010). This means that adding a layer of security requires changes in architecture and relies on the virtualization technology. McAfee, the world's largest dedicated security technology company, has made an effective solution which can be easily embedded into the guest VM. This is the so-called McAfee Database Activity Monitoring (McAfee, 2012). In short, within the proposed infrastructure, the TTP, agent modules and improved sanitization procedure are adopted to assure the security of sensitive data.

PROPOSED MECHANISM

In order to achieve the data sanitization, the entire data life cycle must be monitored. In this way, the manager can record and control the detailed process of data usage and storage. Based on the above-mentioned McAfee Database Activity Monitoring, we further design a monitoring mechanism to handle the data sanitization problem as shown in Figure 1. In cloud environments, the customers, in general, deploy the needed applications, platforms or infrastructures on VMs. Therefore, we suggest that a monitoring agent should be embedded into every VM which hosts the application or database.

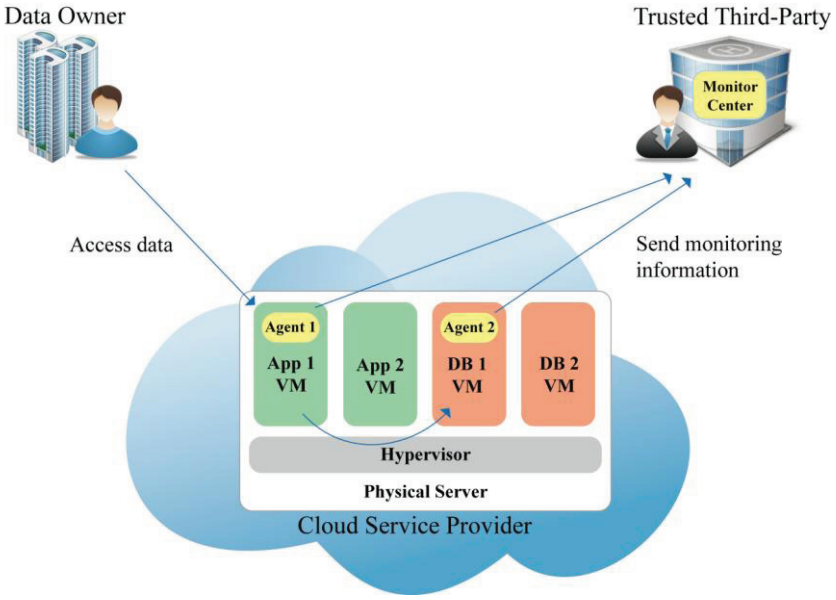

Fig. 1 Monitoring architecture

- Access function：while the data owner accesses data via applications on VM, agent 1 shall collect the log information and sent to the TTP.
- Process function：agent 1 shall also monitor communication between the applications and database.
- Store function：agent 2 shall monitor the database and have all activity reports sent to TTP.

FUTURE WORKS

Currently the design of monitoring mechanism in cloud environment is already finished but the detailed data sanitization procedure is still under construction. Furthermore, the security analysis and performance analysis should be conducted thereafter. The security analysis is going to include the man-in-the-middle attack, verifiability, brute-force attack, and spoofing and so on. We plan to implement the prototype of proposed mechanism by using Hadoop platform. As for the performance analysis, the speed of overwriting and the efficiency of monitoring center will be assessed. Finally, we will compare with McAfee Database Activity Monitoring about performance.

ABSTRACT

Purpose: *As an Internet-based version of word of mouth, electronic word-of-mouth (eWOM), the new information presented from the perspective of consumers who have purchased and used the product, have become a major informational source for consumers. The purpose of this paper aims to investigate the influence of eWOM on purchasing intention. Moreover, this study examines the moderating effect of product involvement and brand image in the relationship between the effects of electronic word of mouth and purchase intention.*

Design/ methodology/approach: *The target samples of this study are people who have ever searched for opinions or reviews through the Internet before buying the product. The survey is consisted of three parts covering the following issues, including eWOM searching experience, measurement items of each variable, as well as demographics and Internet using experience. A structural equation modeling (SEM) is used to assess the relationships of the research model.*

Findings: *Viewing online reviews or comments is helpful for consumers because it makes consumers feel more confident on purchase decision. The results indicate that eWOM quality, eWOM quantity and sender's expertise have positive effect on purchase intention. Most importantly, product involvement and brand image have moderating effect in the relationship between eWOM and purchase intention.*

Originality/ value: *This study provides new insights into the eWOM, which in turn affects customer purchase intention.*

Keywords: Electronic word-of-mouth (eWOM), Product involvement, Brand image, Purchase intention, Structural equation modeling (SEM)
Paper type: Research paper

INTRODUCTION

As a new marketing channel, the World Wide Web differs from traditional retail formats in many ways. Consumers shop online cannot touch or smell the products, as would be possible in traditional retail stores, so their purchase judgments must be based on the product information presented on the website. On-line sellers seek to overcome this limitation by giving consumers the opportunity to share product evaluations on online platform. This consumer-created information is helpful in making purchase decisions because it provides indirect experiences of products.

Word-of-mouth (WOM) is defined as "all informal communications directed at other consumers about the ownership, usage, or characteristics of particular goods and services or their sellers (Westbrook, 1987)." While WOM has been traditionally spread among acquaintances through personal "contagions," its value has also been recognized and used in practice. Pioneered by the seminal Bass (1969) paper, WOM is widely considered as a major driver of new product diffusion for non-adopters. Additionally, the concept of positive word of mouth has been largely used by marketing professionals as it can serve both the purpose of measuring the effectiveness of the marketing tools like advertising and also at the same time be used as a credible source for gaining information relating to the product (Li and Zhan, 2011).

The rapid development of the Internet with its enhanced communication capabilities has dramatically increased the scale and scope of word-of-mouth communication. As an Internet-based version of word of mouth, online reviews, the new information presented from the perspective of consumers who have purchased and used the product, have become a major informational source for consumers. Online reviews have very important implications for a wide range of management activities, such as brand building, customer acquisition and retention, product development, as well as quality assurance. Companies such as Amazon.com and Circuitcity.com, provide convenient access for the customers to read and write review for the products sold on their websites. Reichheld (2003) claimed that a customer's propensity to recommend a product to others – termed referral value - was the most important success measure in business today. Reichheld argued that referral value has a higher correlation to firm performance than such traditional measures as customer

satisfaction.

As an Internet-based version of word of mouth, eWOM has become a major informational source for consumers before they buy the products. Whereas many studies have examined the importance and roles of online product reviews on sales (e.g., Chevalier and Mayzlin 2006, Godes and Mayzlin 2004, Dellarocas, Awad and Zhang, 2004, Judith and Dina, 2006), few studies pay attentions on eWOM's influences on consumer purchase intention, and this reason motivates this study to conduct the research. Therefore, this study aims to investigate the influence of eWOM (including quality and quantity of eWOM as well as sender's expertise) on purchasing intention. Additionally, this study examines the moderating effect of product involvement and brand image on the relationship between the effects of electronic word of mouth and purchase intention.

THEORETICAL BACKGROUND AND HYPOTHESES DEVELOPMENT

Electronic Word of Mouth (eWOM)

Historically, word of mouth is widely considered as a powerful influence in consumer marketplace, especially on consumers' information search and subsequent decision making (Brown & Reingen, 1987; Money, Gilly, & Graham, 1998; Silverman, 1997). With the rapid growth of the Internet, electronic communication has become a critical phenomenon. According to Buttle (1998), computer-mediated communication such as blogs, message boards, and emails can also be included in the definition. Following the notion, Hennig-Thurau et al. (2004) described electronic word of mouth as "any positive or negative statement made by potential, actual, or former customers about a product or company, which is made available to a multitude of people and institutions via the Internet (p. 39)". Comparing with WOM, Bickart and Schindler's (2001) showed that eWOM may have higher credibility, empathy and relevance to customers than marketer-created sources of information on the Web.

In this study, eWOM is viewed from three dimensions, including eWOM quality, eWOM quantity, as well as sender's expertise. Quality of eWOM refers to the persuasive strength of comments embedded in an informational message (Bhattacherjee, 2006). Consumer buying decision can be based on some criteria or requirement that meet their needs and to determined their willingness to buy it will be based on their perceived of quality of information they received (Cheung 2008). Therefore, it is important to determine consumer's perception of information quality as element for assessing their potential buying decision. In addition,

quantity of eWOM refers to total number of posted comments (Cheung and Thadani, 2010). The popularity of the product is determined by quantity of online comments because considered could represent the market performance of product (Chevalier and Mayzlin, 2003). Consumer also need reference to strengthened their confidence to reduce the feeling making mistake or risk while shopping, and online comment quantity represent the product popularity and importance. In other words, consumers may perceive that more reviews represent higher product popularity and importance (Lee, 2009). Furthermore, expertise is aptitude, required training and experience and is domain specific. On the other hand, expertise can be viewed as "authoritativeness," "competence," and "expertness" (Hung and Cheng 2006). It is considered that the expertise of sender when they made a comment in consumer review will attract user to adopt the information and make decision to purchase.

Purchase Intention

Purchase intention refers to consumer's intention to purchase a particular product or service. Purchase intention, was cited by Fishbein and Azjen (1975), as the single most accurate predictor of actual purchase behavior. Several studies have been conducted in this regard, and have found statistically significant relationships between purchase intention and actual purchase behaviors. It has been found that, particularly in the consumer durable goods category, purchase intention is a reliable measure of actual purchase behavior (Kalwani and Silk, 1982). Research conducted by Godes and Mayzlin (2009) tried to focus on the ways a firm should try to use the exogenous word of mouth to foster the sales. The research result showed that exogenous word of mouth accounts for the higher level of sales for the organizations.

Word of mouth could be one of the most believable form (Henricks, 1998) and affect consumer's choices of products in the WOM spread by other consumers (Brown & Reingen, 1987; Herr, Kardes, & Kim, 1991). Moreover, the Internet allows peoples' opinions can be more easily and quickly accessible to other consumers. Advices and product using experiences from online users become influential for their behavior (Thompson, 2003) and eWOM is regarded as a critical source for consumers making a buying decision. Some related studies have also indicated that eWOM messages are an important means whereby consumers can obtain information about product or service quality (Chevalier and Mayzlin, 2006). Moreover, this kind of message can effectively reduce the risk and uncertainty recognized by consumers when purchasing products or services, so that their purchase intention and decision making can be further influenced (Chatterjee, 2001).

eWOM quality is defined as the quality of a review's contents from the perspective of

information characteristics (relevance, understandability, sufficiency, and objectivity). Since previous buyers are anonymous on the Internet, people generally will not easily accept or believe a review posted on a Web site if it does not provide enough information (Ratchford, Talukdar, and Lee, 2001). Other things being equal, reviews that are more persuasive have a greater positive effect on consumers' purchasing intention. Besides, the number of on-line consumer WOM (eWOM quantity) of a product represents the product's popularity as the on-line word-of-mouth effect because it is related to the sales volume of the product (Chatterjee 2001; Chen and Xie 2004). It is likely to lead consumers to rationalize their purchasing decisions by telling themselves, "Many other people also bought the product." Additionally, consumers usually have belief in expert due to experts represent the individuals who have more professional knowledge (Alba & Hutchinson, 1987). Therefore, this study proposes that：

H1: The quality of electronic word-of-mouth positively affects consumers' purchasing intention.
H2: The quantity of electronic word-of-mouth positively affects consumers' purchasing intention.
H3: Sender's expertise positively affects consumers' purchasing intention.

Product Involvement

Product involvement, as defined by Zaichkowsky (1986), refers to "a person's perceived relevance of the object based on inherent needs, values, and interest." Involvement is associated with the motivation to process information, and prior knowledge (expertise) is associated with the ability to process information (Celsi, and Olson 1988; Petty and Cacioppo 1984). Issue-relevant arguments and product-relevant attributes were more influential under high-involvement conditions; while peripheral cues, such as the characteristics of information sources or number of arguments, were more influential under low-involvement conditions (Chaiken 1980; Petty and Cacioppo 1984; Petty et al. 1983). Therefore, this study proposes that：

H4a: Product involvement moderates the relationship between quality of eWOM and purchase intention.
H4b: Product involvement moderates the relationship between quantity of eWOM and purchase intention.
H4c: Product involvement moderates the relationship between sender's expertise and purchase intention.

Brand Image

Keller (1998) conceptualized brand image as a perception of consumers when they see a brand and reflected by brand associations in their mind. And these associations of brand image are multidimensional and contain the emotional dimension or the attitudes regarding the brand and the perceived quality dimension. From consumers' overall picture of their experiences, brand image is important because through this technique, brand image will create the consumer's cognitive, emotional, and behavioral responses as an outcome (Padgett and Allen, 1997). Moore (1981) argued that image is a mental estimate of a general degree of satisfaction from an organization's activities and performances. And through image investigation, organizers will know the attitudes from customers tend to their companies, indeed, how well customers understand and what they prefer of companies.

Park, Jaworski, and Maclnnis (1986) advanced that brand image is one strategic technique with the goal of helping the concept of a brand to be completed by means of an exercise in brand management. The objective of companies is to establish favorable and positive connection about the brand which the outcome in a positive image of the brand. The consumer may have more desire with one brand simply because this brand has the different image from other competitor's brands (Schiffman and Kanuk, 1994). Engel et al. (2001) indicated that consumers will make the decision based on the existing and external information. When there is the conflict between brand image and information content, consumer's decision will be hard to make. Therefore, this study proposes that：

H5a: Brand image moderates the relationship between quality of eWOM and purchase intention.

H5b: Brand image moderates the relationship between quantity of eWOM and purchase intention.

H5c: Brand image moderates the relationship between sender's expertise and purchase intention.

RESEARCH DESIGN AND METHODOLOGY

Research Assumption

Base on the literature review in chapter two, the research model of this study is shown in Figure 3-1.

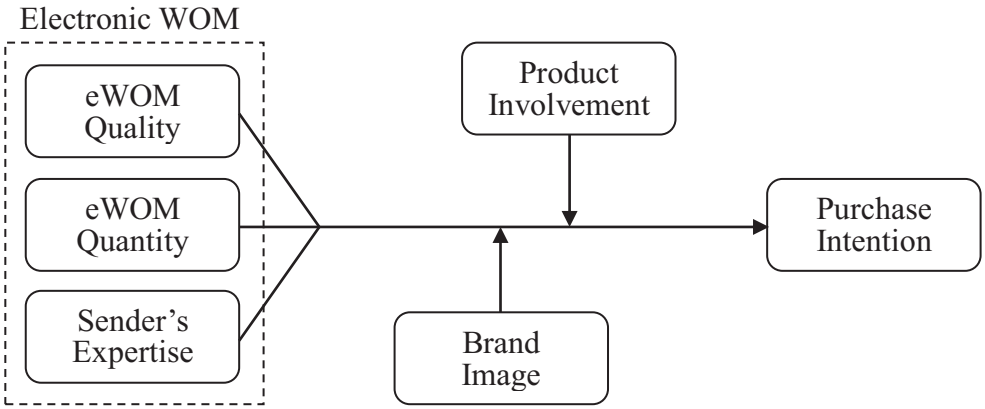

Figure 3-1 The Research Framework of This Study

After reviewing the literature in chapter two and basing on the research objectives and framework, the research hypotheses were proposed as shown in table 3-1:

Table 3-1 Research Hypotheses

Hypothesis	Content
H1	The quality of electronic word-of-mouth positively affects consumers' purchasing intention.
H2	The quantity of electronic word-of-mouth positively affects consumers' purchasing intention.
H3	Sender's expertise positively affects consumers' purchasing intention.
H4a	Product involvement moderates the relationship between quality of eWOM and purchase intention.
H4b	Product involvement moderates the relationship between quantity of eWOM and purchase intention.
H4c	Product involvement moderates the relationship between sender's expertise and purchase intention.

Table 3-1 Research Hypotheses (cont.)

Hypothesis	Content
H5a	Brand image moderates the relationship between quality of eWOM and purchase intention.
H5b	Brand image moderates the relationship between quantity of eWOM and purchase intention.
H5c	Brand image moderates the relationship between sender's expertise and purchase intention.

Research Design

To achieve the study objectives, a self-administered survey questionnaire was developed based on the findings of the literature review. The survey consisted of three parts covering the following issues: (1) eWOM searching experience, (2) measurement items of each variable, and (3) demographics and Internet using experience.

In the first section, respondents were asked to answer their eWOM searching experience, including the channel (ex. BBS, Forum, Blog…etc.) they used, the product they usually search for (ex. 3C product, food, cosmetics product…etc.), and the reasons they search comments via Internet. The second section is for the measurement items. Regarding the electronic word of mouth, to measure eWOM quality, initially 7 items were adapted from the studies of Park et al. (2007) and Bailey and Pearson (1983), however, 1 item was deleted because its factor loading is less than 0.7. Four items were adapted from Park and Lee (2008) as well as Do-Hyung and Band (2008) to measure eWOM quantity, in which, 1 item was deleted because of lower factor loading (<0.7). As for sender's expertise, 7 items were adapted from Gilly et al. (1998), but 2 item were deleted because the factor loading are less than 0.7. Besides, initially 9 items were adapted from Zaichkowsky (1986) 's research to measure product involvement, and 9 items were adapted from the study of Dodds et al. (1991) to measure brand image, however, 3 items of product involvement and 4 items of brand image were deleted because the factor loading are less than 0.7 Furthermore, in order to measure purchase intention, 5 items were adapted from the study of Baker and Churchill (1977). All the measurement questions of eWOM, product involvement, brand image and purchase intention were carried out by a seven-point Likert scale, ranging from "1=Extremely disagree" to "7= Extremely agree". In the last section of the questionnaire gathered respondents' demographic information, such as gender, age, education, monthly income, and

their Internet using experience.

The target samples of this study are the people who have ever searched for opinions or reviews through the Internet before buying the product. Online questionnaire sampling is the major way in this study by using the online survey website- mySurvey. Meanwhile, the address link of online questionnaire was posted in personal website such as facebook, and also spread by friends. In the end, 182 responses were received and valid. Data analysis involves descriptive statistics using SPSS 20 and structural equation modeling using AMOS 20 structural equation program. AMOS is designed to estimate and test structural equation models (SEMs). SEMs are statistical models of linear relationships among latent (unobserved) variables and manifest (observed) variables. Its purpose is estimating the coefficients in a set of structural equations. For this research AMOS is used to investigate the causal relationships, where the path coefficients are tested for significance and goodness-of-fit. The overall model fit measures were used to evaluate the fit of the structural model. In estimating the goodness-of-fit indices (GFI) for measurement and structural models, χ^2 (chi-square) test was used. In addition, the root mean square error of approximation (RMSEA) was used as an absolute fit index. The incremental fit index (IFI) nd the comparative fit index (CFI) were used as incremental fit indices. Standardized estimates were used in reporting the causal relationships between the exogenous and endogenous constructs.

DATA ANALYSIS AND RESULTS

54.6% of the respondents were male and 45.4% were female. The 21–30 age group occupied 72.8% of the total sample respectively. For the education level, 58.3% of respondents are with college/university degree and 37.6% of respondents are with master or doctoral degree. Regarding the experience of Internet usage, 75.5% of respondents said they have used Internet for more than 8 years. The majority of respondents use Internet everyday (82%). When people search for the product review or comment, the major platform that respondents use is the forum (41.6%) to search the 3C product (38.2%) and food (30.6%).

Measurement of Validity and Reliability

As shown in the Table 1, the result of CFA indicates that convergent validity represented by construct reliability (CR) and average variance extract (AVE) are greater than 0.7 and 0.5 respectively.

Table 4-1. CFA Outcome for the Measurement Model

	Factor Loading	CR Construct Reliability	Eigen-value
eWOM Quality			
The online review/comment is clear.	0.863	0.876	1.752
The online review/comment is understandable.	0.871		
The online review/comment is helpful.	0.860		
The online review/comment is credible.	0.752		
The online review/comment has sufficient reasons supporting the opinions.	0.782		
In general, the quality of each online review/comment is high.	0.755		
eWOM Quantity			
The number of online review/comment is large, inferring that the product is popular.	0.873	0. 853	1.746
The quantity of online review/comment information is great, inferring that the product has good sales.	0.846		
Highly ranking and recommendation, inferring that the product has good reputations.	0.768		
Sender's Expertise			
The persons who provided online reviews/comments, I think they are experienced.	0.882	0.850	1.684
The persons who provided online reviews/comments, I think they have abundant knowledge toward the product.	0.876		
The persons who provided online reviews/comments, I think they have the ability on judgment.	0.812		
This person provided some different ideas than other sources.	0.761		
This person mentioned some things I had not considered.	0.752		
Purchase Intention			

	Factor Loading	CR Construct Reliability	Eigen-value
After reading online review/comment, it makes me desire to buy the product.	0.884	0.869	1.728
I will consider buying the product after I read online review/comment.	0.879		
I intend to try the product/service discussed in the online review/comment.	0.872		
In the future, I intend to seek out the product/service discussed in the online review/comment.	0.860		
In the future, I intend to buy the product discussed in the online review/comment.	0.844		
Product Involvement			
When I am looking for the online reviews/comments, I think the product is important to me.	0.873	0.842	1.673
When I am looking for the online reviews/comments, I think the product is meaningful to me.	0.870		
When I am looking for the online reviews/comments, I think the product is useful to me.	0.867		
When I am looking for the online reviews/comments, I think the product is valuable to me.	0.849		
When I am looking for the online reviews/comments, I think the product is attracting to me.	0.765		
When I am looking for the online reviews/comments, I am interested in the product.	0.820		
Brand Image			
The brand is safe.	0.817	0.784	1.569
The brand is reliable.	0.824		
The brand has good quality.	0.808		

	Factor Loading	CR Construct Reliability	Eigen-value
The brand is interesting.	0.739		
The brand can make me feel happy.	0.746		

The Goodness of Fit Test for the Structure Model

The model was estimated using AMOS. Table 4-2 shows the result of goodness fitting indexes for the structure model and provides a reasonably good fit for the data ($\chi 2 = 367.891$, degrees of freedom (df) = 2.485, $p < 0.000$; comparative fit index (CFI) = 0.914; normed fit index (NFI) = 0.909; root mean square error of approximation (RMSEA) = 0.057). All of these fit indices are acceptable, suggesting that the overall structural model provides a good fit.

Table 4-2. The Goodness of Fit for Structure Model

Model goodness fitting	Preferred value	Value
CMIN/DF	< 3	2.835
GFI	> 0.9	0.902
AGFI	> 0.8	0.883
RMR	<0.05	0.036
RMSEA	< 0.08	0.057
NFI	[0,1] and approaches 1	0.909
RFI	[0,1] and approaches 1	0.902
IFI	[0,1] and approaches 1	0.914
CFI	[0,1] and approaches 1	0.914

Hypotheses Test

The result demonstrates that paths representing H_1, H_2, and H_3 are supported as shown in Table 4-3.

Table 4-3. The Result of Hypothesis Test

	Estimate weight	S.E.	C.R.	p-value
H1: eWOM Quality →Purchase Intention	0.452	0.051	8.626	***
H2:eWOM Quantity →Purchase Intention	0.436	0.045	7.947	***
H3: Sender's Expertise →Purchase Intention	0.385	0.047	5.563	**

****p-value <0.001, **p-value <0.05, *p-value <0.1;*

The Moderating Effect

As for moderating effect, Table 4-4 demonstrates the result of Hypothesis 4a, 4b, and 4c as well as Hypothesis 5a, 5b, and 5c. In conclusion, product involvement and brand image can moderate the effect the relationship of eWOM and purchase intention.

Table 4-4. The Moderating Effect of Product Involvement and Brand Image

Variables	Model 1	Model 2	Model 3
eWOM Quality	0. 508***	0.487***	0.442***
eWOM Quantity	0.427***	0.351**	0.406
Sender's Expertise	0.258	0.198	0.205

Durbin-Watson (D-W)	2.348	2.153	2.217

DISCUSSIONS AND CONCLUSIONS

Considerable previous research has studied the effects of offline WOM on consumer behavior. With the substantial growth in electronic word of mouth, there is a need for marketers to better understand how electronic word of mouth might influence consumer's purchase intention. The major objective of this study is to investigate the relationship among electronic word of mouth and purchase intention by adopting Structural Equation Model (SEM). This study also evaluates the moderating effect of product involvement and brand image on the relationship between electronic word of mouth and purchase intention. The research results indicate that, first of all, consumers who feel uncertainty toward the product tend to search for the online comments. Viewing online comments is helpful for consumers because it can make consumers feel more confident on purchase decision. Comments that are clear, logical and persuasive, with sufficient reasons based on specific facts about the product, have a strong positive effect on the purchase intention. Most importantly, this study finds a moderation effect of product involvement and brand image on the relationship between electronic word of mouth and purchase intention

This study makes several practical contributions. The major results emphasize the importance of properly managing online consumer reviews. Since online word of mouth function both as informants and recommenders, they can be used strategically as a communication channel. For example, online sellers can provide a review format that enables reviewers to post high-quality reviews focusing on the informant role of online consumer reviews (providing user-oriented information to improve consumers' understanding of a product). Furthermore, this research brings several new insights for corporations to use electronic word of mouth as part of their strategic marketing campaign in gaining new consumers and holding onto the ones they already have.

Mitchell (2001) stated that people to people communication is indeed more relevant than traditional marketing. Communication brings forth exchange of goods, ideas, opinions and other information. More importantly, communication is able to help people form relationships that include "ties of loyalty and feelings of obligation", as well developing supportive ties with other people. Peppers and Rogers (2000) proposed that knowledge can build relationships between a firm and its customers, and when a customer volunteers information, it is the firm's duty to act upon this information. While Selnes and Sallis (2003), identified relationship learning as a vital way to create differential advantage for the firm. Corporate blogs or online spaces can develop this awareness to their advantage, by providing factual information and encouraging consumer to consumer knowledge exchange, marketers would

be able to get real time feedback from their consumers, thus building customer loyalty and generating sales (Senecal and Nantel, 2004; Goldsmith and Horowitz, 2006). As Scoble and Israel (2006) said, electronic word of mouth as a marketing tool can also help leverage the competitive advantages of small businesses, enabling them to compete among the more established enterprises. Electronic word of mouth can significantly influence consumer behavior, so marketers should not ignore the proliferation of online consumer-to-consumer communication. In all of this, marketers need to remember that electronic word of mouth is consumer-generated and, in principle at least, marketers are on the sidelines. As Brown has pointed out (Brown et al. 2007), marketers need to be aware of the risks involved in attempting to influence electronic word of mouth.

ABSTRACT

Purpose: *To analyze problematic aspects related with the practical approaches of Internet of Things (IoT).*
Design/methodology/approach: *The article discusses problematic issues related with the IoT from various angles. The debates concerning IoT and its possible application fields continue for more than ten years. While the technological framework is created there are many challenges in the field concerning technological, legal and social perspectives. In this article we analyze the application issues related with the IoT. The topic is examined by different authors from narrow views thus lacking the big picture of global technology potential. The objectives of this paper are to overview and analyze the holistic approach towards the application fields of IoT in order to highlight strengths and weaknesses which come with the technology.*
Theoretical findings: *The necessity for web-based services is increasing along with the technological gadgets which support them. Applying things, which are connected in networks, could revolutionize many industry and service sectors thus creating new service provisions and administration methods based on information technology. Practical cases show that the applicability potential for IoT is wide; however, standardization, legal regulation and usability problems approach while the IoT solutions are advancing technologically and its potential market share increases. These issues should be taken into consideration while seeking for better balance among different sectors where the impact of IoT will be most significant.*
Research limitations / implications *– There are few comprehensive studies and projects which emphasize on benefits of IoT. Despite that, the usage of the technology will have its negative effects. It is only the matter of time when next generation networks will create systems which may be too sluggish for effective maintenance or architectural changes. Moreover, the area for application of IoT is so wide that the threats are hard to identify. Because of that it is possible to review the topics only focusing on narrow, but most comprehensively analyzed spectrum of problematic issues.*
Practical implications *– Theoretical framework for future research in the field was developed.*

Keywords: internet of things, internet of services, future internet
Research type: conceptual paper

INTRODUCTION

It took less than twenty years for internet to become one of the most valuable information gathering channel and a gate for new business models all over the world. Not many understood the mass and significance of this technology at the beginning but it is now clear that internet is one of the most important inventions, which transformed the understanding about information, communication and data exchange. While the quality and speed of the internet based services is improving steady, the possible internet evolution questions arise. One of the most probable steps for the next generation internet based service is the Internet of Things (IoT). The main idea of the IoT is circling around a connected network or networks in which things and other sensor-based objects communicate with each other. The ability to integrate small, energetically efficient and cheap sensor based objects into clouds of networks would cause the new business and service models and would expand beyond the human-machine interaction approach which is most frequently used in internet-based environments. The grid of "smart" objects connected together is a conception which may be dated back to 1991 with Mark Weiser's idea of ubiquitous computing (Weiser, 1991). Later on he developed the idea and predicted that the IoT objects will communicate without direct human interaction and will use the specific protocols and communication channels. The usage practices of IoT are not widespread at the moment, but the advances in wireless networking technology, price drop and further standardization of communication protocols is facilitating the process. However, the enthusiasm related with the possibilities of IoT is more based on future predictions then an actual spread at the moment. According to Thomson Reuters (2012): "Rogers Communications Inc , Canada's largest wireless company, says the "Internet of things" - fridges that write shopping lists and smoke alarms that send text messages - will be a C$400 million ($384 million) market in Canada by 2015 and that it wants a significant share". It seems like the IoT is at the doorstep and the major players in the market are trying to keep pace with one of the most promising technologies. On the one hand starting the competition in the newly established business branch enables the company to quickly react to emerging changes and to keep up with the technological base, on the other hand there are few main issues related with the development of IoT technology that should be seriously reconsidered before stepping into this area.

The firs problematic issue is related with the core element of every technology that is made – the user. The final target of and the determinant factor of any innovations is the user who is able to operate and willing to pay for the technology. The rational arguments about life facilitating features and wide opportunities of IoT may be not heard by the end-user if he would not understand the potential and possible benefits from the technology. The user experience and engagement elements are the key components for the success of IoT.

The second issue is the overall cost of the technology. And it is not just the price of the sensors, but also and infrastructure or business solutions as a whole. The internet - main framework for the sensor based objects together the Radio-Frequency Identification (RFID) microchips enable the IoT implementation. But the lack of standardization agreements is stopping the development while the legal and technical questions, related to data gathering and privacy protection arise. The sensor grid needs to reflect physical world and create a cheap and efficient information channel which could be easily accessed with certain type of controllers. The user interface network control application as well as the price and efficiency solutions will determine how easily IoT will find a way to homes and offices.

The last problematic issue comes from legal and ethical field and relates with the data protection and privacy control questions. It is clear that quantities of data which are processed by sensor based objects are massive. The potential value for this type of information is undeniable and is closely related with the most popular application fields for the IoT. RFID – the most popular technological realization of IoT – makes it possible to harvest a wide array of new data types, enabling data mining to predict consumer behavior and monitor other aspects of the physical environment (Winter, 2012). The data about consumer actions may be used by business structures for various purposes and in some cases the final user may not feel pleased if his heart performance data would go to health insurance office which may modify the contract conditions according to the newly obtained information. Preparation of clear privacy policies should be one of the main concerns while examining the issue.

In this article authors discuss and analyze these topics and try to answer the question: "is the IoT the revolutionary technology of tomorrow or is it the overrated technology of today?" The field of IoT is examined by many authors from even more different perspectives. However, the wide and globally usable network of things is still more a conception than the reality. Countries, even regions are competing in this area, because the success of applying the IoT may result an economic wellbeing for those who will be the first and most efficient in the field. Knowing the strengths and weaknesses of the technology opens the ways for solutions and innovations which will be definitely needed in the forthcoming age of IoT.

Internet of things – from the concept to the practice

The term "internet of things" was introduced by MIT Auto-ID Center, which later evolved into organization named EPCglobal. Radio-frequency identification (RFID) chips are used as the backbone of the IoT because of its ability to track a large number of uniquely identifiable objects with the use of Electronic Product Codes (EPC) (Aggarwal, Ashish, Sheth, 2013). Using unique addressing schemes, objects bearing RFID tags are able to interact and cooperate with other objects or detect alterations in their surroundings. RFID is the technological solution of how smart cooperative environment may be organized at the current technological advancement level. The possibilities concerning IoT are even broader. Internet of Services (IoS), 3D Internet, Internet of Content, are only few names of the technologies, which should be considered as a linked parts of the future internet (Haller, Karnouskos, Schroth, 2009). The IoS describes an infrastructure that uses the Internet as a medium for offering and selling services (Cardos, Voigt, Winkler, 2009). Service-oriented Architectures (SOA) and Web services will mainly serve as technological solutions that enable enterprise functionality to be made available to users as shared and re-usable services on a network (Curbera, M. Duftler, R. Khalaf, et al, 2002). With the help of the IoT, the IoS gains more significance and possible solutions for personalization and customization of a service. But IoS represents only one of the layers supported by IoT. These areas overlap, and it is hard distinct them by certain parameters. According to Information Society Technologies Advisory Group (2008), over the last decade, the service sector has become the biggest and fastest-growing business sector in the world and employs most people worldwide. The additional application of ICT solutions may help to expand this area even more, and with the help of IoT the next – generation services become possible, thus giving the boost for IoS. Moreover, if the IoT technology will succeed and find its way towards business and personal use, the snowball effect may occur in related industry sectors. However, it is not an easy task, because technological and social development (need for technology) was not fast (or smooth)

enough during last 20 years. Although the idea of cooperative objects may seem tempting, there are still some unfulfilled fields compared to the early vision of ubiquitous computing. Back in 1991, Weiser predicted, that "ubiquitous computing will enable nothing fundamentally new, but by making everything faster and easier to do, with less strain and mental gymnastics, it will transform what is apparently possible". In later publication Weiser (1993) states: "the challenge is to create a new kind of relationship of people to computers, one in which the computer would have to take the lead in becoming vastly better at getting out of the way so people could just go about their lives". The main idea was to minimize the necessity of human - computer interaction in daily activities by ensuring the smooth and constant data flow from sensor based devices to the processing and control units. All of these activities should have been invisible to human eye thus creating a "calm integrated world". Weiser believed, that over next 20 years "ubiquitous computing will gradually emerge as the dominant mode of computer access". According to the early predictions, at the moment we should be surrounded by smart things which would exchange data among each other, with only small pieces of information visible to humans through user interface modules. So why do we not share calm environments after more than 20 years of progress? First of all, not all scientists agree with the idea of cooperative surroundings which relieves human beings from their mental and physical stress. Rogers (2006) claim that ubiquitous computing (ubicomp) technologies should be viewed as a key to enhanced learning, and contribute to the development of human intellect through creativity stimulation and better decision making. While Gaver (2006) sees object interaction as an environment for exploration and curiosity exercise by applying principles of gamification.

The real world structures and systems may seem al lot more complicated then the computerized model and it is hardly possible to represent the full scale of the environmental processes. At some sense the Weiser's vision is implemented in nowadays world. Smart houses, RFID tags in the product lines, environment aware cars, robots and other machinery show that technologically it is possible to implement the vision. However, Cáceres and Friday (2012) note that "there are nascent building blocks of the ubicomp visions that hint at the more tractable problems and help us identify the many challenges that stubbornly remain". Authors emphasize on world complexity problems, data transmission and security issues, technical aspects of ubiquitous computing. Despite all of these concerns the popularity of cloud computing and price decrease of sensory devices makes IoT one of the most perspective technologies of near future. Its influence will possibly be visible starting from international stage and ending with separate business sectors or individuals (figure 1).

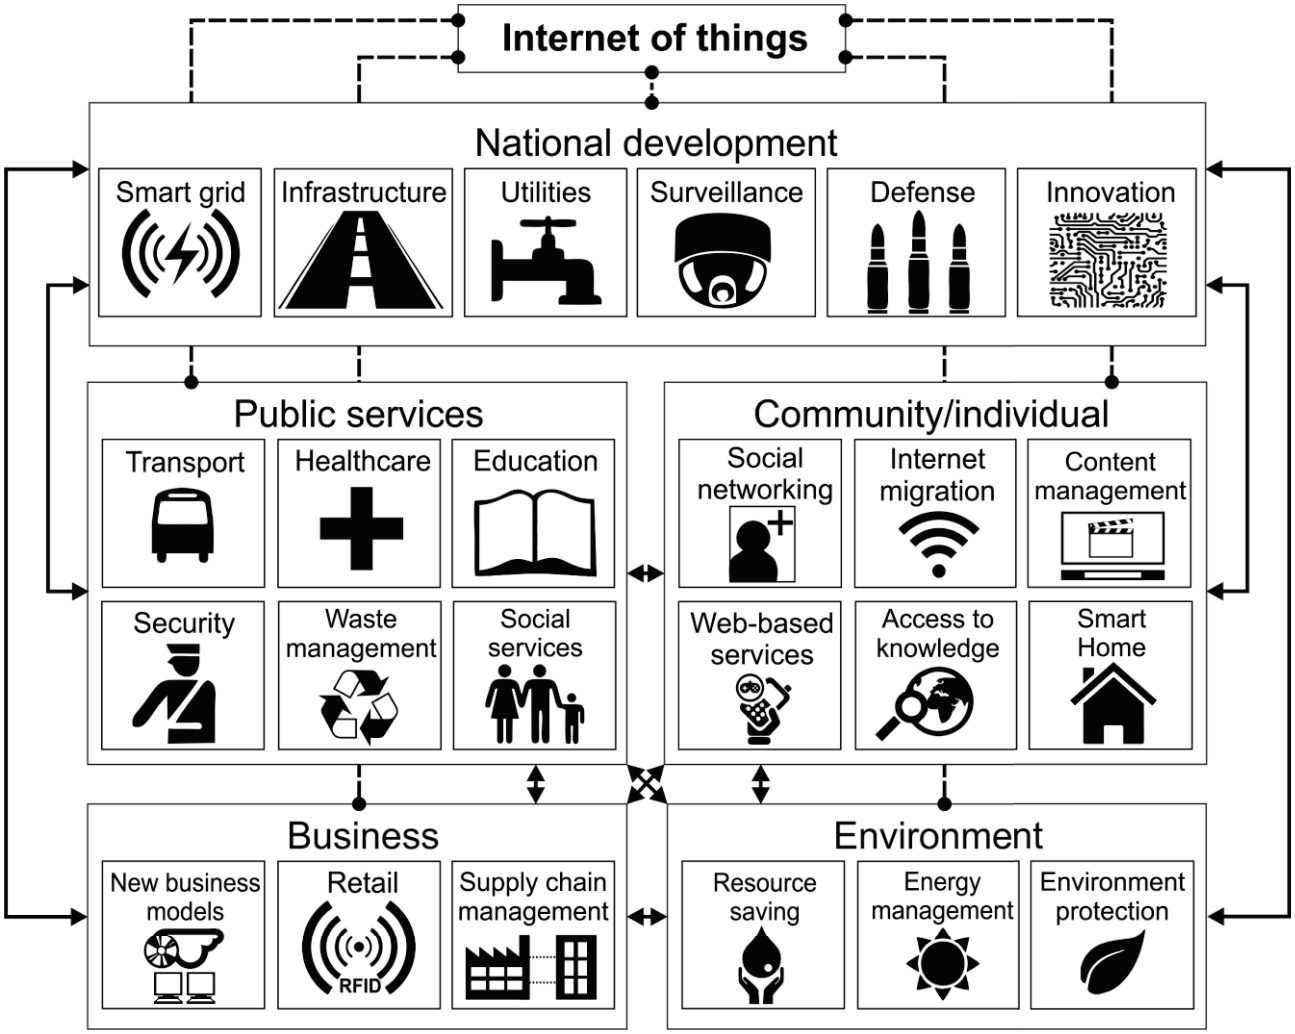

Figure 1. The impact of IoT to national development and related sectors

Looking from national perspective, the IoT may influence the infrastructure development directions. The coverage, speed and quality of telecommunication infrastructure are crucial for the IoT. By supporting or investing into ICT sector, countries may boost the other related industries or increase the living standards of individual households. The IoT technology may help optimizing resource usage, improve surveillance and defense systems and open new possibilities for innovation in associated fields. Grimes, Ren and Stevens (2009) note that better internet infrastructure has the positive impact towards the productivity of the firm. West (2010) supports the idea by concluding that: “high-speed broadband facilitates the adoption of remote wireless health monitors, GIS mapping, social media, distance learning, smart energy grids, file-sharing, and video conferencing”. The investment to the internet infrastructure and communication sector allows faster and smoother flow of information. The counties are competing on statistical numbers in the area of internet penetration, broadband connection rate, user count who works on the internet on daily bases and ect. This trend will be more significant when IoT will gain its momentum. While the internet penetration rates mostly affect people who are directly using the technology, the IoT may have an influence in a much broader scale, where the end users may be not aware of its presence. The European Commission is decided to implement its IoT policy for supporting an economic revival and

providing better life to its citizens, and it financed several IoT research projects as part of the 7th Framework Programme on European Research (CERP IoT, 2010). While going deeper into subject, scientists reveal the weak spots of the IoT conception. On the April 12th of 2012 European commission issued a press release named "Digital Agenda: Commission consults on rules for wirelessly connected devices - the Internet of Things". The Commission is seeking to get the opinions from interested parties on "privacy, safety and security, security of critical IoT supported infrastructure, ethics, interoperability, governance and standards" in the context of IoT (ibid). On the summer of 2013 Commission is planning to present the recommendation of IoT in which problematic questions will be examined more directly. Until then it is clear that the legal, ethical and social issues are none of the less important than the technological barriers and that the countermeasures against the negative effects of IoT should be considered seriously. At the end, the idea of "calm integrated world" seems reachable and possible in nearly future. The problem is, that current evolution of the technologies is not fast and smooth enough in order to create unified network (or networks) of "smart" things, which would revolutionize the way people live. It may take a lot more time to fully develop the IoT than Weiser predicted, because technological nuances reflect only one side of the deal, and the flipside may be not as appealing for the end users, together with its challenges and transformations which may be not too desirable at the moment.

The technological background for Internet of Things

Wireless technologies allow fast and quality information exchange and one of the first inventions which enabled this type of communication was the radio. Radio has been along with us for some time and the reduction of its price, energy consumption and size created new application opportunities in the area of IoT. RFID technology is a major breakthrough in the embedded communication paradigm which enables design of microchips for wireless data communication (Gubbi, Buyya, Marusic, Palaniswamia, 2012). The IoT is partly inspired by the success of RFID technology. RFID tag is a "smart" device equipped with an electronic chip and an antenna. RFID reader interacts with the tag and sends a signal to someone for further elaboration. RFID-enabled system will interpret the data and take actions according to situation. Radio Science and related Technology, represented by tag, makes the physical object an energy consumer, because RFID technology uses energy alimented active tags, or some energy is applied to the passive tags in order to ask them to activate the sending of data (Simonov, Zich, Mazzitelli, 2008). These microchips are widely used in retail businesses, supply and manufacturing chains, animal tracking or logistics. Embedded intelligence can further enhance the power of the IoT by devolving information and knowledge processing capabilities to the edges of the network (ibid). In the near future the application domains may expand towards healthcare, environment mapping or automotive solutions. However, there are few issues related with the application of RFID. First of all, the RFID device must have a unique identification method, which would allow distinguishing it from the millions of other objects. The EPC network may serve the purpose, but it is not the only standard. In Japan, the unicode is gaining popularity, and other groups propose to use IPv6 addresses for this purpose, there are also specific devices which are not mapped to EPC (Haller, et al, 2009). According to Vermesan, Friess, Guillemin, Gusmeroli, ... Doody, (2011) the open standards are key enablers for the success of wireless communication technologies. Without global recognized standards the expansion of RFID and IoT solutions cannot reach a global scale.

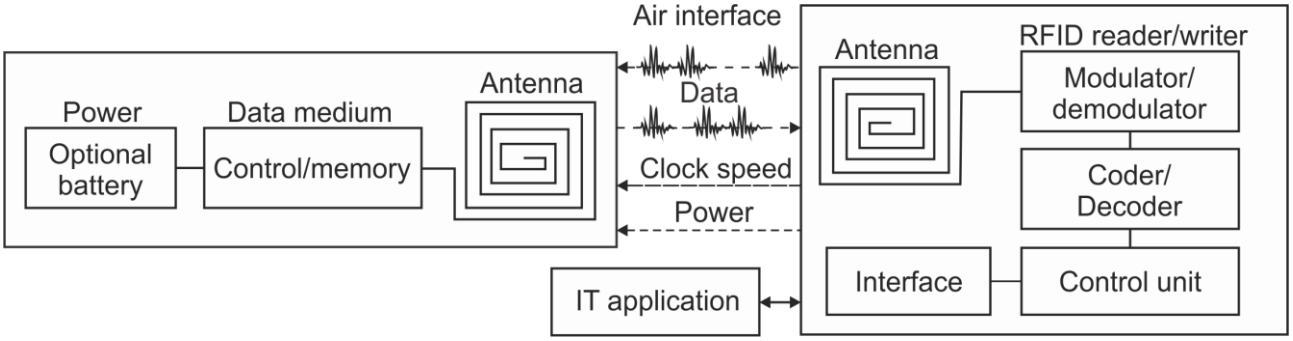

Figure 2. The working principle of RFID

This problem is common to all wide-used technological innovation and is real challenge for industrial and government bodies. Standardization has been sluggish, impacting large-scale commercial deployment of related services. Fortunately, companies are beginning to prioritize standardization (Zhihao, Yongfeng 2010). The EU is trying to move towards in order to apply IoT standards that cover multiple layers including technology, operation, and services. Standardization could reduce the costs of the technology and ensure availability to consumers which are one of the key elements in the field.

RFID standardization may be considered as a case of a good practice and as success, mostly thanks to the efforts of former Auto-ID center (now EPC Global), however, applying standards to the industry of robotics or nanotechnology is a complicated matter (ITU Internet Reports 2005).

RFID still stands at the forefront of the technologies driving the vision. This is a consequence of the RFID maturity, low cost, and strong support from the business community. However, they state that a wide portfolio of device, network, and service technologies will eventually build up the IoT. Near Field Communications (NFC) and Wireless Sensor and Actuator Networks (WSAN) together with RFID are recognized as the components which will link physical and virtual worlds (Atzori, et al., 2010). The EU sees RFID as one of the main technologies which better empower the calm digital environments, compared to the bar codes or magnetic tapes. In the EU vision, the concept of Digital Territory is an ambient layer of connectivity over Europe in order to deliver real-time services to citizens and RFID is seen as the glue to this wireless spectrum (Kranenburg, 2007). However the usage of the tags has its flaws and these negative aspects are mainly related with the legal and ethical issues concerning the data storage and usage. The sensor devices generate a large amount of information which must be transmitted, processed and reacted to. The environment generates data all the time and it is practically impossible to track the entire spectrum. The algorithms which support the data collection and processing should be “intelligent” enough in order to make sense from the data. State-of-the-art non-linear, temporal machine learning methods based on evolutionary algorithms, genetic algorithms, neural networks, and other artificial intelligence techniques are necessary to achieve automated decision making (Gubbi, et al., 2012) in the areas like automation, environmental control or waste disposal. The other challenging issue is related with the origin and usage of the data. This is the area where legal, ethical and technological nuances come into actions and different regulation rules in separate regions may affect the IoT’s positions in future market.

Privacy and data protection concerns

In the EU policy framework for RFID (2007) it is stated that application of RFID must be socially and politically acceptable, ethically admissible and legally allowable. RFID will only be able to deliver its numerous economic and societal benefits if effective guarantees are in place on data protection, privacy and the associated ethical dimensions that lie at the heart of the debate on the public acceptance of RFID. It is also noted that databases in which private data are stored should comply with neutrality and neutrality requirements. The report, "Internet of Things – an action plan for Europe" (2009), proposes 14 action points, including work on the policy governance of RFID, continuous monitoring of the privacy and data security issues arising, action over the recycling of the potentially vast number of smart chips and cards, and pan-European standards work. The right to silence a RFID chip may sound the most controversial. It gives the additional responsibilities to the industry, but the idea itself aims to limit the approach towards data to the third parties. This enables the better control of information stream and may raise the trust in the IoT sector. The question is especially important when speaking about sensitive personal data. Healthcare sector shows one of the biggest potentials for the IoT, however it is also one of the risky ones from the personal data protection perspective. It is possible to implant a microchip which would track the vital body parameters. On the one hand, this type of information is useful to the medical personnel and for the data subject. On the other hand, the leakage of the data to the third parties may result a conflicting situations. For example, health insurance companies could manipulate the terms and conditions in the health insurance contracts, advertisers may try to sell the medicine or other products to the people, who have problems with their health. According to Directive 95/46/EC of the European Parliament and of the Council, data associated with human health are considered as sensitive. It means that usage of technologies create many more legal and ethical questions which need to be answered. In the International Telecommunication Union report for the IoT (2005) it is stated that protecting privacy must not be limited to technical solutions, but encompass regulatory, market-based and socio-ethical considerations. Unless there are concerted efforts involving all government, civil society and private sector players to protect these values, the development of the IoT will be hampered if not prevented. Winters (2012) highlighted six main conflicts with novel practices related to the internet of things. But the most significant ones are related to location data, health data and identity data. Some applications used in smartphones track the location coordinates of the phone. The "smart" object may as well have this functionality and if the IoT grid has a wide coverage it is possible to track a person and his actions. The data may be used in marketing purposes or for illegal surveillance. So the ability to "hide" one's movement or activities should be available in these types of devices, because the tracking object may not always want to reveal its location to the third parties. The second issue is related with the health data problems, which were discussed earlier in the paper. Thirdly, the identity data (including biometric information) helps to determine who the person is, what he does and how he behaves. This type of information varies from sensitive to insignificant, however, the ability to collect identity dada at significantly low cost allow businesses to perform faster and more precise business intelligence actions. The end user does not necessary want to be recognized for his habits or behavior and the privacy policies legal regulation updates solve problem only partially. It is expected that attacks on privacy will become more popular with the growth of the IoT, since an increasing number of personal items will be reachable for queries and intrusions (Radomirović, 2010). So the cyber criminal activities may also appear more often. The privacy protection issues cannot be solved that all interested parties would be happy. The

stricter the regulation model is, the harder financial and management burden lays on the shoulders of the business. While on the opposite, business structure gain tons of valuable data, but customers are annoyed by target marketing complains or personalized advertisements. Moreover, the criminal elements may have a better access to information due to the IoT networks, so there is no simple solution to this issue. It is clear that the regions which try to regulate the IoT field in the context of privacy and data protection are a bit late, because the technology evolves a lot faster than the social norms. The win-win situation is hardly possible when the privacy issues and the development of IoT collide. The most likely regulatory mechanism will sacrifice something from the both sides, but while it's done on the national or regional level, the results may be unsatisfactory in the global scale.

Challenges and opportunities related to business and end-users

While there are many optimistic predictions towards implementing IoT, technical, social, legal and ethical questions are considered a challenging issue. Business, individuals and society are the main pillars on which IoT is based upon. Business is looking for the new opportunities in order to improve productivity and gain competitive advantage. The ICT sector plays an important role in the field and IoT, as one of the most intriguing technologies which may help reducing operation cost and improve resource management. Secondly, business companies are trying to sell more of their products according to customers' needs, expectations and wishes. Environment aware object may become the trending technology of the near future if leading ICT companies will decide to use it as a marketing tool in the fight for customers' pockets. Back in 2005 few would have thought that the phone with a touch screen and a price of a computer will be number one on the wish list. The same situation is with other "smart" devices. Seven years ago nobody cared about a smartphones, because there were no such things on the market, at least in a larger scale. Apple was not the first company which entered the smartphone industry, yet with a refreshing design and many innovations, Apple's iPhone quickly made inroads in the market (Lin, Ye, 2009). Wise marketing moves made by Apple created an army of loyal users who were attracted to something that was not even present a few years ago. The same scenario fits to the tablets. Figure 3 shows Google search trends from 2007 till 2013. The search phrases like "smartphone" or "tablet" compared to each other show an increase of query activity on Google search engine starting from 2010, while on 2007 it was rather low. The comparison of "smartphone" and "Internet of things" phrases show that the second query phrase is almost nonexistent. And it's not because the technology seems too futuristic or not interesting to the masses. The reason for these results comes from the fact, that IoT is more of a conception than a widely accepted phenomenon. Secondly, ICT companies do not push the IoT as a marketing brand.

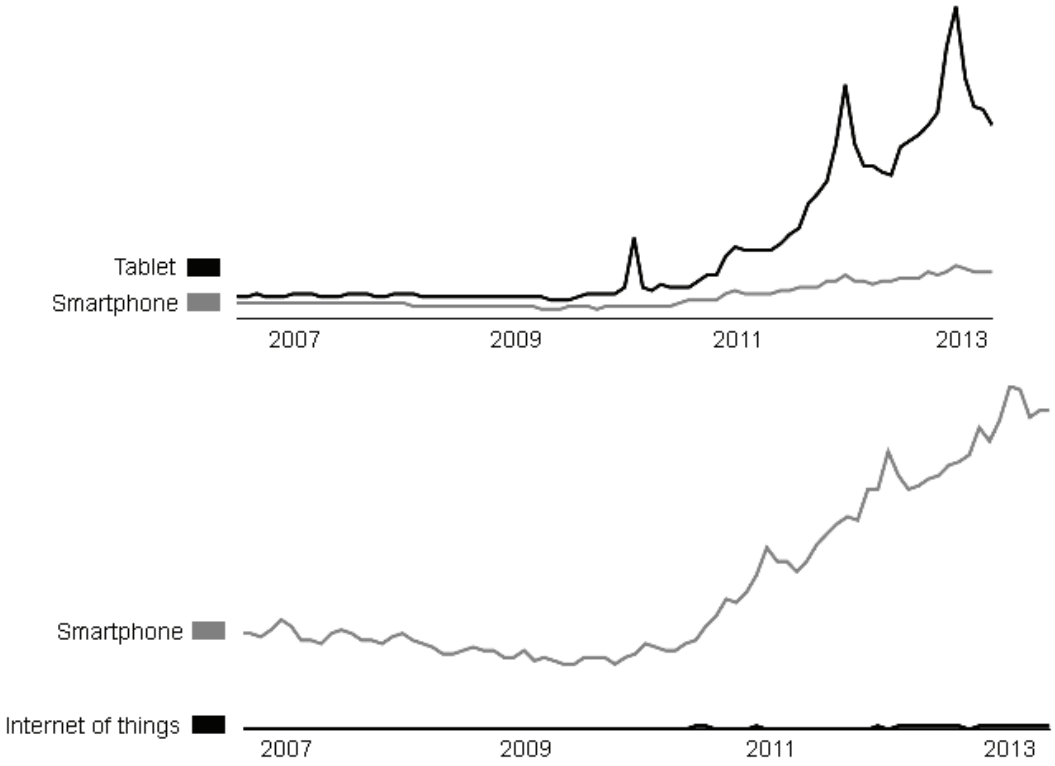

Figure 3. Google search trends since 2007. Keywords: tablet, smartphone, internet of things.

However, the comparison of more related terms like "internet of things, web of objects or ubiquitous computing" shows that the interest towards IoT is growing. It is obvious that Google search keywords related with the IoT cannot compete with popular names of "smart" gadgets. But the Figure 4 show that in some sense, the search trends reflect the social acceptability of the IoT technology as consumers look for more data about various topics of interest (Gubbi, et al., 2012). In order to apply the technology in the larger scale it is necessary that big players of the ICT market would convince the buyers that they are in need of intelligent environments together with the IoT.

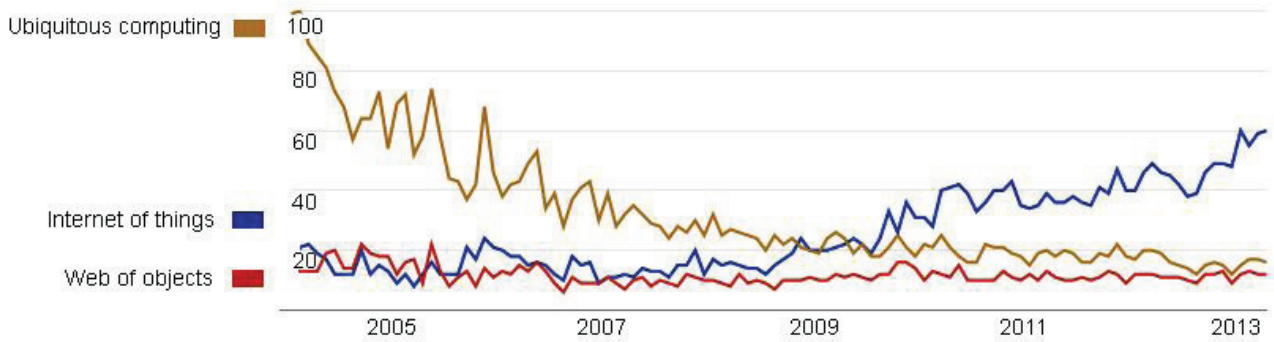

Figure 4. Google search trends since 2005. Keywords: ubiquitous Computing, internet of things, web of objects.

But convincing is only one part of the deal. Business subjects can create a market for the new product if the time is right and the offer is good. The hardest part is to keep the clients interested into product. Firstly, the smartphones and tablets own an entire set of digital products and solutions which makes them an attractive choice, plus they have a well-polished purpose and business model behind them. In the case of IoT all of these elements are lacking. Secondly, the IoT technology is less visible to the naked eye and the changes which it brings may be not so obvious for the end user. It seems like the IoT success is more dependant from business needs and expectations rather than regular user. According to Haller et al (2009), due to the rapid advances in the embedded systems domain, the manufacturing domain is undergoing significant changes as ubiquitous computing is applied to the shop floor. An entirely new dynamic network of cooperating devices can be created which effectively shows that the IoT can reshape the manufacturing domain". Moreover, the tracking of objects in the supply chain during the manufacturing process allows ensuring smoother operations. Real-time information processing technology based on RFID and near field communication (NFC) can realize real-time monitoring of almost every link of the supply chain (Atzori, Iera, Morabito, 2010). So the segment which will gain most out of IoT is the business organizations.

Business sector will be the most important piece on the board when speaking about application of IoT technology. However, at the moment the end-users are not too interested in the topic. European Union is trying to introduce the positive effects and potential areas of interest while publishing the roadmaps, communication plans and press releases (IoT – Strategic Research Roadmap, 2009), but none of these measures will give a significant effect unless the business structures will create new products and services, based on IoT technology. Moreover, these inventions must be presented in the appropriate light and create a real additional value to the end-user or society.

DISCUSSION AND CONCLUSIONS

The IoT is a technology which has truly great potential in improving business productivity, the well-being of individuals or the development of the state. While the first insights, concerning the creation of "calm integrated world" were rather optimistic, it is clear that advantages of the IoT do not come without a price. The technological background is there and governmental policies support the development of "smart" networks. The cost of the IoT infrastructure now seems acceptable, but technological penetration is relatively low. There are some problematic aspects down in the technological field, like the lack of standardization, data transmission, processing and management, middleware problems and system security issues. The next level questions are related with the privacy and data protection concerns. When the sensory objects collect such huge amount of data, or these data have an especial value, are sensitive or may be tampered by the criminal elements – it becomes a really hard equation for the state officials and privacy policy makers to put a balance between the technological progress and the fundamental human rights. But at the final end is the created value for the business subjects and the end-users. Though the optimism around the IoT is not lacking, the masses of the regular users do not seem too interested in the near future technology. Their attention is attracted by the big ICT market players advertising campaigns of other "smart" devices, which are more visible, sensible and understandable. The companies of ICT market have a strongest positions and responsibilities in the field of IoT. Firstly, they get the biggest additional value from the improved supply chain management,

logistic process optimization or object tracking. Secondly, they control the assets which could convince the end-user to accept the innovations related to the IoT. The price, business models and support products or services should also be the priority. So, is the IoT the revolution of tomorrow or the overrated technology of today? The answer lies somewhere in-between these statements. It is hardly possible that many interconnected sectors would apply the IoT in the nearest future. Sometimes development of technology comes chaotic and sometimes the little boost may break the dam, but in this case the nudge should be global and all of the interested parties should be prepared for the emerging changes. Is the technology overrated? No, it is not. But the application fields are so broad and the experience in the IoT is so fragmented, that the utopian scenario of "calm integrated world" will have to wait, maybe, not for too long. So the research on problems and challenges in technological, legal and social areas should be emphasized in order to better prepare for the upcoming era of IoT.

THE BUILDING BLOCKS OF CONSULTING SERVICE EXCELLENCE

Adeline A. Pacia, Assistant Professor, Department of Industrial Engineering and Operations Research, University of the Philippines Diliman

ABSTRACT

Purpose: *The objective of the study was to identify and address areas that will contribute to the competitive strategy of the service delivery group of a Knowledge Process Outsourcing (KPO) company whose business is focused mainly on the sales and implementation of Enterprise Resource Planning (ERP) solutions.*
Design/methodology/approach: *The DMAIC methodology was used in the study: Define, Measure, Analyze, Improve and Control.*
Findings: *For the company to be competitive, seven* ***Building Blocks of Consulting Service Excellence*** *were proposed: (a)* ***Competency Framework*** *which provides a guide for consultants in identifying key competencies needed to ensure high quality consulting service and career growth; (b)* ***Implementation Methodology*** *which serves as a guide for consultants in identifying key competencies needed to ensure high quality consulting service and career growth; (c)* ***Solution Offerings and Value Proposition*** *which are productized solutions specific to an industry or business process; (d)* ***Human Resource Development*** *which programs the skills development and career growth of the consultants; (e)* ***Organization and Management*** *which covers the organizational structure and management team needed to ensure smooth delivery of the service; (f)* ***Infrastructure Support*** *which includes hardware and software platform; and (g)* ***Performance and Rewards*** *which provide a platform to ensure a motivated team committed to the company vision.*
Originality/value: *These Building Blocks provide a structure in ensuring an efficient Human Supply Chain – from personnel recruitment to human resource development to career transitions and retirement. As a Knowledge Process service provider, the quality of the company's employees is critical to both the success and key to its competitiveness, and the success of their partners and the clients it serves.*

Category: Conceptual Paper
Keywords: Performance Measurement and Management, Knowledge Management, Human Resource Management, Competitive Strategy, Quality Improvement and Management, Organizational Development

INTRODUCTION

Background of the Study

Knowledge Process Outsourcing (KPO) is now an emerging sector that promises to provide long-term jobs for intellectual, analytical and knowledgeable people with pay scales much higher than that offered in the business process outsourcing sector (Buban, 2013). KPO is defined as the "allocation of relatively high-level tasks to an outside organization or a different group in a different geographic location" (Investopedia, 2013).

A KPO company is a consulting service organization in which knowledge- and information-related work is carried out by workers in a different company or by a subsidiary of the same organization. This subsidiary may be in the same country or in an offshore location to save costs or other resources. Companies resort to KPO when they have a shortage of skilled professionals and have the opportunity to hire skilled workers earning lower wages in another location for a lower overall cost. KPO include long-term jobs for intellectual, analytical and knowledgeable people within industries such as research and development, financial consultancy and services, business and technical analysis among others (Investopedia, 2013).

An Enterprise Resource Planning (ERP) solution implementation company is an example of a KPO focused on IT consulting services. For an ERP solutions implementation company, strategy must go beyond simply improving efficiency.

Competitive strategy refers to how a company competes in a particular business. It is concerned with how a company can gain a competitive advantage through a distinctive of competing (Harvard Business School, n.d.). Competitive strategy should address areas of customer care, speed and quality. These will differentiate the company's service delivery from its competitors. The competitive strategies identified cover inputs, processes, outputs and the organizational development activities across these three.

Objective of the Study

The study aims to identify and address areas that will contribute to the competitive strategy of a KPO Company whose business is focused mainly on the sales and implementation of ERP solutions.

As an ERP solutions implementation company, the study took into consideration the different technologies and service offerings, the structures and accompanying policies for the service activities, and the organizational development plans to support and complement the different technologies. Initial implementationwas tested on the SAP Business Solution. It can be applied t other technology-enabledBusiness Solutions of an ERP solution implementation company.

Significance of the Study

Organizational Development (OD) is the process through which an organization designs, creates, and builds physical and logical structures and processes,that will link together and combine all the actual and potential resources that will enable it to perform its functions and deliver its mission. OD develops the internal capacity to be the most effective in its mission work and sustain itself over the long term (MMS Institute, 2013). Input from and collaboration with partner organizations and clients in the company's Organization Development initiatives will bring competitive advantage.

The value of this study is to provide a structure in ensuring that the physical and logical structures and processes of the company are in place. As a Knowledge Process service provider, it is imperative to institute an efficient Human Supply Chain – from personnel recruitment to human resource development to career transitions and retirement. The quality of its consultants/employees is critical to the success of the company and key to its competitiveness. A competency-based recruitment and selection process increases the success rate of personnel hiring, training and regularization to full-time employees. It also provides an objective process of selecting candidates for career advancement and promotions. Likewise, the support infrastructure needed to complement the Human Supply Chain is also identified and defined.

OPERATIONAL CHALLENGES

As a Knowledge Process Outsourcing company, its principal operations are highly dependent on human resources. The depth and breadth of the consultants' skills are critical inputs to the successful delivery of the company's services. The main challenge to a Knowledge Process Outsourcing company is ensuring a smooth and efficient Human Supply Chain and a strong support infrastructure.

Human Supply Chain

The following issues are symptomatic of the real problem on Human Supply Chain:

1. To optimize opportunities, consultants are sometimes sent to projects even without the proper skills training required for the project. Consultants are sometimes forced to learn on the job;
2. Consultants are shared among several projects without clear schedules and guidelines;
3. Consultants assigned to projects are sometimes asked to address *Application Support* issues of other projects as well;
4. The skilllevels of consultantsare not always aligned with the skills required in the delivery of the project;
5. Extended work hours of the consultants;
6. Re-work or back jobs that affect the project schedules;
7. High burn-out rate of consultants; and
8. High attrition rate.

Evaluating these symptomatic issues through the lessons learned in each project, the skills and process gaps identified were:

1. Lack of a structured assessment tool to identify the current competencies of the consultants and the gaps from what is needed by the project;
2. No concrete *Training Plan* to address the gaps in skill sets; and
3. Inadequate *Resource Loading* and *Resource Management*.

These problems can be addressed through the implementation of a *Competency Framework* and a clear *Human Resource Development Plan*. The *Competency Framework* identifies the key competencies required for the different roles and levels in the organization. It provides a tool to assess the individual's competency level and gaps in order to identify the necessary training to address the gaps. With a more accurate assessment of competencies and competency gaps, resource loading can be better planned and managed.

Support Infrastructure

The following issues are symptomatic of the problems on Support Infrastructure for an ERP Solutions Implementation company:

1. Inconsistency in the implementation processes among projects resulting to varying implementation timelines for similarly-scoped projects;
2. Frequent project implementation delays;
3. Delays sometimes due to lack of available equipment or delayed delivery of system infrastructure;
4. Similar projects are implemented from scratch because lessons learned from past projects are not acted upon to prevent the occurrence of past mistakes, which in turn makes project implementation vulnerable to and dependent on the skill level of the consultants;
5. Over-commitment of sales people on the project deliverables in order to make the sale;
6. Variable or reduced profit per project; and
7. Delayed billing and collection due to lack of triggers in the system and processes.

Evaluating these issues, the following possible gaps were identified:

1. Lack of structured project implementation methodology to ensure consistency and timeliness of process execution;
2. Opportunity to standardize solutions delivery offerings from lessons learned in previous implementations not maximized;
3. No clear performance assessment and rewards system to highly encourage quality and timely project implementations with managed customer expectations; and
4. Planning and forecasting for hardware and software requirements can be improved to ensure availability of support infrastructure in a timely manner.

These issues can be address by putting the support infrastructures in place. These would include the implementation methodology; standardized implementation packages for specific industries or business processes; packaged hardware, software and network components of the system architecture and the solution implementation team per solution offering.

THE BUILDING BLOCKS OF CONSULTING SERVICE EXCELLENCE

The study proposes the development of a competitive framework for an ERP Solutions Implementation company. Entitled ***"The Building Blocks of Consulting Service Excellence"***(Figure 1), it will cover the seven areas.

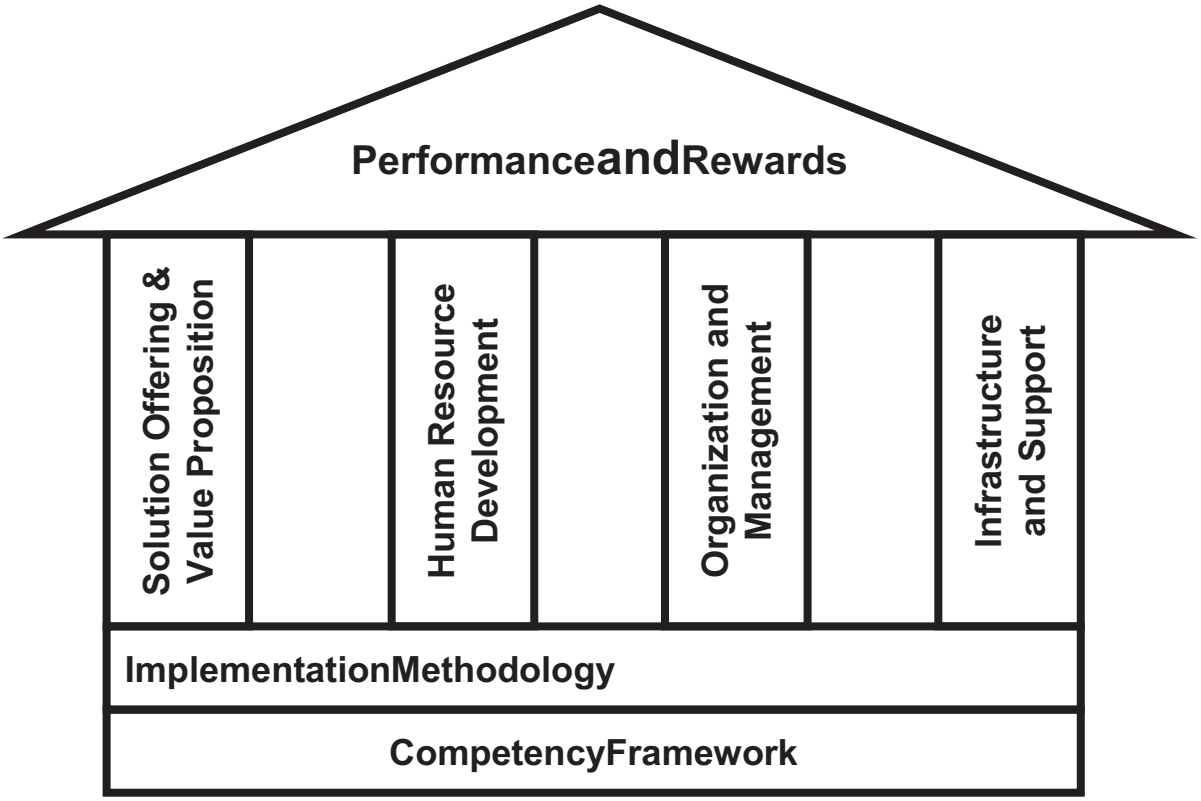

Figure 1. The Building Blocks of Consulting Service Excellence

Competency Framework

The Competency Framework is an approach to link company objectives to individual performance and should be part of the company's organization development initiative. This will provide a guide for the consultants in identifying key competencies needed to ensure high quality consulting service and career growth. This is a key component of the organizational development work needed to bring the consultants/employees to the skill level required to deliver quality service.

As the Competency Framework sits at the core of the program and lays the foundation of the Building Blocks and the entire infrastructure, it is the critical input to the processes and output of Competitive Strategy. Its principal operations are highly dependent on human resources. As a consulting company delivering process consulting, system implementation and support services

in partnership with their clients and their respective teams, their clients' own human resources are also critical in the success of company's service delivery. The depth and breadth of the consultants' and project team's skills are critical inputs to the successful delivery of the company's services. Thus, the Competency Framework will cover the following:

- Competency Framework Concept
- Competency Tracks
- Assessment and Upgrade Policies
- Cross-Track Assessment

The Competency Framework not only identifies the competencies within the process areas and functions across the implementation methodology, it also provides a structure to move up the competency ladder. The competency-based Performance Management and Career Development Programsupports and reinforces the Competency Framework. Its rationale is to take performance management a step forward towards increasing the competitiveness of the firm in terms of increased speed and high quality of service to its clients.

Human Resource Development

Organizational development to ensure high quality consultants will deliver high quality work output. This programs the skills development and proficiency needed to move from one level to the next and is tightly knit with the Competency Framework. Each training and certification requirement is a step forward to the next competency level.

- Training Plan
- Certification Requirements
- Career Development

Organization and Management

The organization should be set-up to ensure focus on customer service and customer care. It should be the consultants' top of mind to serve the customer with fast quality service. Teams will be identified to support identified solution sets and customer group. It includes the organizational structure and the management team needed to ensure smooth operations in the delivery of service.

- Organizational Chart
- Management Team
- Policies

Implementation Methodology

The company will develop its own implementation methodology that is an enhanced version of the standard methodology of the given technology. Picking up from all the lessons learned from past implementation experience, it will identify key differentiators to ensure a faster delivery cycle, higher quality service and client ownership of the system at the onset. This details the phases and activities and the corresponding deliverables and Quality Assurance checkpoints to

complete the implementation project from hand-over from Sales to Delivery and then hand-over to Support. The implementation methodology covers the processes to ensure a successful project implementation.

- Sales and Marketing
- Enterprise Solution Delivery
- Packaged Solution Delivery
- Post-implementation Application Support

Solution Offerings and Value Proposition

The focus of solution development efforts will be on productizing solutions specific to an industry or business process. Productization entails customizing the system to address specific needs of an industry, packaging the solution for proper sales and market positioning, setting up templates for fast and repeatable implementation success and ease of support after the implementation. This will ensure quality delivery from sales and marketing to delivery and support. It also covers corresponding pricing strategies for each set of solution offerings. The following are the strategic output from the technology (input) and the implementation Methodology (process):

- Solution Offerings
- Solution Map
- Industry Roadmaps

Infrastructure and Support

This identifies the strategic infrastructure support needed for product development, operational efficiencies, system and information security, knowledge management. This covers the support processes needed to efficiently deliver service, recognize and book revenue, and effectively collect payment when due. It also includes the hardware, software and network infrastructure needed to support the delivery team in their research and development activities and project implementation activities.

- System Development Landscape
- Production System Landscape
  - Internal Systems
  - Applications Support

Performance and Rewards

This provides a platform to ensure a motivated team committed to the company vision, goals and objectives and the individuals' self-fulfillment.

- Key Performance Indicators
- Upgrade, Promotion and Merit Increase Policies
- Other Recognition and Rewards

ADDRESING THE HUMAN SUPPLY CHAIN ISSUES

The main challenges of consulting companies lies in the human supply chain, from recruitment to development, career transitions and retirement. The key components of the proposed **Building Blocks of Consulting Service Excellence** addressing the human supply chain issues are *The Competency Framework* and *Human Resource Development*.Human Resource Development includes (1) Career Bands and Career Zones, (2) The Job Design and (3) the Training Plan.

The Competency Framework

The Competency Framework has been used by successful global consulting companies for many years. IBM and Accenture, two of the leading It Consulting companies and large global players, have been using the Competency Framework for over 12 years already.

The proposed general framework identifies the competencies for each function within the Implementation Methodology. It covers the competency requirements from Solution Sales to Solution Delivery to License Maintenance and Application Support Services. Four levels of competencies were defined (Figure 2).

The initial level defines the core competencies needed by the employee to be hired by the organization and which can be applicable across the different roles in the consulting organization. This includes communication skills and customer service orientation. The second level identifies the General Consulting Skills. This includes the skills needed to understand the client's business processes and their business requirements, and to discuss and present the analysis and recommendations to the client. These two sets of competencies form the **General Competencies** of the Competency Framework.

Figure 2. The Proposed Competency Framework

From the general competencies, the framework branches out to four (4) different process areas – **Sales and Marketing, Project Management, Technical skills, Application Support**. This covers the areas following the Service Delivery Methodology – from Sales to Delivery to Support.

Each process area will have their own set of competencies and share common competencies in their areas of intersection. The process starts with **Sales and Marketing**. Proper understanding of the solutions and their market positioning will help in setting expectations and proper scoping of the solution offering.

After the sales process, it is turned-over to the Project Managers for implementation. **Project Management** competencies will include managing the project, managing the account and managing all the stakeholders of the project.

The Project Managers will manage the Project Team composed of the **functional and technical consultants**. In order to properly manage the consultants, the Project Manager must have an understanding of the business processes and technologies to be deployed in the project. Likewise, the consultants must also have an overview of the Project Management Framework to help them understand the Key Performance Indicators (KPIs) of a successful project.

Once the project is completed, it is turned-over to **Application Support**. Application Support will share a lot of functional and technical competencies that the consultants have in implementing the project. As such, they will share the technical and application management tools available from the technology provider. Understanding and acquiring skills in using these tools will facilitate the early and successful resolution of the issues received by the Application Support Team.

As the baton is passed from Project Implementation to Application Support, the responsibility of managing the account is turned-over as well. Taking care of the customer's requirements and being present in the account translates to continued business with the client. Opportunities for additional business are then passed on to the Sales and Marketing process and the cycle is repeated.

On top of each track will be the **Leadership track**. This means that each area requires leadership qualities to move up the competency ladder and into the management track. All areas – Core Competencies, General Consulting Skills, Sales and Marketing, Project Management, Technical and Support will have its own set of competencies and will be presented with their own Job Designs. The Technical area, because of its scope, will expand to various tracks applicable to the clients' business processes. These tracks are Finance, In-bound Logistics, Out-bound Logistics, Manufacturing, Supplier Relationship Management, Human Capital Management, Analytics, Programming and Interfaces, System Administration, Industry Solutions and Supply Management.

All these competency areas taken together form the proposed Competency Framework for an ERP Solution Implementation company.

An example of the Competency Model for the Technical Track and Project Management track is shown in Figure 3 and 4 respectively.

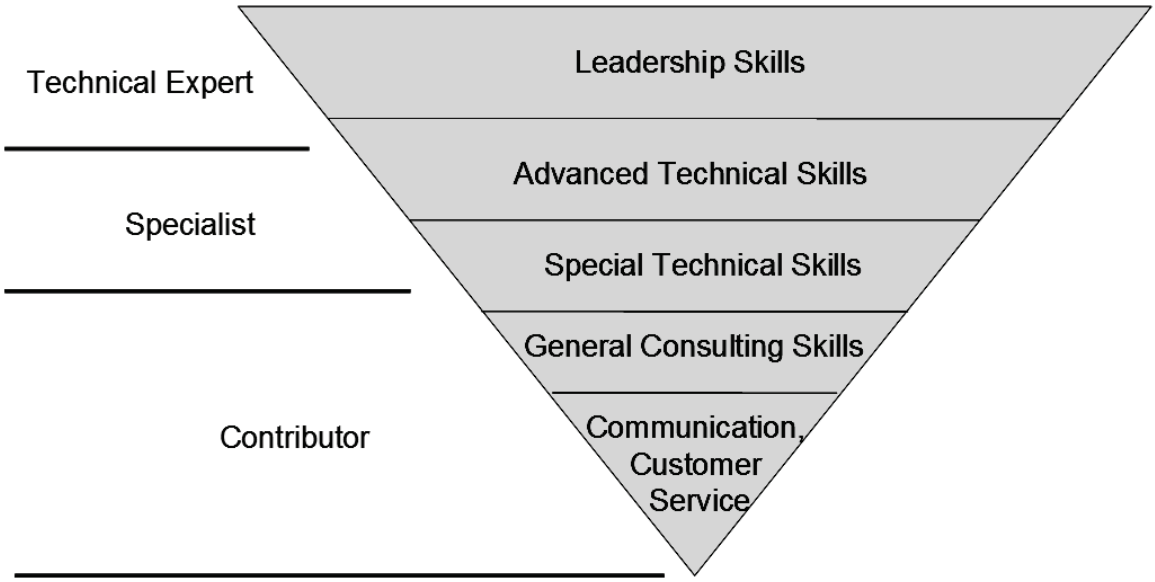

Figure 3. Technical Track Competency Model

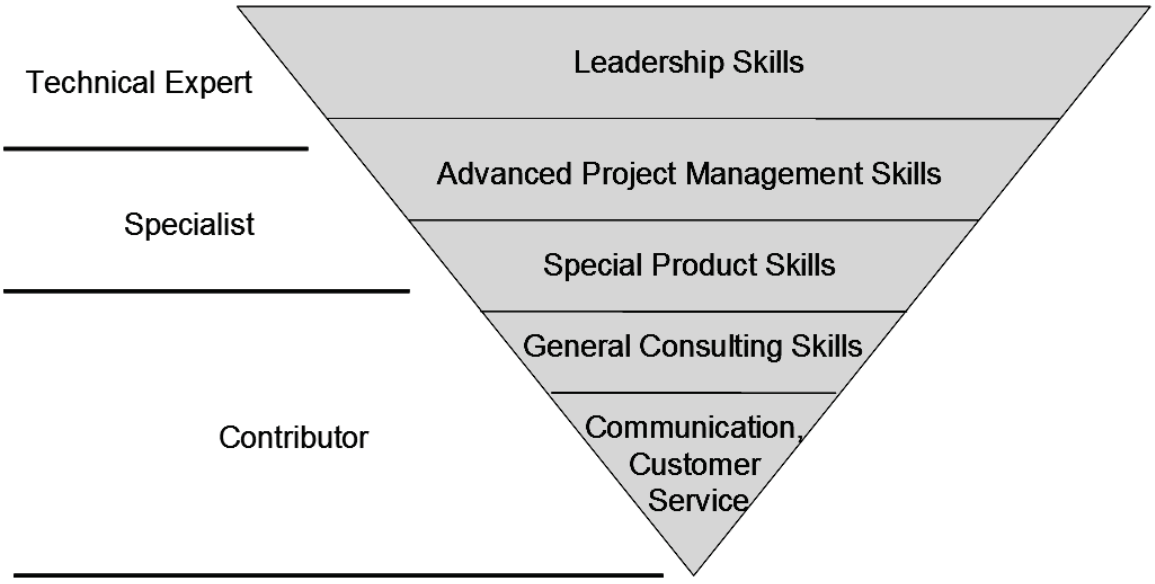

Figure 4. Project Management Competency Model

These Competency Models show the building blocks of skills development from Contributor level to Specialist and Technical Expert / Process Leader levels. It is depicted in an inverted triangle to show that the bigger weight falls under leadership skills. It emphasizes the importance of behavioral and leadership competency in the skills development and career growth of an employee as he moves from the basic communication and customer service skills to basic

technical skills to advanced technical skills until he takes on the leadership role of a track lead or process lead.

Career Bands and Career Zones

The Competency Framework not only identifies the competencies within the process areas and functions across the Implementation Methodology. It also provides a structure to move up the competency ladder. The competency-based Performance Management and Career Development Program supports and reinforces the Competency Framework. Its rationale is to take performance management a step forward towards increasing the competitiveness of the firm in terms of increased speed and high quality of service to its clients. This program allows the organization to:

- Develop Talents from Within
- Rationalize Investments
- Identify activities that target results, and
- Build for the future

The Career Development Guiding Principles:

- Prioritize career development activities that directly link to business objectives
- The training and development approach will utilize existing, new and innovative methodologies to deliver learning
- Staff development is crucial in building a pool of future leaders and specialists, as such, managers will be evaluated based on the development of their subordinates
- Reward people who welcome, seek and contribute in building their own and other employee's talents
- Provide employment security based on the individuals' performance and competencies, the business objectives and the organization's directions

Following the Guiding Principles above, the Career Development and Management Framework was formed (refer to Figure 5). It shows how the company's Mission and Vision statements are cascaded to respective objectives of a Business Unit and Functional area. Within each functional area, the process of staffing and selection is mapped across the performance management system. The components of performance management system include both the behavioral/leadership and the technical competencies and how it is translated to an individual's performance through the Key Performance Indicators (KPIs). This Competency Framework then serves as the backbone of the Career Development Program. With the identification of the competencies within each role or function in the organization, high potentials can be identified and developed faster. The corresponding pay scale can likewise be identified and aligned to the career path.

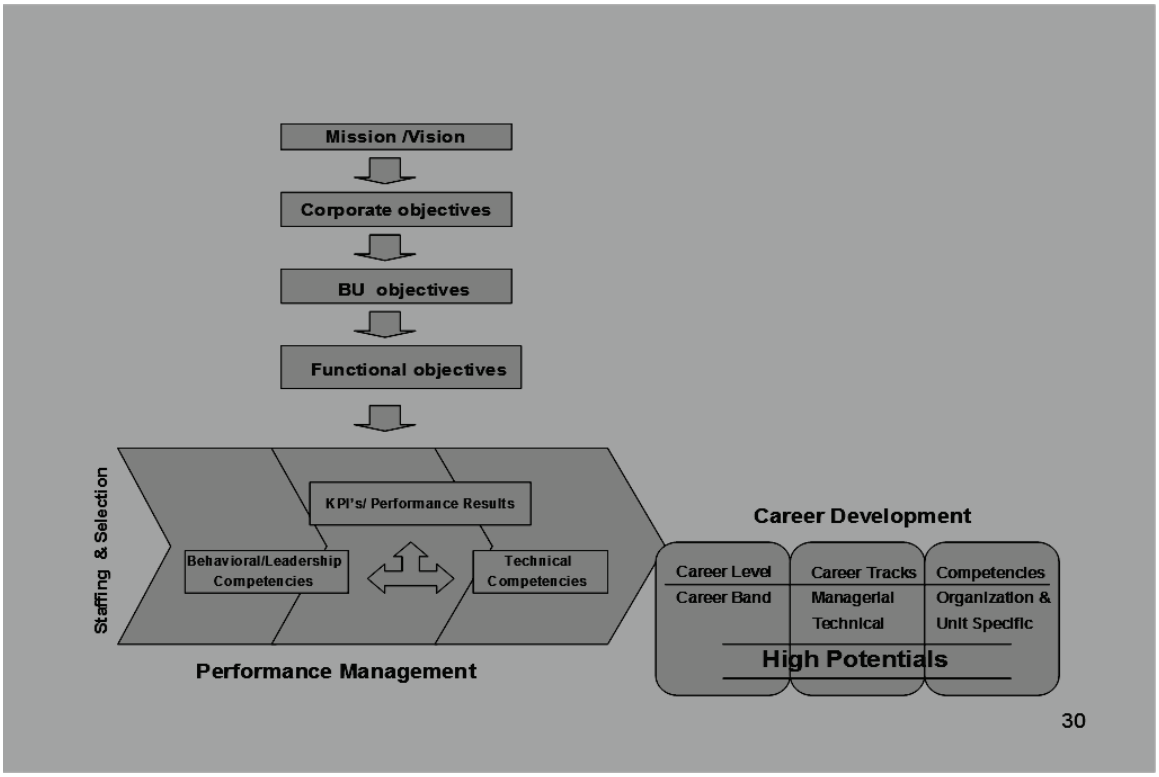

Figure 5. Career Development and Management Framework

There are four (4) career bands – Contributor, Specialist, Technical Expert and Authority/Consultant (refer to Figure 6). **Contributor** is the entry level for the job. The Contributor exhibits application of skills in developing and implementing solutions to commonly anticipated programs, impacts team goals thru own independent work in contribution to team effort. As one increases technical competency in the job and can assume a team lead or supervisory role, he moves up to the Specialist career band. The **Specialist** employs training and broad experience in solving complex problems, influence company goals, tactical plans and programs His work significantly impacts group/division goals, can coach or train others. As the technical competency is further increased and leadership and mentoring skills further developed, he moves up to the Technical Expert band. The **Technical Expert** advises senior management to pursue technical directions, work significantly impacts own group /division/ goals and other major groups/divisions, and can design/innovate major programs and processes. Further up the career ladder is the **Authority/Consultant** level. Being at this level significantly influences company direction, policy, mission and vision. His decision and actions impact the direction of the entire company.

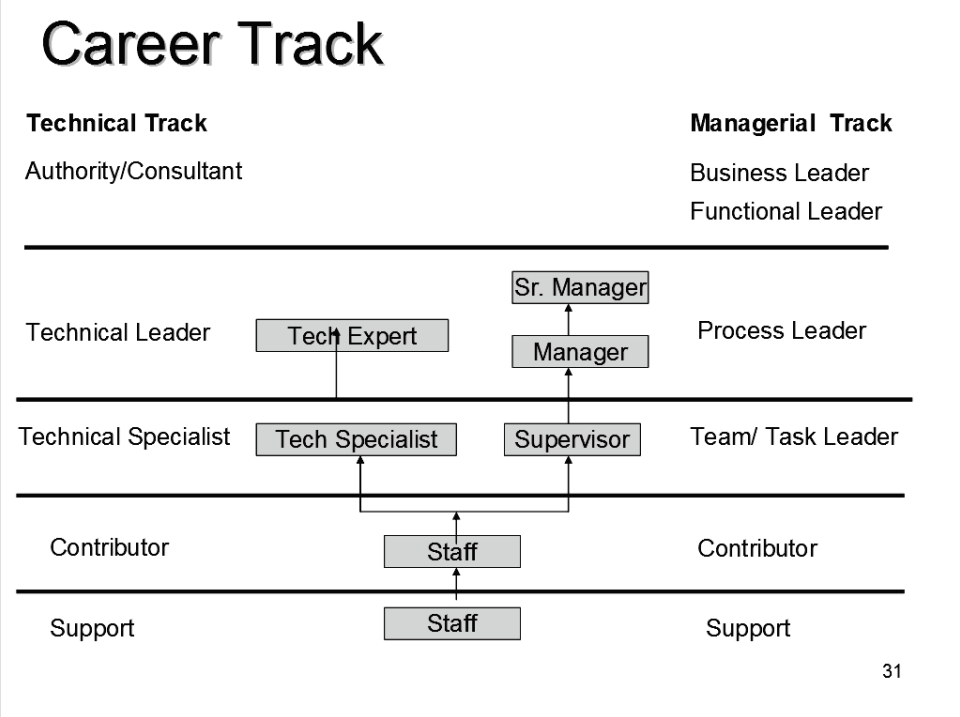

Figure 6. Career Tracks

Within each career band there are three (3) career zones, namely – Learning, Competent and Mature. The Learning zone is the entry point of a career band. It is where the employee gets introduced to the career band and learns the competencies required of that career band. The Competent zone is when the employee gets to display the competencies he learned at the expected proficiency level. As the employee masters the competencies of the career band and is able to apply it in a wide variety of situations without assistance, he qualifies for the Mature zone. Then the employee goes thru these three career zones all over again when he moves to the next career band where he learns, becomes competent and matures in the job and is ready to move to the next career band again.

The Job Design

Job design involves envisioning and defining the specification of work systems related to a particular job. It is an activity to ensure that people and other resources are effectively and efficiently utilized in delivering quality service and system implementations. Job design is undertaken, keeping in mind job satisfaction and performance, not only from the point of view of the organization but from the clients it serves. The Job Design should be validated annually for the first three years to determine its effectiveness and impact on the quality of service to the clients.

Each process area will have its own set of competencies per career band and career zone. These will be reflected in their respective Job Designs. A Job Design details the list of competencies relevant to a specific job or role and their corresponding level of importance as well as the expected proficiency level as the person moves up the career ladder. The Job Design is the scorecard that indicates the minimum score for each career zone within each career band. The score is the sum of the weighted proficiency level (importance level multiplied by the rated proficiency) The Importance Level ranges from 1 to 3 with 3 being the highest level. The Proficiency level ranges from A to D with the numerical equivalence of 1 to 4.

The Proficiency Level is the expected performance of an individual at a certain level. The four (4) levels are A to D as detailed below.

(A) Conceptual knowledge – understands concepts but infrequently applies knowledge; familiarity with terminologies gained thorough readings, briefings, observations; application of basic knowledge or overview; minimal judgment and analysis required (WHAT)

(B) Working knowledge – applies knowledge and experience to mostly routine situations; application of working and functional knowledge and capability in a particular process or method; perform independent action according to acceptable standards and guidelines, may require minimal assistance in unfamiliar situations (WHAT AND HOW)

(C) Thorough knowledge – consistently applies thorough knowledge and experience to a wide variety of situations; has hands-on competence in content area, able to troubleshoot many or most situations without assistance, demonstrates professional discernment and judgment when appropriate (WHAT, HOW, WHY AND WHAT IF)

(D) In depth expertise – high degree of mastery in content area, specialized knowledge enabling advanced analysis and problem solving, innovates, designs systems, processes and approaches, influences critical decision and actions through application of expert opinion and advice (TEACH AND INNOVATE)

The Job Design serves as the guide in rating the current employee's competency level and identifying the areas for improvement and training needs to move him to the next career zone and/or the next career band. The Job Design is a very useful tool in performance evaluation as well as employee selection and recruitment.

In order to balance the competencies per track, alignment of the competency blocks and descriptors will be done so as to group them and come up with equivalences. This will allow the competencies or groups of competencies to total to an equivalent number. This will then serve as a guide for cross-training and up-training. The expansion of competencies will contribute to the increase in job scope and expertise of the consultants for their career development and the company's competitive advantage in delivering cost effective quality service to their clients

The Training Plan

A training plan is a component of a company's training system. A company's training system identifies and addresses the training needs of the company aligned with the company's objectives. It covers a four-tiered analysis of the company's training needs namely - an organizational analysis, a job analysis, a person analysis and a client-needs analysis.

An organizational analysis is used to identify company factors that can impact the effectiveness of the training program, such as the training budget.

A job analysis is the process of identifying the skills to be learned and training activities required to successfully perform a job. The Training Plan is a document that details the training and certification requirements for each job. It involves an examination of the tasks involved in each job and the identification of the corresponding training objective. The objective should identify what the skill is, how the trainee is to learn the skill and how proficient the trainee needs to be in the skill after the training is completed. The Training Plan is needed to maintain a common standard of training for all employees for performance assessment and a guide to employees of the company's expectations.

A person analysis is the identification of the employees needing training and what specific training they need. Input from the past and current performance appraisals and competency assessments are used to identify the specific employee's training needs and individual Training Plan. The Performance Appraisal Form is used for both mid-year and annual performance assessment as well as employee regularization assessment. Citations and areas for improvement are indicated and serve as input to identifying the individual's training needs for the next period.

A client needs analysis is geared towards identifying the core competencies needed to address and deliver, not just quality customer service, but excellent customer service. This is a critical aspect that needs to be considered in the company's competitive strategy. The company gets feedback from the client through the Customer Satisfaction Survey forms to be given at the end of the project. Client assessment is taken for the Project Manager and the consultants. A Training Plan imbedding excellent customer service should be covered by the company's corporate training program. These are the soft skills complementing the technical, project management and support service competencies.

Even sales and marketing, instinctively geared towards customer service, will benefit from this. It is not uncommon that technical people transition to pre-sales then to sales and marketing. Corporate training encompassing communication and presentation skills development, general consulting skills and excellent customer service will support the employees' career development and provide options for the employees who may want to shift careers. But more importantly, the focus on understanding the clients' needs and the level of service needed to address those needs is a key component of the Training Plans.

METHODOLOGY

The Career Development and Management Frameworkfollows the Organizational Development Framework. With this, the general Competency Framework of the Implementation Methodology should be developed. From the feedback of the clients and the lessons learned in previous projects, the study looked at Structures, Processes and the People components of Organizational Change Management as follows:

1. **Structure Development**

   The components of the Structure Development are:

   a. Identification of the different technical tracks
   b. Research on the technical competencies as the initial set
   c. Validation and refinement
   d. Creation of the Job Designs
   e. Development of the Training Plans

The development of the structure was initially based on the different modules of the SAP System. From there, the competencies were expanded to include the understanding and knowledge of the business processes they support and the rationale for such competencies. The structure was enriched by the input from the clients and results of the Quality Assurance (QA) checks done on previous projects.

2. **Process Development**

   The components of the Process Development are:

   a. Competence Assessment
   b. Recruitment and Selection
   c. Performance Evaluation

The process of using the Job designs from recruitment to performance evaluation and career development should be tested and continue to be validated through the results of the projects implemented. It is an iterative process and should be validated at least once a year.

3. **People Development**

   The components of the People Development are:

   a. Human Resource Team
   b. The consultants
   c. The Management Team and Track Leads

Input from the validation of Process Development above feeds the human resource development – from the consultants/employees to the track leads and the management team to the entire organization.

SUMMARY, VALIDATION AND RECOMMENDATIONS

Organizational Development is the process through which an organization develops the internal capacity to be the most effective in its mission work and sustain itself over the long term. Input from and collaboration with partner organizations and clients in Organization Development initiatives will bring competitive advantage. Organizational Development is a long and tedious process but is essential in the growth and success of any organization and the organizations of their customers. The Chief Executive Officer or Executive Director's role is vital to the success of any organizational development work. And the involvement of the board, management team and staff, partner organizations and clients is essential. The stakeholder base for organizational development work should be extended not only to clients but to the academia involved in national competitiveness and productivity improvement as they provide the input to the human supply chain. Organizational Development is a never-ending process so pacing the work is wise.

This study on the Building Blocks of Consulting Service Excellence focused on the Competency Framework and Human Resource Development and tested on the SAP Technology in an ERP Solution Implementation company. It covered the processes from Sales to Delivery to Support on the conceptual level. The execution was limited to the technical tracks. Job Designs were done for four (4) sample tracks – Financial Accounting and Controlling, Supplier Relationship Management, Analytics and System Administration. These tracks were chosen as they represent the different SAP solutions and services, namely, the core Enterprise Resource Planning (ERP) solution, the extension solutions, the Business Consolidation and Enterprise Reporting solution, and the Technical Services. Financial Accounting and Controlling falls under the core ERP solution. Supplier Relationship Management falls under the extension solutions, Analytics is the business Consolidation and Enterprise Reporting solution while System Administration is one of the SAP Technical Services.

The Training Plans were likewise developed for each sample track and accomplished for each employee within that track and eventually, for the entire organization. This then serves as a guide for both the Track Lead and Human Resources to schedule the training courses and list the attendees accordingly. It also informs the employee ahead of time to plan for these training courses and certification requirements he is expected to complete within the year. These requirements are part the Organizational and Personnel Development component of his Key Performance Indicators (KPI) for the year.

The Job Designs and Training Plans of the selected pilot tracks were completed and validated. The Competency Profile of each track was used to identify competency gaps and determine which will be filled through recruitment, up-skilling through training or cross-training from other tracks. The results were also used as basis for salary upgrades and promotions. The Job Designs are also used to assess applicants with prior SAP experience and determine if their competency level falls under the requirements of the track. Job offers are then more aligned to the competency levels.

In sum, the Competency Framework has been very helpful in the proper assessment of skill levels of both employees and applicants. It is a very objective approach to performance assessment and a good basis for determining the compensation and benefits packages offered to employees as it is very much aligned with the revenue performance of each track.

The Competency Framework has also been well received by the employees as it provides a clear guide to career development and growth and a proactive approach to excellence in service delivery to the clients. It benefits the individual employees with the structured approach to skills development and learning. It benefits the leadership of the organization with the alignment of the Competency Profile and the Revenue targets and a vital input to Resource Loading and Management. This will also impact the organization's culture with emphasis on performance and value and provide the needed structure and processes to support the company's performance goals.

The Competency Framework is also expected to benefit clients and partners in terms of providing the appropriate skill level of the consultants assigned to deliver the company's services to the clients. With the proper alignment of the competency levels with the contracted service to be delivered to the client, there should be an increase in the success rate of projects and an increase in customer satisfaction. Happy customers translate to repeat business and client referrals which hopefully translate to increased business and the company's growth and success.

ABSTRACT

Purpose: *This paper extends the dedication-based relationship maintenance mechanism of social exchange theory and customer perceived relationship investment to study the relationship performance of a convenience store launching an in-store kiosk business. Meanwhile, computer anxiety and time consciousness are hypothesized to moderate the effects among the relationships.*

Design/methodology/approach: *Results of data analysis, with in-store kiosk use experience data collected for 211 in-store kiosk users, supported our model.*

Findings: *Our results confirm that dedication-based relationship maintenance is related to perceived relationship investment. Higher levels of customer-perceived relationship investment impact relationship performance. Computer anxiety and time consciousness act separately as both partial and full moderators.*

Originality/value: *We found that the businesses that launch in-store kiosk businesses determine customer perceptions of relationship investment. This study found that customers with computer anxiety have an anchor to the use of technology. customers who think of time as a resource escalate the effect between their perceptions that a business has invested effort in relationship building and the development of customer loyalty.*

INTRODUCTION

There are more and more businesses launching SST businesses intended to provide efficiency and to gain benefits, especially Taiwanese convenience stores e.g. ibon (7-11), Famiport(Family Mart), LifeET(HiLife) (Chiu, Fang, & Tseng, 2010). Thus, the development of SST strategies for convenience stores that maintain customer relationships is gradually becoming an important issue related to gaining e-business profit (Ou, Hung, Yen, & Liu, 2009).

Kim and Son (2009) pointed out that a dedication-based relationship maintenance mechanism is one of the strategies for keeping loyal customers. It is based on social exchange theory (SET). However, very few studies have discussed the link between customer perceptions of how businesses invest their resources in relationship maintenance and their loyalty reactions, especially in the case of SST businesses (Zhu, Nakata, Sivakumar, & Grewal, 2007). Accordingly, convenience stores operate SST business that launch their resources toward keeping loyal customers by providing merchandise variety from products/services complemented by in-store kiosks, the provision of both quality e-services and a novel shopping experience that evokes customer dedication toward maintenance of the business relationship (Wells, Campbell, Valacich, & Featherman, 2010).

Therefore, some people feel anxious about the use of computers (Cambre, & Cook, 1985). A few studies have suggested a relationship between the cognition of customers with computer anxiety to the relationship between e-business loyalty maintenance strategy and customer perceptions of e-business investments of their resources in relationship building. Hence, this relationship becomes an important issue for business intending to launch in-store kiosk businesses for the purpose of gaining a higher market share.

Accordingly, the closing of these research gaps could contribute to SST research in four ways: Firstly, this study is based on a dedication-based relationship maintenance mechanism derived from social exchange theory (SET) in in-store kiosk businesses in convenience stores to discuss customer perceptions of relationship investment related to committing to in-store kiosk business operations. Secondly, this study probes into how customer perceived complementarity features of in-store kiosk retailing both directly and indirectly impact relationship performance through perceived relationship investment perceptions related to customers' post-purchase behavior. Thirdly, this study is intended to determine whether a dedication-based relationship mechanism plays an important role in reducing customer anxiety related to the use of computers and also to determine customer perceptions of

convenience store investment of resources on building customer relationships. Finally, this study will verify the moderating role of time consciousness on the relationship between customer perceived relationship investment and SST relationship performance. It will determine whether or not customers with time consciousness are the target customers and whether these customers have intention toward loyalty to in-store kiosk businesses.

THEORETICAL BACKGROUND AND CONCEPTUAL FRAMEWORK

Self-service Technology; In-store Kiosk

Meuter, Ostrom, Roundtree, and Bitner (2000) proposed that SSTs are 'technological interfaces that enable customers to produce a service independent of direct service employee involvement'. SST has been widely applied for many purposes. One noticeable trend is the increasing use of SST by businesses (Ou et al., 2009). Zhu et al. (2007) specified that SST in physical stores that operates for the purpose of customer transactions are called "in-store kiosks". In fact, in-store kiosks are a kind of business which can help customers independently finish their purchase tasks. Accordingly, in-store kiosks in Taiwanese convenience stores that provide distinctive characteristics (e.g. the sale of tickets, among other services) can also provide user time savings and efficiency when purchasing. Meanwhile, efficient shopping strategies and convenience store launches customer relationship investment lead to the benefit of keeping customers who think time is an essential concern.

Dedication-based Relationship Maintenance

Dedication-based relationship maintenance is based on attitudinal commitment resulting from genuine appreciation for the relationship. On the other side, constraint-based relationship maintenance centers on locked-in "economic, social, or psychological" commitment (Kim & Son, 2009). In other words, the users invest their economic, social, or psychological resources when purchasing.

According to information technology studies that have specified that information technology for business which focuses on ease and usefulness of system design (Delone & McLean, 2004; Rogers, 1983) will provide functional information technology for businesses that will attract the customers' genuine appreciation for the relationship. Indeed, the convenience stores in Taiwan usually adopt the characteristics which result in users perceiving a quality function from their purchasing processes (Delone & McLean, 2004). Hence, this study

focused on convenience store launches of dedication-based relationship mechanisms in in-store kiosk businesses and discusses business relationship-building performance.

Perceived Relationship Investment

De Wulf, Odekerken-Schrod, and lacobucci (2001) developed a model that pointed out that retailer direct their marketing efforts to evoke customer perception that the retailers are investing their resources in developing long-term relationships. As a result, loyalty intentions will develop. Convenience stores launch in-store kiosk businesses (Zhu et al., 2007) to provide customers with a new shopping method intended to fill customer needs for efficiency and time saving features. Hence, this study defined perceived relationship investment as customer perceptions that the convenience store has invested resources in long-term relationship building through the use of in-store kiosk business operations. Hence, this study proposes that dedication-based relationship mechanisms launched by convenience stores are related to perceived relationship investment and relationship performance.

Relationship Performance

The length, breadth and depth of customer purchasing behavior is a measurement of customer's loyalty behavior (Bolton, Lemon, & Verhoef, 2004) This information can result in business owners having a more in depth understanding of the loyalty relationship. Accordingly, relationship performance includes relationship length, relationship depth and relationship breadth, and it is illustrated as below:

Relationship Length

Bolton et al. (2004) proposed that the "duration" of a transaction is the length of the relationship. Convenience stores create strategies for customer relationship building, e.g., merchandise variety in in-store kiosks, quality service, and novel shopping experiences, among others, that will determine the customer's intention to make long-term purchasing behavior in the future (De Wulf et al., 2001). Thus, relationship length is defined as customer willingness to transact with certain in-store kiosks in convenience stores in the future.

Relationship Depth

Relational depth is measured by "how often" a customer purchases in a certain store (Bolton et al., 2004). In this research, this was called "frequency of purchase". Indeed, customers

having positive relationship investment perception with regard to a retailer will determine to commit to the relationship (De Wulf et al., 2001). Hence, relationship depth is customer willingness to frequently transact in certain in-store kiosks in convenience stores.

Relationship Breadth

Bolton et al. (2004) found that relational breadth is measured by customer "cross-buying intentions". Customers performing cross-buying in certain stores help the store create unexpected revenue (Zhang, Fang, Wei, Ramsey, McCole, & Chen, 2011). Accordingly, customer perceived the convenience store do their marketing effort in evoking customer positive SST relationship investment perception. These perceptions will evoke customer commitment to the transaction relationship (De Wulf, 2001). Hence, relationship depth is customers intention to conduct cross buying behavior in certain in-store kiosks in convenience stores.

Accordingly, the conceptual framework guiding this study is presented in Figure 1. This study employed the dedication-based relationship mechanism from social exchange theory (SET) to discuss customer perceived relationship investment toward an in-store kiosk in a convenience store. Meanwhile, we discuss customer computer anxiety as having a moderating effect between the dedication-based relationship mechanism and perceived relationship investment. We also discuss customer time consciousness as a moderator between perceived relationship investment and related relationship performance.

Figure 1 here

RESEARCH HYPOTHESES DEVOELOPMENT

The influence of dedication-based relationship maintenance on perceived relationship investment

Katz and Shapiro (1985) based their research on Metcalfe's law and argued that indirect network externality is *perceived as complementarity*. Perceived complementarity is the user base expands; users can get lots of complementarity functions and services which bring additional value.

Taiwanese convenience stores apply perceived complementarity of perceived network externality to launch in-store kiosks in order to provide efficient shopping. In fact, in-store

kiosks in convenience stores have various products/services that help customers make efficient purchases. In-store kiosks represent complementarity features such as ticket purchasing, paying bills, and copy machines complimented in in-store kiosk businesses) to generate customer benefit perceptions (Kim & Forsythe, 2008). Indeed, synergy will be generated.

According to reciprocal theory (Huppertz, Arenson, & Evans, 1978) "relationship investment emphasizes an aim for reciprocation by consumers that is based on retention efforts made by a retailer". Meanwhile, social exchange theory (SET) specifies that if businesses provide benefits that can be delivered to the customers, it will determine their future behavior (Kim & Son, 2009). In-store kiosks have various products/services that benefit customers. Therefore, customers will perceive the convenience store to have made positive relationship investment in in-store kiosks. Hence, Hypothesis 1 is as follows:

H1: *Customers perceiving a high degree of complementarity associate with higher perceived relationship investment with regard to in-store kiosks in convenience stores.*

E-service quality means an overall judgment of a service with more of an emphasis on consumers personal feelings regarding the process of service delivery, which contributes to user satisfaction, purchase intentions, and in turn, to firm performance (Yang, Cai, Zhou, & Zhou, 2005). Accordingly, e-service quality is defined as "consumers' global judgment related to the superiority of the in-store kiosk of the convenience store that they have chosen".

This study applies the e-service quality measurement of Lin and Hsieh (2011) to discuss an in-store kiosk service quality evaluation. Accordingly, e-service quality includes the following dimensions: First, functionality means that the in-store kiosk provides a stable function for customers' smooth and effective manipulation. Second, enjoyment implies that the in-store kiosk service provider usually provides interesting content that evokes customer enjoyment perceptions, e.g., interactive games. Third, security represents the idea that customers can manipulate in-store kiosks that can protect their personal information e.g., ID number. Fourth, assurance is that the convenience stores which provide in-store kiosks have a good reputation. Fifth, design indicates that the in-store kiosk has invested resources in a platform designed from customer perceptions, e.g. invested in up-to-date, aesthetically appealing technology. Sixth, geographic density will lead customer perceived convenience. Hence, convenience means the in-store kiosks always exist in the main Taiwanese convenience store. Taiwanese convenience stores have high geographic density. The more

customers perceive convenience, the more positive is their relationship investment perception. Lastly, customization means the in-store kiosk can fulfill customers' specific needs. For example, an in-store kiosk in a convenience store can allow the purchase of registered airline tickets.

Reciprocal theory (Huppertz et al., 1978) has pointed that "relationship investment emphasizes an aim for reciprocation by consumers that is based on retention efforts made by a retailer". Kim and Son (2009), on the basis of social exchange theory (SET), pointed out that e-customers will receive benefits from an online business provided to adjust their future behavior. Hence, in-store kiosks provide good service quality that customers can easily use. These benefits will evoke customer perceptions that the convenience store has invested resources in keeping loyal customer relationships with their in-store kiosk businesses. The hypothesis is stated as below:

H2: *Customer perceptions of a high degree of e-service quality are associated with higher perceived relationship investment with regard to in-store kiosks in convenience stores.*

Diffusion of innovation was proposed by Rogers (1983). The main idea is that the technology user's intention to do behavior is affected by the innovator of the network diffusion in the technology product or service context, and it is based on the network effect (Zhu et al., 2007). Wells et al. (2010) argued that past studies do not have a specific construct by which to discuss user perceptions of innovation. Thus, perceived novelty is based on the innovativeness attributes in diffusion of innovation theory. Perceived novelty is the perspective by which to understand the user perceived the business launch the novelty management method which delivers to the customer and it is a benefit for customers using technology products.

Novelty usually attracts customer attentions, and it is a kind of loyalty maintenance strategy from the customers benefits perception (Huppertz et al., 1978). Hence, if customers perceive novelty from in-store kiosk products/services, they will perceive that the convenience store launching the in-store kiosk business has invested resources to keep customers' loyalty. The hypothesis is as below:

H3: *Customers perceptions of a high degree of novelty are associated with higher perceived relationship investment with regard to in-store kiosks in convenience stores.*

The influence of perceived relationship investment on relationship performance

According to the notion of relationship quality theory (Crosby, Evans, & Cowles, 1990), it has been proposed that customer commitment can create long-term relationships. Meanwhile, commitment will be determined by the retailer making an effort to establish customer relationships. In particular, retailer investment of resources in customer relationship building will determine relationship performance.

In fact, in-store kiosks in convenience stores are businesses intended to fulfil customer needs related to efficiency of transactions as well as the convenience store launches resources on building customer loyalty intention through in-store kiosk purchasing. Hence, more efficient shopping and relation maintenance resources launched in in-store kiosk businesses will lead to the generation of more loyal customers (Liang & Chen, 2010). Accordingly, in this study, we posit that customer perceptions that businesses are making an effort in in-store kiosk transactions to fulfil their efficiency transaction needs will result in customer commitment to the relationship, a lengthening of purchasing duration, increases in the frequency of purchasing, and the generation of cross-buying. Hence, the hypothesis as below:

H4: *Customer perceptions of a high degree of relationship investment are associated with higher (a) relationship length (b) relationship depth and (c) relationship breadth with regard to in-store kiosks in convenience stores.*

The moderating effect between dedication-based relationship maintenance and perceived relationship investment

Some people fear computers because they think computer use exhibits a lack of self-efficacy, among other weaknesses (Hackbarth, Grover, & Yi, 2003). E-environments area now wide spread. In fact, technology usually makes things more efficient. Hence, businesses launching technology-related business operations not only are effective but also evoke customer usability perceptions (Collier, & Sherrell, 2010). This study argues that if in-store kiosks in convenience stores have a variety of products/services as a driver, this will evoke perceptions that the convenience store is making marketing effort toward relationship building through the provision of a variety of products/services.

Also, Kim and Forsythe (2008) specified that computer anxiety plays a moderating role in regard to use of technology products. This study argued that a functional information technology platform can reduce customer anxiety (Elie-dit-cosaque, Pallud, & Kalika, 2011).

Hence, quality e-service will diminish customer anxiety toward a technology. Once a user with computer anxiety perceives positive quality in an e-service, this will impact the businesses' continual investment in resources related to relationship building. Hence, this study argues that computer anxiety plays a moderating role between e-service quality and perceived relationship investment.

Finally, convenience stores usually launch in-store kiosks to fulfill customer needs for innovation (Chiu et al., 2010). A novel shopping experience will lead customers to have benefit perceptions of an e-business (Wells et al., 2010). It has been argued that benefit perceptions reduce customer anxiety toward information technology (Elie-dit-cosaque et al., 2010). Hence, customers with computer anxiety will, based on novelty perception of the in-store kiosk use experience, perceive a positive relationship investment on the part of the convenience store in-store kiosk business operation. The hypothesis is as below:

H5: *Computer anxiety moderates the influence of customer (a) perceived complementarity (b) perceived e-service quality and (c) perceived novelty on perceived relationship investment.*

The moderating effect between perceived relationship investment and relationship performance

Some people are concerned about time as resource. They believe that the efficient use of time will lead to an effective life (Kleijnen et al., 2007). Hence, time consciousness in this study is defined as a person's predisposition to consider time as a scarce resource and to plan its use carefully.

Customers are concerned about efficiency and time savings during in-store kiosk use (Collier & Sherrell, 2010). The characteristics of SST are in regards to customer independence and the completion of transactions. Particularly, customers with time consciousness usually think efficient purchasing transactions are one of the most important factors related to their shopping procedures (Kleijnen et al., 2007). Hence, the main purpose of in-store kiosks is fulfilling customers' needs for efficient e-shopping.

This study proposes that customers with time consciousness perceived the convenience store launch their resources in keeping the customers loyalty. This will lead them to be loyal to the in-store kiosk in the future. Thus, this study will deeply discuss the impactions on relationship performance. The hypothesis is as below:

H7: *Time consciousness moderates the influence of customer relationship investment on (a) relationship length (b) relationship depth and (c) relationship breadth.*

METHOD AND DATA ANALYSIS

Pilot Test

A seven-point Likert response scale format that ranged from "strongly agree" to "strongly disagree" was used in the questionnaire in this study. All the construct measurements were modified from previous studies and were consistent with their definitions. We collected 31 paper questionnaires, and we used SPSS 17.0 to analyze the data. Cronbach's alpha and the item-to-total correlation were brought in as the standard items of choice for the main study (Weise, 1975). According to Weise (1975), a level of 0.3 is acceptable for the questionnaire in this study. In the case of the other 67 items, the item-to-total value exceeded 0.3. Therefore, the general requirement of reliability for the research instruments was satisfied. As a result, all 67 items were adopted. There were a total of 67 items used together in the formal questionnaire to measure the constructs.

Samples

Conducting a field survey of a bricks and clicks shopping experience provided the empirical data: An on-line survey (http://www.my3q.com/) was published on a bulletin board system (BBS), which yielded 246 usable responses. 35 questionnaires were eliminated in which the respondents filled in some questions incompletely. Finally, the study had 211 respondents that could be used for analysis. Sample demographics are depicted in Table 1.

Table 1 here

Validity and reliability of the measurement

All of the reliability estimates were higher than 0.8, providing evidence for a high degree of internal consistency among the corresponding indicators. According to Bagozzi and Yi (1988), AVE values greater than 0.5 are considered adequate. As table 2, all the square roots of the AVE were greater than the correlation between the two constructs of interest, indicating that the discriminate validity of the measurement model was satisfied.

Table 2 here

The chi-square was significant ($p < 0.001$), and $\chi^2/df = 2.25$, proving internal consistency between the observations and the theoretical model. The CFI= 0.93, the GFI=0.82, and the RMSEA= 0.08, which achieved the recommended standard. The other indices, NFI= 0.88, and the AGFI= 0.78, which were slightly lower or higher than the recommended values, but all fell within an acceptable range. The above indices proved the research model fit the sample data well.

Hypothesis Testing

AMOS 7.0 was used in this study for SEM analysis, including standardized path coefficients, path significances for each variable and model fit indices, and the results are presented in Figure 2 and Table 3. It can be seen that there are six paths in this model significant at p<0.001*** and one significant at p<0.05**. Customers perceived complementarity between in-store kiosk and variety products/services had a significant effect on perceived relationship investment (γ=0.15***; *t*=2.85), e-service quality had a significant effect on perceived relationship investment (γ=0.70***; *t*=7.07), perceived novelty had a significant effect on perceived relationship investment (γ=0.13**; *t*=2.41), thereby supporting H1, H2, and H3. Perceived relationship investment had a significant effect on relationship length (γ=0.96***; *t*=8.22). Perceived relationship investment had a significant effect on relationship depth (γ=0.91***; *t*=5.90); Perceived relationship investment had a significant effect on relationship breadth (γ=0.75***; *t*=4.99); thereby, H4a, H4b, and H4c were supported.

In fact, every in-store kiosk in a convenience store provides merchandise variety that build complementarity characteristics between the in-store kiosk and its products/services; the strategy is intended to create loyal customers, e.g. a concert ticket that was purchased through an in-store kiosk can be accepted by the organizer; customers can make an efficient purchase without they finding the specific ticket selling point. Accordingly, this study suggests that customer perceived complementarity between in-store kiosk and variety products/services will cause customers to commit to a future relationship with an in-store kiosk in a convenience store.

We conducted a test for the direct effect between customer perceived complimentary and relationship performance (See Table 3). The results shows that perceived complementarity did not have a significant impact on either relationship length (γ=-0.22; *t*=-1.87) or

relationship breadth (γ=-0.10; *t*=-1.80). But perceived complimentary had a negatively significant impact on relationship depth (γ=-0.26**; *t*=-2.27). As a result, perceived complimentary not only has a significant impact on relationship length and breadth but also has a negatively significant impact on relationship depth.

Figure 2 here

Table 3 here

A hierarchical regression was conducted in this study for the purpose of determining the moderating effect between dedication-based relationship mechanism and perceived relationship investment, as shown in Table 5. We found that computer anxiety plays a moderating role between perceived complementarity and perceived relationship investment; however it presented a negative impact on customer perceived relationship investment. Therefore, computer anxiety did not play a moderating role among e-service quality, perceived novelty and perceived relationship investment; therefore, it did not support H6a, H6b, and H6c.

Meanwhile, a hierarchical regression was used in this study to examine whether time consciousness has a moderating role between perceived relationship investment and relationship length, relationship depth, and relationship breadth. The results (see Table 5) showed that time consciousness is a moderator between perceived relationship investment and relationship length, relationship depth and relationship breadth. Hence, H7a, H7b, H7c were supported.

Table 5 here

DISCUSSION AND CONCLUSIONS

Research Findings

This study found that in-store kiosks provide merchandise variety and in-store kiosk business exhibit complementarity; it will evoke the customers perceived the convenience store invest their resources in relationship developing. Meanwhile, good e-service quality in in-store kiosks also relates to customer perceptions that the company is investing resources in

maintaining customer loyalty intentions. Also, novel in-store kiosk experiences will determine customer perceptions of the convenience store related to their belief that the store is making an effort to maintain relationships. Consequently, H1, H2, H3 were supported.

Therefore, we found that the customer perceived complementarity of dedication-based relationship maintenance mechanism is not only unrelated to relationship length and breadth but also negatively significant impact relationship depth. Kotler and Keller (2010) suggested that businesses using product-oriented strategies have not been fulfilling customer purchasing needs. In other words, the business launches product oriented strategy will be failed because the in-store kiosk in convenience store launched variety products/services without matching their relationship marketing strategy up. Indeed, marketing myopia will be infected by the business launches product oriented strategy (Levitt, 1960). Hence, convenience stores managing in-store kiosks should make an effort to complement their relationship marketing strategic slotting strategy in in-store kiosk business running.

This study found that customers perceiving an effort on the part of a store to maintain customer's loyalty intention will determine whether or not customers continue purchasing and purchase frequently as well as cross-buy in specific in-store kiosks. H4a, H4b, H4c were supported.

It was also determined that computer anxiety negatively impacts the relationship between perceived complementarity and perceived relationship investment. This is because customers with computer anxiety have an anchor on their cognition (Tversky & Kahneman, 1974) to E-businesses. Even if the convenience store offers merchandise variety in the in-store kiosk, the customers with computer anxiety will still refusing to use information technology for the purpose of purchasing. Meanwhile, customers who have computer anxiety who think that using in-store kiosk in convenience store for purchasing is a kind of computer manipulating purchasing mechanism will also experience an anchoring effect (Tversky, & Kahneman, 1974). Even if the convenience store provides good quality in-store kiosk service or novel purchasing experiences, it was found that it is hard to diminish anxiety related to the use of an in-store kiosk. Hence, H5a, H5b, H5c were not supported.

In fact, the starting point of in-store kiosk design is the provision of efficient purchasing (Chiu et al., 2010) Hence, efficient purchasing is an appropriate strategy for customers who view time as a resource. Indeed, this study found that the convenience store developing in-store kiosk businesses are making an effort to provide efficient shopping in order to maintain loyal customers. These businesses usually solicit customers who have time

consciousness. Ultimately, relationship performance will go along with this effort. Hence, H6a, H6b, H6c were supported.

Theoretical Implications

Blau (1964) argued that businesses that provide benefits to customers will determine these customers' future behavior. Further, Kim and Son (2010) argued that when online businesses launch dedication-based relationship mechanisms, this will directly impact online user loyalty. Therefore, in-store kiosk business in convenience store launches dedication-based relationship mechanism strategy was not all affecting to the customer commit with their relationship with an in-store kiosk in convenience store. On the contrary, the dedication-based relationship maintenance mechanism should tie into the business relationship building effort. In other words, convenience stores that launch in-store kiosk businesses are not only providing benefits to customers but also are making an effort to evoke perceptions that the businesses are truly investing their resources to maintain customer loyalty. Relationship performance related to loyalty will in turn, be a result.

Meanwhile, this study found that computer anxiety negatively plays a moderating role between perceived complementarity of dedication-based relationship maintenance mechanisms and customer perceived relationship investments. Therefore, the anchoring effect from customers who have computer anxiety will serve as a notice for businesses willing to launch physical e-businesses in the situation of purely in-store kiosk transaction in convenience store (Tversky, & Kahneman, 1974). Hence, the dedication-based relationship maintenance mechanism has limitations that are a result of computer anxiety on the part of customers.

Finally, De Wulf et al. (2010) found that businesses who focus relationship investment in relationship building will determine customer loyalty. In fact, this study found that time consciousness acts as a moderator between relationships. Hence, customers who think of time as a resource escalate the effect between their perceptions that a business has invested effort in relationship building and the development of customer loyalty.

Managerial Implications

We found that the businesses that launch in-store kiosk businesses determine customer perceptions of relationship investment. Hence, convenience stores that are willing to

continually launch in-store kiosk businesses should tie in their relationship marketing strategy. Indeed, provision of merchandise variety, quality service and novel purchasing experiences to customers should be based on relationship marketing strategy. This will help in-store kiosks attract more loyal customers. Meanwhile, the business will earn long-term relationship benefits through relationship building strategies.

Further, this study found that customers with computer anxiety have an anchor to the use of technology. Hence, this study suggests that businesses that are willing to launch e-businesses should set strategy (e.g., on trial) designed to escalate customer experience in regard to the use of technology (Kim & Forsythe, 2008) Consequently, the habit of using technology will be gradually generated (Venkatesh, Thong, & Xu, 2012). This strategy will help the population of users who have computer anxiety. Finally, it will help e-businesses to become smoothly set into action in the future.

Finally, convenience stores that launch in-store kiosk businesses should continually develop efficacy purchasing process and functional relationship marketing strategy. This will benefit the in-store kiosk businesses ability to gain long-term benefits from relationship building with customers, especially the customers with time consciousness.

ABSTRACT

Purpose *- Nowadays, natural disasters happen increasingly and create severe damage worldwide. Being prepared and responsive is of great necessity. Therefore, this study aimed to analyze the capacity and efficiency of the public sector in disaster management, especially regarding online media.*
Design/methodology/approach *- The National Disaster Warning Centre (NDWC) in Thailand was the online media selected as a case study. The website was measured by criteria of the W3C (World Wide Web Consortium). The concept of content analysis was used to analyze the information on Twitterand Facebook during the worst flooding ever in Thailand during October, 2011.*
Findings *- The online media in this study could be considered as a critical and useful tool for developing disaster management. However, the website concerned could not achieve the W3C standard, and Twitter could not interest people in society, due to its content. This fact is confirmed by Twitter having only 11,142 followers, while another NGO; #Thaiflood, had 107,680. Facebook faced the same problem as Twitter of drawing little attention or interaction from society.*
Practical implications - *There are large gapsin the development of online media in the public sector. All media should be improved to meet the required standard, and be considered a reliable source for disaster management.*
Originality/value - *Most e-government in Thailand, for example e-disaster, lacks evaluation of its capacity. This study provides and suggests insightful information for development. If the media could be improved, preparation for disaster would be better, and responses to it prompt.*

Keywords: Disaster management, eDisaster, Online media, Website, Facebook, Twitter

INTRODUCTION

During the past decade, the world has witnessed several natural disasters that took a number of lives and caused severe damages to the infrastructure and economy. For example, Hurricane Katrina, which hit the northern Gulf coast of the USA in August 2005, was 'the costliest and one of the five deadliest hurricanes to ever strike the United States', leaving 1,833 fatalities and estimated damage worth US$ 108 billion (Knabb*et al.*, 2005). Recently, the earthquake of March 2011 in Japan triggered a tsunami that caused 15,854 deaths and over US$ 200 billion worth of damage (as of March 2012) [I]. Also, Thailand suffered greatly from the tsunami in December 2004, which was described as 'the worst natural

disaster ever in Thailand' [II]. It killed 5,395 people and caused approximately US$ 365 million worth of damage in the country [III]. In 2011, Thailand also experienced its worst flooding in half a century, with 657 fatalities and estimated damage worth US$ $75 billion.

In response to such natural disasters, governments have employed information and communication technologies (ICTs) increasingly, in order to prepare well before disasters occur, or be more effective in responding to them and their aftermath. For instance, various early warning systems or simulation models have been developed for tsunamis (e.g. Harjadi 2008; Teh and Koh, 2011); while an attempt was made to use radio frequency identification (RFID) wireless network technology for emergency evacuation (Chatfield *et al*., 2010). Online media such as twitter and Facebook also have been used increasingly in emergency management (e.g. Murphy, 2013; Sakaki*et al*., 2010).

After facing the 2004 tsunami in Thailand, the Thai government established the National Disaster Warning Center (NDWC) in 2005, in order to provide the public with information and early warning of disasters. Like other government agencies involved in disaster management, the NDWC employs online media as one of its communication channels to disseminate disaster information. Its online media were used recently during the 2011 flood. This provided a great opportunity to explore online media for use in disaster management in the Thai public sector context. Therefore, this paper aimed to evaluate use of the NDWC website, twitter and Facebookduring the aforementioned disaster, andfocus on the period of October 2011 [IV].

RELATED WORK

Heeks (2008) stated thate-government is "the use of information and communication technologies (ICTs) to improve the activities of public sector organizations." Thus, government use of online media can be viewed as part of this e-government movement. Government agencies have relied increasingly not only on their websites, but also online media for disseminating information to the general public. For example, many state public health departments in the USA are using Facebook, twitter and You Tube (Thackeray et al., 2012), while use of online media by agencies concerned with fire services has been reported as well (Murphy, 2013).

In the context of disaster management, Lindsay (2011)outlined that online media can be employed by government agencies concerned with such issues as public safety information, emergency warnings, and requests for assistance. Apart from its use as channels of communication between the agencies concerned and general public, online media can be employed also as a tool for 'knowledge exchange between crisis management experts' during an emergency (White, 2012). Although online media have gained currency in disaster management, Keim and Noji (2011) pointed out that its use in this context still faces some challenges such as accessibility compared to traditional media, potential to spread misinformation and rumor, and risk of privacy rights violation. Furthermore, issues like security of information, robustness of the system (e.g. reliability), and overreliance on online media also pose concerns (White, 2012).

In relation to the above work, online media seem to have both advantage and disadvantage, asthe system depends on the provider, user and situation. However, more room still exists to

investigate the influence of online media in disaster management. For a developing country such as Thailand, this study intended to ask the question, 'How does the public sector apply efficient online media for disaster management?'

RESEARCH METHODOLOGY

The data for this study were collected in October 2011 from the NDWC website (www.ndwc.go.th) as well as its twitter and Facebook. The providedInformationand design of the website were evaluated accordingto World Wide Web Consortium (W3C) standards by using the websites:www.validator.w3.org and www.jigsaw.w3.org/css-validator/validator.html.en.The criteria for regulatingaccess to public ICTs for disabled peoplewere shown accordingto ministerial regulations issued in 2011 by using the website:www.thaiwebacessibility.com.

Regarding NDWC twitter and Facebook, the data comprised tweets derived from #NDWC_Thai and messages posted on NDWC Facebook. In total, there were 358 tweets and 59 messages. The data collected were analyzed by means of content analysis. The number of re-tweets, favorites, and replies from each tweet was counted daily. All tweets were categorized into seven groups based on the disaster information provided, which included, 1) preparedness for flood, 2) evacuation warnings, 3) information on natural disasters occurring in Thailand, 4) information on how to follow flood situations, 5) flood relief (requests for relief or information on where to obtain it), 6) information on how to contribute to flood relief, and 7) information unrelated to flood. The sources of information from tweets were classified into nine groups, including online radio stations, online news agencies, online newspapers, the general public, government agencies/NGOs, NDWC, academics/experts, reporters, and others.

Similarly, the number of Likes, Comments and Shares were counted on each NDWC Facebook message. The Facebook messages also were categorized into groups, based on the disaster information they disseminated, including 1) preparedness for flood, 2) information on natural disasters occurring in Thailand, 3) flood relief (requests for relief or information on where to obtain it), 4) requests for information on flood situations, and 5) information unrelated to flood. The sources of messages posted on Facebook were classified into different groups, as with those of tweets.

RESULTS AND DISCUSSION

1. Analysis of the NDWC website

Website design and the information provided on the NWDC website were analyzed according to W3C standards; and the criteria set by ministerial regulations on access to public ICTs for disabled people were shown using standard evaluation websites, as mentioned in section 3. Evidently, the NDWC did not meet W3Cstandards and the criteria stipulated in ministerial regulations were found wanting. For example, 176 errors and 43 warnings were found when testing for 'Markup Validation Service' in the W3C standard (Figure 4.1). Regarding accessibility of ICTs for disabled people, the evaluation found 82 problems on accessibility, 254 items causing incomplete access, and 709 items that would improve accessibility (Figure 4.2). The substandard NDWC website apparently caused difficulties for online media users

trying to follow its information.For instance, the web links provided could not be accessed, and some online media users, particularly disabled people, could not utilize disaster information fullybecause the website was not user-friendly for them.

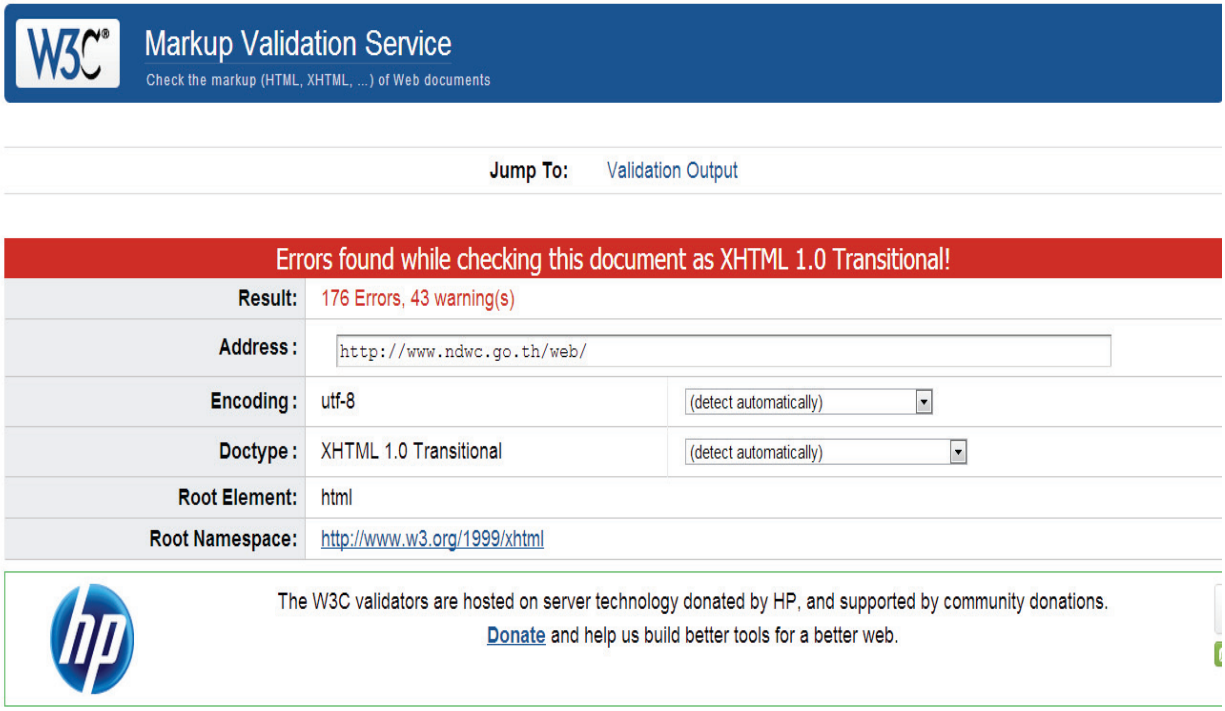

Figure 4.1 Results of NDWC website evaluation regarding the Markup Validation Service.

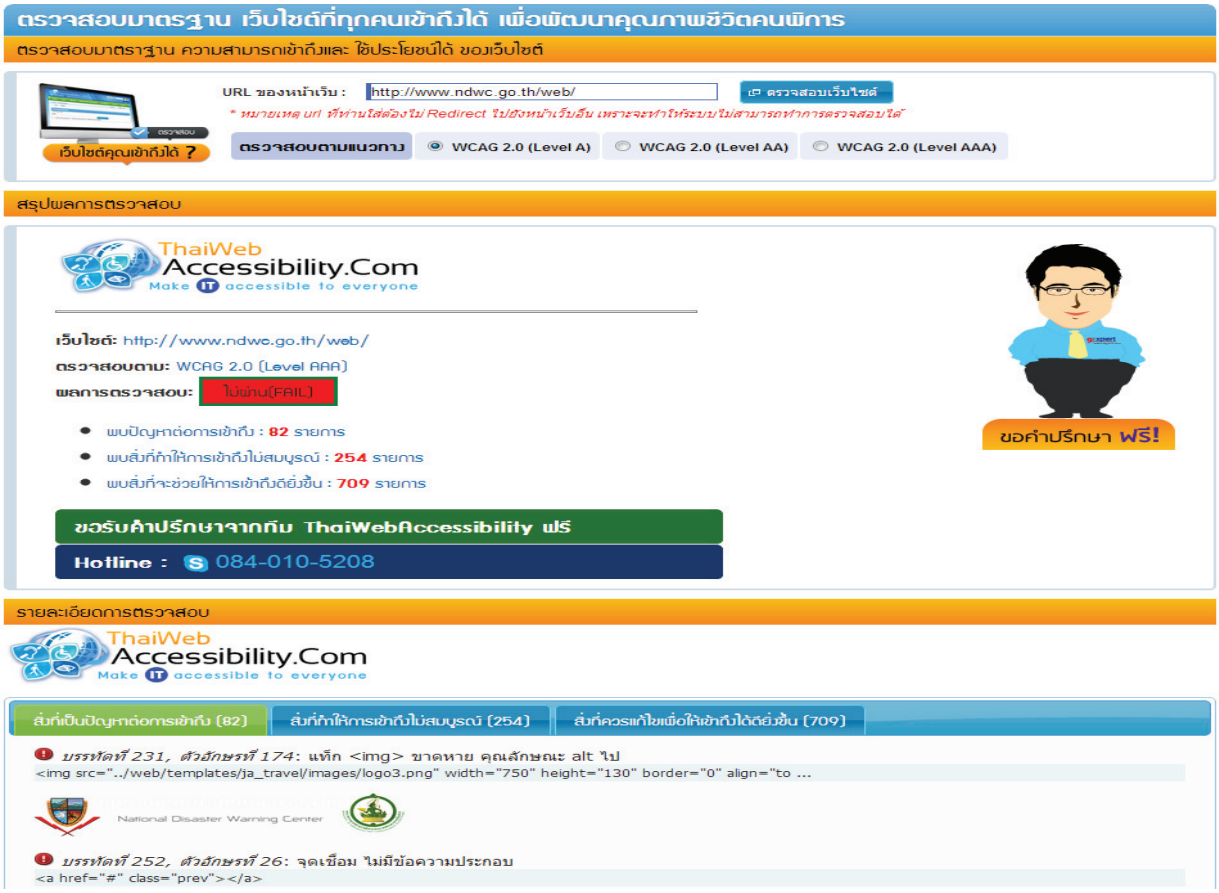

Figure 4.2 Results of NDWC website evaluation regarding the disabled people's accessibility by Thaiwebacessibility website

2 Analysis of NDWC twitter

In October 2011, NDWC twitter was monitored together with hash tag#NDWC_Thai. It was found that NDWC twitter was active for only 11 days during that month, with 11,142 followers. In total, there were 358 tweets, with 121,267 re-tweets, 640 favorites and 16 replies (Table 4.1). On average, there were only 32 tweets and 1,106 re-tweets/day. Apparently, the NDWC attracted very little attention from outsiders. This was confirmed by the fact that twitters fromhash tag #Thaiflood, an NGO working on floods, had 107,680 followers, while NDWC had only 11, 142. Notwithstanding, it could be seen that collected tweets generated a rather high number of re-tweets. Thus, the NDWC twitter may be less active overall.

Table 4.1 NDWC tweets in October 2011

Date	Tweet	Re-tweet	Favorite	Reply
3 October 2011	8	1	0	0
10 October 2011	55	1,145	43	5
11 October 2011	64	2,051	70	3
12 October 2011	63	2,719	54	2
13 October 2011	35	869	39	2

Date	Tweet	Re-tweet	Favorite	Reply
14 October 2011	17	255	26	2
15 October 2011	56	2,404	324	1
18 October 2011	29	901	34	1
19 October 2011	10	1,034	30	0
20 October 2011	12	249	5	0
21 October 2011	9	539	12	0
Total	**358**	**12,167**	**640**	**16**
Average/Day	**32**	**1,106**	**58**	**2**

The contents of NDWC tweets were concerned mostly with flood and flood relief, accounting for 150 and 96 tweets, respectively (Table 4.2). A relatively small number of tweets dealt with flood preparedness (28 tweets), channels for making contributions to flood relief (22 tweets),following the flood situation (22 tweets), and evacuation announcements (5 tweets). The rest contained information unrelated to flood. Despite the small number of tweets, they still covered important corresponding issues that phased in with the disaster management cycle (Carter, 1992). That is to say, tweets providing information on a flood situation, channels to follow it and preparedness for a flood can be considered as phases of *prevention, mitigation and preparedness*, while tweets on flood relief, evacuation announcements, and channels for making contributions to flood relief are in the *response* phase.

The last aspect regarded the source of information from tweets inhash tag #NDWC Thai, and not surprisingly, it was found that most of the messages tweeted were from the NDWC, which accounted for 92 tweets, followed by reporters and government agencies/NGOs, with 60 and 52 tweets, respectively. It should be noted that sources of information from public

figures (e.g. movie stars and signatories, classified under the 'others' groups) accounted for only 10 tweets, but their chances of being re-tweeted were far greater than those of the NDWC and government agencies/NGOs, due to public status.

3 Analysis of NDWC Facebook messages

In October 2011, NDWC Facebook was found to have 19 messages posted on Facebook studies during the course of seven separate days (Table 4.4), with 2,474 followers. Reactions to the comments posted were 149 Likes and 83 Shares. Clearly, the NDWC attracted little attention from the others group. The fact that Thaiflood Facebook and NDWC Facebook had 67, 937 and a mere 2,474 followers, respectively, helped to paint a clear perspective. When considering that 16 messages from a total of 19 were posted by the NDWC itself (Table 4.5), Facebook interaction in this regard was even more marginal, with one message each from an online newspaper, government agency/NGO, and the general public.

Table 4.4 NDWC Facebook messages in October 2011

Date	Number of Messages	Number of Likes	Number of Shares	Number of Comments
5 October 2011	1	8	-	1
7 October 2011	4	41	34	7
11 October 2011	4	9	13	13
12 October 2011	6	47	6	32
13 October 2011	2	24	1	2

Date	Number of Messages	Number of Likes	Number of Shares	Number of Comments
18 October 2011	2	11	24	5
24 October 2011	3	9	5	1
Total	**19**	**149**	**83**	**61**

Note: RD – Online Radio Stations, NP – Online Newspapers, GO/NGO – Government Agencies/NGOs, GP – General Public, EX – Experts, NDWC – National Disaster Warning Center, NS – Online News Agencies/ Television Stations, and OT – Others

When looking into the contents of messages posted, most messages (11 messages, see Table 4.6) were categorized as others, which referred to 'other information unrelated to flood' (see section 2), while seven messages dealt with flood situations and one with preparedness for a flood. Evidently, NDWC Facebook achieved very little in providing flood information.

CONCLUSION

With the number of online media users continuing to rise, together with continual development of related technologies (e.g. internet network and new applications), the potential use of new channels to disseminate information as part of disaster management also increases. However, the capacity to use these channels effectively, particularly by the public sector, needs to be evaluated. As illustrated by the NDWC, a large gap needs to be filled in order to improve the use of online media by government agencies. In turn, this would improve disaster management, and thus enhance preparedness for and responses to disasters. Ultimately, loss of life and damage to infrastructure and the economy would be minimized.

THE ANTECEDENTS OF INNOVATION CLIMATE: CROSS-LEVEL MEDIATION PERSPECTIVES

Li-Yueh Lee, Kun Shan University, Taiwan
Email: wuleliyu@gmail.com

Veasna Sou,Institute of International Management, National Cheng Kung University, Taiwan
Email: souveasna76@yahoo.com

ABSTRACT

Purpose: *This study aims to examine the significance of person-organizational fit on innovation climate through a mechanism of the cross-level mediation effects of emotional intelligence and psychological climate. The moderating effect of leader openness on the relationship between emotional intelligence and psychological safety is also examined in this study.*
Design/methodology/approach: *First, a random sampling technique was adopted to select 158 high-tech firms in Taiwan. Second, a purposive sampling technique was also adopted to select 1:4 dyadic managers and employees relationships in the Research & Development (R&D) department of each selected sample firms. The valid of respondents is tested on 252 subordinates and 67 managers. Structural equation modeling (SEM) in AMOS 21 and hierarchical linear modeling (HLM 7) were used to test six research hypotheses.*
Findings: *At cross-level of analysis, the results of a hierarchical regression analysis indicated that person-organizational fit is positively related to emotional intelligence and innovation climate, respectively. The moderating role of leader openness is also confirmed in this study.At individual level of analysis, SEM showed that emotional intelligence is positively related to psychological safety, and psychological safety is positively related to innovation climate. Form mediation aspects by using a Sobel's test, the findings indicated that psychological safety is partially mediated the relationship between emotional intelligence and innovation climate. Therefore, these findings suggest that person-organizational fit and emotional intelligence can play very critical roles as predictors of innovation climate through a mediation of psychological safety.*
Research limitation/implications: *The main research limitations include the use of high-tech industries in Taiwan. This study also focused on subordinate-manager dyadic relationship in each of the R&D department, which seems to be a small portion of the total staffs of such organizations. Drawing upon person-organizational fit and the affective event theories, this study found that the emotional intelligence partially mediates the effect of person-organizational fit on psychological safety.These research findings may also provide significant contributions to both academics and professionals by which to understand matched pairs in employee-manager relationships in order to improve organizational innovation climate.*
Originality/value: *This study primary integrates the affective events and person-environment fit theories to test the comprehensive research framework of the influences of person-organizational*

fit on innovation climate through a mechanism of the cross-level mediationof emotional intelligence.

Keywords: person-organizational fit, leader openness, emotional intelligence, psychological safety, innovation climate
Paper type: Research paper

INTRODUCTION

Innovation is of great significance with regard to organizational effectiveness and competitive advantage(Hirst, Knippenberg, and Zhou, 2009; Saenz, Aramburu, and Rivera, 2009), and firm performance (Gong, Zhou, and Chang, 2013). Davila, Epstein, and Shelton (2006)indicated that superior innovation providescompanies with opportunities to grow faster, better, and smarter than theircompetitors.In the strategic management literature, innovation climateis recognized as a critical enabler for firms to create value and sustain competitive advantage in the increasingly complex and rapidly changing environment(Chen and Huang, 2009; Daft, 2007; Somech and Drach-Zahavy, 2013). Firms with greater innovativeness tend to be more successful in responding to changing environments and in developing new capabilities that allow them to achieve better performance(Montes, Moreno, and Fernandez, 2004), which result in increasing profits and market share (Baer and Frese, 2003). It is argued that process innovations are assumed to bring multiple benefits to an organization and help an organization achieve competitive advantage (Chen, Li, and Tang, 2009). In this paper we concentrate on key antecedents of innovation climate as a contingency and identify those determinant factors that positively affect innovation climate.

The antecedents of innovation climate have been proposed by several researchers (i.e., Baer and Frese, 2003; Elenkov and Manev, 2009; Gumusluoglu and Ilsev, 2009), however, no studies in organizational innovativeness have simultaneously examined the interrelationships among person-organization fit, leader openness, emotional intelligence, psychological safety, and innovation climate in either at organizational-level or individual-level of analysis. Therefore, this study draws upon multiple perspectives of person-environment fit theory (Kristof-Brown, Zimmerman, and Johnson, 2005), an extension of emotional intelligence research framework (Wong, Law, and Wong, 2004), and available literatures on leader openness (Detert and Burris, 2007), psychological safety (Detert and Burris, 2007; Troster and van Knippenberg, 2012) and innovation climate (Daft, 2007) to focus on three main research objectives. First, the cross-level mediation effect of emotional intelligence on the influence of person-organization fit and psychological safety, and second, the cross-level relationship of person-organization fit on emotional intelligence and psychological safety. Third, the individual-level relationships among emotional intelligence, psychological safety, and innovation climate are also examined by this study.

This study brings contributions to the literature in two important ways. First, by examining emotional intelligence as a cross-level mediation variable, this study extends previous research frameworks that have primarily examined the direct or main effect of person-organization fit on psychological climate and innovation climate (Lee and Wu, 2011). It is expected that the

mediators of this relationship may provide theoretical insight into the mechanism through which person-organization fit influences psychological safety and innovation climate. Second, this study operationalizes the stream of research on the impact of emotional intelligence on employee innovation climatethrough a mechanism of the mediating effect of psychological safety. Based on the above discussions, the following research framework is developed as shown in Figure 1.

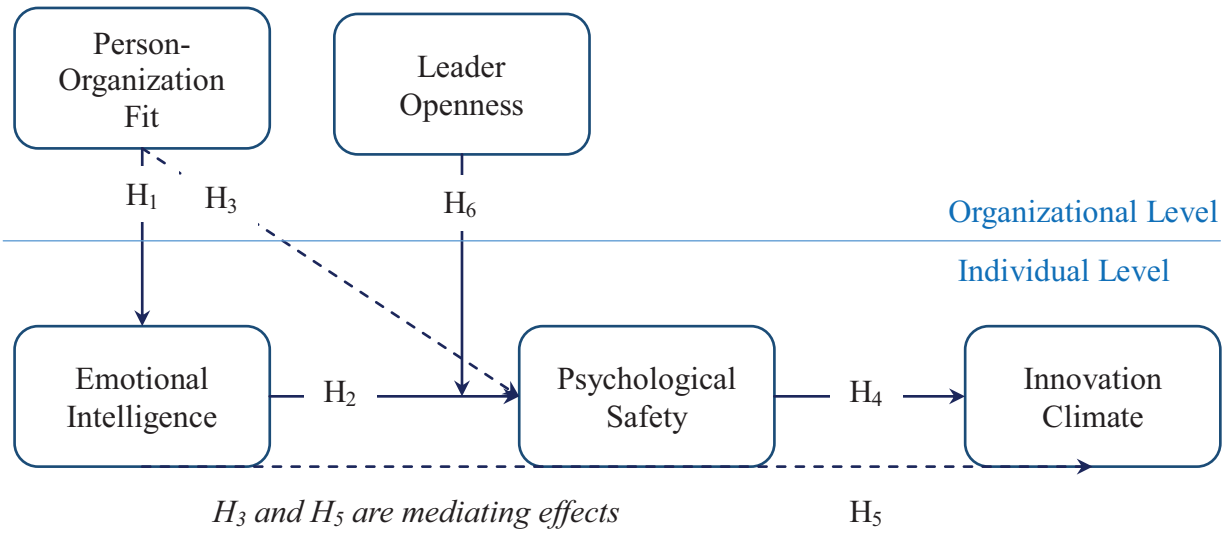

*Figure. 1*A cross-level mediation of emotional intelligence

THEORETICAL AND HYPOTHESES DEVELOPMENT

The effect of person-organization fit

Kristof-Brown et al.(2005) conducted a meta-analysis and empirically summarized the existing literature in four critical domains that included person-environment (PE) fit: person-job (PJ) fit (i.e., matching employees' skills, knowledge, and abilities to performing specific job-related tasks), person-organization (PO) fit (i.e., matching between the organization's values and individual values), person-group (PG) fit (i.e., matching employees' skills, knowledge, and abilities to both the complementary and supplementary requirements of the specific workgroup), and person-supervisor (PS) fit (i.e., the perceived fit between employee and supervisor characteristics (i.e., values, personality, and behavioral styles). Person-organization fit has been proposed and categorized as an organizational level (Werbel and DeMarie, 2005; Werbel and Johnson, 2001), thus person-organization fit is adopted for this study.

Person-organization fit has been suggested that organizational values may be an important factor influencing employee behaviors and attitudes (Tak, 2011; Van Vianen, Shen, and Chuang, 2011). Previous studies investigated the idea that employee attitudes should provide a more complete

picture of how perceived person-organization fit impacts their job satisfaction and performance (Glomb and Welsh, 2005; Kristof-Brown *et al.*, 2005). However, the antecedents of person-organization fit foremotional intelligence of employees have not been empirically tested.

This study argues that person-organization fit plays an important role in transforming organizational value and improving daily working environments (Kristof-Brown *et al.*, 2005; Van Vianen *et al.*, 2011). Employees with higher match with organizational values may experience an increase in their positive emotional intelligence (Kim, Cable, Kim, and Wang, 2009) based upon their individual responses to their work environment (Kristof-Brown *et al.*, 2005). When individuals have similar personal values to those of their organization, they are likely to experience higher levels of fit, which, in turn, enhance their emotional intelligence. Based on above the rationale, the following hypothesis is proposed:

Hypothesis 1: Person-organization fit positivelyaffects employee's emotional intelligence.

The effect of emotional intelligence

Mayer and Salovey(1997)describe emotional intelligence (EQ) as the ability to perceive emotions and to use them to improve performance on cognitive tasks, and to effectively regulate these emotions. According to Davies, Stankov, and Roberts (1998), EQ has been composed of four sub-dimensions (i.e., appraisal and expression of emotion in one's self, appraisal and recognition of emotion in others, regulation of emotion in one's self, and use of emotion to facilitate performance). These dimensions were validated by the recent studies on expatriate context (Wong *et al.*, 2004). EQ enables expatriates to grasp reason correctly with emotional concepts (Côté and Miners, 2006). Mol, Born, Willemsen, and Van Der Molen(2005), define EQ as an ability to perceive, adapt, and perform emotion effectively in new cultural settings. This study assumes that individuals with high EQ can understand their own deep emotions about psychological safety, and thus may be particularly able to maintain and regulate their emotions to complete innovation implementation effectively(Côté and Miners, 2006; Somech and Drach-Zahavy, 2013). Consequently, high EQ individuals are effective interpersonally and this may, in turn, enhance their psychological safety. Theory of person-environment fit suggests that emotionally intelligent individuals are likely to experience a higher level of psychological safety (Carmeli, Yitzhak-Halevy, and Weisberg, 2009; Mayer, Caruso, and Salovey, 1999). The above arguments suggest the following hypothesis.

Hypothesis 2: Emotional intelligencepositivelyaffects employee'spsychological safety.

The cross-level mediation effect of emotional intelligence

According to person-organization fit theory, person-organization fit may increase in employee's positive emotional intelligence (Ang and Van Dyne, 2008; Kristof-Brown *et al.*, 2005). Emotional intelligence has potential for improving safety-related efforts and other aspects of individuals' work (Wiegand, 2007). The key concept of emotional intelligence is associated with self-awareness, where individuals are able to identify their emotions and manage them in various social environments (Seligson and MacPhee, 2004). Emotional intelligence is positively

significant related to retention and workplace environment safety (Codier, Kooker, and Shoultz, 2008). At the work place emotional intelligence is to be developed and a favorable psychological work climate(Owolabi, 2012), which in turn is more likely to experience a higher level of psychological safety (Carmeli *et al.*, 2009). Thus, this study posits that person-organizationfit has influence on employee's emotional intelligence, which in turn to enhance employee's psychological climate. Based on above rationale, the following hypothesis is proposed:

Hypothesis 3: Emotional intelligencepositivelymediates the relationship between person-organization fit and psychological safety.

The mediation effect of psychological safety

As stated earlier, the key concept of emotional intelligence is to enhance employee's psychological safety (i.e., Codier *et al.*, 2008; Owolabi, 2012; Wiegand, 2007).Psychological safety refers to individuals shared belief about the consequences of interpersonal risk taking within the organization (Kessel, Kratzer, and Schultz, 2012). Psychological safety is associated with the work environment, such as the degree of supportive relationships and the degree to which innovation is promoted (Schneider, Smith, and Paul, 2001; Tordera, González-Roma, and Peiró, 2008). In turn, psychosocial safety determines work performance (Idris, Dollard, Coward, and Dormann, 2012), creative performance (Kessel *et al.*, 2012), leader-direct behavior (Troster and van Knippenberg, 2012), and team innovation (Peltokorpi and Hasu, 2013). It is argued that psychological safety can facilitate an organization's innovative climate (González-Roma, Peiró, and Tordera, 2002). Psychological safety is hypothesized to link innovation (Post, 2012). In line with previous study proposed that psychological safety partially mediated the relationship between the structural and cognitive capital and innovation (Gu, Wang, and Wang, 2013). Thus, this study posits that the influence of emotional intelligence on innovation climatewhile considering psychological climate as a mediating variable. Based on above research arguments, the following hypotheses are proposed:

Hypothesis 4: Psychological safety positively affects innovation climate.

Hypothesis 5: Psychological safety positively mediates the relationship between emotional intelligence and innovation climate.

The moderating **effect of leader openness**

Leader openness refers to the extent to which leaders engage with idea and suggestions from team or individual member in an open-minded fashion (Milliken, Morrison, and Hewlin, 2003). Leaders who are open to their subordinates' ideas and suggestions decrease the salient of power differential between leaders and subordinates and they may fear to speak up (Edmondson, 2003). Because leader openness signals subordinates that they may not be afraid of open criticism (Detert and Burris, 2007; Troster and van Knippenberg, 2012). This study hypothesized that when individual employees perceive higher levels of emotional intelligence, their psychological safety would be likely to increase. In addition, emotional intelligence would account for greater

variance in employee's psychological safety among individuals whose effort is determined by what managers perceived as being open to new ideas and suggestions. It is expected thatleader openness will moderate the relationship between emotional intelligence and psychological safety so that the relationship will be stronger for those individuals with highperceived leader openness. In turn, leader openness plays a very critical role in the extent to which employees will vary their psychological safety depending on the perceptions of emotional intelligence they receive from managers. Leader openness (Detert and Burris, 2007)may play an important role as a moderating variable in a cross-level effect that can improve the relationship between emotional intelligence and psychological safety. For example, leader openness may moderate the impact of emotional intelligence on employee's psychological safety in such a way that emotional intelligence relates more positively to employee's psychological safety when individual employee perceived leader openness is higher, rather than lower.Thus, the following hypothesis is proposed:

Hypothesis 7: Leader openness moderates the relationship between emotional intelligence and psychological safety such that employees with higher emotional intelligence will have higher levels of psychological safety.

METHOD

Samples and data collection

The sampling process of this study involved three phases. First, a random sampling technique was adopted to select 158 high-tech firms out of the 200 listed by the Common Wealth Magazine in Taiwan (2010). Second, a purposive sampling technique (i.e., quota sampling)(Cooper and Schindler, 2011) was also adopted to select 1:4 dyadic managers and employees relationships in each R&D department of the 158 firms. Finally, email based survey was used to send 5 questionnaires (one for manager and 4 for employees at the same department). In this stage, we requested via e-mail for the help of managers in each R&D department of each high-tech firm to identify employees as participants. A total of 78 high-tech firms were responded (i.e., cross-industrial zones in Taiwan), which included 78 managers and 234 employees from the R&D departments. Similarly, 11 high-tech firms (i.e., 11 managers and 33 employees) had to be excluded as outliers, and these were deleted using graphic methods, with a residual scatter plot in the range of ± 3 standard deviation. Finally, a total of 67 managers and 252 employees from 67 high-tech industries were determined to be usable. The effective responsive rate was 42.40 percent (67/158).As suggested by Saunders, Lewis, and Thornhill(2007), given that the likely response rate range between 30% and 50%, this response rate was viewed as adequate.

MEASUREMENT SCALES

Person-organization fit

Person-organization fit was assessed with three items which wereoperationalized from Kristof-Brown et al. (2005). The items were: "My values match or fit the values of this organization"; "I am able to maintain my values at this company"; and "My values support me to fit in at this

company because they are same withthe company's values." According toWerbel and DeMarie(2005), and Werbel and Johnson (2001), this study treats person-organization fit as an organizational-level of analysis and 3 to 4 employees of each sample firms were invited to rate these measurement items.

Leader openness

In line with Detert and Burris (2007), we used three items. The items were: "My supervisor is open to suggestions"; "Good ideas get serious consideration from my supervisor"; and "When good suggestions are made to my supervisor, they receive fair evaluation." According to Troster and van Knippenberg(2012), we treated leader openness as an organizational-level of analysis and3 to 4 employees were invited to rate these measurement items.

Emotional intelligence

Twelve items and 4 sub-dimensions of emotional intelligence were developed by Wong, Law and Wong(2004): 1) Self-emotional appraisal contains 3 items related to the statement: 'When I am upset, I will talk to someone who is close to me about my feelings'; 2) Other's emotional appraisal contains 3 items related to the statement: 'When a friend comes to me because he/she is not happy, I will share his/her feeling'; 3) Regulation of emotion contains 3 items related to the statement: 'When you have to do something you don't like, you will try to gain something interesting from it'; and 4) Use of emotion contains 3 items related to the statement: 'When you face problems regarding your work, you will handle the problem yourself because everyone should deal with his/her own life'. We treated emotional intelligence as an individual-level of analysis and self-rating scales were rated by 3 to 4 individual subordinates.

Psychological safety

Psychological safety was assessed with three items which were adopted from Troster and van Knippenberg(2012). The items were: "It is safe for me to speak up around here"; "In this organization, I feel safe to discuss problems and difficult issues"; and "I this organization, I feel safe to say my opinion and make suggestions for improvement even when other disagree." We treated psychological safety as an individual-level of analysis and self-rating scales were rated by 3 to 4 individual subordinates.

Innovation climate

Six items of innovative climatewere operationalized from Daft (2007). The items were: "My firm provides the climate for me to search out new technologies,processes, techniques, and/or product ideas"; " Firm provides the climate for individuals to generate creative ideas"; "Firm provides the climate for individuals to promote and champion ideasto others"; "Firm provides the climate for individuals to investigate and secure funds toimplement new ideas"; "Firm provides the climate for individuals to develop adequate plans andschedules for the implementation of new ideas"; and "Firm provides the climate for individuals to be innovative". We treated innovation

climate as an individual-level of analysis and 1 manager was invited to rate 3 to 4 individual subordinates.

All measurement item scales were measured in a-point 7Likert scale (i.e. from 1 = 'strongly disagree' to 7 = 'strongly agree'). The questionnaire items weretranslated from English to Chinese. A standardtranslation and back-translation procedurewas adopted to ensure the accuracy of the meaning of measurement items.

Analytic procedure

Person-organization fit ratings by the subordinateswere aggregated to the organizational level by averagingtheir values for each organization.The Intraclass Correlation Coefficients (ICCs—ICC1 and ICC2) technique was adopted to assess the interrater reliability of judgments as provided by each department and organization. The term *interrater reliability* is used here to refer to the degree to which judges are "inter-changeable", which is to say the extent to which judges "agree" on a set of "judgments" (James, Demaree, and Wolf, 1984, p. 86).The ICC1 coefficient represents the proportion of variance in ratings at an individual level that is attributed to group membership; whereas the ICC2 coefficient represents the reliability of the group level means (Bliese, 2000). According to James et al. (1984) and Mathieu, Gilson, and Ruddy (2006), the minimum cut-off value for ICC1 is .12, and for ICC2, it is .60. One-way ANOVA was implemented to provide empirical justification foraggregating subordinate ratings of person-organization fit.The results showed that between-group differences weresignificantly higher than within-group differences (person-organization fit: $F=3.26,\ p<.001$). The ICC1of person-organization fit was .325;the ICC2 of person-organization fit was .72.The within-group agreement ($r_{wg(j)}$) was also calculated at an organizational level of analysis. In the case of the 67high-tech firms, the mean of their $r_{wg(j)}$ was .85 for person-organization fit. All of the means$r_{wg(j)}$ were greater than the conventionally accepted value of .70 (James, Demaree, and Wolf, 1993). Taken together, these results showed thataggregation was appropriate and acceptable for theseresearch constructs.

This study employed a cross-level meditational and moderational framework between an organizational level and an individual level of analysis. To test the cross-level mediation and moderation effects of Hypotheses 1, 3, and 6, we adopted thestatistical procedures as proposed by Mathieu, Maynard, Taylor, Gilson, and Ruddy, (2007), and Mathieu and Taylor (2007). Hierarchical linear modeling (HLM 7) was used to test the cross mediation and moderation relationships (Hofmann, Giffin, and Gavin, 2000; Raudenbush and Bryk, 2002). At the individual-level of analysis, structural equation modeling (SEM) (i.e., software package AMOS 21 and SPSS 19) was adopted to test hypotheses H2, H4, and H5, respectively.

Confirmatory factor analysis (CFA)

Confirmatory factor analysis (CFA) was performed using AMOS 21 to evaluate the distinctiveness of the measures used in the present study. Anderson and Gerbing's(1988) procedure was adopted to assess the convergent and construct validity of measurement model. According to Koufteros, Babbar, and Kaighobadi(2009), the CFA procedure consists of two

factor models, such as a first order-factor model and a second order-factor model. A first order-factor model was adopted to examine the individual research constructs of both levels of analyses (i.e., organizational and individual levels), and the results of this procedure indicated that the standardized loading for all items exceeded .70 and that the t-values higher than 1.96 ($p < .05$), thus satisfying the threshold recommended by Hair, Black, Babin, and Anderson, (2010) and Kline (2011). Then, a second-order factor model was conducted to examine the overall model fit of each research construct at both levels of analyses. The following goodness of fit indices were chosen for this analysis, based on suggestions that can be found in previous studies (Bagozzi and Yi, 1988; Baumgartner and Homburg, 1996; Hair et al., 2010; Koufteros et al., 2009; Shumacker and Lomax, 2004).

The results of overall CFA of organizational-level analysis (Fig.2) showed that absolute fit indices (i.e., χ^2=10.49; df=7; χ^2/df= 1.499; GFI=.953; AGFI=.858; RMR=.065) and incremental fit indices (NNFI= .951; CFI=.982) were appropriate. At the individual-level of analysis (Fig.3), the results showed that the overall goodness-of-fit assessment satisfied the threshold of (i.e., χ^2=69.255; df=55; χ^2/df= 1.259; GFI=.962; AGFI=.937; RMSEA=.017) and incremental fit indices (NNFI= .964; CFI=.992) all achieved the minimums threshold. Thus, the model fit assessment of both levels (i.e., organizational level and individual level) can be presented as a good model fit with adequate convergent validity and construct reliability (Gerbing and Anderson, 1992; Hair *et al.*, 2010). Therefore, descriptive statistics, including means, standard deviations, coefficient alpha, and correlations among the research variables are reported in Tables 1 and 2, respectively.

RESEARCH FINDING

Cross-level mediation and moderation effects (HLM)

As shown in Table 3, theperson-organization fit has positive and significant effect on emotional intelligence (γ_{02}=.314, p<.001, R^2=.237), which provided support for Hypothesis 1.By testing the cross-level mediation effect of Hypothesis 3, four conditions of mediation procedures were adopted from Mathieu et al.(2007), and Mathieu and Taylor (2007). Furthermore, theresults also showed that emotional intelligence is partially mediated the relationship between person-organization fit and psychological safety also has a positive and significant influence on employee engagement (γ_{03}=.266, p<.05, R^2=.198) which confirmed Hypothesis 3. The results in Table 4also indicated that leader openness positively moderates the relationship between

emotional intelligence and psychological safety (γ_{02}=.186, p<.05, R^2=.158), which confirmed Hypothesis 6.

Table 3 The results of HLM (cross-level and cross-level interaction)

Independent variables	Dependent variables	
Individual-level (N=252)	Emotional intelligence	Psychological safety
	Hypothesis 1	Hypothesis 3
Education (γ_{05})	.019	.055
Job Tenure (γ_{04})	.033	.045

Transformational leadership (γ_{02})	.315**	.314**	-	.186**
R^2				. 158

Note: *** p< .001, ** p< .05, * p< .01. They are significant at a *t-value*> |1.96|. γ =Intercept (standardized coefficient). R^2 calculations were computed following Hofmann et al. (2000) and Hofmann et al.(2003).

Structural equation modeling (SEM)

Structural equation modeling (SEM) was adopted to test the maximum likelihood estimate method, and Hypotheses 2, 4, and 6. The results showed (see Figure 4) that χ^2 = 74.932; df = 57; GFI = .958; AGFI = .933; RMR =.016, and p=.056, all of which satisfied the threshold as suggested by Hair et al. (2010). Hypothesis 2 predicted emotional intelligence to have a positive

effect on psychological safety. The findings provided support for Hypothesis 2 (β=.552; p <.001; t= 6.446). Hypothesis 4 predicted psychological safety to have a positive effect on innovation climate. The results provided support Hypothesis 4 (β=.563; p <.001; t= 7.268). As suggested by Baron and Kenny's test (1986)and (i.e., structural models of First: independent variable must be shown to be significant related to the mediator; Second: independent variable must be shown to be significant related to the dependent variable, and Third: mediator must affect the dependent variable) which indicated that psychological safety has partially mediated the relationship between emotional intelligence and innovation climate. This notion is in line with Sobel's test (1982) which illustrated that z-test statistic must be exceeded a value of t-test=|1.96|. In this study z-test was 4.541>|1.96| and significant at p<.001 (more details of z-test can be seen (more details of z-test can be seen in Iacobucci, 2012; MacKinnon and Cox, 2012). Therefore, we assume that psychological safety plays an important role as mediating effect, as proposed in Hypothesis 5.

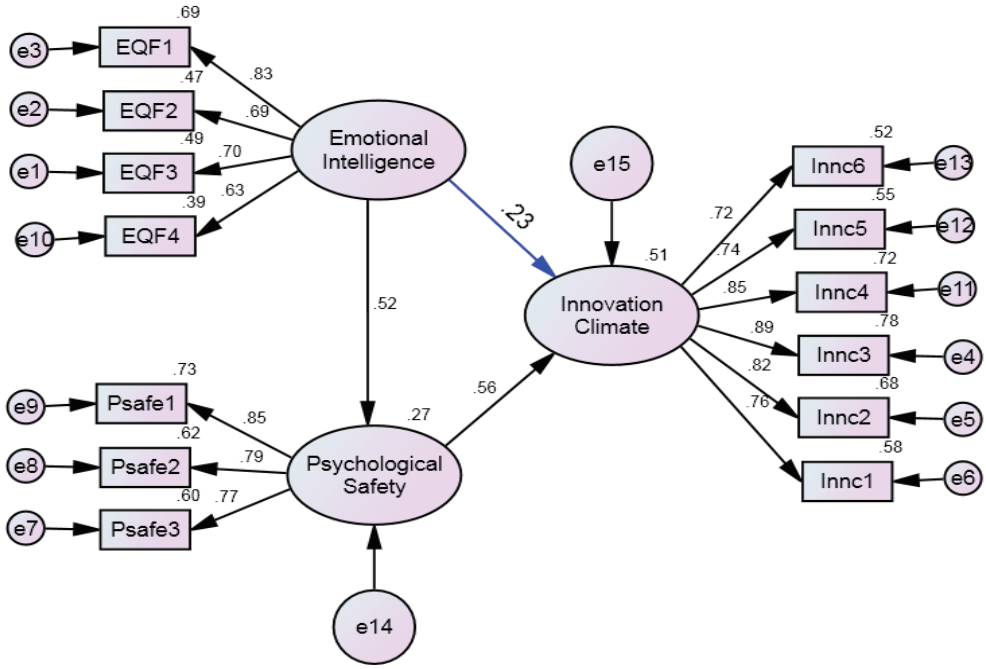

Figure-4 The results of SEM—Individual-level of analysis (N=252)

RESEARCH DISCUSSIONS

This study drew from multiple perspective theory of person-environment fit, and an extension of extension of emotional intelligence research framework, available literatures on leader openness, psychological safety, and innovation climate to explain the proposed hypotheses. Empirical data collected from two different sources, including managers (organizational-level) and subordinates (individual-level), were analyzed. At the cross-level of analysis, the research findings indicated the effect of person-organization fit on emotional intelligence (H1) is significant. This is confirmed that employees with higher match with organizational values may experience an increase in their positive emotional intelligence (Kim *et al.*, 2009).

At the cross-level mediation and moderation of analysis, the findings of this study showed that emotional intelligence partially mediated the relationship between person-organization fit and psychological safety (H3).This is confirmed that person-organization fit may increase in employee's positive emotional intelligence (Kristof-Brown *et al.*, 2005; Owolabi, 2012), which in turn to likely to experience a higher level of psychological safety (Carmeli *et al.*, 2009). The research findings also found that leader opennesshas a positive moderating effect the relationship between emotional intelligence and psychological safety (H5). This is confirmed by this study and expected that leader openness may play an important role as a moderating variable in a cross-level effect that can improve the relationship between emotional intelligence and psychological safety(Detert and Burris, 2007; Troster and van Knippenberg, 2012).

At the individual-level of analysis, the results of SEM showed that emotional intelligence has significant effect on psychological safety (H2). This is consistent with research arguments as proposed by previous studies (i.e., Carmeli *et al.*, 2009; Côté and Miners, 2006; Somech and Drach-Zahavy, 2013), which argued that individuals with higher emotionally intelligence are likely to experience a higher level of psychological safety. Indeed, psychological safety has found to be significant positively related to innovation climate (H4). This is in line with previous research arguments as proposed by recent studies (i.e., Gu *et al.*, 2013; Peltokorpi and Hasu, 2013; Post, 2012), which argued that psychological safety is hypothesized to enhance organizational innovation and innovation climate. The results also indicated that psychological safety partially mediated the relationship between emotional intelligence and innovation climate (H5). This is confirmed by this study.

Implications and Future Research

Although the present study provides valuable insights into an understanding of the extension literature of person-environment fit, emotional intelligence, psychological safety, and personality traits (i.e., leader openness)to explore innovation climate through a mechanism of cross-level mediation effects of emotional intelligence, there are a few limitations that should be recognized and these may provide a departure for future research. First, although there is theoretical and empirical support both the mediation and the moderationof our research model, using the 67 high-tech firms in Taiwan as the sample, the sample size may need to be increased. Second, this studystudy focused on subordinate-manager pairs in each of the R&D department, which seems to be a small portion of the total staffs of such organizations. Therefore, future research should

take a closer look at cross-functional units or teams rather than single units alone. This study proposes that cross-functional units (i.e., R&D, marketing, and HRM departments) will also be important for the developing and creating innovation climate. Thus, individuals from cross-functional units need to bring together to perform unique tasks to create innovative services designed to achieve high levels of organizational performance and customer service (Lussier&Achua, 2007). Third, this study failed to prove that two control variables (i.e., educational and job tenure) are significantly related to their innovation climate. This study suspected that cultural effects including power distance and collectivism(Farh, Hackett, and Liang, 2007; Kirkman, Chen, Farh, and Lowe, 2009) may impact the results of this study. Future research should replicate the findings in this study byusing samples from different cultural contexts.

Fourth, this study argues that hiring employees who belong to Gen Y are key human assets and capitals in terms of effectively adopting new learning processes and creating new ideas to innovate services or products in order to meet customer expectations, as well as increase the market share. Similarly, Gen Yers are even more comfortable with technology and are able to make use of collaborative tools such as cell phones, and social networking platforms to communicate with others and facilitate a collective process of creative problem solving (Mhatre and Conger, 2011). Indeed, Gen Y individuals exhibit a greater preference for seeking guidance, and supervision from their superiors. They tend to follow directions well, value collaboration and teamwork (Dolezalek, 2007; Hastings, 2008). However, Gen Yers seem to be in lack of cooperation and communication with leaders (i.e., Erickson, Alsop, Nicholson, and Miller, 2009). Gen Yers are less loyal to their employers than previous generations (i.e., Durkin, 2008; Hira, 2007). Along with these debates should be further addressed by future study.

In summary, the results presented here contribute to our understanding of how the mechanisms of the effect of emotional intelligence and psychological safety can manipulate innovation climate and offer insights on how to enhance organizational innovation from various person-organizational fit perspectives. These research findings may also provide significant in this study have contributed to both academics and professionals to understand how matched pairs in employee-supervisor relationships can improve emotional intelligence and psychological safety and meet the demands of organizational innovation, as well as organizational expectations.

THE ANTECEDENTS AND MEDIATORS OF NEW PRODUCT DEVELOPMENT SUCCESS

Les Tien-Shang Lee, Department of International Trade, Graduate College of Management School of Business, Kun Shan University, Taiwan
Email: llee321@mail.ksu.edu.tw

ABSTRACT

Purpose: *This study aims to explore the antecedents of new product development (NPD) success rising innovative work behavior and team reflexivity as the mediators. A research model was developed and empirical validations of this model was confirmed.*
Design/methodology/approach: *This study used quantitative study with questionnaire approach to collect the data. The respondents are 41 teams which consist of team leaders and team members from various companies. SPSS software and Smart PLS software was used to analyze the results.*
Findings: *Based on content analysis, this study developed the research framework of NPD team success. The antecedents of NPD success are regulatory focus, project orientation, and task familiarity which affected NPD success through innovative work behavior and team reflexivity. The quantitative result indicates that regulatory focus has significant relationship with innovative work behavior; project orientation and task familiarity has a positive relationship with team reflexivity; innovative work behavior and regulatory focus have significant relationship to the NPD success.*
Research limitation/implications: *The main limitation of this study is that the respondents come from various industries which may results in bias. The comprehensive research framework that developed in this study can be guidance and benchmark for future research. In practice, team leader can get deep understanding about the main factors of NPD success in order to improve their NPD performance.*
Originality/value: *This study developed a comprehensive research framework and ten research hypotheses of NPD success that can be very useful for future focus.*

Keywords: regulatory focus, project orientation, task familiarity, innovative work behavior, team reflexivity, NPD success
Paper type: Research paper

INTRODUCTION

New product success has been an important issue in new product development (NPD) research. Griffin (1997) reports that the average success rate of NPD in USA was 59% and 100 ideas lead to 15.2 successful new products. Ozer and Chen (2006) reports that the success rate of NPD in Hong Kong is 44.91% and 100 ideas only lead to 2.15 successful new products.

Currently, organizations are increasingly relying on teams to innovate and respond to the rapidly changing marketplace (e.g., West, 2002). In other words, an organization needs to maintain and strengthen their NPD teams if they are going to innovate (e.g., Tjosvold,

1991). This study regards team's ability for being reflexive (West, 1996, 2002) as a crucial element to transform the members' knowledge and skills into innovative products. In addition, this study asserts that team reflexivity determined by members' project management skills (Hoegl and Parboteeah, 2006). The skills are necessary for flexible planning and ongoing controlling of the task process, which is of particular importance in the case of innovative projects, since it has high degree of task-related uncertainty and complexity. Moreover, NPD teams will have capability to be reflexive when they have adequate knowledge on certain issues related with the newly developed product. Refer to Brockman and Morgan (2006), team members' knowledge is critical to determine the quality of reflexivity of the team. When the members' have adequate level of knowledge and project skills, team's reflection could generate innovative ideas.

This study proposes that project orientation also determines the level of team reflexivity, either customer- or competitor-related orientation (Kohli and Jaworski, 1990 and Homburg et al., 2007). Based on above discussion, this study considers five variables as determinants of NPD success which are regulatory focus, project orientation, task familiarity, innovative work behaviors and team reflexivity. This study argues that NPD team members' intentional introduction or application of new ideas, products, processes, and procedures to their team (West and Farr, 1989, 1990b; Yuan and Woodman, 2010) also will facilitate the success of NPD. Despite proposing ideas from the team members, innovative work behaviors also includes the ability to adopt others' ideas that are new to one's organization or work unit (Woodman et al., 1993). Similar to the antecedents of team reflexivity, this study proposes that members' innovative behaviors are determined by regulatory focus, project orientation, and task familiarity that NPD teams had.

As a consequences, there are four research objectives of this study. First, to examine the antecedents and consequences of innovative work behaviors and team reflexivity inside NPD teams. Second, to investigate the effect of project orientation, regulatory focus and task familiarity on team reflexivity. Third, to investigate the effect of project orientation, regulatory focus and task familiarity on innovative work behavior. Fourth, to investigate the effect of project orientation, regulatory focus and task familiarity on NPD success.

LITERATURE REVIEW

Definition of Construct

1. Project Orientation

This study identify project orientation based on the concept of market orientation (e.g., Kohli and Jaworski, 1990; Narver and Slater, 1990). According to Narver and Slater (1990) market orientation is "the organization culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers and, thus, continuous superior performance for the business" (p.3). According to Homburg, Grozdanovic, and Klarmann (2007), responsiveness is typically a main facet of market orientation. They further proposed that there are two different kinds of responsiveness: "customer-related responsiveness is the extent to which an organization responds quickly to customer- related changes, and… competitor-related responsiveness is the extent to

which an organization responds quickly to competitor-related changes" (Homburg et al., 2007, p. 19). Based on that, this study adopts both customer-related and competitor-related responsiveness. This study asserts that timely responses to customer-related changes and competitor-related changes will result in many beneficial consequences for NPD teams.

2. Team Reflexivity

According to West (1996, 2000, 2002), there are three central elements to the concept of reflexivity—reflection, planning, and action or adaptation. Reflection consists of attention, awareness, monitoring, and evaluation of the object of reflection. Planning is one of the potential consequences of the indeterminacy of reflection, since during this indeterminacy, the courses of action can be contemplated, intentions formed, plans developed (in more or less detail), and the potential for carrying them out is built up. High reflexivity exists when team planning is characterized by greater detail, inclusiveness of potential problems, hierarchical ordering of plans, and long as well as short range planning. The more detailed the implementation plans, the greater the likelihood that they will manifest in innovation (Frese and Zapf, 1994; Gollwitzer, 1996). Indeed the work of Gollwitzer and colleagues suggests that innovation will be implemented almost only when the team has articulated implementation intentions. This is because planning creates a conceptual readiness for, and guides team members' attention towards relevant opportunities for action and means to implement the innovation. Action refers to goal-directed behaviors relevant to achieving the desired changes in team objective, strategies, processes, organizations, or environments identified by the team. In a variety of studies links between reflexivity and team innovation and effectiveness have been demonstrated (Carter and West, 1998; West, Patterson, and Dawson, 1999; Borrill *et al.*, 2000). This study uses these dimensions - reflection, planning, and action or adaptation – to represents the team reflexivity which can influence the product innovativeness of NPD teams' resulted as well as the new product performance.

3. Innovative Work Behaviors

Drawing on West and Farr (1989, 1990b), Yuan and Woodman (2010) define innovative behavior as an employee's intentional introduction or application of new ideas, products, processes, and procedures to his or her work role, work unit, or organization. Examples of such behavior include searching out new technologies, suggesting new ways to achieve objectives, applying new work methods, and investigating and securing resources to implement new ideas. In keeping with Kanter (1988), Janssen (2000), and Scott and Bruce (1994), this study asserts that innovative behavior as complex behavior consisting of activities pertaining to both the generation/introduction of new ideas (either by oneself or adopted from others) and the realization or implementation of new ideas. One related construct in the literature is creative behavior, which refers to behavior pertaining to the generation of ideas that are both novel and useful (Amabile, 1988; Oldham and Cummings, 1996). Creative behavior can be considered as one type of innovative behavior because innovative behavior includes not only generating novel ideas by oneself but also adopting others' ideas that are new to one's organization or work unit (Woodman et al., 1993). Also, creative behavior concerns new idea generation, whereas innovative behavior includes both the generation and implementation of new ideas (Shalley et al., 2004; Zhou, 2003).

4. Regulatory Focus

Specifically, Higgins (1997) proposed that people have two basic self-regulation systems. One regulates the achievement of rewards and focuses individuals on *promotion* goals, while the other regulates the avoidance of punishments and focuses individuals on *prevention* goals. Promotion goals represent the "ideal self" and include hopes, wishes, and aspirations, whereas prevention goals represent the "ought self" and include duties, obligations, and responsibilities.

The regulatory focus is determined both by situational and chronic factors (Higgins, 1997, 1998). Recent studies on prevention-promotion effects have suggested that the regulatory focus can be thought of as rich syndromes that differ from each other on multiple variables (Kluger, Stephan, Ganzach, and Hershkovitz, 2004; Van Dijk and Kluger, 2004). The basic motivations that underlie these two syndromes are two conflicting motivations: the motivation for stability versus the motivation for change. Both motivations are important for survival of the human being (Levontin, Kluger, and Van Dijk, 2004). According to this notion, the purpose of the prevention focus is to assure one's safety and security, to maintain routines, and to preserve the status quo. In contrast, the purpose of the promotion focus is to pursue development and change and to explore the advantage of creative and novel behaviors. Researchers have used regulatory focus theory to study goal attainment (e.g., Forster, Higgins, and Idson, 1998; Shah, Higgins, and Friedman, 1998), decision making (e.g., Crowe and Higgins, 1997), creativity (Friedman and Forster, 2001), information processing and persuasion (Aaker and Lee, 2001), and feedback and motivation (Forster, Grant, Idson, and Higgins, 2001; Van Dijk and Kluger, 2004). However, the theory has not been applied to the study of NPD.

5. Task Familiarity

The concept of familiarity in organizational teams has been defined as "the knowledge that members of a team have about the unique aspects of their work" (Goodman and Garber 1988), such as knowledge about the task itself and about other members of the team (Littlepage et al. 1997). As members work together over time, they become familiar with the task domain and with each other (Katz 1982), and they develop a common knowledge base through which team interaction and location of expert sources in the team can occur (Alavi and Leidner 2001). Task familiarity deals with the innovation , while team familiarity deals with incremental innovation. As discussed by Smith and Tushman (2005), exploration task familiarity is rooted in variance-increasing activities, learning by doing, and trial and error, while exploitation task familiarity is rooted in variance-decreasing activities and disciplined problem solving.

6. Outcomes

New product performance constitutes the very end of the innovation process (Perez Bustamante, 1999). New product performance has defined by Marsh and Stock (2006) as company's innovative capabilities, product quality, and efficiency of the firms on their new product. Song and Montoya-Weiss (1998) measures new product success as the degree to which a product met a firm's profit objectives. The vast majority of the studies suggest that being market oriented is associated with superior performance of

new-product success (e.g., Harmancioglu, McNally, Calantone, and Durmusoglu, 2007; Narver, Slater, and MacLachlan, 2004). Consistent with this stream of literatures, this study asserts that new product success can be assessed by market success of new product. Following Millson and Wilemon (2006), the market success is determined by four of new product success measurement as follows: (1) the degree to which a new product's profits exceeded or fell short of what is expected; (2) the degree to which sales exceeded or fell short of what is expected; (3) the degree to which a new product created a product category new to the firm; and (4) the degree to which a new product created a market that is new to the industry.

Hypotheses Development

1 The Determinants of Innovative Work Behaviors

Kark and Van Dijk (2007) indicate that the purpose of the promotion focus is to pursue development and change and to explore the advantage of creative and novel behaviors. Consequently, NPD team members will have greater willingness to perform innovative work behaviors when they have greater promotion focus. In contrast, members who operate primarily within the prevention focus are more concerned with duties and obligations, are likely to be sensitive to the presence or absence of punishments, and use avoidance as a goal attainment strategy (e.g., Crowe and Higgins, 1997; Friedman and Forster, 2001). Further, the purpose of the prevention focus is to assure one's safety and security, to maintain routines, and to preserve the status quo (Kark and Van Dijk, 2007). This study argues that members with prevention focus have less willingness to perform innovative work behaviors due to their avoidance attitude

NPD teams might have customer or competitor related responsiveness (Homburg et al., 2007). Either one, responsiveness of the NPD team members toward customer- or competitor-related changes will increase the innovative work behaviors from the members. In a product design firm, Sutton and Hargadon (1996) found that design engineers used brainstorming sessions as "prestige" or "status auctions"—that is, as opportunities to impress their peers and establish favorable social images. Thus, when NPD teams have customer or competitor related responsiveness, the members will tend to introduce innovative ideas in order to impress each other. Therefore, the following hypothesis is developed:

Hypothesis 1. Regulatory focus has positive influence on innovative work behavior
Hypothesis 2. Project orientation has positive influence on innovative work behavior

2 The Determinants of Team Reflexivity

Customer orientation echoes the classic tenet of 'stay close to the customer' and 'put the customer at the top of the organizational chart' and therefore is the most essential part of a market orientation (Peters and Austin, 1985; Deshpande´ and Farley, 1998). Consequently, the NPD team needs to be more reflexive on any changes related with their customers. On the other hand, competitor orientation focuses on the strengths and weaknesses of its competitors (Deshpande´ et al., 1993; Armstrong and Collopy, 1996). To response on any actions being taken by its competitors, NPD team also need to

be reflexive in order to overcome the thgreats posed by the competitors. In summary, Day and Wensley (1988) propose that customer and competitor orientations are two distinct approaches that lead to competitive advantage. A customer orientation, with its detailed analyses of customer needs and wants, helps a firm satisfy its customers better, and thus is more likely to lead to a differentiation advantage. In contrast, a competitor orientation may lead to a cost advantage because competitor-oriented businesses tend to watch costs closely, so they may quickly match the marketing initiatives of competitors. These advantages could be reach when the NPD teams are being reflexive toward their current tasks.

Harrison et.al. (2003) conjectured that the effects of familiarity on team performance may differ depending on the nature of the task itself. Similarly, Reagans et.al. (2005) also concluded that the task matters when studying the effects of familiarity. Their experimental study shows that team performance increased with task experience and decreased with task complexity. Performance on simpler tasks improved more strongly with task experience than on more complex tasks. Based on above descriptions, the following hypotheses are developed:

Hypothesis 3. Project orientation has positive influence on team reflexivity

Hypothesis 4. Task familiarity has positive influence on team reflexivity

3. The Effect of Team Reflexivity

Teams that engage in a complex processing (i.e., that are highly reflexive) will develop more innovations (ideas for new and improved ways of doing things or new products and services) than nonreflexive teams do (Hülsheger et al., 2009). The team reflexivity can make the team develop more innovation in the project. Furthermore, team reflexivity positively relates to higher levels of innovation and greater product performance (e.g., Carter & West, 1998; Tjosvold, et al., 2004). Reflexive teams are also likely to make better use of team members' expertise, thus achieving better project success due to greater awareness of their fellow team members' expertise and skills (Tjosvold, et al., 2004). From the results of previous research we conclude that team reflexivity plays an important role in determining the success of new product development. Based on above descriptions, the following hypothese are developed:

Hypothesis 5. Team reflexivity has positive influence on innovative work behavior.

Hypothesis 9. Team reflexivity has positive influence on NPD success.

4. The Effect of Innovative Work Behaviors

One of the major reasons people innovate in the workplace is to bring performance gains (Yuan and Woodman, 2010). This statement clearly states that there is a relationship between innovative work behaviour and performance gains. Expected performance outcomes are positive when employees believe that their innovative behaviors will bring performance improvement or efficiency gains for their work roles or work units, particularly in NPD teams (Yuan and Woodman, 2010). The innovative work behavior plays an important role in determining the sucess of the product development. Based on above descriptions, the

following hypothesis is developed:

Hypothesis 8. Innovative work behavior has positive influence on NPD success

5. The Effect of Regulatory Focus

Each regulatory focus has different consequences for perception, decision making, and emotions, as well as for individuals' behavior and performance (Higgins, 1997, 1998). Individuals who operate primarily within the promotion focus are more concerned with accomplishments and aspirations, are likely to be sensitive to the presence or absence of rewards, use approach as a goal attainment strategy, are more creative in problem-solving processes, show more willingness to take risks, and experience emotions ranging from elation and happiness to dejection (e.g., Brockner and Higgins, 2001; Crowe and Higgins, 1997; Friedman and Forster, 2001). In contrast, individuals who operate primarily within the prevention focus are more concerned with duties and obligations, are likely to be sensitive to the presence or absence of punishments, use avoidance as a goal attainment strategy, and experience emotions ranging from agitation or anxiety to quiescence or calmness.

The company which support the team by good promotion goals will be able to motivate the team members in doing their job. The purpose of the prevention focus is to assure one's safety and security, to maintain routines, and to preserve the status quo. In contrast, the purpose of the promotion focus is to pursue development and change and to explore the advantage of creative and novel behaviors. Based on above descriptions, the following hypothesis is developed:

Hypothesis 6. Regulatory focus has positive influence on NPD success.

6. The Effect of Task Familiarity

The concept of familiarity in organizational teams has been defined as "the knowledge that members of a team have about the unique aspects of their work" (Goodman and Garber 1988), such as knowledge about the task itself and about other members on the team (Littlepage et al. 1997). As members of a team work together over time, they become familiar with the task domain and with each other (Katz 1982), and they develop a common knowledge base through which team interaction and location of expert sources in the team can occur (Alavi and Leidner 2001). On the contrary, since exploitation task require NPD team to develop new product based on the existing product, thus, has higher familiarity with the tasks, and will able to produce a new product. Based on above descriptions, the following hypothesis is developed:

Hypothesis 7. Task Familiarity has positive influence on NPD success.

7. The Effect of Project Orientation

According to Homburg, Grozdanovic, and Klarmann (2007), responsiveness is typically a main facet of market orientation. They further propose that there are two different kinds of responsiveness: "customer-related responsiveness as the extent to which an organization responds quickly to customer- related changes, and… competitor-related responsiveness as the extent to which an organization responds quickly to competitor-related changes"

(Homburg et al., 2007, p. 19). This study asserts that timely responses to customer-related changes and competitor-related changes have several beneficial consequences for NPD. Based on above descriptions, the following hypothesis is developed:

Hypothesis 10. Project orientation has positive influence on NPD success.

RESEARCH METHODOLOGY

1. Research Model

Based on the above literature review and hypotheses development, this study develops a comprehensive research framework as shown in Figure 1. As shown in the framework, NPD success are influenced by regulatory focus, project orientation, task familiarity through NPD team reflexivity and innovative work behaviors. In this framework, innovative work and team reflexivity are served as two mediators that can facilitate the influences of the three antecedents on NPD success.

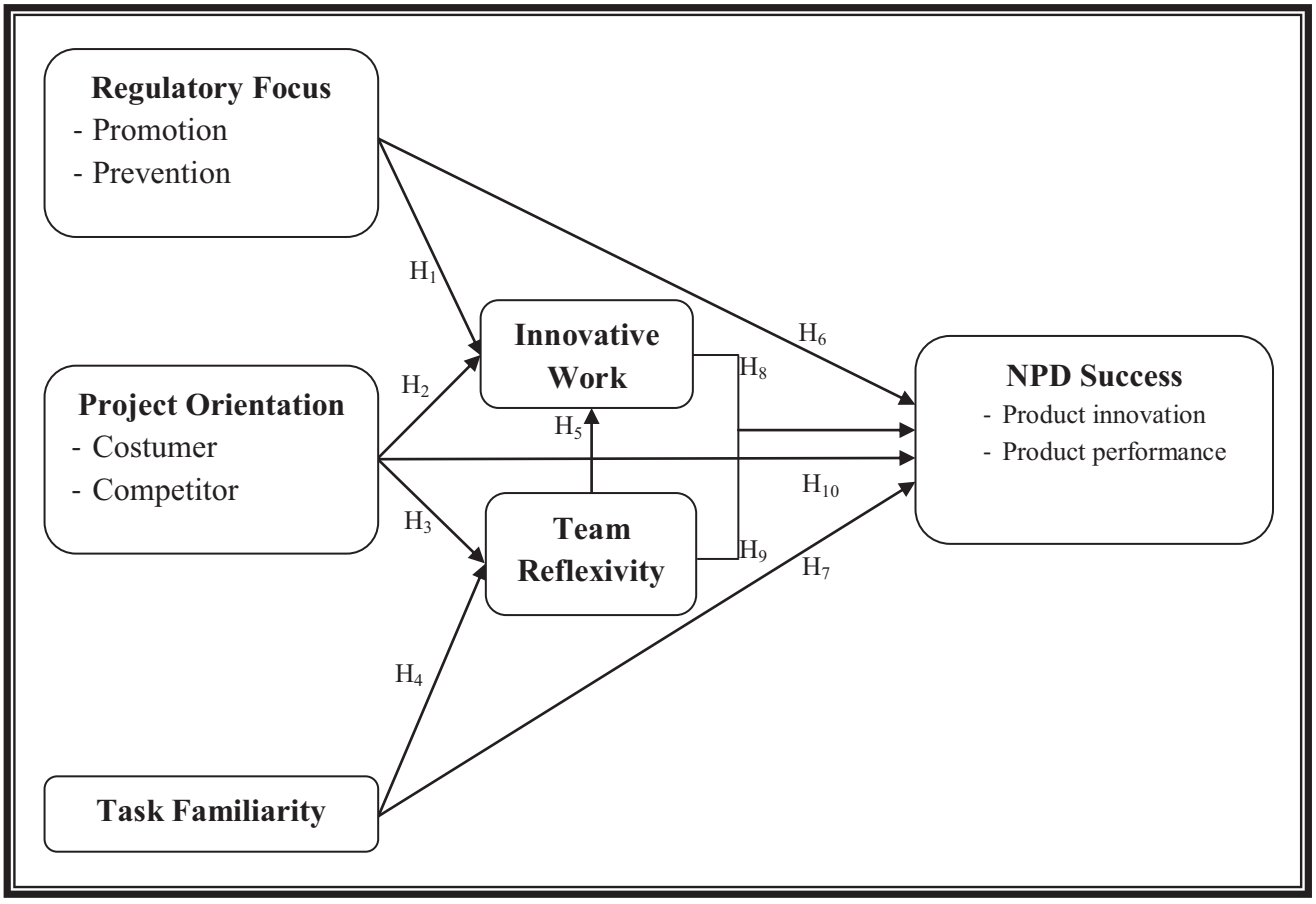

Figure 1 : Research Framework

2. Measurement of Construct

Survey questionnaire items were designed based on the review of literature. Some potential questionnaire items are listed below:

1. *Regulatory Focus.*
   This study adopted RFQ items from Higgins, Friedman, Harlow, Idson, Ayduk, and Taylor (2011) to measure regulatory focus based on their life history. All questionnaire items were measured on a 5-point Likert scale.
2. *Project Orientation.*
   This study adopted the items developed by Narver and Slater (1990) to measure the construct of project orientation. All the questionnaire items were measure on a 5-point Likert scale.
3. *Task familiarity.*
   This study employed items that modified from the existing knowledge developed by Moorman and Miner (1997) and Brockman and Morgan (2006). All the questionnaire items were measured on a 5-Likert rating scale.
4. *Innovative work behaviors.*
   This study employed six items of innovative work behaviors as developed by Scott and Bruce (1994) and further adopted by Yuan and Woodman (2010). All the questionnaire items were measured on a 5-Likert rating scale.
5. *Team reflexivity,*
   The questionnaire items of team reflexivity were adopted from Hoegl and Parboteeah (2006). All the questionnaire items were measured on a 5-Likert rating scale.
6. *NPD Success*
   The questionnaire items of product innovation were adopted from Jordan and Segelod (2006) and product innovation were adopted from Copper and Kleinschmidt (1987), and Akgun et al. (2006).

3 Sampling Design and Data Collection

In both, online and offline questionnaire surveys were conducted in this study. Forty one R&D teams of new product development (NPD) were selected. For each NPD team, there are one team leader and four team members that answer our questionnaire items.

Table 1. Demographic characteristics of respondents

Characteristic		Number	Percent
Gender	Male	147	72%
	Female	58	28%
Marriage	Single	115	56%
	Married	90	44%
Age	Less than 25	61	30%
	26-35	72	35%
	36-45	43	21%
	46-55	25	12%
	More than 55	4	2%
Education	Bachelor degree	111	54%
	Master degree	85	41%
	Doctoral degree	9	4%
Working experience	Less than 5 years	82	40%
	6-10 years	66	32%
	11-15 years	30	15%
	More than 16 years	27	13%
Project Experience	Less than 5 years	128	62%
	6-10 years	51	25%
	11-15 years	13	6%
	More than 16 years	13	6%
Position	General Employee	120	59%
	Supervisor	40	20%
	Lower-level manager	19	9%
	Middle-level manager	13	6%
	Top Manager	13	6%
Position in NPD team	Leader	41	20%
	Member	164	80%
Type of industry	Traditional industries	53	26%
	High-tech manufacturing industry	61	30%
	Other	91	44%

A total of 205 respondents from Indonesia and Taiwan participate in the survey. The survey material includes a cover letter from researcher and university-addressed. Respondents were asked to express their opinions about their project orientation, team reflexivity, task familiarity innovative work behaviors, and NPD success. Respondents were promise to complete anonymity of any information that they submitted.

For each NPD team, the team leader in the high-tech firms in Taiwan and Indonesia were asked to participate in the survey. The survey questionnaires were sent to the leaders and members of representative NPD teams

4 Construct Reliability and Validity

The final versions of the survey questionnaire items were refined through a process of purification including factor analysis, item-to-total correlation, and Cronbach's alpha. A total 205 respondents from 41 NPD teams of firms were participated this study. The

members were asked to express their perception toward regulatory focus, project orientation, task familiarity. While the items related with team reflexivity, innovative work behaviors, NPD success, and firm performance were responded by team leaders. In order to achieve the purposes of this study and to test the research hypotheses, SPSS and Smart PLS software were employed to analyze the collected data.

To purify the measurement scales of each research construct and to identify their dimensionality, principal components factor analysis with varimax rotation were applied to condense the collected data from a number of variables into a few factors. After conducting factor analysis, item-to-total correlation and internal consistency analysis were employed to confirm the reliability of each factors. Result of the factor analysis are presented in table 2. As shown, all factor loadings were higher than 0.6 with eigenvalue is higher than 1. The *item-to-total correlation* for all variables were higher than 0,5 and Cronbach's alpha higher than 0.6, suggest higher internal consistency for all variables.

RESULTS AND DISSCUSSIONS

The research results are displayed in Figure 2. Each latent variable is related to one or more manifest variables that are measured. For example, for the task familiarity (TF) latent variable the four manifest variables are:

a. A great deal of information about this product category (TF1)
b. A great deal of knowledge about this product category (TF2)
c. A strong understanding of this product category (TF3)
d. A great deal of insight regarding this product category (TF4)

There are total of six latent variable with its own manifest variable in this framework. There are also ten hypotheses among the latent variable.

There are ten hyphotheses in this study with 205 samples consist of 41 team leaders and 164 team members of various company. SmartPLS software was used to test the hypotheses. The result of SmartPLS is provided in Table 4.

a. The determinants of innovative work behavior (hypothesis 1 and 2)
   Table 4 shows that regulatory focus has negative effect (β=-0.1554; $p<0.01$) on innovative work behavior and project orientation has no effect on innovative work behavior ((β=-0.0612; $p>0.01$). This result is contrast with Higgins (2001) that stated the company which support the team by good promotion goals will be able to motivate the team members in doing their job. Furthermore, Sutton and Hargadon (1996) stated that NPD teams which have knowledge of project orientations will tend to introduce the innovative ideas. Therefore, it can be concluded that hypothesis 1 and 2 are not supported.

b. The determinants of team reflexivity (hypothesis 3 and 4)
From table 4, we can see that both project orientation (β=0.4797; p<0.01) and task familiarity (β=0.2756; p<0.01) have positive effect on team reflexivity. This result is in line with Zhou, Brown, Dev, and Agarwal (2007) which states that project orientation places the highest priority on creating and maintaining superior customer value, and provides firm-wide norms and beliefs that guide organizational behaviors. Furthermore, Espinosa et al. (2007) states that familiarity can improve team performance. Thus, it can be concluded that hypothesis 3 and 4 are supported.

c. The effect of team reflexivity (hypothesis 5 and 9)
Table 4 shows that team reflexivity has no effect on innovative work behavior (β=0.612; p>0.01) and NPD success (β=-0.0047; p>0.01). This result is contrast with Hülsheger et al. (2009) which state that the team which engage in a complex processing (i.e., Highly reflexive) will develop more innovations (new ideas, new ways of doing job, or new products and services) than non-reflexive teams do. Furthermore, team reflexivity positively relates to higher levels of innovation and greater product performance (e.g., Carter & West, 1998; Tjosvold, et al., 2004). Therefore, it can be concluded that hypothesis 5 and 9 are not supported.

d. The effect of regulatory focus, task familiarity, project orientation and innovative work behavior on NPD success (hypothesis 6, 7, 8, and 10)
From table 4, we can see that regulatory focus (β=0.4935; p<0.01), team reflexivity (β= 0.1540; p<0.01), and innovative work behavior (β= 0.1310; p<0.01) have positive effect on NPD success. This result is in line with Yuan and Woodman (2010) that the expected performance outcomes are positive when employees believe that innovative behaviors will improve their performance or efficiency gains for their work roles or work units, particularly in NPD teams. Higgins (2010) state that the company which support the team by good promotion goals will be able to motivate the team members in doing their job. Furthermore, Alavi and Leidner (2001) state that since exploitation task require NPD team to develop new product based on the existing product, thus, with higher familiarity with the tasks, will able to produce a new product. But, project orientation (β=0.0660; p>0.01) has no effect on NPD success. This result is contrast with Homburg et al. (2007) who asserts that timely responses to customer-related changes and competitor-related changes will have beneficial consequences for NPD success. Therefore, it can be concluded that hypothesis 6, 7, and 8 are supported but hypothesis 10 is not supported.

e. The mediating effect of innovative work behavior and team reflexivity
According to figure 2, first, we can conclude that the effect of regulatory focus on NPD success is partially mediated by innovative work behavior because regulatory focus has direct and indirect effect on NPD success. Second, innovative work behavior is fully mediating the effect of project orientation on NPD success. Third, team reflexivity has no mediation effect on both the effect of project orientation and task familiarity on NPD success.

CONCLUSIONS AND SUGGESTION

This study attempts to explore the antecedents of new product development (NPD) success. Based on extensive literature reviews and quantitative study using SPSS and SmartPLS as the analytical tools, this study found the following results. Firstly, five essential elements that might contribute to the NPD success were identified. These elements include regulatory focus, project orientation, task familiarity, innovative work behaviour, and team reflexivity. Second, both regulatory focus and project orientation have a influence on innovative work behavior. Third, project orientation and task familiarity has a positive relationship with team reflexivity. The quantitative results show these two variables have a

significant and positive impact on team reflexivity. This results further confirm that a more clear project orientation and a higher task familiarity will result in higher team reflexivity.

Fourth, the quantitative results show that innovative work behavior and regulatory focus have significant relationship to NPD success, while the task familiarity and project orientation and have no significant relationship to NPD success.

Fifth, path of regulatory focus to NPD success is partially mediating by innovative work behavior and path of project orientation to NPD success is fully mediating by innovative work behavior. Furthermore, team reflexivity can not be a mediating variable for both of project orientation and task familiarity because the path of team reflexivity to NPD success is not significant.

Finally, this reaserach promises to contribute our understandings of NPD practices by developing comprehensive model that encompassed the antecedents and consequences of team reflexivity and innovative work behaviors. The antecedents include regulatory focus, project orientation and task familiarity. The three antecedents are proposed to be mediated by team reflexivity and innovative work behaviors before having effects on NPD success. This study has aimed to develop comprehensive sources of NPD team reflexivity and innovative work behaviors by proposing that regulatory focus, project orientation, and task familiarity as the determinants. The results can enhance understanding on the role of these antecedents on NPD team operations. This study has aimed to extend the concept of innovative work behaviors as the phenomenon inside NPD teams that will contribute to members', teams, and organizational outcomes. This study further argues that members will have innovative work behaviors when the team has sufficient time to reflect their current assignment. Thus, the results of this study can provide valuable information for NPD management and for further academic validation.

ABSTRACT

Purpose: *In a modern competitive market, business quick decisions are often required at the point of sales to accommodate consumers' demands. New products demanded for fitting the latest portfolio are considered as new variations and sustainable product development is secured in the productization process. However, the scope of productization has not been clearly defined, while industry specifics should be taken into account. The existing situation lacks of a well agreed description of productization process, and it is in need of a well-structured model presenting the core aspects in the productization process, for better understanding and thus for better diagnosis and management. It is getting crucial to explore the practicality of presenting the productization process from a holistic manner.*
Design/Methodology: *The idea of The Yin Yang philosophy has been adopted to explain various phenomena in the reality, including contemporary management issues (Durlabhji, 2004). The five elements (cornerstones) rooted in the yin yang concept offers an opportunity to explain the productization process, while it implicitly implies on the nation of a dynamic balance between complementary forces.*
Findings: *This paper presents a conceptual model confining the productization process by incorporating the 'yin yang five elements' management concept. The model conceptualizes the relevant issues relating to the rapid productization process, and presents according to yin-yang five elements concept.*
Originality/Value: *The model presents the clear picture depicting the facilitating and opposing relationships of the five elements. The proposed conceptual model offers a good start for further study on the productization process, such as how it is affected by various factors, and how it can be managed effectively.*

ABSTRACT

The issues which appear today on electronic social networks and which are trying to be solved are as follows: (1) suppressing the addiction to e-social networking and "online" games on electronic social networks; (2) reducing the number of identity thefts for the participants in e-social networks; and the issue of (3) protecting the electronic information. Addiction to e-social networking among young people exists, while a lot of older people are becoming addicted to electronic social networks. Based on the domestic and foreign research results and their analysis, the paper proves that the addiction to e-social networks exists. The paper presents ways of fighting the addiction to e-social networking. One way of dealing with addiction to the Internet and "online" games on e-social networks, which is described in detail, is setting up parental controls in the operating system (used by addicts) by IT professionals. Today, besides this method of protection from addiction to e-social networks, a number of interesting protection activities, projects and lectures are to be implemented. When it comes to protecting user accounts on e-social networks, users should frequently change their password, and set a strong password. To prevent attempts of an attack on the user through computers, the systems for managing local computer network and the control of electronic information flow are implemented; thus the flow of e-information of social networks users is controlled, which is also described in detail in this paper. In the conclusion, recommendations are made and explanations are given whether to use or not to use e-social networks, considering all the negativity.

Keywords: addiction to e-social networks, attempts of preventing an attack, control of the information flow, e-information protection, internet.

INTRODUCTION

The first part of the paper presents explanations and commentaries of the conducted research results on people addicted to e-social networks, the e-social networks users' abuse, and other threats on e-social networks.

The second part shows the possibilities and ways to protect e-social networks users and to protect electronic information. Nowadays, the Internet and e-social networks are necessary for self-promotion of users, the promotion of products, services, many faculties and their programs, and other organizations.

Figure 1. *Using e-social network for the promotion of University College in the Republic of Croatia*
Source: Facebook. Retrieved on 26th April 2012 from http://www.facebook.com/profile.php?id=1139563573.

Figure 1 presents the promotion of University College RRIF, i.e. a sponsored ad. It is not hard to see why organization for tertiary education use the possibility of such promotions via e-social networking. One of the reasons is the number of users of e-social networks, especially high school students. Today, there is almost no high school student who is not a user of at least one social network. The Internet and e-social networks are an important resource for all users and activities, as well as for their e-learning process. It is necessary to pay great attention to computer security and computer security mechanisms, to the protection of the Internet and e-social networks users, and to the protection of electronic data about all the Internet and e-social networks users. The same way in which young people must be protected, it is necessary to protect elderly people (the Internet and e-social network users), especially teachers who are also exposed to dangers on the Internet and e-social networks. All users need to be guided when using the Internet and e-social networks towards benefits provided by broadband networks. On the Internet, as a new medium, and on e-social networks not everything is negative; there are positive and useful sides of the Internet and e-social networks.

The aim of this paper is to protect the users of e-social networks from threats, addiction, and the possibilities of abuse that they are threatened with on the Internet as the most popular youth medium and e-social networks by making recommendations and methods of protecting electronic information.

Paper Tasks

The paper tasks set on the topic of "Threats and the protection of electronic information on social networks" are as follows: (1) point to possible dangers and threats for the users of e-social networks that exist on the Internet; (2) to show the possibilities of protecting electronic information on e-social networks, to give advice on how to use a particular e-social network, to influence the users of the Internet and e-social networks in order to reduce false presentation on the Internet, and fighting addiction, to describe the combination of characters that comprise an optimum or a strong password. This paper seeks to influence the users of e-social networks by providing rules of conduct that should be respected; to warn the users of the Internet and e-social networks that information once published on the Internet and e-social networks remains on the Internet in most cases forever, (and that they are difficult to "remove" because there are web archives which memorize this information permanently, and that there is a possibility that the information in electronic form and e-documents remain on servers which are no longer parts of the Internet and are owned by the owner of a certain e-

social network); to warn users of e-social networks to be cautious when sending data via chat, which is part of e-social networks, because the other party may present a false name; to make recommendations on the ways of dealing with violations of the rights of the users of the Internet and e-social networks; to alert users to the problem that the addiction to e-social networks and online internet games that are part of e-social networks presents; to display systems for monitoring and controlling the flow of data on the Internet (local networks); to display the privacy settings of certain e-social networks; and to mention how to set parental controls in operating systems to ensure the safety of users.

Research methods used

For the paper entitled "Threats and the Protection of Electronic Information on Social Networks" the following research methods were used: (1) direct observation method; (2) observation method (description of the current state of Internet users is given based on the experiences of the authors); (3) analysis, i.e. the method of content analysis; (4) survey (which extends the already conducted survey with new data collected from the Internet and e-social networks users); and (5) analysis of the results obtained from the survey that was additionally conducted from 20 eApril 2012 to 27 April 2012, in an elementary school (subject teaching) and in high school (in four-year courses).

THE INTERNET AND E-SOCIAL NETWORKS AS A MANIPULATION MEDIUM

The Internet is a global information communication system that connects computer networks of individual countries and organizations, and enables the computer owners, who are also users of the Internet and e-social networks around the world, to communicate with each other, to exchange information and to use many other services through their local and telephone networks (Dragičević, 2004, p. 28). Today, the Internet is a broad term, and there are its many definitions. The Internet is an uncontrolled medium, through which electronic information can be exchanged at high speed. By using the Internet and e-social networks certain information in a digital form is shared faster than via television or radio media. The Internet is a broadband widespread network which connects computers, regardless of their size or group they belong to, and which are connected to the Internet. The Internet can be touched easily if it is observed from the physical level.

The young people's opinion today is focused on playing entertaining games which can be found on the Internet in larger numbers than the educational ones. Older Internet users are also prone to games of chance, online betting and gambling. Based on experience, we can say that the students of vocational schools gamble more. The youth should be guided towards playing educational games, while the elderly users should be directed to use the Internet for useful purposes and gathering of electronic information that can be used for business purposes. Besides entertainment, the Internet is useful for more serious things. It allows finding an address or phone number of the person you wish to contact; buying and selling of personal items; listening to music; watching videos; journey planning; booking and payment of airline tickets; sending and receiving electronic mail using webmail or emails; e-learning; correspondence with other Internet users via web servers and e-social networks that have an IRC service; following the latest news; research; buying and selling securities, and tracking the shares value; distance learning; gathering data on historical figures; translating texts from foreign languages into a language understandable to the user; finding a specific location using

geographic information systems; controlling the consumption of services using the Internet service providers; chatting with and watching a person far away; downloading files; publishing your photos and expressing your opinion via the web site; uploading web pages; CMS and LMS management; downloading free antivirus software. All of the aforementioned features are also the advantages of the Internet. Nowadays, the Internet as a medium can be used to influence public opinion and the opinion of a certain population. In the Republic of Croatia, the Internet as a medium has a very strong influence on the opinion of an average citizen. Numerous organizations as well as individuals now use the Internet and e-social networks as a tool to manipulate the public. It is known that numerous protests are organized through e-social networks, not only in the Republic of Croatia but also in other foreign countries.

Internet structure and the access possibilities

On the Internet, mail servers, web servers, FTP servers, local computers, desktop computers, laptop computers, mobile devices such as tablets and smart phones, and network components such as DSL modems, cable modems, routers and switches can be connected.

Connecting to the Internet is enabled by the ISP (internet service provider). The company, which is the ISP, gives its customers a device for the Internet access, i.e. router, and a username and password that the user can later change. Nowadays, access devices, such as cable modems and ADSL routers, and more rarely modems and ISDN adapters, are used for the Internet access. To access the Internet and e-social networks, three basic types of connection can be used: Dial-Up Connection, Subscribed Connection, and Shared Connection (Engst i Fleishman, 2004).

The Internet connects a growing number of nontraditional end systems such as TV sets, devices in cars, picture frames, household electronic and security systems, web cameras, refrigerators and microwave ovens (Kurose and Ross, 2005, p.2). Nowadays, access to the Internet and e-social networks is not a problem. Besides accessing the Internet from home, we can use it at work, in internet cafés, trams and even taxis.

Newer Internet services

In addition to the basic types of Internet services, such as WWW (World Wide Web), electronic mail, FTP (File Transfer Protocol), Telnet, IRC (Internet Relay Chat), there are tools for e-learning and e-social networks that could largely serve to promote products, services, organizations, faculties, and other educational organizations by using multimedia elements such as text, audio, video, graphics. Nowadays, most Internet users think that the World Wide Web is the Internet, but WWW is only one service on the Internet (global network). www is subdomain usually used to access web sites but it is not service mark. We can say that prefix http in web address represents certain service mark because it signals that we will use HyperText Transfer Protocol which is mostly used for loading of web pages.

PROBLEMS OF E-SOCIAL NETWORKS

E-social networks sometimes cause numerous problems to users and participants. Some users put too much personal information in electronic form in their profile on e-social networks. Malicious people can exploit posted electronic information. Employers can also use this information. Often some e-social network users publish the date when they go on holiday (e.g. I'll be at the seaside next week), which can be used by the burglars in the neighborhood. The problem of e-social networks is hacking Facebook profiles and mail systems and identity theft committed by malicious people. Pedophiles and murderers can also use the e-social networks information.

People addicted to the Internet and e-social networks and the causes of addiction

Everything that causes pleasure during consummation, and suffering because of its lack, we can call addiction. The causes of addiction are often derived from personal and social crisis, the lack of confidence, the need for conformity, boredom, affluence, or idleness (Pezo, 2011). Nowadays, almost all generations almost cannot function normally without the Internet technology. One of the serious dangers of the Internet and e-social networks which threatens all the generations is addiction to the Internet and e-social networks. Addiction to the Internet and e-social networks makes part of contemporary addictions. Addiction is today a major problem for users of e-social networks.

Who can be included in the group of the Internet and e-social networks addicts? All-day users of the Internet or e-social networks (communication with the purpose of solving problems) who are in some ways forced to work using the Internet are not at the same time addicted to the Internet. Addicts to e-social networks like "Facebook" do exist. Time passes by quickly while the addict is searching, viewing profiles, photographs and textual content on the profiles of their acquaintances, friends and famous people from private and public life. There is no end to checking the profiles of "Facebook" users. Each friend has friends whose personal profile contents can be viewed. There is the question: "Can we see a daily or frequent use of the Internet and e-social networks as the Internet addiction"? Today, the Internet is so powerful a medium; without it the business world, economy, banking, education, police, health, and other private and public sectors, including politics and political parties cannot function. People are forced to use the Internet as a medium in certain situations. Those users who due to certain life needs have to work longer hours on the Internet cannot be considered addicts. A group of Internet addicts may include: addicted to electronic mail; the users who are constantly reviewing "Facebook" profiles of other people interesting to them; the users who frequently watch some videos and video clips on "YouTube"; the users of online games which are not educational; the Internet users who frequently view pornography; the addicts to sexual discussions on the Internet; the users of chat services, who would correspond day after day; people who become frustrated if they cannot connect to the Internet for entertainment; the users of "online" gambling, betting and auction bidding; the users of information about other people; the viewers of movies on various online services; the customers who purchase through e-commerce; the participants in online card games; the addicted to downloading songs; the addicted to blogs, forums, etc. The most common causes of addiction to the Internet and e-social networks and online gaming on e-social networks among young people are as follows: (1) poor parental supervision; (2) not responding to viewing inappropriate content by Internet users; (3) passive environment; (4)

online games industry; (5) reluctance of teachers to respond promptly to fight the addiction; (6) not developing critical literacy among students when it comes to the media which manipulate children at schools.

Based on the research of the addiction to the Internet by using the "survey" method, a number of researchers have come to the conclusion that there are people addicted to the Internet and e-social networks based on established criteria.

A research in a neighboring country Slovenia, which was carried out in mid 2002 on the sample of 1194 participants *(N = 1194)* tells of the appearance and the slight increase of the number of addicts to computers and the Internet among young people in high schools. Already at that time, the author came to conclusion that the Internet offers many different options, i.e. services which reduce or make it difficult to control the time spent on the Internet. The author states that the Internet provides an opportunity to ease loneliness, rejection and social pressure (Jeriček, 2011). Studies on the addiction to the Internet and e-social networks have been conducted more frequently in the past fifteen years and even more in some countries. Andre Hanh and Matthias Jerusalem from the Humboldt University of Berlin, conducted a research on the Internet addicts based on a sample of 8,266 participants, of which 7,091 were from the Federal Republic of Germany. The study says that 3.2% of participants formally meet the criteria of the Internet addiction. The group which meets the criterion of addiction spent 34.6 hours a week on the Internet (thus 5 hours a day on average). The next group of Internet users, which is also risky, spends 28.6 hours a week on the Internet (thus 4.09 hours per day on average). Invisible web users use the Internet only 7.6 hours a week (www.onlinesucht.de/internetsucht_preprint.pdf, 2011). Three point two percent (3.2%) of the participants who are addicted (of total) is not much, especially in case of employees who work with Internet technologies within the company. If the aforementioned 3.2% of participants spend 5 hours a day on the Internet after working hours, it may present a significant problem for a person. Such a user necessarily requires abstinence.

Table 1. Addiction of the Internet users to services, in percentages

Internet addiction:				
Addiction to:	**Unnoticeable addiction**	**Potential addiction**	**Addiction**	**Total:**
correspondence	17.8%	26.6%	**35.1%**	79.50%
music	11.7%	14.9%	**14.7%**	41.30%
games, betting	5.4%	7.8%	**11.1%**	24.30%
pornography	6.9%	12.5%	**9.8%**	29.20%
other	21.4%	11.2%	**7.1%**	39.70%
online databases	16.6%	8.5%	**5.2%**	30.30%
online stores	5.6%	4.1%	**3.3%**	13.00%
communication systems	5.7%	4.4%	**3.2%**	13.30%
video-live streaming	2.7%	2.9%	**3%**	8.60%

Internet addiction:				
Addiction to:	**Unnoticeable addiction**	**Potential addiction**	**Addiction**	**Total:**
Exchange	2.5%	1.8%	**1.7%**	6.00%
gambling with real money	0.1%	0.4%	**0.1%**	0.60%

Based on Table 1 (www.onlinesucht.de/internetsucht_preprint.pdf , 2011) shown by authors André Hahn and Matthias Jerusalem in their paper entitled "Internetsucht: Jugendliche gefangen im Netz", it can be seen that the Internet addiction can be divided into (1) invisible addiction; (2) potential addiction; and (3) addiction. When it comes to 'pure' addiction, on the basis of Table 1 it can be concluded that the Internet users are most addicted to: correspondence enabled by chat service (35.1%); music (14.7%); games and betting (11.1%); and pornography (9.8%). Thirty-four percent (34%) of the total number of surveyed people aged 15-29 years consider themselves addicted to the Internet. Internet users were classified as addicts (as stated in the study) because they spend more than 48 hours per week on the Internet, while being at risk the most are people who spend 10 hours a day on the Internet (Miliša and Tolić, 2011). Spending 10 hours a day on the Internet is too much so it can damage the users' health. Today, on the basis of short informative surveys that are not representative in most cases, it can be concluded that there is a certain number of Internet addicts. According to some estimates, it is stated that in Croatia in 2009 there were about 130,000 addicts to the Internet, aged between 20 and 30. As stated in the review article "The crisis of education and the expansion of modern addictions" („Kriza odgoja i ekspanzija suvremenih ovisnosti"), no one here has systematically dealt with such a problem in a multidisciplinary way (Miliša and Tolić, 2011). This certainly is not good. Practice in western countries is a little different, and experts deal with this kind of problems with the Internet users.

Computer addiction can cause numerous physical, psychological and social problems that need to be taken seriously not only for the young, but also for all generations. Addicted to the Internet and e-social networks often have problems with sleeping at night, disregarding obligations which are placed before them, with learning, and poor grades (the young), with weight, loss of will and motivation for other activities and hobbies. Nowadays, more and more young people learn and write seminar papers by using "copy-paste". Using such a method, young people sometimes do not read the contents and information of each web page on a certain topic, but copy the found content with little understanding, and this kind of work becomes their habit.

In order to protect young people from addiction to the Internet and e-social networks, interesting activities, projects and lectures are being organized. The police publish presentations on the threats of the Internet; articles on children addictions to the Internet are frequently published. Lectures for young people are held in schools on the topic of "Threats on the Internet", in the week with the day of the children safety on the Internet (8 February). Teachers who teach computer science in schools are advised by the heads of their section and representatives of the Education and Teacher Training Agency to organize classes on "Safety of Children and Young People on the Internet" at least one lesson, so that young people would not experience some form of abuse. These lectures are also useful for elderly users of the Internet and e-social networks.

Figure 2[1] presents the division of computer addiction according to the levels. If the computer user is addicted to e-social networks and "online" games, they are also addicted to computer. The bigger problem is the information that 89% of "online" games contain violent content. At the first level, there is the addiction to games on the local computer, Internet addiction and addiction to writing on the computer. During the lessons of computer science, young people often show interest in writing on the computer instead of their notebooks. At the second level, there is addiction to "online games", addiction to e-social networks, web mail addiction, addiction to gambling on the Internet, addiction to blogs, forum addiction, Google search information addiction, cybersex addiction, and Internet shopping addiction. Addiction to e-social networks is divided only in the addiction to the most popular and most frequently used social networks.

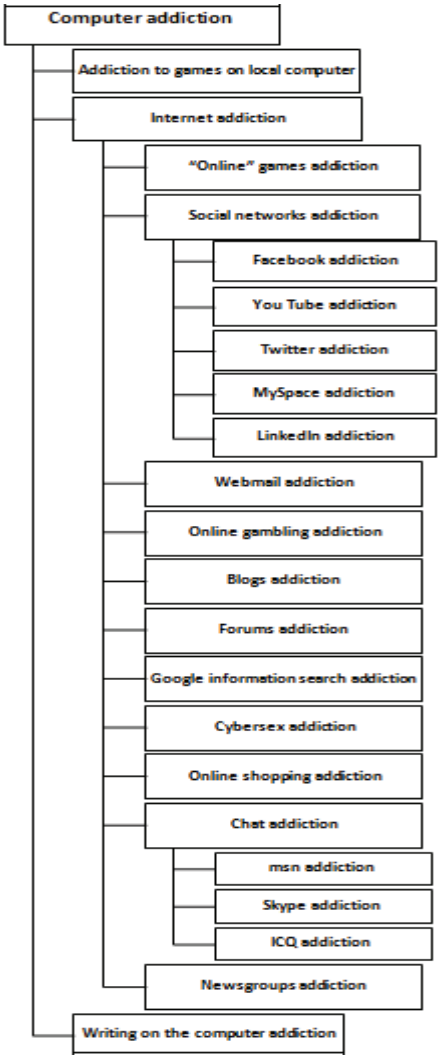

Figure 2. *Division of computer addiction*

[1] Creating an author. Decomposition addiction on the computer.

From the divisional diagram (Figure 2) (which shows the addictions on the Internet and e-social networks), we can compare the use, popularity and the amount of visiting web sites that contain e-social networks with the popularity and the amount of visiting web sites which contain pornographic content. According to the psychologist Sandra Milotti Ašpan (Milotti Ašpan, 2012) e-social networks have become more popular than web sites with pornographic content. This definition is not strange at all, but it is the evidence that the appropriate services "put an end to" pedophiles and malicious people who download forbidden content and photographs from pornographic web pages (web sites).

Identity theft of the e-social networks users

The cases of identity thefts in e-social networks have been tried to be suppressed by raising charges by the police (Ministry of the Interior) and by sending a special report to the public attorney for young people against malicious people who steal identity of the victim and in the person's name publish their personal information (http://dalje.com/hr-hrvatska/zbog-otvaranja-laznog-profila-na-facebooku-maloljetnik-kazneno-prijavljen/, 2011). Identity theft on e-social networks is also one of the forms of abuse and privacy violation.

Based on the published research by the authors of this paper, which was conducted in April and May of 2012, on the sample of 204 participants *(N = 204)* mostly school children, i.e. in primary and secondary schools in the Međimurje County aged between 13-19, came to the conclusion that the privacy of young people was at risk on the Internet. That was the aim of the research. Additional research was conducted in another two schools in the period from 20 April 2012 to 27 April 2012. The study was conducted in an elementary school (subject teaching) in the Međimurje County and in one high school in Zagreb (four-year programs). In this way, the research sample increased by 86 new participants *(N = 86)*. The total number after the additional research amounts to 290 participants (*N=290*). Young people who were interviewed represent a field sample of the population. This field sample is representative, which means that it has properties which are relevant to the subject of research. Besides the mentioned research objective, clear research tasks were as follows: to obtain information about the opinion of the participants in terms of security of personal information on the Internet and e-social networks; to obtain information on potential threats on the Internet and e-social networks consisting of false presenting of young people in certain schools; to obtain information on the specific number of identity thefts on the Internet and e-social networks from the selected sample; to obtain information on how much the participants publicly vilify on the Internet (since the Internet is a public computer network) and e-social networks; to obtain information on the number of spam received; to obtain information on the frequency of deletion of browsing history; the information on the participants' opinion whether it is good to keep a laptop in a place accessible to everyone. Based on the gathered information, computer science teachers should influence the youth in order to suppress (1) endangering the Internet users, (2) false impersonation on the Internet and e-social networks, (3) vilifying of young people on the Internet and e-social networks by that group of young people where the mentioned abuse is present. In the schools where the research was conducted, efforts will be made to have a positive effect on participants in order to reduce any other form of abuse of both younger and older Internet users. The results were processed and presented in 3D pie charts in MS Excel, a tool for analytical data processing.

Figure 3 shows that 79.3% of participants think that the electronic data placed on the Internet or e-social networks is not safe, while the remaining 20.7% thinks the opposite. Fifty-five point five percent (55.5%) of participants answering the second question agreed that their privacy is mostly compromised on the Internet; 13.1% of participants said they completely agree that their privacy is compromised on the Internet; 24.5% of the total percentage of participants stated that they generally do not agree that their privacy is compromised on the Internet and e-social networks. Privacy of Internet users is not compromised if the user does not allow malicious people to publish their personal and other data to compromise their privacy. Based on the above research, it was concluded that most participants do not make false presenting on e-social networks, which is good and deserves praising. Sixty-three point eight percent (63.8%) of the total number of participants said they had never falsely presented themselves on the Internet and e-social networks, while 36.2% of them falsely presented themselves.

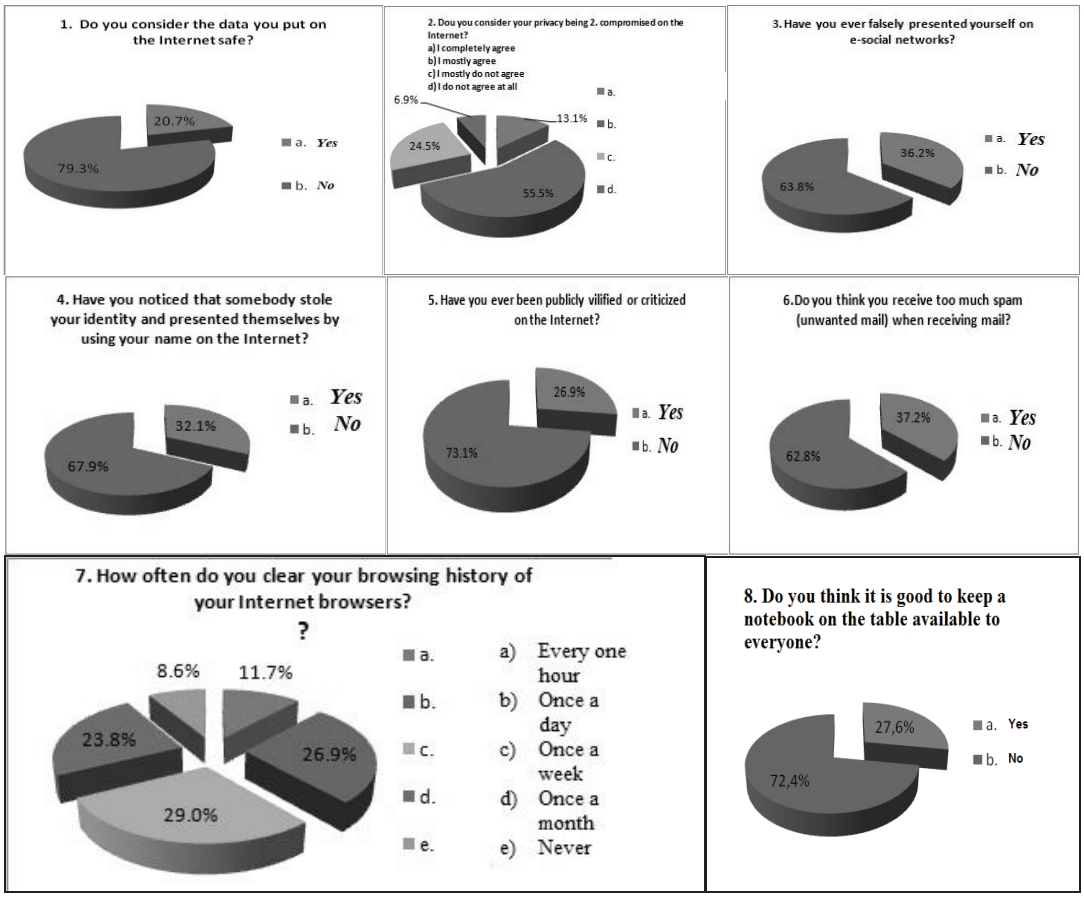

Figure 3. *The results of the survey obtained from the sample of 290 participants*

The situation with young people at schools (where the research was carried out) in terms of identity theft is not alarming (Figure 3). Sixty-seven point nine percent (67.9%) of participants responded that no one stole their identity on the Internet, nor has anyone presented themselves by using the name of the young people interviewed. Thirty-two point one percent (32.1%) of participants had an unpleasant situation when someone else (the attacker) wrote and communicated on the Internet and e-social networks in the name of the participant, at the beginning of communication without their knowledge. Seventy-three point one percent (73.1%) of participants have not experienced public vilification on the Internet,

while 26.9% of participants experienced public vilification and criticism on the Internet and were abused in this way. Sixty-two point eight percent (62.8%) of participants felt that they have not been receiving too much spam in their inbox, while 37.2% of them thought that they did not get too much spam. Cookies are files that your Web browser stores on your hard drive for computer users. Cookies contain information about Internet users and their activities via a web-browser. Cookies are a risk as far as the protection of the system because they can find in it our personal data can get into the wrong hands. If the security system is of great importance, the prohibition of accepting cookies is the best defense.The largest number of participants deletes electronic information on browsing web sites once a week (29.0%), while 26.9% of participants deletes browsing history once a day. Browsing history is deleted once a month by 23.8% of participants, while browsing history is deleted every one hour by 11.7% of participants. Eight point six percent (8.6%) of participants never delete browsing history due to not having the option for remembering the visited web sites enabled in their browser and they do not keep records of browsing history (Pastore, 2004). Most participants think it best not to hold a laptop computer available to everybody (72.4%), while 27.6% thinks otherwise and their personal electronic information is not stored in this way.

Internet and e-social networks users' password safety

Everybody needs to have a user name and password to access a particular service or e-social network on the Internet, i.e. an Internet service provider. It is advisable to change your password every month, and if necessary, it should be changed several times a month. Quite often there are cases when a person finds out the password of another person, and then this malicious person causes them harm in the name of another person. Such a scenario represents one form of abuse of the Internet and e-social networks users. Optimal password used by users of online services should be a minimum of seven characters. It is preferred for a password to contain a combination of uppercase and lowercase letters and numbers. For greater security, sometimes it is necessary to put a character that is used very rarely in the password. It is by no means recommended to use first names, surnames, names of parents, children, date of birth, name of residence, street name, and the like for the password. Such simple passwords are the ones that young people usually use most often. It is not recommended to use for the password the same set of characters. For safety, information systems users should never write down their password on paper and leave it in a drawer to prevent their friends, siblings, or friends to gain access to data and to the user profile on e-social network. The most common attack done by malicious persons on passwords, i.e. the profiles of your friends, is by testing or guessing passwords. Password testing or guessing is an attack in which malicious individuals attempt to access a certain system by randomly guessing the password, where mostly the method of trial and error is used. Although this attack might seem naïve, sometimes it can be effective, especially when malicious person knows the person who set up the password well.

The second most common attack on passwords for Internet users is the so-called “phishing”. The user of a user account receives an unwanted mail written by a malicious person in which it is required to submit the user name and password in the next few days; it says “if you do not send your username and password, you can permanently lose the account”. The recipient of this e-mail has the feeling that the email was sent by the administrator of the web server which provides the service itself. The attacker uses the name of the ISP Internet service provider so that the mail would be more persuasive. Sometimes young people are gullible and

fall for most of these mails. A recommendation to younger and elderly users is to not to fall for such mails, and to not send personal user data in response to such an e-mail.

Privacy settings on e-social networks with regard to Facebook

"Facebook" privacy settings can be adjusted by turning off and deleting. Turning off the "Facebook" profile of young people means that the data and content on the profile would be hidden from the other friends' view, but are stored on "Facebook" servers, in case the user wants to re-activate his or her profile. The user name appears as black text on which you cannot click because the profile is hidden.

By deleting the "Facebook" account, the page is permanently removed. "Facebook" center for help with personal information related to the user account states that permanent deletion deletes information such as a name, e-mail address and mailing address. Copies of some materials (photos, notes, etc.) may remain on the "Facebook" servers due to technical reasons. Permanent storage of photos by "Facebook" is not good for the e-social network users. All the materials on "Facebook" should be detached from any personal identifiers and completely inaccessible to other users. "Facebook" also does not use the contents associated with the accounts which are deactivated or deleted. Before all the data on "Facebook" is deleted completely, several days could go by because there is an option that in the meantime the user could change his or her opinion. When using the e-social network, the "Facebook" user should think twice about the finance policies of the e-social network, and whether they can make profit just by the means of traditional advertising, as well as how the web corporation "Facebook" has achieved such a high value. Facebook profile can be viewed by the executives of the company we work at, business partners we work with, prospect business and love partners, and colleagues, malicious persons, etc. No matter what protection is used on Facebook profile, there is surely someone who could forward our photo to a person who does not quite like us. Our photos can be forwarded by our best friends to their friends who could abuse our digital photograph. Information to be avoided giving on e-social networks are home address and number; photos from the party; admitting not to work and the like; the names of your children; pictures of the apartment and the house; information on the time of vacation; phone numbers because there are applications that display telephone numbers which are posted on Facebook profiles. With all this information, it is not desirable either to count down the days to going on vacation e-social networks.

RECOMMENDATIONS FOR THE PREVENTION OF VIOLATION OF THE INTERNET USERS RIGHTS

In order to prevent violations of the rights of users on the Internet, online services offer the privacy policy and terms of service. Recommendations are to carefully read the rules before using e-social networks and that users adhere to these rules. The user must confirm to abide by the set and stated rules when using online services when creating a profile or user account of electronic web mail. Each Internet service provider tends to set rigorous rules, but the users of Internet services rarely adhere to these rules, and in most cases young people do not read the rules but confirm them automatically by clicking the mouse.

The rule that all users should follow when using the services of correspondence on the Internet is that no activities related to drugs, alcohol and other narcotics should be promoted.

Each individual service provider on the Internet has rules that users must abide by, and these rules should not be mocked at or belittled. It is widely known that the providers of correspondence services do not allow URL addresses of sites and links with content linked to sex or illegal music be published in the writing area. On chat and in newsgroups links of crack sites are not allowed.

Identity theft on e-social networks is among the violations of the Internet users' rights. The way to fight against such violations of users on the Internet is enabling users to authorize themselves biometrically on the Internet services. In this way, it would be easy to identify malicious persons who present themselves by using the names of their colleagues and other users. The only problem with the introduction of biometric authentication system for Internet users is financial viability, and the existence of such a possibility and option for Internet services (the providers of certain Internet services). Nowadays, Internet service providers and the manufacturers of operating systems offer email addresses which the victims of identity theft can complain to and report the case, so as to stop these cases.

THE FORMS OF USERS' VIOLATIONS ON THE INTERNET AND E-SOCIAL NETWORKS

The most common form of user's violation is an abuse. The risks that exist on the Internet, which the users should avoid when "surfing", and which in some way interfere with communication on the Internet and users (especially young people) and can lead to danger are commercial, promotional, offensive, sexual, and value. Commercial risks and dangers that threaten young people include numerous advertising and promotional activities for drugs, alcoholic beverages and tobacco products. The risk for young people may be presented by unwanted mail through which strange and malicious content can be distributed together with sponsored ads. Disclosure of personal information of young people, stalking of young people, illegal downloading of certain content, financial frauds and gambling, are a big problem for Internet users. When young people browse the Internet, there is a risk of experiencing an attack by a malicious person. On the Internet, the users may encounter violence and hatred arousing. Internet users can encounter pornographic content, bullying and other harassment by third parties. There is a possibility that users, especially young people, meet a stranger with strange intentions. Internet and e-social networks users can create and set up inappropriate material and content on a web site (*upload*). The risks of widespread broadband network that Internet users may encounter include misleading electronic information or misinformation and tips; racist statements and aroused hatred for a particular race. On the Internet, with little negligence, users can hurt themselves. A number of cases exist in which a specific web site contains wrong electronic data that young people believe in, i.e. false information or misinformation that makes young people learn in the wrong way, and which makes their development go in the wrong direction. Misinformation is different from information by having no value for the Internet users.

In addition to these forms of the users' violations on the Internet and e-social networks, there are more violations in the form of disturbing and threatening messages, hatred arousing by the service user groups on correspondence services (IRC) directed to a specific person, encouraging further bullying, insulting and spreading violent and abusive comments, creating pages that contain images, drawings, stories and jokes at the expense of peers, sending inappropriate photographs of colleagues, mentioning personal data and information on family

circumstances, spying Internet users via webcam of their computer. Spying young users via webcam of their computer is one of the most serious forms of violation. To make this kind of espionage function, the spy must have access to the computer user who is the target, and must have authorization on the target computer.

An example of this kind of abuse of young Internet users took place in America where school officials were spying their students via webcam. Young people in this case got their computers from the school in order to access the data/resources of that school (http://dnevnik.hr/vijesti/hrvatska/, 2011). In order to fight against this form of violation of young people on the Internet it must be taken into account who the computers are taken and bought from. If young people take or borrow a computer from a person they do not know well or from an organization which sells or services the computer, it would be advisable to pay attention to the possibility of such attacks, and to turn off the camera if they need not to use it.

THE CONTROL OF DATA FLOW ON THE INTERNET IN THE TEACHING PROCESS

In order to protect the Internet users from addiction and other negative sides of the Internet, specific tools that simulate parental supervision should be used, since it is impossible to be 24 hours with the child who browses the Internet. Today there are tools that block access to certain sites on the Internet. Such an option is provided by the tools for managing a classroom or local computer network. Tools to control the data flow can block e-social networks “Facebook” and “YouTube”. SynchronEyes Classroom Management tool is used in teaching by the teachers in schools in the Međimurje County to have supervision and data flow control of computers and computer networks, which students work in. These tools can be used to help students solve the tasks on the computer by taking control of the student’s computer.

The possibilities of certain systems of LAN network management

LAN is a local computer network in a smaller area, organization or institution that is intended for internal use. An example of such a network is the computer network in the classrooms. Teachers Network Management System computers offer many opportunities in the classroom. Systems such as SynchronEyes Classroom Management enable the presentation of content from your computer (screen) to all students in the class, then allow active involvement of students in the teaching by supporting the creation of students groups, and allow the presentation of some solutions on all the computers in class, JIT review of the student’s work, active control of the student’s work using the option of input units control, the creation and implementation of knowledge tests, as well as JIT evaluation of the results, distribution and collection of digital solutions made by students, teaching management in terms of allowing the execution of certain applications and the Internet access, classroom and student computers management, and the management of their works that are currently in digital form.

"Parental" protection of the operating system and OpenDNS

IT professionals can set parental protection on the computer in some operating systems, i.e. parental control over the computer. Since the vast majority of elderly parents especially is not literate enough when it comes to computers to set this type of supervision, for the benefit of users and young users, they should contact an IT professional or an IT company to set up parental control over the account. Through parental controls, the way that the users use the computer can be controlled. IT technician can set limits on the computer owner regarding the hours during which users are allowed to use the computer, the type of game that can or cannot be played, and programs that can be run. When parental control feature blocks access to the game or program, there is a notification that the program is blocked. Users can click a link in the notification to request permission to access a game or a certain program. The access may be allowed by entering the user information. To set up parental controls for the child, you need your own administrator user account. Before the start, it is necessary to check whether the users you want to set up parental control for have a standard user account. Parental control feature can only be applied to standard user accounts. With the control provided by Windows 7 an additional control of a separate provision of services can be installed, such as web filtering and activities reports. In the operating systems, the users' access and opening of specific programs to be used can be limited. OpenDNS allows filtering of web pages which the user wants to access, based on the URL addresses. There are two lists: (1) the list of allowed domains, and (2) the list of banned domains. The top ten contents blocked by OpenDNS include web pages containing pornography in 85% of cases; sexuality in 80.1%; unsavory content in 77.3%; Proxy/Anonimizer in 76.2%; advertising networks in 69%; nudity in 69.2%; discrimination and hatred in 58.7%; lingerie in 58.5%; gambling in 58%; and drugs in 57.3%. E-social networks "Facebook", "MySpace", "YouTube" (www.opendns.com/pdf/opendns-report-2010.pdf, 2010) enter the top three blocked web sites. Based on the research, it can also be concluded that there is addiction to cybersex, social networks, listening to music, chat, etc., because they are not unreasonably blocked and filtered by OpenDNS sites in most cases with the mentioned content. A bad example of blocking certain e-social networks by employers, with the purpose of future employment, is that employers seek from their future employees a username and password of the e-social network they are users of.

CONCLUSION

It is not difficult to conclude that the participants would most often falsely present themselves on those online services and e-social networks they use most. In organizations where the research was conducted (the Međimurje County and a high school in Zagreb) the tendency will be try to have a positive impact on the young Internet e-social networks users with the aim to reduce false presenting on the Internet. With this paper and examples, the existence of violence among users on the Internet and in reality, and (based on the research results) of the Internet and e-social networks addiction in the Republic of Croatia and abroad has been proven, on the basis of a sample of 290 participants *(N=290)*. The next problem that is trying to be solved today is fighting against addiction to the Internet and online gaming on e-social networks. One of the ways to suppress addiction to the Internet that was mentioned in the paper is to place parental monitoring by IT professionals using the options of the operating system and OpenDNS. Moreover, to protect young people from the Internet and e-social networks addiction, interesting activities, projects and lectures tend to be organized. The

publication of presentations on the subject of child protection on the Internet and privacy protection also affect the suppression of the threats on the Internet and e-social networks. Croatian Ministry of Interior[2] also frequently publishes articles on the protection of children on the Internet. In schools, numerous lectures for young people on the topic of "Threats on the Internet" are held. In the week with the day of the children safety on the Internet (February 8), the teachers who teach computer science in schools are advised by the heads of the section and representatives of the Education and Teacher Training Agency to dedicate one lesson on the topic of "Safety of Children and Young People on the Internet", so that young people would not experience some form of abuse mentioned in the paper. When it comes to protecting user accounts on young people e-social networks, young people should frequently change the password, and set the optimal strong password. When it comes to preventing attacks via computers, systems for the management of local computer network (LAN) are often introduced. In this way, the flow of electronic information of young people on the Internet is controlled. Finally, we ask ourselves whether to use e-social networks at all. Our recommendations are to use e-social networks, regardless of any negativity. It is necessary to be cautious with personal information in electronic form and we advise not to believe everything what is said on the Internet or e-social networks. Do not write unverified information about other people. It is necessary to carefully choose which photos from the party you will put on e-social network. It is necessary to take into account possible false presenting of a malicious person, and it is necessary to determine, if possible, which electronic information the social network sells or makes available.

MEDIATING ROLE OF KNOWLEDGE SHARING ON INFORMATION TECHNOLOGY AND INNOVATION

Onwika Kaewchur, Faculty of Engineering, Kasetsart University, Thailand

Kongkiti Phusavat ,Faculty of Engineering, Kasetsart University, Thailand

ABSTRACT

Purpose: *The purposes of this paper are to examine the relationships among the information technology, knowledge sharing and firm's innovation, and while the knowledge sharing as mediating effect is also simultaneously investigated on the relationship between information technology and firm's innovation.*
Design/methodology/approach: *In this research, the quantitative method was mainly employed. First, the research model was constructed by the literature review process. Then, the hypotheses were launched and tested by the survey method. The questionnaires were used as the tool in collecting data. A total of 224 questionnaires from the herbal manufacturing companies were considered. Multiple regression and Bootstrapping method were employed to test these hypotheses.*
Findings: *The finding showed that the information technology has positively influences on both knowledge sharing and innovation. With regard to knowledge sharing, the findings showed that it has positively influence on innovation, while it also has positively mediated influence on the relationship between information technology and firm's innovation.*
Research limitation/implications: *Data collection of this study was primary focused on herbal manufacturing industry. Collecting data of variety industries would gain more understanding of this relationship. Furthermore, other factors or variables should also investigate in order to understand their effect on innovation.*
Originality/value: *This paper demonstrated that the knowledge sharing and information technology had the critical influence on the organization innovation and played a vital role as a critical success factor of organization.*
Keywords: Knowledge sharing, innovation, information technology

INTRODUCTION

Knowledge is a basis of competitive advantage of firm. Knowledge can be created, recognize, archive, access, and apply by the persons within firm (Nonaka, 1995). This organizational knowledge is usually flowed and distributed within the firm. Moreover, the multiple knowledge is required in order to improve products or services of organization (Lee, 2001).

In particular, the organization knowledge can be created from such past learning, experience, and acquiring new information and knowledge of each individual. Then, sharing knowledge of individual with others will increase the ability to solve problem (Nonaka et al., 2006) and enhance the innovation capability of firm (Lee, 2001; Sáenz et al., 2009). Moreover, the firm cannot survive without explicit or tacit knowledge; both types of knowledge should be integrated and simultaneously performed as Hiroshi Okuda, the chairman of Toyota mentioned that *"The strength of Japanese manufacturing industries are at the technology (based on) tacit knowledge. With the progress in Information Technology (IT), tacit*

knowledge is converted into explicit knowledge. Still, we need tacit knowledge. To build a car, we have to educate people.". In addition, this also indicated the need of IT in the supporting organizational knowledge creation process within firm, as information technology is a supporting factor of organization structure to enhancing organizational performance.

In this research, the herbal industry is focused. It can be said that Thailand is rich in a variety of herbs. As we can see from such increasing the amount of new herbal products has enter to the market, and the trend of herbal consumers has also increased. Moreover, nowadays the herbal industry in Thailand has rapidly growth and is becoming popular. According to the report of Ministry of Industry, Thailand, the amount of herbal manufacturers has continuously increase, which about 23 percent since 2004 to 2012. The creation of innovative products is an important matter of herbal industry. The main focus of the herbal industry is to reduce time-to-market and launch their own unique product. Moreover, the herbal industry has unique characteristics such as a high cost of R&D investment in developing product, and a highly regulatory environment (AmpolMitrivej). Currently, most herbal manufacturers develop the product formulations by themselves and keeps them as a secret, so as to the organization knowledge such knowledge and experience of personnel are the most value to the firm.In addition,almost of herb products in Thailand has been developed by an incremental innovation.

The organization aspect, which may be able to support in increasing innovation performance, is knowledge sharing among individuals within firm. Knowledge sharing can bring a lot of benefits to the firm such as faster speed in creating new innovative products or services. Therefore, the purposes of this research aim to;

- To investigate the relationships among knowledge sharing, information technology, and innovation.
- To identify the mediating effect of knowledge sharing on these relationships.

The next sections of this paper are organized as follows, Section 2 describes the relevant literature review, Section 3 develops the research model and launches the hypotheses for testing, Section 4 presents the research methodology and data collection procedure, Section 5 reports the data analyzing and the results, and Section 6 discusses the results, conclusion, limitation of this study, and further research directions.

LITERATURE REVIEW

Knowledge sharing

In an era of competition, one of the most important intangible assets of organization is the knowledge instead of capital and labor. Nonaka et al. (2006) mentioned that knowledge is a key success factor of organization. The organizations must adopt themselves in order to gain the competitive advantage and survival in a fiercely competitive global economy.
There are much earlier scholar defined the definition of knowledge in many different ways, however, there is no consensus about its characteristics (King, 2009). Two common types of knowledge in knowledge management area consist of explicit and tacit knowledge. First, the explicit knowledge refers to the knowledge that can be easily articulated, expressed in words and numbers, and can be easily stored into repositories, communicated, and reproduced. Second, the tacit knowledge refers to the knowledge that is difficult to articulate, hard to

transfer to others, and based on the experiences and commitments of person. (Nonaka, 1994; Polanyi, 1966)

In the managing knowledge resource becomes an essential issue in developing organization in order to gain and sustain a competitive advantage (Davenport, De Long, & Beers, 1998). Organization knowledge is usually occurred and distributed within organization. Moreover, to improve the products, services, or organizational performance, it requires the multiple knowledge sources. The integration of knowledge can be occurred from the sharing of individual knowledge.

Knowledge sharing is defined as "activities of transferring or disseminating knowledge from one person, group or organization to another" (Lee, 2001, p.324). Moreover, the knowledge sharing can bring the benefits to organization if individuals are willing to share (Nonaka, 1995). One benefit of knowledge sharing has directly effect to organizational performance which is innovation. In another word, knowledge sharing is an ingredient of innovation process. Moreover, it provides other benefits to organization such as increase intellectual capital of organization, interchange between individual competitiveness to organizational competiveness, and reduce organizational cost of employee's gathering knowledge. (Zhang et al., 2005)

Information Technology

During the past decade, much literature in information technology has demonstrated the importance of information technology for improving organization performance. Information technology is a supporting factor of organization factor that increase organizational innovation and performance. Yang and Chen (2007) suggest four main factors of organization level, which has effected on the knowledge sharing. These consist of culture, structure, people, and technology. In technological aspects, they identified that IT infrastructure is the most important factor, and followed by IT know-how, and IT-support. Moreover, Hsu (2006) suggested three approaches that are used to enhance employees' knowledge sharing within organizations: 1) a technology-based approach 2) an incentive-based approach and 3) an organizational-based approach. In a technology-based approach is required such an information technology to support an individual to share their knowledge within organization.

Furthermore, There are two basic approaches to knowledge management forwhich IT can providesupport: codification andpersonalization(Hansen et al., 1999). The codification approach: more explicit and structured knowledge iscodified and stored in knowledge bases. The main role of IT here is to help people to share knowledge through common storage so as to achieve economicreuse of knowledge. e.g. IT tools is electronic knowledge respositories.The personalization approach: more tacit and unstructured knowledge isshared largely through direct personal communication. The main role of IT is to help people locate each other and communicate so as toachieve complex knowledge transfer. e.g. IT tools are knowledge expertdirectories and video conferencing tools.Both are fundamental to understanding the role of information technology in knowledge management.

Innovation

Simple explanation, innovation is the introduction of something new (Davenport, 1993). More explanation such as The Oslo Manual (2005) identified that "innovation is the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization, or external relations".Most innovation definitions are focused on improvement within the organization in order to meet their business goals.

The type of innovation can be categorized into various types. For instance, Tidd et al. (2005) focused on the pathway to examine when creating the innovation. The type of innovation has categorized into four types or can be called 4Ps of innovation. These consist of 1) Product innovation: changes in the things (products/services) which an organization offers; 2) Process innovation: changes in the ways in which they are created and delivered; 3) Position innovation: changes in the context in which the products/services are introduced; 4) Paradigm innovation: changes in the underlying mental models which frame what the organization does. Moreover, the Oslo Manual (2005) categorized innovation into four types which consisted of product innovation, process innovation, market innovation, and organization innovation.

THE RESEARCH MODEL AND HYPOTHESES

The research model was constructed following earlier relevant literature as shown in Figure 1. It shows the research model with all variables. Moreover, it illustrates the relationships among knowledge sharing, information technology, and innovation. Four research hypotheses of this study were generated to test the relationships among knowledge sharing, information technology, and innovation, and the mediating effect of knowledge sharing on the relationship between information technology and firm's innovation.

Moreover, to establish the mediating role of knowledge sharing, four hypotheses were proposed according to Baron and Kenny, 1986, p.1177;

> *"First, the independent variable must affect the mediator in the first equation; second, theindependent variable must be shown to affect the dependent variable in the second equation; and third, the mediator must affect the dependent variable in the third equation. If these conditions all hold in the predicted direction, then the effect of the independent variable on the dependent variable must be less in the third equation than in the second. Perfect mediation holds if the independent variable has no effect when the mediator is controlled."*

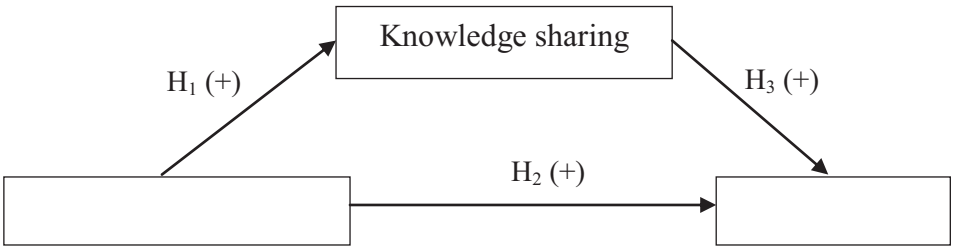

Figure 1 The research framework

Therefore, the hypotheses were established follow the Baron and Kenny (1986) and the earlier relevant literature as follow:

Information technology and knowledge sharing

Information technology is an essential administrative support function, and can increasing the competitive advantagein the firm. Information technologies can not only improving the firm performance, but also supporting knowledge sharing among individuals within firm. For example, Bakhari and M (2010) investigated the influence of technological factors which included information technology infrastructure, know-how, and tools on knowledge sharing quality of government officers in Malaysia. The results showed that information technology know-how such training employees in IT is the most important variables in increasing knowledge sharing quality, followed by infrastructure, and tools. Moreover, much literature argued that IT can support employee's knowledge sharing. Aulawi et al. (2008) described that IT is one of important factor and has directly effect on knowledge sharing behavior of employees. In addition, IT can support the sharing behavior of informal knowledge of employees as well (Davison et al., 2013). Therefore, we proposed the following hypothesis:

H1: Information technology has positively influence on employee's knowledge sharing.

Information technology and innovation

Huang et al. (2009) the level of firm's innovation can be improved by information synergy and IT capability. Bartel et al. (2007) explained that the investment in new information technology in manufacturing firm will valuable thing such increasing the productivity growth, and the product innovation performance. However, the worker skill in IT should simultaneously improve. Therefore, we proposed the following hypothesis:

H2: Information technology has positively influence on firm's innovation.

Knowledge sharing and innovation

Most of earlier literature agreed that the knowledge sharing has influence on innovation. Wang and Wang (2012)pointed out that explicit and tacit knowledge sharing; both have directly influence on firm innovation and performance. Explicit knowledge sharing has more influences on innovation speed while tacit knowledge has more influences on innovation quality. Furthermore, Saenz et al. (2012) focused on the effect of knowledge sharing mechanism on innovation capability. Then, the results indicated that personal-interaction

based knowledge sharing initiatives was the most influential one, and ICT-based knowledge sharing initiatives and knowledge sharing embedded in management processes were respectively significant. Moreover, Liao et al. (2007) argued that knowledge sharing plays an important role in developing firm's innovation. In addition, knowledge must be absorbed and then share between employees with the purpose of increasing firm's innovative capability and benefit to the firm. Thus, we proposed the following hypothesis:

H3: Knowledge sharing has positively influence on firm's innovation.

Lastly, the mediating role of knowledge sharing in the relationship between information and firm's innovation was also test in the last hypothesis. Then, we propose the following hypothesis:

H4: Knowledge sharing is a mediator between information technology and firm's innovation.

RESEARCH METHOD AND DATA COLLECTION

Measurement development

In this study, the measured items of all variables in the research model were primary adopted from the relevant earlier researches. These included three major variables which were information technology, knowledge sharing, and firm's innovation.

Data collection procedure

The quantitative method was employed in this study. The questionnaires were used as the data collection tool. The questionnaires in Thai version were distributed to the herbal industry from November, 2012 to January, 2013. There were totally 224 usable questionnaires.

Reliability Test

The questionnaire design was primarily based on the literature review. The questionnaire were measured the internal consistence reliability based on the Cronbach's alpha coefficient technique. The results indicated that the Cronbach's alpha coefficient of knowledge sharing, information technology and firms' innovation were 0.739, 0.762, and 0.716, respectively, which were above the acceptable level, 0.7. This indicated that each measured items of questionnaire had a high internal consistence.

Measurement

In this study, all of the measured items were adopted from earlier research. These consisted of 3 constructs which were knowledge sharing, information technology, and innovation. Moreover, a five-point Likert scale, which ranged from "1 = strongly disagree" to "5 = strongly agree", was employed to measure all items.

DATA ANALYSIS AND RESULT

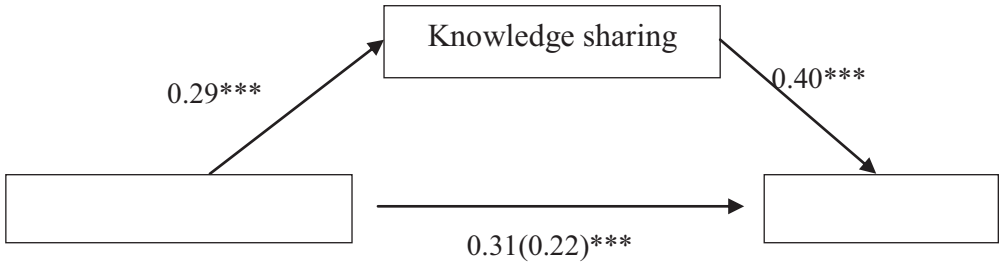
The results of this research found that the relationship between the independent variable, information technology, and the mediating variable, knowledge sharing was positive and significant. Moreover, the relationship between the dependent variable, innovation and the mediating variable, knowledge sharing was positive and significant as well. Therefore, the results of hypotheses testing were following;

H1 presented that the relationship between information technology and knowledge sharing. The results showed that the information technology is positively and significantly (β =0.2984, $t(222)$=6.4397, p<0.001) related to knowledge sharing.

H2 presented that the relationship between information technology and firm's innovation. The results showed that the information technology is positively and significantly (β =0.3135, $t(222)$=9.2709, p<0.001) related to the firm's innovation.

H3 presented that the relationship between knowledge sharing and knowledge firm innovation. The results showed that the information technology is significantly (β =0.4019, $t(222)$=8.9388, p<0.001) related to the firm's innovation.

Moreover, both H_1 and H_2 were significant, mediation analyzes were test by using the bootstrapping method with bias corrected confidence estimates (Preacher and Hayes, 2004). In this study, the 95% confidence interval of the indirect effects was obtained with 5,000 bootstrap resamples (Preacher and Hayes, 2008). The H_4 was tested and the results of mediation analysis confirmed that the mediation role of knowledge sharing in the relationship between information technology and firm's innovation. (β=0.218, CI= 0.0827 to 0.1695). In addition, it indicated that the knowledge sharing provided a partial mediation effect between information technology and firm's innovation. The results of hypotheses testing were shown in Figure 2.



Note: * p< 0.05, ** p< 0.01, *** p< 0.001

Figure 2 Indirect effect of knowledge sharing on the relationship between information technology and firm's innovation

DISCUSSION AND IMPLICATION

This study aims to develop a framework for examining knowledge sharing, information technology, and innovation. The research samples were from herbal manufacturers' employees in Thailand. Moreover, the knowledge sharing, information technology, and innovation were focused on in this study.

The results showed that information technology had positively influenced on knowledge sharing. The results of this study were consistent with the earlier relevant researches (Aulawi et al., 2008; Bakhari and M, 2010; Davison et al., 2013). Besides, the information technology had positively influenced on firm's innovation. The results of this study were consistent with the earlier relevant researches such Huang et al. (2009) and Bartel et al. (2007). In addition, much earlier researches provided a strong relationship between knowledge sharing and firm's innovation such as (Liao et al., 2007); (Saenz et al., 2012); and (Wang and Wang, 2012). The results of this study also indicated that the knowledge sharing had a significant positive influence on firm's innovation. Furthermore, the results indicated that the knowledge sharing was a partial mediator between information technology and firm's innovation. It means that it is not only indirect predict to firm's innovation, it could also supported the information technology influence on firm's innovation.

In case of herbal manufacturing in Thailand, the innovativeness is a key in driven business and competitiveness. Both public and private organizations provided the supporting to herbal manufacturers in order to develop their innovation such as The National Innovation Agency, Thailand. The resulted indicated that most herbal manufacturers focused on their product innovation rather than process innovation. Moreover, most of them had developed their products as the incremental innovation due to some constraints such as high cost in R&D investment and inadequate experts. To develop organization innovation, it requires the multiple source of knowledge. This is not only explicit knowledge, but also tacit knowledge such employee's experience becomes an essential knowledge of organization. The ability of changing tacit knowledge to explicit knowledge and sharing this knowledge with others will be the most valuable to organization. This indicated that the knowledge sharing of employees plays an important role in organization. Moreover, in this study, it indicated that the employees in herbal manufacturer had shared their explicit knowledge rather than tacit knowledge. However, their tacit knowledge could mostly share by training program.

In addition, the information technology becomes an organization factor in increase knowledge sharing and firm innovation. In this study, we found that many herbal manufacturers had emphasized on the information technology issue, however, they focused on the information technology infrastructure rather than the information knowledge of employees. For example, some manufacturers provided the LAN system, and intranet to share their information and knowledge within organization. Moreover, some of them invested in the videoconference system to communicate within organization. Furthermore, some of them preferred to communicate with their employees and customers via social network. However, there are not much organization where had provided training course in information technology to employees. Therefore, organization should provide the effective system of information technology infrastructures, and the knowledge of employees in information technology should be improved such as providing training course to increase knowledge

sharing of employees in the organization and increase the product and process innovation of firm.

LIMITATIONS AND FUTURE RESEARCH

In this research, there are some unavoidable limitations. First, this research was conducted only on a small size of respondents who were the staff level, which might not represent all employees in the firms. Then, to generalize the results for larger groups, the study should have involved more respondents at different levels. Second, this study only focused on the herbal manufacturers, further research could focus on other industry or compare between different industries. Finally, some other relevant variables might be added to the research model and their relationships should be investigated in the future as well.

ACKNOWLEDGEMENT

This research was supported by Ministry of Science and Technology, Thailand.

ABSTRACT

Purpose: This paper investigates associations between the grants, enterprise efficiency and innovativeness using a combination of enterprise accountancy data and unique in-depth enterprise level survey data. Enterprises in Slovenia can obtain investment and research and development grants from different Slovenian and European Union funds. The focus of the study is on grants for co-financing of purchases of new technological equipment with aim to increase enterprise innovativeness and production of new products.
Methodology: The paper employs unique in-depth survey analysis conducted in the enterprises, which have received grants for innovation activities. The focus of the analysis is on the following four economic-financial indicators: total revenues, number of employees, values of profit and value-added per employee. The principal component analysis and multiple regression analysis are used to test the hypotheses on increase of the value of the four economic-financial indicators and their comparisons.
Findings: During the period 2006-2011, in Slovenia, there were 793 enterprises, which received more than 135.3 million euro of grants. The principal component analysis revealed four principal components: supports for innovativeness, procedures and standards for innovation, innovation as condition and the ways of innovation. The multiple regression analysis confirmed the association between innovativeness as a condition and enterprise efficiency, but not for the other three principal components.
Originality: This is the first research to combine enterprise accounts, grants and survey data in order to quantify the impact of grants from public procurements on the economic-financial indicators and on innovativeness. The originality represents the empirical analysis combining secondary enterprise accounts and public procurement data with unique in-depth survey enterprise level data.

Keywords: grants, enterprise innovativeness, enterprise economic-financial efficiency, Slovenia.
Category: Research paper

INTRODUCTION

In the European Union (EU) countries, European Commission allocates direct financial contributions in the form of grants to projects or organizations that promote European interests or participate in the implementation of EU programs and policies (European Commission 2010). On 18 June 2007, the European Commission confirmed NSRF (National Strategic Reference Framework) to Slovenia as to the thirteenth of 27 EU Member States and it includes priorities, indicative annual allocations, and list of operational programs. The

general orientation of the NSRF is to improve the well-being of the population of Slovenia by promoting economic growth, creating jobs and strengthening human capital and ensuring a balanced and harmonious development, particularly between regions. On one hand, this orientation defines prosperity as a global goal, and on the other hand, it places particular emphasis on promoting economic growth and job creation, which are the key objectives of the Lisbon Strategy, as well as balanced regional development. Small and medium-sized enterprises are eligible for assistance in the form of grants, guarantees and loans.

Economic growth is one of the major objectives economic policies (e.g. Bojnec and Fertő, 2012). The countries that are developing dynamically towards the knowledge society are characterized by (OP KRRP, 2008, 19):

- Intensive investment in research and development (R&D);
- Have developed close connection between public research and education sectors and the economy;
- Experience high degree of innovation;
- Are abounded with highly skilled labour force, and
-

Have developed good information infrastructure with support of good quality of institutions.
The paper aims to investigate associations between the grants co-financing, enterprise efficiency and innovativeness using a combination of enterprise accountancy data and unique in-depth enterprise level survey data. The focus of the empirical research is on grants from public tender P4 for co-financing of purchases of new technological equipment with aim to increase enterprise innovativeness and production of new products. The rest of the paper is structured from the following additional three sections. The second section explains specific grants devoted to supportive environment for entrepreneurship and public tender P4. The third section explains and analyses innovation activities in the enterprises. The fourth section tested the hypotheses on an impact of grants from public tender P4 on the performance and innovation of the enterprises. The final section derives conclusions and implications.

GRANTS

1 Supportive Environment for Entrepreneurship

ERDF (European Regional Development fund) constitutes a financial instrument of the European cohesion policy aimed to strengthen economic and social cohesion and help to redress the main development imbalances in the Community regions.

In the background paper on the promotion of entrepreneurship and competitiveness (updated program of measures to encourage entrepreneurship for the period 2007-2013), a program of measures is based on four basic pillars that are connected to each other in a whole:

1. Promoting entrepreneurship and entrepreneurship-friendly environment;
2. Knowledge for the economy;
3. Development and innovation in the economy;
4. Promotion of small and medium-sized enterprises through equity and debt financing.

The first pillar measures are aimed at promoting entrepreneurship and entrepreneurship education with a view to improve the entrepreneurial culture in Slovenia and to increase awareness and use of support services for potential entrepreneurs and established companies. An important component of measures is development of effective, transparent and supportive environment.

The second pillar measures are devoted to strengthening the internal capacity of companies for more intensive, knowledge-based development, especially in the field of technology in order to enable the Slovenian economy, especially SMEs, to cope with rapid technological progress, which is the main element in increasing competitiveness in the global economy.
The third pillar measures are focused on increased investment in R&D and economic infrastructure of the private and public sectors. Measures to support the development and innovation in the economy are aimed at establishing an effective support environment, the creation of adequate infrastructure at the local and the national level, and strengthening the financial resources for R&D and innovation in the Slovenian economy.

The fourth pillar measures are aimed at financial support to SMEs through equity and debt financing. Venture capital is provided through venture capital funds as a form of equity financing in the context of public-private partnerships.

2. Public tender P4

One of the most interesting public tenders was P4. The subject of the public tender P4 was co-financing (direct subsidies) of the purchase of new technological equipment which represents the initial investment. Initial investments are investments in tangible and intangible assets related to the establishment of a new business, expansion of an existing business, expanding the company's activities into new additional products or a fundamental change in the overall production process of an existing company. The purpose of the public tender P4 is to promote the initial investment, which will be reflected in the greater competitiveness of companies as measured by increased growth and productivity, and more competitiveness on the market and higher value added per employee.

The purpose of the public tender P4 and the criteria for achieving the objectives are oriented in the direction of increasing innovation and value added per employee. This means that through the grants the organizer of the public tender P4 wanted to achieve a higher value of financial indicators, to increase the level of innovation and to increase the value added per employee in companies.

INNOVATION

Innovation is mentioned in all EU strategic documents that are the basis for drawing up public tenders. Receiving grants from the EU is in all public tenders related to innovation. All public tenders which were published for the enterprises and other organisations included reaching objectives by integrating innovation. Organisations were requested to provide: a new product developed by the development team within the organization; a new product developed with external research institutions; a new patent; a new internal innovation; new technological processes; and similar.

1. Innovation as Factor of a Competitive Advantage

The vision of the European Research Area is to connect and bring together different research systems into a single area that will encourage creative thinking, strengthen Europe's competitiveness and enhance the quality of life of its citizens (European Commission 2005, 1). The Lisbon strategy and the Barcelona targets advocate for Europe to become along with Slovenia the world's most innovative economy which should provide sufficient jobs and a high quality of life for citizens (Mulej 2006, 17).

In Slovenia, from 1998 to 2008, a slight growth for a percentage of gross domestic expenditure on R&D of GDP is shown in Table 1. However, Slovenia is still well below the EU average.

Table 1 : Gross domestic expenditure on R&D (% of GDP)

Year	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008

If there are relatively limited R&D expenditures, we cannot, on the other hand, expect to increase innovation and new patents that would place Slovenian enterprises ahead of the competition within the EU and in global trade (Bojnec and Fertő, 2011). In this way, the country is losing competitiveness and more likely deteriorates its international trade competitiveness.

Table 2 presents the Global Competitiveness Index (GCI) for selected European countries in the period 2012-2013. The Slovenian economy is ranked on the 56th place among the world economies, which are included in the comparative analysis of the GCI. .

Table 2: Global Competitiveness Index for the years 2012-2013

Source: World Economic Forum 2013.

More specifically, Slovenia is among the 144 countries on 56th place as regards the global competitiveness. In the years 2010-2011 it was on 45th place (Schwab 2012, 15), and in 2011-2012 it was on 57th place; this means that in the recent years Slovenia has been losing global competitiveness or global competitive advantage compared to other countries.

2. Economic Environment and Innovation

Slovenia's Development Strategy (UMAR 2005, 8) ranks among the most important national development objectives for 2006-2013 the increased global competitiveness by means of promoting innovation and entrepreneurship.

In Slovenia, in 2008, of all the enterprises, 50.3% were innovative ones, as shown in Table 3. Most innovative enterprises were in Germany, followed by Belgium and Luxembourg.

Table 3: The Share of Innovative Enterprises in Slovenia and in Other EU and Associated Countries

Source: Eurostat 2012

More than half of the Slovenian enterprises are innovative. The state should provide an economic environment where this innovativeness will represent the competitive advantage of companies.

Bérubé and Mohnen (2009, 222-223) determine the performance for the Canadian enterprises that received grants and tax exemptions. The core activity of analysed enterprises was growing plants. They discovered that the most successful enterprises were the ones which received grants and tax exemptions. The lower is the performance of enterprises that have received only tax exemptions. In addition, the enterprises that have received grants and tax exemptions are much more innovative, have more registered global patents and are more successful in marketing their innovations.

Czarnitzki and Bento Lopes (2011) analyzed the effects of the grants in German enterprises. They showed that enterprises that receive grants – both national and directly from the EU or

both – have a higher degree of innovation than if these resources would not have been received. They found out that the grants which the enterprises received directly from the EU, had a greater effect than national resources. Most likely, the reason behind is that the average size of grants that are drawn directly from the EU is higher. They also concluded that enterprises that have received grants from both sources, they have the highest salaries. As far as patents are concerned, the most successful are the enterprises that have received national resources, or a combination of national and direct EU funding. Most of them make a patent application within the next year t +1.

METHODOLOGY AND DATA

We investigate the relationship between financial indicators and innovation of the enterprises that have received grants from the public tender P4. We measure the financial effects and indirect effects. The financial effects are monitored through financial indicators that are accessible through publicly accessible databases such as Bisnode (2012). Through this group of effects, we examine the impact of the grant from the public tender P4 on the financial indicators of the enterprises: turnover, profit, growth in employment and value added per employee. The indirect effects were monitored through the relationship between financial indicators and innovation of the enterprises and employee satisfaction. This group of effects was measured with data from the questionnaire. The Cronbach's alfa was used to measure reliability of the questionnaire. The principal components method was applied to map each variable into a number of new variables and the principal components. This was followed by multiple regression analysis in which the effects between the dependent and independent variables are determined.

Hypotheses

As part of the research, two hypotheses were tested, namely:

1. H1: Grants from the public tender P4 are positively associated with the performance of the enterprise which is measured by financial indicators.
2. H2: Reaching the effects of grants from the public tender P4 is positively associated with innovation in the company.

Data Collection and Data Processing Data to test the set H1 were obtained through the portal Bisnode (2012). Returned completed written questionnaires were first examined, and then a database was created in Excel and then the set H2 was tested in a computer program SPSS17.

The data collection approach used is a structured written questionnaire. The written questionnaire was anonymous. It included several types of questions: the respondents wrote the answer or they circled the answer among given answers or circled the answer that indicated the intensity of agreement or disagreement with the statement based on Likert scale. The used written questionnaire was accompanied by a cover letter, which explained the aims, objectives and content of research as well as explained the selection approach for the survey's conduction. The written questionnaire was sent to the enterprises on the list of the recipients of the grants from the public tender P4 by e-mail. Data collected by the written questionnaire

from the enterprises are the primary data, which includes nominal, ordinal, interval and ratio variables.

Three different types of information about the respondents are obtained:
- Nominal data give information about naming the categories: enterprise size and statistical region. Based on these data, the structural shares of enterprises are calculated;
- Ordinal data were obtained from answers to questions about innovation and employee satisfaction. Perceptions were measured by using the Likert scale where the respondents' answers had been ranked with a possibility to give the mark from 1 (completely disagree) to 5 (completely agree). Unit of measurement according to the Likert scale is the interval and ratio. Ordinal data were used to measure the variables that determine the innovation and employee satisfaction;
- Interval data are represented by the answers to the questions about the age of enterprise and number of employees.

Written Questionnaire

For the validation of the set H2 a written questionnaire was used. The written questionnaire was prepared in the web application 1ka (Faculty of Social Sciences, 2012). The invitation letter and a link to the written questionnaire were sent by e-mail to the enterprises that have received grants from the public tender P4.

The written questionnaire was divided into five sections:
I. Basic questions about the enterprise, where it was necessary to answer 10 questions, in particular the control variables. In this context, the enterprise gave a written reply and chose a particular value for a particular question.
II. Innovation, which was divided into the following four dimensions: Innovation culture and climate, Innovation and rewards, Creativity as the basis for innovation, and Innovation performance. 22 statements were given on the five-point Likert scale, with possible answers from 1 – very untrue to 5 – very true.
III. Employee satisfaction, which was divided into the following five dimensions: Overall satisfaction, Salary, Organizational culture, Characteristics of work, and Loyalty of employees. 20 statements were given on the five-point Likert scale, with possible answers from 1 – very untrue to 5 – very true.
IV. Reasons for failure to achieve the set goals. 11 statements were given on the five-point Likert scale, with possible answers from 1 – very untrue to 5 – very true.
V. Information about the respondent. The respondent answered the four questions regarding age, gender, education and position in the company ...

Arguments for the second and third set of questions were taken from previous research such as Fatur et al. (2007); Fatur and Likar (2009); Likar and Fatur (2010).

Sample and Units

Data collection through the written questionnaire was conducted by sending an invitation letter and a link to the written questionnaire by e-mail. The enterprises that have received grants are micro, small and medium-sized enterprises. They deal with different economic activities and are from each of the statistical regions in Slovenia. The public tender P4 was

implemented in 2006, 2007, 2008 and 2009. The calculation of financial indicators was made for each of the enterprises that have received grants from the public tender P4. There were 918 successful applications by the enterprises from the year 2006 to the year 2009, of which some enterprises had received several successful applications; therefore there were 793 enterprises that had received grants from the public tender P4 in the period 2006-2009. In 2012, when the financial analysis to test the set H1 started, 55 companies have been exited from the businesses, either being in bankruptcy or insolvent. For 73 enterprises it was not possible to obtain the correct e-mail addresses. Thus, the written questionnaire was successfully sent to 665 enterprises: 118 enterprises answered on the written questionnaire, representing 17.3% of the enterprises that have received the e-mail. They represented 14.9% of the enterprises, which were successful in the public tender P4. The e-mail was sent to the enterprises for the first time on 2nd February 2012. The e-mail to the enterprises that had not responded to the written questionnaire, were re-sent by the e-mail on 28th February 2012. The surveys with the written questionnaire were completed on 11th March 2012.

RESULTS OF HYPOTHESIS TESTING

The Financial Effects: Testing the Set H1

As part of the testing the set H1, a financial analysis of enterprises that have been successful in applying the public tender P4 was conducted. The financial effects were measured by four financial indicators:

- Total revenues,
- Net profit for the period,
- Average number of employees, and
- Value added per employee.

The public tenders P4 were published in the years 2006-2009. For each of the years under consideration, the average increase in the four financial indicators for the enterprises that have been successful in applying to the public tender P4 in the respective year was calculated. In addition, the average increase in the four financial indicators for the enterprises that responded to the written questionnaire was calculated. The number of positive, negative and neutral individual financial effects for the four indicators was calculated. Total revenues, net profit and the value added per employee for the period 2006-2009 were deflated by the consumer price index, which was obtained from SORS (2012).

Table 4: The results testing the set H1, The average increase / decrease, all companies (nominal)

The average increase / decrease over the years in percentages	Year 2006	Year 2007	Year 2008	Year 2009	Average
Total revenues	14,43%	-4,55%	9,47%	12,03%	7,84%
Net profit for the period	21,86%	-111,38%	2,67%	36,61%	-12,56%
Average number of employees	16,06%	6,54%	27,82%	5,27%	13,92%
Value added per employee	7,55%	45,62%	3,11%	1,89%	14,54%

The Principal Component Analysis

The principal component analysis of variables for innovation suggested the following four principal components:

- The principal component 1: Incentives for innovation;
- The principal component 2: Procedures and standards for innovation;
- The principal component 3: Innovation as a prerequisite;
- The principal component 4: Ways to innovate.
-

The criteria for determining the number of principal components were: diagram of Scree plot (where the line breaks), the eigenvalues greater than one and the proportion of explained variance at least 50% and substantive reasonableness.

Testing the Set H2

The purpose of testing the set H2 is to determine the impact of innovation on enterprise's performance. The analysis is based on primary data obtained from the written questionnaire. The set H2 argues that the effects of grants from the public tender P4 is positively associated with innovation in the enterprise, which determines economic efficiency positively. Therefore, in the regression framework, the dependent variable is economic efficiency measured by value added per employee. The independent variables are the four principal components of innovation in enterprises: the incentives for innovation, procedures and standards for innovation, innovation as the prerequisite, and ways to innovate. The tested multiple regression equation is:

$DVZ = a + b_1*INOP + b_2*INOPO + b_3*INOST + b_4*INOSP$ where:

DVZ = value added per employee.

a = regression constant,

b_1, b_2, b_3 and b_4 = regression coefficients,

INOP = Innovation in the way to innovate,

INOPO = Innovation as a prerequisite,

INOST = Innovation as the procedures and standards for innovation, and

INOSP = Innovation as incentives for innovation.

The estimated regression model was shown to be insignificant at 10% level (F = 1.82, Sig. 0.128). The corrected coefficient of determination is 0.028, which means that only 2.8% of the variance in the dependent variable can be explained by the independent variables.

The standardized regression coefficient for the incentives to innovate is -0.056 and is insignificant (Sig. 0.538). The standardized regression coefficient for the procedures and standards for innovation is 0.012 and is insignificant (Sig. 0.897). The standardized regression coefficient for the Innovation as a prerequisite is 0.176 and is insignificant or significant at 6% level (Sig. 0.056). The standardized regression coefficient for the Ways to innovate is 0.163 and is insignificant (Sig. 0.077).

These results would suggest that the innovations increase the value added per employee or that innovation has a positive impact on the value added per employee, which is consistent with the set H2. However, some of these coefficients are insignificant or are on the border of statistical significance at 6-8% of significance level.

The calculated bivariate regression analysis, where is checked whether the principal component Innovation as a prerequisite actually has a positive impact on value added per employee, is tested by the following bivariate regression equation: $DVZ = a + b_1*INOPO$, where:
DVZ = value added per employee,
a = regression constant,
b_1 = regression parameter, and
INOPO = Innovation - innovation as a prerequisite,

The corrected coefficient of determination is 10.9%. The standardized regression coefficient for the Innovation as a prerequisite is 0.347 and is statistically significant (Sig. 0.002).
On the basis of these results can be confirmed that the principal component of innovation as a prerequisite has a positive impact on value added per employee. The other three principal components do not affect the value added per employee significantly.

FINDINGS AND IMPLICATIONS

In the analysis of financial indicators on testing the set H1 confirmed that the enterprises achieved positive financial impacts from grants from the public tender P4. The enterprises that have been successful in the public tender P4 on the basis of the three analysed financial indicators are more successful than the average of enterprises operating in eligible activities. Thus, the set H1 can be validated as confirmed. This imply that the successful companies are more likely to have capacity to efficiently apply and compete in the public tender P4, which is further increasing their competitive abilities and the level of economic efficiency.

To test the set H2, a multiple regression analysis has been conducted using previously estimated principal components as independent variables. In the set H2 is determined the impact of innovation on enterprise's performance. The value added per employee is significantly positively associated with the principal component Innovation as a prerequisite, but not with other three components. This means that the set H2 2 can only be partially validated.

CONCLUSION

The novelty and contribution of the paper is on the assessment of the impact of grants of the public tender P4 to the economic-financial efficiency and enterprise innovation. This research is the first in Slovenia, which measured the impact of a certain tender (i.e., the public tender P4) on the achievement of the aims and objectives identified in the public tender. In addition to the importance for research, it has also important policy implications directed towards the implementation of the public support programs and EU directives in order to measures the overall impact of the grants and to explore the specific aims and the effects achieved.

The study was financed by Ministry of Science and Higher Education in Poland (National Research Center) Grant NN 115419840.

ABSTRACT

Purpose - *The aim of the study is to identify factors conditioning the innovativeness of countries and regions, those well-developed and less developed ones as well. The analysis will be performed regarding different aspects for European and Asian countries and the United States of America. The analyses will be performed on the basis of the indices and data collected in Global Innovation Index 2012. The work will also present an analysis of the influence of corporate culture on innovativeness, as well as a study of innovativeness in Polish enterprises against the international perspective.*

Design/methodology/approach - *The comparative analysis in the following aspects:*

1. *GDP per capita*
2. *The Global Innovation Index*
3. *Hofstede Culture Index*

The research was focus on the comparison of five countries: Poland, Slovenia, Thailand, Ukraine and USA. The examples was selected not as a random sample but the criteria refer to the variety in values, and innovation dimensions as well as America, Asia and Europe representations based on the triad influences.

Findings - *It is clear that different business environments and culture environment exist throughout triad partners and it influence different innovation approach development.*
There are national culture values strengthening and limiting innovations. Analysing Organizational culture models – in Poland, Slovenia and Ukraine the high power distance and high uncertainty avoidance can be the barriers, in Thailand – long term orientation helps to built life long innovative approach and in USA high individualism and low avoidance of uncertainty helps to generate innovations.
The awareness of organizational culture supporting and limiting values should be used in every day management and international cooperation.

The interrelations of organizational culture and economics phenomenon are of great importance not only for a certain company but also on macro level and it worth to analyze the relations in more details. It shows the need of further research focused on the mutual influences analysis.

The analysis of the collected data indicates that countries with higher score in Global Innovation Index 2012 exhibit a higher level of regional development.

Research limitations/implications - *The research and theory on cross-cultural comparisons is then limited to the acknowledgement that cultural differences exist. The models which have been created to evaluate the transferability or application of theory to a different culture can identify some areas in which problems may be expected but they cannot prescribe methods or techniques to be used in another culture. More intensive research which investigates how culture influence innovation on macro, micro and project level and what leads to effective innovation development in different cultures may lead to working out more useful models. At the moment any cross-cultural application must be made with great care.*

Originality/value *- The authors explain the importance of identification of factors conditioning the innovativeness of countries and regions.*

Keywords: *innovativeness, cross culture comparison, culture dimensions, economic development, national innovation system, economic conditionings*
Classification: *Conceptual/Research paper*

INTRODUCTION

At the time of globalization the existing sources of economic growth, such as relatively low labor costs, availability of cheap resources or favorable geographical situation are insufficient. It is necessary to search for new sources of the competitive advantage, and developmental tendencies in highly developed countries show that the only way to guarantee permanent development is to build up a competitive advantage based on knowledge and innovations. Moreover, it is believed that innovativeness is a multidimensional phenomenon which should not be perceived merely as a linear transition from research activities to launching a new product on the market.

Innovation has been introduced into formal economic growth models in 1957 by Robert Solow, a professor at MIT. He was awarded a Nobel Prize in Economics for this and related work in 1987. Solow defined growth as the increase in GDP per hour of labour per unit time. According to theory, innovation gives a chance to increase a competitiveness and economic growth of country.

The aim of the study is to identify factors conditioning the innovativeness of countries and regions, those well-developed and less developed ones as well. The analysis will be performed regarding different aspects for countries such as Poland, the USA, Thailand, Slovenia and Ukraine. Additionally, an analysis will be carried out to study the effect of the level of innovativeness on the economic development in these countries. The analyses will be performed on the basis of the indices and data collected in Global Innovation Index 2012.

The work will also present an analysis of the influence of corporate culture on innovativeness, as well as a study of innovativeness in Polish enterprises against the international perspective.

NATIONAL INNOVATION SYSTEM

Innovativeness is one of the factors which have an essential effect on the level of economic competitiveness. Innovation capacity has been widely acknowledged as a critical force to national economic growth for developed countries (Nelson 1993, Porter 1990). Competition and innovation are important for the countries in building up the innovation capability as they provide possible pathways to accelerate the process of technological catch-up as well as sustain productivity growth and competitiveness (Porter 1998). Clearly observed differences among particular countries at the level of innovativeness of their economy provided us with an impulse to analyze the agents conditioning their degree. Conditionings concerning the development of innovations are determined by economic, cultural, social and technological factors which are characteristic of individual countries, economies or regions. Although it is commonly argued that countries need to innovate in order to grow and achieve success, it is important to known which factors determinate this. Innovation capacity can be defined on micro (company level) or macro (a national level).

National innovation capacity may only be considered via a properly functioning national innovation system (NIS). The term was coined by C. Freeman and developed in the following years (Lundvall, 1992; Nelson, 1993; Edquist, 1997).

In OECD countries, NIS was standardised and analysis of technology performance and policies has traditionally focused on inputs (such as expenditures on research and development and the number of research personnel) and outputs (such as patents) (OECD, 1997).

The national innovative capacity framework seeks to integrate three perspectives regarding the sources of innovation: ideas-driven growth theory, microeconomics-based models of national competitive advantage and industrial clusters, and research on national innovation systems. While these perspectives contain common elements, each highlights distinct drivers of the innovation process at the national level[1].

An innovation system is a network of organizations, enterprises, and individuals focused on bringing new products, new processes, and new forms of organization into economic use, together with the institutions and policies that affect their behavior and performance (World Bank 2006).

National innovative capacity is not the realized level of innovative output per se but reflects more fundamental determinants of the innovation process. Differences in national innovative capacity reflect variation in both economic geography (e.g. the level of spillovers between local firms) as well as cross-country differences in innovation policy (e.g. the level of public suport for basic research or legal protection for intellectual property (IP)).[2]

The actual output of innovation in terms of new goods and services or improved processes is already captured in the gross domestic product (GDP) and the National Income and Product Accounts (NIPAs). The amount and type of investment that lead to innovation, however, are

[1] Stern S., Porter M.E., Furman J.L. (2000), The Determinants of National Innovative Capacity, Working paper 7876, Cambridge, Massachusetts, National Bureau of Economic Research, pp.4.
[2] *Ibid.*, pp. 900.

not captured. This type of information is needed to improve our understanding of economic growth[3].

ORGANIZATIONAL CULTURE CONTEXT OF INNOVATIONS

The era of globalization and the economy based on knowledge creates new challenges for management. Innovation have to be developed faster and more effectively. All the determinants supporting innovative economy and enterprises have to be analyzed and organizational culture is one of the leading ones.

In the literature there are three following levels at which innovation has been researched:

- The macro–focusing on the source of impact of innovation within economies and industries;
- The micro and company – investigating on how companies manage innovation and the advantages that brings them in terms of competitive advantage, revenue and profits;
- The project level looking at the management of innovation projects, particularly new product development.

The organizational culture impact on all three levels is important, although it has not been examined in the macro context very well. The paper tries to fulfill the gap presenting comparison of pro - innovative indicators as well as the organizational culture of selected countries.

One of the key themes underlying the analysis of the issues discussed in this paper is cultural difference in the context of influencing innovation.

There is the view that that the factor, which influence on innovation is organizational culture (Carmeli, 2005). Since it influences employee behaviour, it may lead them to accept innovation as a fundamental value of the organization and to feel more involved in the business (Hartmann, 2006). Consequently, the literature considers organizational culture to be one of the factors that can stimulate the most an innovative behaviour among the members of the organization Furthermore, we suggest that different organizational cultures will be required depending on the innovation models in various countries.

Regarding organizational culture, there is an agreement in the literature about its importance for innovation (Chang & Lee, 2007, Lau & Ngo, 2004, Martins & Terblanche, 2003, Mumford, 2000, Obenchain & Johnson, 2004)
