There have been some attempts to separate cultural differences from other environmental differences in research (Saha, 1993; Easterby-Smith et al, 1995) but their overlap in most models for cross-cultural comparisons remains problematic. Hofstede (1996) states that systems and culture are part of the same circle; this would imply that there is no need to separate local environment from culture. However, this assumes that political and economic structures and systems in a country arise from a consensus - then these could be seen to represent an articulate part of national culture.

[3] Rose S., Shipp S., Lal B., Stone A. (2009), Frameworks for Measuring Innovation: Initial Approaches, A. Working Paper #06, Athena Alliance, Science and Technology Policy Institute, pp.1.

As culture represents or expresses values, behaviours and attitudes, it is important to understand cultural differences in order to understand which management methods will work, and how to develop innovation.

There are many manifestations of cultural differences. These are evident in national and regional differences in style, taste, family relations, government structures etc. There is also evidence of differences in working methods and business organisation from one country to another: German co-determination, Japanese management methods etc. The following are a few examples of definitions and methods used to compare cultures.

Hofstede (2010) defines culture as "collective mental programming of human mind which distinguishes one group of people from another. This programming influences the patterns of thinking which are reflected in the meaning people attach the various aspects of life and which become crystallized in the institutions of society" .

Hofstede's method of analysing culture was derived from a survey of work values conducted at IBM between 1968 and 1973. The four dimensions concerned attitudes to authority, group membership, risk and competition versus co-operation. Later work led by Bond at the Chinese University of Hong Kong added a fifth dimension: Confucian dynamism (Bond et al, 1987). The basis of this model is that the dimensions can be measured and compared. The dimensions represent a system of values which are related to behaviour, management practices and methods of organising systems. Schein (1992) disagrees with these methods - he replaces values with 'basic assumptions' which are both taken for granted and non-negotiable (p16). Schein does not agree that cultural assumptions (or values) can be broken down and measured by a survey method.

Culture then is described as something - orientations (Trompenaars, 1993), values (Hofstede, 1980) or assumptions (Schein, 1992) - which is shared by a group of people. There are different groups which can be considered, such as national groups, occupational groups, industry groups and firms. This gives rise to different 'cultures' - that is national business culture, occupational culture and corporate culture. It is clear that people from different cultures do some things differently, for example, they may speak differently and/or treat one another differently. From the models described, it emerges that different approaches to innovation would prevail in different cultures.

Hostede's dimensions are probably the best known and most frequently used but Hofstede himself criticises many of the applications of his questionnaire. The model has a certain elegance - four or five dimensions which can be compared along straight line continuums, some of which have been shown to be related to preferences for different organisational systems as well as to economic development. However, the questionnaire is not designed for 'one-off' measures in a given country.

ORGANIZATIONAL CULTURE INDICATORS

In Hofstede's original research data was collected from a large multinational business corporation (IBM) with subsidiaries in 64 countries. This initial structure consisted of four individual cultural value dimensions.

The first one is *power distance* (PDI). According to Hofstede (1980), power distance is the extent to which the less powerful individuals in a society accept inequity in power and consider it as a normal. In high power distance cultures, individuals respect their superiors and avoid criticizing them, while in low power cultures, it is acceptable to challenge superiors, albeit with respect. The second dimension is *individualism versus collectivism* (IND), reflecting the degree to which a society views its members as individuals or as group members. In individualistic cultures, individuals are mostly concerned with their own interests, while in highly collective countries, they are not defined by their own actions but rather the group' actions. The third dimension is *masculinity versus femininity.* The firs one is described as cultures where the dominant values are expected to ambitious, assertive and competitive, while in feminine cultures there is a dominance of values such as "friendly atmosphere, position security, physical conditions" (Hofstede, 2001, p.281). The last dimension is uncertainty avoidance presenting the degree to which people in a culture generally prefer structure to risk (Hofstede, 1984). Societies high in uncertainty avoidance feel anxious by situations that are unstructured , unclear and unpredictable, while cultures low in this dimension are reflective, less aggressive, relatively tolerant, and unemotional.

The fifth dimension was added by Michael Harris Bond (Chinese Culture Connection, 1987) and was originally labeled *"Confucian dynamism".* It refers to time orientation on life and work and with the long one there is the preference for delayed reward versus the instant one. The most recent Minkov (2007) proposed three new dimensions: Exclusionism versus Universalism, Indulgence versus Restraint, and Monumentalism versus Flexhumanity.

Table. 1. Organizational Culture of countries.

Country	PDI	IND	MAS	UAI	LTO
Poland	68	60	64	93	32
Slovenia	71	27	19	88	-
Thailand	64	20	34	64	56
Ukraine	very high*	low*	low*	very high*	-
USA	40	91	62	46	29

MEASUREMENT OF INNOVATION

For national innovation system the relationship between innovation inputs and outputs seems crucial. Countries and market agents aspiring to strengthen innovation performance must be efficient in transforming innovation inputs into innovation outputs.

In order to measure national economies' innovation, attempts at standardisation utilising various definitions and data collecting methods have been in progress. Numerous organisations such as OECD, Eurostat, Statistics Canada, Statistics Sweden, INSEAD and

World Intellectual Property Organisation (WIPO) have developed guidelines for the development of innovation indicators.

It is also noteworthy that there exists no perfect set of indicators applying to innovation policies. However, such indicators constitute a useful tool for making international comparisons. The innovation index could also help assess what a country ought to do in order to boost innovation, resulting in fostering economic growth and stimulation of the creation of new workplaces. Furthermore, the innovation index highlights policy challenges – national policies to craft new national innovation strategies. However, conditionings will not replace analyses aiming at establishment of correlations and causal dependencies.

Due to its influence upon economic progress and competitiveness, innovation is a fundamental phenomenon both for developed and developing economies. Innovation is more complex and multidimensional and the level of innovation is not solely influenced by R&D expenditures, which constitute one of the many conditionings.

Innovation is important for driving economic progress and competitiveness – both for developed and developing economies. Many governments are putting innovation at the center of their growth strategies. There exists awareness that the definition of innovation has broadened – it is no longer restricted to R&D laboratories and to published scientific papers. Innovation could be and is more general and horizontal in nature, and includes social innovation and business model innovation as well. It is seen as crucial for inspiring people, especially the next generation of entrepreneurs.[4]

Innovation is important for driving economic progress and competitiveness – both for developed and developing economies. Many governments are putting innovation at the center of their growth strategies. Second, there is awareness that the definition of innovation has broadened – it is no longer restricted to R&D laboratories and to published scientific papers. Innovation could be and is more general and horizontal in nature, and includes social innovation and business model innovation as well. It is seen as crucial for inspiring people, especially the next generation of entrepreneurs.[5]

In order to evaluate and analyse the innovation of national economies, methodology and data collected in "Global Innovation Index 2012. Stronger Innovation Linkages for Global Growth" report will be utilised. The report was compiled by INSEAD and the World Intellectual Property Organisation (WIPO, a specialized agency of the United Nations). In this 5th edition of report, the knowledge partners consisted of the Confederation of Indian Industry, Booz and Company and Alcatel-Lucent. The realisation of Global Innovation Index (GII) was launched by INSEAD in 2007 in order to develop a tool allowing for measurements of nations' innovation. The GII adopts a broad notion of innovation, originally presented in the Oslo Manual developed by the European Communities and the OECD6. GII model includes 141 economies, which represent 94.9% of the world's population and 99.4% of the world's GDP (in current US dollars)7. The advantage of the study lies both in the

[4] The Global Innovation Index 2012, Stronger Innovation Linkages for Global Growth, edited by Dutta S., INSEAD and the World Intellectual Property Organization (WIPO), 2012, pp.4.
[5] *Ibid*., pp.4.
[6] *Ibid*., pp.5.
[7] *Ibid*., pp.6.

number of countries the study encompassed and the amount of statistical data collected and applicable to a more in-depth analysis in the present paper. Moreover, the GII helps to create an environment in which innovation factors are under continual evaluation, and it provides a key tool and a rich database of detailed metrics for refining innovation policies[8].

As regards Global Innovation Index 2012, countries such as Switzerland, Sweden, Singapore and United Kingdom occupy leading positions.

In order to evaluate the influence of economic factors upon the level of innovation, countries of various sizes and level of development were selected. The USA, Poland and Slovenia were selected from among high income economies, Thailand from upper-middle economies and the Ukraine from low-middle economies[9]. Global Innovation Index for the selected countries was presented in Table 2. Individual categories can be scored 0 to 100.

Tabele 2. Global Innovation Index ranking for studied countries.

Country	Rank	Score (0-100)
United States of America	10	57,7
Slovenia	26	49,9
Poland	44	40,4
Thailand	57	36,9
Ukraine	63	36,1

Source: authors' own study based on data from the Global Innovation Index 2012.

The Global Innovation Index (GII) relies on two sub-indices, the Innovation Input Sub-Index and the Innovation Output Sub-Index, each built around pillars. Each pillar is divided into three sub-pillars and each sub-pillar is composed of individual indicators, for a total of 84 indicators[10]. The data used in a raport are from 35% from 2010, 21% from 2009.[11]

ANALYSIS OF ECONOMIC CONDITIONINGS INFLUENCING INNOVATION OF THE STUDIED COUNTRIES (BASED ON GLOBAL INNOVATION INDEX 2012)

For the purpose of Global Innovation Index 2012 evaluation the research team selected individual conditionings which, based on the team's experiences, influence the level of innovation[12].

[8] *Ibid.*, pp.4.
[9] Categorisation as regards the value of income was conducted by World Bank Income Group Classification (April 2012).
[10] More in: The Global Innovation Index 2012, Stronger Innovation Linkages for Global Growth, edited by Dutta S., INSEAD and the World Intellectual Property Organization (WIPO), 2012.
[11] *Ibid.*, pp.5.
[12] Based on: The Global Innovation Index 2012, Stronger Innovation Linkages for Global Growth, edited by Dutta S., INSEAD and the World Intellectual Property Organization (WIPO), 2012.

The GII helps to create an environment in which innovation factors are under continual evaluation, and it provides a key tool and a rich database of detailed metrics for refining innovation policies.[13]

Global Innovation Index 2012 conditionings influencing the level of innovation were divided into 7 pillars. The analysis of their influence upon the selected countries' innovation was carried out.

Global Innovation Index 2012 report specifies the following pillars:

Institutions

Institutional framework, which encourages and facilitates development of innovative activities for businesses and R&D institutions, is fundamental for innovative development of a country. Moreover, good governance and the correct levels of protection and incentives are essential for innovation. The Institutions pillar captures the institutional framework of a country.

This pillar includes 3 sub-pillars[14]:

- political environment,
- regulatory environment,
- business environment.

Among the analysed countries, institutions pillar had the greatest influence upon the level of innovation in United States of America and Slovenia. In case of the Ukraine, the factor exerted an unfavourable influence on the level of innovation. Figure 1 presents scores for individual countries.

[13] *Ibid*., pp.5.

[14] *Ibid*., pp.44.

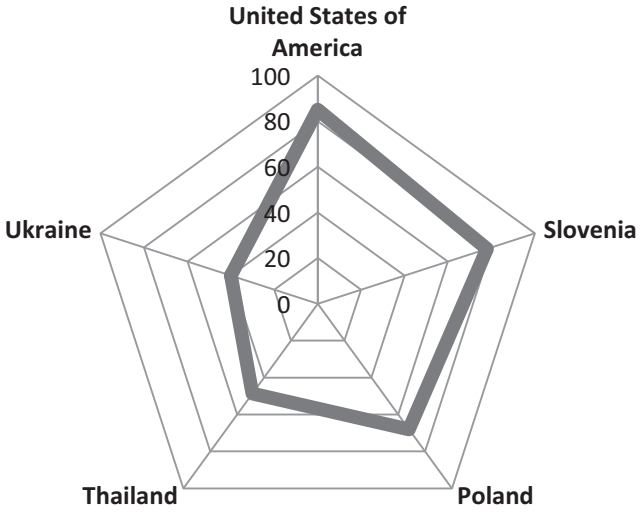

Figure 1. Scores for individual countries as regards Institutions pillar.
Source: authors' own study based on data from the Global Innovation Index 2012.

Political environment, including political stability and government effectiveness, is of strategic importance as regards the development of innovation. Data indicate that for low-income countries such as Thailand and the Ukraine, the factor exerts unfavourable influence upon the level of innovation.

Business environment also belongs to factors influencing the level of innovation. It defines the ease of starting and resolving a business and also the ease of paying taxes. In case of the Ukraine, this particular factor hinders the development of innovation, which seems to have found confirmation in results of the study. The country ranked 137th among 141 evaluated countries. As a consequence of troublesome tax-paying procedures, Poland also ranked among the low-scoring countries (95th out of 141 countries).

Human capital and research.

Education system in the country, tertiary education and well-developed research and development area constitute an important factor influencing the innovation capacity of a nation. In GII 2012 report, the following sub-pillars encompass the pillar[15]:

- education,
- tertiary education,
- research& development.

This factor influences the level of innovation in USA and Slovenia the most, which was presented in Figure 2.

[15] *Ibid*., pp.44.

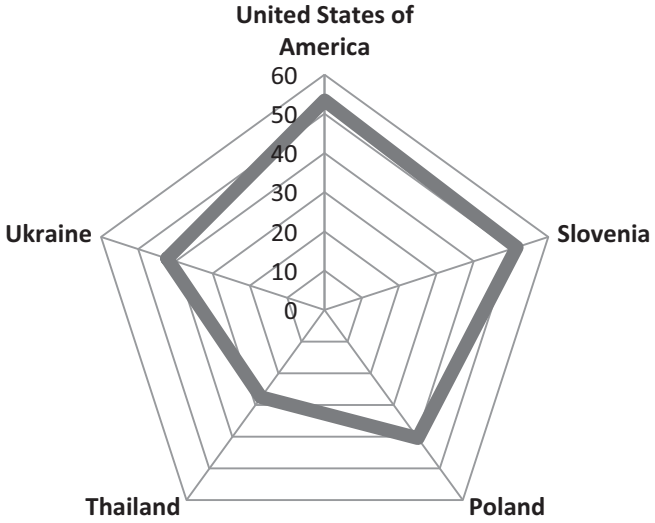

Figure 2. Human capital and research pillar- ranking for the individual countries.
Source: authors' own study based on data from the Global Innovation Index 2012.

Education system was evaluated the highest for Slovenia (ranked 14th), Poland (30th) and USA (31st). Thailand ranked the lowest (97th position) among the evaluated countries. Tertiary eduction, on the other hand, influences the innovation of the Ukraine the most. In case of Thailand it constitutes the factor exerting an unfavourable influence upon the country's innovation.

Research and Development is an economic factor conditioning the innovation of a country. As regards the factor, USA ranked the highest (12th position) and Thailand the lowest (84th position). Gross expenditures on R&D (%GDP) considerably influenced these scores with USA ranking 9th and Thailand 82nd.

Infrastructure.

The development of infrastructure, good and environmentally friendly transport and energy infrastructure facilities present opportunities for the search of innovation and its sources which may serve increased productivity and efficiency, lower transaction costs, better access to markets, and sustainable growth. This pillar includes 3 sub-pillars[16]:

- ICT,
- general infrastructure,
- ecological sustainability.

Figure 3 presents scores for individual countries as regards the development of infrastructure. Infrastructure, in particular information&communication technologies which support innovative processes, exerts positive influence on the level of innovation in USA. In case of the Ukraine, the factor has unfavourable influence upon the level of innovation, in particular

[16] *Ibid,* pp..44.

ecological sustainability (110th position in the ranking) and general infrastructure (98th position).

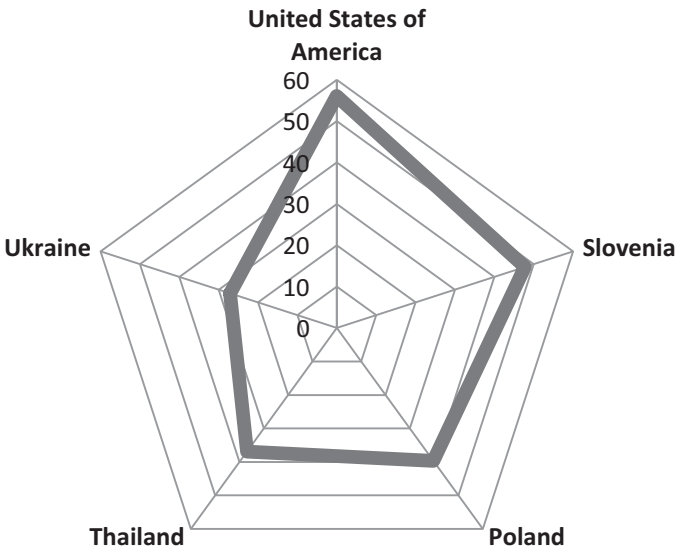

Figure 3. Ranking for the individual countries as regards Infrastructure pillar.
Source: authors' own study based on data from the Global Innovation Index 2012.

Market sophistication.

During the economic slowdown the factor gained importance for the development of innovation. The availability of credit, investment funds, and access to international markets are crucial for entities who desire to develop their innovation. This pillar includes 3 sub-pillars[17]:

- credit,
- investment,
- trade&competition .

The factor significantly influenced the level of innovation in USA which ranked 2nd in the ranking. USA boast ease of obtaining credits and high total value of stock traded. As regards the Ukraine, the factor exerted unfavourable influence (68th position) especially concerning protection of investors and intensity of local competition. Figure 4 presents values of the factor for individual countries.

[17] *Ibid*., pp.44.

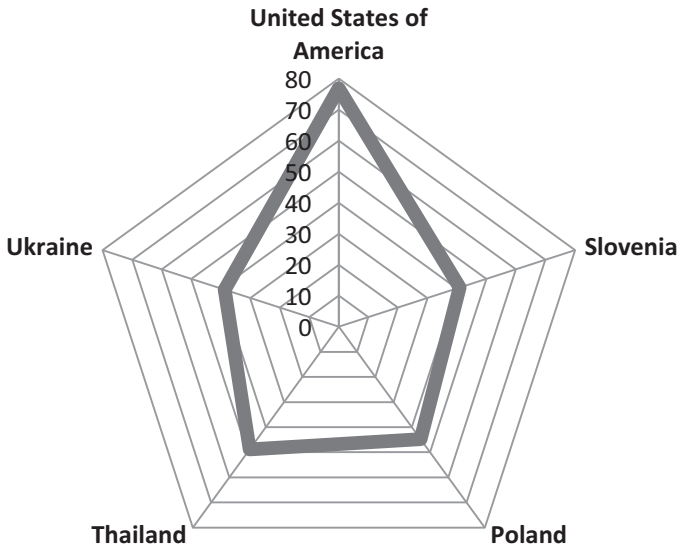

Figure 4. Scores for individual countries as regards Market sophistication pillar.
Source: authors' own study based on data from the Global Innovation Index 2012.

Business sophistication.

This factor defines the level of business sophistication to assess how conducive firms are to innovation activity, and includes 3 sub-pillars[18]:

- knowledge workers,
- innovation linkages,
- knowledge absorption.

Business sophistication exerted the most considerable influence upon the level of innovation in USA (9th position in the ranking), especially as regards knowledge workers in USA. Innovation linkages, collaboration among universities and industry in particular, have positive influence upon the level.

In Poland, this factor had unfavourable influence upon the level of innovation. This is a consequence of a low number of innovation linkages. Thailand stands out from among the evaluated countries with its score in knowledge absorption which is the highest among the countries. Figure 5 presents detailed information pertaining to scoring in this area.

[18] *Ibid*., pp.44.

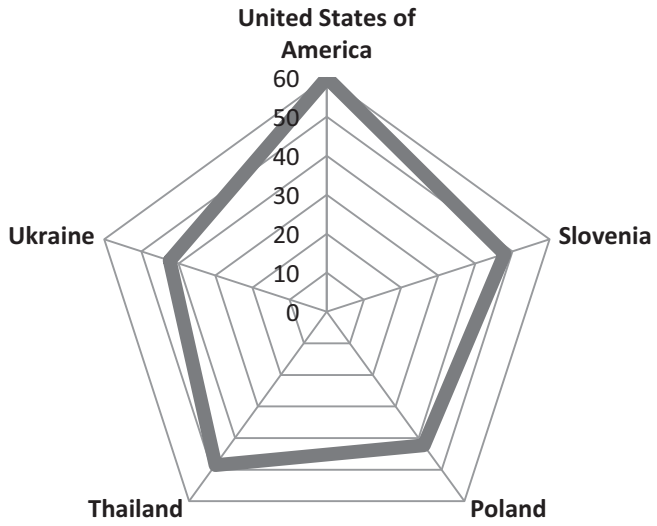

Figure 5. Scores for individual countries concerning Business sophistication pillar.
Source: authors' own study based on data from the Global Innovation Index 2012.

Knowledge&technology outputs.

In a knowledge-based economy, where knowledge is the basis for competitiveness, numerous countries rely upon knowledge to gain a competitive edge. Innovation capacity has become a key factor in shaping economic processes, individual, economic and social development. This conditioning covers all variables traditionally considered as fruits of inventions and/or innovations. This pillar includes 3 sub-pillars[19]:

a. knowledge creation,
b. knowledge impact,
c. knowledge diffusion.

As regards the pillar, USA, which occupies 11th position in the ranking, was evaluated the highest. Poland (51st position) and Thailand (50th position) were evaluated the lowest. Evaluations are presented in Figure 6.

[19] *Ibid*., pp.44.

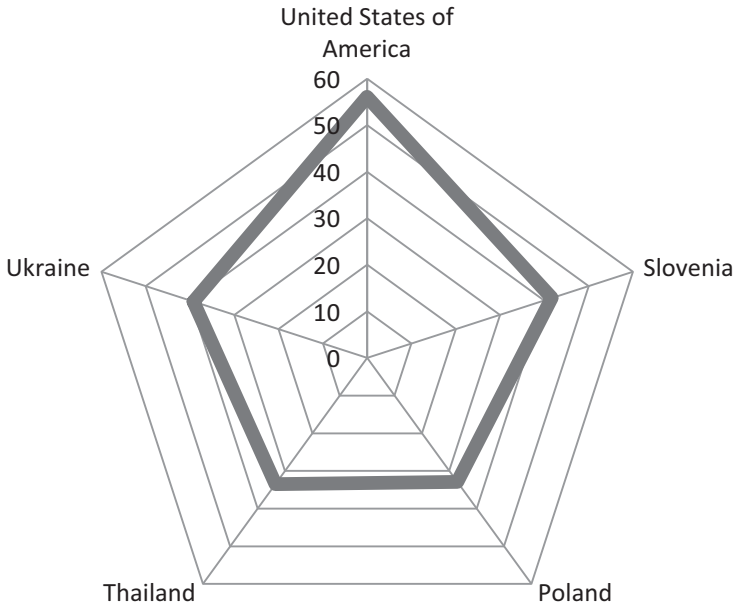

Figure 6. Scores for individual countries concerning Knowledge&technology outputs pillar.

Source: authors' own study based on data from the Global Innovation Index 2012.

The factor exerts considerable influence upon the Ukraine's innovation. Results obtained in knowledge creation contribute to this fact in particular (21st position in the ranking). The first position in the ranking deserves closer attention as regards domestic res utility model ap/BN PPP$ GDP.

Creative outputs.

The influence of creativity upon the level of innovation is undervalued. However, in recent years and in connection with the economic slowdown, it has proven to be fundamental for economic development. According to D. Hübner, creativity may be perceived as the main source of innovation i.e. translating creative ideas into products and services. In this respect, creativity is present where innovations lead to economic results[20].

The GII has always put emphasis on measuring creativity as part of its Innovation Outputs pillars. This pillar includes 3 sub-pillars[21]:

- creative intangibles,
- creative goods & services,
- online creativity.

The factor influenced the level of innovation is Slovenia the most. On the other hand, Thailand was influenced unfavourably, which is reflected in Figure 7.

[20] Creativity and innovation, Driving competencies in the Regions, Panorama inforegio, European Union, Regional Policy 2009, Spring 2009, pp.29.
[21] The Global Innovation Index, op.cit., pp.44.

It is noteworthy that in case of Slovenia, Madrid resident trademark reg/bn PPP$ GDP is the best among all 141 evaluated countries.

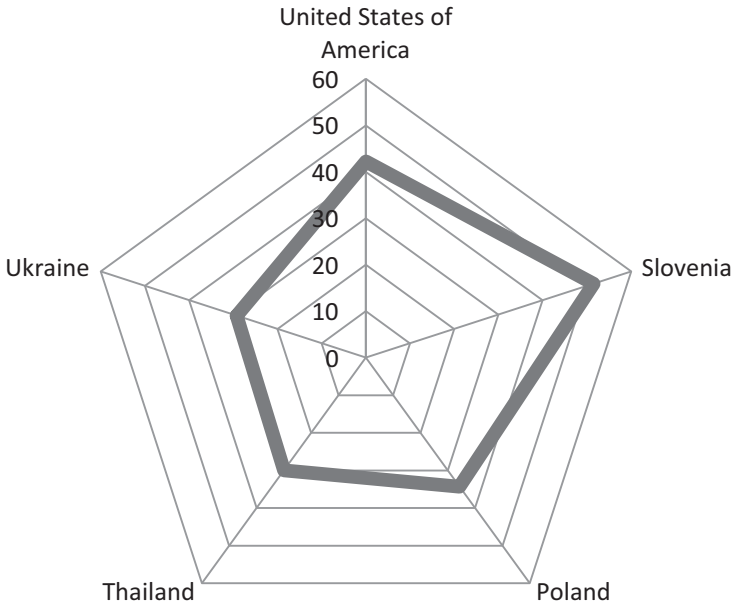

Figure 7. Scores for individual countries as regards Creative outputs pillar.
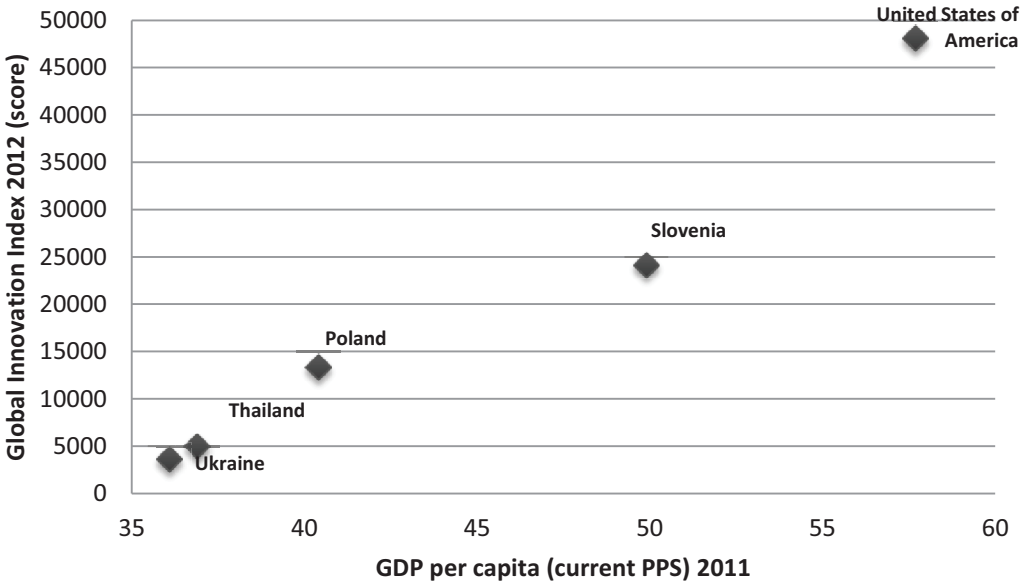
Source: authors' own study based on data from the Global Innovation Index 2012.

The analysis of level of innovation's influence upon economic development

For years, the increase of economic growth has been measured in Gross Domestic Product per capita (GDP per capita). This is one of the most frequently used benchmarks for measuring economic growth. The increase in GDP does not necessarily translate into the improvement of material situation of the society because GDP may not be streamed into the increase of consumption but rather to boosting production investments e.g. purchase of new technologies, establishment of new businesses, etc. GDP does not constitute the best yardstick when analysing standards of living as it does not reflect qualitative changes. Moreover, it does not provide full information on living standards and wealth.

In order to conduct international comparisons GDP per capita (GDP per capita= GDP/ population of a country) was expressed in USD.

For the selected countries, the analysis of the level of innovation's influence (expressed by Global Innovation Index 2012) upon the economic growth (expressed in GDP per capita) was carried out. The relationship was presented in Figure 8. The analysis indicates the existence of a relationship between the two, which seems to corroborate the hypothesis presented in the paper.



Graph 2. Ranking position vs. GDP per capital
Source: authors' own study based on data from the Global Innovation Index 2012.

The analysis of level of innovation's influence upon economic development was carried out for the selected countries. The level of innovation for individual countries was taken from Global Innovation Index 2012. The level of economic development is presented by means of GDP per capita (current PPS) 2011. Data was taken from World Bank Income Group Classification (April 2012).

The analysis of the collected data indicates that countries with higher score in Global Innovation Index 2012 exhibit a higher level of regional development, which seems to justify the thesis put forward in the paper.

SUMMARY

One ought to remember that when discussing innovate on of an economy, the general state of technical development of a country is a function of three main actors (science, industry, government). The level of innovation depends largely on their involvement and results of their activities.

Summing up there are three culture model – the European one containing Poland, Slovenia and Ukraine, Asian – Thailand and American – USA. They are closely connected with innovation preferences and building the competitive advantage. Cultural values limit the innovative approach in the European model through two dimensions: high power distance and resistance to change expressed by high uncertainty avoidance.

There are also internal differences between researches counties- Slovenia very much in favor is based on collective approach, which helps to stimulate proactive projects.
Asian model represented by Thailand supports innovation in terms of long term orientation and patient, system even life- time approach to innovation.. It allows to receive systemic results.

The basic support for innovation in American model seems to be high individualism and low uncertainty avoidance. It stimulates activity of employees and openness to change.

Cultural values review shows that organizational culture of every country influence the specific innovation model applied in particular region. It is very important to identify it in order to focus on the supporting ones and reducing the barriers.

In order to boost the economic development, increasing the level of innovation seems crucial. The increase in only possible when conditionings exerting influence on it are clearly defined. The analysis indicates that the level of innovation is influenced both by economic and social conditionings presented in the paper. The analysis indicated that countries with higher scores in Global Innovation Index 2012 exhibit a higher level of economic development.

It is noteworthy that innovation rankings constitute a yardstick and a benchmarking tool for innovation performance across countries. These tools enable observation of activities undertaken by individual countries, adoption of worked-out solutions and introduction of changes in innovation policies.

SELF-DISCLOSURE ON SOCIAL NETWORK SITES IN ADOLESCENTS: THE EXPLORATORY STUDY OF THAI STUDENTS

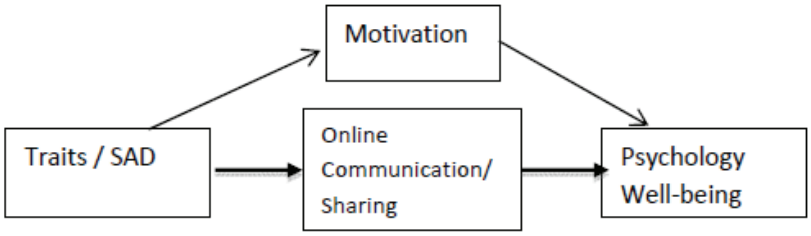
Yupin Patarapongsant, Sasin Graduate Institute of Business Administration, Chulalongkorn University, Sasa Patasala Builing, Phayathai Road, Pathumwan, Bangkok 10330, Thailand

Issariya Woraphiphat[1], Sasin Graduate Institute of Business Administration, Chulalongkorn University, Sasa Patasala Builing, Phayathai Road, Pathumwan, Bangkok 10330, Thailand

ABSTRACT

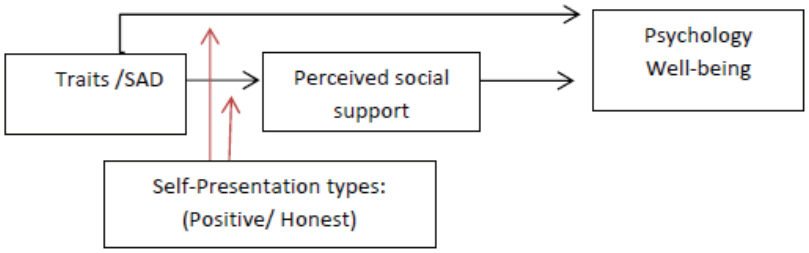
Purpose: *Online media increase popularity among adolescent as they are growing up with the development of technology, particularly "Internet". Adolescent has higher rate of using Internet and email as source of information in comparison to other age group (world value survey collected during 2005-2007). Social Network sites (SNS) received popularity among these adolescents. They are transforming the nature of social relations (Greenfield at al. 2012). Recent studies show the positive side of using SNS such as facebook, which lead to improvement in psychological well being via emotional sharing (Buechel and Berger 2012) and through perceived social support (Kim and Lee 2011). This study aims at extent the current research by examining the effect of how communication and sharing strategies (positive vs. honest) lead to psychology well being among individual from different traits. (Introvert vs. extrovert).*

Theoretical Framework 1



We posit that introvert individuals psychology well being will be enhance by online communication/ sharing. This effect is mediated by their motivation for using social network sits (SNS).

Theoretical Framework 2



We posit that effect of positive self presentation is directly lead to improving psychology well-being, while the effect of honest self presentation is mediated by perceive social support. We predict that the degree of effect is varies on traits of individual.
Design/ Mythology/ Approach: *Participants were high school students from two schools located in different part of Bangkok,*
Thailand. We held a meeting with school research department and inform teacher the procedure. Students need to fill out 7 points, Likert-type format questionnaires and hand in to their class teacher in exchange for a gift. The questionnaire includes the several questions such as; "Motivation for using SNS", which consists of twenty items, which can be divided into 3 subscales including (Self presenting, keep up with trend, information sharing and storage, entertainment, and showoff) with the alpha reliabilities of 0.863, .743, .836, .856, and .839 respectively. (We test for test for the reliability of our instrument, please see more detail in the appendix.)
Finding: *The preliminary analysis shows that participants were 376 students; 210 students from a vocational school in a less affluent area of Bangkok and 166 students from an elite high school in the central business district of Bangkok. 95% of the participants were between 16-17 years old. Participants engage in various social network sites activities including chat, chatroom, bulletin board, blog, social network sites, and online games. The correlation analysis shows association among variables we are interested in such as traits, motivations, self-disclosure, and psychological well-being.*
Limitations: *Since this study was on the exploratory stage. Long-term research programs studying should*
detect the change in adolescent's psychological well-being overtime with respect to the degree of social network sites usage to capture the casual effect.
Implication: *Social Media Marketing received popularity in recent year. Understanding the motivation and consequences of consumer engagement in SNS could help firms design appropriate relationship marketing tools that could involve with consumer self disclosure.*

Appendix I Scales

Question	Scale (Adapted from)	Reliability Test
Part I Internet Usage		
a. Form of Use	"Online service adoption likelihood (1999)", Carolyn A. Lin	
b. Frequency of use	"Adolescents online communication usage", Patti M. Valkenburg (2007)	
c. Motivation of Internet usage (8 items scales)	Marketing Scale Handbook: Refernce, Lin, Carolyn A. (1999, 2000) alpha .91	
Part II Self Disclosure in Social Network		
d. Communication with friends (Private vs. public)	Adapted from "Communication with friends scales" , Adriana M. Manago, Tamara Taylor, and Patricia M. Greenfield (2012)	Alpha = .877 6 items, one component
e. Motivation for Self disclosure Scales	Adapted from "Motivation and consequence for Self disclosure Scales", Soo Hee Lee, Seunghee Im, and Charles R. Taylor (2008)	1. Self presentation .863 (6 items) 2. Keep up with trend .743 (3 items) 3. Info storage sharing .836 (5 items) 4. Entertainment .856 (3 items) 5. Showoff .839 (3 items)
f. Positive self disclosure and Honest self discloser	Adapted from "self presentation scale", Junghyun Kim and Jong Eun Roselyn Lee (2011)	Positive Alpha = .734, 5 items, one component Honest Alpha = .865, 2 items, one component
g. Perceive social support	Adapted from "Multidimensional scale of perceived social support", Zimet, Dahlem, Zimet & Fareley (1988)	Alpha = .853, 6 items (friends) and Alpah = .795, 3 items (family)
h. Consequence for Self disclosure Scales	Adapted from "Motivation and consequence for Self disclosure Scales", Soo Hee Lee, Seunghee Im, and Charles R. Taylor (2008)	1. Relationship management = .886 (4 items) 2. Psychology well being =.901 (3 items) 3. Habitual =.893 (3 items)
Part III Personality/ Trait/ Self esteem/ Social anxiety		
j. Personality (10 items)	Adapted from Hand book of marketing sclaes, William O. Bearden et al. (3rd ediction 2011)	Extravert (5 items) = .749 Aggressive (3 items) = .517 Introvert (2 items) = .416
k. self esteem (10 - items)	Adapted from Rosenberg's self esteem scale (1965)	Alpha =.738 (5 items)
l. social anxiety (Fear of Negativity -FNE, Social avoidance and Distress - SAD)	Adapted from "Social Anxiety Scale for Children-Revise (SASC-R)"Annette M. La Greca and Wendy L. Stone (1993)	SAD New = .85 (4 items) SAD General = .847 (4 items) FNE =.868 (7 items)

Appendix II *Instrumental Testing*

Ten Items Personality Inventories (TIPI) consists of ten items referring traits and characteristic of individual (e.g. Warm, Careless, and Conventional). We can divide into 3 subscales. However, we will focus on two dimensions, "Extrovert (e.g. extraverted, enthusiastic)" and "Introvert (Conventional, reserved)" with Alpha reliabilities of .75 and .42 respectively. ***ii) Social Avoidance and Distress (SAD)*** consists of eight items referring to in group and out group social avoidance, which can divided in to two subscales with alpha of .85 and .847 respectively. ***iii) Self esteem (adapted from Rosenberg, 1965)*** we select 5 items with alpha =.738. ***iv) Communication with friends*** consists of six items referring to how frequent individual communicate with friends n public and private. The alpha reliabilities is 0.877. ***v) Motivation for self-disclosure*** consists of twenty items, which can be divided into 3 subscales including (Self presenting, keep up with trend, information sharing and storage, entertainment, and showoff) with the alpha reliabilities of 0.863, .743, .836, .856, and .839 respectively ***vi) Self Presentation (Adapt from Lee, Im, and Taylor, 2008)*** consists of 7 items, 2 subscales; "Positive self-disclosure" with alpha of .734 and "Honest self disclosure" with alpha of .865. ***vii) Perceive social support (Adapt from Zimet et al., 1988)*** consists of 9 items, 2 subscales; "Friends" with alpha of .853 and "Family" with alpha of .795. ***viii) Psychology Well-being*** consists of 3 items with alpha of .901.

ABSTRACT

The aim of this study is to propose a cloud virtualization technology infrastructure with an implementation of a case study. Applications of cloud computing in manufacturing and application of virtualization technology in the manufacturing literatures are reviewed in this paper. A manufacturing model is proposed based on cloud virtualization technology. An application scenario of the manufacturing management system based on cloud is developed and evaluated. This cloud-based manufacturing management system model to be proposed here includes infrastructure as a service (IaaS), platform as a service (PaaS) and software as a service (SaaS). This cloud-based manufacturing management system based on real manufacturing scenario is implemented. Three virtualization technologies are adopted to make the system maintained on different operating systems. For evaluation of the developed system, each verified user accessed the services with portable devices in various operating

systems. The developed system was verified with various windows-based operating systems. The experimental results show the function of the developed system is workable.

Keywords：Virtualization; Virtual machine; Virtual Application; Virtual USB Device; Cloud Manufacturing Management System;

INTRODUCTION

Traditionally, enterprises deploy own manufacturing management systems in almost every computers in their firm. Enterprises encountered two issues. First, when the systems need to be updated, IT staff should reinstall the latest version in all computers. Second, these systems are also limited to specific operating systems, which cause it difficult to deploy and manage. For example, every Windows-based computers need to be reinstalled the latest software version and cannot install Mac-based software. Therefore, this study develops virtual application to solve above problem. However, using virtual application can't access the USB device in some occasions. Take logistic inventory system as an example, staff usually uses RFID reader for cargo inventory. Normally, RFID readers are connected to computers through USB ports, which cause another issue that virtual applications on virtual machines cannot directly connected to local computer USB ports. An USB virtualization solution based on virtual technology is also proposed in this research to solve the issue.

LITERATURE REVIEW

Applications of cloud computing in logistics

In recent years, many scholars have proposed the cloud technology based on the innovative service model of logistics [2, 3]. Some studies are introduced the wireless radio frequency technology. For example, some researches applied RFID and Zigbee to develop logistic management systems [4, 5]. Its achievement is to make an automatic inventory and information access that can help the development of logistics cloud.

Zhiying Zhou et al. proposed a three-layer wisdom logistics model, including infrastructure layer, application layer, and service provider layer. In the infrastructure layer, there are hardware resources and software resources which support the platform. It is divided into public cloud and private cloud. Most of the low security data of small and medium-sized enterprises can be allocated in the public cloud by purchasing data warehouse storages. Therefore, it can avoid duplicate development and waste of resources. The application layer

is worked as software. In this layer, the users can design and operate cloud services. The service provider layer provides cloud computing on the basis of the new business model. The cloud software can be revised based on user demand [6]. According to the study, the cloud computing can be applied in the logistics system in real scenarios.

Shang-Liang Chen [7] et al. proposed the architecture of the logistics management system based on SaaS concept. As shown in Figure 1, the system is divided into four layers: physical resource layer, SaaS service pool layer, middleware layer and service-oriented architecture layer. The cloud architecture installs the functions of the service module, and the application can call service on the cloud to achieve the concept of computing cloud. It is necessary to install the application in local computer and cannot get the services in different devices. Therefore, this study improves the defects, extends the architecture, and develops the systems.

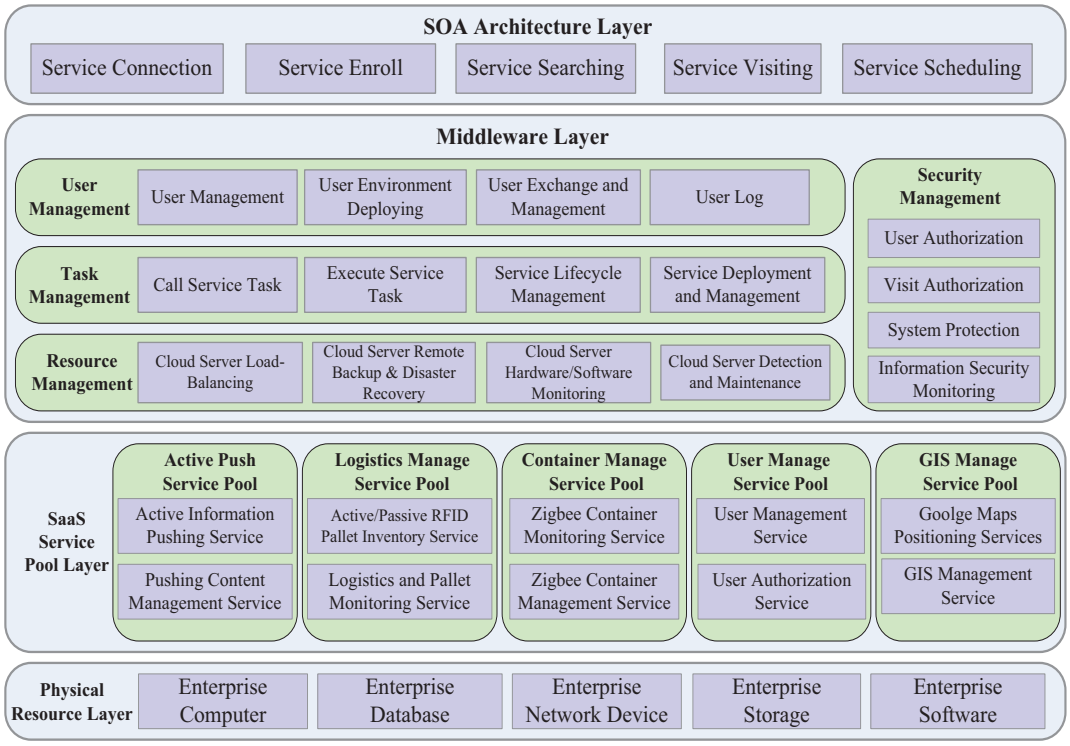

Figure 1. SaaS architecture of logistic management system [7]

Application of virtualization technology

Xing Wang [8] proposed the cloud-computing based logistic information network and offers a brand-new mode in hardware environment construction, software development, network platform management. It can reduce the investment of the initial stages of information technology for the small and medium-sized logistics enterprises. The logistics informatics network is divided into four layers: base layer, support layer, service layer and logistics information business layer. The first layer includes hardware facilities (telecommunication network, network equipment, computer hardware, logistics facilities) and logistics information standards (product electronic code, EDI standards). The second layer is support layer which is a covering the entire supply chain. It includes database, certification, and data exchange. The third layer is the logistics information services layer including the operation of logistics information platform, the development platform and service Platform. The fourth layer is logistics information business layer. It is constituted by warehouse management system, transportation management system, customs system, and order management system. It is used to achieve high-level information processing and handling. According to the architecture, the system is extended and implemented in this study.

THREE-LAYER VIRTUALIZATION INFRASTRUCTURE

Architecture of Three-layer Virtualization Infrastructure

In this study, the architecture of virtualization is divided into three layers, Virtual Machine, Desktop Virtualization, Application Virtualization, and USB Device Virtualization, as shown in Figure 5, and explained as follows:

Layer 1, Virtual Machine (VM): hardware virtualization technology is applied to the cloud server. Several virtual machines are created for installing the different operation systems. For example, WIN XP, WIN 7, WIN 8, WIN Server and Linux, etc..

Layer 2, Desktop Virtualization (DV) and Application Virtualization (App-V): users can select the operating system to connect to the cloud server through various devices. For example, notebook, PC, and mobile device.

Layer 3, USB Device Virtualization (UDV): when USB device plugged in to the local computer, it will create a virtual com port to the virtual machine. Normally, remote services in virtual machines are unable to access local USB comports. Our UDV solutions provide users a way of accessing services in virtual machines and receiving/transmitting from local USB comports.

The three-layer virtualization technology is developed in this study. The end user device can connect to the cloud to use different operating system. The end user can use virtual application in different operating system.

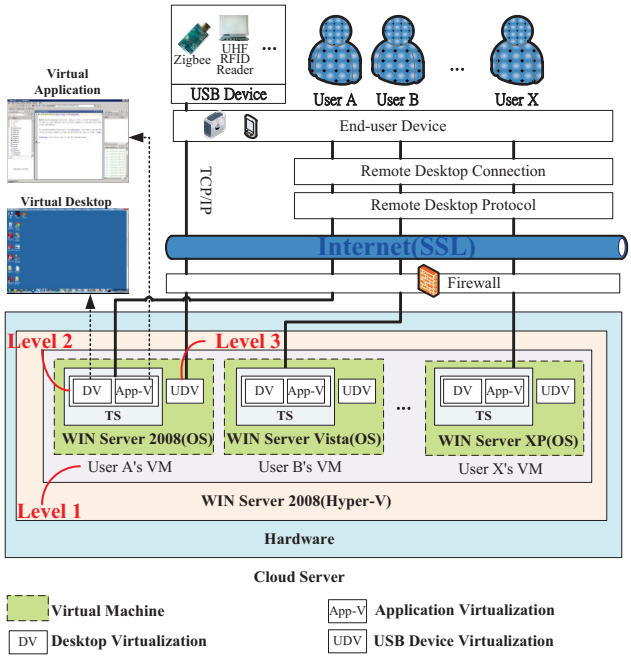

Figure 5. Architecture of 3-Layer Virtualization Infrastructure

Server virtualization

The Para Virtualization is adopted in this study. Hyper-V is adapted to construct virtual machines in the operating system of Windows Server 2008. Three physical machines are divided and virtualized to eleven virtual machines. Five of the virtual machines are used to construct virtual desktop. Four of the virtual machines are deployed the cloud service pool. One of the virtual machines is used as Active Directory (AD) server. Two of the virtual machines are cloud load balancing servers. All the virtual machines add into the same domain. In this case, AD services can manage the virtual machines and user identity verification. This study introduces “Integration Services” into virtualization of operating system. It makes different operating systems to communicate with the Hypervisor. Then, the virtual machines can connect to the hardware. For example, Network Interface Card (NIC) and Small Computer System Interface (SCSI).

Desktop and Application Virtualization

This study adopts Remote Desktop Protocol (RDP) to access virtual desktop [9]. Applications are installed in loud servers. And AD server will provide different software for different users based on limits of authority. A web interface is designed as a platform to provide virtual desktop service and virtual application service. The users can connect to the cloud web server to access the virtual services. It is convenient to use the applications in the local computers. The web interface includes the virtual application (Remote App) and virtual desktop (Remote Desktop). The web page is developed with ASP.NET and ActiveX to connect to the Terminal Service (TS) on the cloud. For information security, the application uses Active Directory (AD) to verify the user's identity and his authority for that application. When the users login to the web page of Remote App, it shows the applications available. The remote control function is designed to show the accessibility of disk drivers, printers, and clipboard software shown in Figure 6.

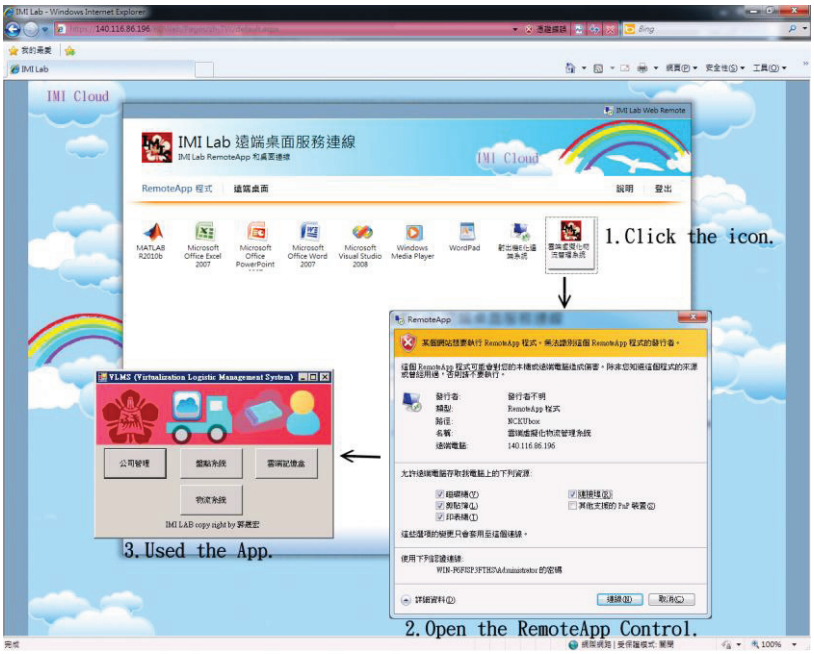

Figure 6. Virtual service (Through web browser)

USB device Virtualization

WIN Server 2008 virtualization services can access data through local USB devices. In pervious researches proposed by many researches, virtual machines are unable to access data from USB devices connected to computers. For solving the issue, this study design and implement an USB device transmission module, which can transfer data from USB devices

(connected with local computers) to virtual machines, named Virtual USB (V-USB). Both the local personal computer and the virtual machine should install this V-USB module which can access data of USB devices from the local part to the virtual machines through the TCP/IP connection, as shown in Figure 7.

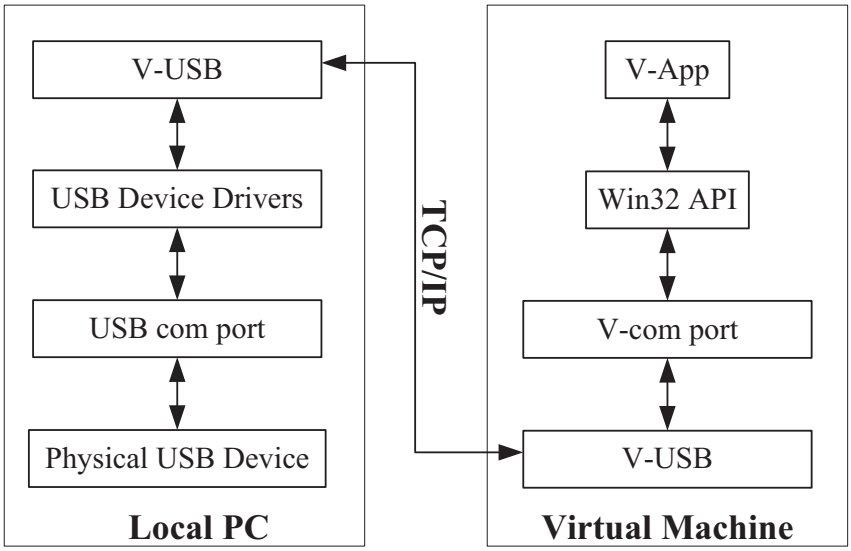

Figure 7. Architecture of virtual USB device

CASE STUDY

Implementation of CLMS based on 4-Layer Virtualization Model

The logistics cloud is proposed in this study and the virtualization technology makes the applications easier to manage and deploy in the cloud. The users can use different operation systems and get the latest cloud service with end-user devices.

1 Application scenario of CLMS

The cloud logistics management system can be applied in different factory. For example, a company divides into factory A, factory B …factory N, as shown in Figure 2. The goods inventory of factory can connect to the virtual server on the cloud through the internet. When the staffs make an inventory, the system needs to connect the hardware devices. For example, UHF RFID Reader and Zigbee ,as shown in Figure 2. Therefore, the system uses the USB device virtualization to access the local USB device. Then the system can serve as a local application, and it can simply be used by any browsers through the internet. The cell phones send GPS signals to any readable device at all times. It aims to make the users can monitor the status of goods and vehicles with the end user device (For example, Table PC

and PDA) when transported.

Figure 2. Application scenarios of CLMS

2 Model of CLMS

The six-layer logistics model of this study is shown in Figure 3. It includes Physical Resource Layer, Support Layer, Virtualization Layer, Information Layer, End Device layer, and USB Hardware Layer. The six-layer model is explained as follows:

1. Physical Resource Layer: physical hardware of the cloud includes server, network equipment and data storage, etc..
2. Support Layer: includes database, certification, data encryption, cloud service pool and data exchange, etc..
3. Virtualization Layer: implementation of cloud virtualization technology includes virtual machine, virtual desktop and virtual application, etc..
4. Information Layer: provides the related information of logistics management.

5. End Device layer: user devices. For example, PC, notebook, PDA or tablet computers, etc..
6. USB Hardware Layer: it contains all the user-side-connected devices. For example, RFID UHF or HF inventory equipment. And the cloud application can call the uses-side hardware devices based on USB device virtualization.

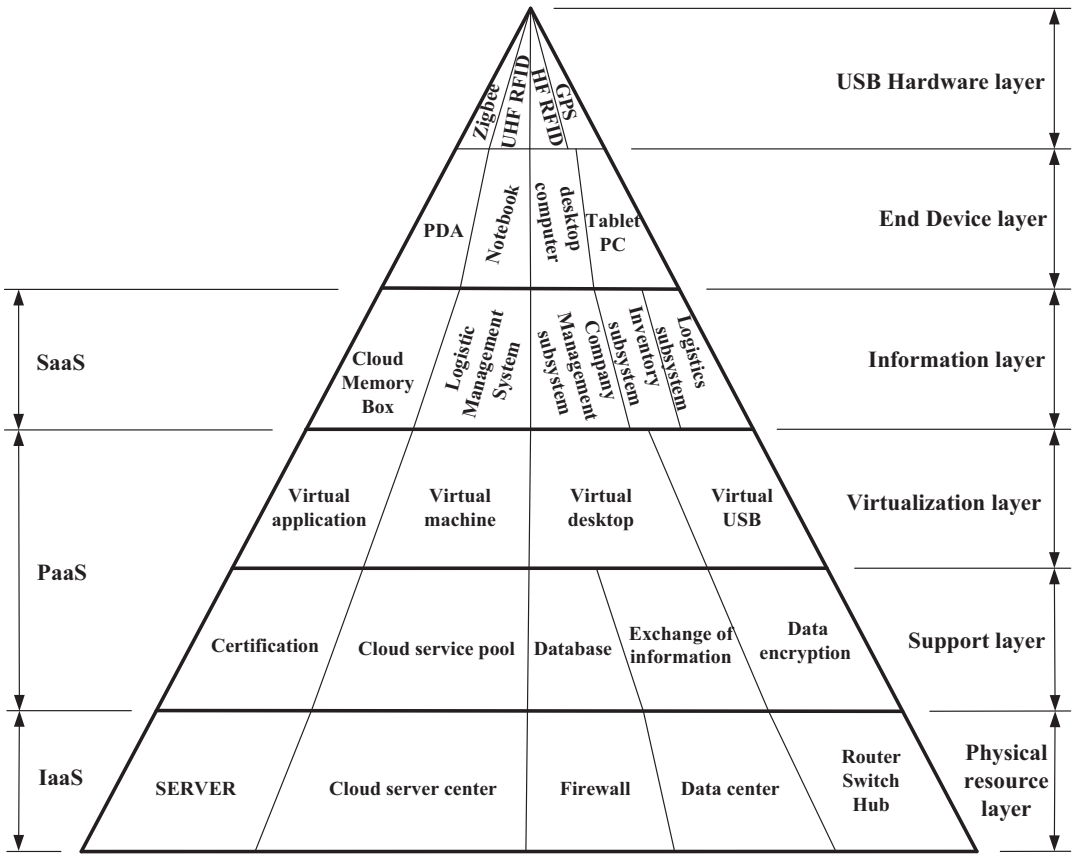

Figure 3. Model of CLMS

3 Architecture of CLMS

In the cloud architecture, the system of this study can be accessed in two ways:

1. Web Browser. For example, Internet Explorer.
2. Application. For example, Remote Desktop.

The above ways are accessed through the internet. The system architecture of this study is shown in Figure 4 and explained as follows:

1. Virtualization architecture: includes virtual operating system, virtual desktop, virtual application, and virtual USB.
   (1) virtual operating system: WIN server 2008, WIN 7, and XP, etc..
   (2) virtual desktop: open and perform the operating system through the internet.
   (3) virtual application：includes cloud logistics management system, Microsoft Office, and MatLab 2010, etc..
   (4) virtual USB: through the USB device virtualization the virtual application can access local USB devices.
   (5)
2. Cloud load balancing: includes cloud load balancing monitoring platform, and cloud load balancing distribution platform.
3. Cloud service pool: provides active message delivery services, logistics management services to the cloud, login service, and GPS location services.
4. Virtualization Management System: responsible for the management server of the entire cloud. For example, add a server, add the VM, and install and release of the virtualization application, etc.
5. Cloud Logistic Management System: responsible for the management of the logistics information. For example, inventory of goods, cargo shipments, monitoring of cargo locations and other services.

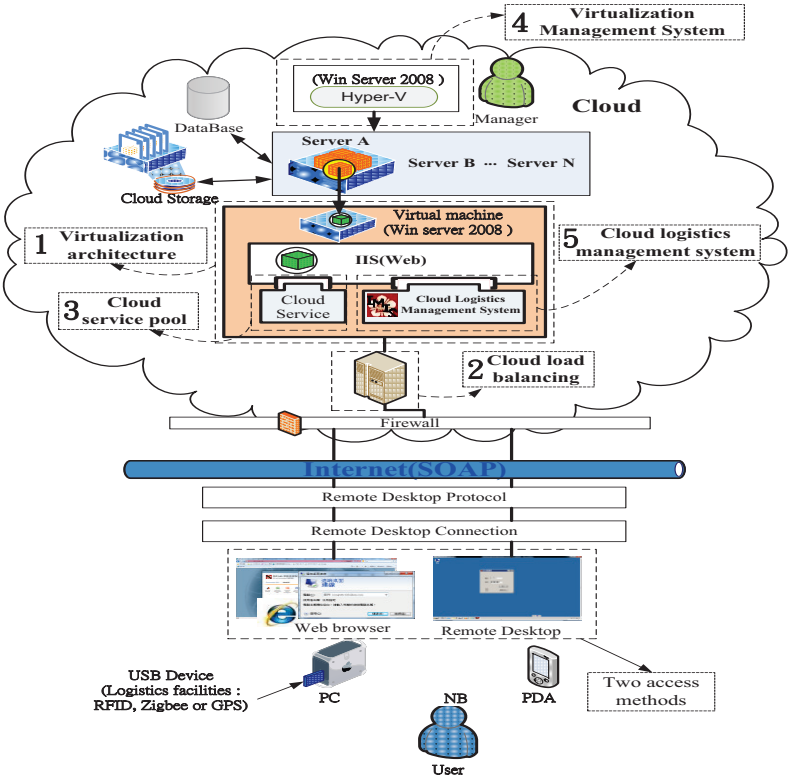

Figure 4. Architecture of CLMS

4 Implementation of CLMS

The cloud-based logistic management system in this research was implemented with a case study CLMS. CLMS has three major subsystems, including company management subsystem, inventory subsystem and logistics subsystem. The company management subsystem is to manage the basic information of the company. The inventory subsystem is to make an automatic inventory for the goods, establish the information of goods and access USB hardware device information. For example, UHF/HF RFID reader, Zigbee and GPS. The logistics subsystem is responsible for displaying the real-time information of goods outside. For example, the logistics subsystem uses the GPS positioning to track current positions of goods on vehicles equipped with GPS devices.

This study uses the Virtual USB to read the information of the local computer RFID UHF reader device within the inventory subsystem, as shown in Figure 8. COM9 is a virtual com port which redirecting local USB device (RFID UHF reader) on the cloud.

The data of this RFID system is received with four antennas signals. The information of the pallet will be sent into the system. For example, there are ten lamps placed in the pallets belongs to the TYC company, etc.

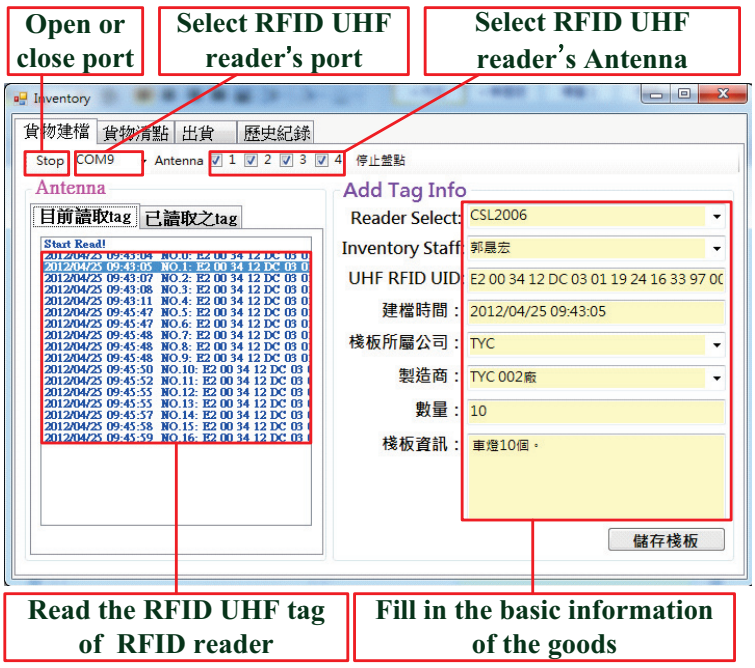

Figure 8. Inventory subsystem – Filling basic information of pallet

When new pallet information is created, the users can inventory the goods of the pallet. And the system will prompt the number of the goods. The users determine whether the information is correct or not and save it. In the shipping screen, the users can choose which pallets to ship, transmit, and display the goods.

The logistics subsystem can read the latitude and longitude of GPS and display the current location of users. It also shows the destination in the screen. The recipients need to sign the signature, and the system sends the E-mail or SMS to the customers. The customers will receive the mail to identify whether the signature and the goods are correct or not.

SYSTEM EVAUATION

Notebooks, tablet pc and mobile devices are tested with systems in this study. The specifications of hardware and software within system tests are shown in Table 1. The functions (includes virtual desktop, virtual application, and cloud logistic management system) are all tested with the system.

Table 1. Specifications of hardware and software within the system tests

Hardware Name	Hardware Type	Operating System
ASUS A42J	Notebook	WIN 7
SAMSUNG SGH-i908	mobile device	WIN mobile 6.1
Surface for Windows 8 Pro	tablet pc	WIN 8

The information of the testing systems is shown in Table 2. The tests are normal in the notebooks and tablet pc. The mobile device cannot connect to the RFID reader and Zigbee etc.. Therefore, the mobile device cannot support most of functions in the RDP and the function of virtual USB. But it can display the information for the managers to make decisions.

Table 2. Comparison of various system tests

		ASUS A42J (WIN 7)	SAMSUNG SGH-i908 (WIN mobile 6.1)	Surface for Windows 8 Pro (WIN 8)
Virtual desktop	WIN XP	✓	✓	✓
	WIN 7	✓	✓	✓
	WIN 8	✓	✓	✓
	WIN Server 2008	✓	✓	✓
	Linux	✓	✓	✓
Virtual application		✓	×	✓
Cloud logistic management system		✓	×	✓
Virtual desktop's	Application	✓	✓	✓
	Cloud logistic management system	✓	✓	✓
	Virtual USB	✓	✓	✓

CONCLUSIONS

In this paper, a cloud virtualization technology infrastructure is proposed with an implementation of a case study: cloud-based logistics management system (CLMS) based on real logistic scenario. Contributions of this research are listed as follows:

1. Applications of cloud computing in logistics and application of virtualization technology literatures are reviewed in this paper.
2. A logistics model is proposed based on cloud virtualization technology. A three-layer virtualization technology is designed with three main solutions for real logistic scenario. Cloud virtual machines can access local USB devices based on our solutions.
3. An application scenario of the logistics management system based on cloud is developed and evaluated.

The results show the system can manage and install the application on different operating systems. The developed system was verified with various windows-based operating systems. The experimental results show the function of the developed system is workable.

MANAGING KNOWLEDGE TO ENHANCE THE PERFORMANCE OF THE GRASSROOTS TECHNOLOGICAL INNOVATION FOR THAI SMES

Somchai Numprasertchai, Faculty of Engineering, Kasetsart University, snp@ku.ac.th

Haruthai Numprasertchai*, Faculty of Business Administration, Kasetsart University, haruthai.p@ku.ac.th

ABSTRACT

It is widely recognized that SMEs play significant role in driving the country's economy. Thai SMEs as well are heart of the Thailand's economy. Numbers of Thai technological SMEs applies knowledge management (KM) to enhance their innovation capability. This qualitative research, applying a case study method, aims to investigate the practices of knowledge management towards the grassroots innovation of Thai technological SMEs.

The research found that the successful Thai SMEs integrated both internal knowledge, namely technical knowledge, and the external knowledge related to the markets, and the needs of their target customers in inventing product or service innovation. Knowledge management facilitates the Thai entrepreneurs to create and select the right choice for innovation. Knowledge creation and integration help increasing the efficiency of the design and innovation management process. In addition, collaborations from their business alliances help promoting their innovations to the markets. Accordingly, knowledge management indeed supports the efficient innovation management process to Thai SMEs.

Keywords: Knowledge management, Grassroots innovation, Thai SMEs

INTRODUCTION

Future growth must increasingly come from innovation-induced productivity growth (OECD, 2010). This statement is also true for SMEs around the world. In Thailand, numbers of SMEs which are in the field of information technology has built a lot of technological innovations. Most of these innovations, however, are grassroots innovation, applying simple but locally practical technology. Their value is that they all well respond to the needs of the customers. On the other hand, with the uncomplicated technological development, their innovative products are easy to imitate by competitors of the same size. In the meantime, the large-scale business ignores such a grassroots innovation because it is incapable to efficiently serve a huge demand in the markets and it generates unattractive incomes.

In Thailand according to the official report for year 2011-2012 of the Office of Small and Medium Enterprise Promotion, there were 2,652,854 SMEs in 2011, contributing to the 10.9 million employments which accounts for 83.89% of the total employment. However, number of constraints exist for the SMEs, for example, the lack of experts, capital, machines, and especially knowledge to develop new products and sustain its standard quality. This causes SMEs to be incompetent with the large-scale industry in the field.

Innovation management process is defined as the ability of people to manage and control the factors that drive the innovation processes (Tuominen, Piippo, Ichimura, and Matsumoto, 1999). Basically, the innovation management process is a set of processes of enhancement for commercialization or utilizing of an innovative product, process or service.

In an economy increasingly based on knowledge and innovation, the development of fully functioning knowledge networks and markets can have a significant impact on the efficiency and effectiveness of innovation (OECD, 2010). A knowledge management system (KMS) is considered as an effective management tool that focuses on utilizing the knowledge for enhancing the organizational performance (Matensson, 2000). It plays a critical role in creating innovation and thus is important for the organization's survival and maintenance of competitive advantage (Numprasertchai and Igel, 2004, Numprasertchai, Kanjanasanpetch and Numprasertchai, 2009). The use of KM leading to innovation is found relative to increasing new products and service development within the organization (McAdam, 2000). Applying KMS in SMEs would help an entrepreneur to enhance his or her innovative capability under such constraints. As a matter of fact, KMS can reduce SMEs' weaknesses and could be done at low cost.

Accordingly, with a dominant role in a country's economy, the strengthening of the competitiveness of SMEs is crucial. SMEs need to improve its internal process of new product development (NPD) and make it aligned with the product innovation.

RESEARCH OBJECTIVES

This research aims to explore the current knowledge management practices of Thai SMEs especially the technological SMEs. The reason to focus on Thai technological SMEs is that this type of SMEs involves directly with the grassroots innovation and it is a major group of non-agricultural sector. It involves both manufacturing and service sector, each accounting for approximately 30% of the Thai GDP (Office of Small and Medium Enterprise Promotion,

2012). The obtained information is then integrated to develop a knowledge management model that can be applied for Thai technological SMEs in implementing their grassroots innovation.

RESEARCH METHODOLOGY

To investigate in-depth information about the knowledge management practices in the innovation management process of Thai SMEs, a qualitative research were conducted, using multiple case studies. The reason for this approach is that there is an unclear boundary between knowledge management practices and the innovation management process in Thai technological SMEs. Four cases of Thai technological SMEs were selected based on the two selection criteria as the following.

1) It must be Thai SMEs with grassroots technological innovation.
2) It must be a successful Thai SMEs in terms of financial performance and marketable products.

The research followed the following steps shown in Figure 1.

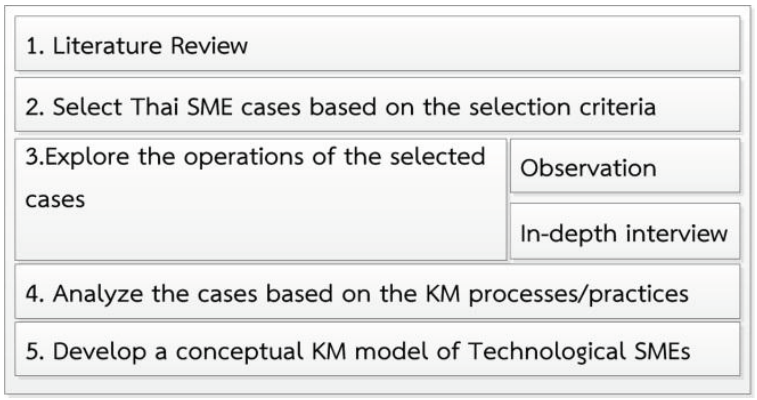

Figure 1 Steps for the research

An in-depth interview was used as a tool for data collection. It was conducted with the selected SME management, staffs and business partners. Due to the requests of the informants to keep the name of the company anonymous, the cases under the study are named as SME_A, SME_B, SME_C, and SME_D respectively. In addition to the interview, observation by the researchers is also included to gather related information.

Results and Discussion

Based on the interviews and observations, the results are presented in 3 sections: overview of each SME, knowledge management concepts in innovation management process of each SME, and knowledge management model for grassroots innovation in Thai technological SMEs.

Overview of the SMEs as the Case Studies

Overview of SME_A: It has been operated since 1997. Its service mainly relies on information technology and internet network. At the beginning, there were only four staffs and some of them were undergrad engineering students. The main strategy that was adopted was creating new service innovation for its members as well as maintaining the customer relationship. At present, SME_A provides a knowledge portal service mainly through an e-service. Its members can create, share, and exchange knowledge whereas the non-members can only read and share their viewpoints but they are not allowed to create or add any issues to the system. With this service, SME_A connects more than 600,000 visitors per day. Based on the figures of the previous years from 2008-2010, SME_A made a profit as an average of USD 670,000 a year.

Overview of SME_B: The business focuses on wireless services and internet network. It started in 2001 by a duo who were friends and just graduated in the field of engineering. At the beginning, the business focused on developing an application on mobile phone. Later on, the business model was modified. Instead of selling the applications to end-users, it made contracts with mobile phone producers and distributors. This change has provided the SME_B not just an increase in revenue but also an access to new knowledge when working with large companies. In 2007 SME_B became a business alliance with one of the biggest phone service providers in Thailand. Since then, the business model of SME_B has been changed to be the sole application developer for its business alliance.

SME_B mainly emphasizes service innovation for mobile phone users. However, the technological change in social network like Facebook and Twitter has brought difficulty to some parts of its services.

In addition, to generate more source of revenue SME_B also provides a service of system development for companies. This type of job also helps increase skills of the staffs. Considering its financial performance in the previous years, SME_B made an average profit of USD 1,300,000 per year.

Overview of SME_C: The business focuses on software. It started in 2001 by only two persons as founders, developing a computer controlling software program for internet cafe. The developed software could enhance internet service efficiency as it could control more numbers of computers. SME_C adopts a strategy of keeping up good quality of developed systems and pricing on unit base. Along the last three years SME_C made an average profit per year of USD 2,700,000. Currently, SME_C has expanded its business to oversea markets in Singapore, Malaysia, Indonesia, and China. In addition, it extends its product line to mobile application as well as embedded electronic system development.

Overview of SME_D: The core service of this business is developing products of intelligent home electronic equipment. It emphasizes continuous R&D. All the products are high quality, user-friendly, and inexpensive when compared with the imported items. SME_D adopts a branding strategy. All the products are available only in large department stores and electronics specialty stores. The company also participates in business events such as product expo and publicizes in magazines. Along the last three years SME_D made a yearly profit as an average of USD 667,000.

Knowledge Management for Innovation Management Process of Thai SMEs

To explore the conducts of Thai SMEs related to grassroots technological innovation development, the four selected Thai SMEs were intensively investigated using the concept of the relationship between knowledge management and grassroots innovation management. The process is as shown in Figure 2.

Based on the four successful Thai SMEs case analysis following the concept shown in Figure 2, it was found that each SME shared some common concepts and conducts in managing knowledge for grassroots innovation management. Importantly, all of the four entrepreneurs are knowledgeable in a technical work aspect. They are determined and work hard. The common problem they all encountered at the beginning was related to management and marketing issues.

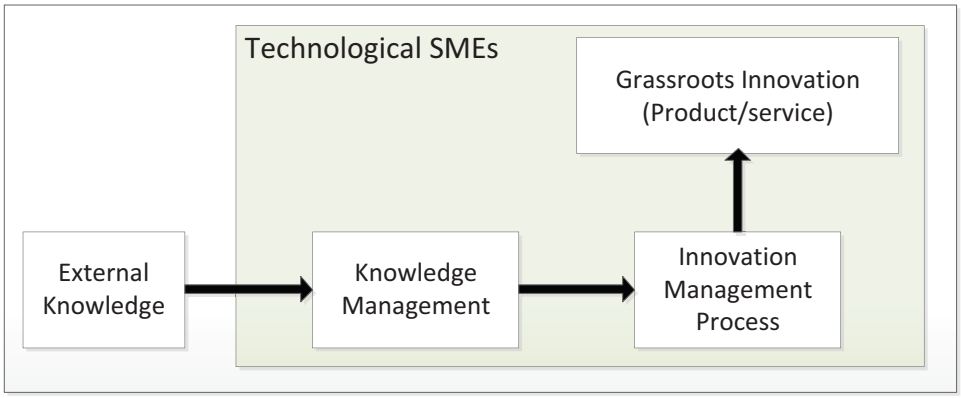

Figure 2 Concept of knowledge management for Thai SMEs' innovation management process

Knowledge Management Practices and Innovation Management Process

Innovation management process consists of 1) idea generation, 2) idea selection and evaluation for innovation, 3) design and innovation development, and 4) launching an innovation to markets. Accordingly, table 1 below summarizes the findings of knowledge management practices within the innovation management process from idea generation to launching an innovation to the market of the four successful Thai SMEs: SME_A, SME_B, SME_C, and SME_D. However, the innovation management process is not straightforward but evolves in numerous loops within the different process phases.

Table 1 Thai SMEs practices on innovation management process and KM practices

Innovation management process	Knowledge management practices (KM Practices)	SMEs			
		A	B	C	D
1. Idea generation	• An idea is initiated by the entrepreneurs/business owners	✓	✓	✓	✓
	• Integrate ideas with its business alliances		✓		
	• Learn from world-class organizations about their innovative products/services	✓	✓	✓	✓
	• An idea is created from customers' direct comments and comments on social network	✓	✓		✓
	• Create a fine work environment		✓		✓
2. Idea selection for innovation	• Decisions were made by the entrepreneurs/business owners based on their experiences	✓		✓	✓
	• Decisions were made together with its alliances based on the opportunity of success analysis		✓		
3. Design and innovation development	• Design and develop innovation based on their experiences and knowledge gained from extending their existing products	✓	✓	✓	✓
	• Design and develop innovation based on R&D team	✓	✓	✓	✓
	• Enhance competence of staff through coaching and on-the-job training	✓	✓	✓	✓
	• Store data and information regarding the process, problems, and approach to product development for each product category	✓	✓	✓	
4. Launching an innovation to markets	• Building trust to public by having the product tested by recognized institutions to obtain a quality certificate				✓
	• Launch the products directly to the market	✓		✓	✓
	• Launch the products to markets through their business alliances		✓	✓	✓

Idea Generation: For SMEs, idea generation for creating an innovation is usually viewed as to create something new to markets or to improve the quality of the existing products or services so that their customers' needs are satisfied. Indeed, it should be in good quality with

an affordable price. Most of the time, the idea is created by the entrepreneur. Accordingly, the entrepreneurs or SME owners should be creative, eager to learn, and observant by characteristic.

Based on the case of SME_A, its entrepreneur is keen to create service innovation to promote and attract more users to utilize the service of the knowledge center. Mostly the idea is created from 3 sources: the entrepreneurs, comments from web board, and adapting the service innovation of the world-class service providers to make it fit with the Thai context. *"I need to learn continuously the technology trends, how it is going to change. I need to know what the-number-one business leader in this field is doing, what my customers want, what I should do. Moreover, I have to encourage my team to do the same thing I do, learning new things so that they can help me think and create a new idea"*, said the owners of SME_A.

Regarding the conduct of SME_B, it integrates the creation of products and services for its own and for the business operations of its alliances. Based on this fact, the concept of new product/service development is taken from both SME_B entrepreneur through the brainstorming with his team and its alliances. Realizing that the technological changes usually affect its alliances, the SME_B entrepreneurs emphasizes the fast learning so that the business can provide a quick response to the needs of its alliances' customers. This finally becomes a business opportunity for SME_B.

For SME_C, it emphasizes development of product innovation for its targets which are large organizations with a mixed variety of business types. Accordingly, modifying product innovation to match with each of its customers is essential. The SME_C entrepreneur stated *"if we know the customers' problems and needs, we then know how to customize our products' features to satisfy those needs. However, we still need to continue thinking creatively what needs to be done further so that our product quality can be improved and respond well to the needs of other groups of customers too."*

Considering SME_D, as it focuses on developing products for intelligent home, the SME_D entrepreneur takes the space in the office as a place to display the products. Office is arranged as a resort-style office, creating a relaxed environment. He believes that such a physical setting like this helps promote creativity. He said *"Actually, the office space here used to be a restaurant. It was reorganized and re-arranged, adding a green area and now it becomes a fine green office with trees and a pool, creating a relaxed working environment which helps create many good ideas."* The new ideas for product innovation of SME_D come from many sources. One is from the existing products itself. Somehow, it could be by accident. Some are from customers' problems and needs. They want the product to be more user-friendly. No matter what, the entrepreneur needs to be observant and skillful in analyzing a business opportunity.

It is obviously seen that all four cases of Thai SMEs mentioned above share one thing in common: an idea to create an innovation that works for business is usually integrated from many sources especially the knowledge about the product or service, comments from customers and business alliances as well as competitors. The mix of information from variety of sources is also useful for the further step of product design.

Acquiring an information and knowledge related to a qualification of the products or services from the target groups such as customers, distributors, business alliances as well as large-scale competitors is necessary. It should be done continuously so that the product or service improvement can be efficiently managed. Information technology, i.e. web-board, Facebook Fanpage, etc. are useful tools to acquire such an information especially the one direct from customers. Nevertheless, the entrepreneurs need to further analyze and synthesize the data utilizing their own experiences to make decision how to create an innovation.

Idea Selection for Innovation: With a variety of ideas to develop an innovation as well as some existing constraints for SMEs, an entrepreneur has to employ a process of idea selection to assure the quality of the decision to further develop an innovation.

The main criteria the SME entrepreneurs use to make a decision on new product or service development include the followings.

1) A technical feasibility which is a self assessment on its own existing capability and knowledge as well as what needs to be acquired to develop an innovation.
2) Time
3) Cost of operations
4) Value of investment
5) Level of risk
6) Business opportunity to make benefits

In the past, an entrepreneur who was a business owner exclusively made an assessment and a decision on the concept for an innovation development based on his or her own experience. Anyhow, making a decision solely caused an entrepreneur a lot of problems as they made a wrong decision. To avoid problems, an entrepreneur shares ideas and comments among business partners and alliances. During the process of idea sharing, there might be an offer of a support on new product development. SME_B has its business alliances engage in the brainstorming and decision making process. It gains a support from its alliances in terms of information as well as resources to develop product and service innovation.

Based on the observations of the researcher, it was found that these four SMEs encouraged all of their staffs to comment on their new products or services even though some of the staffs did not engage at all to the product or service development process. This is a way to acquire a different point of view. However, the decision to continue the product development or to commercialize the product still depends mainly on the entrepreneurs or business owners except for the one with the business partners as alliances.

Design and innovation development: At this stage, most of SME entrepreneurs focus on self designing and developing as for the reason of business confidentiality. This is true for those four SMEs under this research. However, each of them has different approach of innovation design and development.

SME_A: The approach taken by SME_A is the participation of all staffs since the beginning of the project. This is due to the limited number of employees. The entrepreneur aims to have all staffs clearly understand everything in the organization. However, once the project is well formed, a designated staff will be in charge later on.

To solve some hard problems occurring during the design process, the SME_A entrepreneur coordinates with academic institutions to get an advice. He said *"If we encounter a problem with no solution, we lean on professors in universities and they all are willing to help. It does not matter if we are alumni or not. Advice is available in those academic institutions. SMEs should turn on to this source of information."*

SME_B: The approach taken by SME_B is a team approach. Each team is assigned a particular task. With this approach, each team member can learn the job in-depth and has a clear cut of his or her responsibility. However, later on each team member will be re-assigned the new task so that they can learn more about others and be able to substitute each other.

For the projects that work for its alliances, the staffs of the SME_B are assigned to work in cooperation with its alliances whilst the SME_B entrepreneur takes a role of coordinator and leader of design and development team.

SME_C: The entrepreneur of this SME takes a role of developer, responsible for the design and development of the core of the product. The design for the minor parts of the product is assigned to team members. Everyone works separately on a particular task and then all the outputs from each team member are integrated by the entrepreneur. This is to maintain its business confidentiality. The SME_C entrepreneur has to assure that there is no imitation of their software products.

SME_D: As the entrepreneur emphasizes a good quality and valuable price for customers, the product developers are assigned challenging tasks from the SME_D partner who is in charge of the marketing. However, the design and development of the innovation are being responsible by SME_D partner who takes charge of the development team leader.

The development team leader assign tasks and responsibility to each team member based on skills and expertise of each. The leader himself is mainly responsible for the design and technical aspect especially for the business confidential one. SME_D concentrates on the design that is hard to imitate by others especially by the Chinese. To do so, it employs a reverse engineering approach for the design and develops intelligent software to control the functions of the products.

Additionally, SME_D places an importance on supplying good quality parts with good price to the innovation development. The SME_D entrepreneur said "some parts of the product are applied from the parts available for other products in the market. These parts are in good quality and inexpensive. It is not necessary to make a custom-made order. This helps us reduce the developing cost.

For the process of design and development of innovation, it is important that employees must be competent. Their skills and expertise need to be developed or it is difficult to achieve the goal of innovation development. The learning styles and work patterns of each SME are different mainly due to the entrepreneurs, type of work and number of workload. However, these entrepreneurs employ some activities to develop its own staffs, which include "a senior-junior training system", on-the-job training and problems recording system.

All four SME entrepreneurs are confident in their staffs as they conduct a fine process of human resource selection. SME_C entrepreneur said "*the major concerns for SMEs are capital and operational capability. We do not welcome such problems so we recruit only a competent person who can work and stay with us. We promise him or her a career success. We provide him or her chances to be partnership with us. It is only if he or she wants it and is competent enough.*"

Launching an Innovation to Markets: This is a highly important step and simultaneously a difficult one for SMEs. An innovative product/service becomes worthless if it is not accepted by customers or markets. According to the survey with those four SMEs, it is found that all of them used to encounter the marketing problem. However, at present all these SMEs have business alliances which support the product launching to markets. SME_B entrepreneur stated that *"we used to do it all by ourselves. It was so difficult that we almost failed. We were good at producing but not selling. We made a product that could not sell. We did not know what we made did not respond to the needs of the customers. We did not know where and how to sell. Once we have business alliances, it helps. Our partners know the markets, understand customers, and can access to marketing channels. At present, we are not afraid of making no sales anymore.*" This is consistent with the statement by SME_C entrepreneur: *"We used to think that we well understood the oversea markets. But, the truth is not. Right now we have oversea alliances which help us a lot. For example, our Malaysian alliance could help us generate more profits, which is much higher than what we did by ourselves."*

Applying knowledge management in the innovation management process helps enhance efficiency especially in terms of product quality and satisfying market needs. Obviously seen from the four cases of successful Thai SMEs, they all conduct activities related to knowledge management in the innovation management process. Even though there is no precise announcement within their organization that they are promoting knowledge management, the impact of knowledge management practices on innovation management hinges on determined and continuous actions of the SME entrepreneurs.

Knowledge Management for Grassroots Innovation in SMEs

Knowledge management can be utilized as a tool to support the technological SMEs in the grassroots innovation management process with higher efficiency. Knowledge management model for innovation management can be summarized in Figure 3.

It is necessary for SMEs to be capable of creating knowledge from research and development and integrate the knowledge within the organization with external knowledge, i.e. market knowledge from alliances, customer knowledge, competition knowledge, etc., in order to create its own concept for innovation development. The findings are aligned with Zeng, Xie, and Tam (2010) concluding in their research that the vertical and horizontal cooperation with customers, suppliers, and other firms played a more distinct role in the innovation process of SMEs than horizontal cooperation with research institutions, universities or colleges, and government agencies. Storing knowledge to reduce time consumption and costs in extending innovation must be considered as well. Transferring and sharing knowledge among employees is another important matter which helps develop employees to be knowledgeable and competent in innovation development.

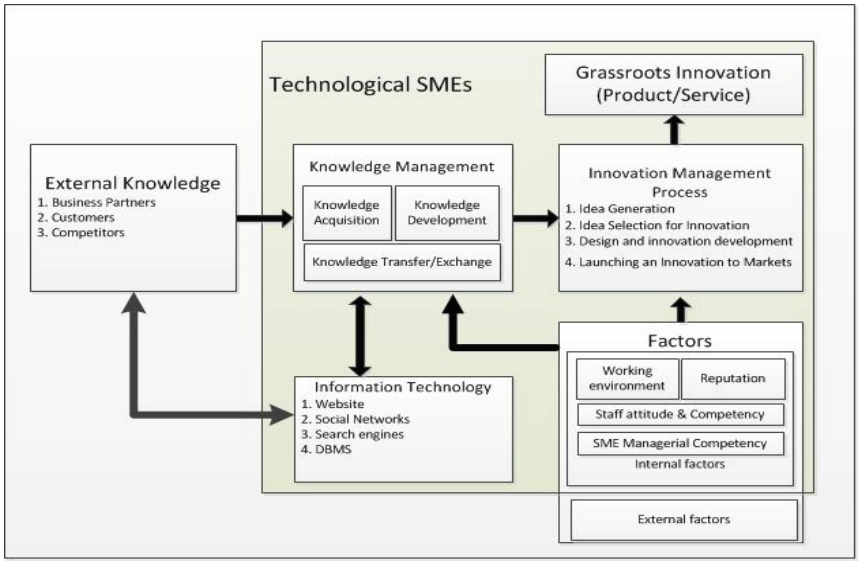

Figure 3 A Conceptual model of knowledge management for grassroots innovation in SMEs

As SME entrepreneurs or owners, they all are to be knowledgeable and have a vision in selecting the right concept for innovation development. Moreover, they should be able to plan and design the right innovation so that the products/service can respond well the market needs. Ability to efficiently manage organizational resources including human and physical resources is essential. Creating a good and casual working environment with the right attitude of employees helps elevate the efficiency of innovation development process.

In addition, it is an advantage for SME if the entrepreneurs are able to apply appropriate information technology to support knowledge management processes. For example, using information technology to acquire external knowledge, using database technology to store and retrieve knowledge for further innovation. Using website and Facebook to disseminate information and knowledge about product or service innovation to the target markets would also be recommended.

CONCLUSIONS

Nowadays knowledge management plays an important role in most organizations. It is one of the most important tools that can enhance competitive advantage. Comparing this tool to others, it costs less or even nothing as knowledge has already existed in an organization. Knowledge management becomes an efficient tool for organizations to successfully compete in the world of business.

Knowledge management supports an organization to achieve its goal. Well managing knowledge can create new knowledge essential for new product and service development as well as improve the innovation management process to be more efficient. As long as an organization gains efficiency and effectiveness, a chance of success is wide open.

Knowledge management can also be well applied for SMEs. Obviously seen from the cases presented above, it has proved that knowledge management is practiced by its nature, mostly

unofficially. The competence of SME staffs can be improved by implementing knowledge management more systematically, so does the innovation. It helps strengthen SMEs to be competitive and ready to play in the modern trading regions like ASEAN Economic Community (AEC) which are now approaching them.

ACKNOWLEDGEMENT

This paper is produced as a part of the project of "The Design of Knowledge Management to Enhance the Performance of the Grassroots Technological Innovation for SMEs in Thailand" supported by Kasetsart University Research and Development Institute (KURDI) at Kasetsart University.

Dr Janne Harkonen received his Bachelor's degree (1st Class Honours) from University of Greenwich in the UK and both his M.Sc. in Process Engineering and Dr (Tech) in Industrial Engineering and Management, from the University of Oulu, Finland. He has also studied in the University of North Carolina at Wilmington, USA. He has worked for several years in the IT and environmental technology industries. Currently, he is a post doctoral research fellow at the University of Oulu in Finland. Dr Harkonen has authored and co-authored twenty-five journal articles, and also a number of other publications.

Dr Harri Haapasalo is Dean for Research, Faculty of Technology, and Professor of Technology Management in the Department of Industrial Engineering and Management at the University of Oulu. He has a Dr. Sc. in Technology Management and a Master's degree in Economics and Business Administration, both from the University of Oulu, Finland. He has research interests in planning, product management, product development and technology commercialisation.

Mr Kai Hanninen is a researcher at the Department of Industrial Engineering and Management at the University of Oulu, Finland. He has a Master's degree in Engineering. Mr Hanninen has over 10 years of experience in civil engineering and over 15 years experience in the telecommunication industry at the managerial level in R&D and technology management.

ABSTRACT

Purpose: *Productisation seems to be a managerial practice as the term is commonly used by practitioners. Industrial managers often comprehend productisation as combining and translating product, or service elements into a whole, that can be offered to customers. Dictionary defines productisation as "the act of modifying something to make it suitable as a commercial product". However, the literature is not clear with productisation. Therefore, the purpose of this study is to combine and analyse all journal articles referring to productisation. The aim is to obtain a better understanding on how the literature understands productisation, and how the discussion is distributed.*
Design/methodology/approach: *This study is founded on a thorough literature search, the approach being content analysis, with two main steps: 1) defining sources and procedures for the searches, and 2) defining categories for classifying the found articles (e.g. Li and Cavusgil, 1995). Keyword searches were conducted through article databases, including; Google Scholar, Scopus, Emerald and Science Direct. The analysed literature contains 185 journal articles.*
Findings: *The analysed articles are divided into five content categories. Productisation of products seems to be the most discussed theme, with 37.3 % of the articles classified into this category. Productisation of services, productisation of software, and productisation of technology are the next most covered with 25.4 %, 17.8 %, and 16.2 % of the articles respectively. Noteworthy is that most articles referring to productisation are relatively new. This study also clarifies the characteristics of productisation as recognised by the articles, together with identifying relevant research interfaces.*
Research limitations/implications: *The limitations of this study include analysing articles found in certain databases, potentially ignoring some important work. The implications include synthesising, and making available the overall state of research surrounding productisation.*
Originality/value: *The authors have not identified similar studies conducted on productisation.*

Keywords: Productisation; Productization; Product management; Product development; Literature review; Categorisation; Content analysis.

INTRODUCTION

Meeting the ever increasing customer demands and the resulting product proliferation are widely discussed in the literature (e.g. Forza and Salvador, 2002; Zhang et al., 2005; Bramham et al., 2005). Also, product development is widely discussed (e.g. Browning et al., 2002; Cooper and Kleinschmidt, 1995). Products are seen to constitute of tangible and intangible elements (Bitran and Pedrosa, 1998), to be a marketable mix of compatible hardware, firmware, and software (Mitola, 1999), or to be mainly software based, consisting of a set of computer programs, procedures, associated documentation, and data for delivery to users (Fricker, 2012). In addition, service industries are seen to have an increasingly important role in the global economy, while the basis of customer value is changing from manufacturing to a more product-service oriented systems (e.g. Wise and Baumgartner, 1999). Manufacturing companies increasingly provide product-service offerings rather than pure products; growth is often sought by increasing the sales of services (e.g. Baines et al., 2009). As a consequence, the scope of interaction with customers is being broadened from transactions to a relationship (Martinez et al., 2010).

Research on integration of products and services seems to use a variety of terminology, some discussing the same issues using different terms. Terminologies referring to the integration of products and services include system selling (e.g. Helander and Möller, 2006), bundling (e.g. Herrmann et al., 1997), system solution (e.g. Mont, 2002), integrated solutions (e.g. Davies et al., 2006), functional product (Alonso-Rasgado et al., 2004), functional sales (e.g. Sundin and Bras, 2005), product-service system (Morelli, 2002; Baxter et al., 2009), integrated product and service offering (Baines et al., 2007), and some others. The literature also uses terms of productisation and servitisation while discussing the integration of products and services (Geum et al., 2011). Nevertheless, the content and the level of discussion in the literature varies to a great degree, and is often very ambiguous, hence, this article focuses on clarifying one of the used terms, namely productisation.

This article presents a literature review on journal articles that refer to productisation to clarify the content of one part of the existing literature on the act of making something product-like, an offering that can be sold. An extensive literature search of academic journals was carried out through article databases, including; Google Scholar, Scopus, Emerald and Science Direct, yielding a total of 185 articles. Categories were defined and the found articles were classified.

This article attempts to answer the following research question:
RQ 1: How do the existing journal articles convey productisation?
RQ 2: What are the characteristics recognised for productisation and what are the relevant research interfaces?

Both research questions are answered based on literature findings.

METHODOLOGY

The research process applied in this study is described in Figure 1. This study is founded on a thorough literature search. According to Fink (2004) literature review is a systematic, explicit, and reproducible method for identifying, evaluating, and synthesising the existing body of recorded work. More particularly, the approach used in this study, is content analysis, a research technique for systematic, qualitative and quantitative description of the content of literature in an analysed area (Li and Cavusgil, 1995).

Figure 1 Research process

When carrying out a study on the state of knowledge in a field or subject, three principal basic approaches have been used (Li and Cavusgil, 1995). One of these three approaches is the Delphi method through which experts familiar with the studied area are surveyed (Dalkey and Helmer, 1963). The second one is meta-analysis, an approach in which empirical studies on a studied subject are collected and analysed statistically. For example, Montoya-Weiss and Calantone (1994) used this approach for analysing the determinants of new product performance. The third approach, the one utilised in this study, is content analysis, a research method used for systematic, qualitative and quantitative description of the content of literature in a field or subject.

The procedure for conducting content analysis is seen to contain two main steps: (1) defining sources and procedures for the search of articles, and (2) defining categories for the classification of the collected articles (Li and Cavusgil, 1995; Seuring et al., 2005; Marasco, 2008). These two steps have been applied in the review of literature referring to productisation. In this study, only journal articles are included in analysing the research surrounding productisation. Any books, business periodicals, conference proceedings and other written material are left outside the scope of the study. Literature for inclusion contained published journal articles but was not limited to any particular journals. Key word searches were conducted through article databases including Google Scholar, Scopus, Emerald and Science Direct. The keywords utilised in this study contain the both transatlantic forms of productisation. The utilised keywords were expected to appear in the articles. Should the keywords appear only in the list of references, not in the actual discussion, the article was not analysed further. Once articles were identified, their references were reviewed to aid in locating additional papers, resulting in some beneficial findings. Journal articles were carefully read to understand their content and analyse their contribution to the research questions and aims. As the terminology surrounding the topic of interest is not cemented, some additional keyword searches were also made to reveal the surrounding discussions. This procedure yielded a total of 185 journal articles that were identified by the databases and search engines combined. Even though a number of other potentially relevant publications, aside journal articles, may be found using the keywords, they were not included in this study. The reference list to this article contains all the found articles. Although there is always the possibility that some

articles have been missed, the reviewed journals constitute a reasonably representative body of productisation-related research work that has been published.

Classification categories

Based on the database searches and the analysis during this study, articles referring to productisation can be divided into five categories. These categories are: *Productisation of Products*: Those articles that convey productisation to be linked to offering that constitutes of tangible and intangible elements, often provided with supporting services. *Productisation of services*: Those studies that convey productisation to be linked to offering that constitutes of services that are often abstract and intangible. *Productisation of software*: Those articles that convey productisation to be linked to offering that is software based, consisting of computer programs, procedures, associated documentation, and data for delivery to users. *Productisation of technology*: Those articles that convey productisation to be linked to future offering that constitutes of technology currently under development. The biggest difference to the category of productisation of products, or other categories, is the discussion being more at frontiers of technological knowledge in terms of products and manufacturing technologies, and/or discussion closely related to technology topics. The category *other*: Contains those articles that include miscellaneous discussion, one that cannot objectively be linked to any of the other categories, yet the articles refer to productisation. The first four categories of articles referring to productisation each have their own characteristics and clear commonalities to a degree.

CLASSIFICATION AND REVIEW OF PRODUCTISATION LITERATURE

This chapter presents the classification of journal articles referring to productisation, based on a content analysis conducted during this study. Table 1 illustrates the distribution of the reviewed articles by the content categories. There are a total of five content categories, including; *productisation of products*; *productisation of services*; *productisation of software*; *productisation of technology*; and *other* context. The categories are based on the context of the discussion on productisation in the articles. Each article belongs to only one category.

It can be seen from Table 1 that the term productisation, in journal articles, is mostly linked to productisation of products with about 37 %, and to productisation of services with about 25 % of the total articles. Productisation is linked to productisation of software, third mostly with some 18 % of the articles. Roughly, 16 % of the total articles fall into the category productisation of technology. Finally, the category other, accounts for about 3 % of all the published journal articles.

Table 1 Distribution of articles by content (productisation)

Content category	Number of articles	Percentage of articles
Productisation of products	69	37.3
Productisation of services	47	25.4
Productisation of software	33	17.8
Productisation of technology	30	16.2
Other	6	3.2
Total	**185**	**100**

Table 2 shows the details of the classification by content, providing a summary of all the reviewed articles that fall under each category. Should anyone be interested in searching for references under the category topics, this table may prove beneficial.

Other	Dobris (2005), Lysgard, (2013), Parjanen (2012), Pekkola, (2013), Prokkola (2007), Wu and Guo (1999)

Based on the publication years, the articles that refer to productisation seem to be mostly relatively new. In the category *productisation of products*, the first article found was published in 1985, yet the majority of articles have been published after year 2000. Most articles in the category *productisation of services* have been published since year 2000. In the category *productisation of software*, the earliest found article had been published in 1994 and over half since 2000. Out of the articles classified to belong to the category of *productisation of technology*, some had been published in the 1990s, yet most were published after year 2000.

Figure 2 illustrates the origins of journal articles referring to productisation, as given in the affiliations for the first author.

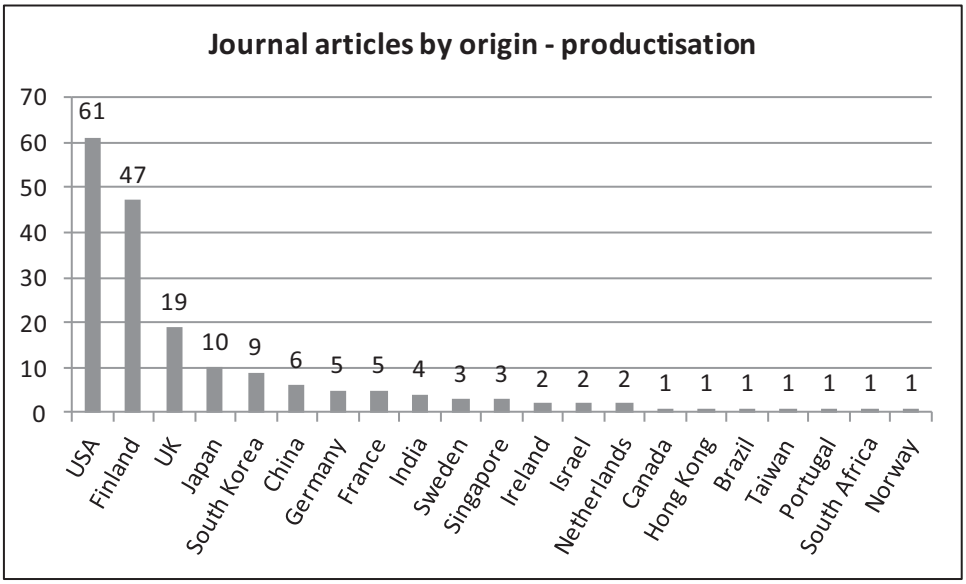

Figure 2 Journal articles by origin as given for the first author

The biggest proportion of journal articles that refer to productisation originate from the USA with 33.0 % of the articles, as given in the affiliations for the first author. Finland and UK are the next largest origins with 25.4 % and 10.3 % of the articles. Japan, South Korea, and China are the next biggest origins for journal articles referring to productisation with 5.4 %, 4.9 %, and 3.2 % of the articles, respectively. Should the European Union countries be seen as a single origin, the share of articles would be 84, or 45.4 % of the published journal articles.

Figure 3 presents the origins of the journal articles that refer to productisation, divided into the five classification categories. The origins of the articles are presented as given in the affiliations for the first author.

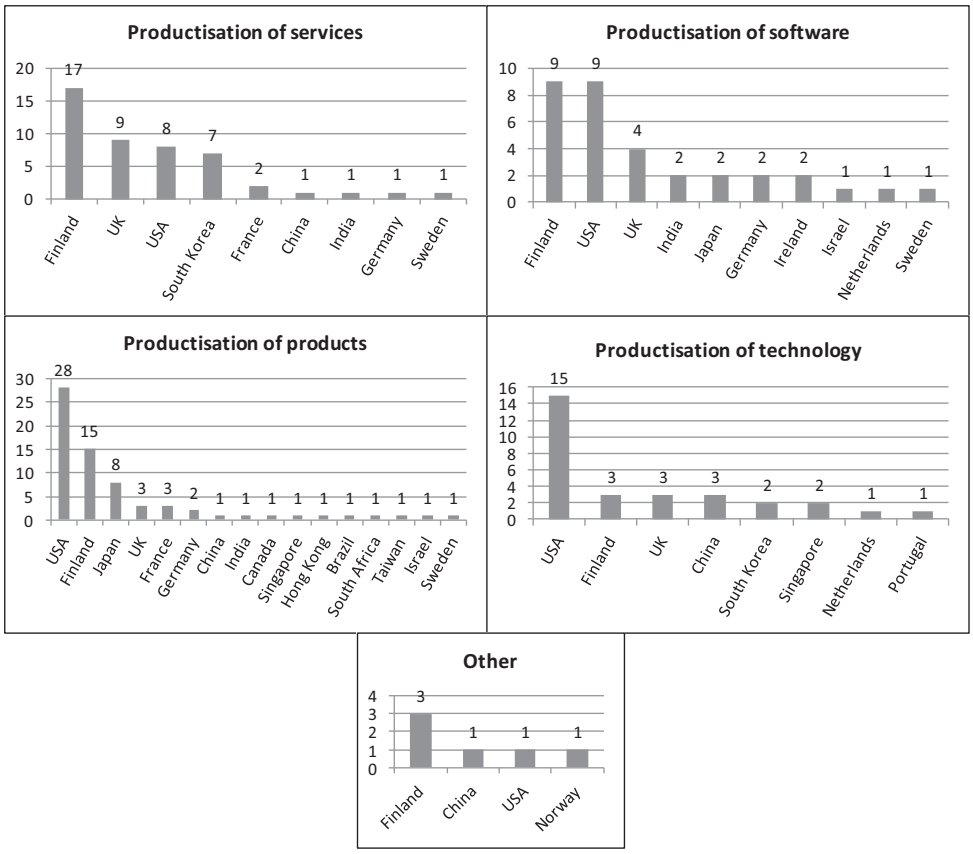

Figure 3 Journal articles by origin by the classification categories

The biggest proportion of journal articles that refer to productisation, in the category *productisation of services*, originate from Finland with 36.2 % of the articles. UK and USA are the next largest origins with 19.1 % and 17.0 % of the articles. South Korea is the origin for 14.9 % of the articles in this category. Should the EU countries be seen as a single origin, the share of articles would be 30, or 63.8 % of the articles in the category *productisation of services*. In the category, *productisation of software*, the biggest proportion of articles originate from Finland and USA with 27.3 % both. UK is the origin for 12.1 % of articles in this category. India, Japan, Germany, and Ireland are the next biggest origins with 6.1 % of articles each. If EU countries would be seen as a single origin, the share of articles for EU would be 19, or 57.6 % of the articles in the productisation of software category. The biggest proportion of journal articles that refer to productisation, in the category *productisation of*

products originate from USA with 40.6 %. Finland and Japan are the next biggest origins with 21.7 % and 11.6 % of the articles. UK and France come next with 4.3 % of the articles each. Germany is the origin for 2.9 % of articles in this category. Should the European Union countries be seen as a single origin, the share of articles would be 24, or 33.8 % of the published journal articles in the category *productisation of products*. In the category, *productisation of technology,* USA is the biggest origin of journal articles, with 50 % of the published articles. Finland, UK, and China are the next biggest ones with 10 % each. South Korea and Singapore are both the origin for 6.7 % of the articles. If EU countries were seen as a single origin, the share of published articles would be 8, or 26.7 % of the articles in the category of *productisation of technology*. The category *other* contains few miscellaneous articles that refer to productisation, ones that cannot be categorised into any of the other categories. Finland is the biggest origin in this category with 50 % of the published articles. The share for EU would be the same 3 articles, or 50 % of articles in the category *other*.

CONTENT ANALYSIS

The following chapters by the content categories present discussion supporting each category together with the content analysis of all the analysed articles. These chapters further reveal the type of discussion found in the articles of each category. Relevant research interfaces are also attempted to identify.

Productisation of products

Products often have tangible and intangible elements, tangible referring to physical elements and intangible to non-physical elements. The product development literature is seen to mostly deal with tangible characteristics of both elements (Bitran and Pedrosa, 1998). Products can range from fairly simple ones to complex systems, often provided with supporting services, sometimes also referred to product-service systems (e.g. Tukker, 2004). Typically, products are developed and produced to satisfy a need. However, understanding the needs of potential customers can be tricky, especially when considering intangible elements. For example, marketing literature often discusses value proposition and value creation in relation to understanding customer wishes. Customer wishes are seen to be met via processes of new product development and customer order fulfilment. (e.g. Slater, 1997). Value experienced by a customer is seen to be driven by product and process attributes, i.e. a process producing right deliverables and a product meeting the expectations (Browning, 2003). Marketing literature also discusses product differentiation in terms of attaining higher desirability and promoting sales (e.g. Sharp and Dawes, 2001). The literature also discusses commercialising products in conjunction with meeting customer expectations. Rapid commercialisation of new products is seen as one of the current top priorities in many organisations. (Harmancioglu et al., 2007). Producing a product recipe that satisfies requirements is emphasised as the goal of a product development process (Browning et al., 2002).

The literature referring to productisation of products mostly convey productisation as a phase in developing products (e.g. Eliezer et al., 2009; Karjalainen and Lappalainen, 2011; Meehan et al., 2010; Ayanoglu, 1999, Eliezer and Staszewski, 2011; Nigussie et al., 2012; Czuchry and Czuchry, 2009; Klein et al., 2010; Mort, 2001; Fujishiro et al., 2011; Nakazawa and Tokuda, 2012; Yamane et al., 2012; Tanaka et al., 2012; Yoshitake et

al. ,2011; Tokumitsu, 1999; Ferguson and Kline, 1997; Kettunen et al., 2009; Lev. et al., 1995; Iskanius et al., 2006; Strand, 2005; Zhou et al., 2013; Pratap and Arunkumar, 2007; Leminen and Westerlund, 2012; Tan, 2003; Leon et al., 2007; Fey, 1985; Huang et al., 2003; Martin, 1992; Parks and O'Hanlon, 1993, McDonald, 1996). Nevertheless, in many cases productisation is presented self-evidently as a part of the discussion, leaving room for interpretations. Some authors present productisation as an activity that follows a research and development (R&D) phase (e.g. Murray, 1999; Van der Loos, 1995). Ma and Fuh (2008) name and organise different development phases as: industrial design, conceptual design, detailed design, *productisation*, process planning, manufacturing, assembly, sales, maintenance, and recycle or destroy. Productisation is also presented as a late product development phase (e.g. Belt et al., 2010; Harkonen et al., 2009), and as a part of innovation cycle including R&D, new product development, productisation, after-sales, and disposal. (Maatta et al., 2009). Many articles present the development of products simply as productisation, including analysing the needs of customers, designing the product and developing the ability to produce it. They view productisation to involve, in the case of a production company, the design and manufacturing phases, and in the case of a service company, forming a system for providing services to customers. (Flamholtz and Hua, 2002; Flamholtz, 2002; Flamholtz, 2005; Flamholtz and Kurland, 2005; Flamholtz 1995; Flamholtz and Aksehirli, 2000). In many cases, R&D projects are seen to result in exploitation that includes productisation, i.e. making commercial products from R&D prototypes (Segarra, 1999). Productisation is also seen as an activity of making something tangibile in the real physical world (Muzellec et al., 2012). Tikkanen and Jaakkola (2010) view productisation to allow understanding product content to enable better quality. In addition, total time to market is suggested to include productisation efforts, while productisation simply means all activities required before a product is ready commercially (Pyron et al., 1998).

Other authors emphasise the marketability aspects in conjunction with productisation while viewing productisation as a phase in developing products. (Tatsumi, 2011; Cummings and Haruyama, 1999; O′Mahoney et al., 2013). Some authors discuss productisation purely as activities related to making something marketable (Leinonen et al., 2009; Henton, 2005; Cheng et al., 2009). For example, Mitola (1999) indicates a product being productised as a marketable mix of compatible hardware, firmware, and software modules. Skervin (2010) emphasise the value-adding aspects of productisation in developing products, while Greco (2007) view productisation as a part of value creation pipeline, a phase where validated concepts are converted into commercially ready products. Velamuri et al. (2011) associate productisation of products with hybrid value creation, i.e. the process of generating additional value by innovatively combining products (tangible component) and services (intangible component). Also, Bowman and Swart, (2007) associate productisation with value creation. Velamuri et al. (2011) also differentiate designing for hybrid value creation from traditional product offerings by hybrid value creation requiring the involvement of more stakeholders. Nakagawa et al. (2012) point out how, in collaborative product development, product requirements are often negotiated and how different actors may have their own interests during productisation. Productisation is also viewed to have two outputs, a product that is delivered to an internal or external customer, and knowledge related to the product, its production and use (Kasvi et al., 2003). Also, Wiig (1997) discusses the knowledge content.

The following aspects are also brought up by the journal articles referring to productisation of products. Sharif (2012) view productisation as an essential follow-up measure for commercialising R&D, linked to new goods and services, aside capitalising intellectual property (monetisation). Also, Hossain (2012) discusses productisation as a commercialisation activity. Van der Loos (1995) highlights the importance of involving the prototype developer and the importance of technical documentation for productisation. Levänen and Hukkinen (2013) see productisation as one of the critical points of industrial activities as the productisation process still contains significant risks. For example, productisation risks include products under productisation being potentially viewed differently in the eyes of the legislator. Hanninen et al. (2013b) present a concept of rapid productisation that covers versatile activities before the actual productisation.

Productisation of products is also associated with the concepts of complex product systems, customer solutions, extended products, functional products, hybrid products, hybrid solutions, integrated solutions, product based services, product related services, product services, product service systems, and servitisation. (e.g. Velamuri et al., 2011). Productisation is in some cases discussed as a part of product integration process, the product constituting of software, service components and a subset of application components. These parts are seen to be combined into more complex ones and eventually into a product or system that will be delivered to a customer. (Larsson et al., 2009). Productisation is also viewed as a process of defining products based on customer needs (Danson et al., 2005). Some authors view Product-Service System as the convergence of productisation and servitisation, trends that consider a product and a service as a single offering (e.g. Beuren et al., 2013). Ruohonen et al (2006) view productisation as standardisation - an opposite to cooperative customisation that is conducted when it is difficult for customer to express product preferences or the product involves complicated specifications.

As a summary on *productisation of products*, ignoring any terminology-related inconsistencies, the published journal articles recognise the following characteristics:

- seen as a process phase
- making something marketable
- activities before a product is ready commercially
- defining products based on customer needs
- hybrid value creation
- standardisation
- potentially three outputs, product, service and related knowledge
- a follow-up measure for R&D commercialisation
- making tangible

Productisation of Services

In the service industry, the object of exchange is abstract and intangible, a clear distinction between services and tangible products, (e.g. Shostack, 1977, Gummesson, 1991). Services are also characterised by heterogeneity, customer participation, and perishability (e.g. Chai et al., 2005). Services can be customised for individual customers' unique needs, and produced

and delivered as a result of an interactive process. However, in many cases services are only partially customised rather than bespoke solutions (e.g. Hipp, 2000; Aapaoja et al., 2012). High degree of customisation and the resulting heterogeneity are seen to cause challenges in communicating, promoting, and pricing service products (e.g. Clemes et al., 2000).

The literature referring to productisation of services points out how service productisation is acknowledged among practitioners, discussed commonly in managerial magazines and seminars, but not discussed explicitly in the academic literature. (e.g. Jaakkola 2011). Productisation of services is seen to be conducted due to various challenges, including inefficient production of services, services being tailored from scratch for each client, difficulties by customers and company employees perceiving the service offering (Valminen and Toivonen, 2012; Jaakkola 2011).

A need to make services more product-like, repeatable, and tangible are seen as the motivations for productisation of services, hence productisation contributing to competitiveness and overall efficiency (e.g. Valminen and Toivonen, 2012; Bask et al., 2010; Chattopadhyay, 2012; Karmarkara and Apte, 2007; Skalen and Hackley , 2011; Morrison, 2003; Nadim and Singh, 2008; Rissanen et al., 2010; Mattila et al., 2013; Ojala and Tyrväinen , 2008; Gupta, 2011). Productisation is also seen as a tool for packaging services (Ukko et al., 2011; Bruce et al., 2008).

Most of the literature on productising of services view productisation as means for enhancing customer understanding, an activity by which a company gives a service more tangible features, and makes buying easier (e.g. Salmi et al., 2008; Valminen and Toivonen, 2012). Hence, productisation is seen to help customers to understand where they get value and what they spend money on, potentially influencing a company's revenues positively (e.g. Stone, 2010; Chattopadhyay, 2012). Shin et al. (2009) view service productisation as a way to stabilise revenue stream through the resulting continuity. In addition, Artto et al., (2008) view pricing of services and service productisation to be closely related activities. Chattopadhyay (2012) emphasises how productisation makes pricing of the service easier. On the other hand, Rekola and Haapio (2011) emphasise the importance of justifying expenses on productisation activities for ensuring continuity.

In productisation of Services customers are seen to have a role in producing the services (e.g. Jaakkola 2011). Nysten-Haarala et al. (2010) highlight productisation as a pre-sale activity. Productisation is also seen beneficial for cooperation with clients (e.g.Toivonen et al. 2008), for example, Anupam et al. (2006) point out how productisation can be favourable in learning customer preferences. Also, Hanninen et al. (2013a) discuss the customer interface.

Productisation of services is also discussed in conjunction with standardisation (e.g. Meyer , 1999), and service productisation is seen to be particularly essential for implementing modular products (Vähätalo, 2012). Rajahonka (2013) views productisation as a characteristic of modularity in services. Productisation of services includes standardisation and modularisation of service processes (Kim, 2009). Productisation of services is also presented as a part of a value creation mechanism (Nam et al., 2009), and seen as a managerial practice (Jaakkola 2011). Productisation is also

seen as one of the stages of service content lifecycle (e.g. Crane, 2005; Crane, 2007; Daim et al., 2013; Wardlaw, 2005; Reitman, 2001). Geum et al. (2011a) view productisation as a relationship between technology and a service, one on which eventually evolves towards productisation, i.e. development of a product that combines technology and service.

In general, the discussion on productisation of services in the published journal articles seems to be somewhat limited and lacking depth. Also, the terminology utilised is not unambiguous. Neither are the discussed issues new, for example, already Levitt (1976) referred to standardisation of services when discussing industrialisation of services.

Productisation of services and *servitisation* of products are seen as overlapping concepts (e.g. Bask et al., 2011). The borderline between products and services is seen to be disappearing while products are servitised and services are productised (Thomas, 1994). Servitisation is seen as a concept related to productisation, yet the relationship between service and product elements are somewhat different in these two. According to Chattopadhyay (2012) productisation of services is accomplished largely by associating tangible features with intangible service offerings. Geum et al. (2011a; 2011b) view servitisation to mean converting an existing manufacturing offering to a service that includes elements such as planning, consultation, realisation and evaluation. McAloone and Andreasen (2002) present an example of servitisation on Xerox, changing its competitive offering from manufacturing copying machines to offering an integrated document management service. Park et al. (2012) see servitisation as companies offering fuller market packages, or bundles of customer-focused combinations of goods, services, support, self-service, and knowledge. In simple terms, servitisation could be understood as a shift from selling products to selling integrated product and service offerings that deliver value in use (e.g. Martinez et al., 2010). Companies are increasingly adopting a service oriented model on manufacturing (e.g. Wang et al., 2011). Delivering value in use is also discussed using the concept of *product-service system* (e.g. Baines et al., 2007), the difference to other concepts is in the existing approaches starting from the perspective of a physical product (Aurich et al., 2009). Also, Kim and Yoon (2012), Laperche and Picard, (2013), and Baines et al. (2007) see a strong link between productisation, servitisation and product-service systems.

As a summary on *productisation of services*, aside any terminology-related inconsistencies, the published journal articles recognise the following characteristics:

- making services more product-like
- defining services better
- systemising and creating repeatability
- making more tangible
- enhancing and improving services
- standardisation and modularisation of services
- making service production more efficient and profitable
- combining a tangible product and service offerings

Productisation of software

Many of today's products are increasingly software-based, rather than electro-mechanical. A software product is seen to consist of a set of computer programs, procedures, associated documentation, and data for delivery to users. (e.g. Fricker, 2012). Software products are seen flexible and soft, allowing relatively easy changes in a technical sense (Kilpi, 1997). A software product can also be seen as modular, consisting of one or more software modules (Ajila and Dumitrescu, 2007). Hence, a software product consists of many artefacts that are linked (Beuche et al., 2004).

The discussion on productisation of software in journal articles seems to be somewhat limited and lacking depth. Nevertheless, the literature does refer to productisation, even if the term is occasionally taken for granted. Productisation of software is seen to relate to characteristics and concerns that software systems should adopt as soon as they become products, i.e. deployment, security, configuration, and usability among any others (Barzilay et al., 2009).

Productisation of software is viewed as a managerial area related to marketing challenges, indicating that customer understanding of software products could be one of the driving forces (Helander and Ulkuniemi, 2006; Helander and Ulkuniemi, 2012; Baumert et al., 1998; Mohapatra and Roy, 2012). Productisation of software is also seen as means to demonstrate value (e.g. Feller et al., 2008), and make a product more tangible so that a buyer is able to test its functionality before the purchase decisions (Alajoutsijärvi et al., 2000). Productisation of software is also seen as means for standardisation and reproducibility. (Sainio and Marjakoski, 2009; McBride et al. 2003; Ward et al., 2006).

The discussion in Mont et al. (2006) indicates that productisation of software relates to packaging software to a form that can be offered to customers. Hence, productisation can be seen as an activity that relates to marketability (e.g. Kiessling et al., 1994; Emmerich and Sawyer, 1998). A process of converting routine software functions into modules that can act as building blocks for different applications (Youngdahl et al., 2010).

On the other hand, productisation is also seen as a process phase after creating an initial prototype, created to prove a concept (Davey et al.; 1995; Tsou et al., 2005; Seager and Gorda, 2009; Carayannis, 1999; Hori et al., 2004; Takafuji, 2011; Fay, 2003; Nguyen and Sohn, 2003; Mont et al., 2006). Wallin et al. (2002) present productisation as a phase of a software development life-cycle model, one that precedes production. Productisation is seen as a process involved in software effort (e.g. Russell, 1994), but not discussed thoroughly in journals.

From the perspective of software industry, productisation is seen to include a shift from unique service-intensive customer projects towards tangible standardised products aimed for international markets. (Alajoutsijärvi et al. , 2000; Helander and Kukko, 2009; Kuivalainen et al., 2007). In other words, productisation of software is seen as a transformation process from customer specific software to a standard product (Vlaanderen et al., 2012), meaning that productisation relates to delivering standardised software products (e.g. Parry et al., 2012; Salo and Kakola, 2005).

Ojala and Tyrväinen (2006) view the degree of a software productisation to be connected to the amount of required installation and after-sales services, where a low level of productisation means that a product requires intensive consulting, support, and maintenance, while a highly productised software product can be installed and used by customers without additional support. Nevertheless, according to Iivari and Molin-Juustila (2009), the extent to which users are listened during product based software product development is not dependent on the degree of productisation.

In addition, productisation of software is seen as an emerging trend, (Mathur, 2006), discussed in conjunction with final quality and packaging of a product, and also, incremental innovation is seen to be prevalent in productisation (Carayannis, 1998). Productisation is also seen as one of the central capabilities of software product business. (Alajoutsijärvi et al., 2000; Helander and Ulkuniemi, 2006).

Discussion, similar to productisation can be found in articles on *software product management* (e.g. Ebert, 2009; Fricker, 2012; Helferich et al., 2006). Software product management is seen as a discipline and a business process that governs a product from inception to the market to generate the largest possible value to a business (Ebert, 2009). Nevertheless, also the discussion on software product management is seen to lack in some aspects, as for example, Ebert (2007) calls for clarifying the roles of product manager, project manager, and marketing manager to successfully define, engineer, produce, and deliver a product.

As a summary on *productisation of software*, ignoring any terminology-related inconsistencies, the published journal articles recognise the following characteristics:

- improving customer understanding
- demonstrating value
- tangibilising
- standardising
- reproducibility
- relates to required amount of support
- packaging to a form suitable for customers
- seen as a process phase

Productisation of technology

The literature on productisation of technology contains discussion that is more at the frontiers of technological knowledge in terms of products and manufacturing technologies (Thompson and Azvine, 2004; Shah et al., 2008; Sparkman, 2002; Elkind et al. 1999; Cross and Montemorra, 2012; Sturgill et al., 2008; Chew et al., 2006; Saultz, 1997, Wisely, 2007). In many cases the literature refers to productisation, but does not discuss it thoroughly. Productisation is seen as converting research findings, or technology into marketable products or services (Fontes, 2005). Myers et al. (2002) link productisation to three stages of technology development; i.e. *proof of concept*, *limited application*, and *widespread application*, particularly to the second and third ones.

Productisation of new technology is also linked to product development and technological innovation, while the discussion seems to refer a bit further into the unknown than in the category for productisation of products. (e.g. Mathur, 2007; Karbhari, 1995; Smith et al., 2002). Productisation is also conveyed as a development phase, aside sufficient supporting infrastructures of scientific understanding of a technology, engineering design, process and product development, manufacturing, reliability, and such. (Myers et al., 2002). Hantos (2011) emphasises the technology readiness in relation to productisation of technology.

Few authors also imply commercialisation in conjunction with productisation of technology, productisation being a relevant activity (West, 2008; Autio et al., 2004; Xiuli, 2011). Productisation is also discussed together with technological innovation, and technology transfer (Oh et al., 2009; Autio et al., 2004; Van Den Elst et al., 2006; Peterson, 1995; Ballato and Stern, 1999). Oh et al. (2009) point out the importance of timely productisation when developing and planning to introduce disruptive technologies to the market. Sohn et al. (2012) discuss productisation in terms of technology evaluation; productisation is seen as a R&D variable among laboratories, patents, utility patents, and types of funding applications.

Another line of literature discusses productisation together with intellectual property, patenting and licensing technologies (Hytönen et al., 2012; Hou and Lin, 2006; Zayadi, 2012; Quey and Malhotra, 2004; Shapira et al., 2012). Hou and Lin (2006) discuss productisation in conjunction with patent/technology appraisal. Hytönen et al. (2012) point out how the royalty levels should be predictable enough to support the planning of technology development and productisation investments. Zayadi (2012) emphasises how one ought to consider whether they have adequate enough ideas for using, or productising a patent, and if not, consider licencing to someone who has the required depth to realise productisation of the technology. Quey and Malhotra (2004) mention productisation, referring to technology transformation; companies using their own intellectual property to others' platform technologies. Shapira et al. (2012) present productisation of technology as a part of a "double-boom phenomenon" where corporate patenting activity first concentrates on technological improvements, then followed by a period of technology productisation. The first cycle is seen to be propelled by technological prospects and the second by marketing prospects.

In addition to the above presented, Zhu et al. (2012) discuss productisation of technology and marketisation of products in terms of imitating technology, i.e. analysing existing technology and productising the core without infringing the relevant rights. Sahlman and Haapasalo (2011) refer to productisation relating to product offering relevant to technology management objectives, technology acquisition and development lead time for productisation in particular.

As a summary on *productisation of technology*, ignoring any terminology-related inconsistencies, the published journal articles recognise the following characteristics:

- at the frontiers of technological knowledge
- making something marketable
- a development phase
- relevant to product offering

Productisation – category other

Productisation, category *other*, contains all those journal articles that refer to productisation, but could not be objectively placed into any of the other categories. It was not possible to judge based on the discussion in these articles, whether they should be placed elsewhere. In some cases, it was clear that the article would not belong to any of the other categories. For example, Wu and Guo (1999) utilise the term productisation in the context of cybernetics and pansystems theory. Dobris (2005) discusses productisation of trusts and trustification. Prokkola (2007) uses the term productisation in the context of tourist destination packaging and commercialising a destination in a manner that the article could not be placed to the categories of products, or services. Neither could (Lysgard, 2013) be placed into any of the other categories, even if the article discusses productisation and culturalisation of products in conjunction with culture-based development strategies where experiences, services and products are seen to have a large role in peoples' lives. Parjanen (2012) uses the term productisation in the context of open innovation, innovation sessions, and exchange of ideas. In addition, Pekkola (2013) discusses productisation of academic work, i.e. work done by academics in universities or other higher education institutions. Some of the articles in this category have weak indications to packaging something and commercialising in reference to productisation activities. Other articles are merely impossible to judge.

CONCLUSIONS

The act of making something suitable as a commercial product is an important topic. Productisation is one of the relevant terms used when discussing these matters. Nevertheless, the previous literature is somewhat ambiguous when discussing productisation. This article aims to clarify the content of one part of the existing literature on the act of making something into a product-like offering. An extensive literature review is presented on journal articles that refer to productisation. A total of 185 relevant journal articles identified through article databases, including; Google Scholar, Scopus, Emerald and Science Direct, are analysed. Suitable categories are defined and the found articles are classified into these categories. The content of discussion on productisation is analysed carefully, together with identifying relevant research interfaces.

The literature that refers to productisation can be divided into five categories of *Productisation of*: *Products; Services; Software; Technology*; and *Other*. Respectively, the frequency of these categories is roughly 37 %, 25 %, 18 %, 16 %, and 3 % of the published journal articles. The four first categories have their own distinct characteristics. Articles in the category *Productisation of products* convey productisation to be linked to offering that constitutes of tangible and intangible elements, often provided with supporting services. Many of the articles in this category also view productisation as a process phase, or phase in new product development. Productisation of *services* conveys productisation to be linked to an offering that constitutes of services that are often abstract and intangible. The literature on productisation of *software* presents productisation to be linked to offering that is software based, consisting of computer programs, procedures, associated documentation, and data for delivery to users. Articles on productisation of *technology* convey productisation to be linked to future offering that constitutes of technology currently under development, more at the frontiers of technological knowledge.

The analysed journal articles are all relatively new; the majority of the articles have been published after year 2000, some during the 1990s, and even the earliest found article during the eighties. Hence, it seems that the streams of journal literature that refer to productisation are relatively new. Interestingly, large proportions, some 25 %, of all the articles originate from Finland, a small country of just over five million people. USA is the origin of one third of all the articles and the UK just over 10 %. The distribution of origins in different categories also varies somewhat. Although there is always the possibility that some articles have been missed, this review provides some reasonable insights into how the literature conveys productisation.

The literature on the first four identified categories of productisation of: *Products; Services; Software; and Technology* present some commonalities in terms of characteristics. Nevertheless, none of the identified characteristics are simultaneously common to all four categories, yet three characteristics could be identified that are common to three of the categories. Two of the characteristics are common for two categories. The literature on the categories of product, software, and technology indicate productisation as a process, or a development phase. The literature on categories product, service, and software see productisation as an activity that has a goal of standardisation, systematisation, better defining the offering, and reproducibility. The literature on product, service, and software also see productisation as an activity of making the offering more tangible, to translate something abstract into an exchangeable offer and make value more visible. In addition, product and technology categories present productisation as an activity of making something marketable, while only the articles in product and service categories refer to hybrid value creation through combining tangible and service offerings.

There seem to be many relevant research interfaces for productisation as productisation seems to have linkages to activities such as sales, new product development, product management and product data management. Linked or similar issues are also discussed in the literature in conjunction with the following concepts: product-service systems, product-service integration, servitisation, complex product systems, customer solutions, extended products, functional products, hybrid products, hybrid solutions, product service, software product management, marketising of products, commercialisation, and probably many others.

The implications of this study include any potential benefits of the review combining journal articles that refer to productisation and bringing together different streams of literature on an issue that is relevant to many companies. Clarifying the used terminologies, recognising the characteristics of productisation conveyed by the literature, and recognising relevant research interfaces may also be beneficial for those interested in the topic.

The limitations of this article includes the analysis only including those journal articles that refer to productisation, available, at the time of search, through the article databases of Google Scholar, Scopus, Emerald and Science Direct. Also, only journals were included in the review, as they are generally considered to be the highest level of research for acquiring information and disseminating new findings. Hence, this article

potentially ignores other relevant knowledge published in other forms of literature. Including knowledge from other sources might influence the results and the made conclusions. Also, the choice of terms utilised during the literature searches may have influenced the results.

Future analysis could include, a review of research approaches used in the literature referring to productisation, as well as the distribution of approaches by articles, and content categories. Future analysis could also include the level of journals that have published articles that refer to productisation. Aside addressing the limitations of this study, future studies could include, extending the literature search to cover potential other terminologies on the act of modifying something to make it suitable as a commercial product.

ABSTRACT

Purpose: *Website is a powerful tool in business today and its advantages have been well established in the research field of e-commerce, IT, ICT and SME. In construction-related professional sector, website could be a platform for greener, effective communication and collaboration among team members as well as a tool for marketing. However, the current scenario of website adoption in construction professional is unknown due to the lack of research. Therefore, this paper is intended to provide an overview of website adoption in Malaysian cost engineering firms in terms of adoption rate, the profiles of adopters and non-adopters, determinants and inhibitions of the adoption.*
Design/Methodology/Approach: *319 sets of questionnaire had been posted to all cost engineering firms throughout Malaysia, and then complemented by online survey. 58 firms out of 319 firms responded to the survey resulting in 18.1% response rate.*
Findings: *Website adoption rate in Malaysian cost engineering firms is 27.6%, 11.9% are developing own website and 69.0% plan to develop own website. Majority of the adopters are matured firms with more employees and higher average commission, compared to non-adopters. Meanwhile, adopters' projects predominantly from private and public sectors and mostly involved with overseas project. Furthermore, firm size, average commission and involvement with overseas project influenced the propensity to adopt this initiative. Finally, the slowness of adoption is associated with perceived 'not lead to more efficiency or lower cost', 'not lead to more commission' and 'lack of time'.*
Research Limitations/ Implications: *Low response rate jeopardised the credibility of the findings. However, it could be useful to indicate the current website adoption scenario in Malaysian cost engineering firms.*
Practical Implications: *Website could be utilised to help in firms' growth. The adoption could be a kick-start to grow and expand beyond local boundaries.*
Originality/ Value: *The scarcity of information regarding the adoption of website among construction-related professionals indicates that only few research have been done in this area.*

Keywords: Website adoption, cost engineering firm, profile, determinants, inhibitions
Classification: Research Paper

INTRODUCTION

Website could be more than just a shop window for a construction business and holds great entrepreneurial opportunities such as powerful branding and sustainable stakeholders' loyalty if designed and managed effectively (Preece et al., 2001). The advancement in web-based technologies enable website to be integrated with other software, hence expanding its purposes as communication and collaboration platform among project team members and reduce the impact of fragmentation in this industry. The scarcity of literature pertaining website adoption in construction related areas indicates that this area is not receiving sufficient attention from academicians in this field. Due to this constraint, most of the website adoption literatures have been derived from technology adoption such as IT, ICT and e-commerce among SMEs.

LITERATURE REVIEW

Benefits of Website

The precondition for success in today's business world is the use of internet technologies and aligned it with its organisational goals (Porter, 2001). Internet technologies have intrinsic characteristics that bring tremendous changes in conducting business; potentials to reduce costs of coordination, communication and information processing as well as able to reach a large number of potential clients (Tsikriktsis et al., 2004). Website is one of internet technologies and its adoption, especially in small businesses, takes the internet adoption to a higher level, regardless of the levels of website sophistication and its relevance to target customers (Simmons et al., 2008). Besides, adoption of e-business via website now is a low-price technology accessible to firms of any size, enabling smaller firms to be at par with their larger counterparts (Cerdan and Acosta, 2005).

Construction project is highly dependent on efficient communication, collaboration and successful competence integration (Gustavsson et al., 2012). The utilisation of web technologies promotes coordination and collaboration among team members of a project (Redmond et al., 2012). It enables faster and more effective information transfer, hence offer unique opportunities for teamwork and workflow automation across the organisations boundaries. Furthermore, the adoption could lead to better communication and financial control, increase the quality and timeliness of documentation, speed of works, simpler and faster access to common data and decrease in documentation errors. Apart from that, website could also be utilised as a tool to create a powerful brand and as a marketing tool (Preece et al. 2001; Preece and Suhaimi, 2009) because a strong online presence could enhance business performance (Cerdan and Acosta, 2005; Goi, 2012) as well as it contributes to overall growth of firms (Teo, 2005). Website adoption indicates strategic commitment to e-commerce and these initiatives improve firms' competitiveness (Teo and Pian, 2004).

Characteristics of Website Adopters

Firm size is the most likely drivers of e-commerce commitment, hence translated into website development (Kowtha and Choon, 2001; Simmons et al., 2009). Larger firms favour early entry because more often than not, they enjoy quicker access to capital and skills as well as they have some built-in capabilities. Teo and Pian (2004) supported this finding as

they too found that firm size has been substantially influenced the adoption of website as a strategic commitment to e-commerce.
Internet technologies such as website hold great promise in facilitating the internationalisation of small, knowledge-intensive firms (Prashantam and Young, 2004). It enables firms with limited resources to significantly reduce cost in communication because physical present is no longer necessary for effective communication with clients globally. Besides, website is effective for marketing and information sharing, both locally and beyond (Abari, 2011).

Barriers to Website Adoption

According to Walczuch et al. (2000), small firms were not adopting the internet with the same speed of the larger firms, although it could offer many advantages to them. Small businesses perceived that the website would not lead to more efficiency or lower cost and not suitable for a particular business because they failed to see the direct benefits out of this initiative, therefore reluctant to invest time and money in an internet presence. In a developing country of Oman, Alkalbani et al. (2012) found that lack of IT competent personnel, reluctance to change, security issues and financial constraints are the main barriers to adopt ICT in construction industry. Meanwhile, in Australian construction industry, limited resources in SMEs, lack of perceived return on investment on IT expenditure and lack of strategic planning are the organisational barriers for IT deployment (Stewart at al., 2004).

METHODOLOGY

Postal and online survey had been utilised to gather data in this research. The sampling frame was obtained from the website of the government body that governed the cost engineering practices in Malaysia. Questionnaires were sent to all 319 firms by postal. In effort to increase response rate, self-addressed envelope was enclosed in the postal survey and invitation to answer the survey online was sent to the respondents' e-mail. Respondents could choose to return the answered questionnaire either by post, online or 'scan and e-mail'. Despite of the convenience to send the answered survey, two reminders were sent by postal and online within four months of data gathering period. This research suffers a low response. Only 58 out of 319 questionnaires were returned, resulting in 18.1% response rate.

FINDINGS

Demographic

Table 1 shows the details of the participating firms. Majority of the respondents are non-adopters (72.4%) and 72.4% of the survey were answered by the top management personnel in their respective firm. In terms of firm category, 50% of the responses came from sole proprietorship firms.

Table 1: Respondents' Profile

Website Adoption	Adopter	27.6% (16)
	Non-Adopter	72.4% (42)
	TOTAL	100% (58)
Position	Top Management	72.4% (42)
	Manager	6.9% (4)
	Cost Engineer	20.7% (12)
	TOTAL	100% (58)
Firm Category	Sole Proprietorship	50.0% (29)
	Body Corporate	24.1% (14)
	Partnership	22.5% (13)
	Multi-Disciplinary	3.4% (2)
	TOTAL	100% (58)

Table 2 shows the intention of developing a website in the future among the website non-adopters. Majority (69.0%) would like to develop a website but still uncertain of the time while 11.9% are in the process of developing own website. However, 19.0% do not have the intention to develop a website for their firms.

Table 2: Intention of Developing Firms' Website in the Future

	Frequency	Valid Cases
Maybe, but uncertain of the time	29	69.0%
No intention of developing a website	8	19.0%
In the process of developing own website	5	11.9%
Total	42	100.0%
Missing Cases	16	
Total	58	

Characteristics of Adopter and Non-Adopter

Table 3 shows the details of adopter and non-adopter characteristics in five criteria namely firm age, firm size, average commission, source of project and involvement with overseas project. The mean value of firm age for adopters is 23 years while for non-adopters is 15 years. In terms of firm size, the average number of employee employed by adopters is 48 persons compared to 10 persons by non-adopters. Meanwhile, there is a huge difference in terms of average commission between adopters and non-adopters; RM19.5 million and RM4.1 million respectively. Apart from that, majority of adopters' source of project is from public and private sectors but majority of non-adopters' source of project is predominantly from public sector. Obviously, majority of adopters have been involved with overseas project and majority of non-adopters have never been involved with overseas project.

Table 3: Profile of Website Adopter and Non-Adopter

CHARACTERISTIC		Adopter	Non-Adopter	Mean / Mode
FIRM AGE	Less than 5 years	12.5% (2)	26.2% (11)	Mean Adopter: 23 years Non-Adopter: 15 years
	5 years and above	**87.5%(14)**	**73.8%(31)**	
	TOTAL	100.0% (16)	100.0% (42)	
FIRM SIZE	Small (1-10 persons)	25.0% (4)	**66.7% (28)**	Mean Adopter: 48 persons Non Adopter: 10 persons
	Medium (11-30 persons)	**50.0% (8)**	31.0%(13)	
	Large (> 30 persons)	25.0% (4)	2.4% (1)	
	TOTAL	100.0% (16)	100.0% (42)

Determinants of Website Adoption

Table 4 shows the results of the statistic tests to determine the significant difference and correlation strength between the five criteria and website adoption. The results show that firm size, average commission and involvement with overseas project have significant difference on website adoption. Then, correlation tests indicate that there are medium strength correlations between these three criteria and website adoption respectively. On the other hand, firm age and source of project do not have significant differences on website adoption, therefore are not tested for correlation.

Table 4: Determinants of Website Adoption

Variables	Significant Difference	Correlation Strength
Firm Age	Z= -1.108, p>0.05 (Not significant)	-
Firm Size	Z=-3.183, p<0.05** (Significant)	r(58) = -0.422*, p<0.05; r^2= 0.178 (Medium strength)
Average Commission	Z= -2.879, p<0.05** (Significant)	r (40) = -0.464**, p<0.05; r^2=0.215 (Medium strength)
Source of Project	χ^2(2, N=58) = 0.018, p> 0.05 (Not significant)	-
Involvement With Overseas Project	χ^2(1, N=58) = 11.484, p<0.05** (Significant)	r(58) = -0.445*, p<0.05; r^2=0.198 (Medium strength)

Inhibition Factors on Website Adoption

Table 5 shows the ranking of inhibition factors on website adoption. 'Not lead to more efficiency or lower cost', 'not lead to more commission' and 'lack of time' are the top three factors in rank, followed by 'sceptical on cost vs ROI', 'have other priorities' and 'lack of IT expertise'. Meanwhile, factors namely 'afraid of organisational change', clients not using the internet' and 'unaware of internet marketing practices' are the bottom three in the rank.

Table 5: Inhibition Factors on Website Adoption

Inhibition Factors	Mean (Standard Deviation)	Rank
Not lead to more efficiency or lower cost	3.57 (0.63)	1
Not lead to more commission	3.55 (0.63)	2
Lack of time	3.48 (0.86)	3
Skeptical on cost vs ROI	3.48 (0.83)	4
Have other priorities	3.40 (0.73)	5
Lack of IT expertise	3.33 (0.93)	6
Doubtful regarding e-transaction	3.31 (0.95)	7

Inhibition Factors	Mean (Standard Deviation)	Rank
security		
Troublesome to have website and to maintain it	3.31 (0.92)	8
Doubtful regarding the security of personal / confidential information	3.31 (0.87)	9
High maintenance cost	3.29 (0.77)	10
Not suitable due to nature of business	3.26 (0.89)	11
Unclear regarding cyber law	3.19 (0.83)	12
High initial cost	3.12 (0.83)	13
Sufficient number of clients	2.98 (0.87)	14
Technically too complicated	2.79 (0.87)	15
Never thought of having a website	2.76 (0.91)	16
Sceptical of technology change	2.74 (0.91)	17
Afraid of organisational change	2.48 (0.86)	18
Clients not using the internet	2.43 (0.97)	19
Unaware of internet marketing practices	2.19 (0.89)	20

DISCUSSION

The Rate of Website Adoption

The rate of website adoption among Malaysian cost engineering firms is 27.6%. This percentage shows an encouraging increment where in 2002, the adoption rate in Malaysian construction industry at large was 24% (Mui et al., 2002) and in 2007, the adoption rate among Malaysian quantity surveying firms was 19.2% (Abdullah and Haron, 2007). Furthermore, Alam and Ahsan (2007) argued that the website adoption rate among Malaysian SME service firms was at 9.4% in 2007. Eventhough the pace of adoption is relatively slow among cost engineering firms, this pattern is consistent with Alam and Ahsan (2007) statement that the Malaysian SMEs are slow in adopting a website for businesses. In comparison, website adoption in architectural practices in Western Cape has been increasing from 17.5% in 2000 to 42.6% in 2012 (Grosskurth et al., 2012). Meanwhile, the e-commerce adopters in Singapore have been reached 52.8% in 2004 (Teo and Ranganathan, 2004). In Netherland, Walczuch et al. (2000) stated that 21% of Dutch small firms have had a website and this figure would be increasing as the upgrading of internet access was in progress.

The percentage of website adoption in Malaysian cost engineering firms would likely to increase in the future as almost 12% of the non-adopters are in the process of developing a website for their firms and almost 70% expressed the intention to develop a website for their businesses. These figures indicate that awareness on opportunities offered by website among the practices have been increased almost four folds in 10 years duration as Mui et al. (2002) found out that, in 2002, only 21% of the construction-related firms in Malaysia had the planning to develop a website for their firms in the future.

Fierce competition in the construction service sector due to liberalisation and globalisation could have been the push factors to encourage the practitioners to rethink their strategies to be competitive and more visible in the ever dense market. Construction-related-service market is not only flooded with new entries from local fellows but also receive entrance from highly competitive companies from overseas (Abidin et al., 2011). Website is a multi-purpose tool that enable small firms to be at par with their larger counterparts (Walczuch et al., 2000); a showcase of firm image and reputation (Xi et al., 2007), could be integrated with other applications and serves as a project collaboration platform (Redmond et al., 2012), as well as an effective medium for communication (Yong et al., 2012). Somehow, by having a website, the firms convey message to the potential clients that they are technology savvy and up-to-date with the current trend in doing business (Armstrong and Durkin, 2008; Kowtha and Choon, 2001).

The Profile of Website Adopters and Non-Adopters

In order to understand the website adoption trend among the Malaysian cost engineering firms, preliminarily, it is useful to comprehend the adopters and non-adopters profiles. In this research, data regarding firm age, firm size, average commission, source of project and involvement with overseas project are selected to depict the profiles.

The result shows that the adopter firms have been existed longer in practice, they have a larger pool of resources in terms of manpower and financial, their source of projects is predominantly from both sources; public sector and private sector and majority have been involved with overseas project (see Table 3). In comparison, the non-adopter firms are younger firms with smaller pool of staff and financial resources, more dependent on public projects and majority have never been involved with overseas project. In terms of firm age, this finding is consistent with Hoskinsson et al. (2008) that found more established firms are more effective in exploiting the identified opportunities while younger firms are more effective in identifying opportunities and producing radical innovations. Furthermore, by reckoning the entrepreneurial opportunities offered by the website, the larger firms could have more capabilities and resources to utilise the website for the benefits of their firms. This finding is consistent with Teo et al. (2009) findings that firms with larger pool of staff and higher annual revenue are associated with the adoption of e-procurement. The advantages in resources especially manpower and financial enable larger firms to allocate more skills and higher budget on their IT initiatives to ensure its effectiveness. Besides, they have a greater need to keep ahead in technologies advances to remain competitive compared to the smaller firms.

The source of project among adopter firms is predominantly from both sectors namely public and private, meanwhile the non-adopter firms are more dependent on public projects. References on this matter cannot be found and it is a new variable tested in this research. Nevertheless, a plausible reason could be that the adopter firms are more visible in the market and their experiences and reputation are displayed on the website for reference. Potential clients from private sector could have easily accessing the firms' information via the website and contact the firm for further actions. Apart from that, majority of adopter firms have been involved with overseas project compared to non-adopters firms and this indicates that having a website could be a strategic move for expanding beyond local boundaries. Since an excellent track record is the most important factor relative to internationalisation (Gunham

and Arditi, 2005), website is an effective tool to canvass the firms' track record as well as firms' image and reputation globally. This advantage could have been fully utilised by the adopter firms to market their service and project their firms' image, hence increase the chances to be shortlisted by clients in other countries.

The Determinants of Website Adoption

Statistic results show that, out of five determinant variables tested, three variables positive for significant differences namely firm size, average commission and involvement with overseas project, while firm age and source of project are not significant (See Table 4). The significant variables also tested for correlation strength and each has medium strength correlation with the adoption of website initiative.

The propensity to adopt a website is associated with large firms, indicated by the number of employees and internationalisation move. This finding is consistent with other research in most ICT and IT adoption and internationalisation of service firms (Aziz et al., 2012; Hadaya and Pellerin, 2010; Teo et al., 2009). In order to grow and expand overseas, website could have been an important tool, initially for marketing and reputation exposure, then as a communication platform and collaboration stage for all team members in a project. Furthermore, the adoption of website is also associated with higher average commission. Possibly, website could be the kick-start in firm growth; easily spotted via search engine, convincing reputation displayed on the website and easily contacted via email or by telephone.

Inhibition Factors on Website Adoption

As mentioned above, Malaysian cost engineering consultant is slow in adopting website. Almost 70% of non-adopter firms have the intention to develop a website for business and this indicates that Malaysian cost engineering firms recognised the entrepreneurial opportunities offered by website. Nevertheless, the current overall non-adoption rate is still more than 70%.

The adoption of website among cost engineering firms in Malaysia have been hindered by the perception that website will not lead to more efficiency, lower cost or more commission. Besides, "lack of time" and "skeptical on cost versus return on investment" are the major concerns that hampering the intention of non-adopter firms to develop a website for their firms. These findings are consistent with other research (Alkalbani et al., 2012; Stewart et al, (2004; Walczuch et al., 2000). Previous study by Mui et al. (2002) showed that 'time consuming' and 'high initial cost' are the major factors that hindered the website adoption initiatives in Malaysian construction industry. Eventhough 'time constraint" is still a relevant factor, high initial cost is no longer a major concern to adopt a website.

The concerns pertaining to website adoption are relevant as majority of non-adopter firms are small in size, therefore constraint in resources especially manpower and financial are inherent with them. Inability to measure the tangible benefits especially in terms of financial out of the initiatives increased the perceive 'not lead to more efficiency, lower cost or more commission' and 'skeptical on cost versus return on investment'. Small firms need to be extra careful with their financial budget and physical evidence on financial returns has always

been the major consideration before making any decision on innovation adoption initiatives. Lack of time to manage the website is another issue in adopting a website due to the small number of employees, but hiring IT staff to manage the website will incur extra cost in operation. More often than not, the existing employees have their hands full with the core business and having a website might be seen as unnecessary extra load to the employees.

SUMMARY AND MANAGEMENT IMPLICATION

The website adoption rate in Malaysian cost engineering firms is 27.6%, and this figure will likely to increase in the nearest future as almost 12% is developing a website for their firms and 69% have intention to develop own website. In terms of profiles, adopter firms have been longer in establishment, consist of larger firms, enjoy higher average commission, projects are predominantly from private and public sector and have been involved with overseas project compared to non-adopter firms. Moreover, website adoption initiative is associated with larger firms, higher commission and involvement with overseas project. Non-adopter firms perceived that website adoption initiatives 'do not lead to more efficiency or lower cost', 'do not lead to lower cost', 'lack of time' and 'skeptical on cost vs ROI' have been major inhibition factors that hindered the adoption.

This study could be an indicative guideline for cost engineering firms to decide on website adoption for business. The adoption of website is associated with larger firms, higher average commission and involvement with overseas project. These indicate that website could have been one of the influences that speed up business growth and expansion beyond the local boundaries. At the very least, the adoption of website could be a virtual brochure for firms to market their services locally and globally.

CONCLUSION

Combination of click-and-brick promises huge entrepreneurial opportunities for business including knowledge-intensive services like cost engineering services. Despite the hype of website benefits in today's business landscape, the adoption rate in Malaysian cost engineering firms is relatively low and slow. The benefits are intangible and difficult to measure, hence increase the pessimism over the website adoption initiative. Nevertheless, majority of adopter firms enjoy business growth, higher commission and have been involved with overseas project. Website is a medium that is relatively cheap, multi-purpose and able to reach potential clients around the globe in seconds. Therefore, developing a website should be one of the strategic business moves that might be kick-start to business expansion and prosperity.

ABSTRACT

Purpose: The purpose of this work was to propose a new approach to assess the influence of decision variables on the running costs of networks providing services, taking recycling networks as an example. The authors have analyzed the importance of these variables and the trends in these changes.
Design / methodology / approach: A computer system supporting decisions about the location of ELVs recycling network facilities, which indicates globally optimum locations of all facilities, was applied. An analysis of output variables sensitivity: location and cost of recycling on decision variables changes, i.e. the ELVs stream, and cost components connected with recycling was performed. The results of the analysis were presented in the form of graphs showing the relation between the cost of recycling generated by the network in the period of one year and the changes in the cost of transport, storage and dismantling of ELVs as well as the transport of dismantled parts and materials.
Findings: The approached proposed by the authors allows to reject insignificant decision variables (it simplifies decision-making) and identifies the values which have the greatest impact (shortens decision-making for alternative data variants).
Practical implications: The proposed approach allows to specify the values of decision variables, and provides information required for the evaluation of profitability of the recycling network.
***Originality / value*:** The proposed approach allows to assess the relationship between the cost of recycling and decision variables at a general level - the territory being analyzed in the period of one year, and at a detailed level - the cost of recycling one vehicle.

Keywords: system supporting location, case study, vehicle recycling, sensitivity analysis

INTRODUCTION

The location problem has been known for a long time, and it is discussed while planning networks of a certain kind of facilities (objects). When designing a network, we wish to select the locations of the objects that belong to the network so as to optimize the function that characterizes the location of all the objects that make up the network. Due to the huge variety of networks, the solution to the problem is sought in each case individually. The development of IT techniques created new possibilities concerning the optimization of the location of objects in the spatial structure of the system being designed or managed. There are various models and methods of optimization, including linear programming and sophisticated heuristics, depending on the complexity of the problem.

Recently, there have been published a lot of work concerning the location problem, e.g. location of product distribution centres with respect to selected parameters of the process, most frequently minimization of the distance. There were developed models taking into account a different number of products (multi-product) (Nozick and Turnquist, 2001) and different methods of distribution (Nonås and Jörnsten, 2007) and (Weiwei Gong *et al*. 2007). (Daskin *et al*., 2002) and (Zuo-Jun *et al*., 2007) formulated this problem in the form of a nonlinear integer programming model and used Lagrangian relaxations. Various tools were used to solve the model depending on the degree of the model complexity (Shu *et al*., 2005) - Column Generation Method. (Ek Peng Chew *et al.*, 2002) used genetic algorithms to solve the problem of location and took into consideration the cost of the distribution process and the quantity of stocks. Given random changes of distribution process parameters, the quantity of stocks may be assessed using computer simulation, (Miranda and Garrido, 2006) and Monte Carlo methods, (Kwilosz, 2011).

The above research do not analyze the influence of individual decision variables in the model on the assessment indexes of the networks designed. Such analysis might simplify the structure of the network model as well as shorten the time required to assess solutions. A similar idea regarding improvement of simulation research was proposed in transport problem by KwangSup Shin *at al.,* 2012. The paper proposes a simulation method using genetic algorithms for the optimal location of objects of the network, with a limited site selection. Here, the location is understood as a spatial organization of objects of the network in the topographical sites to choose from, within the specified industrial/administrative area (country/macroregion). In order to assess the importance of selected decision variables, sensitivity analysis was applied to study their influence on the cost of recycling.

FORMULATION OF THE OPTIMIZATION TASK

Appropriate location of the objects of recycling network in Poland, conforming to general criteria of providing services (including both local and European Union regulations), should facilitate the development of this kind of business activity. The optimization problem regarding the studied case is complex and includes:

- linear and non-linear problems,
- problems not defined formally,
- huge spaces of possible solutions,

- operating on sets of possible solutions and not on values of individual decision variables,
- no model solutions,
- seeking a global optimum for systemic selection of the location of objects in a network, instead of the optimum location of a single object in a network.

With regard to the above, seeking an optimum solution by means of non-classical methods seemed justified. Recycling is an environment friendly and cost-effective way of end-of-life vehicle (ELVs) utilization. The authors assumed 3-level organization of a recycling network. The network consists of the following objects: vehicle collection points, dismantling stations and processing facilities. The cost of recycling depends on the cost of transport of vehicles, parts and materials between the facilities (objects) of the system. Therefore, the location of each object should be correlated with the locations of other objects of the network.

The general form of the objective function and the optimization criterion for the presented case has the following form:

$$K_{rec} = f(K_s, K_m, K_d, K_c) \rightarrow \min \tag{1}$$

and individual costs depend on the following variables:

$$K_s(k_s, Q_j, a(\mathrm{i,j})),\ K_m(k_s, \sum_{j=1}^{N} Q_j),\ K_d(k_d, \sum_{j=1}^{N} Q_j),\ K_c(k_c, S_k, a(j,l))$$

$N \geq J \geq 1,\ L \geq 1$

where:

i=1,…,N - number of vehicle collection points,

j=1, …, J - number of vehicle dismantling stations,

l=1, …, L - number of processing facilities,

K_s, k_s – the total cost and the unit cost of transport ELVs, PLN/year, PLN/t km,

K_c, k_c - the total cost and the unit cost of transport of parts and materials, PLN/year, /t km

K_d, k_d - the total cost and the unit cost of dismantling, PLN/year, PLN/psc.

K_m, k_m – the total cost and the unit cost of storage, PLN/year, PLN/psc.

Q_i - stream of vehicles transported from vehicle collection point VCP_i to dismantling station

DS_j, psc./day

S_k – stream of materials and parts transported to processing facility PF_k, t/day

a(i,j), **a**(j,l), – matrices of transport distances, km.

Consequently, the optimization task involves the determination of the cost of recycling depending on the stream of vehicles Q_j, and such locations $\mathbf{a}(i,j)_{min}$ and $\mathbf{a}(j,l)_{min}$ of facilities in the region that the total cost of transport which also depends on Q_j is minimized. A computer system supporting selection of the location was developed for this purpose, (Gołębiewski, 2011). The principle of operation of the system supporting the selection of the location of vehicle dismantling stations is presented in Fig. 1.

"Take in Figure (No.1)"

The system has the following output variables: daily stream of vehicles, number and location of vehicle collection points (determined by the criteria adopted for the selected region), number and location of processing facilities and cost components connected with recycling. The location and number of dismantling stations are determined using genetic algorithms, to minimize the cost of recycling.

RESULTS OF SIMULATIONS AND DISCUSSION

The following parameters of the optimization task were identified in the analyzed case study: $J \leq 37$, $k_m(Q_j>30)=2.50$ [PLN/psc.] ; $k_d=205+334\exp(-0.124Q_j)$, PLN/psc.; $k_s=1.62$ [PLN/tkm]; $k_c= 2.21$ [PLN/tkm]; distances $\mathbf{a}(i,j)$ and $\mathbf{a}(j,l)$ were determined based on the current maps of the region.

The results of simulated locationns of dismantling stations for selected input variables were presented graphically: on the maps of the province and in the form of graphs. The diagram in fig.2. presents the system of simulation experiments; the symbol w_p denotes a coefficient change of the unit the cost components.

"Take in Figure (No.2)"

Comparative analysis was based on the cost of recycling calculated for the maximum stream of vehicles directed to all recycling stations in the Mazovia province and other parameters identified for this area, $K_{rec}=f(Qmax, PF_{pd}, k_S, k_d, k_m, k_c)$.

The obtained values of K_{rec} for the identified data that constitute the basic set of data in the conducted research, were presented in fig. 3. The result K_{rec} considered the best, due to the value of the adaptation function, was obtained after 71 iterations - generations. Stations are located in seventeen (J = 17) district towns.

"Take in Figure (No.3)"

The sensitivity (Tarnowski and Kiczkowiak, 2006) of the developed system was analyzed by studying the influence of percentage changes (w_p) of the objective function components, i.e. cost connected with the following: transport of vehicles K_S, transport of parts and materials K_C, dismantling K_d and storage K_m on percentage changes of the total cost of recycling.
The analysis of sensitivity presented in fig. 4, 5, 6 significantly depends on the cost connected with transporting parts and materials and the cost of dismantling, whereas the cost connected with transport and storage of vehicles are less significant.

"Take in Figure (No.4)"

"Take in Figure (No.5)"

"Take in Figure (No.6)"

Changes in the cost connected with transport of parts and materials have the greatest influence on the cost of recycling, which is a consequence of long distances between stations and processing facilities.

The influence of changing the location of processing facilities on the location of dismantling stations - DS was also studied. The basic variant, presented in Fig.7.A. and in Fig.7.B., assumes that materials and parts are transported to processing facilities located south of the area being analyzed.

"Take in Figure (No.7)"

Fig.7. shows the consequences of locating these facilities north of the Mazovia province. DS located in the same places on maps A and B in Fig.7. are marked by the symbol ●.

CONCLUSIONS

The results of the sensitivity analysis, shown in figs. 4,5 and 6, provided both the information that is easy and difficult to anticipate a priori. The cost of transport of parts and materials have the greatest impact on the cost of recycling, which can be attributed to considerably long distances between dismantling stations and processing facilities. The cost of dismantling ELVs also has a considerable influence on the total cost of recycling, while the costs of storage and vehicle transportation are negligible due to small number of stored vehicles and short distances between collection points and dismantling facilities. Given the specified constraints of the case being analyzed, the global cost of connected with the recycling network operation considerably depend on the number of dismantled vehicles. A percentage change in the cost of recycling depending on the cost components depends to a little extent on the demand for the services being analyzed, provided that the objects of the recycling network have the optimum locations in the given area. Similarly, if the objects of the recycling network have optimum locations, the average cost of recycling one vehicle do not depend on the demand for this type of services, which, in case of conducting this type of activity, has a considerable importance in assessing its profitability.

ABSTRACT

Tourism is considered the "super star" industry with most growth potential in the 21st century. It is expected to bring huge economical benefits, and would be what countries in the world compete for. With the rapid development in technology, services provided by cloud technology have become increasingly diverse. One of the major areas for applying cloud service is to integrate it within travel industry to provide a value added service. Taiwanese government has been actively promoting local tourism. For example, the Taipei City Government utilizes cloud technology to promote itself as a smart city, using "MOTA (Map of Taipei Amusement)", a map based interactive guiding tool to deliver rich location based information. To understand how users take advantage of cloud technology, this study aims to construct a tourist cloud service accept behavior system (TCSAB) based on three elements, including innovation diffusion, the technology acceptance model, and media richness. Through an extensive literatures review, theories relevant to innovation service (i.e., reasoned action theory, innovation diffusion theory, and technology acceptance model), and to media richness (i.e. media richness theory, enjoyable experience) will be extracted in the TCSAB system. This study uses questionnaire to collect data. Structural Equation Modeling (SEM) is adopted to analyze the data to clarify the determinants influencing users' intention of tourist cloud service. Some implications from our results will be discussed and be expected as a reference for promoting the tourist industry in the future.

Keyword: cloud services, innovation diffusion, media richness, Structural Equation Modeling (SEM), tourist cloud service accept behavior (TCSAB)

LITERATURE REVIEW

Innovation Technology acceptance model

The MOTA system is an integrated technical service that applies the users for tourism information researching. The technology acceptance model (TAM) predicts consumers' acceptance of technical products or services. It was developed from the Theory of Reasoned Action (TRA) and was first proposed by Davis (1989). The TAM includes five constructs related to the use of technology, namely, perceived ease of use (PEOU), perceived usefulness (PU), attitude towards use (ATT), behavioral intention to use (BI), and actual behavior on use (AU). Among these, PU and PEOU are the most dominant determinants for system adoption. Furthermore, PEOU has a direct influence on PU. ATT directly influences a user's BI, which determines actual system adoption.

Innovation diffusion primarily focuses on exploring how business should develop and promote innovation to increase consumer intention to accept or adopt such innovations. As Meyer and Goes (1988) highlighted in their study, to understand, evaluate, use, adopt, and diffuse innovations are the necessary steps for diffusing innovations within an organization. IDT proposed by Rogers (1995) explains how individuals adopt new ideas or innovations.

Additional social influences: Social influence was defined as the social information that individuals received from innovation adoption by others. Peres, Muller and Mahajan (2010) pointed that social influences are transmitted to other individuals, who follow the consumption behavior of people in their aspiration groups. In particular, these influences are observed by potential adopters who infer from them the social consequences of adoption.

Due to the effectiveness of IDT in explaining innovation acceptance behavior (Alam, Ali & Jani, 2011), this study adopted the IDT as the theoretical base to propose a MOTA system for new tourism cloud technology.

H1: An individual's IN has a direct and positive impact on PEOU with respect to MOTA.

H2: An individual's PEOU has a direct and positive impact on PUB with respect to MOTA.

H3: An individual's PUB has a direct and positive impact on BI with respect to MOTA.

H4: An individual's PEOU has a direct and positive impact on BI with respect to MOTA.

H5: An individual's IN has a direct and positive impact on BI with respect to ACMS.

H6: An individual's SN has a direct and positive impact on BI with respect to MOTA.

RESEARCH DESIGN

Data collection

The development of MOTA is still in promotional process in Taiwan; thus, the users who realize this new technology and adopt it are limited. Therefore, individuals from the public over 3 years old with experience in using MOTA were selected as the sample in this study.

Through the convenience sampling method, 52 people were chosen and asked to fill out the questionnaire. After excluding missing or incomplete data, the final valid questionnaire responses were obtained from 52 users, 53.8 percent of whom were male and 50 percent were aged 21–25 , and 28.8 percent were aged 16–20. Most of the respondents had college education (82.7percent)

Measures of the constructs

Based on the TAM (Davis, 1989; Davis et al., 1989), IDT (Rogers,1995), ,and MRT(Daft and Lengel,1986)–this study selected 26 constructs as the basis to develop the integrated acceptance model for MOTA. These constructs were PEOU, PUB, IN, SN, MRT, PE and BI. Their definitions and measures (see Table 2) are as follows. PEOU was used to present the user's perceived ease of use of MOTA and was evaluated by four measures (i.e., PEOU1~PEOU4). PUB was used to present the user's perceived usefulness of and benefits from MOTA and was evaluated by six measures (i.e., PUB1~PUB6). SN was used to present the user's perceived MOTA and was evaluated by four measures (i.e., SN1~SN4).

IN was used to present the user's innovativeness with respect to MOTA and was evaluated by three measures (i.e., IN1~IN3). MRT was used to present the user's media information with respect to MOTA and was evaluated by four measures (i.e., MRT1~MRT4). PE was used to present the user's perceived enjoyment from MOTA and was evaluated by three measures (i.e., PE1~PE3). Finally, BI was used to present the user's behavioral intention to use MOTA and was evaluated by three measures (i.e., BI1~BI3). For each measure, a five-point Likert scale was adopted, where the scores 1 to 5 were equivalent to "extremely disagree," "disagree,"

"neither agree nor disagree," "agree," and "extremely agree," respectively.

Data analysis methods

First of all, the confirmatory factor analysis (CFA) was used to examine the validity and reliability of the measurement models, and next the structural equation modeling (SEM) was employed to interpret the structural model, making use of LISREL 8.12 as the instrument for data analysis. Each of the impact coefficients was estimated using the maximum likelihood method, while the model's overall fit used the following indicators: chi-square statistic/degrees of freedom ($\chi 2/df$), goodness-of-fit index (GFI), adjusted goodness-of-fit index (AGFI), parsimony goodness-of-fit index (PGFI), non-normalized fit index (NNFI), comparative fit index (CFI) and root mean square error of approximation (RMSEA)

RESULTS

Reliability and validity of the measurement model

This study used multiple items to present the latent constructs (i.e., PEOU, PUB, IN, SN, MRT, PE and BI) using a structured questionnaire. First, most of the goodness-of-fit indices suggested that the measurement model was a good fit to the data (see Table 1). Each latent construct was then tested for internal consistency using Cronbach's α and construct reliability. As shown in Table 2, the coefficients α ranged from 0.68 to 0.88, while the construct reliabilities ranged from 0.65 to 0.88. These indicated a higher internal consistency of measurement indicators; hence, the reliability of each construct was ensured (Nunnally, 1978; Bagozzi and Yi, 1988).

The convergent validity and discriminant validity were then assessed. Convergent validity is supported if the standardized factor loadings of the items on latent constructs are above 0.50 or are statistically significant (Bagozzi and Yi, 1988). In Table 2, the standardized factor loadings ranged from 0.60 to 0.86 and were statistically significant at $p<0.05$. Therefore, the convergent validity of the measurement indicators was supported. Discriminant validity test was performed to establish the distinction among the constructs used in this study. Thus, this study followed the method suggested by Hair et al. (2006) by pairing these two latent constructs and subjecting them to the two models of CFA. The first model allowed the correlation between the two constructs to be estimated (unconstrained), while in the other model, the correlation between the two constructs was set to 1 (constrained). The chi-square difference test was then used to compare the first model with the second model. The results

indicated that all of the chi-square difference values were statistically significant at $p<0.05$. Hence, the discriminant validity was supported.

Table1 Fit indices for measurement and structural model

Fit indices	Recommended value	Measurement model	Structural model
$\chi^2/d.f.$	≤ 3	1.34	1.49
GFI	≥ 0.9	0.64	0.61
AGFI	≥ 0.8	0.55	0.52
PGFI	≥ 0.5	0.51	0.50
NNFI	≥ 0.9	0.88	0.86
CFI	≥ 0.9	0.90	0.88
RMSEA	≤ 0.1	0.08	0.098

Table2 the results of CFA for measurement model (*N*=52)

Latent construct and items	Standardized factor loading	Construct reliability	Cronbach' α
Easy to use (PEOU)			
PEOU1: I think that the way using MOTA simple	0.81*	0.88	0.88
PEOU2: I think that the way using MOTA easily understandable and clear	0.79*		
PEOU3: I think that the way using MOTA easy to learn	0.86*		
PEOU4: As a whole, I think that the way using MOTA convenient to use	0.74*		
Perceived usefulness/benefit (PUB)

Personal innovativeness (IN)			
IN1: I'm the first to try new technology among the surrounding people.	0.35*	0.65	0.68
IN2: I like to try new technology.	0.89*		
IN3: I'm open to new ideas.	0.57*		
Behavioral Intention (BI)			
BI1: If necessary, I would make use of MOTA often	0.62*	0.76	0.82
BI2: When I need, I am willing to use MOTA	0.85*		
BI3: As a whole, I am highly willing to use MOTA	0.68*		

Note: *: $p < 0.05$.

Structural model

The SEM technique was used to interpret the unified model (as illustrated in Figure 3). According to the analyzed results (see Table1), the overall fit indices of the model were all found to be within the acceptable scope, suggesting that the model was a good fit to the data.

It is obvious that there are only eight hypotheses that can be supported (see Table 3 and Figure 4): IN has a significantly positive impact on PEOU (λ = 0.71*); PEOU has a significantly positive impact on PUB (λ = 0.77*); PUB has a significantly positive impact on BI (λ = 0.42*); PEOU has a non-significant impact on BI (λ = 0.05); PI has a non-significant impact on BI(λ = -0.52); SN has a non-significant impact on BI (λ = 0.17);MRT has a non-significant impact on BI (λ = 0.12); and PE has a significantly Vpositive impact on BI (λ = 0.81*) In addition, the R^2 value of the unified model is 0.73 (> 0.5), showing that the unified model has good explanatory power.

Table3 summarizes the results of standard path coefficient for each hypothesis.

Hypothesis	Standard Path coefficient	Decision
H1:PI->PEOU	0.71*	Supported
H2:PEOU->PUB	0.77*	Supported
H3:PUB->BI	0.42*	Supported
H4:PEOU->BI	0.05(ns)	Not Supported
H5:PI->BI	-0.52(ns)	Not Supported
H6:SN->BI	0.17(ns)	Not Supported
H7:MRT->BI	0.12(ns)	Not Supported
H8:PE->BI	0.81*	Supported

Note: *: $p < 0.1$, **: $p < 0.05$, and ns: non-significant.

Furthermore, we analyzed the total effects of the factors on BI. The results indicated that the most critical factor that affects BI of MOTA is PE (0.81), followed by PUB (0.42), SN (0.17), MRT(0.12),PEOU (0.05) and PI(-0.52). Likewise, the effects of the other factors on BI are non-significant at $p < 0.05$.

ABSTRACT

Purpose: *This study tries to examine how a company utilizes knowledge integration mechanisms (KIMs) to achieve the success of product innovation in a new product development (NPD) process.*

Research questions: *(1) How KIMs affect new product performance in the NPD process? (2) Is the effect of KIMs on performance different for developing products with different level of product advantage?*

Design: *This study forms a mediation model to examine that knowledge integration capability (KIC) mediates the effect of KIMs on new product performance, and then forms a moderated mediation model to examine the moderating effect of product advantage on this mediating relationship.*

Methodology: *The hierarchical regression is used to examine 128 Taiwan's manufacturing firms. This study follows Baron and Kenny's (1986) procedure to examine the mediation effect, and follows Muller, Judd, and Yzerbyt's (2005) steps to examine the moderated mediation effect.*

Findings: *KIC positively and completely mediates the effect of KIMs on new product performance. The mediating effect of KIC is strong when the level of product advantage is low.*

Research limitations: *This study only examines the relationship with a cross-sectional data. The generalizability of the findings is limited. This study merely examines product advantage as a moderator in the relationship.*

Research implications: *The use of KIMs is not a sufficient condition for product innovation but the integration capability is the key driver of product innovation. For developing product with*

less product advantage, the mediating effect of knowledge integration capability is stronger.
***Practical implications**: Although KIC converts the effect of KIMs on new product performance, but its effect varies as a function of product advantage. The view implies that by failing to consider the KIC's moderated-mediating role, managers may have reached an overly optimistic view on the effect of KIMs on product innovation.*

Keywords: knowledge integration mechanisms, knowledge integration capability, product advantage, new product performance

INTRODUCTION

Based on the knowledge-based theory, knowledge integration was viewed as the critical factor affecting firms' competitive advantage (Grant, 1996). To create competitive advantage, a firm must create new knowledge by exploring and exploit the acquired knowledge (Marsh and Stock, 2006; Teece, Pisano, and Shuen, 1997). Previous research suggests that the use of *knowledge integration mechanisms* (KIMs), which refer to the formal processes and structures that ensure the access and integration of knowledge among different functional units within a firm, is a critical factor that enables managers to internalize and reorganize what it has learned and decide how to use it in firm's new product development (NPD) process (Hamel and Prahalad, 1994; Zahra, Ireland, and Hitt, 2000). Even several studies have pursued extensively an understanding of the link between the use of KIMs and new product performance, how the effect of using KIMs on new product performance remains unclear. The interest in the assumed relationship between the use of KIMs and new product performance has shown apparent strategic importance in marketing literature. Moreover, previous study suggests that product innovation success appears to depend on the management's capability to effectively integrate all resources and utilize them to achieve success (Wells, 2008). Therefore, this study proposes that knowledge integration capability (KIC) is the key which leads the effect of KIMs to new product performance.

On the other hand, previous studies show that product advantage, which is considered a product's uniqueness and superiority relative to other products in the market (Atuahene-Gima, 1995; Langerak, Hultink, and Robben, 2004; Song and Parry, 1997), positively associates with product performance (Calantone, Chan, and Cui, 2006; Henard and Szymanski, 2001; Langerak et al., 2004). Some studies also indicate that product advantage is related to product newness (Kleinschmidt and Cooper, 1991), and product newness always represents a high uncertainty to firms. Other research suggests that the NPD process and its outcomes depend on the level of perceived uncertainty of the firm's decision makers regarding the external environment (Capon, Farley, Lehmann, and Hulbert, 1992; Zirger and Maidique, 1990). This study therefore tries to link the relationship to examine the moderating effect of product advantage in the KIMs-KIC-new product performance relationship.

LITERATURE REVIEW AND RESEARCH HYPOTHESES

Knowledge integration mechanisms

Some knowledge is tacit, making it difficult to use unless the knowledge integrates into the firm's operation (Grant, 1996). The task of knowledge integration is often accomplished by the use of structures and processes. Using the formal processes and structures ensures the access and integration of knowledge among different functional units within the firm (De Luca and Atuahene-Gima, 2007). Past literature suggests that the use of KIMs enables a firm to internalize and reorganize what it has learned and to decide on how to use the new knowledge (De Luca and Atuahene-Gima, 2007; Hamel and Prahalad, 1994). In order to utilize embedded knowledge that resides within individuals or social groups (Badaracco, 1991), firms need to integrate knowledge into the NPD process. During the integration process, managers must decide what knowledge should be accessed, evaluate the importance, and explore the way to reconfigure knowledge (Zahra et al., 2000). Firms that neglect knowledge integration processes may fail to achieve product innovation (De Luca and Atuahene-Gima, 2007).

Knowledge integration capability

Grant (1996) proposed that integration capability is a key to organizational survival in dynamic environments. Knowledge integration capability refers as a firm's ability to perform repeatedly a product task efficiently, extensively, and flexibly. Grant (1996) identified three characteristics of knowledge integration capability: efficiency of integration, scope of integration, and flexibility of integration. The efficiency of integration refers to the extent to which the capability accesses and utilizes the specialist knowledge held by individual organizational members. The scope of integration refers to the breadth of specialized knowledge the organizational capability draws upon. The flexibility of integration refers to the extent to which a capability can access additional knowledge and reconfigure existing knowledge.

The Mediating role of knowledge integration capability

Previous study identified the positive effect of KIMs on new product performance. However, how does KIMs affect new product performance remains unclear? The resource-based view literature emphasizes that the development of a capability for generating knowledge from external resource is based on internal processes and routines that are organizationally embedded in managerial interpretations (Sharma, 2000). The process of collecting and transferring knowledge among individuals characterizes with ambiguity, and then increasing the likelihood that firms will develop suitable KIMs (Birkinshaw, Nobel, and Ridderstråle, 2002; Germain and Dröge, 1997).

Previous research indicated that integration of primary activities usually results in greater efficiency (Barki and Pinsonneault, 2005) because integration saves time, reduces errors, facilitates the coordination of activities, and reduces total inventory cost (Malone et al., 1999). In addition, integration improves cross-functional communication and synergy, which led to a higher innovation rate and greater new product success (Cooper and Kleinschmidt, 1986). By

building on its existing knowledge, firms can build a broader understanding of market and technological requirements (Marsh and Stock, 2006). As relative capabilities change, firm boundaries are adjusted accordingly (Langlois, 1992). In NPD process, the increase in a firm's knowledge integration scope enhances the positive impact on its new product performance. For example, Hoegl, Ernst, and Proserpio (2007) indicated that as team member dispersion increases, the team work positively and significantly affects team performance. However, a flexible integration, either through continually integrating new tacit knowledge or through constantly reconfiguring existing knowledge, is likely to impose substantial costs in terms of reducing the efficiency of knowledge integration (Grant, 1996). This study argues that as the use of KIMs may increase the integration efficiency, scope, and flexibility of a firm's capability, thus increasing the success of new product performance. This study proposes:

H1: Knowledge integration capability positively mediates the relationship between knowledge integration mechanisms and new product performance.

Product advantage

In the NPD literature, product advantage is considered a product's uniqueness and superiority relative to other products in the market on dimensions such as quality, benefit, and function (Atuahene-Gima, 1995; Calantone et al., 2006; Langerak et al., 2004; Song and Parry, 1997). Highly innovative products are more differentiated from competitors' product in the market and have and greater product advantage (McNally, Cavusgil, and Calantone, 2010). A number of studies have confirmed a positive association between product advantage and performance (Calantone et al., 2006; Gatignon and Xuereb, 1997; Li and Calantone, 1998). A meta-analysis found that product advantage is the most potent driver to new product performance (Henard and Szymanski, 2001).

The Moderating role of product advantage

Product advantage is considered to be related to product newness (Kleinschmidt and Cooper, 1991). Highly innovative products are usually associated with novel attribute, and customers may be perceived more favorable to the new product. Owing to the novel attributes of new products, innovating products may face high uncertainty to firms in the NPD activity. Other research suggests that the NPD process and its outcomes depend on the level of perceived uncertainty of the firm's decision makers (Capon et al., 1992; Zirger and Maidique, 1990). Uncertainty is related to managerial perceptions of business environment that is unpredictable (Dess and Beard, 1984; Milliken, 1987). Highly uncertainty makes sales forecasts and market trends difficult to monitor or predict (Celly and Frazier, 1996). Information processing theory suggests the need of different types of integration mechanisms depends on levels of uncertainty and ambiguous (Sicotte and Langley, 2000). Therefore, businesses operating in an uncertain condition are likely to have a greater need to use KIMs in order to facilitate the flow of information.

The higher the uncertainty that makes internal information transfer more complex, the more need to integrate and centralize in the strategy decision. Therefore, high unpredictable environment

may encourage the firm to engage in dialogue within the firm in order to identify opportunities and facilitate new product development. Managers perceive environment uncertain when they have difficulty to predict the direction and viability of future technologies or to monitor the changing needs of consumers' preferences for product and services (Rueda-Manzanares, Aragón-Correa, and Sharma, 2008). Integration capability helps the firm to develop new knowledge and generate innovations (Sharma and Henriques, 2005). According to the resource-based view, firms obtain competitive advantage not only through the generation of unique, heterogeneous, tangible or intangible assets but also via their ability to integrate and develop these assets as capabilities to achieve new product success (Amit and Schoemaker, 1993; Barney, 1991). Therefore, this study proposes:

H2: The higher the advantage of a new product, the more positive the mediating effect of knowledge integration capability on the knowledge integration mechanisms-new product performance relationship.

RESEARCH METHODS

Measures

Most scales for the constructs included in this study are available in the extant literature: existing measures are used or adapted to suit the purposes of this study. However, scale for knowledge integration capability does not exist from previous study. This study develop knowledge integration capability scale based on Grant's (1996) conceptual definition. These items are pre-tested through interviews with both academic researcher and managers. At each stage, participants are required to comment on the ease with which they understand the items. Where items are confusing, they reword or eliminate in keeping with questionnaire development guideline (Churchill, 1979). After incorporating suggested changes, pilot test is conducted. Each measure is addressed as follows.

New product performance is measured using a five-item scale that is adapts and refines scale from De Luca and Atuahene-Gima (2007), Langerak, Hultink and Robben (2004). This study uses the scale to assess the extent to which the firm has achieved the product development objectives on market share, sales, profitability, sales growth, time-to-market, time to break-even, and within budget. *Knowledge integration mechanisms* are measured by a seven-item scale that is adapted from De Luca and Atuahene-Gima (2007). This study uses the scale to assess the extent to which a firm uses a set of formal processes to capture and integrate knowledge. This study develops *knowledge integration capability* scale based on Grant's (1996) conceptual definition. This study defines knowledge integration capability as the extent to which a firm's ability to perform repeatedly a product task efficiently, extensively, and flexibly. The efficiency of integration is defined as the extent to which a firm's ability to access and utilize the specialist knowledge held by individual organizational members. The scope of integration refers as the extent to which a firm's ability to collect different types of specialized knowledge. The flexibility of integration refers as the extent to which a firm's ability to extending existing knowledge to encompass additional type of knowledge and reconfiguring existing knowledge into new type of knowledge. Product advantage is measure using a seven-item scale adapted from Song and Parry

(1997), Langerak, Hultink, and Robben (2004), and Atuahene-Gima (1995). This scale assesses the extent to which a new product is highly innovative, is superior to competing product, and offers unique benefits for customers.

In addition to the above constructs, this study includes five control variables to reduce the possibility of alternative explanations, and to lend weight to the analyses in the next section. Firm size represents the degree to which a firm has plentiful resources (Bonner and Walker, 2004). Firms may be more able to innovate when they have greater resources (Autio, Sapienza, and Almeida, 2000). This study, as with previous studies (e.g., Atuahene-Gima, 2005; Tsai and Wang, 2008), employs the number of employees as a proxy for firm size. This study also controls the firm age variable because younger firms tend to be more flexible, while older firms may develop a more rigid bureaucratic structure and encounter a competency trap (Gopalakrishnan and Bierly, 2006; Tushman and Anderson, 1986). Besides, this study also controls three types of e*nvironmental context* adopted from Jaworski and Kohli (1993) which is composed of technological turbulence, market turbulence and competitive intensity. The technological turbulence is measured by a five-item scale that assesses the extent to which a firm perceived that a technology in an industry was in a state of flux. The market turbulence is measured by a seven-item scale that assesses the rate of change in the composition of customers and their preferences. Competitive intensity is measured by a six-item scale that assesses the behavior, resources, and their ability of competitors to differentiate product in the market. All variables are rated with Likert scales ranging from 1 (disagree extremely) to 7 (agree extremely).

Sample and data collection

The sample is drawn from Taiwan's manufacturing firms. Survey respondents were personnel from R&D, marketing, or manufacturing functional units that have been responsible for at least one NPD project launched within the three years prior to data collection in Taiwan. Collecting data at the project level was consistent with earlier research efforts (Souder et al., 1998). Accordingly, all measures were specified on the project level. Initially, each subject was contacted by telephone to verify qualification of having launching new product less than three year from the date and then to solicit cooperation in the study. Managers were promised, as an incentive, a summary of the research findings. A package was then mailed out consisting of a personalized letter on university headed paper, a copy of the questionnaire survey and a stamped return envelope. A reminder letter send out two weeks later and another letter and package to those who still had not responded three weeks later.

Survey respondents were personnel from R&D, marketing, or manufacturing functional units that have been responsible for at least one NPD project launched within the three years prior to data collection in Taiwan. The respondent was asked to complete the survey with respect to the product development process in which he or she had been involved. Before answering the questionnaire, we asked respondents to identify one new product launched by their firm within last three years among all product lines. This new product then served as a referent for all questions pertaining to the firm's product development process. Respondents then answer each question item according to their experience and judgment on whether they agree or disagree with the statements in the question items.

Reliability, Validity, and Descriptive Statistics

Reliability was initially evaluated using Cronbach's alpha and item-to-total correlations. This study uses confirmatory-factor analysis (CFA) to verify the reliability and validity of the scales. Except for technological turbulence construct, all the multi-item measures demonstrate adequate internal consistency, with all producing alphas of 0.70 or more threshold for acceptable reliability. These results indicate that the measures are internally consistent (Nunnally, 1978). The composite reliability (CR) of each scale was calculated using the procedures suggested by Fornell and Larcker (1981). The CR values for the constructs ranged from .61 to .94, exceeding the acceptable level of .60 suggested by Bagozzi and Yi (1988). As a further check, the major constructs of the values for average variance extracted (AVE) exceeded the threshold level of .50 suggested by Bagozzi, Yi, and Phillips (1991). The significance of each standardized coefficient loading indicates convergent validity (Bagozzi et al., 1991). The CFA results show that each of the measures loaded significantly on its intended construct, indicating convergent validity in each scale. The square roots of the AVE for each construct are significantly greater than the off-diagonal elements (Hulland, 1999), meeting Fornell and Larcker's (1981) criterion for discriminant validity. The model shows that a comparative fit index (CFI) of 0.94, incremental fit (IFI) of 0.94, non-normed fit (NNFI) of 0.93, and the root mean square error of approximation (RMSEA) of 0.078, suggesting an acceptable degree of model fit. Table 1 shows the means, standard deviation, correlation, and square roots of average variances extracted in this study.

RESULTS

This study evaluates the proposed models using the Baron and Kenny's (1986) procedure to examine the mediation and using Muller, Judd, and Yzerbyt (2005) approach to examine the moderated mediation. Since the product term is usually highly correlated with its individual variable, the model estimations follow the straightforward procedure suggested by Friedrich (1982) to reduce or eliminate multicollinearity bias. Table 1 shows the result of mediation and Table 2 summarize the statistical results of moderated mediation.

TABLE 1 Mean, standard deviation, correlation, and square roots of average variances extracted

Variable	1	2	3	4	5	6	7	8	9
(1) New product performance	**.85**								
(2) KIMs	.39	**.81**							
(3) KIC	.42	.69	**.77**						
(4) Product advantage	.25	.41	.44	**.75**					
(5) Market turbulence	.42	.30	.41	.49	**.63**				
(6) Competitive intensity	.23	.14	.17	-.00	.44	**.65**			
(7) Technological	.30	.39	.25	.46	.52	.40	**.54**		
(8) Company Age	-.02	.01	.08	.06	.12	-.10	.00	N.A.	
(9) Company Size	.13	.04	-.03	-.28	-.11	-.08	-.09	.34	N.A.
Number of items	5	7	11	7	6	5	4	1	1
Mean	4.51	5.16	4.99	5.04	5.12	5.16	5.31	5.23	4.60
SD	1.20	1.13	1.03	1.09	.85	1.09	.87	2.07	1.73

Note: * The notations are interpreted as below, and used in the rest of this study: KIMs: knowledge integration mechanisms. KIC: knowledge integration capability. N.A. = not applicable.

** Square roots of average variances extracted are bold on the diagonal. The figures on the triangle elements are correlations among the composite measures (unweighted mean of the items for each construct).

In Table 1, the result in model 2 show that the coefficient estimate of KIMs is significant, indicating that KIMs has a positive effect on KIC. Furthermore, the results in Model 3 show that the effect of KIC on new product performance is significant and that the coefficient estimate of KIMs on new product performance is significantly reduced from Model 1. This results support H1, suggesting that KIC totally mediates the positive effect of KIMs on new product performance.

TABLE 2 Results of regression analysis for mediation

	Criterion: KIC		Criterion: NPP			
	Model 2		Model 1		Model 3	
Independent Variables	**b**	***t***	**b**	***t***	**b**	***t***
Firm age	.03	*(.86)*	-.06	*(-1.54)*	-.07	*(-1.73)*
Firm size	-.03	*(-.79)*	.12	*(2.51)*	.13	*(2.67)* **
Market turbulence	.33	*(3.54)* ***	.42	*(3.69)*	.35	*(2.96)* **
Competitive Intensity	.02	*(.29)*	.03	*(.34)*	.02	*(.29)*
Technology turbulence	-.19	*(-2.13* *)*	.02	*(.14)*	.06	*(.51)*
KIMs	.67	*(9.79)* ***	.27	*(3.23)* ***	.13	*(1.16)*
KIC					.21	*(1.93)* *
F value	23.43 ***		8.45 ***		7.94 ***	
R^2	.54		.30		.32	
Adjusted R^2	.52		.26		.28	
ΔR^2	.37		.06		.02	
F change	95.78 ***		10.43 **		3.73	

*p < .05; **p < .01; ***p < .001 (one-tailed test for hypotheses, and two-tailed test for control variables).

Notes: N = 128. b = standardized path coefficients. *t* = t value. NPP = new product performance. KIMs = knowledge integration mechanisms. KIC = knowledge integration capability.

In Table 2, the results from Model 1 indicate an overall effect of KIMs on new product performance (β_{16} = .26, p < .01), but that of the product term of KIMs and product advantage does not achieve a statistical significance (β_{18} = .01, p > .05). This satisfies the necessary condition required for a moderated mediation examination. Next, Model 2 presents a significant coefficient estimate of KIMs (β_{26} = .62, p < .01), Model 3 indicates that the coefficient estimate of the KIC × product advantage interaction is significant (β_{26} = -.21, p < .05). Taking these statistical results together, the results support H2, suggesting that KIC have a mediating effect on the link between KIM and new product performance and that this mediating effect is affected by product advantage. Previous research suggests that merely inspecting the signs and magnitudes of regression coefficients is usually insufficient for a moderation (contingency) hypothesis (Schoonhoven, 1981). Hence, this study further performed post hoc analysis to examine the nature of this interaction using the Aiken and West (1991) procedure. Results of post hoc analysis reveal that the mediating effect of KIMs is stronger when product advantage is low (β= .27, *p* < .01). In contrast, when product advantage is high, the mediating effect of KIMs remains the

same (β= -.01, p > .05).

DISCUSSION

Summary

This paper seeks to advance the marketing and innovation management literature by untangling the relationships among KIMs, KIC, product advantage, and new product performance. The results show that KIC completely mediates the relationship between KIMs and new product performance, and this mediating effect is strong when the level of product advantage is low.

Contributions to Scholarship

This research contributes to extant literature in the following ways. First, previous study suggested that new product performance is enhanced by KIMs (De Luca and Atuahene-Gima, 2007; Ruekert and Walker, 1987); this study deepens the current literature by providing a completely mediating factor of knowledge integration capability which leads the effect of KIMs to reach new product success. In other words, the success of knowledge integration can be attributed to the increase in integration capability. Second, this study further demonstrates that such an effect varies with the level of product advantage. The findings of this study show that KIC play an important role for utilizing KIMs in the NPD process to achieve new product performance, and further show that when product advantage is low, a product's uniqueness and superiority relative to other products in the market is not particularly obvious; firms utilizing integration mechanisms in the NPD process possess high integration capability of innovating product, thus producing higher innovation performance. On the contrary, when product advantage is high, the mediating effect of knowledge integration capability remains the same. These findings imply that for it is especially important to fertilize the integration capability for developing less innovative product.

Applied contributions

The finding of this study demonstrates that it is not integration mechanisms itself but integration capability to achieve new product success in a NPD process. It indicates that the use of KIMs is not a sufficient condition for product innovation but the integration capability is the key driver of product innovation. Managers who encourage the use of KIMs but do not focus on the increase of integration capability will not achieve new product success. In the other way, the finding of this study show the mediating effect of knowledge integration capability is especially useful for products with less superiority to other product in the market in the NPD activity. For those firm developing less innovative products, managers should deliberate the use of KIMs to make progress on integration capability to achieve new product success.

Limitations and future research directions

This study attempts to discover some fundamental ideas among knowledge integration mechanisms, knowledge integration capability, product advantage, and new product performance.

However, any conclusions drawn from this study should be viewed in the context of its limitations, and should also be extended in future studies. The results of this study have three main limitations that also offer opportunities for further research. First, this study examines the relationships with a cross-sectional data. The results of this study may not accurately portray firms' long-term product performance. Future study may use a longitudinal research design and assess actual performance with the data from company records. Second, the generalizability of these findings is limited because these findings are based on a sample of Taiwanese manufacturing firms. Future study should be validated in detail in other contexts. Third, this study merely examines product advantage as a moderator in the stated relationship; however, there are other possible moderators affecting the relationship.

ABSTRACT

Purpose *The objective of this study is to construct the procedure of business case analysis for rapid productisation. The paper studies the practice of business case analysis to aid collaborative decision making between product management and sales management.*
Design/Methodology *The research is qualitative and constructive in nature. We studied relevant literature and conducted an exploratory case study. Primary data was collected by semi-structured interviews. Business case analysis procedure for rapid productisation is constructed based on the literature study and the interview data analysis.*
Findings *A state of the art practice of analysing rapid productisation opportunities is described. Such an analysis includes estimating and calculating revenue and costs, and checking strategic fit. Especially it includes considering the importance of the customer and the sales case in the revenue side, and project cost and resource reallocation cost. In addition, cost structure and market potential are estimated for the items that decided to include into global portfolio.*
Originality/Value *This study provides insight of the co-operation between sales, R&D and product management in building business case for rapid productisation. The results of the study are applicable for benchmarking similar industrial practices. The study contributes to the research of order delivery process and new product development in the area of rapid productisation.*

Keywords: Business case analysis, productisation, rapid productisation

INTRODUCTION

To succeed in competition, companies need to offer products and services which meet the diverse needs of customers and market (Ulrich and Eppinger, 2008; Henard and Slymanski, 2001). An efficient way to provide wide product portfolio is mass customisation, which relies heavily on configurable and modular products (Hvam et al., 2008; Kratochvi´l and Carson, 2005). However, needs may evolve and new opportunities rise after products are launched. In case of modular product structure, companies could respond by changing or redesigning product modules on the fly. The context of this study is limited to the process of introducing

that kind of changes in existing products to serve sales and order-delivery process. The focus of the study is in business case analysis for such rapid productisation.

Business case analysis is common practice for analysing and defining potential investments (Keen and Digrius, 2002; Randall et al., 2012). Its main goal is to demonstrate, in a rational way, the true business value of potential investment. According Keen and Digrius (2002) business case analysis describes business reasons why or why not specific investment options should be selected. Ultimately, productisation is driven by intent to create successful products and profitable business. The same drivers must be employed in business case analysis for productisation (Kinnunen et al., 2011).

Rapid productisation is widely utilised industrial practice especially in business to business companies. Typically, managers describe rapid productisation as an ad-hoc procedure which may disturb other business processes but is necessary for satisfying a customer and getting a new order. Compared to incremental product development (e.g. Gautam and Singh, 2008), rapid productisation as a customer-initiated and sales-driven process comes up unexpectedly, necessitates fast reaction and decision-making, and may not necessarily settle on the product portfolio. The more systematic procedure for rapid productisation could provide benefits and even competitive advantage for some companies (Hanninen et al., 2013). Literature does not recognise any holistic framework to recognise and analyse opportunities of rapid productisation. This clearly indicates a gap between literature and practice.

The aim of this study is to construct a framework and procedure of business case analysis for rapid productisation. The aim is divided to two research questions:

RQ1: *How does business case analysis for rapid productisation differ from the analysis for new product development?*

RQ2: *How should business case be constructed in rapid productisation?*

To fill the gap in literature the research questions will be answered by an exploratory case study. At first, relevant literature was studied in the fields of productisation and business case analysis to synthesise the theoretical frame for the study. Then, the case study was designed and primary data was collected by interviewing industrial experts involved and interested on this area. Then the data was analysed and the findings were discussed. Finally, we conclude the study by summarising the main results and findings. In our study, literature creates the framework but research questions are finally answered through empirical data.

LITERATURE STUDY

In a simplified matter, each product goes through two types of processes during its lifecycle; the product process and the order-delivery process. The product process includes new product introduction, product development, product maintenance and marketing processes while the order-delivery process consists of five phases: sales, procurement, manufacturing, delivery and service or maintenance (Saaksvuori and Immonen, 2008). The product process, the product creation process and the new product development process are concerned as synonyms with the productisation process in this study. Productisation is understood as a commercial function by which a company creates and updates its offering to respond a market opportunity and need. While the essence of any product is to satisfy customer needs or solve a customer problem, the purpose of productisation emphasise creating a tangible,

repeatable offering which is efficient to produce and deliver and easy to sell, buy and use (Hietala, 2004; Simula, 2008).

The concept of rapid productisation is not yet well established in literature. Thus the definition of rapid productisation requires critical examination from two different process viewpoints. At first, the productisation process defines, designs and develops new products to the product portfolio (Ulrich and Eppinger, 2008). Secondly, the order-delivery process which defines how individual products are sold, manufactured and delivered to the customer, and maintained after sales (Chung et al., 2007; Saaksvuori and Immonen, 2008). Within this viewpoint, it may be beneficial discuss about stock and delivery items instead of products in general.

Business case analysis in new product development

New product development (NPD) is a key process for companies in seeking business success. Strong business-orientation is very apparent in NPD literature for example through gate criteria (Carbonell-Foulquie et al., 2004; Hart et al., 2003; Ronkainen ,1985). Typically, the starting phase of an NPD process is employed to both screen out the ideas with weak business potential and prioritise ideas with strong business potential. For example, Cooper (2001, 2007) describes the first NPD phase as scoping which contains preliminary market, technical and financial assessment as well as a rudimentary quick check of the business rationale and financial prospects of the project. Similar issues may be checked preceding the formal NPD process. Koen et al. (2001) proposes business case development during front end of innovation based on estimates of market potential, customer needs, investment requirements, competitor assessments, technology unknowns and overall project risk.

Business case is prepared during early phases of NPD to aid decision-making whether to invest resources for a development project (Otto and Wood, 2001). According Cooper (2001) the business case has three main components:

1) *Product and project definition*. Whom the product will be targeted at and what the product will be? Define benefits, features, and design requirements of the product.
2) *Product justification.* Why should a company invest in a project? It includes a review of financial, profitability and risk considerations. Also nonfinancial considerations, such as strategic rationale, competitive advantage, leverage and market attractiveness, should be included.
3) *Project plan*. How and by whom the path from development to launch is taken? It may be formulated as a critical path plan including schedule, the launch date and required resources – money, people, and equipment.

An important precondition for business case analysis is the existence of past financial information or analogous product data. Otherwise, the data must be extrapolated from a similar or analogous product, or rough estimates of product layouts. The cost data must be established considering the marketplace: e.g. unit costs and sales volume curves, dependence on other products or systems of the customers. (Otto and Wood, 2001).

Business case analysis in new product development may be too laborious and extensive to be used in rapid productisation. All the required data for different business case elements, namely market assessment, technical assessment, strategic fit and financial analysis, might

not be available or not relevant (Kinnunen et al., 2011). For example, rapid productisation does not include thorough technical assessment because totally new technologies are too risky to productise rapidly, uncertainties must be manageable and technical solution must be defined quickly. Market assessment for rapid productisation is more sales-driven excluding a thorough market study. However, customer value may be evaluated similarly, and potentially market assessment provides similar outcome data. Strategic fit must be straight-forward to check quickly in case of rapid productisation. Finally, financial analysis is quite similar in both cases since it includes calculating and synthesising financial value into few key business performance indicators, such as return of investment (ROI) and net profit.

Instead of NPD business case analysis, rapid productisation business case analysis may be more similar to business consideration during the front end or the very first phase of NPD process. E.g. Cooper (2001) defines that as scoping phase which includes issues such as to check any market prospects, potential and requirements; technical feasibility, solutions and risks. Still, NPD literature does not provide any means to analyse a sales case or evaluate an order from either a customer or a company viewpoint.

Order delivery process and rapid productisation

Companies' current customer order point (COP) and order delivery process set the context for rapid productisation (Hvam et al., 2008). Rapid productisation does not fit all kind of delivery modes. In case of engineer-to-order delivery mode, all delivered products are productised or tailored for customers and rapid productisation is not a necessary option. In contrary, the make-to-stock delivery mode focus on efficient operations with existing stock items excluding any new specifications for orders (Chung et al., 2007). Thus rapid productisation is not a meaningful option for companies which current delivery mode is make-to-stock. Nevertheless, rapid productisation fits for the companies that have adopted modular product structure and use the configure-to-order delivery mode. In that mode products are built from standard parts and modules, and possible variants are specified by a configurator according predefined configuration rules (Hvam et al., 2011). If available configurations do not satisfy customer rapid productisation can be initiated to redesign or change existing modules to meet customer needs. In addition to productisation challenges this is an exception case for sales and current order-delivery process.

From order delivery process viewpoint, rapid productisation cases could be processed by order partitioning and hybrid mode of product delivery (Rafiei and Rabbani, 2011) or by bringing forward the customer order point (COP) from the current mode of delivery, e.g. from variant selection to configure to order (e.g. Hvam et al., 2008) Each order which include rapid productisation increases product variety from the order delivery viewpoint. Increased variety may be necessary to keep customers satisfied and to increase sales. However, it may disturb the normal order delivery process and include hidden costs related to the process. Thus, complete picture of the costs and benefits of variety should be known to assess the true profitability of rapid productisation (Ward et al., 2010) An example of case evaluation including order delivery process issues, namely variety cost-benefit calculator, is described by Ward et al. (2010).

METHODOLOGY

This research is a qualitative case study in nature. The study applies an explorative and constructive research approach. The research process is illustrated in figure 1.

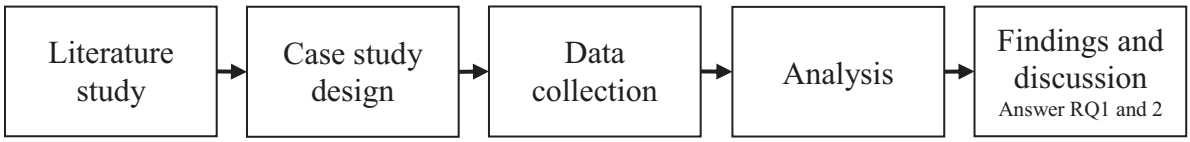

Figure 1. The research process

Case study design included creating a semi-structured interview questionnaire. The questionnaire was sent in advance to the interviewees to aid their preparing. The data was gathered through semi-structured interviews. Seven highly-experienced business managers engaged to rapid productisation were interviewed in six different companies. Interviews were recorded and transcribed to ensure thorough analysis. The transcriptions and interview summaries were sent to the interviewees to correct any misunderstandings. The interview data was collected during August 2011. In addition to the interview data and literature study, also secondary data was collected including business case documentations in two companies, discussions with experts and meeting minutes.

The interview data was analysed to provide a picture on rapid productisation business case in general and piece-by-piece as perceived by company managers. The secondary data sources were used to enhance understanding, support analysis and validate findings.

RESULTS AND ANALYSIS

The results are described by presenting relevant excerpts from the interview data. Table 1. provides managerial perceptions on business case in general and go through in a more detailed way one of the key issues of any business case that is named as profitability analysis.

Table 1. Managers' perceptions on business case and profitability analysis

Issue	Excerpts from interview data
Perceptions on business case	A) *"It is a document" – " Combined with an offer business case indicates an acceptable price"* B) *"Business case becomes after calculating monetary value. Otherwise it is a mere case."* *"It is an analysed and documented team effort to aid managerial decision making"* C) *"Business case is a payback plan." – "Business case is done for the company in collaboration between a product manager and a sales representative. Sales intend to make a deal and their task is to calculate break-even point of a sales case. Product managers intend to create a commercial product and their task is to consider business case for the solution.* D) *"Business case consists of two sections: sales plan and cost plan. Sales plan includes product sales during its predicted lifecycle and impact on sales of other products. Cost plan includes costs "* E) *"It is a justification for why to initiate a case. They are used for prioritisations."*
Profitability analysis	A) *" As a part of price determination, profitability is a type of NPV (net present value) calculation " – "A customer variant is not always profitable. It may be necessary to make it in order to win a big deal where the benefit comes standard blocks."* B) *"Profitability assessment depends on the size of the project and the customer." – "Calculation can be based an internal price compared to the invoiced price and related costs."* C) *"For customer variant requests we have a good formula for calculating cost of changes and implementation lead time." – "Finance and Control organisation provides manufacturing cost and total cost of products." – "In negotiations the profitability is calculated quite efficiently by Sales Simulation system which collects fact-based information from different places."* D) *"Globally defined, cost-based transfer prices are the starting point for pricing by a sales team."* *"Depending on the state of negotiations, certain products may take a loss and certain products may make profit in the same deal. Finding out the profitability of an individual deal, sales item or product in the global business may be challenging."* E) *In that case, a sales representative assesses whether marginal income is adequate. Typically it is very short profitability analysis focusing only to the project in hand."* F) *"It is a pretty basic business thing to consider the expenses and income."*

Managers perceive business case as

- being a document and justification for the case
- aiding decision-making
- including essentially calculation of monetary value

The perceptions on business case are quite consistent with our findings from literature. Instead, profitability analysis seems to vary more from a company to other. This may illustrate the fact that rapid productisation concerns different kind of changes in different products. An interesting point is the co-operation between sales representatives and product management. They may form a core team related to business case analysis in rapid productisation.

The relevant quotations on delivery capability and product portfolio consistency issues are presented in Table 2.

Table 2. Business case issues related to rapid productisation

Issue	Excerpts from interview data
Delivery capability	A) *"Delivery organisation is responsible for deliveries. Assessing team has always someone involved from that organisation."* B) *"It is left for the project manager's or team leader's shoulders."* C) *"There is a clear process for that in case of a variant request." – "If a request concerns a case of not having ability to deliver, the process is bypassed and relevant teams are assigned to consider how to deliver."* D) *"Practically, ability to deliver means three issues: purchasing, logistics and manufacturing capability. In case of new third party item, the owner of the product must be found to discuss how to deliver." –"At worst, it is not verified when a deal is agreed."* E) *"It is assessed as a collaboratively by a business consultant and a sales representative. Of course they discuss with R&D and project team consider is it realism to get that capability."* F) *"Capacity is an issue which must be considered especially in SMEs"*
Consistency with product portfolio	A) *"The aim is to build an individual commercial product"* B) *"It is very important also in customer-specific applications to make as generic solutions as possible." – "There must be some policy to manage this."* C) *"It has to be completely in line with our product portfolio." – "Global product and its variants are always managed same way from the viewpoint of product hierarchy and product lifecycle management."* D) *"Product master data and portfolio structure data determine its compatibility rules. Which similar products this is compatible with and how it can be combined with other products."* E) *"It is an informal activity and there are not supporting processes."* F) *"Generally, there are many business issues to consider of what to include in the portfolio. Does the existing product structure provide possibility to combine a solution for the problem or market?*

Delivery capability is a crucial element behind a credible business case analysis for rapid productisation since the customer is expecting to know the delivery time. Nevertheless, the research data indicates that it may not belong to the analysis. Thus, delivery information may be provided by a separate delivery capability analysis or delivery project plan. Consistency with the product portfolio instead seems to be an essential part of business case analysis that must be included.

Productisation has strategic role in most companies, and product creation includes always risks. Table 3. presents quotations on these nonfinancial considerations.

Table 3. Strategy and risk considerations in rapid productisation

Issue	Excerpts from interview data
Business strategy	A) *"Assessed by business leaders."* B) *"Short-term and long-term key areas where the focus and which things are emphasised right now. Of course things come from customer interface, but the decisions are made at the top."* C) *"Strategy must be clear in terms of whether to make new variants or not." – "In most cases strategy consideration is not relevant but there may be cases where strategy affects very strongly."* D) *"Is the business strategy only to have a global product portfolio or also how much is local productisation allowed?" –"Business strategy belongs to senior management"* E) *"Subcontracting is a relevant option if a request is out of strategic scope."*
Risk analysis	A) *"Risk analysis is part of the sales process and depends on the size of client. Sales representative must be able to justify why the client is worth of investment."* B) *"For example, delivery risks are analysed e.g. possible component delivery problems." – " The account process includes risk analysis to clarify the financial standing of a client."* C) *"The normal risks which relates to productisation and running business. Profit risk - Is the cost structure of product known to determine the correct price? Is it known from where the product is sourced, who does supply it and how it is delivered? Also warranty issues, e.g. hardware service and associated costs. "* D) *"Project team is primarily responsible for risks and delivery."* E) *"Risk related to a possible partner. In principle, all the basic business risks."*

Strategic discussion has at least two levels related to rapid productisation. In the higher level, rapid productisation is either decided to accept or not as a business practice. This must be clear for sales representatives. In the lower business case level, strategic fit need to be considered with each rapid productisation business case. A common understanding seems to be that mostly the strategy is not an issue in business case analysis but potentially there may be cases where it is a crucial issue. Strategy consideration may affect strongly to the portfolio analysis, without strategic fit the case may never end up to the portfolio.

Although risks are always present in productisation, the research data indicates that they may not belong to the business case analysis as an individual element. Business case itself can be seen as a tool to manage business risks since it predicts business consequences of the case including cost and revenue estimations.

FINDINGS AND DISCUSSION

Business case is such a generic concept which any business-minded manager can produce, understand and utilise in decision making. Typically, business cases analysis practises are applied for the company specific needs and the practises vary a lot e.g. the level of formality,

is it personal or team effort etc. Some companies consider their analysis practise even as a source of competitive advantage since it potentially helps selective decision-making and succeed in setting profitable price level. Business case analysis as a systematical procedure is motivated by an intent to know true business value of potential investment. The procedure includes gathering relevant and trusted data, analysing the data in rational way, calculating predictable business consequences and synthesising the results to the formal business case document. This kind of procedure ignores personal, managerial and orgasational relationships as well as cultural issues which, in turn, may affect strongly to actual analysis in companies. Table 4. illustrates how does business case analysis for rapid productisation position itself in relation to the responding analysis for new product development.

Table 4. Business case analysis for rapid productisation in relation to the analysis for NPD

Content similarities	**Content differences**
- Necessitates development project plan - Analysis of item cost structure / unit cost - Financial assessment / calculations - Market potential analysed if the item is included in portfolio	- Strategic fit is mainly connected to the portfolio decision - Start from a customer-specific need
Included only in RP business case	**Lacking from RP business case**
- Include evaluation of sales case and of customer ship - Need to analyse whether to include to product portfolio - strategic fit	- Technological uncertainties out of scope - No delivery capability creation cost (utilises existing delivery capability and supplier base) - No competitor assessment

In the context of rapid productisation, business case analysis is quite straightforward. Explorative and constructive research approach enables to outline the principal logic and main issues: cost analysis; revenue estimation and strategic fit, for the procedure based on the research data. In Figure 2, we provide an illustrative example of business case analysis procedure for rapid productisation. However, adopting the procedure necessitates careful consideration of the organisation specific and type of business needs.

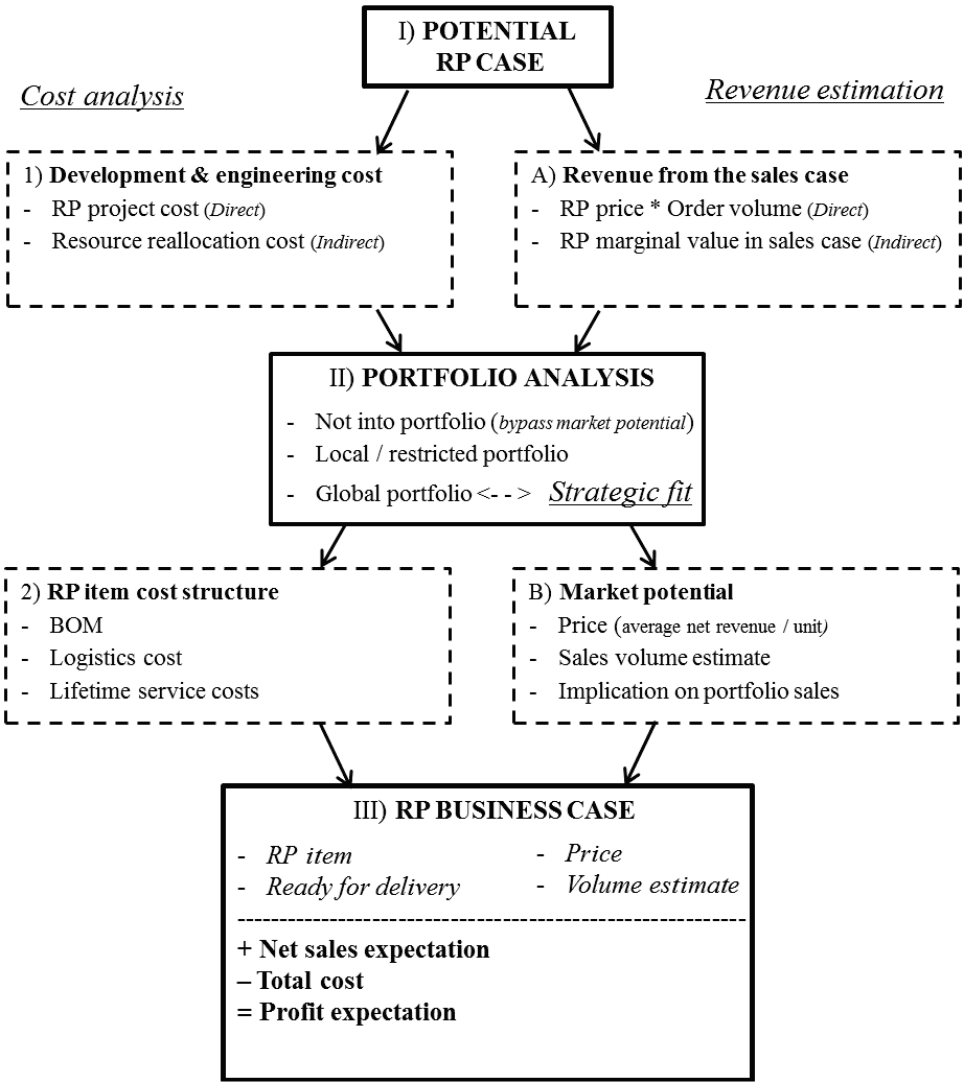

Figure 2. An illustrative example on business case analysis procedure for rapid productisation

In rapid productisation decision-making is culminating in two points: 1) whether to carry out a potential RP case or not, and 2) whether to aim rapid productisation (RP) item only at one customer or at the portfolio. The example procedure flows through two phases. In the first round, a potential RP case is roughly analysed as a RP project to clarify related development and engineering costs. Based on the first-round cost-revenue comparison, the case can be either eliminated or analysed further from portfolio viewpoint. Analysis continues if the RP case includes strategic fit and is aimed at the portfolio. In the second round market potential of RP item is evaluated by predicting sales window and estimating price level and development time, sales volume and impact on portfolio sales. Similarly, the cost structure of RP item from operations and lifecycle viewpoint need to be clarified and calculated. Finally, the estimates from first and second rounds are further synthesised as business case document which by its nature is aiding decision makers to decide whether to carry out the RP case. In case the decision is to carry out rapid productisation, business case serves sales representatives with customer communication, RP project team and product management, and RP item owner or product manager in business planning.

Seldom companies may face exceptional rapid productisation cases which have very strong impact to the strategy, either as a threat or as a new opportunity. In general, business strategy just guide whether rapid productisation is seen as an acceptable business practice. Productisation carries always risk and business case analysis assists to manage business risks. Risk is present through all the elements and it is not a separate analysis element. Only potential warranty costs include a clear risk that is priced. The warranty costs are associated with lifetime service costs. Risks could be taken into account by calculating different cost and market scenarios (e.g. Otto and Wood, 2001).

Business case analysis drives management to make well-informed decisions. A good question to be discussed is how much effort one should put on business case analysis for rapid productisation. It is challenging task to recognise the trade-off point after which more information would not anymore change the following decision. Furthermore, it is always possible that a strong business case does not lead to success and a weak business case would do. To summarise, analysis, estimation and future prediction includes always risk.

CONCLUSIONS

Many companies are demanded to offer wide variety of products and services to meet the diverse needs of customers and market. Evolving needs challenge companies' capability to react quickly enough. Rapid productisation can be used to changing or redesigning product modules on the fly to serve sales and order-delivery process.

New product business case analysis is clearly more extensive than the analysis for rapid productisation. For example technological uncertainties, competitive assessment and delivery capability creation cost are not included in business case analysis for rapid productisation. In turn, business case analysis for rapid productisation includes sales case analysis and portfolio analysis which are not part of NPD business case.

Business case of rapid productisation is constructed through revenue estimation, cost analysis and portfolio analysis activities according to our case study. In the first phase sales case is evaluated to estimate the revenue, and project and engineering cost is analysed. In the second phase, if the rapid productisation aims at product portfolio, market potential is analysed to estimate the total revenue, and cost structure of RP item. Finally, all the information and data is synthesised into a business case document which include essentially profit expectation and such RP item basic data as price, ready for delivery date and volume.
The results of this are applicable at least for companies which currently apply the configure-to-order delivery mode. Our business case analysis procedure is limited to RP cases which can be as an individual item which may have own business plan. Results of this exploratory case study are not general but need to be applied to the company context considering especially used delivery mode and customer order point. Sales representatives, product managers and researchers interested in productisation may find our findings as benchmark object and could further validate the results in their contexts. Further research would include how to recognise the trade-off point after which more business case information would not change the following business decision.

ABSTRACT

Purpose: *In this study, an overall framework for green marketing strategies is presented. The framework shows all green marketing strategies influencing customers' purchasing intention. This paper also stresses that certain green marketing strategies are independently influencing the purchasing behaviour and some are dependent on other factors namely the brand positioning.*

Design/methodology/approach: *This paper examines the constructs of green marketing strategies to identify how customers are convinced to purchase green products in Malaysia. As one of the marketing strategies is reliant on brand positioning, the existing theories such as the Elaboration Likelihood Model (ELM) and the Affect-Reason-Involvement (ARI) are referred. This paper constitutes the quantitative results of customers through questionnaires with the size of 400 respondents. The questionnaires were analysed using AMOS version 20.0 which is a structural equation modelling solution for marketing research.*

Findings: *This study is expected to distinguish the influence of the green marketing strategies components on customers purchasing intention. By doing this, the prominent green marketing strategy in determining customer decision making is highlighted. Thus, a new direction for green product marketers focusing on customers' intention to purchase is established.*

Research limitations/implications: *Lack of green knowledge towards green concepts due to different locations and cultures among customers may be problem encountered during this study. This is a fundamental implication to this study especially in Malaysia as it has various ethnicities.*

Originality/value: *This paper presents all the green marketing strategies together with related brand positioning factors in determining the customers' purchasing intention. Thus far, the existing researches only feature these strategies as factors impacting customers' decision in purchasing green products. However in this work, the appropriate green marketing strategy in deciding customers' behaviour is indicated.*

INTRODUCTION

From the past decade, environmental issues have been given much attention globally. Many researchers, academicians and practitioner have contributed and are still working to solve and improve the environmental issues. Besides that, the awareness of environmentalism has lead to green product decision making. Mc Kinsey in 2007 stated that people around the world from France, China Greece and U.S has continuously support the green products which cited by (Sanzero 2009) (Rylander 1993) (Sirgy 1991) . In certain countries customers are willing to pay more for products provides value for them due to different product positioning.(Cathy J. Cobb-Walgren 1995). In Malaysian context, hypermarkets and supermarkets such as Tesco and Carefour also have turned their business strategies by supporting environmental preserving activities. Among the commonly practiced activities in these stores are "No Plastic Day" on every Saturday and providing recycling items collection bins to increase the awareness of consumers while participating in the global interest of preserving the environment. (Mohd Helmi Abd Rahim 2012). Green positioning is defined as a subset of attribute, benefits and environmental values that convinced green customers to be loyalty over green products(T.Vukasovic, 2011)(Patrick Hamann, 2005). Green customers refer to individuals that buy products with high environmental conscious and knowledge(Ricky Y.K. Chan, 2000).Overtime as more customers switch on to green products, there is an argument on the subject of types of positioning; functional attributes and emotional benefits which have become obsolete. (L. J. Shrum 1995) .This situation occurs as customers only focus on green products that give immediate impact for them rather than being loyal to it. (Oliver 1999). Even though there is a negative rumor about traditional types of product positioning, these product positioning has to be taken into consideration as a basic foundation to identify customer attitudes and behaviors.

The purpose of this study is to identify the effect of green positioning strategies (functional attributes and emotional benefits) towards product attitudes and customer's intention to purchase. The recent study contributes to the future literature along with understanding of the effectiveness of basic green product positioning and the relationship product attitudes and purchase decision.

In the next section, the related studies on functional attributes, emotional benefits, product attitudes and intention are clearly conversed. Next, the research methodology which emphasized on methods, sample and data collection and following by structural model analysis and finally discussion, conclusion, limitation and future direction.

LITERATURE REVIEW

Functional Attributes

From the empirical studies by past researcher, functional attributes is defined as a device that provide information about the products and intangible tools for promote the green products for customers. (Patrick Hartmann 2005) The definition of functional attributes is consistent with the prominent theory and justification of personal satisfaction; perceive value to the products, physical justification, usage effectiveness and reliability which lead to build brand names for

organizations in the society. (A. Belén Del Río 2001) Researchers in the green literature examined the role of functional attributes or in other words "utilitarian" serve the customers with an effective informational marketing which indirectly create the beliefs toward the product or brands. (Sirgy 1991)

Emotional Benefits

Symbolic benefits or value- expressions defined as a transformational advertising segment highlighted on creating “characteristics” for the brands with a specific objective. (Sirgy 1991) Such conceptualization of emotional encompasses tendency of green product benefits through image basically react as a mediator over customer's cognitive process and the likelihood of green products(Keller, 1993)(Woon Bong Na, 1999) .In recent times however there is a strong argument by Lisa especially role of emotional benefits which is just for build a brand image and reputation and not really focus on quality. (Wood 2007)

Product Attitudes

Product attitudes defined as a subset of correlation between beliefs and values of customer's behavior towards different types of green products in the business market. Product attitude has been classified into different dimension with the principle of rising customers attraction on green products.(Syed Saad Hussain Shah 2012) The structure of product attitudes in green products induces by environmental consequences and individual consequences as main parameters which indirectly support the customers purchase intentions. This favorable relationship between the parameters and product attitudes are likely to foster future customers purchasing intention, which is based on brand positioning ((T.Ramayah, 2010). In several big companies, product attitudes will responsible to connect marketing strategies such as “story telling” to enlarge the understanding of the product and services offered. In fact, it has the capability to change customer's memory and create the desire to purchase (Hung Chang Chiu, 2012) However in this study, its represent as a mediation between independent variables (functional attributes and emotional benefits) and dependent variable (intention to purchase).(Scott B Mac kenzie, 1986)(Andrew A. Mitchell, 1981) (Iman Khalid A.Qader, 2010)

Functional Attributes - Product Attitudes

The impact of functional attributes as a super ordinate product positioning factor instantaneously influences customers' purchase intention on green products which manifest from positive motivation (M Joseph Sirgy, 1991). Some studies have stated that value and quality such as price, features of product is the main indicator to determine the customers understanding of green product concepts (Jin-Soo Lee, 2010). Normally in some environmental companies, if there is a lack of functional attributes the number of customers that have been loyal is also affected. However, companies fail to create an impact on customers, as imitation is the main barrier of using functional attributes compared to emotional benefits. (Heesup Han, 2011)

Emotional Benefits -Product Attitudes

Classic theories basically stress the chaining effects between customer behaviors and purchase intention. Different dimensions in past theories lead to existences of different personality such as sincerity, capability and enthusiasm towards green products(Aaker 1997) .Real nature and feeling towards the product attitudes is emotionally effect the customer purchase intention(Patrick Hartmann, 2008)(Sirgy, 1982). In one articles by J.J Gross, he explained that, this personality or behavior is derived from the signaling theories which aligned with emotional cues. It's actually a process that functions as an instrument that transforms the level of behavior in mental cognitive. The Antecedent - Response -Focused -Emotional Model in 1998 is a clear example to understand emotional cues and behaviors (Gross, 1998).

Product Attitudes – Intention

Although there is a common confirmatory between product attitudes and intention to purchase, the key area that significantly influences the product attitudes is customers' brand attachment. The review of literature point out that, product attachment behavior such as feeling and positive images is the key implication that creates customers attitude towards green products and influences to intention to purchase (C.Whan Park, 2010) (H.Bui, 2005). Apart from that, numerous researchers and practitioners also have emphasized the effectiveness of demographic profile such as age and education towards purchase intention (Abhishek Dwivedi, 2012)(Heesup Han, 2011)(Zakersalehi, 2012). For instances, customers who have knowledge about the importance of environmental issues, is easily engaged with the green products compared those with conventional products. In modern research, researchers have started to focus on the degree of involvement likelihood in green products in other terms researchers are paying more attention to customers' product attachment. Therefore, the higher the involvement in the green products, the higher the involvement likelihood will be. (Jung - chae Suh, 2006)

Hypothesis Development

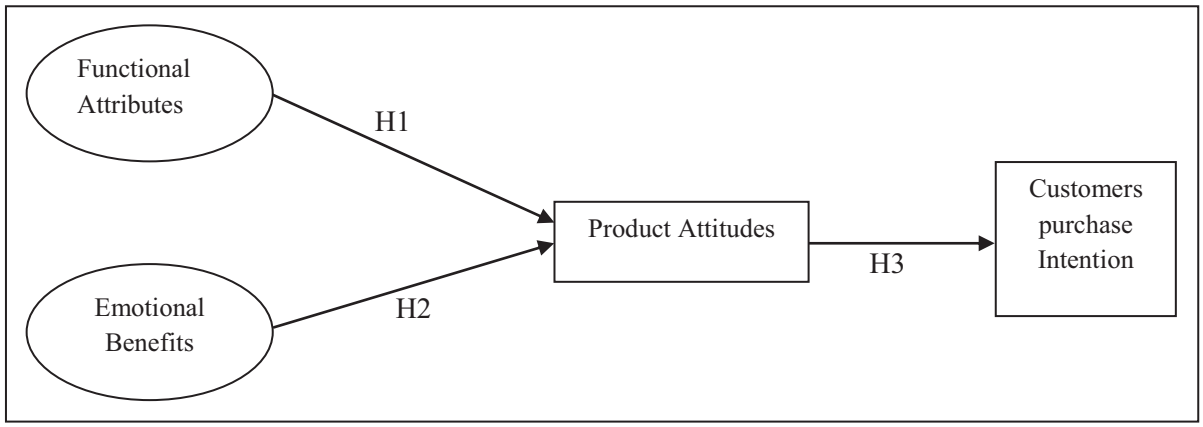

Figure 1: Proposed Research Model

Hypothesis

H1: Functional attributes have positive effects on product attitudes
H2: Emotional benefits have positive effects effect on product attitudes
H3: Product attitudes have positive effects on purchasing intention

METHODOLOGY

Method

In this confirmatory study, a self - administered questionnaire was used on a scale used in previous studies. The sampling frame consists of green product positioning and market strategies towards customers purchase intention. In this study, Giant and Econ Save are the two stores selected as location to conduct the survey. These stores are selected due to the high density of customers' frequencies in visiting these stores. Normally this self administered questionnaire is better compare to other survey instruments. This questionnaire has the ability to reduce the acquiescence and dis-acquiescence bias. All items used are base on customers' perspectives and their response towards green products. The questionnaire consists of 10 items on customers product positioning (functional attributes, emotional benefits and product attitudes) and 4 items on purchase intention of customers towards green products in supermarkets. All items are measured by using the 5-Likert scale ranging from 1 -5 denoting strongly agree to strongly disagree.

Sample and Data Collection

The population for this study is consists of customers in the Giant and Econ save supermarket, which considered as among the top visiting supermarket by Malaysian peoples. The respondents for this study are 500 and after excluding all the respondent bias and unusable responses a total of 200 questionnaires were used for this analysis. Thus, the accepted response rate for this study is 40%. A part from that, there is no limitation for the respondent or even any criterion for them to answer the survey. The respondents have pick up randomly to make the questionnaire easier to answer.

RESULT

Measurement model

Based on finding in this study, structural Equation Modelling (SEM) using AMOS software version 20 is the best method to get the accurate output for exogenous and endogenous latent variables. Some of the prior studies also stressed the measurement of research model is basically identify through the construct reliability, convergent validity and discriminant validity.

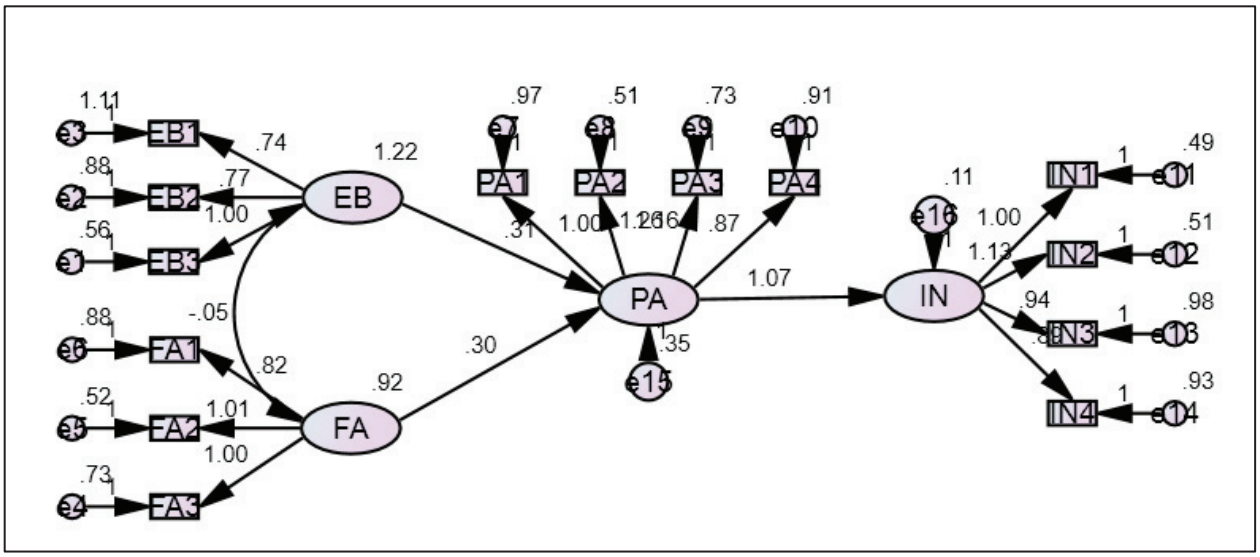

Figure 2: SEM analysis of research model

In general, the good model fit is accessed and measured using several elements such as chi squares degree of freedom, goodness of fit index (GFI) adjusted goodness of fit index (AGFI), comparative fit index (CFI) and root mean squared error (RMSEA).This all measurements have its own standard and cut off value was recommended such as chi square degree of freedom should not exceeded 3, goodness of fit index (GFI) should not exceeded 0.9, adjusted goodness of fit index (AGFI) should exceeded 0.8, non-norms fit index (NNFI) should exceed 0.9, comparative fit index (CFI) should exceed 0.9 and root mean squared error (RMSEA) should not exceeded 0.08.

The result of reliability analysis for all items has been perform and given in Table 1. In general composite reliability value and the average variance extracted (AVE) is the key assessment to identify the effectiveness of convergent validity. The cut off value to all factors loading must exceed 0.6 which used similarly by some researcher to their studies (Caroline A Haynes, 2000).For average variance extracted (AVE) the cut off value is must exceed 0.5.

Table 1: Measurement Model

Construct	Item/Actual Loading	Loading	Average Variance extracted (AVE)	CR
Functional Attributes	**FA1**	**0.609**	**0.501**	**0.748**
	FA2	**0.669**		
	FA3	**0.828**		
Emotional Benefit	**EB1**	**0.646**	**0.539**	**0.777**
	EB2	**0.801**		
	EB3	**0.747**		
Product Attitude	**PA1**	**0.598**	**0.448**	**0.761**
	PA2	**0.791**		
	PA3	**0.707**		
	PA4	**0.557**		
Intention	**IN1**	**0.774**	**0.509**	**0.804**
	IN2	**0.806**		
	IN3	**0.632**		
	IN4	**0.623**		

Table 2: Discriminant Validity [1]

	Functional Attributes	Emotional Benefit	Product Attitude	Intention
Functional Attributes	**0.734**			
Emotional Benefit	-0.047	**0.707**		
Product Attitude	0.375	0.442	**0.669**	
Intention	0.345	0.408	0.662	**0.713**

[1] Diagonal elements signify average variance extracted and the rest signify the variable -correlation

Based on table 1 above, the factor loading for all item is achieve their cut off value and in the correct direction exception of 2 items (Product attitudes 1 and product attitudes 2) which have 0.598 and 0.557 as an cut off value. Even though the AVE power of other three constructs is stronger and reaches the satisfactory of discriminant validity but one construct (Product Attitudes) does not have high AVE compare with the rest at 0.448.In an overall scheme the discriminant validity has been achieved and with AVE of constructs is better than the rest of the constructs. The correlation of all constructs is lower that AVE.

Structural Model

The model fit analysis revealed that X^2/df was 2.13, GFI - 0.897, AGFI - 0.901, CFI - 0.918, RMSEA - 0.075 and p- value is highly significant. This finding implied the significant levels of each constructs and their relationship between each other. The overall scheme of the model and path shows that the range is at 0.30 which show positive significant and the variance enlighten at the range of 30%. We can conclude that, the model is enough fit to be fit in this study in the maximum level.

Table 3: Structural Model

Hypothesis	Un- standardized Beta	Standardized Beta	Standard Estimate	C.R.	P.Value	Decision
H1- FA →PA	**0.304**	**0.396**	**0.070**	**4.367**	**0.001**	**Support**
H2- EB →PA	**0.308**	**0.461**	**0.065**	**4762**	**0.001**	**Support**
H3- FA →IN	**1.075**	**0.922**	**0.139**	**7.710**	**0.001**	**Support**

*** p>0.001

Following the measurement model and validity in this study, the structural model is assesses the relationship between the independent variables and dependent variables. Thus, this analysis representing the hypothesis that tested to determine whether it's supported or rejected. The output of this process is basically engaged with the prior's studies which stressed that there is a positive affect for all variables. In examining the relationship between functional attributes and product attitudes there is a positive affect at p>0.001 and $R^2$is 0.07.Hence H1 is supported. This result is similar to previous study which emphasize on positive relationship between functional attributes and product attitudes(Olivier Mairesse, 2012) .On the other hand, emotional benefits has ultimately create a positive relationship with product attitudes at the significant level p> 0.001 and $R^2$is 0.06. The reactions of customers over emotional benefits have strong relationship when they visit supermarket .Therefore H2 is supported. This finding are consistently has tested this variable and its show that positive relationship between emotional benefits and product attitudes (Patrick Hamann, 2005). Finally, relationship between product attitudes and intention is examined and the result indicates that there is a positive effect over product attitudes towards intention at the significant level p>0.001 and $R^2$is 0.13. It's correlated with the (Patrick Hartmann, 2008) that product an attitude has a significant relation with customer's intention to purchase. So H3 is supported.

DISCUSSION AND CONCLUSION

This study has created a platform to determine the effectiveness of green product positioning towards customer's purchase intention in Supermarkets. Some of the previous studies have argued that using one type of product positioning is enough to convince customers but this study has empirically confirmed that both product positioning have positive effects on customers' intention to purchase. From the result, its shows that functional attributes has a stronger effects on customers' intention to purchase over emotional benefits. For instances, high green knowledge over the environmental issues makes green customer more aware of the green product qualities. Thus, they afford to pay more to the green products due to the quality of the products and immediate benefits. On other hand, demographic factors also play a vital role in increases role of functional attributes. Basically education and genders are the most significant factors that indirectly position the green products Invalid source specified.. Likewise emotional benefits also have significantly affected the customer attitudes leading to purchase intention. Feeling and love towards green products is highly correlated with the intention to purchase. For instance, the "story telling" about the green products can simply convince the green customers to be loyal with the products. Thus this situation actually creates good attitudes towards the products as with hypothesis which is supported. However, it is difficult to summarize that the effectiveness of both product positioning equally play an important role to determine the customer intention to purchase. Therefore, combining both functional attributes and emotional benefits produces more concrete strategy in determining customer intention to purchase. Consequently, this study also increase the understanding of the marketers and producers that already in the market to specify green product positioning that can motivate customers to purchase.

Limitation and Future Direction

A major criticism of this study is respondent's lack of green knowledge and awareness of the green products. Different knowledge of the green concepts among the respondents affects the questionnaire that answered. Most of them actually struggle with the questions in the questionnaire because it's actually new for them. Another limitation of the study is the effectiveness of emotional benefits which is not completely tested in this research as Malaysia is a multicultural country having vast ethnic citizen. This inadequacy is due to the different cultural, socio- economic and believes that practicing in Malaysia. Future research should focus on one specific product categories and the result must be clear for that specific green products. It will more explain more appropriate to understand the effectiveness of product positioning. Nevertheless, future researcher also can include more sub- variables to functional attributes and emotional benefits such as love, quality, and price and so on to get better result and understanding of effects of variables towards dependent variable.

ABSTRACT

Purpose: *Service quality measurement in e-shopping service is an area of growing interest to researchers and managers. The purpose of this study is to explore the disconfirmation in online purchase behavior based on the expectancy disconfirmation theory (EDT).*
Design/ methodology/approach: *A two-phase study is designed to collect data and 657 usable samples were obtained. The participants are asked to fill out a questionnaire before and after purchasing in web store. A structural equation modeling (SEM) is used to assess the research model.*
Findings: *This study presents the evidence of the scale's factor structure, reliability, content validity and discriminant validity based on the results of analysis. The results also reveal that Disconfirmation, expectation and perceived usefulness has been influenced by second-order factors.*
Research limitation/ Implication: *This study aims on widely e-shopping customers without controlling the kinds of goods or services for participants purchased. The framework can be adopted to investigate the impact of different type and price for goods or services in the future study.*
Originality/ value: *The framework is built through SEM method, and several critical factors included are proposed to measure the disconfirmation in online purchasing behavior.*

Keywords: Online purchase, E-service quality, E-commerce, Expectancy disconfirmation theory (EDT), Structural equation modeling (SEM), Measurement

INTRODUCTION

With the rapid growth of the Internet, more and more people are participating in the Internet activity and increasing electronic commerce (e-commerce). An increasing number of businesses are utilizing the World Wide Web as a marketing channel to deliver their products and services (Li et al. 2006). Moreover, the existence of the virtual marketplace facilitates the interaction between consumers with a wide array of product choices (Lim and Ting 2012), and Internet become a popular channel for business marketing.

For a long time, customer satisfaction is an important factor for marketing research. The tradition marketing research confirms that customer satisfaction is one of the mean factors of repurchase in various different industrial (e.g., Hallowell 1996; Rust and Zahorik 1993). Recently, on the e-commerce or electronic applications literature, satisfaction also is a mean factor for the research. For instance, Eid (2011) believes that ensuring customer satisfaction is the goal of online sellers, and satisfaction is believed to influence post-purchase intention to repurchase a product or reuse a service (Yen and Lu 2008). Moreover, Lee (2010) argues that Satisfaction is the strongest predictor of users' continuance intention, followed by perceived usefulness, attitude, concentration, and perceived behavioral control as significant. Therefore, not only tradition business but also e-business is pursuing increase customer satisfaction.

Disconfirmation is the gap between the consumer's expectations of the product or service and perceived performance (Yen and Lu 2008), it is the psychological state results from a cognitive. According to Oliver (1980) cognitive model of satisfaction decisions, the expectancy disconfirmation theory (EDT) was developed, and has been widely used in the marketing field to understand consumers' intentions. The studies almost to reported the relationship of expectation, perceived performance, customer satisfaction and how customer intentions change over time. There was absence of research projects dealing with explore the measurement scale. In this research, we propose the measurement scale and model for the disconfirmation in online purchase behavior.

THEORETICAL BACKGROUND

Expectancy Disconfirmation theory

The success of business depends on that how can they keep the customer and catching business opportunities. The satisfaction is crucial to fostering customer loyalty, that is viewed as the key to building and retaining a loyal base of long-term consumers (Anderson and Sullivan 1993).

The disconfirmation theory proposes that a key determinant of product evaluation is the product's performance relative to initial expectations (Darke et al. 2010).

The Expectancy Disconfirmation theory (EDT) was developed by Oliver (1980) cognitive model of satisfaction decisions that consumers' post-purchase satisfaction is jointly determined by pre-purchase expectation and disconfirmation, that is widely used in the marketing and consumer behavior research. Churchill and Surprenant (1982) argues that perceived performance could also affect satisfaction directly, and sometimes it emerges as the only influence. In general, EDT was used to discussing of consumer satisfaction, repurchase intentions, post-purchase behavior, service marketing, and used to predict the consumers' product repurchase and service continuance use.

Recently, EDT has been used to understand consumers' intentions in the e-commerce context. Some studies show that disconfirmation and performance are important factors in explaining satisfaction (e.g., Bhattacherjee and Premkumar 2004; Chih et al. 2012; Khalifa and Liu 2003), and Yen and Lu (2008) found that buyers' disconfirmation is positively associated with their satisfaction, and satisfaction is positively associated with loyalty intentions.

Conceptualization of disconfirmation

Disconfirmation is the psychological state results from a cognitive appraisal of expectation and perceived performance. Disconfirmation theory posits that satisfaction is an evaluative outcome of the gap between performance and expectations (Oliver and Desarbo 1988). Yi & La (2004) defined disconfirmation was perceived discrepancy between prior expectations and performance. Kopalle & Lehmann (2001) also defined disconfirmation- sensitive consumers are those who are more satisfied/ dissatisfied when products perform better/ worse than expected. This study defined the disconfirmation as perceived discrepancy between initial expectations and perceived usefulness. Lower expectation and/ or higher performance lead to greater confirmation, which in turn positively influence consumers' satisfaction.

The Disconfirmation is the gap of cognitive between expectation and perceived performance, which used in online purchasing behavior can be affected by many dimensions, and that multidimensional concept associate with satisfaction. Yen et al. (2008) argues that efficiency, privacy protection, contact, fulfillment, and responsiveness have statistically influences on buyer's disconfirmation (Yen and Lu 2008). Bhattacherjee (2001_b) used performance, productivity, effectiveness and overall evaluate to measurement perceived usefulness construct, and used experience, service level and overall evaluate to measurement confirmation construct.

Kauffman and wood (2006) argues that customer will tend to pay more for the goods with the pictures on the web store. Zeithaml et al. (2002) detailed that information availability and content, ease of use, privacy/security, graphic style and reliability/fulfillment as relevant to e-SQ perceptions. Wolfinbarger and Gilly (2003) argues that Efficiency, system availability, fulfillment, privacy, responsiveness, compensation and contact is the eTailQ scale. Lee et al. (2011) used perceived value, perceived ease of use, perceived usefulness, firm's reputation, Privacy, trust, reliability and functionality to understand the relationships with online repurchase intentions. Liang and Lai (2002) found that the quality of e-store design has an effect on the consumer purchase decision. Consumers are effect more likely to shop at well-designed websites. Teo and Yeong (2003) also found that the perceived risk has a negative relationship with consumers' overall evaluation of the deal, and overall evaluation of the deal has a positive relationship with consumers' willingness to buy online.

According to previous literatures, this study used eleven items to measurement consumers' initial expectation, perceived usefulness and disconfirmation that including concept of service of internet store, efficient of transaction process, security, convenient of internet store, save money of online purchasing, easy navigation of website, the products' complete, the description of the products, deal experience, evaluation of purchasing decision, evaluation of overall shopping experience.

METHODOLOGY

Sampling and Data Collection

Empirical data for this study was collected via two-phase field survey; we conducted a survey based on respondents' online purchasing experience. The data for our study were collected through a web-based questionnaire. We set up an online survey website, and the participants complete the survey questionnaire before them purchasing the goods or services; in addition, when the participants get the goods or services, they must fill out the questionnaire again. We used the participant's e-mail address and web store name to comparing the sample data was come from the same respondent. A sample of 657 respondents was obtained. The sample consisted of 64.5% women and 35.5% men.

Measurement instruments

Three constructs were measured in this study: Initial Expectation, perceived usefulness, and disconfirmation, among initial expectation was measured before the participant online

purchasing and both of perceived usefulness and disconfirmation were measured after they get the goods. Items were measured using seven-point Likert scales anchored between “strongly disagree” and “strongly agree”.

Most of the measuring instruments were extended from Bhattacherjee (2001_a) and Khalifa and Liu’s (2007), in addition to this, some instruments were adapted from EDT, e-commerce, and e-service quality research. There are eleven measure items, respectively, would measuring constructs of Initial Expectation, perceived usefulness, and disconfirmation.

Analysis and Results

The structural equation modeling (SEM) approach was used to assess if the model fit the data set. The first step was developing a measurement model by confirmatory factor analysis (CFA), that was evaluated on the criteria of reliability, convergent validity, and discriminant validity.

A confirmatory factor analysis (CFA) was to test the reliability and validity of the measurement model. Table 1 shows the descriptive statistics and correlation. Figure 1 show that each item’s standardized loading for disconfirmation. All loading value is exceeding 0.55. But the values of fit indices were not within the threshold of recommended values. Therefore, we consider four latent factors.

The Figure 2 and table 2 show the result of consider four latent factors. Standard item loadings were over 0.70 and all items were significant at the 0.001 level. Composite reliability of each factor was all above 0.70. All AVEs of factors range from 0.7 to 0.86, well above the recommended value 0.5. The results to achieve the criteria of convergent validity assess, that standard loading of each item on its underlying factor should be over 0.7 (Gefen et al., 2000), composited reliability should be above 0.7, and the average variance extracted (AVE) should exceed 0.5 (Bagozzi and Yi 1988). The result shown the convergent validity was established. In Table 3, the most square root of the AVE for each factor was larger than the correlation of any specific factor with any of the other factors, showing that we had discriminant validity. This study also considers second order factor analysis, the result as shown in figure 3, and the goodness of fit for Model1, Model 2 and Model 3 are compared in Table 4.

Table 1. Descriptive statistics and correlation

	Mean	SD	D1	D2	D3	D4	D5	D6	D7	D8	D9	D10	D11

			Disconfirmation		
			Model 1	**Model 2**	**Model 3**
X^2/df	<5	(Bentler,1989)	22.24	4.58	5.65
RMSEA	<0.06	(Hu and Bentler, 1999)	0.18	0.07	0.08
NFI	>0.9	(Bentler and Bonett, 1980)	0.94	0.99	0.98
NNFI	>0.9	(Bentler and Bonett, 1980)	0.92	0.99	0.98
CFI	>0.95	(Bentler, 1989)	0.94	0.99	0.98
GFI	>0.9	(Hu and Bentler, 1999)	0.79	0.95	0.94

CONCLUSION

This study aims on widely e-shopping customers without controlling the kinds of goods or services for participants purchased. Our study developed and tested three models explaining the measurement of disconfirmation model in online purchasing behavior. We suggest eleven items to measure the construct of disconfirmation, and the items are influenced by four latent factors, and we also test the second-order model.

ABSTRACT

Purpose: *Purpose of this paper is to explore consumers' behavior connected with product reuse, particularly to assess what product categories are reused more frequently and why. Also paper deals with consumer motivations, knowledge and inspirations to reuse. Product reuse is operationally defined for this paper as usage of particular product in a new context, way of use ect. – not as usage for the same purpose by new owner.*
Design/methodology/approach: *Authors are using virtual ethnography as main data collection technique, supplemented by secondary data sources. Observation will use selected social media portals, including status and fanpages on Facebook (likes, comments and sharing), as well as Pinterest and Pinspire (pin and follow activities).*
Findings: *Main drivers to product reuse are not connected with simple ecological motives – those are important to some users, but only as additional motivations. Observation leads to conclusion, that most often reasons to engage in product reuse are connected with the needs to express yourself and show own creativity and individualism, mainly by DIY (Do It Yourself) activities leading to product reuse. Another reasons to engage is seeking savings (not always monetary). Research is suggesting also that people need inspiration, some things that trigger such behavior, they often need to see possibilities before they can change their attitudes toward product reuse.*
Research limitations/implications: *Main study limitation is qualitative approach to analysis. Subjective selection of places and subjects for observation may be perceived as another shortcoming. Careful data analysis should overcome those shortcomings.*
Practical implications: *Findings from the analysis will be useful for marketing practitioners to create marketing activities promoting ecological behavior.*
Originality/value: *Taken approach originally uses virtual ethnography to study conscious and unconscious motives for product reuse. This leads to revealing alternative ways of indirect shaping consumers' attitudes toward ecological consumption.*

Keywords: product reuse, motivations, thriftiness, creativeness, social media
Classification: research article

INTRODUCTION

The issue of reuse of the products is becoming more and more significant in an era when consumers are constantly bombarded by information about the deteriorating state of the environment, depletion of resources, consumption-driven lifestyle, or even exacerbating economic crisis.

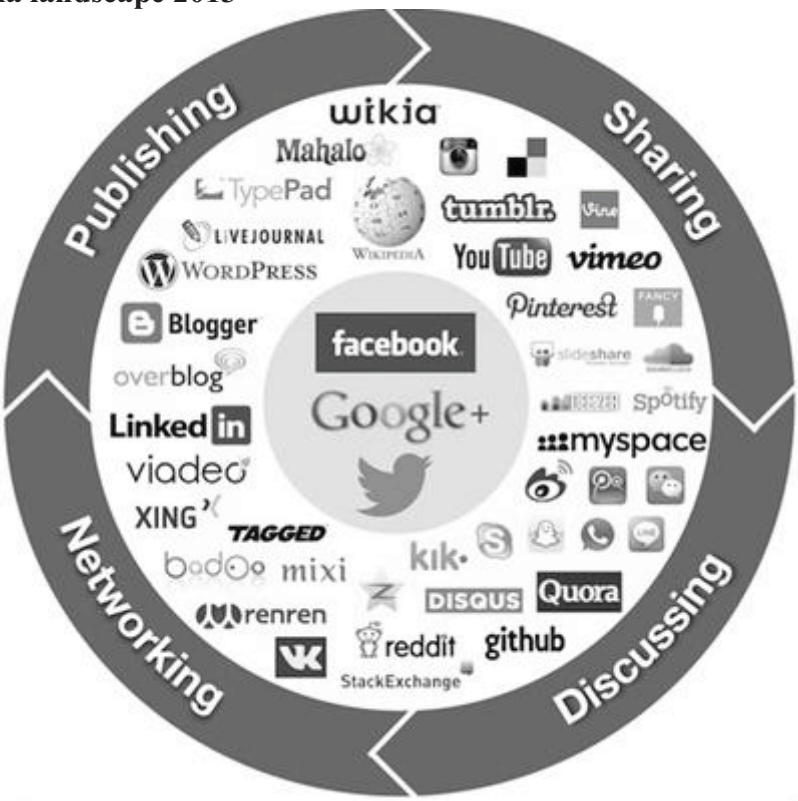
Re-use of products is part of the philosophy of "3R" (Horsman, Brown, Munro, Kendon 2011): reduce, reuse, recycle, and therefore, is the most commonly identified with pro-ecological behavior. The various propositions are trying to extend this formula for a further Rs, such as rethink, repair, refuse and so one. Adopted point of view seems to be well founded. There are many incoming messages seeking to develop and strenghten attitudes of responsible consumption used in almost all media. These standard media are using typically different forms to spread this idea: television (news), radio (interviews), newspapers and magazines (articles); internet (dedicated portals). Also less standard forms as a custom viral campaigns, ambient campaigns, etc. have been deployed to reach this goal. However, with the development of the Internet, particularly social media, one can note different motivations for reuse than the standard attributed catching.

Deployment of quantitative research methods to assess issues connected with product reuse can lead to a rather typical and trite conclusions. This is due to the fact that the phenomenon of product reuse previously been interpreted in terms of taking care of the environment or the savings for low budget households. However, the observation of this phenomenon in Social Media allowed to point out the issues previously overlooked. Thus, the authors decided to use the method of virtual ethnography and maintaining a closer look at the product reuse. The research examined primarily Facebook.com portal, with additional and extended observations on Pinterest.com and YouTube.com.

SOCIAL MEDIA CHANNEL

The world of social media is now very rich. Every year it becomes more and more popular, mainly due to world-popular site Facebook.com.

Pic. 1 Social media landscape 2013



Source: Social Media Landscape 2013, online: http://www.fredcavazza.net/2013/04/17/social-media-landscape-2013/

Social media allow users to create communities - in several dimensions. One of them is to create groups of friends who know each other, so that they can stay together in constant contact (online), share interesting materials (text, audio / video, photos) directly on the website or in relation to external sites (e.g. redirecting the blogs). Another option is to group of fans gathered around a particular brand (physically existing on the market, but also the ideas treated as brands, people around ideas can create the brand from them). The third option is to create communities of interest – this is important for people who do not know themselves, they live in the remote parts of the world, speaking different languages – but can share common and rare interests and spread interesting content for them. This allows the circulation of certain ideas is much higher, reaching a much larger group of people than the traditional channels, as well as it reaches people who are much interested in the content to show some activity. Can it be (depending on the service) viewing the content – text, picture or videos (the most passive), press *like* button, comment and share on somebody's' profile. Staying even a passive observer of the content (which is the most common for about 90% of users) users are getting familiar with certain things, they develop their own opinions, they develop particular tastes, gain knowledge, gain greater awareness, which is particularly important for building a specific attitudes. The same is when they are using other tools (websites, blogs), but in social media:

- allowing for move from push to pull strategy , which is an advantage to the user, he or she (more often, through information and technology solutions) alone determines what content to display,
- user is itself informed when new content on sites that interest him is shown (for example, Facebook is the main catalyst and synthesizer of content that often link to

external sites), chooses those which are interesting and he/she wants to deeper explore, ignoring less interesting at the same time.

COMMON TYPES OF PRODUCT REUSE

At this point it is worth to systematize some knowledge. The reuse of product we can see as:

- the second life of product (Nalewajek and Mącik 2012)– change the function of the product; a situation in which the package is used in unchanged form again, despite finishing of basic product content, such as box of chocolates;
- upcycling (the most often type) – change the function of the product; upcycling is the reuse of materials as oppose to recycling them. Recycling is the reprossessing of used products down to raw materials and then into new products. Upcycling is reusing the materials without reprocessing them, for example cutting apart old clothing and making new products from the material. Any left-overs from the upcycling process can then be recycled. Upcycling requires less energy than recycling and can be done time and time again;
- the product exchange – changes only the owner of the product, now it works in the second circuit (eg clothes)

Pic.2 Example of second life of the product

Source: own research (2012)

THE PRODUCT REUSE – TYPICAL APPROACH

Looking at the chosen tools of social media (Facebook, Pinterest - portal allows you to create unique collections of photos, You Tube - a service for watching and collecting movies) it can be seen that some content types are spreading in one channel much more dynamically than in another. For example, searching through the channels - an ecological approach to product reuse is easier to find on Facebook or YouTube than Pinterest. It is associated with the capabilities of these services and perceived attractiveness of content, which can be obtained this way. Facebook allows you to create profiles (for people, brands, ideas) and collect of so-called fans around them, You Tube channel allows to collect subscribers, and the last one - Pinterest – you can create and follow specific boards with pictures. So results of seeking content data thus depends on the used keywords that we know - not always it is easy to guess them. Everything depends on t how the item (profile, video, photo) is tagged or described by the user. So by looking for word "reuse" we can find some results, but they are not complete.

There may be sections dealing with the product reuse, but calling themselves quite differently, for example, responsible consumption. In this way - on some sites, some content spread more easily, because they are called in better way.

For instance searching on Facebook for word *reuse* the authors found that for more than 100 profiles established, their names contain this string of letters. The number of fans ranges for them from a several dozen to several thousand (i.e. Reuseit fanpage has 17 052 fans). However, to verify the phenomenon of reuse must also be taken into account fanpage dealing with environmental behavior or responsible consumption, since the same "reuse" is only a small part of the ecological behavior. It is not possible to look at all, and the whole content they made and publish, because there are so many of them, and some of them are very intensively carried out (changes of status, new posts ect. occur in this case as often as every three hours).

Thanks to social media, their users are made aware of the issue of the effects of waste (e.g. by infographics, simple description of the photos and sometimes video), have presented the products can help to protect the environment (such as reusable bags and containers for lunch, instead of disposable bags, etc.). They also can spot the images where one can see the process by which the old items in a fast and simple way are transformed into something new. Users also can be introduced to the easy ways to get rid of old, unwanted items, which would be a problem with disposal or proper segregation of garbage.

Pic. 3 Examples of product reuse

Source: Pinterest.com

In addition to fanpages general in terms of content that revolve around themes reuse, you can already find these specializing in a more narrow subject, such as:

- clothing,
- bags,
- jewerly/watches,
- baby goods/kids goods,
- furniture,
- glass/jars/watter bottles,
- computers/technology.

In this way, a narrower group of interest in a particular specific area can be found and utilized to spread even very exotic ideas – but always strictly connected with fanpage topics covered.

WHAT IS HIDDEN?

Exploring the phenomenon of the product reuse through virtual ethnography in social media helped to point out quite important behaviors, which were not expected to be seen in such quantities. It turns out that the interest for product reuse connected topics can come not only from ecological reasons. More often it is dictated by the need or desire to do something by yourself (which is part of a DIY trend - do it yourself). Profiles on Facebook focused on this subject (DIY) have very fast growing number of fans (one, within three months - almost 90,000 of fans, the other, within two months - 84,000 of fans). Number of fanpages and the number of people interested in the content posted on it continues to grow. Major importance of such growth is the viral mechanism, ie. situation in which a particular user action learn his friends (depending on the settings of the profile) what is going on. In this way, the fanpage learn more and more new people. Naturally, if we analyze the number of the fans on different profiles - some of them would be covered. This reflects the degree of interest in the topic and the desire to stay up to date with the content. Intensity of getting messages and stronger interaction with posted messages can result in the substantial evolution of attitudes. Observing simplicity how to do various items by yourself, they can limit their own shopping and get satisfied using the compilation of products that already have at home. Very often in the analyzed social media channels were found remade and reused: clothing, household items - furniture (eg bed or table built from industrial pallets), organizers (the kitchen stuff) and things for the garden.

For some people watching, searching and sharing the images presenting things handmade from reusing other products is also a source of hedonistic feelings. Such things allow them to find inspiration over the Internet and then create unique solutions in the home. The most common were product types spotted here were furniture and household items.

Pic. 4 Hedonistic motivation of the product reuse – shelf made from chair and another from ladder

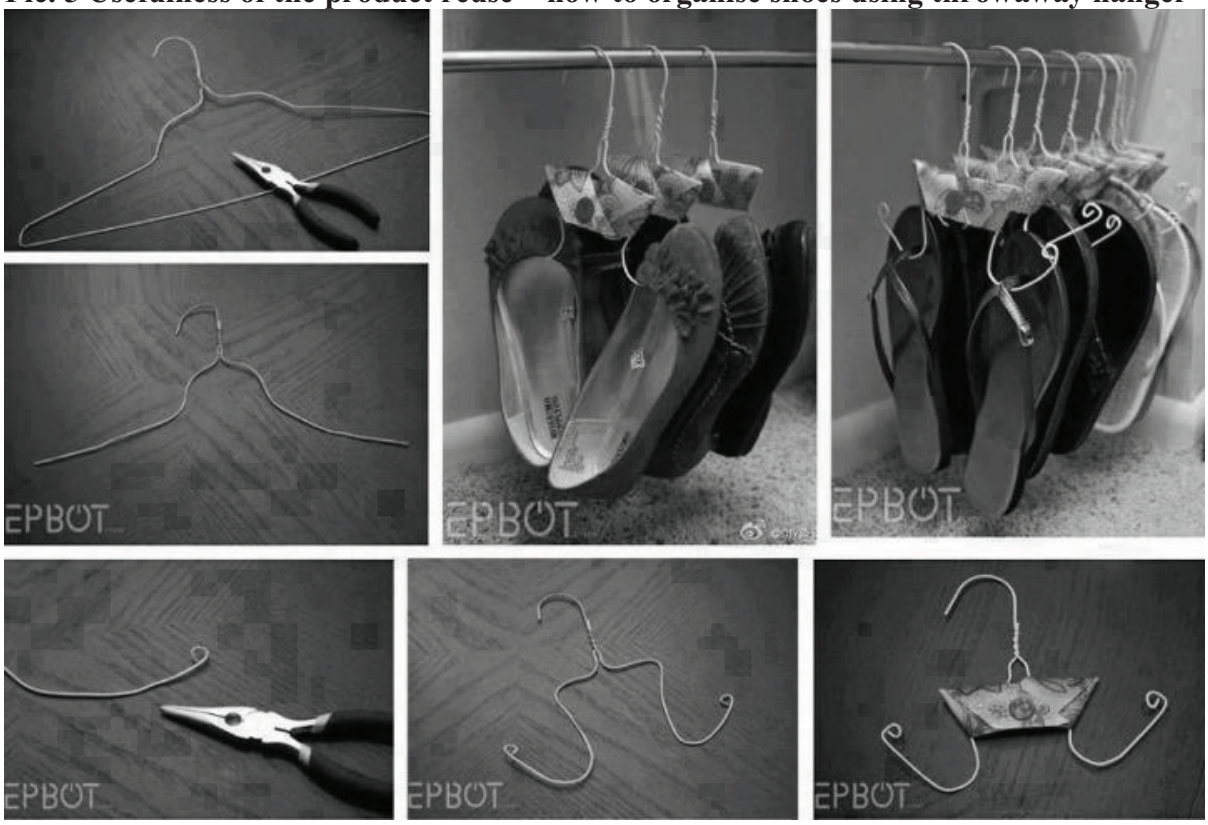
Source: Facebook.com

For the others finding new solutions by using old objects is the result of creative expression, for others who benefit from these solutions – form of award. Often they share these handmade products on their blogs presenting the product development stages as well as the end result - using the extensive photographic documentation (or video tutorial), along with a brief description.

For the young persons, because they are the main users of social networking sites and blog makers - is becoming an important aspect of the division (Młodzi 2011). They do not want their ideas to act for themselves, but spread throughout the world. In this way, individuals become creators, gaining popularity and recognition (often being identified with the name of the blog, nickname and not by name). Looking at it from a different perspective, you can see growing trend of C2C (consumer to consumer) exchange. Also when individuals are starting to show and set some trends, mass-production companies are in opposition to the unique concepts and design.

Yet another motive interest in the product reuse is the desire/need to look for useful solutions that simplify, organize some things. In this way, are conserved not only money but also time and effort (it is easier to find something in the house or harder to destroy, eg by breakage). In the case described, the important role played by Facebook, which acts as a catalyst for some content and allows you to enchant removing reference to external sources (often blogs devoted to this subject). Visible are also references to the videos on YouTube, where most young girls show how to use things in your home to prepare organizer for clothes (shawls, scarves, belts, underwear) or cosmetics. On Pinterest are created a whole collection of images dedicated to the theme. Often these are powerful images showing several smaller ones that illustrate the step-by-step how to get the effect discussed.

Pic. 5 Usefulness of the product reuse – how to organise shoes using throwaway hanger



Source: Pinterest.com

Another motive, so that people interested in the repeated use of the products is to spread the idea of creativity. Profiles / channels / boards (depending on social media platform) are filled with creative solutions, how to do something yourself. They encourage stimulating the imagination, inspire, create, shoving ideas. Analyzing the content of those sites from that angle you can see the word refer to overcome the daily grind, boredom, move away from mass production and buying products that "kill" thinking. Colorful pictures encourage the implementation of children's toys and learning them creativity. Pictures 6 illustrates the simplicity of implementation, short time needed to do and small amount of materials needed – those anyone have at home.

Pic.6 Toys for children made from reused products

Source: Facebook.com

Reuse is also connected with thriftiness. This is not necessarily associated with a lack of sufficient funds to buy new things, but associated with the deliberate reduction needs or responsible consumption . Observation of the content appearing in social media in this area has shown that often the content is shown in a very attractive way, that does not mean that somebody could feel touched, but it shows that saving can be fun, easy, nice and pleasant. It has to do with all the previously described phenomena.

Pic. 7 Saving money by using reused things

Source: Pinterest.com

Social media shows the richness of possibilities of the things you can save. Ways to reuse plastic bottles, glass jars, wooden items are countless proving it does not take much effort to achieve what you need in a very simple way. Any material can be used again.

WHY SOCIAL MEDIA?

Social media allows for a very fast rate spread some ideas. They are removing such barriers as:

- time - the content is available around the clock, constantly "refreshed" on the other fanpage boards, blogs, creating so called long tail effect,
- location - give access to almost every person on earth that has free access to the internet,
- language - the main medium of communication is an image rather than text. The Facebook statuses are short, comments are mostly in English, on Pinterest dominates the image, words are not enough to express all feelings needed; and You Tube offer tutorials that show how to get the effect to which the understanding of words is not often needed.

These portals intersect. Some refer to the latter. Facebook offers YouTube and Pinterest plug-in,. So it is easier to meet the data content that are still out there on the net. They are in a nice form - images are often nicely prepared, in a particular style with a suitably chosen typography.

Another issue is that the users of these sites are mostly young people, for whom a group of friends is a very important point of reference. The importance of family, tradition, humility

falls, creativity, resource fullness, self-confidence, individuality gains. All these factors make the product reuse becomes something totally different than it was previously interpreted.

IMPLICATIONS

Exploring the motivation to reuse helped to verify the situations of the product reuse widely regarded as the ecological. Such themes did not need to be dominant in behavior described in the text, there must also be conscious of the consumer, especially when for many people the care about the environment is not something interesting and involved, but on the contrary - a boring and far. The above qualitative data shed light on the direction of research in which quantitative research should go, so that could be undertaken to attempt to estimate the scale of the phenomenon.

Taken analysis suggests that underlying the repeated use of the product may be not only a desire to save, which has its economic consequences (the crisis). The issue of conservation is also a second meaning here. People want to not only save money (by reducing their purchases), but also a time (better organization of space) or effort (pre-purchase stage of buying process often become extended: consumers have to evaluate many alternatives before making a decision, rather than directly choose product that will look beautiful and perfectly answers their needs - without hours of searching in stores or online). Such dimension of saving has been not described up to date with reasonable depth.

Another issue is the scale of the problem. Netnography research shows that it is much bigger than we might think. Direct search can show a little, but to extend them for a certain word show that the situation of the product reuse is reflected also in other phenomena.

An important premise of the study is the "degree of independence" for consumers who turn away from the trends dictated by global brands, but are looking for simple solutions, which are the product manufactured themselves.

SUMMARY

Main drivers to product reuse are not connected with simple ecological motives – those are important to some users, but only as additional motivations. Observation leads to conclusion, that most often reasons to engage in product reuse are connected with the needs to express yourself and show own creativity and individualism, mainly by DIY (Do It Yourself) activities leading to product reuse. Another reasons to engage is seeking savings (not always monetary). Research is suggesting also that people need inspiration, some things that trigger such behavior, they often need to see possibilities before they can change their attitudes toward product reuse.

AN EVALUATION OF MANUAL METERIAL HANDLING TASKS IN A MANUFACTURING COMPANY

Grepo, Lorelie, Department of Industrial Engineering and Operations Research, University of the Philippines, Diliman, Quezon City, Philippines

Yabis, David John, Department of Industrial Engineering and Operations Research, University of the Philippines, Diliman, Quezon City, Philippines

Po, Ronald Aaron, Department of Industrial Engineering and Operations Research, University of the Philippines, Diliman, Quezon City, Philippines

ABSTRACT

Manual material handling (MMH) is one of the most common causes of accidents and ill-health in the workplace. Material handling encompasses a wide range of work activities - from occasional movement of very large loads with cranes and powered industrial trucks to routine, repetitive lifting of relatively light objects and tasks that are incidental to a worker's regular, daily activities.

Manual material handling tasks in a Philippine manufacturer (the Company) of Baby Diapers and other personal products were evaluated and analyzed. Five months worth of data from the Company showed that 7% of workers suffer from work-related musculo-skeletal injuries. Of these, 58% are classified as low back pain. It should be noted that most Philippine companies are notorious for under-reporting workplace related injuries, particular those that only cause loss of man-hours (as opposed to losing man-days or months) due to relatively lax regulations though the Company encourages employees to report these types of injuries.

The manufacturing line for Product H (a baby diaper) was analyzed using ergonomic checklists for general posture, task evaluation, and workstation evaluation, as well as a Cumulative Trauma Disorder (CTD) Risk Index. It was seen that bulk packing, auto-bagging, manual sealing and box stacking are the most problematic among the tasks. Poorly designed workstations as well as heavy manual lifting and moving tasks contributed as likely main causes for low back pain.

Proposed solutions included an improved layout for the manual packing, auto-bagging and bulk packing workstations, job redesign of the on-line inspector, as well as job rotation among the different product lines.

INTRODUCTION

Manual material handling (MMH) is one of the most common causes of accidents and ill-health in the workplace. Material handling encompasses a wide range of work activities - from occasional movement of very large loads with cranes and powered industrial trucks to routine, repetitive lifting of relatively light objects and tasks that are incidental to a worker's regular, daily activities.

MMH activities are often of concern when assessing job tasks for risks that have the potential to lead to musculoskeletal disorders. MMH activities usually contain ergonomic risk factors that may include awkward posture, repetition, excessive force and mechanical or contact stress. Several evaluation methods and guidelines exist for evaluating manual material handling tasks.

Many of the work-related injuries associated with ergonomic problems include musculoskeletal disorders (MSD) such as back injuries and carpal tunnel syndrome and result from overexertion or repetitive motion. About one-third of these injuries are serious enough to require time off work. Workrelated MSDs account for one-third of all workers' compensation costs each year because these injuries can require a lengthy recovery time. Aside from the lost days of work, the corresponding amount of money lost because of it is significant that it can't be ignored.

It is then important to minimize, if not completely eliminate, the causes of these work-related MSDs to reduce the costs associated with these.

A. **Objectives**

The paper aims to

[1] identify work-related injuries and illnesses;
[2] evaluate and analyze specific tasks that can potentially cause manual material handling injuries;
[3] determine possible causes of these injuries and illnesses;
[4] identify other risks that may as well contribute to the injuries;
[5] analyze the factors in the work environment and layout that triggers work-related injuries and illnesses;
[6] utilizing appropriate tools in evaluating manual material handling practices

B. Scope and Limitation

This study covers one of the product lines of The Company, the infant care product line (disposable baby diapers). The Company manufactures different grades of infant care products. This study will focus on the production of Product H. It will be limited to the evaluation of the manual material handlers in the infant care division. The analysis will concentrate on the different tasks such as manual bulk packing, auto-bagging, manual box sealing, automatic box sealing, online inspector and box stacker. Only the workers in the first shift of this production line were observed. Other data that will be used such as the medical data on work-related illnesses and injuries are from recent records of The Company.

C. Methodology

In evaluating the manual material handling practices in The Company, the proponents first got medical records on incidences of work-related illnesses and injuries from the clinic. The records were analyzed, and then the analysis was concentrated in on musculoskeletal and soft tissues disorders since the number of incidences of work-related illnesses and injuries is the area of interest.

The injuries and illnesses were then related to the work done by identifying which factors are responsible for it. Several evaluation tools were used to aid in identifying these factors. The tools used were: Worksite/Job Analysis, CTD Risk Index and Workstation Evaluation Checklist.

Interviews were conducted as well as first hand observations in the production area to be able to accomplish these forms. After accomplishing the said forms, the tasks are analyzed in general to identify which has the highest probability of causing the injuries or increasing the risks.

Finally, recommendations on how to mitigate or eliminate the risks are provided at the end of the study.

E. Short Company Profile

The Company produces and markets a wide range of health and hygiene products. The Company is classified into three global business segments: Personal Care, Consumer Tissue and Business to Business.

Personal Care segment manufactures and markets feminine care products, disposable diapers and other related products. The Consumer Tissue segment produces and markets facial and bathroom tissue, paper towels, napkins and other products intended for household use. In contrast with the Consumer Tissue, the last segment which is the Business to Business manufactures the same products but is meant for away-from-home use. It also produces health care products such as surgical gowns, facemasks, exam gloves and respiratory products.

REVIEW OF RELATED LITERATURE

Manual material handling (MMH) is an activity requiring the use of force exerted by a person to lift, lower, push, pull, carry or otherwise move, hold, or restrain a person, animal or thing. It covers a wide range of activities including lifting, pushing, pulling, holding, throwing and carrying. It includes repetitive tasks such as packing, typing, assembling, cleaning and sorting, using hand-tools, and operating machinery and equipment.

In manual load handling, human effort intervenes in both a direct (raising, positioning) and indirect (pushing, hauling, shifting) manner. The carrying or holding of a load in a raised position is also considered to be manual handling. MH also includes holding the load with the

hands or other parts of the body, such as the back, and throwing the load from one person to another.

Because most jobs involve some form of manual handling, most workers are at risk of manual handling injury. Of course, not all manual handling tasks are hazardous. But it is significant that around a one-third of all workplace injuries are caused by MMH.

Some of the work-related injuries and long-term health problems are known as repetitive strain injury (RSI), occupational overuse syndrome (OOS), cumulative trauma disorder (CTD) and work-related musculoskeletal disorder (WRMSD). All of these conditions are referred to as musculoskeletal disorders (MSD). MSD is defined as an injury, illness or disease that arises in whole or in part from manual handling in the workplace, whether occurring suddenly or over a prolonged period of time.

Other injuries that may also be caused include: upper limb injuries (shoulders, arms and hands), burns produced by loads at high temperatures; wounds and scratches caused by excessively sharp corners, splintering, very rough surfaces, nails, etc.; bruising caused by falling loads due to slippery surfaces (oils, greases or other substances); circulatory problems or inguinal hernias and other harm produced by hazardous substance spills.

Many of the work-related injuries associated with ergonomic problems include MSDs such as back injuries and carpal tunnel syndrome and result from overexertion or repetitive motion. About one-third of these injuries (600,000) are serious enough to require time off work. Work-related MSDs account for one-third of all workers' compensation costs each year because these injuries can require a lengthy recovery time.

The International Labor Organization (ILO) maintains that manual handling is one of the most frequent causes of accidents at work, accounting for 20-25% of all those produced. A study carried out by the U.S. National Safety Council in 1990 revealed that the greatest cause of occupational injuries (31%) was overexertion. The back is the part of the body that most frequently suffers injury (22% of 1.7 million injuries). This problem also exists in many EU Member States. In the United Kingdom a report prepared in 1991 indicated that the cause of 34% of accidents resulting in injury was manual load handling. Of these accidents, 45% affected the back. In France during 1992 manual load handling was the cause of 31% of all accidents at work involving time off. In Spain, the greatest cause of accidents at work in the period 1994-95 was overexertion. In particular, statistics for 1996 relating to accidents at work and occupational diseases include 22.2% of accidents at work with time off caused by overexertion, many of them probably due to manual load handling. As regards the nature of the injury, 8.9% of accidents were due to lumbago and 0.1% a slipped disc.

PROBLEM IDENTIFICATION AND DOCUMENTATION

Data on work-related injuries and illnesses

Before evaluating the manual material handling practices in The Company, it is essential to identify the problems associated with improper manual material handling. To see this, date were gathered on the number of work-related musculoskeletal and soft tissues disorder (MSD) incidents. The tabulated summary of the data (five months) is shown in Appendix A. About 7% of workers suffer from workrelated musculo-skeletal and soft tissues disorder.

The data on work-related musculoskeletal and soft tissues disorder shows that low back pain contributes the most to the illnesses/injuries that workers suffer from. It constitutes 58% of workrelated musculoskeletal and soft tissues disorder in the company.

Tasks to be analyzed

The following jobs under the production of Product H are to be analyzed in the succeeding section of the paper. The proponents thought of analyzing the jobs individually and not to analyze the workers per se because the workers switch over in their work and it would be more difficult to make an analysis this way.

All the following tasks are dependent on the speed imposed by the process. The Product H machine produces 500 diapers per minute, so it is important that the workers are efficient in what they do, or else, the production of Product H would suffer.

[1] Bulk pack Packer – the worker packs Product H diapers directly into a box; a manual bulk pack packer averages 500 boxes per 8-hour shift

[2] Auto-bagger Packer– the worker packs the Product H diapers that are bagged in packs of 8 by the machine into a box; an auto-bagger averages about 657 boxes per 8-hour shift

[3] On-line Inspector – the on-line inspector inspects Product H randomly during the production; he/she sees to it that the Product H being produced and bagged are not defective; he/she also signals the line leaders if defectives come out of the process so they can either check the machine while in production or temporarily stop production and resolve the cause of defects

[4] Box Sealer (manual and automatic) – manual sealers seal the box by hand while a machine is used for automatic sealing

[5] Box Stacker – the stacker places the boxed items in the pallets to be placed in the stock area, ready to be transported; for the bulk pack, the stacker lifts a box that weighs about 2.5 kgs; for the auto-bagging, he/she lifts a box that weighs about 2.6 kgs.

Job/Worksite Analysis Guide

The job/worksite analysis guide identifies problem areas within a particular area or worksite. Before collecting data, the analyst has to observe the worker, the task, the workplace and the surrounding guide the analyst in using other, more quantitative tools for collecting and analyzing data.

To initiate the ergonomic evaluation of the jobs enumerated above, the proponents then performed a job/worksite analysis guide to determine which factors, and their corresponding tools, and problem areas to focus on. The job/worksite analysis guide can be found in the appendix.

From the results of the analysis, it can be seen that the analysts have to concentrate on the problem areas namely repetitive lifting and grasping, awkward posture, awkward wrist and shoulder motions and unacceptable noise level.

The analysts then performed the following to evaluate the jobs: CTD Risk Index, General Posture and Task Evaluation Checklist and Workstation Evaluation Checklist.

The CTD Risk Index is then computed to identify which among the jobs is the most risky, injurious and prone to Cumulative Trauma Disorder (CTD). It will also help in identifying poor postures and serves as a design tool for selecting key conditions to redesigning. The Workstation Evaluation Checklist will aid in analyzing the workstations of the workers while the General Posture and Task Evaluation Checklist will aid in the analysis of the performance of the tasks.

RESULTS AND DISCUSSION

General Posture and Task Evaluation

The first evaluation tool used is the General Posture and Task Evaluation Checklist. This checklist has been modified as the proponents see fit for the assessment of the said tasks. Table 1 shows the results for each task.
Table 1 shows which among the tasks is problematic with regards to posture and task. It can be seen that bulk packing, auto-bagging, manual sealing and box stacking are the most problematic among the tasks. Automatic sealing is the least problematic because the worker is only feeding the box to the sealing machine. Inspection, meanwhile, is not as problematic as the other tasks since the worker is not subjected to excessive bending and twisting as the other four.

Table 1. General Posture and Task Evaluation Checklist Results

POSTURE EVALUATION	TASKS					
	Bulk packing	Auto-bagging	Manual Sealing	Automatic Sealing	Inspection	Box Stacking
forward bending	✓	✓	✓	✓	✓	✓
twisting of the trunk	✓	✓	×	✓	✓	✓
sudden movements or jerks	✓	✓	✓	✓	×	×
changes in posture	✓	✓	✓	×	×	✓
excessive reaches	×	✓	✓	✓	✓	✓
TASK EVALUATION	**Bulk packing**	**Auto-bagging**	**Manual Sealing**	**Automatic Sealing**	**Inspection**	**Box Stacking**
static muscle exertions	×	×	×	×	×	×
long duration of static exertions	×	×	×	×	×	×
materials and tools not w/in normal working area	×	×	×	×	×	×
tasks carried out above shoulder level	×	×	×	×	✓	✓
tasks carried out below knuckle height	✓	×	✓	×	✓	✓
lifts performed quickly without knees bent	✓	✓	✓	×	×	×
no breaks allowed during shift	×	×	×	×	×	×
Total Score (# of checks)	6	6	6	4	5	6

Workstation Evaluation Checklist

The next evaluation tool used is the Workstation Evaluation Checklist. The result of the evaluation is shown in the appendix. Two workstations are evaluated: Standing and Sitting. For the standing workstation, only the inspector has one cross mark since the inspector is originally to be seated but most of the time the inspector is standing.

The most poorly designed workstations among the tasks are that of manual sealing and case stacking since they got three cross marks and no check marks (check=positive). The manual sealing task has a problematic workstation since the worker has no permanent workstation. By this, we mean that the manual sealing of boxes is done on the floor and the worker is bent the whole time he/she is performing the task. The back angle of the worker -- between 45º and 90º -- is terrible for the back, more so that this is sustained for eight hours of work.

The workstations of the automatic sealing, auto-bagging and bulk packing are relatively acceptable. But there are some problem areas that need to be addressed in these workstations too. The analysts observed that the workstation layouts for the auto-bagger and automatic sealing are not properly designed which causes much of the awkward bending and twisting motions of the workers in this area. The depth and height of the bin where the bagged diapers accumulate while the packers stuff them into a box is low with respect to the height and reach of the worker. The bin looks like Figure 1.

Figure 1. Bin at a working height where the worker has to bend to reach a far object
Source: Kroemer et al, Ergonomics: How to Design for Ease and Efficiency (Fig. 11-17, p 540)

The top view of the workstation for auto-bagging and automatic sealing can be seen on the figure below. The two circles on both sides of bin represent the auto-baggers. The boxes are placed on their sides.

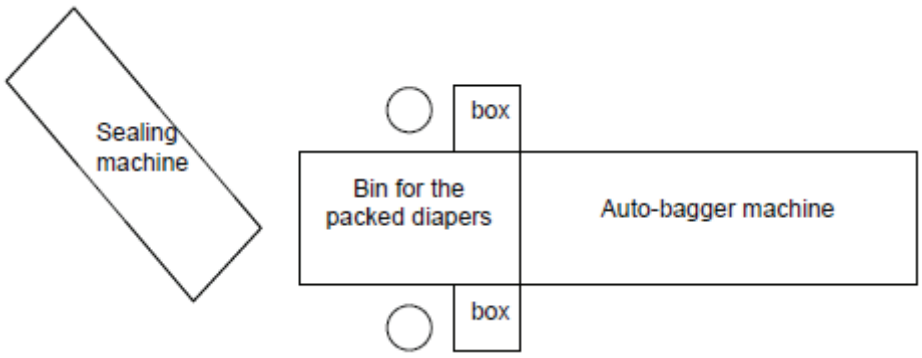

Figure 2. Top View of the current workstation for auto-bagging and sealing

The machine-packed diapers falls on the deposit from the machine and the packer grabs them and stuffs them into a box. And since the speed of the worker in packing is imposed by the process, bending and twisting motions becomes more unavoidable as the worker tries to hasten his/her packing to avoid bottleneck or excessive accumulation of packed diapers in the deposit area.

The single sealing machine placed to the sides of the workers working on the auto-bagger is also not properly situated which causes a lot of awkward twisting motions for the worker. The sealing process looks like this:

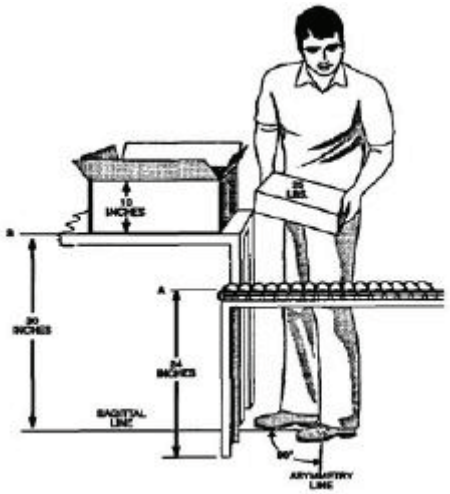

Figure 3. Layout of Work Area for Packaging
Source: Waters et al, Applications Manual for the Revised NIOSH Lifting Equation (p 80)

Meanwhile, for the on-line inspection workstation, there is also a problem with the posture and chair provided for the inspector while working. The chair doesn't have a backrest and a footrest that is large, stable, and adjustable in height and slope. And most of the time, the inspector is standing while he/she randomly inspects Product H and then she bends every time she selects a diaper to inspect because the opening where she gets the diaper is placed on slightly above the knee level.

It can be concluded that poorly designed workstations are one of the main causes of low back pain complaints of the workers.

CTD Risk Index

The Cumulative Trauma Disorder (CTD) Risk Index is then computed for all the tasks to determine which of the tasks is/are the most prone to CTD. CTD risk analysis sums risk values for all three major causative factors into one risk score. A frequency factor is determined by the number of damaging wrist motions, and then scaled by a threshold value of 10,000. A posture factor is determined from the degree of deviation from the neutral posture for major upper extremity motions. A force factor is determined form the relative percentage of maximum muscle exertion required for the task, and then scaled by 15 percent, the maximum allowed for extended static contractions. A final miscellaneous factor incorporates a variety of conditions that may have a role in CTD causation. For relatively safe conditions, the index should be less than one.

The values of the force determined for each tasked were rough estimates since the analysts don't have the proper tool to measure the forces required for each task. The analysis was based on the observations made by the proponents during their visits in The Company. The table below summarizes the calculations performed for each job. The individual calculations are found in the Appendix.

Table 2. Computed CTD Risk Index for each task

Type of Job	Frequency Factor	Posture Factor	Force Factor	Miscellaneous Factor	CTD Risk Index
Bulk Packing	0.40	0.80	2.33	0.33	1.092
Auto-bagging	0.54	0.90	1.67	0.33	0.965
Manual Sealing	0.45	0.80	1.67	0.33	0.9080
Automatic Sealing	0.3375	0.40	1.67	0.33	0.7543
Inspection	0.55	0.80	1.67	0.33	0.9380
Box Stacking	0.27	0.70	2.13	0.33	0.963

The results show that the most prone to CTD and the most risky task is manual bulk packing. The next most risky job is manual sealing of boxes. It can be seen that most of the manual jobs are riskier than the ones where a machine assists in doing the job. The least risky of them all to CTD is inspection. This is of course expected since the inspector's job is not as physically demanding as the other jobs.

All the jobs, except manual bulk packing, have indices of less than one which means that they are *relatively* safe from CTD. This must be verified by The Company since the values of the force factor which contribute a relatively large value to the computed indices are only rough estimates.

Noise Levels

The production area for Product H has a very high noise level. The source of the noise is the machine itself and there is no way to eliminate this because this means shutting down the machine entirely. All the workers are subjected to noise levels of 90-91dB the entire eight hours of their work. The workers, though, are provided with earplugs for hearing protection. But some of the workers, the analysts observed, do not use this earplugs to protect themselves from this ear-damaging noise level. They are sometimes unmindful of the noise surrounding them.

The earplugs effectiveness is measured quantitatively by a noise reduction rating (NRR). To compute for the reduction in noise level, we use the formula:

New Noise Level = Original Noise Level – (NRR-7)/2

The earplug that The Company provides for its workers has an NRR of 33. The computation for the new noise level given that The Company has a noise level of 90dB in the Product H

production area is 77 dB, which is lower by thirteen decibels. But typically, in a real-world setting, with hair, improper fit, etc, the NRR value is going to be considerably lower.

The possible outcome for the workers who don't use their earplugs while at work is hearing loss. As the exposure time increases, especially where higher intensities are involved, there will eventually be impairment in hearing. Nerve deafness is due most commonly to excess exposure to occupational noise. Individuals vary widely in their susceptibility to noise-induced deafness.

CONCLUSIONS AND RECONNENDATIONS

After evaluating the manual handling practices in The Company using the three tools and observations, the most problematic tasks are manual sealing and both packing tasks (automatic and bulk packing). These tasks have bad workstation designs and they entail excessive bending and twisting motions. Manual sealing is particularly awkward because the worker is bent most of time, the back angle being 45º to 90º.

The workstations of the on-line inspector and the auto-bagging process (both packing and sealing) are found to be in need of redesigning to fit the worker to the workstation. Another thing that can be identified with the workplace design is the distances of the equipment or machines or tools from the worker. It should be within the reach of the worker and should be designed or laid out such that awkward movements and postures will be minimized, if not eliminated entirely.

We said earlier that workers switch over jobs during the 8-hour shift. This is a good thing because it will minimize worker fatigue from doing a single, sustained task. And it is also very flexible in that once bottlenecks occur in the packing of diapers, the others can help to remedy it.

For the auto-bagging task, The Company should reconsider redesigning the depth and height of the bin. They could also provide a chair for the auto-baggers so as not to tire the workers easily fromstanding for long periods of time. They can also opt to add another worker to assist in the sealing of the boxes so that the auto-baggers will not do the dual task of packing and sealing concurrently.

We propose a redesigned workstation for the auto-bagging process (packing and sealing) which can be seen at the figure below. This alternative requires that The Company buys another sealing machine (which is costly). In this workstation, the auto-baggers still do the sealing of the boxes.

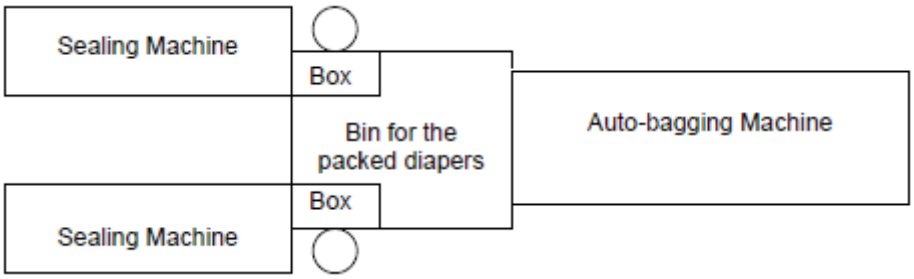

Figure 4. Proposed layout of workstation for auto-bagging process (option 1)

A cheaper alternative is for The Company to hire another worker that is tasked solely to do the automatic sealing of the boxes. He will get the boxes from both auto-baggers. This will avoid excessive bending and twisting motions for the auto-baggers and this could also prevent bottlenecks in packing since they will only concentrate on their task. The workstation design for this can be seen on the figure below. The baggers should be provided with comfortable chairs (with a back rest and an adjustable foot rest).

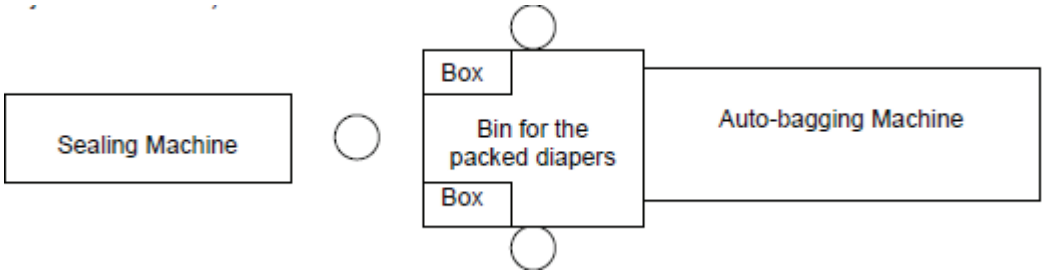

Figure 5. Proposed layout or workstation for auto-bagging process (option 2)

For the on-line inspector, he/she should also be provided with a comfortable chair (with a back rest and an adjustable foot rest) that is placed near the opening where he/she gets the diaper for testing. It is not advisable to redesign the height of the opening because it is dependent on the positioning of the huge machine. To place the opening higher means redesigning a big part of the machine. For the manual sealing task, The Company should provide a table where the sealer can prepare and seal the boxes. This will eliminate the excessive bending brought about by the current manual sealing practice.

ABSTRACT

Purpose: *Nowadays higher education (HE) meets a number of challenges, global, systemic and local: international competition, competition between public and non-public sectors, competition inside the sectors, growing expectations of the market, population decline, insufficient funding, etc. Higher education institutions (HEIs) must be effective to succeed in research, to provide best academic practices and high quality of studies.*
The purpose of the paper is to present the concepts and results of Program "Benchmarking in HE" conducted by the Polish Rectors Foundation.
Methodology: *Benchmarking is crucial for the whole HE system as the method of searching for best practices that enables the achievement of the best results by learning from the others, using their experience and collaborating with them. To be appropriate to HE system, research methodology includes external benchmarking and benchmarking of processes. Also open method is used, so the project beneficiary is the entire system of Polish HE.*
The benchmarking system applied by PRF monitors a wide range of quality and efficiency characteristics of Polish HEIs.
Findings: *Research program "Benchmarking in HE" studies and evaluates Polish HEIs performance through comparative institutional learning approach providing them with crucial information, promoting wider environmental networking, increasing efficiency and improving their international competitiveness, etc. The benchmarking research program consisted of 5 projects that can be grouped into studies aspects (e-learning, quality assurance systems, studies flexibility, National Qualifications based on European Qualification Framework and managerial ones (university governance). Each project results in a summary report providing not only analytical survey, but also practical recommendations.*
Value: *Benchmarking being a part of good governance principle in HE is valuable research both in Poland and internationally (e.g. European Benchmarking Initiative). Our benchmarking program boosts quality of Polish HE system, university strategic profiling and performance improving for ensuring the life-long-learning principles in Poland.*

PURPOSE

Nowadays higher education (HE) meets a number of challenges at global, local and systemic level: international competition, convergence of public and non-public sectors, competition inside the sectors, growing expectations of the labour market, population decline, insufficient funding, etc. All those factors are becoming increasingly important catalysts for the situation in higher education. Their impacts will depend on the performance of the HEIs; the international position and prestige may be a prerequisite for the successful acquisition candidates and entering the local market with various educational offers.

The ongoing implementation of the Bologna Process in Europe, including Poland, prompts comparisons with international competitors and efforts to match their standards, while also opening up to the European market to Polish higher education institutions, whether public or non-public, especially the more renowned ones and those which are already gearing up towards European expansion. The competitiveness of Polish HEIs should be significantly boosted by the comparable quality of their curricula contents, providing best academic practices and high quality of studies, comparable levels of education process achieved thanks to ECTS, diploma supplements and evaluation performed with modern management tools [1].

Due to external dynamic changes in the academic environment the efficiency of the adjustment processes in tertiary education requires, on the one hand, to provide the autonomy of higher education institutions in order to ensure the ability to solve problems effectively on their own, and on the other hand, to equip the minister responsible for higher education with tools enabling him to regulate and supervise the higher education system. Both of these conditions are now met in Poland by the Act on Higher Education [2].

However, it is essential to provide rectors with professionally compiled and maximally comprehensive governance-related information creating more opportunities for successful development of the HEIs in competitive higher education environment. Taking into account the trends and processes at the international level, it is expected that the academic institutions – in order to be successful in the European higher education and research area – will have to be both slow in changes in some areas, and dynamic and profound in the others. The harmonization of such activities in higher education is a challenge for university managers.

One of the ways ensuring evaluation of university performance, diagnosis of the institutional strengths and weaknesses, priorities and specific targets definition as well as being a tool for boosting the university competitiveness is the use of benchmarking methods in higher education.

It's worth to mention that academic benchmarking is declared a strategic tool for university management in a number of European documents:

• Document of European University Association – The Lisbon Declaration – Europe's Universities beyond 2010: Diversity with a Common Purpose*: Governments are urged to benchmark progress against target levels set in relation to both autonomy and funding of universities. Universities will strive to reinforce further leadership and strengthen professional management*.

• Communique of Ministers responsible for Higher Education of European countries – London Communique: Towards the European Higher Education Area: responding to the

challenges in a globalised world: *Priorities for 2009: (...) Data collection: we recognize the need to improve the availability of data on both mobility and the social dimension across all the countries participating in the Bologna Process.*

Benchmarking has emerged in the sphere of business and it has been widely used in industry, finance, transport, retail, services, etc. aimed at quality improvement, discovering work optimizing ways. In Europe, the use of benchmarking as a tool for improving performance both in the private and public sectors has also been supported by the European Commission (DG Enterprise) for more than ten years Benchmarking initiatives were started in the late 1990s such as a benchmarking group on competitiveness, a European Benchmarking Forum and a High level Group on Benchmarking. A Benchmarking Coordination Centre was also established to provide support with data and resources. In 1998 the Great Britain Commonwealth Higher Education Management Service published a research paper „Benchmarking in Higher Education" having particular reference to the higher education of the United Kingdom, Europe, Australia, and North America.

The first EU-funded benchmarking project "European Benchmarking Initiative in Higher Education" was conducted in 2006-2010 and implemented by four partner organizations: the European Centre for Strategic Management of Universities (ESMU), the Centre for Higher Education Development (CHE), the International Centre for Higher Education Management (ICHEM), University of Bath and the Institute of Education (IoE), University of London. The Initiative was designed to help modernize higher education management and to promote the attractiveness of European higher education. The European Commission's view was the benchmarking would be a modern management tool to progress with institutional reforms, increased operational efficiency and the capability for innovative changes to adapt to new challenges in their environment [3].

In the framework of this EU-project a number of papers and books were published, including „Practical guide on Benchmarking in European Higher Education" (2008), and „A University Benchmarking Handbook. Benchmarking in European Higher Education" (2010).

In 2010 the new on-line benchmarking research project named "Global Research Benchmarking System" (GRBS) was started by United Nations University International Institute for Software Technology and the Centre for Measuring University Performance. In 2012 the research covered higher education establishments in Asia-Pacific, the USA, Canada and Europe (27 EU-member states plus Norway and Switzerland).

Following to European trends, benchmarking researches on the national level were held in some European countries and in the USA, Australia, etc. In Poland for the first time benchmarking in higher education on broader scale was used by Polish Rectors Foundation (PRF)[1] within the Program "Benchmarking in higher education", which is being carried out since 2007. Thus, *the purpose of this paper* is to present the concepts and results of research PRF program mentioned above in the area of education and training.

[1] Polish Rectors Foundation working together with Institute of Knowledge Society has been evaluated by Polish National Rectors Conference (CRASP) as a leading think-tank in research into HE in Poland.

METHODOLOGY

Benchmarking is crucial for the whole HE system as the method of searching for best practices that enables the achievement of the best results by learning from others and use their experience. Benchmarking is based primarily on the identification of best practices and their creative adaptation, which excludes the possibility of copying. The direct purpose of this method include: better processes identification, comparing with others, identifying strengths and weaknesses on the background pattern, learning from others, and boosting working practices. Indirect objectives of benchmarking are development of management skills, overcoming reluctance to ideas generated outside the institution, increase of students' satisfaction and competitive advantage [4].

Based on the criteria of subject benchmarking can be subdivided into internal and external (which can be competitive and general). Internal benchmarking is used in large organizations with complex organizational structure. Due to the specificity of the "Benchmarking in higher education" Project, we have selected the method of external benchmarking, comparing different higher education institutions.

From the point of view of the goal criteria, benchmarking can be: of results (comparison of the results gained in any subject sphere), processes (comparing procedures and processes occurring in the institution), and strategic (comparing operations at the strategic level). In the Program "Benchmarking in higher education" we are using benchmarking of processes.

Benchmarking can also be carried out using two methods: closed and open one. Closed method is used for a specific group of entities, often paying a fee for the opportunity to participate in the survey, and aims to increase their individual competitiveness. This means that beneficiaries of the benchmarking are only the organisations participating in the survey (and only them have access to its results). In our Program we are using the open method. In this case, the university group voluntarily participates in the research, and are not subject to any fees. Findings of the survey are publicly available, however in anonymised version. As a result, the main beneficiary of the project is the entire system of higher education, and the research is carried out to improve its competitiveness (and not only selected organisations).

The benchmarking system monitors Polish higher education institutions based on a variety of criteria. A wide range of relevant quality and effectiveness characteristics are taken into account, having to do with the current state of the institutions, their tasks and resources, strategy and competitiveness, performance and development perspectives, both domestically and in relation to European higher education institutions [5-7].

Data are gathered through all available channels of information. Specifically, the data are taken from publications by relevant Polish and foreign institutions, from online sources as well as from materials provided by HEIs based on special agreements relating to the benchmarking system [8,9]

Research carried out within the program "Benchmarking in higher education" is conducted with the use of questionnaires available electronically for the respondents in system KWERO, developed specifically for the Program. This system includes a central repository of data, which holds all the data needed to carry out the benchmarking process.

The surveying system KWERO allows differentiation of applications concerning many different issues: publishing surveys, further working with them, completing survey by proper respondents, surveys verifications by participants of steering committee experts, and so on.

There are 4 types of applications in the system:

- the client application - allows access to the database (filling in questionnaires, review of results, etc.);
- the analyst application - allows to define questionnaires, export of data and support the process of filling questionnaires;
- the administrator application - manages users access rights;
- the content manager application that allows publishing new content and structuring the site.

Access to specific functionalities of the system is determined on the basis of a system positions (roles) and permissions. The system differentiates several groups of users with different activity rights (e.g. users, analysts, administrators).

Data input into the system is mainly held by filling in the electronic users surveys and also by placing the data available from external sources. Completed questionnaires are stored in the database after approval by a data entry supervisor [10].

FINDINGS

Research program „Benchmarking in HE" studies and evaluates Polish HEIs performance through comparative institutional learning approach providing them with crucial information, promoting wider environmental networking, increasing efficiency and improving their international competitiveness, etc.

Therefore the program aims are to develop and launch a benchmarking system providing public and non-public higher education institutions as well as other interested organizations (such as institutions conducting rankings) with advanced governance-relating information. It is also important to respect the principle of access confidentiality, allowing to detect the factors affecting the competitiveness of stakeholders: universities and their associations, consortia, networks, universities, etc. with regard to international relations.

The benchmarking research program consists of 5 projects that can be grouped into 2 types:

Group 1. Studies issues:

1) Benchmarking of e-learning processes (31 participating universities)
2) Benchmarking of processes related to internal quality assurance systems (33 participating universities),
3) Benchmarking of processes of studies flexibility (32 participating education establishments),
4) Benchmarking of processes related to the implementation of the National Qualifications Framework (48 participating universities).

Group 2. Managerial aspects:

1) Benchmarking of process of university governance to improve productivity and competitiveness - management control (37 participating education establishments)

Each project results in a summary report providing not only analytical results but also practical appliances and recommendations.

In this paper we will discuss some findings from benchmarking of processes related to internal quality assurance systems and benchmarking of processes of studies flexibility.

1. Benchmarking of internal quality assurance systems

1.1. Context and goals

The Bologna Process, which from the beginning at its foundation has been closely associated with the issue of lifelong learning, entered a new stage with the adoption of the Recommendation of The European Parliament and of the Council of 23 April 2008 on the establishment of the European Qualifications Framework for life long learning (EQF).

The formal objective of the EQF is to establish a common European system of relating of the various countries' national education (qualification) systems to a common reference framework and accordingly facilitating mobility between them. EQF has revolutionary significance in the word „qualification" that means that the factor for comparing national systems will not be the input criteria, describing the content of the curriculum and requirements for staff and a learning process, so-called learning outcomes: the scope of actually acquired knowledge, skills, and so called soft skills – attitudes, the acquisition of which can be associated with a given level of education. Such approach obviously means a huge change in the way providing research and information on the quality of education, and the implementation of appropriate quality assurance system is essential for entry of the university into the qualifications framework system.

The research related to the advancement of quality assurance and reasons for application of this approach was of innovative character. The main difficulty stemmed from the fact that structured set of rules for the creation and operation of such systems were not refined in Poland. The authors faced with a challenging task of measuring the level of advancement of a very diverse set of internal quality assurance systems in HEIs, implemented at different times, focused on achieving different goals and, what is crucial, usually introduced without awareness or taking into account of the requirements of the adopted by Poland obligations related to the implementation of the Bologna Process.

1.2 Results

The results of this research, conducted in 2008, showed that all Polish universities have established the rules (e.g. in the Statutes or Regulations) on the number of learning groups, but at the same time, however, only 64% of institutions regulate the ratio of students to teachers, and 85.7% - the number of graduates conducted per a promoter in a given academic year. Particular procedures were also introduced defining the bases that are periodically reviewed and changed (93% of responses).

It's interesting, that 14% of institutions did not provide rules on the form of a thesis (monographic, experimental, etc.), and 7% - its format.

All universities have declared conducting systematic surveys of students, analysis of their results and their dissemination of among the university staff. Our research showed, that there are strong differences between HEIs in the form of collecting those data (electronically - only 57% of universities) and the way in which evaluation sheets are being prepared (again, only 57 % of institutions committed to the professionals). It could be assumed that the HEIs collecting data in the form of paper only, applying unprofessional questionnaires are not able to properly analyze the collected data.

The mass character of contemporary tertiary education makes the need for mechanisms to promote attitudes of special commitment in the teaching process, and their introduction and activity certainly is an important part of quality assurance systems. The responses to the questions on those issues in the survey to a large extent confirm the formal and declarative support for involvement of teaching staff into educational activities. The majority of universities declared that the outcome of the assessment of university professor only to a relatively small extent, influences the final assessment of his work. Universities, however, usually have a system for defining people with the great achievements in teaching.

Both the currently binding legal regulations and the recommendations clearly indicate the need for an external evaluation of the quality assurance system as a condition for the credibility of declarations applied by the universities in particular procedures and mechanisms. By the Law universities in Poland are subjected to control of Polish Accreditation Commission (OAC) . However, as our research shows accreditation obtained outside PAC is not that common. The research revealed that 28.6% of HEIs had not received any accreditation of this kind, while one of the universities had got 25 accreditations.

Flexible design of study programs and ongoing adjustment to the needs of the wider external environment is one of the most important manifestations of the fulfillment by the university of its social mission. Our results confirmed the generally known fact that Polish universities have small, but still growing flexibility of programs. The deeper analysis, however, considers the case of two or three schools offered a very large number of new fields of study and / or specialty running since the academic year 2005/2006 (from 65 to 69).

All universities participating in the survey responded positively to the questions on the existence of collegiate bodies engaged into the plans and programs of study, and certainly they comply with the truth, because by law the programs and plans of studies conducted at universities are approved by the collegial bodies.

Polish HEIs have already experienced the effects of international competition (significant drain of prospective students), and in the coming years, awareness of the need to build the competitive position not only at the national level but also internationally, will be a necessary condition for their proper functioning. In this context, it is interesting that 42.9% of HEIs declared that in their development plans and training programs they address the international models and benchmarks.

The next important factor influencing the range of programs and ensuring the quality of its implementation in the coming years will be the new organization of training requirements resulting from the introduction NQF and the need to ensure the reliability of the declared learning outcomes. The way to achieve this objective and the external acceptance of the

program offer by candidates for studies and employers, will be transparency of programs and procedures created with the support of external stakeholders. Thus, interesting and relevant to the assessment activities in these areas is the declaration of more than 50% of universities seeks for such support.

The mobility of students and the internationalization of the university is one of the flagship objectives of the Bologna process. The survey revealed that the universities appreciate the significance of the mobility on both a domestic and international level. In fact, only one HEI reached the rate of 5% students participating in the exchange programs between universities, but actually low activity of students in terms of participation in international seminars and schools has been observed.

Analyzing the efficiency of search and recruitment of foreign students we found that it is hard to consider all universities participating in the study. Two leaders are the medical HEIs, where the situation is quite different from the universities outside this sector. Our conclusion was, that in the future, with a considerable interest, this kind of HEIs should be analyzed separately. Perhaps it would be advisable in this case further to differentiate the universities in the survey according to their specific sector.

A small number of HEIs declaring their joint diplomas with foreign universities (28.6%) confirms the existence of systemic problems in the development of such initiatives.

The proper and wide use of ECTS could be an important indicator of the effectiveness of internal quality assurance processes. As research demonstrated, the majority of Polish universities implemented it on the initial stages, often doing it in formal way and considering as an additional administrative requirement than for process improving and optimizing the curricula and syllabi.

Periodically made assessment of the implementing of the Bologna process indicates more or less satisfactory progress. Remembering that an essential prerequisite for the introduction of two-cycle was promotion of the horizontal and vertical mobility of students and we should highly evaluate the information obtained from the survey, which shows that in many universities introduction of this system significantly created the conditions for such mobility. At the same time, a considerable difference in answers demonstrates the value of such a specific benchmark for positioning university in terms of advancement of the „bolonization" of the education process and thus creating of a new quality.

Taking into account the requirements of university responsibility for the credibility of the declared learning outcomes, the collected information on documenting, monitoring and maintenance of the system and its accessibility for different groups of stakeholders appeared to be valuable. This study was the first attempt to develop a method of determining the measures to enable benchmarking processes related to internal quality assurance systems in higher education. At least a few factors makes this task very difficult. Firstly, the issue of internal quality assurance systems in the majority of Polish universities still remain rather innovation than routine action. Second, the educational institutions have never received external support in developing of such systems. Thirdly, the economic conditions and changing legal framework does not encourage so far to take a long-term and systematic

measures for the quality of education and support of these activities effort to provide adequate logistical support.

2. Benchmarking of processes of studies flexibility

2.1. Context and goals

The problem of flexibility of studies was identified as especially interesting during the research conducted in 2008. Furthermore, since 2008 a lot of innovations have been introduced to Polish higher education system, and thus it was important to analyze those changes in the context of previously obtained data.

The flexibility of the studies is based, generally speaking, on the existence within it the certain extent of freedom, allowing its functioning more effectively than its failing. The flexibility of the study system is its gradable feature: in this regard we can speak of a more or less flexibility in the educational system, as well as the elasticising. Flexibility is a multidimensional feature of the education system: determining the degrees of autonomy may in fact appear in different elements of the system.

Studies flexibility means flexibility of the structure of the studies systems, the flexibility of the programs and the course of study. In the first case, the system provides a possibility to choose the level of qualification obtained at the end of the training, the possibility of design learning paths during the study, and the possibility of reducing curriculum.

Studies flexibility must provide a correspondingly wide range of elective subjects individualizing process of studying (for all students) and the procedure to create individual study programs that meet the minimum requirements for learning outcomes. Each subject should be related to the program (the content) and a number of attributes to enable efficient and reliable creation of individual programs. The set of such attributes include:

- number of hours of study divided into various forms of teaching,
- the number of credits assigned,
- a list of required preceding courses (the predecessor),
- a list of similar themed courses (courses are formally equivalent and that can't be chosen alternatively if student passed the exam),
- a form of assessment,
- the nature of the subject from the point of view of curriculum requirements.

The use of thematic classes when formulating the curriculum requirements is that the set of thematic classes, corresponding to the areas of knowledge important from the point of view of the completeness of the education, and then for each of these classes is determined by the minimum number of credits that a student must pass (in addition, may also be a specific set of compulsory subjects in this class). Requirements relating to particular thematic classes are supplemented by a general requirement to obtain a certain number of credits for all years of study together - are summed points assigned to all the classified objects.

The creation of thematic classes enables students to do the overview of the program, as well as foster:

- definition and consistent use of common terminology and conceptual apparatus of the objects belonging to the same class;
- coordination of the implementation of the content and form of subjects belonging to the same class, in particular the reduction of unintended redundancy (the same content in multiple subjects) and development issues of under-represented in the curriculum;
- the interaction of departments dealing with related subjects, and operating under different organizational units (departments, institutes, HE establishments).

The flexibility of the course of study, which is an important element of the studies flexibility, includes the opportunity to study according to an individual plan of study in subsequent semesters and the possibility of accounting the student achievement (using ECTS) in periods longer than one semester. Both of these solutions help students to adjust their charges in particular study periods, and thus, the pace of study to their needs and abilities.

The main objective of this study was to illustrate the rate of flexibility at the universities operating in early 2011, under the Law on Higher Education in 2005, just before the implementation of the National Qualifications Framework. 32 Participating HEIs sent questionnaires for 208 basic organizational units (mostly – faculties).

2.2. Results

As we can see from the data many HEIs do not provide mechanisms to prevent duplication of content of elective subjects. The problem appears to be much larger at the universities (67%) than at technical universities (30%). The lack of such a mechanism could lead to violations of the assignments of credits to student achievement and a waste of financial resources allocated to education.

The vast majority of surveyed HEIs (90%) allow students to change the direction of the study during the period of their education. The data also showed that the idea of continuing education and lifelong learning (LLL) is still met with limited understanding: other than postgraduate courses and specialized forms of this training are offered by only 7-8% of the surveyed universities.

The results also allow to assume that the structure of curricula is very often determined by the structure of the teaching staff, the curriculum traditions and / or infrastructure limitations rather than the result of a deeper optimization of learning outcomes that these programs are designed to provide. Only partially the outcomes can be justified by the existence of the education standards and the belief that they are sufficient to systematize the content scheme. The situation is better at technical universities.

One of the most interesting findings was that high percentage of respondents offer training in macro-fields (9%), unique (11%) or interdisciplinary studies (10%). The corresponding figures for the universities (12%, 22% and 14%) are significantly higher than for technical institutions (9%, 1% and 7%).

Concerning quality issues, data obtained from answers to questions about the number of ECTS credits for compulsory courses (83%) and elective ones (14%) indicate how rigid generally are the 1st-cycle programs offered by the surveyed HEIs. Likewise, the 2nd-cycle study provided by responding universities are only slightly more flexible (20% subjects chosen by the students). It is even more surprising, since the studies of 2nd level are supposed to be integrated into the research and Master thesis' topics should be related in some way to research projects carried out by the academic staff

The curriculum of the 1st-cycle education dedicated to especially gifted students are only slightly more flexible than programs for all students, with the appropriate indicators, designated for universities (16%) are slightly worse than the average (28%), and the indices determined for the technical university (29%) are slightly better. In the case of the second cycle programs, curriculums dedicated especially to gifted students are generally much more flexible (54% ECTS for elective subjects) than obligatory programs for all students. It turns out, however, that it does not appear to be true in the case universities (only 21%).

In general our research showed that Polish HEIs are embracing opportunities introduced by implementation of NQF. Since first wave of surveys in 2008 a lot has changes in the area of studies – universities are more used to the idea of Bologna Process, however some of them are more ready for the upcoming reform (especially for the freedom of defining study programs on their own) then others. That's why Polish Rectors Foundation has decided to conducts third wave of surveys - benchmarking of processes related to the implementation of the National Qualifications Framework, which is currently at its final stage.

VALUE

The Program has provided us strong analytical data and informational characteristics of different HEIs for new findings concerning positioning of Polish HE, more successful grouping, internal and external university rankings. The research discovered a kind of map of HEIs using criteria for quality of studies and quality of management that is critically essential for education as a system and studying process, as well as for the strategy of Life-Long-Learning development in Poland.

Benchmarking of HE in Poland is valuable research both in Poland and internationally. The benchmarking boosts competitiveness of Polish HE system, university strategic profiling and performance improving.

BIOGRAPHICAL

Professor, PhD, DSc in Electronics Engineering Since 1973 he has been working in Faculty of Electronics and Information Technology of Warsaw University of Technology where he passed by all levels of academic career from assistant to full professor. His scope of research activity covers electronics and the issues connected with knowledge society and knowledge based economy.

In the years 1996-2002 he was the Rector of the Warsaw University of Technology.

Until now he has performed the duties in many prestigious scientific organizations inter alia as the member of the Presidential Board of the Polish Section SPIE, Currently he is the President of the Polish Rectors Foundation and the Director of the Institute of Knowledge Society.

Mariusz Luterek, PhD, is an associate professor at Warsaw University (Institute of Information Science and Book Studies). Since 2004 he closely works with Institute of Knowledge Society (IKS) and Polish Rectors Foundation (PRF), where he participated in many projects in the area of higher education, e.g. “Benchmarking in higher education”, “Strategy for Development of Higher Education in Poland 2010-2020”. Since 2012 he is Scientific Secretary at IKS.

Iryna Degtyarova, PhD, is an associate professor at Oles Honchar Dnipropetrovsk National University (Faculty of Ukrainian and Foreign Philology and Study of Art), and a Vice-Chairman of Dnipropetrovsk Oblast Council of Young Scientists. Her scope of research activity covers linguistics and higher education policy in Ukraine and EU. Since 2012 she has closely worked with Polish Rectors Foundation (PRF), now she is a holder of PRF scientific scholarship.

BRAND AND CORPORATE IMAGE OF A SPORT ORGANIZATION AS A FACTOR OF BUILDING LOYALTY

Agnieszka Rak, Strategic Management Department, Faculty of Economics, Wroclaw University of Economics, Poland, agnieszka.rak@ue.wroc.pl, rak.agnieszka@gmail.com, +48 501 793 391

ABSTRACT

Purpose:*The aim of this paper is to highlight the importance of focusing on customer loyalty on exaple of Polish sport organisations which neglect this area in their marketing strategies. For members of sport organisations who provide a balanced healthy lifestyle or fans and supporters who are a part of a TV or stadium audience sport means strong emotions, love for the game, competition and values they share. Sport organisations give their customers opportunities to practise their beliefs and engage in rituals that develop and strengthen connectivity to their ideologies and the brand, too (Head et al., 2012, p. 209). It is also proofed that corporate reputation may effect satisfaction and loyalty of consumers (Chun, 2005, p. 91). Strong brand and the good reputation have become an important beneficial attribute of an organisation nowadays (Davies et al., 2010, p. 530). When, on the other hand, poor performance of the organisation (or an athlete or a whole team in case of sport industry) may destroy its reputation and cause poor self-esteem not only of employees or members but most importantly of customers (fans and supporters) (Arnett et al., 2003, p.92). Fans can be also a public relations mechanism who spread the word through word-of-mouth (Hopwood, 2010, p. 140). That is why sport organisations should concider their fans as customers for whom brand and organisational image are factors strenghtening loyalty that also play important part of their lives.*

Design/methodology/approach: *Customers (also fans of Polish football teams) were sampled (N=150), with qualitative and quantitative results suggesting that there are many factors influencing reputation of Polish football teams what builds (often a negative) an image of the whole discipline in Poland.*

Findings: *The research revealed that even though football is the most popular sport among Polish fans, even those loyal fans do not share only positive opinions of their favourite teams (also in case of management). In their opinion football clubs do not focus as much as they should on customer satisfaction, which does not attract potential customers.*

Originality/value: *Most of researches focus on business performance, financial stability of sport organisations, and effectiveness of sponsoring or media attention in Poland. There is almost none attention paid on fans and supporters as consumers. The study shows an importance of implementing business strategies in polish sport organisations that focus more on customer, building loyalty and attracting customers. Managers of those organisations should concentrate on customers as much as they focus on sport results. They should consider the game and a team as a product (or service) that has to be presented on the market properly.*

Keywords: image, brand, reputation, sport, organisation, loyalty

INTRODUCTION

Football is the most popular sport discipline in Poland. According to results of a research in run annually by ARC Rynek i Opinia (2013, p. 6) almost 60% of people in Poland are football fans (38% are volleyball fans, 38% ski jumping fans and 29 are boxing fans). Football has a strong influence on Poles (brings values of fair play, desire for physical activity and becoming a sportsman, brings people together) also in case of purchase decisions (buying sponsors products or product offered by the club or team, watching and attending games, etc.). Strong emotional bonds between fans and their favourite discipline, team or a sportsman is what distinguishes sport on the market of all other goods and services. The mechanism of creating those relationships is very important for sport organisations. Fans identify themselves with an organisation (its values, qualities, interests, origins, tradition, etc.) and became ambassadors of its brand (Hopwood, 2010, p. 140). The importance of creating bonds between company and consumers is emphasised nowadays. The desired partnership between an organisation and its stakeholders leads to mutual trust and loyalty, that strengthen its position on a market (Morrison and Wilhelm, 2004, p. 1690). It is said that one of best and most successful marketing strategy is the one focused on maintaining and increasing level of involvement and loyalty of fans and participants (Kontogianni *et al.,* 2011, p. 15). Those relationships are created through displaying and promoting the brand of a product (team, sports man, stadium, event) or the entire organization constantly and consistently, and it often leads to loyalty. Strong brand is a very important asset of an organisation because is a carrier of values and ideas desired by consumers for enriching their lives. People, fans too, surround themselves with brands that became a fulfilment their lives or even personality.

The aim of this paper is to present how both brand and corporate image are important in a process of creating loyalty between sport organisations and their customers (fans). Power and Hauge (2008, p. 125) suggest “our tastes in brands are seen as social tools and indicators that work alongside a host of other symbols, objects, and activities as weapons and reflections of our identities and aspirations”.

Brand in sport

Brand is defined by American Marketing Association as the name, design, symbol or any other feature that identifies one seller's product or service as distinct from those of other sellers (AMA Dictionary). It is a tool of identification of the company and its offer on the market, and in the minds of clients it becomes a subjective image, which is called brand image. Brand image is described as “the perception of a brand in the minds of persons and is a mirror reflection (though perhaps inaccurate) of the brand personality or product being” (AMA Dictionary). It stands for what people believe, their thoughts, feelings and expectations towards a brand.

Both brand and its image make an offer real and enable to distinguish from the competition by proofing a quality and source. A positive brand image is important factor in consumer choices in purchasing process, because it makes those decisions easier to make. From the point of view of the company it contributes to acquiring new clients, caring about present ones, which determines the acquisition or maintenance of a strong market position. The brand is an integral part of the organization that constitutes a promise concerning the offered

features, functions and value of a given product or service (Mruk and Chłodnicki, 2008, p. 13). A strong brand is characterized by its familiarity and recognition by consumers, perceived quality, loyalty, as well as its visibility on the market. Brands functioning on the market become a kind of social glue that attracts and concentrate customers around them. Consumers search for brands that complement their lives with values, emotions, giving the status of consumption, which affects their lifestyle.

A special case of the brand is the one related to sports. It can be a brand of sports team (club), organisation, event, coach, product, professional league, equipment, facility or television programme, etc. This means that the concept of "brand in sport" is a broad definition and may identify commercial and social (non-profit) entities that offer services and products that satisfy needs in the scope of sport and recreation. What distinguishes the brand in the business of sport is the strength of its impact and ability to influence on emotions, as well as passion and commitment that unite fans/consumers by creating strong ties between them (Babiak and Wolfe, 2009, p. 722).

A strong brand can be characterised with five main attributes, which are: brand awareness, brand image, perceived brand quality, consumer loyalty and other brand assets (Witek-Hajduk, 2011, p. 40). Therefore, a strong brand is characterized by its familiarity and recognition by consumers, perceived quality, loyalty, as well as its visibility on the market. It constantly is influenced by changes taking place on the market and in the socio-economic environment of consumers and organisation itself. This means that to maintain a strong brand, an organisation has to manage and support relationships between the brand and consumers (loyalty) and take care about elements like image, quality and awareness, which are all related to performance of the organisation. Different aspects are important for consumers in purchase decision process. They may consider (Kuś, 2011, p. 161):

– the external appearance of people and place providing services and their image (hairstyles, clothing, interests, lifestyles, successes, products used and opinions of sportsmen as well as design, appearance, history, comfort, safety of a stadium, gym or court),
– the opinions of other consumers (ideologies, believes, customs of other fans, supporters or members),
– feelings as to direct contact with the company (experienced through meeting sportsmen, attending the game, contacting sport organisation, ticket or product purchase),
– promotional activities of the company (advertisements, memberships, merchandising, hospitality).

The convergence of those elements, therefore, also associations connected with the brand, determines its cohesion, which affects the unique brand image. Brands that have unchangeable external attributes over time (logo, colour, slogans, etc.) have a chance to permanently take root in consumers' awareness. This means that the consistency and durability of an image reinforces the familiarity of a brand and its strength (Gwinner and Bennett, 2008, p. 413). Fans become extremely attached to team symbols, colours and arms (they often brand themselves with “team” tattoo) so they do not accept any changes.
When a brand is recognised, known and accepted even by those, who despite not using it are aware of it, it is perceived as a market leader that achieves success, offering products or services of high quality. In such a situation the brand becomes something expected through its image and creates demand. Today, the consumption of goods, and mainly the values,

which they provide through its brand, is what connects people. Numerous examples of "consumer communities" can be identified that are integrated around the brands of specific goods and services, where buyers establish ties among each other through common interests, preferences and exchange of opinions and experience. A particularly active place of consumers jointly celebrating a brand is social networking services and events organized by companies for their customers (so-called "brandfests") (Avery, 2012, p. 149). The development of social networks depends on the activity of consumers and the need for exchanging information between them. While the organization of events by companies is a tool for building trust and loyalty of clients towards a brand.

Image and reputation of sport organisation

Image may be described as outsider's (fan, participant, client, partner, competitor etc.) perceptions of the organisation (Lahdesmaki and Siltaoja, 2010, p. 209). American Marketing Association Dictionary (AMA Dictionary) defines image as "consumer perception of a product, institution, brand, business, or person that may or may not correspond with reality or actuality". The concept of reputation is wider because if is a synthesis of the opinions, perceptions and attitudes of an organisation's stakeholders including employees, customers, suppliers and investors and community (Chun, 2005, p. 93). As Corley *et al.* (2000, p. 59) suggest, the reputation is a strategic concept which is centered on long-term impressions of the organization that are created corporate images (that exist as actions, media stories, advertisements, annual statements, events, games, publications) that may be intentionally or unintentionally shared by an organisation. Organisation can manage how others perceive it. Managers and academics believe that the image of an organisation (whether or not a company is seen as reputable) affects market performance (Davies *et al.*, 2010, p. 530). It means that having a good image and reputation becomes on of the most competitive advantages nowadays and sport organisations in Poland become more focused on managing it. Poor performance of an organization or in case of sport a team or a player can lead to poor self-esteem of fans, customers, even employees and sportsmen what may influence a corporate image and reputation (Arnett *et al.*, 2003, p.92).

According to Brown, *et al.* (2006, p. 101) there are four main perspectives of how an organisation may be perceived by internal and external stakeholders, which are:

1. Identity: members' and insiders' perception of an organisation. It is an answer to a question: Who we are as an organisation?
2. Intended image: elements and images that organisation desires to be associated with. It is an answer to a question: What does an organisations want others to think about the organisation?
3. Constructed image: values and images that an organisation believes it is associated with in minds of stakeholders. It is answer to a question: "How does an organisation believe it is perceived and associated with?
4. Corporate image or reputation: associations and reputation representing how is an organisation perceived by stakeholders. It is answer to a question: How is the organisation actually perceived by others?

Both image and reputation are influenced, to a certain extent, by the message the organization sends through its actions (the intended organizational image), it also depends on other outside sources (their opinions and attitudes), such as competitors, industry analysts, consumer

activists, the media etc. (Boros, 2009, p. 646). Corporate reputation affects behaviour of stakeholders who are very important for an organisation such as employees (influences retention), customers (their satisfaction and loyalty) (Chun, 2005, p. 91). In a model of customer based corporate reputation presented by Walsh *et al.*, (2009, p. 191-192) there are four factors to be analysed: customer satisfaction and trust which are predictions of a reputation, and loyalty with word of mouth behaviour that are consequences of corporate reputation. That means that organisations have to focus on customer orientation aspects and quality of offered services and products to maintain customer satisfaction and trustworthiness what may lead to loyalty.

Loyalty of sport fans

Loyalty towards a brand is the degree to which consumers maintain a positive attitude in relation to a given brand or organization, they are faithful and willing to buy its products or services, regardless of the changing economic factors, therefore, in a situation where it would be rational to benefit from a competitive offer (Witek-Hajduk, 2011, p. 184). This attitude is the subjective feeling of a given customer and is related to attachment to a given brand. Consumer loyalty towards a brand is defined also as extended trust. Loyal fans are those who hold favourable attitudes toward a sport organisation, recommend it and promote among other people and exhibit repurchase behaviour (Javadein, et al., 2008 , p.4).

Trust is a key value building loyalty of two sides, but maintaining the principle "concentrating activities on customers based on a set of values that place buyers on a pedestal and in the centre of attention" (Gulati, 2008, p. 87). The strength of loyalty towards a brand may arise from (Patkowski, 2010, p. 110):

– the consumer's assimilation of the feeling that a given brand best meets his/her needs and gives him/her unique benefits desired,
– creating an emotional tie between the consumer and the brand being the result of the brand having an impact on the consumer,
– matching the brand image to the personality and expectations of the consumer.

This means that at the moment the consumer makes purchase decisions, he/she subconsciously compares two systems of values - his/her own and that represented by the brand.

Enthusiasm, identification and passion for sports bonds fans (supporters) with sport organisations, teams, players and also other fans by building strong interpersonal relationships through experiencing different but strong emotions together (Hunt *et al.*, 1999, p. 440). Sport organisations give their fans opportunities to practise their beliefs (about a game, rules, fair play, strategy) and engage them in rituals (rooting, chanting, wearing teams' colours, watching game together) that develop and strengthen connectivity to their ideologies (Head *et al.*, 2012, p. 209). Passion and most importantly loyalty towards brands in sport can have an irrational basis because buyers are mainly guided by emotions and acquire products and services related to the brand (team, player, sport discipline, etc.) regardless of their prices, costs incurred or quality offered (Bühler and Nufer, 2010, p. 65). The typical fan will not change a club or player he/she supports over time due to momentary failure or decrease in form (Hopwood *et al.*, 2010, p. 144). The change of preferences, which may happen, is usually condemned by the surroundings and badly seen, and can result from low attachment

and submitting to a fashion for a given discipline, where successes are achieved at a given moment. The more a fan identifies with a team or sports organization, the more it is likely that over time the strong relationship between him/her and the organization or brand will turn into loyalty (Masteralexis *et al.*, 2012, p. 56).

Sport fans spontaneously make purchase decisions based on. Their behaviour on the market may appear irrational as they result from passion, the assessment of their own identity and the brand. From the point of view of behaviour of consumers on the market, fans are unique, because long-term loyalty is something that can be very difficult to achieve on other markets. Furthermore, fans make sure to constantly publicly emphasize their membership and preferences towards a club. Their statements, i.e. (Greenhalgh *et al.*, 2011, p.45): "I often watch, listen to, read about a given sport", "I have been a fan of this sport for a long time", "I know the rules of the game in this discipline" or "I'm interested in this sport". There are three main consumption behaviours typical for sport fans (Gray and Wert-Gray, 2012, p. 276):

- usage – in-person and media-based attendance (attending games, organised events, meetings of fans, rooting, meetings with team or sportsman, watching a game on TV or online)
- responsiveness to product merchandising (purchase of clothing and gadgets with team logo, name or colours, collecting team gadgets, media releases, autographs),
- word-of-mouth communication – fan talking about the team (with other fans, friends and family, encouraging other people to attending games.

However, in order for people to be loyal and willing to represent and promote the brand of a product (team or a sport organisation) it is necessary to awaken their passions through trust towards the brand, and is what the company is responsible for (Lobby, 2012, p. 19). Sport supporters may be divided into two main groups: television audience and spectators in a stadium or arena (Bühler and Nufer, 2010, p. 68). Fans that attend games may be oriented on consumption (they are not loyal to a certain team, because they only want to be entertained, spend their spare time and have fun), discipline (those are loyal and passionate fans, tracking results of their favourite team, analysing tactics and technical aspects) or an event (those are ground hoppers, ultras and hooligans who don't care about the match itself). Sport organisations should know and understand desires of their fans to be able to fulfil them and to build trust and loyalty. They also should decide on which fans they should focus are which are important for them. Fans considered as “ultras” always show support for their favourite team (not only at a stadium), but on the other hand they often discourage those people who are on consumption (with their attitude, vandalism acts and aggression towards competing team) and want to spend their time with friends and family in a friendly and safe place (they also consumers who are willing to buy gadgets, beverages food, and to pay for extra services).

Polish sport organisations are more aware nowadays and start to care more about their fans and members. Some of them focus more on inviting families to the games, condemning acts of aggression. They understand that loyalty of fans of important for them (it brings profits, attracts sponsors, and promotes teams by fans by word-of-mouth marketing). Football teams try to attract their fans and potential customers by offering loyalty programmes. Fans are able to get club cards that let them get discounts and buy tickets for games. The truth is that those initiatives do not build trust and loyalty but rather destroy the brand and lower brand equity. They encourage fans to profit from discounts only (Muller, 2012, p. 13).

Sport is often considered as powerful tool for community building (Warner *et al.*, 2012, p. 1000). It may also yield images of healthy lifestyle that may be distributed among community members. Sport organisations are aware of it and often decide to encourage social responsibility of supporters and participants through activities that involve supporting community or charitable societies (Ratten, 2011, p. 766). That involvement brings benefits and positive effects for both sport organisation (better organisational image, loyalty and stronger relationship with community and fans) and the community (integration, support, awareness, health, patronage intentions of sport consumers, emotional relationship with the sport organisation) (Walker and Kent, 2009, 759).

FINDINGS OF THE RESEARCH

Presented study has a preliminary character. It highlights which factors influence perception of brands of Polish football teams as well as what does loyalty mean for fans. During quantitative research fans of sport organisations (football clubs) were sampled (N=120). Men and women between 20 and 32 years old were surveyed. Those young people represent generation of conscious and independent consumers, for whom sport plays an important element of life.

Almost half (42%) of surveyed fans support specific team usually because it is from the same region or city they live (Take in Figure 1.). Smaller group of people admitted that they are fans because the team succeeds and has excellent sport results (20%) or it is open for cooperation with fans (13%). It is possible that people more often are loyal to local sport teams who they can relate to (they have the same origins, traditions, history, values, relatives used to be members or players, or parents are or used to be fans of). At the same time they show support to a different or even foreign team whose successes, team members, coaches, tactics and skills are outstanding and are in some way a role model. Fans express their loyalty towards a team with strong emotions (with acts of loyalty like: wearing teams colours, having team gadgets at home, in a car in a place visible to others, tattooing their body with team logo, writing posts about the team online, joining supporters organisations) and sometimes it becomes similar to religion (believing that the team is the best one, singing songs with other supporters, joining rituals, fighting for a team). Nevertheless, they admit that they understand that football clubs focus on financial profits the most, and this main goal is followed by entertaining the society, sport education, development of sport and serving society as the least important. According to the findings of presented research, actions taken by football clubs and sport organisations toward communities (also socially responsible activities) are usually local. Even sport organisations run nationwide events, customers (fans) note, take part in and remind those local ones. It is possible that football clubs in Poland focus more on getting involved in local rather than nationwide initiatives because they understand importance and impressiveness of the bonds with local communities or it is due to limited budgets they manage. It is understandable that as members of local communities they focus on solving local problems. In opinion of respondents of the research, focusing on local initiatives is a good direction for sport organisations in Poland. This way football teams may show their respect and build loyalty and strong bonds with fans on values like trust, origin, history and tradition, and that is why they support them locally. The survey revealed that fans believe that social activism of football clubs is a great opportunity for them to improve image among those who are not fans and supporters.

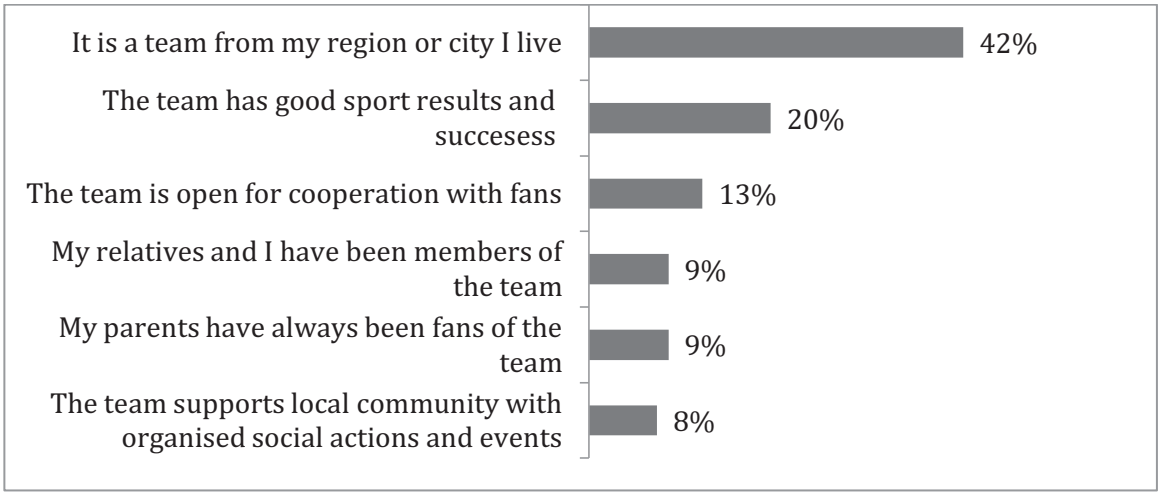

Figure 1. Reasons for supporting specific Polish team

Respondents were also asked about ways they support their favourite football team and were choosing the most suitable statement for them (the statements were representing attitudes of a fans) (compare Figure 2.). Most of interviewed fans support not only Polish teams but also foreign ones. They more often watch games at a stadium than transmissions of games on TV. Study show that in is important for fans to watch and attend games to be able to show their support, integrate with other fans, and to track sport results and meet with the team. Very little group of respondents admitted that supporting the team means for them buying gadgets with team logo and colours. It is surprising because when attending games at the stadium almost all the fans. When analysing what fans attending games wear, it is visible that almost every one of tem wears something with team colours (neckerchief, shirt or a cap). Probably, for Polish fans, having gadgets means not a way of supporting a team but rather a way of showing their affiliation, preferences and origin (people are very often fans of a team from an area where they have grown up).

Figure 2. Ways of supporting a favourite team in Poland

CONCLUSIONS

Reputation of organisation influences minds of both consumers (their satisfaction) and members or employees (willing to stay and support it or leave and change an organisation) (Chun, 2005, p. 91). Customer satisfaction even in sports is very important. The loyalty between a person and an organisation in sport business in not based on sport results but mostly emotions. For sport fans sport results have secondary significance. For them history, origin and personality of a team is more important.

The preliminary research revealed that young Polish people (age 20-32) are willing to express their support for their favourite football time by cheering and watching the game on a stadium. They also watch TV transmissions of teams representing both Polish and foreign football leagues. Supporters are loyal to those teams that have the same origin with a sport organisation they are loyal to. Those fans are emotionally attached to teams not only because of the local character but also because their friends or relatives are fans or used to be members or players of the team. Even though, there is a very strong and unique bond between them and a team, they are aware that those sport teams have commercial character. It may a proof for an assumption that sport organisations should focus more on their loyal supporters (understand them, meet their needs, maintain loyalty and positive associations which are foundations of those bonds).

Managers of sport organisations should find a balance to focus less on gaining new customers (new fans, also oriented only on consumption during an event) and concentrate more on cooperation and maintain loyalty of present supporters. Achieving business goals with succeeding in sports (achieving good sport results) is crucial for sport organisations but it is impossible to do so without long-term customer satisfaction. Fans, supporters and members of sport organisations should truly feel that activities taken by sport organisations are honest and designed for supporting and cooperating with them leaving business goals behind as secondary. Polish football teams should begin to work on their prosocial attitudes, openness to fans desires and needs and to dialogue. All football fans in Poland are often wrongfully treated as hooligans who represent a small group, which acts of vandalism, are often showed and condemned in media. That small group of fans builds a very negative image of all other fans that are focused on spending time in a atmosphere of tolerance, friendliness, safety and fun. Polish football clubs should focus on showing their respect and gratitude to them to gain their loyalty and trust. That change should be a trigger for new strategy of a whole sport organisation, its personality, and as a result corporate image and reputation. Building a brand of an organisation and its corporate image rich in positive values (trust, friendship, fair play, safety, fun, brotherhood, tradition, respect) will bring more and more fans who will show their support and loyalty. Those social bonds will bring both financial and immaterial profits. With that strategy a football team is able to become a responsible member of society, and community members will share reputation of the organisation, support for their actions which will make an organisation and its activities (also sport ones) more permanent and visible on the market. It is also said that organisations should focus more on customer orientation and product and service quality in case of reputation to satisfy customers (fans, supporters, local community) to succeed (Walsh *et al.,* 2009, p. 198). That approach limits costs of searching and building trust with potential customers, while maintaining loyalty and satisfaction of present ones is much cheaper.

ABSTRACT

Purpose: *As a result of increasing competition, organizations have realised the importance of using technological advances in bringing about continuous improvement in quality, thereby securing increased customer satisfaction and loyalty as well as sustainable development. This study aims to assess managerial perceptions of the extent and nature of monitoring and controlling quality (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) that takes place in the organization in efforts to achieve total quality management. Biographical influences on these managerial perceptions are also assessed.*
Design/methodology/approach: *A sample of 202 managers (middle, senior, top) was drawn using a stratified random sampling technique. Data was collected using a pre-coded, self-developed questionnaire whose psychometric properties were assessed using Factor Analysis and Cronbach's Coefficient Alpha respectively. Data was analyzed using descriptive and inferential statistics.*
Findings: *The findings reflect that managers believe that monitoring and controlling quality takes place at a moderate pace in the organization with the greatest focus being on competitive benchmarking, followed by continuous monitoring of sources of defects and lastly, on statistical quality control. The regression analysis, however, indicates that statistical quality control has the greatest impact on monitoring and controlling quality followed by continuous monitoring of sources of defects and then competitive benchmarking.*
Research limitations: *The study was undertaken in a public sector organisation and caution must therefore, be taken to generalize the results of the study to the private sector or any other business environment.*
Originality: *Based on the empirical analysis, since all action plans for monitoring and controlling quality in the organization reflect areas for improvement in bringing about total quality management, a graphical representation is outlined to recommend strategies for enhanced monitoring and controlling of quality and the accomplishment of TQM.*

Keywords: monitoring and controlling quality, competitive benchmarking, continuous monitoring of sources of defects, statistical quality control, statistical process control, total quality management

INTRODUCTION

The continued recognition of quality and quality control is the fulcrum of business leverage, strategic goals and challenges faced by today's competitive work environment. This solution building organizational perspective calls for a review on quality requirements for organizations to secure a place in today's aggressive global markets. Globally, burgeoning literature maps out core and engaging information on managing quality in all spheres of organizational activities. This information flow compels organizational managers to continuously rethink the relevant action plans to monitor and control quality. The inherence of a certain amount of variability is normal. Quality management has set boundaries and the building blocks for competitive challenge and continuous improvement. Quality, a determinant of success is more than a basic either/or proposition of product and service quality needs analysis (Kreitner, 2007). To enhance organizational performance and superior service, the study delves into managerial perceptions of the role of monitoring and controlling quality in efforts to achieve total quality management.

The TQM approach with its strategic intent steers organizations to be effective and efficient (Schultz, Bagraim, Potgieter, Viedge & Werner, 2003), and places strong emphasis on collaborations for process improvement and ultimate customer satisfaction. To win a new customer may take five times more than it does in keeping a present one but the strategic challenge regarding service is to anticipate and exceed customer expectations (Kreitner, 2007). Customers judge products and services, and will favour the ones that reach high standards (Anyamele, 2005). Hence, the key drivers for monitoring and controlling quality are to obliterate deleterious obstacles which have become axiomatic in reflecting how competitive advantage is achieved and how to move into new domains and fuel competitive goals and objectives. Responsibility and accountability for quality processes should be the focus (Dale, van der Wiele & van Iwaarden, 2007).

Employees, considered as assets, deliver quality product or services for organizational performance (Ijaz, Kee & Irfan, 2012). Engaged with these precepts, a spirit of idealism needs to be at the helm to weave commitment and dedication. TQM's key elements entail customer focus, teamwork, continuous improvement and a reduction of reworks, amongst others (Yang 2005, cited in Ijaz, Kee & Irfan, 2012). The five distinct service characteristics portrayed by Kreitner (2007) is direct participation with customers in the production process, immediate consumption of service, the provision of services where and when the customer requires, the tendency for services to be labour-intensive, and for services to be intangible. Whilst less waste, faster cycle times and flexibility are avenues for continuous improvement (Kreitner, 2007), monitoring and controlling quality is the centrefold in business activities. Quality control of a service is to watch it unfold whilst simultaneously evaluating it with the consumer's judgement and the validity of the comparison is the satisfaction level of the customer (McGregor, 2004 cited in Kreitner, 2007). Tools such as benchmarking and control charts are evident features of the long-term drive for continuous improvement (Kreitner, 2007).

High levels of productivity and high quality results in a long-term competitive strength. Deming's work draws on "Shewhart's concept of statistical process control" (Kelemen, 2003:25), whose message to the Japanese is that variability is within any process which is due to special causes and common causes. Special causes are assignable, identifiable and

solvable, whereas common causes relate to "design and operation and only management can eliminate" (Kelemen, 2003:25). TQM and its interconnected practices, such as "statistical process control (SPC), quality circles, benchmarking and business process re-engineering, and ISO 9000 certification" (Yang, Chang, Niu & Wu, 2008:430) are adopted in many industries.

Competitive benchmarking

Benchmarking which involves searching for industry best practices results in superior performance (Belcourt, McBey, Hong & Yap, 2013; Evans & Lindsay, 2005). Benchmarking of processes is as important as the analysis of product and development, and that is a strategic organizational tool that accomplishes organizational goals. This strategic tool enhances transparency (Braadbaart, 2007), and its measurement standard for performance and a best-in-class achievement, amongst others (Punniyamoorthi & Murali, 2006), enables a company to measure their performance against that of the best performing companies in the industry, and assesses how industry leaders accomplish such performance levels. Via benchmarking, the following can be accomplished: a review of processes, practices and systems; motivation for higher performance through targets for improvement; display of comparative data with 'best-in-class organizations' and stimulation of improved ways of operating (Belcourt *et al.*, 2013). A salient point is the focus on 'high-visibility key processes' with the possibility of a high return on investment; hence, the benchmarking practice is encouraged (Dale, van der Wiele & van Iwaarden, 2007). With organizational comparisons, improvement opportunities may emerge. With focus on processes instead of people, a culture of blaming others would be removed.

The level of values for organizations is that after data collection and comparison, the gaps will be obvious as the best organization might have metrics, for example a six-week processing time whereas your organization may process in twelve weeks (Belcourt *et al.*, 2013). Such analysis enables a company to assess performance gaps, which serve as a springboard for setting realistic goals and ensuring continuous creativity, innovation and improvement. Hence, competitive benchmarking equips a company to identify its strengths and weaknesses and those of other industry leaders, and to learn how to integrate the best practices into its own operations in terms of setting targets, developing strategies and engaging in implementation. TQM and benchmarking highlight product quality index with follow-up action for evaluation and TQM emphasizes the correction to reduce defect rates (Jung-Lang-Cheng, 2008). Furthermore, the American Productivity and Quality Centre and the European Foundation for Quality Management are explicitly engaged in promoting and training in benchmarking as an essential approach to achieve excellence (Dervitsiotis, 2000).

The benchmarking technique, a 'breakthrough improvement' and the implementation of best practices is often not enough as the best at certain practices are from diverse areas. This technique needs to be instituted into a company's culture to improve continuously (Dale, van der Wiele & van Iwaarden, 2007).

Monitoring of sources of defects

A defect is a non-conformance on one of numerous possible quality characteristics of an item that causes customer dissatisfaction and may be categorised as a critical defect, major defect

or a minor defect (Evans & Lindsay, 2005; Gitlow, Oppenheim, Oppenheim & Levine, 2005). Zero defects, a performance standard, means mistake-free or error-free (Crosby, 2006), and few quality standards call for perfection. It does not mean that mistakes will not occur, but defects are not acceptable (Crosby, 2006). Crosby's concept of the zero defects theme which is within the framework of his quality absolutes is to 'do it right the first time' by preventing defects instead of finding and fixing them. This concept or performance standard gained popularity (Davies, 2001:224) and refers to quality as conformance to requirements.

A common occurrence is that without clarity, employees will select the performance standard they think will best suit the leader. Inconsistencies on the performance standard will emerge in the quality of products and services. The zero defects concept must infiltrate organization-wide (Crosby, 2006). Evidently, Six Sigma shows acceptance of a few defects (Crosby, 2006). Whilst critical defects need close observation including monitoring and control, minor defects do not as they are still useable. Where quality improvement is the focus, defect detection and inspection on a mass basis is not good enough. In a TQ environment, the aim is to constantly improve processes so that products and services are within the specification range, are of quality and have zero defects.

Furthermore, quality indicates conformance to requirements and not elegance (Evans, 2005), and task completion follows measurements to determine conformance. Quality begins in functional departments (responsible for problems), and not in quality departments. The quality department's task is to measure conformance, report results, and lead the initiative for a positive quality improvement attitude (Evans, 2005). Non-conformance as an expense trails to the cost of quality and thus, managers' attention and corrective action leads to ultimate improvement and recognition of achievement.

Deming places emphasis on quantitative methods, and the difficulty in defining quality is to translate the user's needs into measurable features. Juran's definition of quality is 'fitness for use'. Many scholars with their findings realize that quality management should not result in emasculation and tend to corroborate to the concepts and principles of zero defects. It is critical to align product features and products free from deficiencies and to instil this culture into employees. Meeting customer expectations is Juran's strong viewpoint (Suarez, 1992). Juran and Deming argue that it is futile, if not hypocritical, to exhort a line worker to produce perfection because the extremely large amounts of imperfections are linked to poorly designed manufacturing systems which is beyond the workers' control (Evans, 2005:30-31). Evidently, Juran and Deming see no fruition in encouraging line workers to produce perfection.

The priorities to reach zero defects include: performing to the leader's standards, conforming to the requirements, quality as an absolute, clear quality standards with products and services, errors emerging from poor attitudes, lack of ability and problems in the work environment, quality as the employer's responsibility, and the performance standard must be adopted and made known (Crosby, 2006). Crosby (2006) emphasizes further that zero defects are sound and it always works, and managers need to adopt and publicize this organization-wide. This in-depth information on quality matters offers fertile information and powerful solutions to the piloting of processes and for the ultimate accomplishment of end products.

Statistical quality control and statistical process control techniques

A certain amount of variability will always exist with production processes and this may emerge because of assignable causes (can be discovered and eliminated) or chance causes (cannot be eliminated) (Lakshmi & Ramesh, 2012). The utilization of statistical techniques determines the presence of assignable cause and signals to make a process adjustment to avoid out-of-control situations (Lakshmi & Ramesh, 2012). The authors corroborate that in some instances the control chart techniques were not successful to some extent which may be due to technical reasons but the non-conformance of normality is the main one. The non-parametric methods (easier to conduct) seem more applicable. In their study, Lakshmi & Ramesh (2012) use sign test and run test for application in quality control. They concluded that the non-parametric test can be a hand for a layman before deploying the traditional statistical techniques for the control of quality of materials produced.

Quality control techniques are important in all sectors, including the service industry. Bin Jumah, Burt & Buttram (2012) opine that using Lean Six Sigma in, for example, banking is of benefit, as in using statistical process control (SPC) in trading machines. To cope globally, service industries need efficiency with operational processes. Statistical quality control (SQC) control approaches provide tools, for example, control charts for monitoring processes. SQC was introduced by Deming and Juran who convinced managers in Japan that continuously controlling and improving quality would lead to improved productivity, to new world markets and to survival (Evans & Lindsay, 2005). Walter Shewhart who introduced SQC charts maintains that the process expands beyond inspection to focus on identifying and eradicating the problems in the production processes that cause defects (Evans & Lindsay, 2005). SQC approaches provide tools for monitoring and detection of anomalies and assists employees by keeping 'key quality measurements' in a range that is acceptable. Furthermore, a control chart monitors actual and desired quality measurements for operations that are repetitive.

Furthermore, statistical process control (SPC), a method of fault detection (Yang, Chang, Niu & Wu, 2008) is a methodology for process monitoring to identify special causes of variation and to signal the need to take corrective action appropriately; it gives a rational basis for applying statistical thinking to controlling processes, thereby enhancing consistency of output (Evans, 2005). Failing to implement and operate SPC effectively can hinder an organization's ability to meet product specifications, reduce the cost of production and improve quality, amongst others (Goetsch & Davis, 1994 cited in Yang *et al.*, 2008). Simply, the SPC statistical technique monitors to reduce production variation. Decades have foreseen the use of SPC to improve quality processes and products in quality management (Bergman & Klefsjo, 2003 cited in Bergquist & Albing, 2006). The SPC quality improvement technique quantifies the performance of a process over a period of time. It tracks the process output to ascertain the variation that exists and to determine whether performance targets are met with the process. Control charts, a segment of SPC, aids in tracking the consistent calculation of statistical information and detects changes that are of significance in a process, and with the detection of special cause action it can eliminate the form of variation (Boe, Riley & Parson, 2009).

A salient point is that apart from the manufacturing industry, statistical methods have been utilized in other forms of problems, for example, to understand the needs and behaviour of

customers (Green & Srinivasan, 1978 cited in Bergquist & Albing, 2006). Evidently, statistical methods have 'found applications in service' (Mason & Antony, 2000 cited in Bergquist & Albing, 2006) and this use of statistical methods is also "amplified by the broadened focus of Six Sigma" (Hoerl, 2001 cited in Bergquist & Albing, 2006:962). The comprehension, use and applicability of statistical methods is imperative. Customers may request proof of SPC control from organizations, thereby enabling them to display their ability to deliver quality, which is much needed for survival in a highly competitive corporate environment.

Those concepts that are developed within the process control realms have indicated that close loop systems have superior performance with regard to maintaining the service level requirements (SLR) and "rejecting disturbances than the corresponding open loop systems" (Shaikh & Prabhu, 2009:2786). An advantageous approach to increase performance would be to close the loop between planning and execution. Furthermore, software agents are required to add dual capabilities of monitoring and notification (the detection of discrepancies between planning and execution and indicating alerts) and responding (to determine an appropriate correction action) (Shaikh & Prabhu, 2009). Having a consistent and reliable SPC is important and the tools/techniques form an imperative part of the overall quality management strategy.

Moreover, whilst strategic management concentrates on internal requirements TQM focuses on statistical process control to ensure continuous improvement (Vinzant & Vinzant, 1996). The link between TQM and strategic planning is that strategic planning must be customer driven, and must precede TQM initiatives, and results must be the focus to ensure long-term success.

Aims of the study

This study aims to assess managerial perceptions of the extent and nature of monitoring and controlling quality (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) that takes place in the organization in efforts to achieve total quality management. Biographical influences on these managerial perceptions are also assessed.

RESEARCH DESIGN

Research approach

The research methodology has been designed to assess the importance of monitoring and controlling quality in order to accomplish total quality management (TQM).

Respondents

The population comprised of middle, senior and top management in a large public sector department in eThekweni (Durban) in South Africa. The population comprised of approximately 400 managers. The sample of 202 subjects was drawn using a stratified random sampling technique to ensure proportionate representation from the strata of the designated groups of interest, that is, managers. According to the population-to-sample size

table by Sekaran (2003), the corresponding minimum sample size for a population of 400 is 196, thereby confirming the adequacy of the sample size for this study. In terms of the composition, 12.9% of the sample consisted of top managers, 32.7% were senior managers and 54.4% were middle managers. In addition, 29.7% of the respondents were 50 years and older, 39.1% were between 40-49 years, and 24.8% were between 30-39 years with only 6.4% being below 30 years. Indian respondents made up 39.1% of the respondents, followed by Whites (34.7%), Blacks (19.8%) and Coloureds (6.4%). In terms of tenure, 24.8% of the respondents worked in the organization for 21 years and over, 16.8% served for 16-20 years, 27.2% for 11-15 years, 21.3% served for a term of 6-10 years and only 9.9% were between 0-5 years in the company. The majority of the subjects have a postgraduate degree/s (40.6%), followed by those who hold a first degree (24.3%), those who have a diploma certificate (16.3%), a postgraduate diploma certificate (10.4%) and 8.4% who have between Standard 8-10 (Grade 10-12). The majority of the subjects were males (85.1%) with only 14.9% being females, thereby indicated the disproportionate percentage of females to males in management. The adequacy of the sample was further determined using the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (0.758) and the Barlett's Test of Spherecity (1429.264, p = 0.000) for the sub-dimensions of monitoring and controlling quality (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) which respectively indicated suitability and significance. The results indicate that the normality and homoscedasticity preconditions are satisfied.

Measuring Instrument

Data was collected using a self-developed questionnaire consisting of Section A (biographical information) and Section B included items relating to the sub-dimensions of monitoring and controlling quality. The biographical data in Section A was collected using a nominal scale with pre-coded option categories and the items in Sections B were measured using a 5-point Likert scale ranging from strongly disagree (1), disagree (2), neither agree/not disagree (3), agree (4) to strongly agree (5). The questionnaire was formulated on the basis of identifying recurring themes that surfaced during the literature review and the 20 items included in the questionnaire related directly to the constructs being measured (10 items related to competitive benchmarking, 3 items pertained to continuous monitoring of sources of defects and 7 items related to statistical quality control). This ensured face, content and construct validity. Furthermore, in-house pretesting was adopted to assess the suitability of the instrument. Pilot testing was also carried out using 12 subjects, selected using the same procedures and protocols adopted for the larger sample. The feedback from the pilot testing confirmed that the questionnaire was appropriate in terms of relevance and construction.

Statistical measures of the questionnaire

The validity of the questionnaire was assessed using Factor Analysis. A principal component analysis was used to extract initial factors and an iterated principal factor analysis was performed using SPSS with an Orthogonal Varimax Rotation. Only items with loadings >0.4 were considered to be significant and when items were significantly loaded on more than one factor only that with the highest value was selected. In terms of the sub-dimensions of monitoring and controlling quality (Section B), three factors with latent roots greater than unity were extracted from the factor loading matrix. Factor 1 related to statistical quality

control and accounted for 16.17% of the total variance, Factor 2 related to continuous monitoring of sources of defects and accounted for 15.47% of the total variance and Factor 3 related to competitive benchmarking and accounted for 14.63% of the total variance in monitoring and controlling quality to achieve total quality management. The reliability of Section B of the questionnaire relating to the sub-dimensions of monitoring and controlling quality was determined using Cronbach's Coefficient Alpha (Alpha = 0.854). This alpha coefficient indicates a very high level of internal consistency of the items and hence, a high degree of reliability. The reliabilities for the individual sub-dimensions of monitoring and controlling quality were also assessed. Whilst competitive benchmarking (alpha = 0.760) and statistical quality control (alpha = 0.789) reflected strong reliabilities, the inter-item consistency for continuous monitoring of sources of defects (alpha = 0.483) displayed a moderate level of reliability.

Administration of the measuring instrument

The questionnaires were administered over a three month period and respondents could either post the questionnaire in the attached self-addressed envelope or send them electronically to the researchers.

Statistical analysis

Descriptive (means, standard deviations) and inferential (correlation, ANOVA, t-test, Post Hoc Scheffe's test, multiple regression) statistics were used to analyse the quantitative data. The data was captured using Excel (Version 5), processed with Simstat and presented using tabular and graphical representations.

RESULTS

Managerial perceptions of efforts in the organization to monitor and control quality in order to enhance total quality management were assessed in terms of assessing the extent to which the organization engages in competitive benchmarking, continuous monitoring of sources of defects and statistical quality control (Table 1).

Table 1: Descriptive Statistics – Monitoring and controlling quality

		Monitoring and controlling quality			
Statistic		**Overall**	**Competitive Benchmarking**	**Continuous monitoring of sources of defects**	**Statistical quality control**
Mean		3.1729	3.2640	3.2600	3.0157
95% Confidence	**Lower Bound**	3.0887	3.1738	3.1560	2.9058
Interval for Mean	**Upper Bound**	3.2572	3.3542	3.3640	3.1257
Variance		0.354	0.418	0.556	0.622
Std. Deviation		0.5951	0.64660	0.74585	0.78857
Minimum		1.40	1.20	1.00	0.57
Maximum		4.45	4.80	5.00	5.00

Overall, managerial perceptions of monitoring and controlling quality to achieve total quality management is fairly positive (Mean = 3.1729). In this organization the focus on competitive benchmarking (Mean = 3.2640) and continuous monitoring of sources of defects (Mean = 3.2600) are almost equal, followed by statistical quality control (Mean = 3.0157). Against a maximum attainable score of 5, there is room for improvement in each of the sub-dimensions.

Frequency analyses were computed to obtain greater insight into these managerial perceptions. With regards to competitive benchmarking, 65.3% of the managers agreed and a further 5.4% strongly agreed that they find that action plans are developed to ensure improvement. Furthermore, 63.4% of the managers either agreed or strongly agreed that the organization incorporates best practices into its operations in terms of setting targets. However, 12.4% of the managers either disagreed or strongly disagreed that with benchmarking, their organization sets realistic goals. Furthermore, 9.4% of the managers disagreed that their organization incorporates best practices into its operations in terms of developing strategies and another 37.1% were not convinced about this. Also, 9.4% of the managers disagreed that with benchmarking action plans are developed to ensure innovation and another 41.6% were not convinced about this. In addition, 38.7% of the managers were unsure that with benchmarking, action plans are developed to ensure creativity.

With regards to continuous monitoring of sources of defects, 60.4% of the managers agreed and a further 7.4% strongly agreed that by observing, monitoring and controlling sources of defects, the occurrences of defects are eliminated. However, a substantial 64.2% of the managers were not convinced that in the organization, the improvement processes in total quality is continuous so that where applicable the concept of zero defects is maintained.

With regards to statistical quality control, whilst 57% of the managers find control charts to be of importance to establish a state of statistical control, 53% did not find control charts to be of importance to monitor a process to identify special causes of variation and to take correction action when needed and 62.4% did not find them to be important in determining process capability. Furthermore, managers were not convinced that the practice in their organization is to control (65.4%) or improve (65.9%) quality by using statistical quality control charts. Also, 57.4% of the managers did not feel that the tools/techniques used in quality control are an integral part of the overall TQM strategy of the organization.

Hypothesis 1:
The sub-dimensions of monitoring and controlling quality that contribute to total quality management (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) significantly correlate with each other (Table 2).

Table 2: Intercorrelation – Sub-dimensions of Monitoring and controlling quality

Sub-dimension	Competitive Benchmarking	Continuous monitoring of sources of defects	Statistical quality control
Competitive Benchmarking	1		
Continuous monitoring of sources of defects	0.567 **0.000***	1	
Statistical quality control	0.542 **0.000***	0.388 **0.000***	1

*** p < 0.01**

Table 2 indicates that the sub-dimensions of monitoring and controlling quality that contribute to total quality management (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) significantly correlate with each other at the 1% level of significance. Hence, hypothesis 1 may be accepted. The implication is that an improvement or change in any one sub-dimension has the potential to impact on the other sub-dimensions thereby, influencing total quality management. The combined improvement of all the sub-dimensions will have a snowballing effect and exponentially contribute to monitoring and controlling quality and hence, the realization of TQM.

Hypothesis 2:
There is a significant difference in the perceptions of managers varying in biographical data (position, age, race, tenure, academic qualification, gender) regarding each of the sub-dimensions of monitoring and controlling quality that have the potential to contribute to total quality management (Tables 3 – 5).

Table 3: ANOVA and t-test - Biographical Variables and Sub-dimensions of Monitoring and controlling quality

Monitoring and controlling quality and sub-dimensions	ANOVA										t-test		
	Current Position		Age		Race		Tenure		Academic Qualifications		Gender		
	F	p	F	p	F	p	F	p	F	p	t	df	p
Monitoring and controlling quality	5.552	0.005*	0.627	0.598	1.381	0.250	1.248	0.292	2.503	0.044**	-1.035	196	0.302
Competitive benchmarking	8.072	0.000*	1.998	0.116	1.327	0.267	1.244	0.294	1.434	0.224	-0.312	195	0.756
Continuous monitoring of sources of defects	0.949	0.389	0.286	0.835	2.500	0.061	0.308	0.872	0.957	0.432	0.773	195	0.441
Statistical quality control	2.443	0.089	0.414	0.743	1.199	0.311	1.608	0.174	2.641	0.035**	-0.165	196	0.869

*** p < 0.01**
**** p < 0.05**

Table 3 indicates that the perceptions of managers varying in position (top, senior, middle managers) regarding monitoring and controlling quality and competitive benchmarking respectively, differs significantly at the 1% level of significance. Furthermore, academic qualifications of managers also significantly influences their perceptions of monitoring and controlling quality and statistical quality control at the 5% level of significance. No other significant biographical influences were noted in Table 3. Hence, hypothesis 2 may only be partially accepted. In order to assess exactly where these significant differences lie, the Post Hoc Scheffe's test was computed (Tables 4 – 5).

Table 4: Post Hoc Scheffe's Test – Current Position and Dimension and sub-dimensions of Monitoring and controlling quality (Multiple Comparisons)

Dependent Variable	**(I) Current Position**	**(J) Current Position**	**Mean Difference (I-J)**	**p**
Monitoring and controlling quality	Top manager	Middle manager	0.412	0.001*
Competitive benchmarking	Top manager	Senior manager Middle manager	0.348 0.533	0.017** 0.000*
*** The mean difference is significant at the 0.01 level** **** The mean difference is significant at the 0.05 level**				

Dimension and sub-dimensions of Monitoring and controlling quality		**Top manager**	**Senior manager**	**Middle manager**
Monitoring and controlling quality	N Mean Std. Dev.	26 3.487 0.459	66 3.223 0.573	110 3.075 0.612
Competitive benchmarking	N Mean Std. Dev.	26 3.669 0.522	66 3.322 0.662	110 3.136 0.621

The mean differences in the Post Hoc Scheffe's Test results (Table 4) indicate that top managers (Mean = 3.487) differ significantly from middle managers (Mean = 3.075) with regards to monitoring and controlling quality. Top managers strongly believe that monitoring and controlling quality occurs in the organization in attempts to ensure total quality management as compared to middle managers. With regards to competitive benchmarking, top managers (Mean = 3.669) differ significantly from senior managers (Mean = 3.322) and to a large extent from middle managers (Mean = 3.136). Top managers' perceptions of competitive benchmarking as a mechanism to bring about total quality management are more positive in comparison to senior managers and middle managers in the organization.

Table 5: Post Hoc Scheffe's Test – Academic Qualifications and Dimension and sub-dimensions of Monitoring and controlling quality (Multiple Comparisons)

Dependent Variable	(I) Academic Qualifications	(J) Academic Qualifications	Mean Difference (I-J)	p
Monitoring and controlling quality	Post-graduate degree/s	Standard 8-10	0.429	0.012*
		Diploma/Certificate	0.253	0.037*
	Post-graduate diploma/certificate	Standard 8-10	0.427	0.035*
Statistical quality control	Post-graduate degree/s	Standard 8-10	0.558	0.011*
		Diploma/Certificate	0.394	0.014*

*** The mean difference is significant at the 0.05 level**

Dimension and sub-dimensions of Monitoring and controlling quality		Standard 8-10	Diploma/ Certificate	Under-graduate Degree	Post-graduate Degree	Post-graduate Diploma/ Certificate
Monitoring and controlling quality	N	15	33	49	82	21
	Mean	2.864	3.041	3.146	3.293	3.291
	Std. Dev.	0.793	0.748	0.437	0.553	0.525
Statistical quality control	N	15	33	49	82	21
	Mean	2.623	2.792	3.009	3.186	3.075
	Std. Dev.	1.101	1.071	0.589	0.702	0.627

The mean differences in the Post Hoc Scheffe's Test results (Table 5) indicate that managers who have post-graduate degree/s (Mean = 3.293) differ significantly from managers who have Standard 8-10 (Mean = 2.864) and from managers who have a Diploma/Certificate (Mean = 3.041) in terms of monitoring and controlling quality in the organization. The results reflect that managers who have a post-graduate degree/s have more positive perceptions about monitoring and controlling quality as compared to managers who have a Diploma/Certificate or Standard 8-10. Furthermore, with regards to monitoring and controlling quality, there is a significant difference between managers who have a post-graduate Diploma/Certificate (Mean = 3.291) and managers who have Standard 8-10 (Mean = 2.864). Clearly, managers who have a post-graduate Diploma/Certificate are more certain that monitoring and controlling quality takes place in the organization in efforts to bring about total quality management as compared to managers who have Standard 8-10.

Table 5 also indicates that with regards to statistical quality control, there is a significant difference between managers who have a post-graduate degree/s (Mean = 3.186) and managers who have Standard 8-10 (Mean = 2.623) and those who have a diploma/certificate (Mean = 2.792). Clearly, managers who have a post-graduate degree are more certain that statistical quality control effectively takes place in the organization in efforts to bring about total quality management as compared to managers who have Standard 8-10 or a diploma/certificate.

Hypothesis 3:
The sub-dimensions (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) significantly account for the variance in monitoring and controlling quality aimed at achieving total quality management (Table 6).

Table 6: Multiple Regression – Monitoring and controlling quality

Model	R	Adjusted R Square
3	0.882	0.881

Model	Standardised Coefficients Beta	t	p
Competitive benchmarking	0.363	53.948	0.000
Continuous monitoring of sources of defects	0.420	67.542	0.000
Statistical quality control	0.444	73.174	0.000

Table 6 reflects that the sub-dimensions (competitive benchmarking, continuous monitoring of sources of defects, statistical quality control) significantly account for 88.1% of the variance in monitoring and controlling quality aimed at achieving total quality management, although in varying degrees. Hypothesis 3 may, therefore, be accepted. Based on the Beta loadings it is evident that statistical quality control (Beta = 0.444) has the greatest impact on monitoring and controlling sources of defects followed by continuous monitoring of sources of defects (Beta = 0.420) and then competitive benchmarking (Beta = 0.363).

DISCUSSION OF RESULTS

The results (Mean = 3.1729) indicate that monitoring and controlling quality takes place at a moderate pace in the organization with the greatest focus being on competitive benchmarking (Mean = 3.2640), followed by continuous monitoring of sources of defects (Mean = 3.2600) and lastly, on statistical quality control (Mean = 3.0157). Evidently, against a maximum attainable score of 5, there is room for improvement in monitoring and controlling quality in efforts to achieve total quality management with the greatest improvement needed in statistical quality control. Statistical quality control was introduced by Deming and Juran who convinced managers in Japan that continuously controlling and improving quality would lead to improved productivity to 'new world markets' (Evans & Lindsay, 2005). Evans (2005: 298) cautions that since statistical process control needs processes to reflect measurable variation, "it is ineffective for quality levels approaching Six Sigma" but statistical process control is effective for organizations that are in the early phases of quality efforts. Cognizance must be taken of the three applications of control charts:

- the establishment of a state of statistical control,
- process monitoring and signalling when the process goes out of control, and
- to determine process capability (Evans & Lindsay, 2005).

The results also reflect that the sub-dimensions of monitoring and controlling quality (competitive benchmarking, continuous monitoring of sources of defects and statistical quality control) significantly relate to each other at the 1% level of significance. Hence, an improvement in any one sub-dimension of monitoring and controlling quality has the potential to have a snowballing effect and enhance all the other sub-dimensions as well as total quality management. A combined improvement in all the sub-dimensions therefore has the potential to enhance total quality management exponentially. For example, an organization can strive to adopt best practices in benchmarking in attempts to enhance total quality management. Best practices in benchmarking refers to approaches that give outstanding results, are innovative regarding the use of 'technology or human resources', and are recognized by 'customers or industry best practices' (Evans, 2005). Statistical quality control also plays a significant role in ensuring performance.

Based on the philosophy of W. Edwards Deming, the methods of statistical process control, and basic statistics, a system may be designed for effectively benchmarking a performance index (Maleyeff, 2003). However, a standardized system for performance benchmarking does not exist due to the differences among industries with regard to the nature of the benchmarking process and the complex statistical methods that may be involved (Maleyeff, 2003). Statistical process control is imperative for monitoring the process to identify special causes of variation that signals the need to take corrective action when needed (Evans & Lindsay, 2005). However, Six Sigma does indicate that a few defects are acceptable (Crosby, 2006).

With regards to the impact of biographical data, it was found that there is a significant difference amongst employees varying in current position (top, senior and middle managers) in the organization regarding both monitoring and controlling quality and competitive benchmarking at the 1% level of significance. Furthermore, there is a significant difference amongst employees varying in academic qualifications regarding both monitoring and controlling quality and statistical quality control at the 5% level of significance. A similar finding shows that managers without graduate degrees often take courses to equip themselves with methods, techniques and statistical formulae to enhance efficiency and improve quality (CareerPlanner.com, 2013). However, no significant difference was found amongst employees varying in the other biographical data (tenure, gender, age, race) regarding monitoring and controlling quality. Similarly, with regards to monitoring and controlling quality and gender, it was noted that women have entered into every sphere of activity and are performance-oriented; therefore, companies will work towards retaining them irrespective of gender. Furthermore, the relationship between gender diversity and business outcomes is evidenced in the performance of organizations with a more robust mix of women and men in senior management (Pellegrino, D'Amato, & Weisberg, 2011).

RECOMMENDATIONS AND CONCLUSION

A strong recommendation to monitor and control quality is to adopt benchmarking in order to set realistic goals in the organization. Furthermore, it is imperative to implement control charts to indicate its importance in determining process capability. Furthermore, when monitoring sources of defects where quality improvement is the focus, engage in constant improvement processes that ensure that products and services are within the specification range, are of quality and have zero defects. With competitive benchmarking, search for industry best practices that result in superior performance and assess performance gaps, set realistic goals and ensure continuous creativity, innovation and improvement. In addition, with statistical quality control (SQC) and statistics process control (SPC), use SQC and SPC charts to identify and eradicate problems in the production process by taking corrective action. Consistent and reliable SPC ensures consistency of output and is an imperative part of the overall TQM strategy.

With regards to the biographical data, monitoring and controlling quality is influenced by managers' current position in the organization. The finding in this study reflects that the higher the managerial level, the more convinced managers are that monitoring and controlling quality is occurring in the organization. In view of this, it is of utmost importance that managers at lower levels be aware and understand that monitoring and controlling quality would lead to improved productivity as this forms an imperative part of the overall TQM strategy.

Furthermore, monitoring and controlling quality is influenced by managers' academic qualifications in the organization. The finding in this study indicates that the higher the academic

qualifications of managers, the more convinced they are that monitoring and controlling quality is evident in the organization. In light of this, it is important to ensure that managers with lower qualification are given the opportunity to perhaps further their education or attend training courses to fully understand the impact of monitoring and controlling quality on the organization's overall productivity.

In addition, competitive benchmarking is influenced by managers' current position. In this study it was found that the higher the managerial level, the stronger the perceptions that competitive benchmarking is practiced in the organization. In view of this, managers at lower levels must be communicated to and convinced that benchmarking, which involves searching for industry best practices, results in superior performance.

Furthermore, statistical quality control is influenced by managers' academic qualification. In this study, it was found that the higher the academic qualifications of managers, the more convinced they are that statistical quality control is taking place in the organization. Taking this into consideration, it is important to ensure that managers with lower qualifications be equipped with adequate knowledge and perhaps take further studies to understand statistical quality control within the organization as customers may request proof of statistical quality control from the organization.

The aforementioned recommendations relating to monitoring and controlling quality are graphically represented in Figure 1 and when effectively implemented have the potential to ensure total quality management.

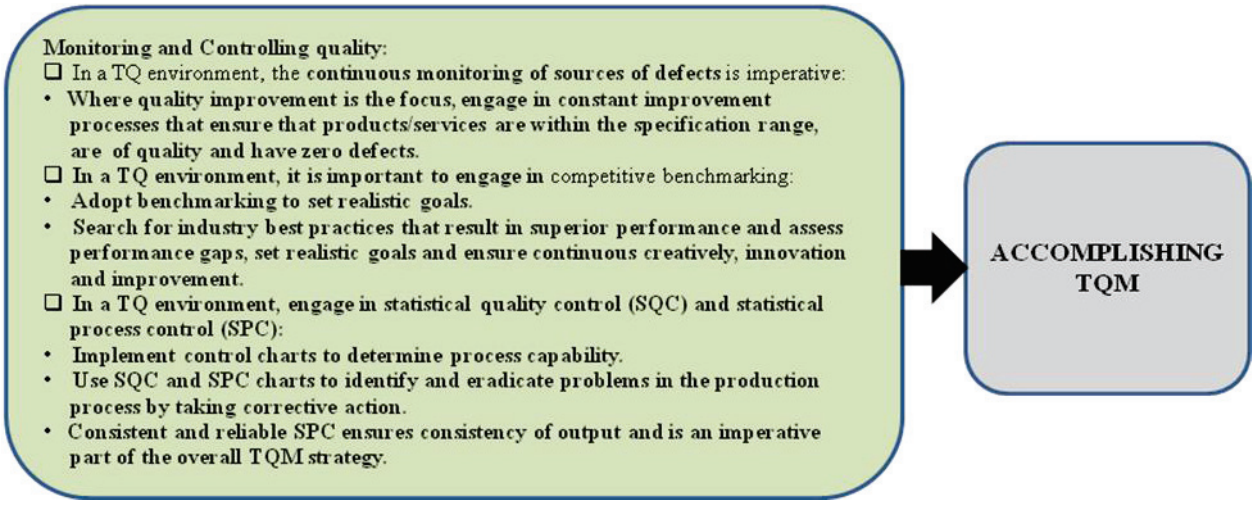

Figure 1: Recommendations relating to monitoring and controlling quality in efforts to accomplish total quality management

The results of the study open many avenues for a fresh perspective of the various facets of monitoring and controlling quality in attempts to enhance total quality management. In particular, it emphasizes the role of competitive benchmarking, continuous monitoring of sources of defects and statistical quality and process control in the evolution of world class organizations. These strategies are imperative for organizations seeking to produce more with less and to design customer centric strategies and fuel their growth objectives.

BIOGRAPHICAL

Prof Sanjana Brijball Parumasur is in Industrial Psychologist and Professor at the University of KwaZulu-Natal, South Africa. Her publications have predominantly been in the areas of consumer behaviour, change management, organizational behaviour, organizational development and various aspects of human resource management. She has supervised an extensive array of masters and doctoral students in the fields of human resource management/development and industrial psychology. She serves on the Editorial Board of the International Retail and Marketing Review and the South African Journal of Industrial Psychology and reviews manuscripts for numerous local and international journals. She has presented several papers at local/international conferences.

Dr Patsy Govender is an academic in the School of Management at the University of KwaZulu-Natal, South Africa. She completed her doctoral degree in Human Resource Management at the University of KwaZulu-Natal. She currently lectures in management of human resource development, organizational behavior, employee wellness and HR planning and strategy. Her publications have predominantly been in the areas of total quality management, change management and managerial/leadership effectiveness and she has reviewed a text in HRM. She is actively involved in honours and masters supervision. She has presented several papers at local and international conferences.

ABSTRACT

***Purpose**: Purpose of this paper is to compare perceived characteristics of different physical and virtual retail formats by consumers in Poland. There is proposed that physical and virtual retail channel are not only substituting themselves but also there is complementary each other. Analysis of changes over time is also important goal of the authors.*
***Design/methodology/approach:** Paper uses mainly quantitative approach. Main data source is CAWI questionnaire administered nationwide in 2012. Supplementary data are coming from study made in 2009. Representative to the population of Internet users in Poland samples of 1100 persons in both cases were obtained. There are also results from focus groups (FGIs) performed in 2012 and 2009 presented. Quantitative (from multidimensional scaling - MDS) and projective (from FGIs) perception maps are presented.*
***Findings:** For both time points MDS perception maps revealed similarity and differences patterns. Two dimensional solutions are fitting the data very well and allow to describe compared formats in following dimensions: 1) perceived level of personal interactions with the salesperson in particular retail format, and 2) perceived total cost for consumer. Virtual channel formats are forming distinct group – signalizing feeling of depersonalization of contact with customer. Standard forms of internet sales (online stores and auctions) are similarly perceived – as still having high perceived cost to the customer, despite lower perceived price level – this suggest that delivery time, necessity to return or sent to repair, are perceived as important drawbacks of such purchasing. Over the time visible is substantial change in discount stores perception – they become accessible for consumers even from small towns, and because of frequent location within/close to residential areas, they are substituting traditional local stores.*
***Originality/value:** Paper presents wide range of comparisons – up to 15 retail formats compared over two time periods. Authors are establishing method for further studies.*

Keywords: consumer behaviour, perception of retail formats, perception maps, Poland

INTRODUCTION

Preferences for retail channel and format choice within particular channel depend on factors external to the consumer and internal ones. Those preferences are subject to adaptive change when important factors occur.

External factors on macro level are influencing consumer preferences on general level, sometimes with prolonged lag. For instance cycles in economy, including crises or slowdowns are resulting in changes in consumers income, to which consumers should adapt changing spendings and structure of consumption. Another important factors are trends in retail industry, e.g. development of new sales channels and/or store formats, when they become visible to consumers. Since about last 20 years influence of technological change, mostly through information and communication technologies (ICTs), substantially increased. ICT is treated nowadays as general purpose technology (GPT) and its impact on economy (for both supply and demand sides is overwhelming (Basu and Fernald, 2007). For consumers this means to adopt ICT related devices and tools and get skills to operate them, to buy over the Internet or cope with self-service cash registers. For retailers it will need to follow technology change to be in touch with consumer needs and competitors – this can lead for instance to utilize virtual sales channel and become multi-channel retailer.

External factors on micro-level include among others: perceived price level (for the format, and particular retail outlet), physical effort to buy (including commuting), amount of time needed to fulfill shopping task (Peter and Olson, 2002). Most of micro-level external factor are creating perceived total cost of buying for the consumer, considered currently by growing numbers of consumers during their decision processes.

Among internal factors there are i.e.: consumer demographics, and consumer personality manifesting in decision-making styles and perceived level of cognitive and emotional effort connected with shopping. Although consumer personality issues are not considered in this paper directly, they are connected with emotions, lead to beliefs and attitudes. Such factors create emotional and rational perception of retail channels and formats mostly in terms of emotional attitude toward them, as well as in terms of perceived risk and trust for retail channel, format or particular outlet.

PREFERENCES FOR RETAIL CHANNEL AND FORMAT CHOICE

Studying store choice factors and issues has a long tradition from at least 70's of the 20th century. In earlier studies (Monroe and Guiltinan, 1975; Arnold *et al.*, 1978; Arnold *et al.*, 1983; Mason *et al.*, 1983; Keng and Ehrenberg, 1984; Louviere and Gaeth, 1987; Spiggle and Sewall, 1987; Dawson *et al.*, 1990; Burke *et al.*, 1992; Arnold *et al.*, 1996) – store choice task has been rationalized using different approaches regarding external and internal factors to the consumer. For instance the store attributes and situational factors were studied, shoppers and their households demographics, shopping patterns, attitudes toward stores, implied importance weights of factors like price level, store attractiveness or commuting distance etc. In more recent research studies were examined also other things i.e. the impact of task definition on store choice (Kenhove *et al.*, 1999), but most of mentioned store choice studies have been restricted to the same format, i.e., supermarkets or discount stores. There also exist some studies examining the influence of retail pricing formats on shopping behavior (Bell *et*

al.,1998), often assuming that one store format has in general higher prices than the other one. Bhatnagar and Ratchford (2004) represent interesting approach (limited to non-durable goods) to explore fixed and variable costs of shopping. Under assumption about consumers preferring to shop at minimum total cost, and different price levels between formats, they found conditions in which the store format choice would be optimal.

Although non-store retail has long tradition in some countries, with mail order popular in the past in Great Britain, Australia or Germany, this sales channel has been used by consumers mostly as addition to typical retail, not replacing directly (when possible) visits at stores. But situation changed since e-commerce began play important role in retail industry. Consumers are choosing not only store format but also channel of buying. Recent studies about channel choice and change (Gensler et al., 2012; Joo and Park, 2008; Mokhtarian and Tang, 2011; Schoenbachler and Gordon, 2002) are focused on the influence of consumer characteristics or perceived channel characteristics on channel choice at different stages of consumer decision-making process, mainly at information search and transaction (Mącik, 2012).

This paper focuses on perception of retail formats from both physical and virtual channel, on the base of declarations about shopping frequency and emotional attitudes toward them – from both quantitative and qualitative point of view. This approach with direct comparison of retail formats seems to be interesting and valid under circumstances of multichannel shopping behavior being nearly a norm or very common practice. So we do not assume, that channel is chosen first, and choice of store format is the next step in buying process. Qualitative investigation proved that channel choice is often situation driven, especially when there are no strong preferences to use particular channel. Also when seeking information is treated separately from actual buying, channel changes in both ways are occurring very often.

METHOD

Data presented in this paper are coming from two large nationwide samples, about 1100 subjects each. Data were collected by CAWI questionnaire in 2009 for first sample and at the end of 2012 for the second one. Quantitative data are representative for population of Internet users in Poland regarding gender and age (between 18 and about 65 years old). Additional data used are coming from focus groups (FGIs) – performed in January 2013 to deepen knowledge gathered from second quantitative study. FGI participants (n=30) were differing in age (between 20 and 67yo) and gender. Some background data from previous studies and statistics of retail sector in Poland were also provided.

Used measures include among others declared frequency of using particular formats within both channels (15 formats for 2012 and 12 formats for 2009) as well as emotional attitudes toward them.

Data analysis relies on descriptive statistics and graphs. Multidimensional scaling procedures (MDS) to produce perception maps were used. Also projective perception maps provided by FGIs participants were aggregated and discussed. There should be noted that presented analysis has an exploratory character. No exact hypotheses have been settled and tested in this case.

Research has been founded from public funds through grant given by Polish National Center for Science to first author.

RETAIL SECTOR IN POLAND

Economic transition in Poland starting at 1989 involved substantial changes in Polish retail sector. It is worth to note, that even before 1989 in Poland existed in noticeable numbers private-owned shops, but economic system changes led in early 90's of 20th century to very quick growth of the number of retail outlets, mostly independent and family owned. Foreign capital store chains entered the market right after introducing hypermarket and supermarket formats into larger Polish cities first. About 2000 there was also discount store format introduced. Since 2005 there is visible concentration of sales volumes in mentioned store formats, and after 2009 systematic decrease of number of independent, small stores. Some statistics about retail outlet numbers are shown on Figure 1.

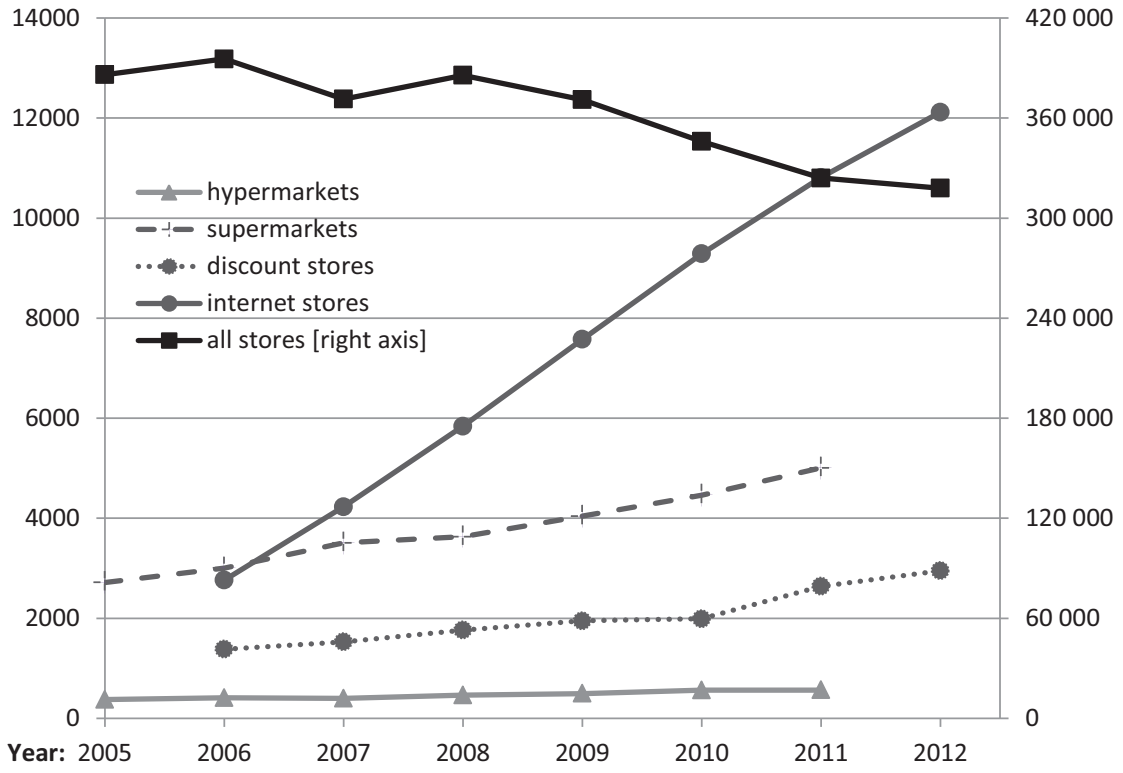

Figure 1. Changes in numbers of selected formats of retail outlets in Poland (2005-2012)

Note: All stores number is depicted on right axis, numbers for particular formats – on left one.
Source: Polish Central Statistical Office (GUS), GfK Polonia, Nielsen, Sklepy24.pl

During the time hypermarket format lost their leadership in driving changes of retail sector in Poland – its share in total sales according to Nielsen data decreased from 15 to about 13% (between 2006 and 2011), when number of hypermarkets increased by ca. 38%. Limited number of larger cities in Poland and aversion to drive longer for shopping leaded to growth of supermarket format first and discount format later. Such stores were located with time with

smaller towns, and were successfully competing on local markets with more traditional FMCG stores, despite entering to store-chains and remodeling into convenience format. Between 2006 and 2011 share in total retail sales through supermarkets increased by about 2 percentage points to 17%. For discounts growth was more dynamic – 7 percentage points (to 20% share in 2011). Main discount chains in Poland (Biedronka, Lidl and Netto) are employed rather soft discounter strategies after 2010, and are growing in terms of store numbers very quickly. Biedronka ("ladybug" in Polish) is unquestioned market leader for this format with about 2000 local stores under this brand.

Virtual channel in Poland is dominated since many years by one auction platform – Allegro.pl. Despite this, number of active internet shops increases rather quickly with growth of e-commerce sector (between 2006 and 2011 number of internet stores increased from 2800 to about 12100, and its share in total retail grown from about 1% to circa 3-4% according to various sources (Chodak et al., 2012). Most of internet shops are small firms – about a half of them employs no more than two persons. As mentioned auction platform Allegro.pl generates about half of total Polish B2C e-commerce turnover, about of 20% of internet stores in Poland is generated through this platform. Also about half of internet stores are multi-channel sellers, having at least one physical store (Chodak et al., 2012).

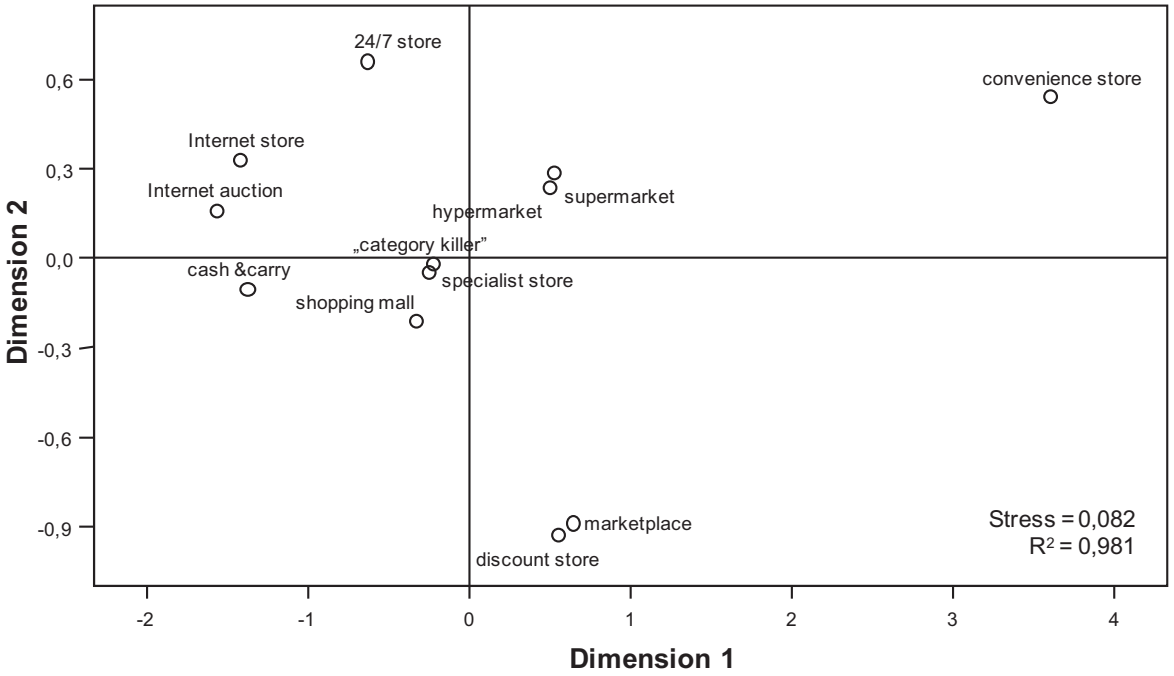
PERCEPTION OF STORE FORMATS BY POLISH CONSUMERS – QUANTITATIVE APPROACH

For visual interpretation of perceived attributes of analyzed retail formats, ALSCAL procedure – one from typical algorithms for multidimensional scaling – has been performed. Figure 2 contains graphical representation of two main dimensions revealed from 2009 and 2012 samples respectively.

Dimension 1 – horizontal one on Figure 2 – can be interpreted as perceived level of personal interactions with the salespersons in particular retail format – (with alternative explanation of representing consumer familiarity with particular format). While dimension 2 – vertical one on Figure 2– represents perceived total cost for consumer in sense described by Peter & Olson (2002, p. 459-461).

Provided interpretation is more clear for 2009 data, and for new data set should be used more carefully, although there are no direct suggestions indicating that such approach is not appropriate.

a) **2009 data**



b) **2012 data**

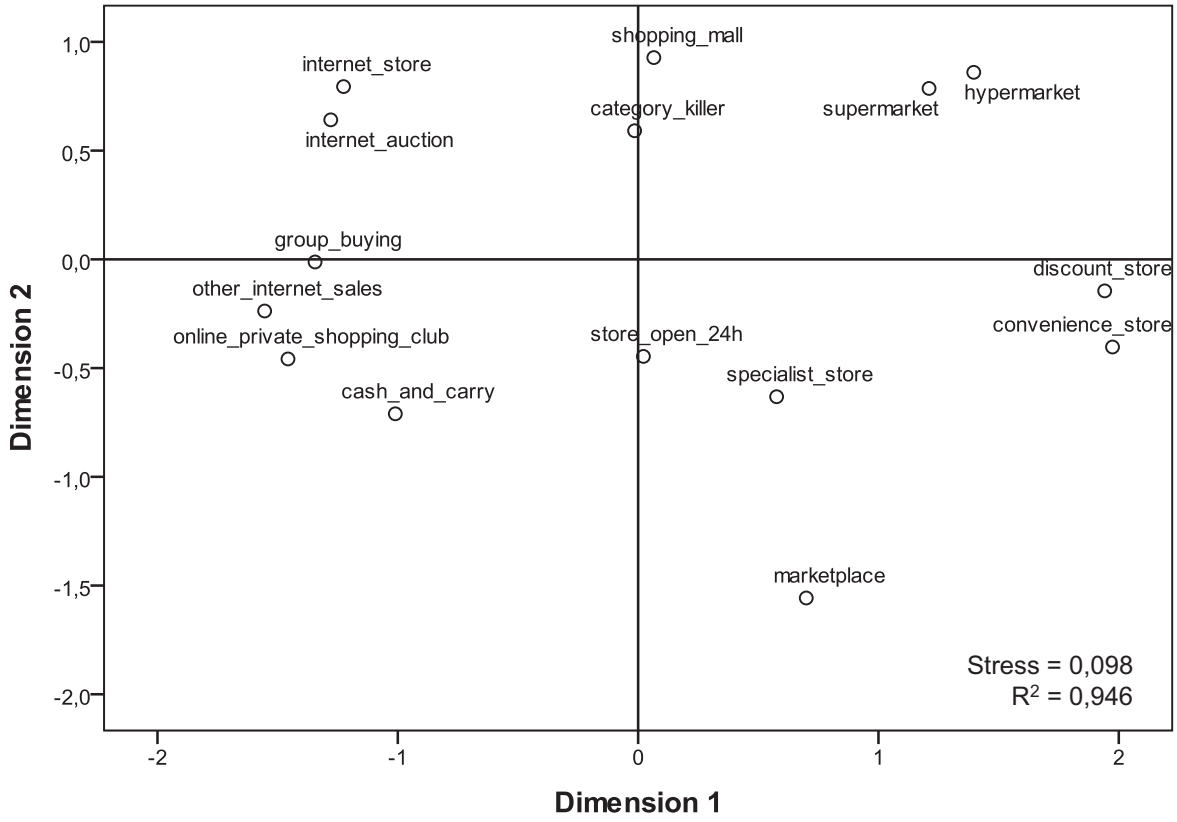


Figure 2. Perception maps of retail formats on the base of declared shopping frequency – multidimensional scaling approach (ALSCAL procedure, Euclidean distances)
Source: own research

Two-dimensional solution for both cases fits the data very well. Also Stress value is better or close than acceptable 0,1, and R^2 statistic is very high, exceeding minimum of 0,6 (Borg & Gronen 2005, p. 48).

In both cases virtual channel formats are forming group on the left side of dimension 1 – signalizing feeling of depersonalization of contact with customer. Also standard forms of internet shopping (online stores and online auctions) are similarly perceived – still having high perceived total cost to the customer, despite lower than in physical retail perceived price level – this suggest that time of delivery, possible need to return (i.e. clothing) or sent to repair (i.e. consumer electronics), are seen as important drawbacks of such purchasing. For other formats of internet sales included in 2012 study, perception of substantially lower price creates climate of "good deal" (in qualitative study this has been explained by younger participants in the context of group purchasing via Groupon or similar places as "real" price to the value, "affordable" price – in most cases persons using such offers declared not buying things or services different way (good example is expensive SPA package bought via Groupon by young student – catalogue price was in this case far beyond payment possibilities of this person). Group purchasing and private online shopping clubs by creating limited time offers are successfully exploiting hedonic motives of consumption and tendency for impulsive buying – this was not seen by consumers.

Comparing map from 2009 research with new one, very visible is dramatic change in discount stores perception among consumers – during the time between both measurements they become accessible by most consumers even in small towns, and because of location policy, within or close to residential areas, they are substituting larger independent convenience stores. It is worth to note that stores described as discounts became between two measurements rather soft discounters – two main chains in Poland – mentioned "Biedronka" and "Lidl" – are not focused only on low prices (but still communicating them in ads), instead they introduced many premium products (mostly under own labels) to their assortment, and consumers are perceiving them as at least not worse quality comparing main national brands.

The second important change is differentiation between classical specialist stores and so called "category killers" – mass merchandisers with deep product assortment within specialized product categories (like consumer electronics, home and garden ect.). In qualitative study (using FGIs) this difference has been explained as follows: classical specialist stores are perceived as trustworthy, so consumers often are using them to get more specific information about products, than to buy – they want to buy in such stores (have positive attitudes toward them), but at the same time higher prices are driving them out of this format. In "category killer" stores consumers are instead more prone to perform so called "showrooming" – looking at/experiencing product in-store with clear intention to buy it cheaper online.

Perception of stores open 24/7 also changed significantly during last years – previously they were referred mostly as small shops existing in little numbers selling mainly alcoholic beverages (with prices surcharged for "availability", and not easily accessible in terms of time to get in). Now they are perceived in most cases more similarly to smaller convenience stores with very limited assortment of FMCG merchandise – mostly snacks and beverages – as well as simple bistro-type gastronomy. This format nowadays is connected with gas

stations facilities, and total cost to the customer is perceived as lower than previously, as they are easier available.

Most isolated format in 2009 study was convenience store – differing significantly from other formats in both dimensions, in 2012 research isolated is marketplace – perceived as a sales format with lowest cost to the consumer. Similarities in perception between hypermarkets and supermarkets still persists, and today more often than previously the same store brands are operating simultaneously in both formats – good example of such strategy is Tesco, having older hypermarkets in large cities, and supermarkets in smaller towns. Also shopping malls and "category killers" are still similarly perceived

EMOTIONAL ATTITUDE TOWARD RETAIL FORMAT AND SHOPING FREQUENCY

Declared shopping frequency should be connected with emotional attitude toward particular store format. Mentioned variables are plotted Figure 3 confirming this relationship – they are highly correlated – Pearson correlation coefficient r equals +0,845 (p=0,000), suggesting very strong positive correlation. This is reasonable because consumers are buying more frequently at places they like – on the level of format as a whole and particular store location. Buying at places not preferred emotionally involves perception of taking greater risk – which should be rewarded by substantially lower price or other bonus having value for the consumer.

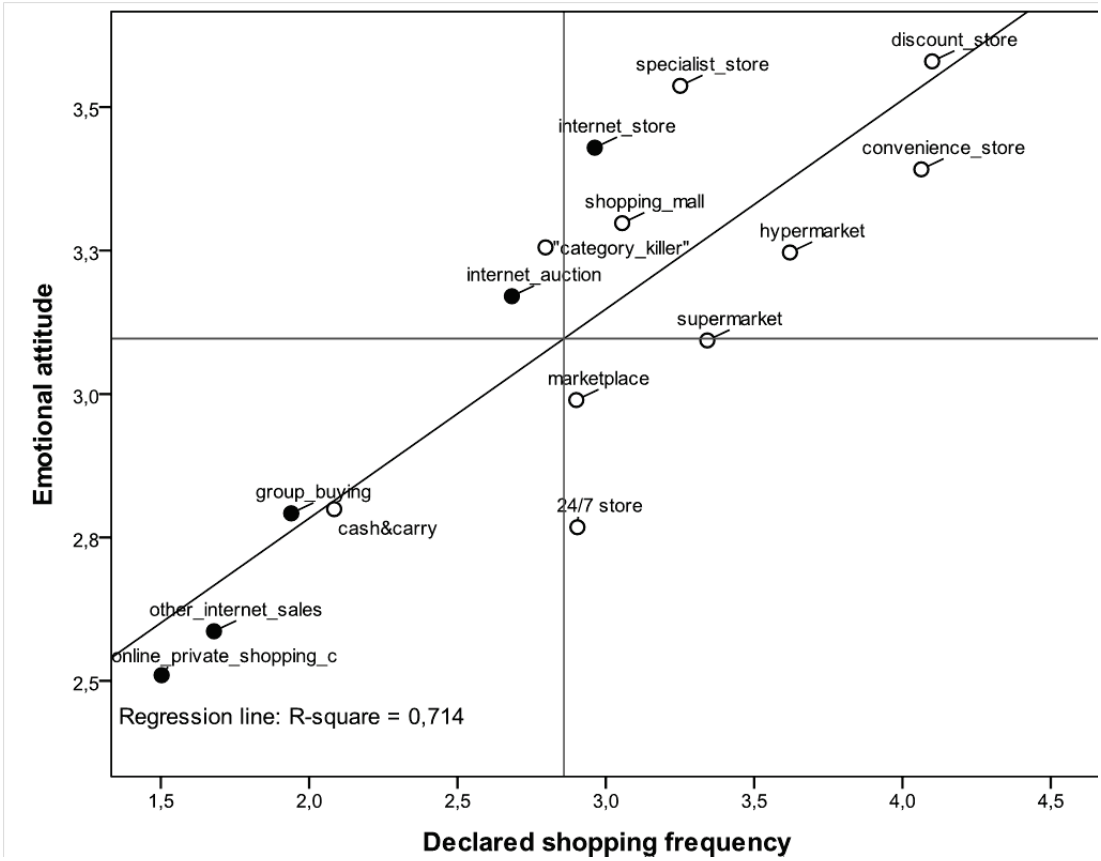

Figure 3. Declared shopping frequency vs. emotional attitude toward retail format (2012) Source: own research

Regression line plotted on figure 3 allows easily find formats for which declared shopping frequency differs much from emotional attitude. Highest positive difference is for internet stores and specialist stores (both perceived better emotionally than used frequently), and greatest negative distance (suggesting disliking) is for 24/7 stores.

Most positive attitudes are connected with discount stores – people feel "smart" buying at discounts – it saves money and time, gives access to interesting products perceived as having good value. Most negative attitudes (disliking) are for two relatively new internet sales formats: online private shopping clubs and informal internet sales (mostly C2C – not using auction platforms but rather social media tools). This comes from little knowledge about those forms – from cognitive perspective it is hard to like the unknown. More often used group buying is connected with more positive attitudes.

Positive attitude toward internet stores leads to conclusion that consumers want to buy more often in them, than do this in reality. Positive attitude comes in this case from availability of products not easily accessible in physical retail, and from ease to perform comparison shopping – as expressed by focus group participants, while main force prohibiting the consumers to buy at internet stores is still a risk, perceived mainly as possible delay with shipping and logistics, hidden costs or future problems after purchase. Consumers also like specialist stores – they trust the salespersons, appreciate their professional knowledge and advice, but think that price level is too high for them to made transaction. As common market practice in Polish specialist stores is having many products available on order, which consumers dislike (they must wait instead getting products immediately – and immediate availability is perceived as one from main advantages of physical retail), in effect many purchases are done outside this format, mainly over the Internet or through large store chains.

Not liking, but quite often buying in 24/7 stores is obviously connected by respondents with shopping by the way of fuel purchasing – this is sometimes perceived as overspending or with necessity to buy some FMCG products (including alcoholic beverages) beyond typical open hours. It is worth to note that in Poland there are very little restrictions of open days/hours for retail (most of shops must be closed on 12 National or Christian holidays in year only), but limited demand causes that only in large cities exist larger stores open 24/7 (for instance in Lublin having about 350 thousand inhabitants only one Tesco hypermarket is open 24/7).

PERCEPTION OF STORE FORMATS BY POLISH CONSUMERS – QUALITATIVE APPROACH

Because CAWI questionnaire to be effective must be as short as possible, authors incorporated topic of store formats perception to qualitative parts of both research. There was in both cases technique called projective perception map utilized, where FGI participants using response cards with empty perception map should as quickly as possible locate positions of objects from given list on two-dimensional space according to personal perception. One map with dimensions labeled: "unsafe" vs. "safe" (horizontal one), and "inexpensive" vs. "expensive" (vertical one) has been used in 2009 study. In recent research two such maps were provided to participants: first exactly the same as in 2009, and second labeled: "inconvenient" vs. "convenient" (horizontal dimension), and "I dislike" vs. "I like" (vertical one). The task was to locate positions of 5 main formats in 2009 (3 physical and 2

virtual), changed to locate up to 15 formats in early 2013 (10 physical and 5 virtual). Example of filled response cards from early 2013 are shown on Figure 4. Time between main CAWI study at the end of 2012 and FGIs from early 2013 not exceeded two months.

Individual responses were aggregated by coding positions for each format on the map. Next step was to find centroid of individual responses (with extreme outliers eliminated from analysis). Figure 5 contains aggregated map from 2009 – at this time formats asked were perceived consistently regardless of age and gender – so only one map is provided. Findings from early 2013 are shown on 8 separate perception maps (two maps for each from four age groups) – Figure 6.

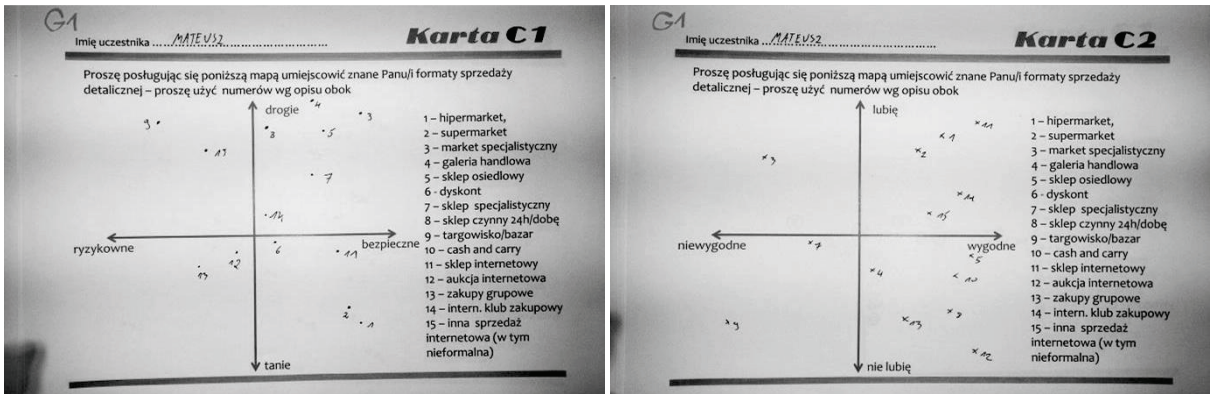

Figure 4. Examples of individual perception map from early 2013 study
Source: own research

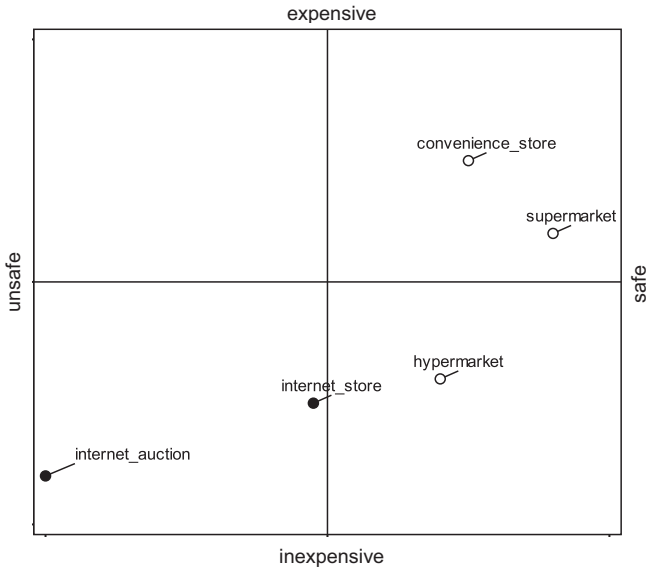

Figure 5. Projective perception map of retail formats – aggregation of all groups (2009)
Source: own research

Simple conclusion from 2009 map is that virtual channel formats were perceived less expensive than main formats from physical channel, and less safe (particularly Internet auctions). Lover price was expected compensation for lower safety of purchasing. Other costs than listed price were probably neglected by consumers participating in this research.

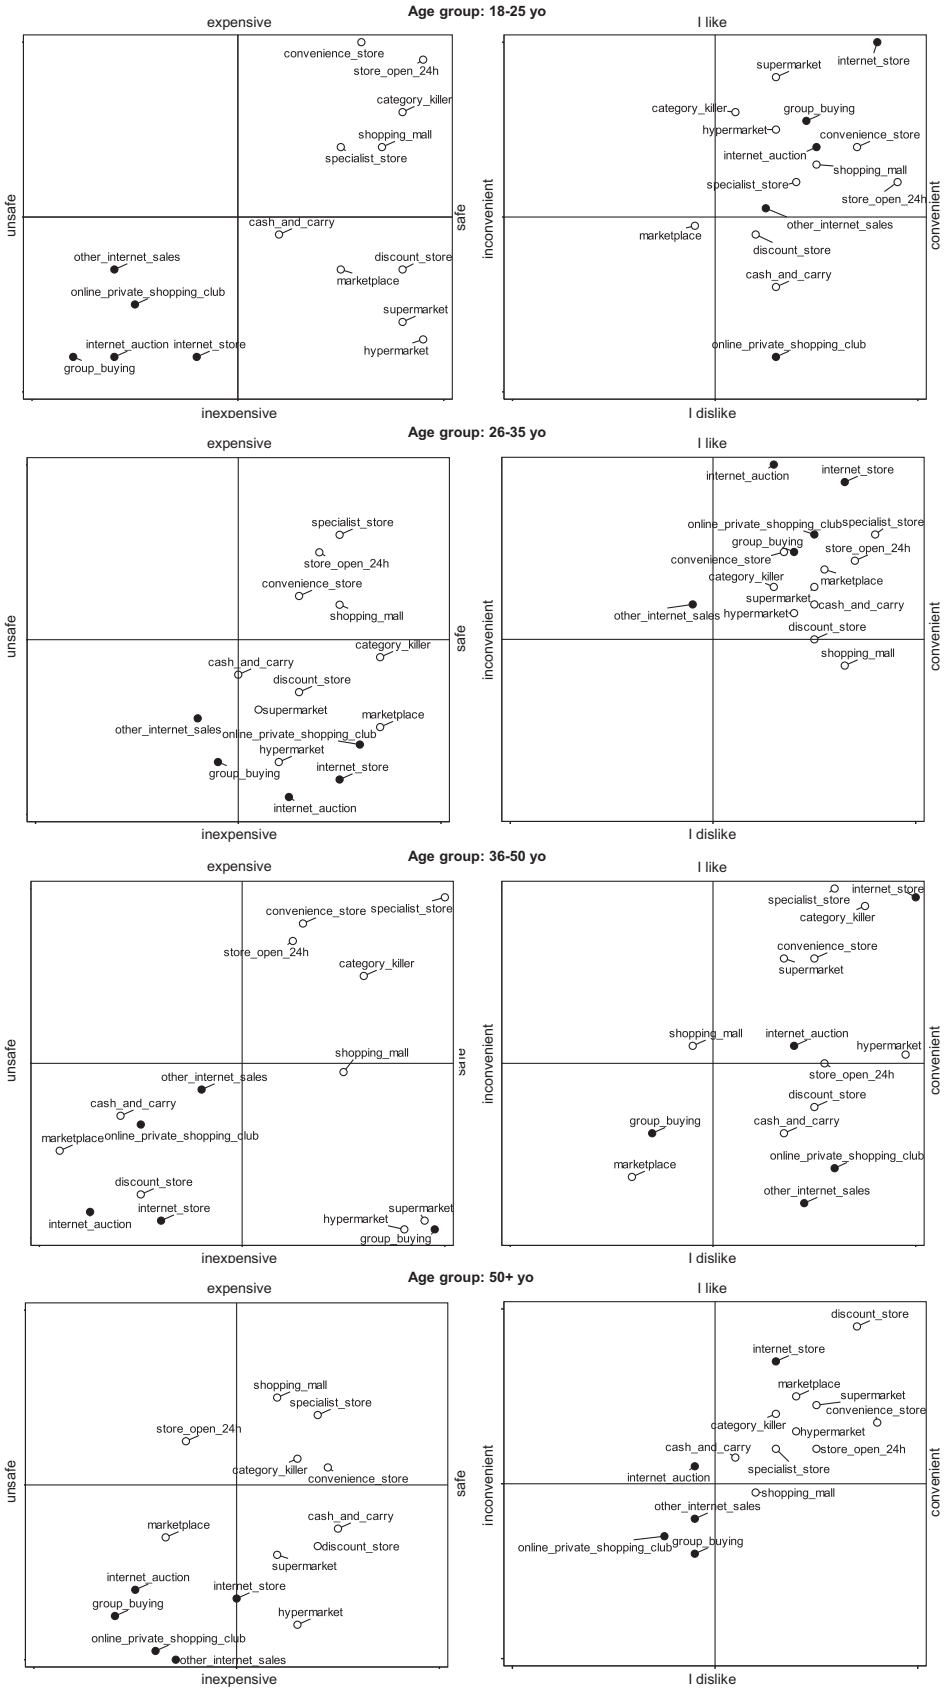

Figure 6. Projective perception maps of store formats by age groups (2012)
Source: own research.

As results from 2009 were very general, for next study more detailed approach has been used. Results shown on Figure 6 for separate age groups and two set of descriptors for each group allow to compare influence of age on perception of store formats, particularly those utilizing the Internet, which was harder to find on quantitative level (although UNIANOVA results – not presented in this paper – are consistent with qualitative findings).

Virtual retail formats are perceived as different than most formats of physical retail in terms of perceived price level an safety of purchase – they are perceived as having low listed price level and less safe comparing to physical stores. For youngest group three clusters are visible – mentioned virtual retail formats together are forming first group (inexpensive and unsafe), second group is perceives as inexpensive and safe (mostly grouping so called modern physical formats), and the third group consists of more traditional formats with shopping malls and category killers as replacements of their traditional counterparts. Interesting is similar pattern obtained in youngest focus group and group with persons aged 36-50 – in both groups perception of Internet retail is very similar (cheap and risky), this similarity applies also to perception of some physical formats perceived as safe and expensive (this applies for instance to convenience stores and 24/7 stores). Some similarities exist for mentioned dimensions between groups 26-35yo and 50+ yo (for example specialist stores).

For second set of descriptors interesting is perceiving nearly all store formats as convenient (only for 50+ group virtual retail – excluding internet stores – is rather inconvenient). Both younger groups are liking most of modern retail formats including virtual ones (with exception for discount stores). For both older groups disliking internet retail is more common, although for 36-50yo group disliking them not implies perceiving them as inconvenient. It should be noted that in this age group there was much more disliked formats comparing to other groups.

Discount stores and also cash and carry format were most disliked formats. Internet stores are liked very much and at the same time perceived as very convenient retail format. This not applies to very popular in Poland auction platforms – they are perceived as less convenient and less liked in comparison to internet stores.

Also there is a need to point out less positive perception of discounts in qualitative data – they are perceived as less convenient than other formats and rather disliked, but less expensive, [and what was not measured directly they are close to the consumers].

CONCLUSION

There are quite substantial differences in perception of retail formats. Still virtual retail is perceived as less safe, but also less expensive. For common types of internet sales even older persons have rather positive attitudes (younger ones have such attitudes for all virtual formats). Internet retail is perceived also as convenient.

Comparing results from quantitative part with qualitative ones visible is discrepancy in perception of gaining popularity discount stores – perceived similarly to convenience stores when investigated quantitative way, they show less positive perception in qualitative data – are perceived as less convenient than other formats and rather disliked, but less expensive.

All presented research conducted by authors allowed to build set of research tools and analysis techniques (both quantitative and qualitative) useful to assess perception of different retail formats. Results from different approaches are convergent each other and graphical way of their presentation is easy and useful. Repeating measurements over time allow also to examine changes in perception (when treated as longitudinal data from consumer panel). Lack of strong cultural cues in questions and response cards allows with ease international comparisons.

ABSTRACT

Purpose: *Customer relationship management (CRM) is an important tool to achieve marketing strategy for firms. This study investigated the influence of completeness of CRM relational information processes on customer-based performance. Besides, interaction orientation and CRM system readiness were adopted as moderators on the relationship between CRM relational information processes and customer-based performance.*
Design/methodology/approach: *Both qualitative and quantitative approaches were applied in this study.*
Findings: *The results revealed that completeness of CRM relational information processes indirectly and positively affects customer-based profit performance through customer-based relational performance. The implication and suggestion for managers were also discussed.*
Originality/value: *This study showed that well-built information processes strengthen customer-based relational performance. Moreover, managers should thoroughly strengthen customer-based relational performance to promote the customer-based profit performance. Finally, managers should build appropriate CRM technology systems and create complete rules, rewards and mechanisms to meet the developmental level of the CRM relational information processes and further promote customer-based performance*

INTRODUCTION

In the past, Customer Relationship management (CRM) performance was mostly measured by the financial outcome. Estimating customer loyalty through customer behavior is one of the methods that has been used to measure customer value. In order to measure customer value precisely, CRM performance must be evaluated by different evaluation metrics. In other words, a firm that has adopted a customer-centric philosophy must have different evaluation criteria than product-centric organizations (Sheth ,Sisodia, & Sharma 2000). Therefore, this study adopts customer-based performance, which has rarely been used in the past to evaluate CRM performance. Further, in customer-based performance metrics, this study not only investigates customer-based relational performance, which focuses on the behavioral dimension, but also employs customer-based profit performance, which focuses on the attitude dimension to more comprehensively evaluate customer-based performance.

In addition, this study is intended to lead to an understanding of weather there are influencing factors on the relationship between CRM relational information processes and customer-based performance. Therefore, the trend of individual marketing, this study puts the concept of interaction orientation into a research model. Nowadays, customers require more specific offerings to meet their heterogeneous demands. Firms collect and analyze customer data at the individual level in order to recognize each customer's individual needs. For firms, the method of interaction orientation can facilitate the collection of data through communicating with each customer. Ramani and Kumar (2008) considered the idea that interaction orientation reflects a firm's ability to interact with its individual customers and to take advantage of information obtained from them through successive interactions to achieve profitable customer relationships. Thus, interaction orientation assists in the accomplishment of CRM relational information processes more smoothly and further, cooperatively promotes customer-based performance.

Moreover, the implementation of a CRM system induces huge changes in processes, technology, and the people in firms. Reinartz, Karfft, and Hoyer (2004) suggested that CRM-compatible organizational alignment and CRM technology positively moderate relationships between CRM processes and economic performance. CRM system is a technology-oriented business strategy. The key point is that CRM technology plays a critical role in the context of leveraging CRM-related activities and thus contributes to improved organizational performance in the market (Reinartz et al., 2004). CRM system readiness is a facilitator of information processes that leads to better firm performance. Although prior scholars have suggested many factors that may affect CRM implementation, there is little

research specifying these factors as constructs. Thus, this study combines these factors into a single construct labeled as CRM system readiness.

Based on the discussion above, this study presents a framework with which to explore how a CRM information system is manipulated and how the performance of a CRM informational system is affected in a service industry. The purpose of this study investigates (1) to evaluate whether well-built information processes have a positive influence on customer-based performance, and (2) to assess the moderating effect of interaction orientation and CRM system readiness on information processes leading toward customer-based performance.

THEORTICAL BACKGROUND AND HYPOTHESES DEVELOPMENT

1. CRM Relational Information Processes

The definition of relevant information processes in this study is the process of segmenting customers and tailoring relevant offerings for them to create value for a firm (Day, 2003). This study defines CRM relational information processes as a procedure of data collecting. Firms can have contact with their customers and gather relevant data at the same time through various channels. The data then is stored in database that can be analyzed and transformed into useful information and concurrently supplied to front offices for the management of customer relationships.

2. Customer-based Performance

Chang and Wong (2010) mentioned that CRM enhances a company's competitive capabilities such as cost reduction and market share enlargement, within the environment of a web based value chain integrated by internal operations, suppliers and customer relationships. This study applies customer-centric performance measures: customer-based relational performance and customer-based profit performance (Ramani & Kumar, 2008). Customer-based relational performance assesses performance on attitudinal parameters, whereas customer-based profit performance assesses performance on behavioral parameters.

2.1 Customer-based Relational Performance

The measurement of customer-based relational performance stresses the evaluation of the relationship between firms and customers, which presents customer attitudes toward a given firm. Ramani and Kumar (2008) identified the measure of customer-based relational

performance in terms of three indicators: customer satisfaction, customer ownership, and positive word of mouth. Customer-based performance is a different way to measure information processes and also bring benefits to firms. This study focuses on customer relationships to develop the dimension of customer-based relational performance. The dimensions include customer satisfaction, customer ownership and positive word-of-mouth, which cultivate customer loyalty and sustain long term relationships.

The completion of CRM relational information processes includes information reciprocity, information capture, information integration, information access, and information use. The implementation of entire processes certainly requires collaboration among all of the various functions. This results in a complete realization of customer needs and an adequate utilization of customer information to design marketing activities. Customers can obtain what they want, and firms can gain profit from customer satisfaction; meanwhile customer satisfaction can bring positive word-of-mouth communication to firms. According to the above description, this study develops a hypothesis as follows:

H1: *CRM relational information processes positively affect customer-based relational performance.*

2.2 Customer-based Profit Performance

Customer-based profit performance includes three dimensions: identifying profitable customers, acquiring and retaining profitable customers, and conversing unprofitable customers to profitable ones. These three dimensions are applied to measure customer value, and based on this; firms can assign resources and develop marketing strategies.

Firms that invest in information processes that enhance their interaction response capacity and implement their customer value management practices are in a position to distinguish between the characteristics of profitable customers and those of unprofitable customers and can use this information to identify potentially profitable customers (e.g., Reinartz & Kumar, 2003). Firms that have well-built information processes and provide customized and personalized offerings can evoke customer intention to maintain long-term relationships. According to the above description, this study develops a hypothesis as follows:

H2: *CRM relational information processes positively affect customer-based profit performance.*

2.3 Customer-based Relational Performance to Customer-based Profit Performance

Customer-based relational performance assesses performance on attitudinal variables, whereas customer-based profit performance measures performance on behavioral variables. In accordance with the theory of planned behavior, Ajzen (1991) determined that customer attitude (e.g., satisfaction, ownership, and word of mouth) influences firm behavior (e.g., identifying profitable customers, acquiring and retaining profitable customers, and converting unprofitable customers to profitable ones). A higher level of customer-based relational performance has direct effects on customer-based profit performance. As long as customers are satisfied with firm offerings, they exhibit repurchase behavior (Spiller, Vlasic, & Yetton, 2007). Additionally, firms can understand customer requirements through information processes designed to analyze customer purchase history and preferences, thus helping sales managers to identify and target their most valuable customers. According to the above description, this study develops a hypothesis as follows:

H3: *Customer-based relational performance positively affects customer-based profit performance.*

3. Interaction Orientation

Firm-customer interaction is two-way; firms not only obtain customer data, but customers also receive up to date information about firms. This two-way interaction allows firms and customers to understand each other completely. Moreover, firms analyze customer data at the individual level, which can allow firms to provide customized products/services to fulfill customer demands.The market success of service organizations is crucially dependent on the interaction between frontline employees and customers (Ramani & Kumar, 2008; Chang & Ku, 2009).

Jaramillo and Grisaffe (2009) noted that customer orientation should have positive effects on performance. Customer-oriented selling should also increase customer satisfaction, which leads to overall better performance when satisfied customers reward salespersons by continuing to place repeat orders (Poddar, Donthu, & Wei, 2008). Salespersons with high levels of interaction orientation truly are concerned about customers and thus engage in actions related to customer value such as listening to customer feedback and solving customer problems. Together, interaction orientation and adaptive selling lead to win-win outcomes because customers are served in better and more individually relevant ways,

producing higher levels of success for the sales force and the organization (Jaramillo & Grisaffe, 2009). By CRM relational information processes, firms are able to gather and utilize complete customer data to design customized products/service to meet their requirements. According to the above description, this study develops a hypothesis as follows:

H4a: *Interaction Orientation has a moderating effect on the relationship between CRM relational information processes and customer-based relational performance.*

CRM applications automate the customer-facing interactions between an enterprise and a customer based on an acknowledged fact that it costs three times as much to acquire a new customer as it takes to retain an existing customer (Vinod, 2007). Bradshaw and Brash (2001) suggested that CRM is a management approach that involves identifying, attracting, developing and maintaining successful customer relationships over time in order to increase retention of profitable customers. According to the above description, this study develops Hypothesis 4b as follows:

H4b: *Interaction Orientation has a moderating effect on the relationship between CRM relational information processes and customer-based profit performance.*

4. CRM System Readiness

CRM system readiness means that firms collaborate with CRM infrastructure, software, departments, and employees in order to implement CRM relational information processes effectively. These success factors for CRM implementation belong partly to organizational attributes and partly to technological attributes (Ramani& Kumar, 2008). CRM readiness consists of two dimensions, which are organizational readiness and technological readiness.

4.1 Organizational Readiness

Firms can not succeed in implementing CRM without internal function cooperation and adequate financial resources. Therefore, cross departments must be working together and supporting to each other, and in the meantime, senior managers also have to support the adoption of a CRM system. A customer-oriented culture is essential for the quality and extension of customer-knowledge creation and dissemination, as well as the implementation of a relationship-management strategy (Su, Tsai and Hsu, 2009). The appropriate collaboration of internal departments has positive effects on the implementation of CRM systems. Organizational readiness is assessed by financial and technological resources which

reflect whether or not a company has the capability to deal with the compatibility and consistency of a CRM system regarding firm culture, value, and preferred work practices (Grandon & Pearson, 2004). Moreover, Chan and Ngai (2007) stated that IT adoption includes the level of IT knowledge among top management, the level knowledge of individual learners, the level of IT use within the organization, the size of an organization, and its financial resources.

4.2 Technology Readiness

The use of CRM technology is expected to boost the ability of an organization to sustain profitable customer relationships by enabling information to be integrated and shared smoothly, thus facilitating more efficient and effective on firm-customer interaction, analysis of customer data, and customization of responses (Day, 2003).

A high level of technology readiness fosters the capturing of customer data, the analysis of customer information, and provides a coherent view of customers. Firms understand each customer's individual demands and adopt differentiation marketing based on these demands. Similarly, technology readiness supports the development of capabilities that result in a potential for competitive advantage.

At the heart of CRM is an organization's ability to leverage customer data creatively, effectively, efficiently, and based on these elements, to design and implement customer-focused strategies (Chang and Ku, 2009). Companies that are equipped with customer IT and knowledge have greater potential to make correct decisions, produce desirable products, services, and deliver value for customers. Reinartz et al. (2004) stated that firms that use technology in their organizations regard technology as a resource that supports the implementation of information processes. According to the above description, this study develops Hypothesis 5a as follows:

> H5a: *CRM system readiness has a moderating effect on the relationship between CRM relational information processes and customer-based relational performance.*

CRM information relates not only to current customers, but also to future potential customers to anticipate and to respond to their needs. As a management tool, CRM manages a company's relationship with its customers, thereby enabling the former to identify and attract customers and initiate appropriate steps towards the retention and identification of those customers that are profitable (Ryals, Knox, & Maklan, 2001). In order to obtain precise

information on targets or market segments and micro-segments, CRM enables organizations to reach high levels of profitability by using databases, data warehouses, data mining, one-to-one marketing, automated call centers and sales force automation (Maleki & Anand, 2008). According to the above description, this study develops Hypothesis 5b as follows:

H5b: *CRM system readiness has a moderating effect on the relationship between CRM relational information processes and customer-based profit performance.*

5. Conceptual Framework

The conceptual framework is shown in Figure 1. This study employed the CRM system relational information processes to discuss customer-based relationship performance and customer-based profits performance.

— Figure 1 is about here —

RESEARCH DESIGN

A qualitative approach consisting of individual in-depth interviews was adopted for the purpose of this study in order to understand the detailed operational processes and results of a CRM system within the firms being considered. Meanwhile, a confirmation of each dimension of the constructs in this study matched empirical practice and was, as a result, reasonable. After collecting abundant information from case studies, a questionnaire survey was adopted in order to further obtain the quantitative data for analysis. Eisenhardt (1989) and Yin (2003) addressed the idea of combinations of the qualitative and quantitative approach and suggested that it is precise and reliable.

Three companies participate in the case study. The first is 3C product retailer with extensive branches, Tsann Kuen Enterprise Co., Ltd. (TKE). The selected interviewee is the director of the Yung Hua branch, Mr. Daniel Yeh. The second one is a financial services company, Shin Kong Financial Holding Co., Ltd. (SKFH), which provides a variety of financial products. The chosen interviewee is a training lecturer of the firm, Mr. Kao. The third company is an insurance company, Kuo Hua Life (KHL), which focuses on life insurance. The selected interviewee is the sales manager in Southern Taiwan, Ms. Yang. In order to be concurrent with interview content, past literature, Internet data, and theory, this study is comprised of revised constructs and a questionnaire designed in terms of customer relational information processes, customer-based relational performance, customer-based profit performance,

interaction orientation, and CRM system readiness.

After conducting the interviews, questionnaires were delivered to firms that were in service industries with business-to-customer markets. The respondents were required to be either marketing or sales managers.

CASE ORGANIZATIONS

1. Case Studies Summary

From the findings that result from the interviews, this study found out that there were several common viewpoints. These interviewees were all in agreement with the adoption of sales representatives, call centers, and the other methods used to collect customer data. The collected data is all stored in a central database, analyzed by separate departments, and integrated to turn to useful information. Hence customer information remains stored in the databases, the front office is able to use the information to develop adequate marketing activities. Moreover, the three interviewees all considered customer satisfaction to be a very important evaluation criteria for their companies. A high level of customer satisfaction is equal to the willing of customers to sustain a long term relationship with firms. Satisfied customers communicate with positive word-of-mouth to their friends and relatives. These interviewees also indicated that the companies use customer information to segment the markets depending on customer value. Developing potential customers is also a main concern for all of the interviewees because new customers can expand the market size of firms.

The CRM system of the three companies was built in-house. In-house CRM systems can really match to the organizational structure and business model of each company. As a result, the companies prefer to develop CRM system in-house. The three companies have all applied their in-house CRM systems for over ten years. Thus, each company's CRM system has a user-friendly interface, and it is also compatible with their organizational structures.

Different perspectives from the interviewees were customer ownership which is the dimension of customer-based relational performance. Customers who purchase financial products such as insurance, funds, and other monetary related items are concerned about the financial statements of firms. However customers are rarely concerned about the financial well-being of firms when they purchase consumer products.

2. Revised Model: Based on Case Organizations

According to the findings from interview, this study discovered CRM system was regarded as a tool to assist daily business operations in chain stores. For instance, they adopted POS to record transactions of each customer such as amount of purchase, number of purchases, item purchased and so on. However, financial organizations interact with their customers through CRM system and sales representatives. Financial organizations collect each customer's up-to-dated information and provide individual customer with customized products/services. Although the chain stores and financial service are classified in service industry, the purpose of CRM system for two of them is different. The chain stores deem CRM system as a facilitator, whereas CRM system for financial organization is a medium for communicating with customers. However, customer ownership in customer-based relational performance was not supported in the case study. For example, customers visit to 3C outlets and purchase 3C products are not necessarily actively concern about the financial well-being of firms. The results of the case analysis reveal that not all customers are highly concerned about firms' financial conditions in every industry. Therefore, the study excluded the dimension of customer ownership from the conceptual framework.

DATA ANALYSIS

As discussed previously and following the case study, a questionnaire was designed consisting of six parts as follows: CRM relational information processes, customer-based relational performance, customer-based profit performance, interaction orientation, CRM system readiness, and background information. The questionnaire was based on seven-point Likert-scale response format that ranged from 1 (strongly disagree) to 7 (strongly agree). There were 48 items, including the background information items listed in the questionnaire. After that, a pilot test was conducted to evaluate reliability (Cronbach's alpha and an item-to-total correlation) and validity, and the aim was to ensure the readability and understandability of the questionnaire. Questionnaire items were revised based on the results of the pretest prior to conducting the formal survey.

Sample Characteristics

Paper-based questionnaires were distributed to eligible subjects in service industries such as retail, finance, and technology, among others. Meanwhile, 1000 questionnaires were distributed; there were 250 survey responses, and the response rates were about 25%. 209 surveys were considered valid for further analysis. The majority of the respondents were aged between 20 and 29 (49%). Most of them had a Bachelors degree or above (98%), and their

working experience ranged between one to five years (46%). The largest employment sample was from the financial industry (52%), and the most frequent position was (56%). Moreover, the majority of the respondents were working in the marketing department of their company (44.0%).

Data Analysis

The data was analyzed using SPSS 12.0 and AMOS 5.0. A CFA examines the adequacy of the measurement component of the proposed model and evaluates the discriminate validity of the constructs. Hierarchical regression was used to test the moderating effects. Item-to-total correlations were above 0.5 (0.57~0.877) except in the case of IC5, so IC5 was deleted. All of the remainder of the items had standardized factor loadings above the criteria of 0.5 (0.57~0.89).

In assessing reliability, although customer-based relational performance showed Cronbach's α and CR values slightly lower than 0.7, the value was still considered in the acceptable range (α= 0.680, CR= 0.657). Overall, all of the measures in this study can be regarded as having a satisfactory level of reliability. Convergent validity, the *t*-value of factor loading is commonly used to establish convergent validity. In this study, the fact that all factor loadings were relatively high and significant also provided strong evidence of convergent validity. Support for convergent validity was also demonstrated by the high average variance extracted (AVE) for all constructs. The AVEs of the five constructs in this study ranged from 0.465 (IC) to 0.743 (CBPP).

In Table 1, the change in chi-square of the constrained model is larger than 3.85 ($p < 0.05$). "A significantly lower χ^2 value for the model in which the trait correlations are not constrained to unity would indicate that the traits are not perfectly correlated and that discriminate validity is achieved."

— Table 1 is about here —

The standardized coefficients and significances for the hypothesized paths of the structural models and model fit indices are shown in Figure 2. The overall fit of model was excellent (chi-square, p= 0.003) and significant. The comparative fit index (CFI), the goodness of fit index (GFI), the adjusted goodness of fit index (AGFI) and the normed fit index (NFI) were 0.974, 0.95, 0.914, and 0.944, respectively. The root mean square error of approximation (RMSEA) was 0.063 (> 0.05), which fell in an acceptable range. The CRIP was positively

associated with the CBRP (γ= 0.652, $p < 0.001$) in support of H1. H2 predicted that the CRIP would lead to CBPP, was not significant (γ= 0.013, $p > 0.05$). H3 predicted that superior CBRP would lead to superior CBPP, was supported (γ=1.028, $p < 0.001$). Table 2 exhibits the results of path analysis and hypotheses testing.

— Figure 2 is about here —

— Table 2 is about here —

To test the hypotheses of the moderating effects (H4a and H5a,), hierarchical regression analysis was executed in this study to determine whether a significant interaction effect existed among CRM relational information processes (CRIP), interaction orientation (IO), and CRM system readiness (CSR) with customer-based relational performance (CBRP) as the dependent variable. To test H4b and H5b, hierarchical moderated regression was also used for analysis to determine whether a significant interaction effect existed among the CRIP, IO, and CSR, with customer-based profit performance (CBPP) as the dependent variable.

The results of hierarchical regression analysis are reported in Table 5. In the main effects-only model, the main effect of CRIP on CBRP was significant (β= 0.48, $p < 0.001$). The main effects of IO and CSR on CBRP (β= 0.292, $p < 0.001$; β= 0.356, $p < 0.001$) were all significant. The interaction orientation has a positive and significant effect on the relationship between CRIP and CBRP (β= 0.146, $p < 0.05$). Therefore, H4a is supported.

Customer-based profit performance as the dependent variable was used to examine Hypotheses 4b and 5b. The main effect of CRIP on CBPP was significant (β= 0.545, $p < 0.001$) The interaction terms of CRIP and IO had a non-significant effect on CBRP (β= -0.02, $p > 0.05$). Therefore, H4b was not supported. The interaction terms for CRIP and CSR had a non-significant effect on CBRP (β= -0.02, $p > 0.05$). Therefore, H5b was not supported.

— Table 3 is about here —

CONCLUSION AND SUGGESTIONS

Discussion

The results of this study refer to indications that CRM relational information processes directly affect customer-based relational performance, and then customer-based relational performance directly affects customer-based profit performance. Through the gathering, sifting, and analyzing of information regarding their customers, firms gain knowledge about the characteristics and behavior of every customer. Then, according to this knowledge about their customers, firms can develop customized actions oriented toward customers to meet the requirements of each customer on an individual basis. Therefore, well-collaborated CRM relational information processes facilitate an increase in customer satisfaction levels and positive word of mouth. Favorable customer satisfaction raises the level of return to extend and increase their amount of purchases, and the positive word of mouth attracts more new customers. The promotion of the value of customers therefore increases the sales and profit of firms.

However, it was found in this study that CRM relational information processes do not directly affect customer-based profit performance. This result does not seem to correspond to the research of Jayachandran et al. (2005), who investigated the association between relational information processes and customer relationship performance. This is because the concept of customer relationship performance in their study only explored customer satisfaction and customer retention. However, the definition of customer relationship performance in this study was more extensive. Not only was customer-based relational performance, which consists of customer satisfaction and word-of-mouth, investigated, but also customer-based profit performance was included. Additionally, the above results mean that CRM relational information processes must, through their influence on customer-based relation performance, also affect customer-based profit performance. CRM relational information processes stress the collecting and applying of information which is obtained from customers, so they only focus on the customer relationship levels. Through the operation of CRM relational information processes, the most direct influence toward firms is the customer's feelings and then their relationship with their customers. In other words, the more smoothly the CRM relational information processes are, the more the customer-based relation performance is promoted. Therefore, the levels of quality of CRM relational information processes are not so directly translated into financial outcome. After building favorable customer relationships, firms can retain more original customers, acquire more new customers and increase customer value and then realize the effects in profit performance. Therefore, the CRM relational information processes must through the mediator mechanism of relation-related performance

influence the ultimate financial-related performance.

Additionally, the effects of the two moderator constructs were partially significant. Interaction orientation had moderating effects on the influence of CRM relational information processes on customer-based relational performance. Interaction orientation is based on a customer-centric philosophy that includes information observed at the individual customer level, is recorded from each customer's transactions, opinions shared with customers, and predicted profitability. The adoption of interaction orientation on information management could foster the process of CRM information reciprocity, capture, integration, access and use more easily and more efficiently. Further, through an understanding of customers that corresponds to their preferences, firms establish favorable relationships with their customers. Retaining favorable relationships can be transformed into an improvement of higher levels of customer satisfaction and positive word of mouth.

As for CRM system readiness, although it had moderating effects on the influence of CRM relational information processes on customer-based relational performance, the effect was shown to be negative. CRM system readiness is the foundation of the accomplishment of the CRM information process. Complete technology infrastructure and specific mechanisms and rules for the implementation of tasks can assist with the collection and application of the information about customers and smooth the CRM information process. However, if the development and renewal of CRM system readiness is over complicated and fast, the steps of information processes must be updated continuously, so both the employees and organizations involved cannot correspond to the rapid growth of IT in real time. Therefore, CRM system readiness cannot be brought into full play to promote the establishment of favorable customer relationships and satisfaction. On the contrary, if the CRM system technology infrastructure is not complete, and the organizations do not provide the necessary support for executing CRM tasks, the building of relationships between a firm and its customers requires the assistance of complete CRM relational information processes. Therefore, when CRM system readiness is not so complete, the importance and influence of CRM relational information processes on customer-based relational performance are stronger.

However, the results in this study suggested that interaction orientation and CRM system readiness do not moderate the effect of CRM relational information processes on customer-based profit performance. The major reason for this was that the direct effect of CRM relational information processes on customer-based profit performance was not significant, so the moderating effects of interaction orientation and CRM system readiness on the relationship between them were also insignificant. Additionally, interaction orientation is

an intangible concept of interaction with customers. Customer-based profit performance is used to measure customer profitability, which is defined as tangible CRM benefits; moreover, customer-based relation performance is used to measure customer satisfaction and word-of-mouth, which is defined as intangible CRM benefits. Therefore, interaction orientation moderates the relationship between CRM relational information processes and customer-based relation performance but does not moderate the relationship between CRM relational information processes and customer-based profit performance, whose measurement character is different from interaction orientation.

Theoretical Implications

This study adopted more exact criteria to evaluate the performance of CRM. In the past, most research has employed financial indexes to measure CRM performance (Kumar and Reinartz, 2006); however financial outcomes can not entirely reflect customer attitude and behavior. Therefore, in order to actually explore customer value, customer-based performance, which is customer-centric, was adopted in this study. Further, this study found that CRM relational information processes first affect customer-based relational performance and then influence the customer-based profits performance. Past research only has investigated the influencing factors on the general performance of CRM; however, this study further divided the performance dimensions and showed that the completeness of CRM relational information processes must, through customer satisfaction and word of mouth, affect final profit performance. Therefore, CRM performance measures in this study were more comprehensive with regard to presenting customer value and more precisely pointing out the path of the quality of a CRM information system's influence on performance.

The role of the moderation of interaction orientation and CRM system readiness on the influence of the level of completeness of CRM relational information processes on the customer-based performance, which have been ignored in past research, were investigated in this study. The results of this study indicated that if the reciprocity, capture, integration, access and use of information are implemented at an individual level, firms provide customized products or services according to the needs and preferences of customers more easily. Fulfilling the requirements of customers improves customer satisfaction and word of mouth. Therefore, interaction orientation can foster the function of CRM relational information processes to enhance customer-based relational performance.

The results of this study suggested that higher CRM system readiness requires higher CRM

information processes. Overly complex and fast development of a CRM system make the CRM information processes hard to address, so firms cannot provide favorable and customized service to customers and cannot further strengthen their long-term relationships with their customers. On the contrary, when the CRM system infrastructure is not high quality, and the organizations do not provide training, rewards and rules corresponding to the CRM system, the influence of the completeness of CRM information processes with regard to retention and promotion of the relationship between the firms and its customers is higher. Therefore, a moderating effect of interaction orientation and CRM system readiness on the relationship between CRM relational information processes and customer-based relational performance was found.

Managerial Implications

There are several implications in this study for managers. This study showed that well-built information processes strengthen customer-based relational performance. Therefore, firms should develop information processes systemically to make firm collection, analysis, and use of customer information more precise. According to customer information that includes buying history, personal preferences, and other personal history, firms can offer customized products/services for each customer. In addition, firms can distribute resources adequately to profitable customers and reduce marketing costs spent on unprofitable ones. Through CRM relational information processes, firms can establish customer value management and then use resources more effectively and efficiently.

In addition, managers should thoroughly strengthen customer-based relational performance to promote the customer-based profit performance. When customers are satisfied with firm products/services, they tend to spread good word-of-mouth and further maintain long term relationships with firms. As a result of having a quality relationship with customers, firms can segment customers efficiently as well. Market segmentation can identify profitable and unprofitable customers. As different value driven from customers, firms can customize and personalize marketing activities and then exploit the full value of each customer to promote their profit performance.

This study showed that if there is a high level of CRM system readiness, it will not necessarily have a positive effect on the association between information processes and customer-based performance. When a firm that depends on its CRM system excessively, there is a negative effect, and the result is a case in which the CRM system is not user friendly or in which employees misunderstand the role that CRM plays in their organization. Therefore,

managers should build appropriate CRM technology systems and create complete rules, rewards and mechanisms to meet the developmental level of the CRM relational information processes and further promote customer-based performance.

ABSTRACT

Purpose *– The paper aims to improve the key quality performance of the terminal of earphone in an electronic company.*
Design/methodology/approach *– Sequential experimental designs are employed. Significant input variables are found trough a full factorial design. Then a response surface model is constructed considering curvature in the linear model.*
Findings *– Optimized key input variables' parameters are found using the response surface model. The key quality performance, coplanarity of the terminal of earphone has been improved.*
Research limitations/implications *– Instead of running a full factorial design in the first stage, a fractional factorial may be used to reduce experimental runs.*
Originality/value *– The methodology used in this case can be easily extended to similar cases.*

Keywords quality improvement, design of experiments, response surface methodology, central composite design, parameter optimization

INTRODUCTION

Response surface methodology (RSM) is a collection of statistical and mathematical techniques useful for developing, improving, and optimizing products and processes. The most extensive applications of RSM are particularly in situations where several input variables have potentially influence on some performance measures or quality characteristics of the product or process. RSM initiates from design of experiments (DOE) to determine the factors' values for conducting experiments and collecting data. The data are then used to develop an empirical model that relates the process response to the factors. Subsequently, the model facilitates to search for better process response, which is validated through

experiments. The above procedure iterates until an optimal process is identified or the limit on experimental resources is reached. RSM is a very important tool for product and process improving in the improvement phase of Six Sigma Management.

Company A is an electronics enterprise in Tianjin, which engaged in supplying many kinds of electronic connectors for Motorola mobile phone division. In the supplying process, the company often received feedback complaints from customers. One kind of earphone named AJR45 had defect of bad echo caused by large coplanarity of the terminal. In order to improve the quality of products and reduce quality cost, the company adopted the one-factor-at-a-time (OFAT) approach and just selected the best existing experiment conditions as the optimal operating conditions. As we know, OFAT does not work well for process optimization if there are interactions among input variables. The solution by OFAT was not optimal in practice. The article presents a systematic solution to this problem through sequential use of experimental design to minimize the coplanarity and thus improve product quality.

LITERATURE REVIEW

Experimental design is widely used in manufacturing (Mukherjee & Ray, 2006; Sharma & Yadava, 2013; Koleva and Luchkov, 2005). C F Jeff Wu and Michael S Hamada(Wu & Hamada, 2009) classify experimental problems in to five broad categories according their objectives: treatment comparisons, variable screening, response surface exploration, system optimization and system robustness. RSM is a critical technology in developing new processes, optimizing their performance and improving the design and/or formulation of new products (Box et al,2005; Myers and Montgomery, 1995; Sefa-Dedeh, et al 2003). Myers and Montgomery (1995) also point out that most applications of RSM are sequential in nature. A screening experiment or a first order model is conducted first to identify important input factors. If the there is strong curvature exists and the first order model is not adequate, a second model or response surface model is needed. Cihan M.T. et al construct response surface for compressive strength of concrete through sequential design of a 2^{7-4} fractional factorial and then a D-optimal design (Cihan, Güner & Yüzer, 2013). He et al (2009) use sequential experimental design to improve the isolation of the fused biconical taper wavelength division multiplexer. In this paper, we design a full factorial experiment to find the important factors and a response surface model to optimize process parameters to improve coplanarity of the terminal of earphone.

THE FIRST STAGE EXPERIMENT

Most applications of response surface methodology are sequential in nature. That is, at first some ideas are generated concerning which factors or variables are likely to be important in the response surface study. This usually leads to an experiment designed to investigate these factors with a view toward eliminating the unimportant ones. This purpose of the experiment at this stage is to screen important factors or input variables.

Before starting experiment, we need to identify factors that affect coplanarity of the terminal by cause and effect analysis using fishbone diagram and cause and effect matrix. The coplanarity is mainly affected by the operating conditions of the gas riveting end machine. The factors are cylinder pressure, block height, decent speed, slot width. Table 1 gives factors and their levels in the experiment.

Table 1. Factors and their levels in experiment

Factors	Types	Levels	Are there center points
A (cylinder pressure)	variable	6-8 Pa	Yes
B (decent speed)	variable	2-4 s/mm	Yes
C (block height)	variable	13.1-13.7 mm	Yes
D (slot width)	variable	40-60 mm	Yes

Because there are less than five factors, we can use full factorial design in order to screen significant factors. We choose the 2^4 design with four center points to check the possible curvature. Table 2 shows the experimental arrangement. Note that the run order of the experiment has been randomized.

Table 2. Experiment arrangement for the 2^4 design (coded variables)

Run order	Center pt	A	B	C	D	Y
1	1	1	-1	-1	-1	0.069
2	1	-1	-1	-1	1	0.087
3	1	1	1	-1	1	0.071
4	1	-1	1	1	-1	0.095
5	0	0	0	0	0	0.082
6	1	-1	1	1	1	0.093
7	1	-1	1	-1	-1	0.086
8	1	1	1	1	1	0.083
9	1	1	-1	1	-1	0.081
10	1	1	1	1	-1	0.082
11	1	-1	-1	-1	-1	0.088
12	1	-1	-1	1	1	0.094
13	0	0	0	0	0	0.081
14	1	1	-1	-1	1	0.072
15	0	0	0	0	0	0.079
16	1	-1	1	-1	1	0.085
17	1	-1	-1	1	-1	0.093
18	0	0	0	0	0	0.081

Run order	Center pt	A	B	C	D	Y
19	1	1	1	-1	-1	0.073
20	1	1	-1	1	1	0.084

The experimental data in Table 2 were analyzed by Minitab. Table 3 shows the estimated effects and coefficients for response Y. From Table 3 we can find that factor A and C are significant with p-value<0.05, the interaction of A*C is significant with p-value=0.05.

Pure error	15	0.0000263	0.0000263	0.0000018		
Totol	19	0.0011110				

Note: * means that the p-value is less than 0.05, and the corresponding term is significant

Figure 1 shows the Pareto chart of the standardized effects, and Figure 2 shows the normal probability plot of the standardized effects. Both of them indicate that the effects of A, C and A*C are significant. But the curvature term is also significant. That means the first order model is not adequate. A second-order model for the significant variables A and C needs to be designed, and more experiments need to be done to fit the model.

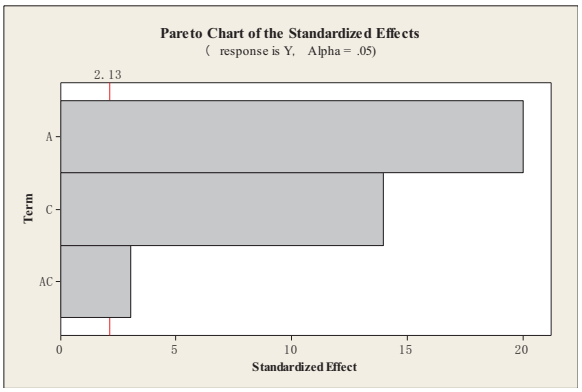

Figure 1 Pareto chart of the standardized effects

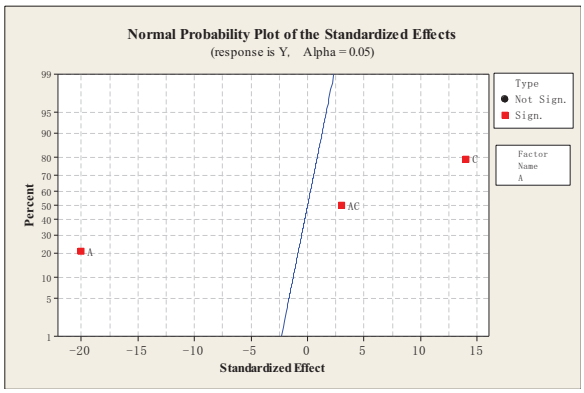

Figure 2 Normal probability plot of the standardized effects

EXPERIMENTAL DESIGNS FOR FITTING RESPONSE SURFACES

The first stage experiements results also shows that the lower pressure (factor A) and higher Height may yield possible lower coplanarity. Based on the engineering experience and steepest ascend analysis, we choose the high level of pressure to the high end of operating range, and the low level of height to the low level of operating end. Coplanarity was significantly reduced through the first stage experiement. Since there is possible curvature, a composite face-centered design (CCF) is used for the second stage experiments as shown in Figure 3, for two variables, there are four factorial points, five centre points and four axial points in the design.

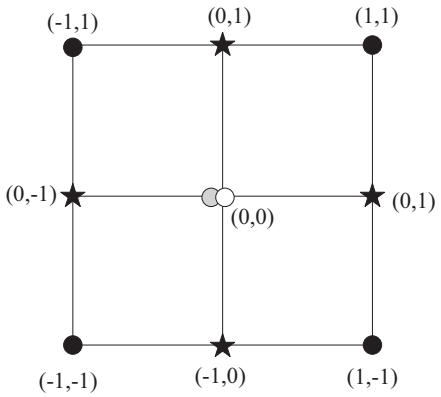

Figure 3 CCF design for two factors

Table 6 shows the experiment arrangement and results. In the second column, Pt type is the type of the experiment run. 1 stands for corner point, -1 stands for axial point, and 0 stands for center point. Also the run order of the experiment has been randomized.

Table 6. Experiment arrangement for the CCF (coded units)

Run order	Pt type	A	C	Y
1	0	0	0	0.029
2	-1	0	1	0.036
3	-1	1	0	0.022
4	1	-1	-1	0.031
5	1	1	1	0.039
6	-1	0	-1	0.022
7	0	0	0	0.024
8	0	0	0	0.029
9	1	1	-1	0.018
10	0	0	0	0.027
11	0	0	0	0.027
12	-1	-1	0	0.030
13	1	-1	1	0.033

Tables 7 and 8 show the analytical results. It can be seen from Table 7 that two-order term A*A is not significant and deleted from the model. The new results are shown in Table 9 and 10.

Table 7. Estimated regression coefficients for Y (coded units)

Lack-of-Fit	4	0.000013	0.000013	0.000003	0.77	0.596
Pure Error	4	0.000017	0.000017	0.000004		
Total	12	0.000414				

Note: * means that the p-value is less than 0.05, and the corresponding term is significant

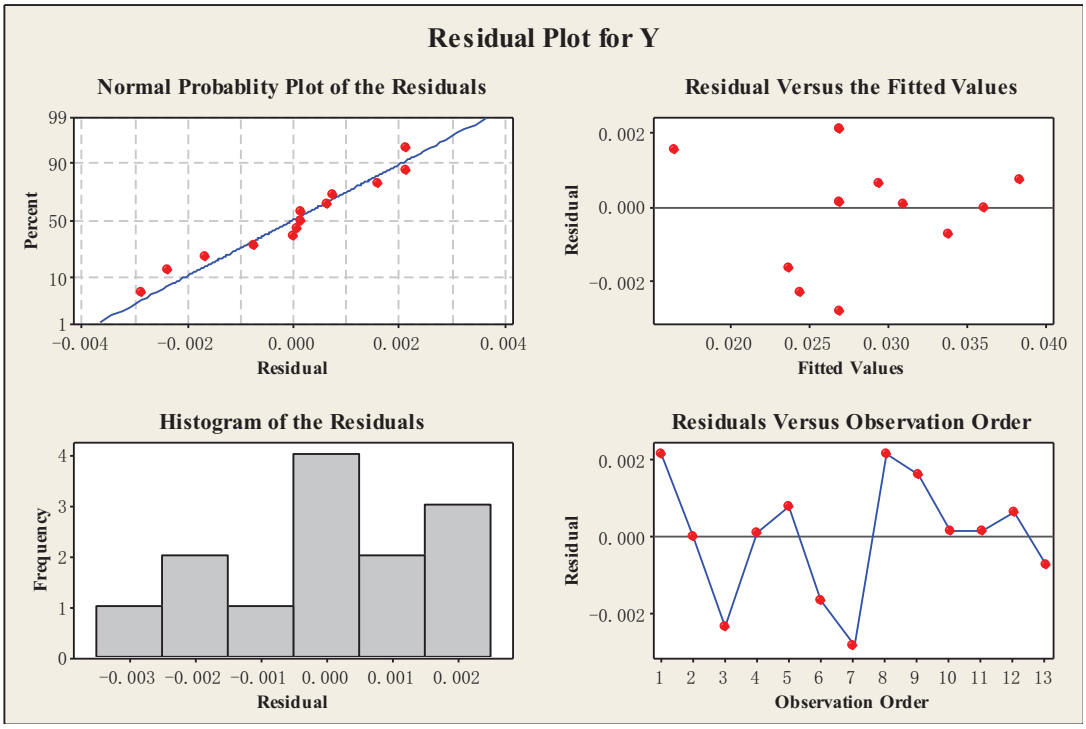

Figure 4 Four-in-One residual plots for response Y

The second-order model fit to the coded variables is

$$\hat{y} = 0.0269 - 0.0025A + 0.00617C + 0.00298C^2 + 0.00475A \times C \quad (1)$$

The model is fit well since R-Sq=92.81% and R-Sq(adj)=89.22%.

To check the validity of the fitted model we also conducted residual analysis (see Figure 4).

Results show that the residual is normally distributed, and equal variance and independence hold true.

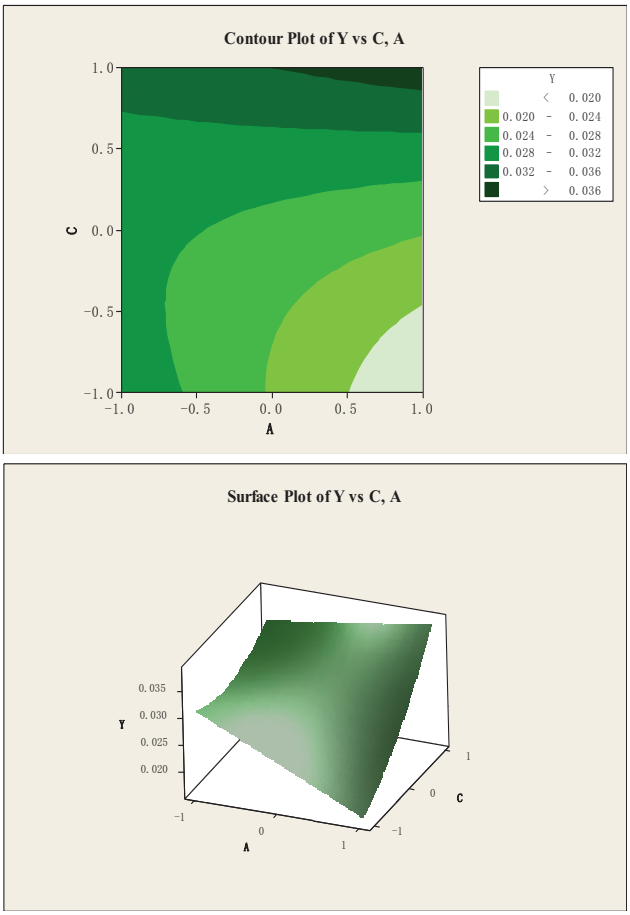

Figure 5 Contour plot and response surface

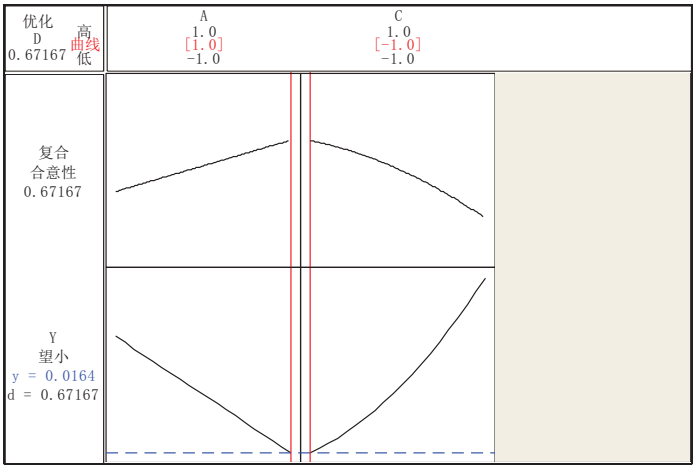

Figure 6 Response optimizer output

We can obtain the minimum point from model (1) directly, unfortunately, the minimum point is not at the region of operability. Hence we use computer to search the optimal point using

"response optimizer" of Minitab automatically. As shown in Figure 6, the optimal point is at A=1.0, C=-1, with the response Y=0.0164. At the same time, we estimate that at the optimal point the prediction confidence interval at α=0.05 is (0.0126, 0.0203). The coplanarity had a mean 0.0975 mm with a standard deviation 0.01mm before optimization, while it is 0.012-0.0203 mm after optimization. It is obvious that the coplanarity has been significantly improved. The experimental result is confirmed by confirmation runs.

CONCLUSION

The article presents a solution to optimize the coplanarity of the terminal of earphone, using designed experiments and response surface methodology. By designing experiments and analyzing experimental data, the optimum technical condition has been found, and the coplanarity has been improved.

ABSTRACT

More and more organisations and companies have realised that they need to put their customers at the front and centre of their businesses, and to support an effective customer care process, while customer relationship management (CRM) becomes essentially about better managing all aspects of a company's relationship. CRM is not a new concept for organisations or companies. Nowadays, many businesses such as banks, insurance companies, and other service providers realise the importance of CRM and its potential to help them acquire new customers, retain existing ones and maximise their lifetime value. Particularly within the mass consumer banking sector, where customer numbers are large, these need to be managed systemically by information technology applications. Senior bank staffs, from seventeen Taiwanese banks, were interviewed about their understanding and performance of CRM. This finding discovers that CRM systems have been applied for at least two decades in Taiwanese banks. Specifically, banks often provided their CRM experience for their marketing strategies in order to evaluate valued customer and create customer relationship portfolios by understanding individual needs and preferences. However, the result also indicated that CRM has provided limited success expected. More specifically, the finding suggests that people-driven CRM is capable of the responsibility of the executives or front-line service staffs. Banks should apply not only the technological aspects of CRM, but also people-driven aspects in their marketing strategy. Customers, employees, and bank managers are all key parties in this process of CRM implementation.

Keywords: Customer relationship marketing, People-driven processes, Banks

INTRODUCTION

Over the past two decades, there has been an explosion of interest in customer relationship management (CRM) by both academics and executives. CRM was popularised in the 1980s and derived from an earlier concept called contact management (Ling and Yen, 2001; Goldenberg, 2006) which took place through contact channels (or media) to provide goods or services. More and more organisations and companies have realised that they need to put their customers at the

front and centre of their businesses, and to support an effective customer care process, which includes profiling customers, segmenting customers, researching customers, investing in technology, and managing customers (Brown, 2000).

CRM is not a new concept for organisations or companies. Nowadays, many businesses such as banks, insurance companies, and other service providers realise the importance of CRM and its potential to help them acquire new customers, retain existing ones and maximise their lifetime value (Wang and Ma, 2005; Blery and Michalakopoulos, 2006). Particularly within the mass consumer banking sector, where customer numbers are large, these need to be managed systemically by IT applications. Some Western studies (e.g. Ryals and Knox, 2001; Blery and Michalakopoulos, 2006) have demonstrated that CRM is intended to identify the most profitable customers and prospects, and devotes time and attention to expanding account relationships with customers. Meanwhile, implementation of CRM in the banking sector was considered by Blery and Michalakopoulos (2006), whose study focused on the evaluation of the critical satisfaction dimensions and the determination of customer groups with distinctive preferences and expectations in the private banking sector. In Taiwan, studies have showed that CRM is the feature hat banks most care about, however, but banks are short of knowledge and professional support for implementation of CRM (Chen and Popovich, 2003).

The purpose of this paper is intended to extend the understanding of the CRM performance in the consumer banking sector, especially with these mass consumer banking sectors, where customer numbers are large, these need to be managed systemically by information technology applications of CRM. More specially, this paper concerns the investigation of how CRM is implemented in the Taiwanese consumer banking sector in order identify alternative perspectives of CRM.

LITERURE REVIEW

Defining Customer Relationship Management

In the literature, there have emerged many definitions of Customer relationship management. However, to date, although CRM has become widely recognised as an important business approach, there is no universally accepted definition of CRM. The main differences among these definitions are related to the technological and relationship aspects of CRM. Some authors from a marketing background emphasise the technological side of CRM while others consider the IT perspective of CRM. The following section will discuss the definitions from the technological perspectives and marketing perspectives of CRM.

The Technological Perspectives of CRM

The increased accessibility of information technology (IT) coupled with increasingly sophisticated software allows for the capture of data from customers, its storage and its retrieval for marketing purpose in order to provide customised products and services. Ngai (2005) identifies 205 CRM articles published between 1992 and 2002 covering 89 journals, and implies that IT and Information System (IS) play an important role in the development and implementation of CRM. The three most popular topics addressed in IT and IS for CRM are ‘software, tools, systems (e.g.

decision support system, expert system, IS, enterprise resource planning, etc.), which can be viewed as technology-based applications to support the CRM process. These application systems should include database capabilities to collect and analyse customer information using statistical techniques such as data mining. Data mining plays a fundamental role in the overall CRM process and is a critical component in the CRM system (Rygielski et al., 2001). It helps transform customer data into useful information and knowledge. Customer information and knowledge is a company asset that must be managed. A deeper understanding of data mining and knowledge management in CRM is necessary in today's highly customer-centred business environment (Shaw et al., 2001).

Hence, from a technological perspective, CRM was claimed as the market place of the future and is undergoing a technology-driven metamorphosis (Peppers and Roger, 1995). Consequently, IT and marketing departments must work closely to implement CRM efficiently. Furthermore, there are two different interpretations of CRM in the literature to comprehend the technological perspectives of CRM: data-driven and process-driven CRM (Greenberg, 2004). Data-driven CRM focuses on CRM systems that integrate customer information using applications, interfaces, and automation tools (Greenberg, 2004). Process-driven CRM pays attention to the business integration process between people and systems which use data mining to enrich the process for the profiling of their customers (Little and Marandi, 2003; Greenberg, 2004). Mostly, the application of CRM is focused on technological application. For example, Battery (2003) asserts that CRM is only a technological infrastructure, comprised of both hardware and software, with the purpose of managing a large quantity of customer data. Hence, to most academics, CRM is technology-enabled RM (Little and Marandi, 2003, pg.198).

To summarise, from a technological perspective, CRM is a kind of technology approach to analysing customer behaviour for the purpose of better targeting customers, and so in this sense, 'CRM is essentially database or direct marketing' (Parvatiyar and Sheth, 2001). In fact, if CRM is to be successful handled, there has to be an aspect of marketing thinking in all business functions, and this may be one of the key aspects of the relationship perspective (Grönroos, 2007). The next section will discuss the marketing perspectives of CRM.

The Marketing Perspectives of CRM

From a marketing perspective, CRM is a managerial philosophy that has been defined as a combination of business processes and technology that seeks to understand a company's consumer behaviour. This viewpoint focuses on the relationship with the customer that integrates database knowledge within a long-term customer retention and growth strategy (Peppers and Rogers, 1995). For example, Jackson (1985, p.2) applies the individual account concept in industrial markets to suggest CRM to mean, 'Marketing oriented toward strong, lasting relationships with individual accounts'. In other business contexts, O'Neal (1989) and Doyle (1995) have proposed a similar view of CRM. Others, such as Swift (2001, p.12) consider CRM as an enterprise approach to understand and influence customer behaviour through by continue meaningful communications in order to improve customer acquisition, customer retention, customer loyalty, and customer profitability. Parvatiyar and Sheth (2001) indicates the potential of CRM to offer better customer service and to improve marketing effectiveness thorough a more focused approach. Kincaid (2003) emphasises the importance of viewing CRM as a comprehensive set of strategies for managing

those relationships with customers that relate to the overall process of marketing, sales, services, and support within the organisation. Information technology (IT) and information systems (IS) can be used to support and integrate the CRM process to satisfy the needs of the customer.

In summary, by integrating these definitions, this study proposes that CRM is about focusing on the needs and values of individual customers to maximise long-term profitability. This is achieved by attracting the right customers, enhancing life-time value through cross selling and up-selling, and by maximising the loyalty and retention of the right customers. It is about creating a new value with individual customers and sharing the benefits of the value over a lifetime of the relationship.

Additionally, most previous studies have focused on characteristics of CRM strategy, especially on the link between customer loyalty and profitability (Reinartz and Kumar, 2000). However, there is no clear indication of what specifically constitutes the implementation of CRM process. Some companies view CRM primarily as investments in technology and software, whereas others treat CRM more expansively and are aggressive in developing sound and productive relationships with customers. In addition, some companies have implemented CRM processes to a greater degree than others. Previous studies show that although the promises of how CRM can improve the performance of a business are many, the practical guidelines on how to design and implement CRM successfully are few, and that, as a result of this, practitioners have been struggling. Moreover, many banks are still following the traditional ways of marketing and only few banks are making attempts to adapt CRM. The lack of understanding on CRM is always a concern among the service providers especially banks. Lu et al. (2002) suggest that when implementing a CRM system, Taiwan's banking industry would normally focus on the customer-service system rather than on the overall strategies. Banks have their own way of managing their relationships with the customers. Therefore, what do these marketing managers in Taiwanese banks, who are in the front lines of implementing CRM think it is? This study provides empirical proof to fill these research gaps in the extant literature.

DATA COLLECTION AND ANALYSIS

Data collection took place between August 2010 and April 20012. 17 banks agreed to take part in and 34 in-depth interviews were conducted. All managers interviewed claimed to have knowledge of their marketing strategy, and typically occupied posts such as Marketing Manager or Vice President Personal Banking Division. An interview guide was used during the interviews which included questions asking what the interviewee understood by the term 'customer relationship management', what circumstances and how bank apply CRM to identify their customer segmentation and profitability. All interviews were taped, transcribed and analysed using thematic coding.

FINDINGS

The results of this study demonstrate that customer relationship management (CRM) systems have been applied for a long time in Taiwanese banks, so the finding data shows it's manifestly affected from both concepts and implementation of marketing strategies. Specifically, nearly all interviewees mentioned about CRM in their marketing strategies whether in relationship creation,

enhancement, or maintaining.

Banks Place over Emphasis on the Functions of CRM

This study finds that the majority of interviewees placed considerable emphasis on the functions of CRM such as allows gathering customer information and customer segments. The findings show that banks often provided their CRM experience within their marketing strategies implement in order to evaluate the valued customer and create the customer relationship portfolio by understanding individual needs and preference. However, some participants of this study indicated that CRM imitative have not reached the success expected from their bank because they regarded technology as an isolated element, without taking into account determining factors on which a relationship must support itself. For example, one interviewee stresses although CRM is so important, their bank consider different uncontrolled variables and makes the decision by human-being not just only with it.

Applying both Technology and People-driven CRM

Many interviewees also indicated their consideration about their disadvantage on lacking the knowledgeable staffs to manage and identify the mass customer information. In the literature on CRM, there are two kinds of interpretation of CRM: data-driven and processes-driven CRM (Greenberg, 2004), however, this study finds people-driven CRM in order to fill the lack of CRM which over focused on its technological facet. More specifically, this study suggests that people-driven CRM is capable on the responsibility of bank managers and operational staff in using nearly face-to-face communication and emotional contents establishment and their customer knowledge to process CRM with their customers. In other words, this kind of processes highlight on CRM on human side. Therefore, people-driven processes need that bank manager and service staff owning the capabilities of understanding and analysing customer knowledge to face and satisfy customer needs in CRM-using organisation.

CRM should be a Strategy not just a Solution

Many interviewees did however recognise that they required more employees to carry out data mining from CRM systems. In other words, people-driven processes need executives and front-line service staffs sharpening their capabilities and understanding with regards to manipulating, and analysing knowledge to face and satisfy customer needs in a consumer-oriented culture. These include processes that are difficult to implement or that cannot be carried out using technological solutions alone, such as planning customer strategy (Rigby et al., 2002), making critical decisions, and coping with customer problems (Chen and Popovich, 2003). Hence, bank managers conceive of CRM as a strategy rather than as a solution, and there still needs to be executives and front-line service staffs who understand customer needs and handle communications and responses.

Key Parties of CRM System

This study finds that many Taiwanese bank managers were applying CRM without any academic background, they still capitalised on a variety activities such as face-to-face interaction and emotional content linked with *guanxi* development (e.g. friendship) to understand customer needs and handle various communications and responses, especially when the greater customers' emotional needs, the greater the dependence on people-driven process in CRM. Therefore, this study suggests that customers, employees and bank managers should be the key parties in the CRM system. Not only bank managers and service personnel should take a proactive stance. Banks should pay more attention to the growth of knowledgeable customers and encourage their customers to engage actively in relationship development with their financial service provider.

DISCUSSION

Since many companies would like to better understand their customers, the focus of CRM turns to the implementation of sophisticated software for analysing different kinds of data. This situation has also been found in this study. Taiwanese banks place too much emphasis on the methods of analysis and adopt them as tools to provide value to customers. This is one of the key misinterpretations of CRM. Rigby et al., (2002), and Little and Marandi (2003) point out that more than half of all CRM initiatives fail to produce the anticipated results. Therefore, CRM is combination of people, processes, and technology that seeks to provide understanding of customer needs (Little and Marandi, 2003), to support a business strategy (Ling and Yen, 2001; Bull, 2003), and to build long-term relationships with customers (Gummesson, 2003). Although enabled by information system, CRM is not a technology solution (Rigby et al., 2002; Chen and Popovich, 2003). The system process cannot manage customer relations (Rigby et al., 2002; Chen and Popovich, 2003) because customer knowledge needs to be comprehended busy business managers and the face-to-face communication needs to be performed by front-line operation. Hence, the key processes are performed by human beings and required clear understanding of the goals and contents of key decisions and system-people interactions (e.g. Ling and Yen, 2001; Rigby et al., 2002; Chen and Popovich, 2003). In order words, companies are integrating operations and investing in information systems that share data from customers. The potential of CRM lies in its ability to help company increases the profits by identifying profitable customers and tailoring company offers to customer's needs, willingness to pay, and profitability.

Moreover, this study proposes the people-driven processes in CRM could provide a reference for planning effective RM for customer relationship and can supplement existing studies on data-driven and process-driven CRM. 'People-driven processes' in CRM emphasises that executive and service encounters in face-to-face interactions and customer knowledge to process CRM. The human side of CRM processes should receive greater attention in CRM studies.

ABSTRACT

Purpose: *The purpose of the research is to study the applicability of the (Q,R)-model in inventory management of the maintenance materials in investment intensive industry companies. The objective of the research is to answer the following research questions: 1. What is the applicability of (Q,R)-model in maintenance materials inventory management? What are the main challenges, if any, in applying the (Q,R)-model in maintenance materials inventory management?*
Design/methodology/approach: *The research is a case study using data-analysis in answering the research questions. The case company is a Finnish steel manufacturer.*
Findings: *The study results show that inventory levels are not controlled by the parameters of the (Q,R)-model which causes unnecessary stocking. One mechanism which causes inventory uncontrollability is also identified.*
Research limitations/implications: *The research is based on a single case study. The maintenance management of the case company is similar to many other companies in the basic industries, but the applicability of the findings require wider empirical research.*
Practical implications: *The paper suggests material managers to address more attention to the structure of the internal maintenance materials supply chain. Recommended actions for reducing the share of the uncontrollable material flows, include, for example, returns to the suppliers, better scheduled maintenance demand forecasting, and adding repairable transaction to the Computerized Maintenance Management System (CMMS).*
Originality/value *– This paper presents novel results from maintenance management in process industries. The research indicates that widely applied (Q,R)-model is not a feasible method in all maintenance material applications.*

Technology Innovation and Industrial Management
29-31 May 2013, Phuket, Thailand

Keywords – Maintenance materials inventory, spare parts, inventory management, inventory control.

INTRODUCTION

During the past decades the capital tied to the production equipment has increased. As a result, the importance of maintenance management, and therefore maintenance materials supply chain management, to the company's business has grown. In today's industrial companies maintenance costs can represent the largest part of operational budget (Garg and Desmukh, 2006), and the value of capital tied in maintenance materials inventories can be tens of millions euros (e.g. Porras and Dekker, 2008).

Maintenance can be determined as activities, either technical or administrative, needed to maintain and restore the desired operation condition of the production equipment or any other physical asset (Muchiri et al., 2011). Maintenance activities are typically divided into two fundamental types – reactive and proactive maintenance (Kothamasu et al., 2006). Reactive maintenance can be seen as corrective activities which are carried out only after the equipment breakdown, and proactive as activities which are carried out before the breakdown. The taxonomy of maintenance activities is more clearly shown in Figure 1. In addition, the activities aiming to reduce the future need of maintenance or to improve the operation of the equipment have been, in some cases, specified as a class of aggressive maintenance. In this study, the aggressive maintenance does not fit to our earlier stated maintenance determination (Swanson, 2001).

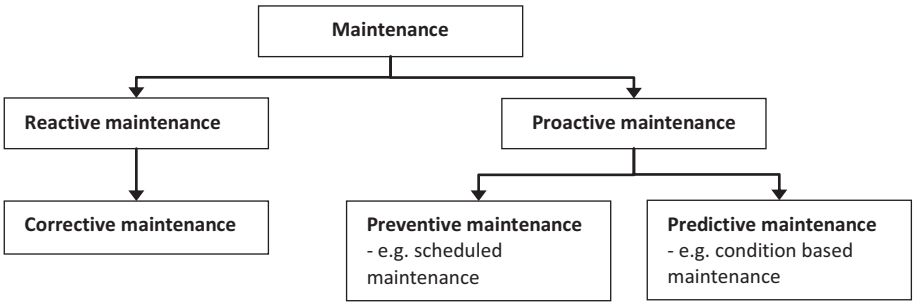

Figure 1. Taxonomy of maintenance activities (modified from Kothamasu et al., 2006).

Supply chain management of maintenance materials, i.e. spare parts and consumables needed for the maintenance, is essential for ensuring the operational reliability. Unavailability of maintenance material can cause extended downtime, which in critical process phase leads to high costs. In addition to the high availability requirements, other characteristics of maintenance materials are sporadic demand and relatively high price of individual item (Huiskonen, 2001).

Management of the supply chain, and especially inventory management, is challenging because of the nature of maintenance. For proactive maintenance, it may be possible to procure materials to arrive just when needed to avoid unnecessary warehousing. For corrective maintenance, stock

outs can cause significant production loss and a safety stock is typically needed (Kennedy et al., 2002). The function of the inventory therefore derives from the needs of the maintenance and the size of the inventory depends on the production equipment's maintenance policy. These aspects differentiate the management of maintenance materials inventory from other manufacturing-related inventories.

Despite special characteristics, the maintenance materials inventory management typically relies on traditional inventory management theories and practices, e.g. Economic Order Quantity (EOQ), developed by Harris (1913), and reorder point method with fixed or non-fixed order quantity. In industrial maintenance context, the inventories, or at least part of the inventory items, are often controlled by continuously reviewed fixed order quantity (Q) and reorder point (R) inventory model, i.e. (Q,R)-model (Figure 2).

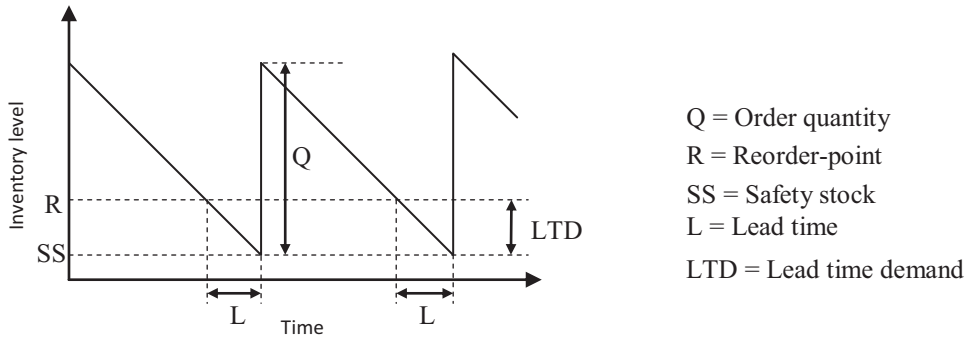

Figure 2. Logic of continuously reviewed fixed order quantity inventory model (Tersine, 1984).

In the (Q,R)-model, the replenishment orders are fully controlled by the parameters Q and R. The R expresses when to order and the Q expresses how much to order. Buyer needs to decide only the supplier. Because the model controls the amount and frequency of inbound material flow to the inventory, the inventory optimization is typically seen as optimization of the parameters (e.g. Chang et al., 2005). However, not enough attention has been addressed to the (Q,R)-model's applicability to the maintenance context, where other inbound sources besides replenishment orders may exist. These include, for instance returns.

In this research the applicability of the (Q,R)-model, utilized in the case company's inventory management, is analyzed. The main aim of the study is to research whether the applied model can manage the inventory level in a sound way and what is needed for better control of the inventory. The applicability is analyzed by answering following research questions:

1. What is the applicability of (Q,R)-model in maintenance materials inventory management?
2. What are the main challenges, if any, in applying the (Q,R)-model in maintenance materials inventory management?

LITERATURE REVIEW

In the early 2000s, the research of maintenance materials supply chain management focused on its differences to the conventional logistics. At that time, the maintenance materials were identified to have characteristics, e.g. sporadic demand, high service-level requirements and high price, which affect the inventory management (Huiskonen, 2001). More recently, the demand of the maintenance materials has been linked to the maintenance policy of the production equipment (Wang and Syntetos, 2011) and several studies about joint optimization of maintenance and inventory emerged (Van Horenbeek et al., 2012).

In the inventory management research generally, the (Q,R)-model is widely applied in the last decades and lot of extensions have been made to adapt the model better to its context, e.g. demand uncertainties and backordered/lost-sale stock-out policy (Williams and Tokar, 2008). The models have evolved to be context-specific due to the different requirements in operating environments, e.g. deteriorating items, supply chain structures, etc.

In industrial maintenance, the structure of the supply chain differs from the assumptions of the (Q,R)-model. In addition to the obvious supplier-inventory-customer material flow, also other flows exist. For example, some spare parts may be in the internal repair cycle, where used parts are recovered for future use by the plant's repair shop. Also unused spares can be returned to the inventory. Driessen et al. (2010) refer to these other flows as part return streams. Driessen et al. (2010) propose a delay time between the material request and demand registration; if the request is not justified, it can be returned to the inventory within the delay and no new purchase order is triggered. In the model, only external suppliers replenish the inventories.

Wang and Syntetos (2011) continued contributing to this phenomenon by making a distinction between material requests arisen from the proactive or reactive maintenance. For reactive maintenance, the requested amount is typically deterministic but the moment when the need arises is stochastic, while, for proactive maintenance, requested amount is stochastic but the moment when the need arises is deterministic. Practically, this means, that from proactive maintenance activities, returns of excess materials to the inventory may cause a significant source.

Product returns and their impact on the inventory management have been studied widely from reverse logistics point of view. Fleischmann et al. (1997) discuss a system, where a certain share of demand returns to the inventory as recovered products. A clear distinction can be made between the recovered returns and the unused returns, and for repairable maintenance materials management, e.g. the METRIC-model (Sherbrooke, 2004) can be applied.

Unused material returns are a common challenge especially in catalogue/internet mail order retail business, due to the customers' legal right to return the product without expenses. In that context generally, Mostard and Teunter (2006) observed the return rate to be approximately 35-40 % of deliveries, and applied the newsboy problem to it with promising results.

RESEARCH PROCESS

The research process of the study is shown in Figure 3.

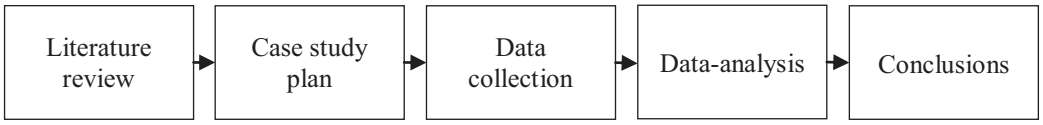

Figure 3. Research process.

The study started with reviewing the relevant literature. The recent research of maintenance materials supply chain management, (Q,R)-inventory model and product returns were reviewed. The second phase is the planning of the case study.

The research aims to answer whether the assumptions of the (Q,R)-model are realistic in the maintenance context. For this purpose, a case study was seen an appropriate research strategy. The research strategy was preferred because of the research environment. The focus of the study is on a contemporary phenomenon, i.e. maintenance materials supply chain, within the real-life context. The design of the study is an embedded single case design. Not much can be said about the functionalities of the inventory at inventory level, so we pay attention to the subunits, e.g. inventory items and transactions. A major risk of this kind of study is that the original target of the study becomes the context. To avoid the research becoming an inventory item and transaction study, the results of subunit analysis are presented in relation to the whole inventory. (Yin, 2003.)

The rationale for the selection of the case company is a mix of critical and typical case. From the maintenance point of view, the maintenance-intensive company represents the critical case. Maintenance has particularly significant impact on the case company's business and therefore it can be assumed to be well managed. From heavy process industry, or computerized maintenance management system (CMMS) point of view, the company is assumed representing a typical case. (Yin, 2003.)

The data collection from the CMMS includes all inventory transactions recorded in 2011 for all inventory items determined as maintenance materials. Practically, two databases, inventory item database limited to maintenance materials and inventory transaction database were combined by using the item identification code as a join. The current inventory level and current control parameters were available from the inventory item database. In the analysis phase, the MS Excel and MS Access were used. The item selection is more detailed presented in the case company section.

The current state of the inventory controllability is analyzed by comparing the contemporary inventory level to the situation where the inventory level is controlled by the control parameters. After analyzing the inventory levels, the transaction types are investigated to identify different material channels and their impact and significance to the inventory value.

Case company

The company under research was a Finnish steel manufacturer listed on the Helsinki Stock Exchange. The company currently has operation units globally, but its largest steel mill, where the study was conducted, is located in Finland.

At the time of the study (2012), for maintenance materials, there was one main storage facility and there were nine smaller production-unit-specific storage facilities at the site. There were almost 40,000 items kept in stock, and the value of the capital tied in these inventories was tens of millions euros. In addition, there were the vendor managed main inventory and the smaller satellite inventories, also managed by the vendor, around the site. However, the value of material replenishments and consumption was highly concentrated in the mill's main storage facility.

The actual stock control is based on a fixed order quantity and reorder-point method, where a new purchase request with the stated quantity takes place every time the storage level reaches the reorder point. Responsibility for these item-specific control parameters was designated to a relevant department. Usually this department was the one using the item, or the material management department, which was also responsible for the management of all storage facilities at the site. No systematic or instructed procedure existed for the determination or the optimization of the parameters.

The order-quantity and reorder-point optimization was thought in the company to be a primary development effort in inventory management because of the previous attempts to reduce the tied capital had been unsatisfactory. However, before the optimization project the company wanted to have a comprehensive picture about the factors affecting to the inventory levels currently.

In the CMMS, the inventory items are classified according to Table 1. In the company, maintenance materials were seen including the physical items in the classes 2-7. 38 774 inventory items existed after service items were excluded. Obviously, maintenance materials are not a homogenous group of items and demand patterns and supply characteristics vary between items.

Table 1. Material classes in the CMMS.

Class	Name
0	Basic materials
1	Refractories
2	Consumable machine parts
3	Piping and HVAC consumables, hydraulics and pneumatics
4	Electrical devices, instruments and spare parts
5	Electrical installation consumables and electronic components
6	Power transmission, lifting and moving devices
7	Machine and construction elements
8	Typed structures
9	Tools, safety and security equipment

RESULTS

1. Inventory level controllability

In (Q,R)-model, the inventory level is controlled by the parameters. In table 2, the control parameters (Q) and (R) with item's price and current inventory levels (CL), are shown for four items. The stock expresses how many years the current inventory level would meet the demand if the future demand is projected from the past five and half year consumption. For all of these items, the inventory level is relatively high in the light of the past consumption and current control parameters.

Table 2. Example maintenance inventory items.

Item ID	Q	R	Price	CL	Stock
666388	*11.67*	*10.00*	*327 €*	*476*	*12.5*
173427	*3.50*	*4.00*	*20 660 €*	*9*	*2.60*
364265	*0.08*	*1.00*	*5300 €*	*6*	*4.71*
302901	*0.08*	*1.00*	*3590 €*	*7*	*19.3*

Current inventory levels (Table 2) shows, that the inventory levels do not follow the parameters. Consequences of the inventory uncontrollability are evaluated by estimating the inventory level in the situation where the inventory level is fully obeying the control parameters. In the (Q,R) context, the average inventory level can be approximated by using e.g. Hadley-Whitin's (1963) method. However, it is unknown, how well the instantaneous view describes the average inventory at item level. Another restriction of the use of the Hadley-Whitin's expression is that the value of safety-stock remains unknown. Therefore the portion of overstock has been estimated in two ways:

Method 1. *Overstock = CL - (Q + R), and*
Method 2. *Overstock = CL - (½Q + R).*

For example, item's 666388 (Table 2) overstock by using method 1 can be calculated as 454.33 units which equals 148 566 € or 95.4% (Overstock/CL). By using method 2 the overstock equals 460.17 units which is 150 474€ or 96.7% of total inventory value of the item.

In Table 3, the overstock of all inventory items has been added together and shown as a share of the total inventory value. Totally, the inventory level exceeds the maximum level (Method 1) for every fourth item and the value tied to the exceeding share is 19.1% of the total inventory. The average level (Method 2) exceeds for 42% of items and the exceeding value is 36.2% of total inventory.

Table 3. Shares of overstock.

Estimation method	**Method 1**		**Method 2**	
	Items	**Overstock**	**Items**	**Overstock**
Results	9312	19.1 %	16295	36.2 %

2. Causes of overstocking

The study of the mechanism, which is causing the excess in inventory levels, started with the identification of the transaction types. In the CMMS, there were 17 different types of transaction to get the materials into or out of the inventory. Those transactions are shown in the Table 4.

Table 4. Inventory transaction types in CMMS.

	Description	**Out transactions**	**Description**
Material transactions:			
Receipt of purchase order	*Arrival of purchase order triggered from R*	**Returns to supplier**	*Return of non-conformance goods*
Return of pick-up	*Return of material due to the oversized pick-up*	**Pick-ups for consumption**	*Material pick-up for maintenance activity*
Transfer in	*Material transfer from other storage facility*	**Transfer out**	*Material transfer to other storage facility*
Return without order	*Material return which are not related any pick-up*	**Cancellation of return without order**	*Cancellation of return without order*
Stock-taking, gain	*Stock-taking correction > 0 €*	**Stock-taking , loss**	*Stock-taking correction < 0 €*
		Scrap	*Material pick-up for to be scrapped*
Return from sale	*Return of material on sale*	**Pick-up for sale**	*Material pick-up for to be sold*
Corrections:			
Manual price change		**Manual price change**	
Transfer correction		**Transfer correction**	

Material can be brought to the inventory with receipt of purchase order; returns to inventory; transfers in; returns without order; stock-taking or returns from sale transaction. Receipts of purchase orders (RPO) were caused by conventional purchases triggered from the re-order point. Returns without order (RwO) resulted from the returns of the direct purchases which can be caused by scheduled maintenance or investments, but also in-house reparable spare parts were brought to the inventory with this transaction. Return of pick-up was the way to return the excess material caused by oversized amount of pick-up. Transfer transactions are for the material transfers between different storage facilities.

Materials can be moved out of the inventory for returns to supplier; pick-up for consumption (PU); transfer out; cancellation of return without order; stock-taking; scrap and pick-up for sale transaction. The main channels out of the inventory were pick-ups for consumption, returns to suppliers and transfers out. Main channels to the inventory were replenishment orders, returns without order and returns from pick-ups. In addition to the physical material transactions, records can be corrected by manual price changes or transfer corrections.

The cumulative value of transaction types in 2011 are presented in the table 5. The main transactions to the inventory included the receipt of purchase order, return without order and return of pick-up. Main out transaction types included pick-ups for consumption, transfer out and returns to supplier.

Table 5. Values of transaction types in 2011

.

In transactions	Value	Out transactions	Value
Receipt of purchase order	*14.28 M€*	Returns to supplier	*0.89 M€*
Return of pick-up	*1.43 M€*	Pick-ups for consumption	*18.2 M€*
Transfer in	*0.90 M€*	Transfer out	*0.90 M€*
Return without order	*6.59 M€*	Cancellation of return without order	*0.09 M€*
Stock-taking, gain	*0.73 M€*	Stock-taking , loss	*0.34 M€*
		Scrap	*0.06 M€*
Return from sale	*0*	Pick-up for sale	*0*
Total	*23.93 M€*	Total	*20.48 M€*

Values of the major transaction types, including RPO, RwO and PU, are presented monthly in Figure 4. The sum value of transactions (SVT) presents the amount of increase or decrease in inventory value when month's in and out transactions are summed.

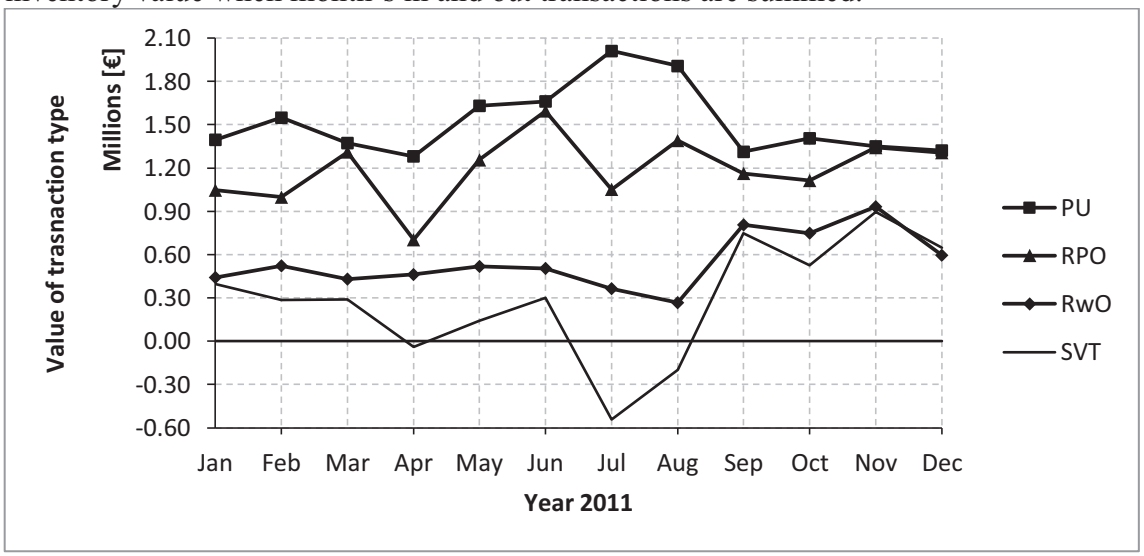

Figure 4. Monthly values of transaction types in 2011.

The SVT has risen to higher level starting from September, which means increasing inventory value. Actually, the SVT remained below zero only for a short period of time. The trend was confirmed directly from the inventory value by analyzing the monthly value during the year 2011. The change to higher level in SVT is caused mainly by increase in returns without order and decrease in pick-ups for consumption, while receipts of purchase orders stay quite flat.

The summer season is typically intensive maintenance period, which obviously affects to the patterns. The unique aspect of the year was the completion of the major investment project in August, which may appears in the results. A systematic event or error, which causes the raised returns without order since August, was not found.

3. Major material flows in and out of the inventory

The most significant transactions or materials flows to the inventory were replenishment orders, returns without order and returns to inventory. Pick-ups for consumption were the main outbound flow. The major material flows are shown cumulated in the figure 5 where inventory is set in between of the suppliers and maintenance, i.e. customers.

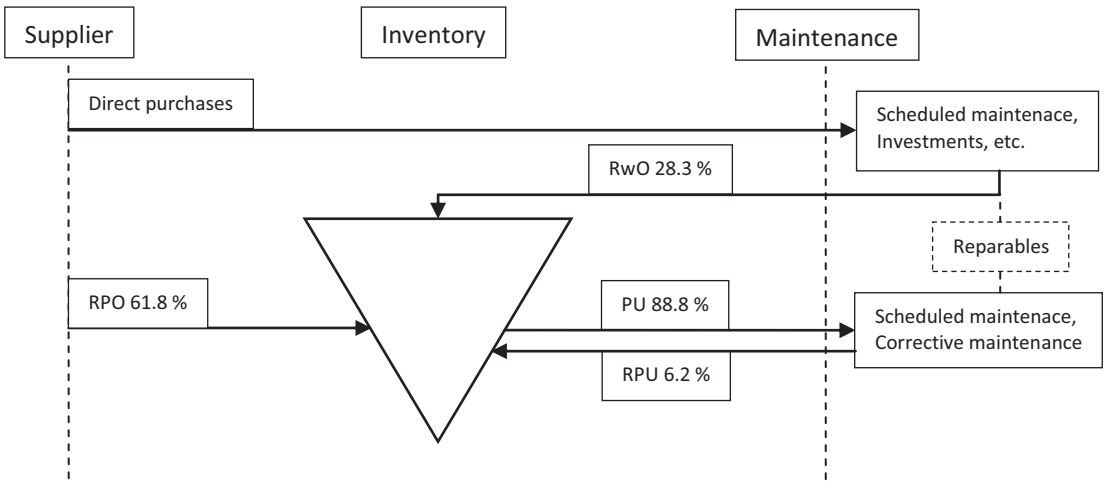

Figure 5. Cumulated material flows into and out of the inventory in 2011.

The conventional replenishment orders (RPO) is not the only significant intake of the inventory. RwO describes the returns without order and RPU describes returns of pick-ups to the inventory. RPO is controlled at item level by control parameters, i.e. order quantity (Q) and reorder point (R), but RwO and RPU cannot be controlled directly by control parameters, because they are caused by incorrectly estimated consumption.

DISCUSSION

In general, the maintenance inventory level in the case company is not fully controlled by the control parameters of the (Q,R)-model, resulting in the unnecessary inventory. The share of overstock depends on reference value used in the estimate. If the reference inventory level is the absolute maximum level enabled by the parameters, the current overstock represents 19.1% of total inventory value. More realistic view of consequences of uncontrollability can be obtained if the current inventory level is compared to the approximated average level, resulting in 36.2% overstock estimate.

The study reveals that there are multiple ways to procure materials using the CMMS, enabling the uncontrolled material flows to the inventory. Thus, the phenomenon of overstocking is permitted. Over a third of the total material flow to the inventory consisted of uncontrolled returns. Increased level of returns and decreased consumption also explain the faster accumulating inventory value starting from September 2011.

In such an environment, the (Q,R)-model is incapable to ensure the material availability in economically sound manner. Especially returns without order (RwO) needs a special attention because it adversely affects to the function of the (Q,R)-model. Because of the RwO, only the lower boundary of the inventory level can be ensured. This means that the service-level can be ensured by the control parameters but, practically, no upper limit to the item's inventory value exists. This also reduces the potential benefits of parameter optimization. Returns of pick-up to the inventory (RPU) can cause a similar effect but with a distinctly smaller magnitude.

1. Theoretical implications

Driessen et al. (2010) describe the structure of the maintenance materials supply chain in the industrial context, but they assume the replenishment orders to be the only way to purchase, which limits at least partially the upper boundary of item's inventory level. For, example, if the material return leads to an unnecessary replenishment, the second replenishment is prevented until the inventory level reaches the reorder-point again. In the case studied in this paper, the materials for some proactive maintenance activities and investments were purchased directly without any link to the inventory control parameters.

This research focuses on the differences between the basic assumptions of the (Q,R)-model and the real context. These basic assumptions are widely hypothesized to take place in the maintenance related literature (e.g. Kennedy et al., 2002). The results of this study show that reality in maintenance material context makes it very challenging to manage the inventory with only two parameters: reorder point and order quantity. It can also be difficult to modify the context to fit to the assumptions of the (Q,R)-model, due to the tendency to maintain the production equipment proactively.

2. Managerial implications

Material managers ought to reduce the share of uncontrolled material flows to the maintenance inventory. One way is to remove the causes of these flows, and another way is to try to predetermine the amount of returns in order to take it into the account in the parameter optimization. The first way includes actions to prevent the materials to flow to the inventory, and the second different kind of forecasting techniques.

An option to remove a cause of the uncontrolled material flow is to develop the procurement policy. If unnecessary materials from scheduled maintenance can be returned to the supplier without expenses, the issue is moved to the upstream in the supply chain. A second option can be the delay time between the request and demand registration as Driessen et al. (2010) proposed.

It may be reasonable to accept a certain amount of returns and instead of total prevent, to try to forecast them as accurately as possible. An obvious action to enable the better forecasting is improving data quality. Currently, the unused product returns and reparables are mixed in the CMMS, and clarification of the data is an overwhelming task. Clearly separating the reparables from other material flows by, for example, creating a new transaction type would enable using the data more precisely. Widely studied newsboy problem (e.g. Mostard and Teunter, 2006), i.e. inventory level determination problem with uncertain demand and perishable products, may also give applicable models for material returns from proactive maintenance activities.

CONCLUSIONS

In this paper, the basic assumptions of the (Q,R)-model turned out to be challenging to fulfill in the maintenance context. As a result, the upper boundary of the items' inventory level, set by the model, does not limit the actual inventory level. On the other hand, nothing indicates that the lower boundary would not be functioning properly. The instant view to the inventory revealed the 25% of the items having higher level than the theoretical maximum enabled by the control parameters. The share of the overstock was 19.1% of the total inventory compared to the theoretical maximum and 36.2 % compared to the theoretical average (Table 3). This means that the model is applicable from service level point of view, but not from the economic one.

The main challenges in the case company in applying the (Q,R)-model in maintenance inventory management, were the uncontrollable returns to the inventory. These returns may contain excess materials from the planned maintenance operations, reparables, and spare parts procured with some investments to the production equipment (Figure 5). The share of these returns was 28.3% of all material flows to the inventory.

In this study, the maintenance materials internal supply chain was analyzed in the case company, which limits the generalization of the results even though the case was selected from capital intensive industry. Also the data and analysis include uncertainties. For example, different kind of errors and mistakes may relate to the individual transactions. In addition to the one identified mechanism, others may exist too, so to be able to confirm the unambiguous causality between the overstocking and uncontrollable material flows, deeper research is required. Another

potential direction for the future research is to identify and analyze the other inventory models than the (Q,R)-model developed to maintenance materials inventory management.

BIOGRAPHICAL

Antti Puurunen is a Doctoral Student at the University of Oulu, Finland. He received his M.Sc. in Engineering from the University of Oulu, in 2012. His research interests cover maintenance materials supply chain management.

Jukka Majava received his M.Sc. in Engineering from the University of Oulu, Finland, in 1999. His industrial experience includes technology marketing, customer care, partner management, project management, and supply chain development at Nokia Corporation. Currently he works as a Doctoral Student in the Department of Industrial Engineering and Management at the University of Oulu.

Hanna Kropsu-Vehkapera (Dr.Sc.) received her MSc in Engineering, majoring in Industrial Engineering and Management, in 2005 and her Dr (Tech) in 2012, both from the University of Oulu, Finland. She currently works as a Post doctoral research fellow at the Department of Industrial Engineering and Management, the University of Oulu, Finland. Her research interests cover information management and product lifecycle management. She has some years of experience from the IT industry.

Pekka Kess (Dr. Sc., Dr. Eng.) is professor of Industrial Engineering and Management at the University of Oulu, Finland. He has extensive managerial experience from both universities and industrial enterprises. He has worked in managerial positions in chemical, steel and electronics industries as well as in software business. He is an active project evaluator and manager in international research and development projects. His research areas are strategic management, production organizations, knowledge management, quality management and e-Learning. He has an extensive network of partners in Europe, Asia and Americas.

STRUCTURED ABSTRACT

Purpose: *Paper presents differences between private and public higher education (HE) in Slovenia regarding number of students, graduates, academic and non academic staff. It reflects upon growing fragmentation of Slovenian HE and the blurred line between private and public HE institutions (HEIs). Characteristics of Slovenian private HE are described in more detail and can be useful to policy analysts and policy makers as well as researcher-scholars focused on higher education.*
Design/methodology/approach: *Based on the data of the Statistical Office of the Republic of Slovenia (SORS) we first prepared basic overview of HE in Slovenia. Then we examined the relationship between the number of students, graduates, academic staff and non-academic staff in public and private HEIs, and even between publicly and non-publicly funded private HEIs.*
Findings: *We find that growth of private provision has been substantial despite the demographic decline in number of students. Student-to-teacher ratio (Full Time Equivalent – FTE) is better in public than in private HEIs and private institutions offer fewer full-time jobs than public ones. On the other hand private HE has more responsive management, is more flexible and cost-effective. Students –to- non-teaching staff ratio is higher in private than in public HEIs. Publicly funded HEIs account for more than half of enrolled students, graduates and academic staff in private HE. Some similarities can be drawn from public and publicly funded private HEIs on one hand and non-publicly funded private HEIs on the other.*
Limitations/implications: *In conclusion we provide implications for future policy decisions on public-private sector relationship.*
Practical implications: *We provide suggestions to increase interest among students in enrolling in private HE study programmes.*
Originality/value: *We provide a detailed analysis of the private HE in Slovenia with original data that we have collected on individual request.*

Keywords: private HE, public HE, funding, Slovenia
Classification: research paper

INTRODUCTION

In past decades, higher education (HE) has been characterised by an increasing globalisation, market-orientation, privatisation of public and growth of private HE. Private HE has been a result of expanding HE systems, increased and differentiated demand and supply, substantial private returns, increasing constrains on public expenditure, increased levels of cost-sharing, introduction of neo-liberal economic policies and by fostering more internal and external efficient management in HE (Teixteira, 2009; Sanyal and Johnstone, 2011; Varghese, 2013).

However, the concepts of private and public, in the continually changing context of HE are more complex and can be misleading (Marginson, 2007). The difference between public (institutions established by the National Assembly) and private HE is not as obvious as one might think since the first is increasingly adopting characteristics of the latter (e.g. part-time studies with usually employed or older individuals paying tuition fees to study or complete their studies), while private HE is "becoming" public (e.g. public funding of full-time studies at private HE institutions - HEIs). The lines demarcating public and private HEIs have become almost impossibly blurred in many developed and also developing countries (see Sanyal and Johnstone, 2011, 166; Varghese, 2013, 145).

CHARACTERISTICS OF SLOVENIAN HE

In the academic year 2011/2012, there were 89,600 HE students in Slovenia (91,539 in 2010/11), i.e. 70,422 undergraduates and 19,178 postgraduates. One fifth of all students were enrolled in part-time (subject to tuition fees) studies. Women represented 61.1 % of all students.

According to Eurostat, in 2009 Slovenia (where in addition to HE students there were also 14,403 students enrolled in 2-year higher vocational study programmes, adding up to a total of 104,003 students) allocated to tertiary education (TE):

- 1.38% of its GDP , which was above the EU27 average of 1.22% of GDP;
- institutions funds below the EU27 average. Measured in purchasing power standards, Slovenia allocated 7,261.4 EUR per student compared to the EU27 average of 9,243.7 EUR;
- 22.1% of public expenditure for TE for student aid, which was above the EU27 average of 17.4%.

Table 1: Number of public and private HEIs v Slovenia (February 6, 2013)

	Universities (faculties and academies)	**Single HEIs**
Public	3 (49)	1
Private	2 (6)	36

Source: MESCS , 2013.

In Slovenia, there are 4 public and 38 private HEIs (legal entities). In terms of individual faculties and academies, there are 50 public HEIs, i.e. 49 members of 3 public universities and one public single HEI. Among private HEIs, there are 2 universities, i.e. Euro-Mediterranean University - EMUNI which is a network of universities and another university

with 6 faculties, as well as 36 single HEIs reflecting a high level of fragmentation of private HE which is still increasing.

In Slovenian HE, a number of private HEIs have had publicly funded study programmes (programmes with concession) since the beginning of private HE in the mid-90s. Today, there are 12 (33%) single HEIs and one university with concession, meaning a total of 28 study programmes with concession, 20 of which are first-cycle and 8 second-cycle study programmes. Concessions were granted on the basis of a government public call in two periods, in the mid 90s and in 2007/2008 on the basis of two criteria: study areas of shortage occupations (engineering, natural sciences, health care) and regional criterion (located outside the major cities with developed public HE).

Regions in which HE is not developed or present are, irrespective of the small size of Slovenia (20,000 km2), in a very unequal position compared to the regions with university centres. In academic year 2006/07 living expenses of students who did not study in their home town were significantly higher than those of students who lived at home, 634 vs. 292 EUR respectively (Eurostudent SI, 2007, 40).

In Slovenia, social dimension of HE is very important since it can improve access to HE, increase educational structure of the population of the region, and create quality jobs in the region. Furthermore, numerous OECD studies and recommendations show a major influence of HE on the development of human capital, innovation and competitiveness of towns and regions with universities and other HEIs.

These are the key reasons why Slovenia allocates more public funds for student aid than the EU average and why it publicly funds its private HE. In 2010, it allocated 251.4 million EUR to HEIs for study activities (for first- and second-cycle full-time studies), 10.4 million EUR (4.1%) of which went to private HEIs with concession (MHEST, 2010).

CHARACTERISTICS OF SLOVENIAN PRIVATE HE

Private HEIs usualy accounts for a larger number of total HEIs, but for a smaller number of enrolments (Tilak, 2006, 113). This is also true in the case of Slovenia. The number of private HEIs accounts for 45,7 % of total HEIs in terms of individual faculties but the share of students enrolled accounts for 11,7 % (see Figure 1).

Table 3: Students, Graduates and Teachers and assistants in private HE in 2010/11 and 2011/12

	Total	Under. Students / 1st cycle	Post. students/ 2nd +3rd cycle	Total	Under. Students / 1st cycle	Post. students/ 2nd +3rd cycle
Students (2010/11 and 2011/12)	**10,321**	**8,098**	**2,223**	**10,446**	**8,167**	**2,279**
. HEIs with concession	5,652	4,039	1,613	5,521	3,942	1,579
. HEIs without concession	4,669	4,059	610	4,925	4,225	700
Graduates (2010 and 2011)	**1,448**	**1,154**	**294**	**1,500**	**1,124**	**376**
. HEIs with concession	690	516	174	788	579	209
. HEIs without concession	758	638	120	712	545	167
Teachers and assistants* (2010 and 2011)	**1,461**	**420****		**1,556**	**490****	
. HEIs with concession	849	280**		796	319**	
. HEIs without concession	612	140**		760	171**	

* Higher education teachers, assistants and researchers
** FTE (Full Time Equivalent)
Source: SORS, 2012.

Publicly funded private HEIs in 2011/12 account for as many as 52.9% of students (48.3% of undergraduates and 69.3% of postgraduates), 52.5% of graduates and 51% teachers and assistants or 65% (FTE) of private HE.

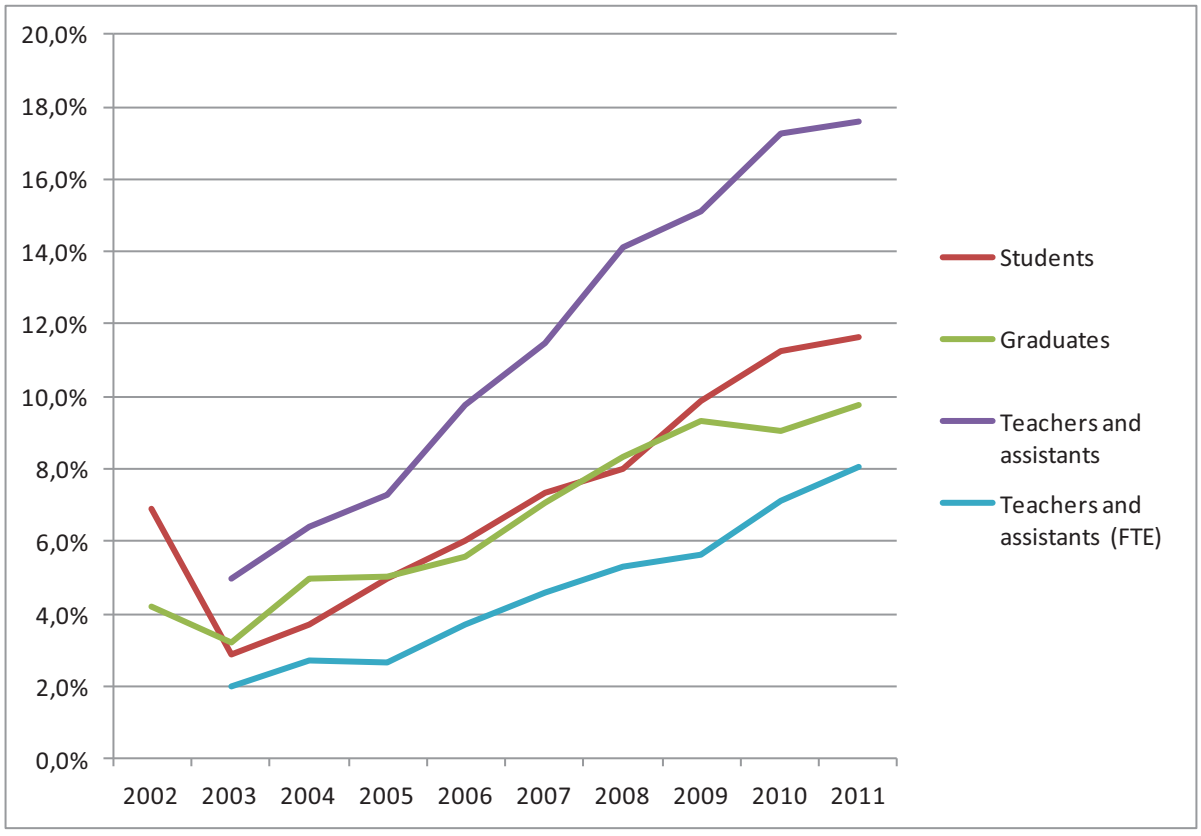

Figure 1: Share of private HE 2002-2011
Source: SORS, 2012.

Since 2003 when single HEIs in Primorska region joined to become the third public university, which is an interesting example of nationalisation of private HE, we have witnessed a sustained growth of private HE despite the decline in the number of students after 2005 when there were over 100,000 students compared to just below 90,000 in 2011.

Private HEIs offer considerably fewer full-time jobs than public HEIs. The main reason for this is that only 33% of them have a concession providing them with a greater stability of funding than tuition fees which depend on annual student enrolment. Another reason is a method of teaching in larger groups which is common in social sciences, business and administrative studies and law, the fields with the most students in private HE.

Table 4: The students to teacher and assistant ratio for 2010/11 and 2011/12

	Students / teacher and assistant		**Students / teacher and assistant (FTE)**	
Academic year	2010/11	2011/12	2010/11	2011/12
HE in total	**10.8**	**10.1**	**15.5**	**14.7**
Public HE	**11.6**	**10.9**	**14.8**	**14.1**
Private HE	**7.1**	**6.7**	**26.9**	**21.3**
. with concession	6.7	6.9	20.2	17.3
. without concession	7.6	6.5	33.4	28.8

Source: SORS, 2012.

The students to teacher and assistant ratio in terms of FTE is significantly better in public (14.1) than private (21.3) HE (2011/12). It is especially unfavourable in HEIs without concession (28.8 in 2011/12 and 33.4 in 2010/11) although a two-year trend indicates improved. This raises a question about the quality of their education and research as much education is carried out by contract teachers and assistants, in addition to which many private HEIs do not carry out research activities.

ADVANTAGES OF PRIVATE HE

One of the key advantages of private HE in Slovenia is that the "interest" of founders of HEIs is much more pronounced and present than in public HEIs. This is reflected in management where individuals in leading positions such as rectors, deans and directors are often not elected but appointed. Management of public HEIs is characterised by a dominant role of teachers who are not qualified for it. Its other feature is an inappropriate composition of management boards in which founders and representatives of employers have much too little influence.

Mainly due to different (better) management, private HE (both foreign and Slovenian) is more flexible and responsive and usually also more cost-effective. This is also reflected in the number of employees in professional/support services.

Table 5: Non-teaching staff ratios for academic year 2011/12

	Non-teaching staff		**Stud. / member of non-teaching staff**		**Non-teaching staff / all staff**		**Teachers and assistants (FTE) / member of non-teaching staff**	
Academic year	2010/11	2011/12	2010/11	2011/12	2010/11	2011/12	2010/11	2011/12
HE in total	**3,726**	**3,845**	**24.6**	**23.3**	**30.5%**	**30.3%**	**1.6**	**1.6**
Public HE	**3,439**	**3,589**	**23.6**	**22.1**	**32.9%**	**33.0%**	**1.6**	**1.6**
Private HE	**287**	**256**	**36**	**40.8**	**16.4%**	**14.1%**	**1.3**	**1.9**
. with concession	161	148	35.1	37.3	15.9%	15.7%	1.7	2.2
. without concession	126	108	37.1	45.6	17.1%	12.4%	1.1	1.6

Source: SORS, 2012.

In public HE there are 22 students per member of non-teaching staff compared to as many as 41 students in private HE for academic year 2011/12 (24 and 36 respectively in 2010/11). This is not only due to less widespread support activities in private HEIs but also to a large duplication of staff at public universities in, for example, accounting, human resource, etc. departments at the level of faculties, academies and rectorates. These results in non-teaching staff representing 33% of all employees in public HE compared to only about 14% in private HE. 1.6 and 2.2 teachers (FTE) per member of non-teaching staff in public HE and private HE with concession respectively is certainly not enough considering that non-teaching staff in Slovenian HEIs generate much less revenue than at foreign universities which as a result have much more diverse revenues and are therefore less dependent on public funds than our HEIs.

VISION OF PRIVATE HE DEVELOPMENT BY 2020

By 2020 the number of 19 year-olds will drop to just over 19,000 compared to over 23,000 in 2010 (in 2000 there were over 29,000 of them and their number will be the lowest in 2019, i.e. 18,776). In this context, the key challenge is how to improve the reputation of private HEIs and thus increase the interest for enrolment in their study programmes.

This can be achieved by:

- strengthening human resource structure which is not integrated in the public sector and therefore has a better wage policy,
- promoting the diversity of study programmes and targeting groups of people not targeted by public HE,
- emphasising the quality of education and introducing online studies,
- enhancing research and international cooperation,
- joining single HEIs into universities which are organised differently than public universities and have a dynamic management with a clear vision and plenty of energy.

INTEGRATION IS THE FUTURE

Private HE contributes to a more dynamic Slovenian HE area, brings much-needed competition and is a balance to the dominance of public HE which has many advantages and privileges in accessing public funds for education and research. Concessions through which a

number of private HEIs are publicly funded have an important positive role not only for the institutions, their employees and students but for the entire HE. This is demonstrated in a greater similarity between public HE and private HE with concession on one hand than between private HE with and without concession on the other.

The state must provide a framework and mechanisms to:

- encourage the development of public and private HE in accordance with EU and national targets,
- encourage the greatest possible quality and accessibility of HE for all those interested,
- supervise HE activities and thus contribute to its greater effectiveness, efficiency and transparency.

Therefore, HE should do its best to follow the OECD recommendation that the future of HE lies in a reliable connection between public and private HE, and that distrust and competition between them should be replaced with mutual trust and cooperation. Only then will HE be able to provide access to quality education and contribute to the development of society (Cheng, 2009, 68).

SHOPPING CART ABANDONMENT : A COMPARISON BETWEEN AMERICAN AND TAIWANESE PERSPECTIVES

Chuleeporn Changchit, College of Business, Texas A&M University – Corpus Christi 6300 Ocean Drive, Corpus Christi, TX 78412, Tel: 361-825-5832, Fax: 361-825-5609, chuleeporn.changchit@tamucc.edu

ABSTRACT

Despite the fact that millions of people use the Internet every day and visit various shopping sites, it is interesting to find that quite a few of them do not complete purchase transactions. It is still a major challenge for online businesses to learn why these e-shoppers chose not to complete the process. This study aimed at comparing the factors that influence the purchase intent and shopping cart abandonment between American and Taiwanese consumers. Three hundred and eighty-six (386) Americans and three hundred twenty-nine (329) Taiwanese participated in this study. The research findings may be used by online businesses to help recognize the factors that influence purchase intentions of these two nationalities. The results should help online businesses gain an understanding of these factors and thus direct their efforts to develop features that satisfy the needs of their target customers.

Keywords: e-Commerce, Shopping Cart Abandonment, Culture, Taiwanese, Americans

INTRODUCTION

According to a survey of U.S. market research by Internet World Stats, the number of Internet users continues to rapidly increase due to the rapid development of the Internet. Until June 2009, the population of global Internet users was more than 1.66 billion people. International Data Corporation (IDC) also estimates that in 2013, global e-commerce trading amount will amount to more than 16 trillion U.S. dollars. As Internet usage increases globally, the e-commerce market also increases, particularly in countries with well-developed marketing infrastructures. Pew Internet, Inc. (2010) reports that 72% of U.S. Internet users made purchases online. Many online shoppers are attracted to the ease and convenience that shopping via the Internet can provide (Shang, Chen, and Shen, 2005).

As the number of Internet user's increases, so does the number of businesses establishing an online presence. Unfortunately for businesses, despite the increased access to customers that the Internet provides, the number of Internet consumers who complete intended purchases without abandoning their cart has not risen. In order to engage with potential online consumers, companies must build a website, attract visitors to the website, and offer products to the customer with the ease of online purchasing in mind. The crucial point in this selling-purchasing process is the final phase — the completion of the purchase. Businesses must be able to close the sale and have a completed purchase before the customer leaves their website. However, their ability to do so can be difficult. Forrester Research (2005) reported that 88% of online shoppers have abandoned their online shopping cart in the past. The phenomenon

of customer shopping cart abandonment prior to purchase completion is a major challenge facing online retailers. Website abandonment rates may vary for different online vendors. However, overall abandonment rates are disturbingly high and indicate that despite the amount of effort and money spent on attracting customers to an online store, companies continue to fail in closing sales.

Prior studies have attempted to find out why shoppers abandon their shopping carts before buying (Changchit, 2006, Kukar-Kinney and Close, 2010; Fenech, 2002; Moore and Mathews, 2008). Although several studies have attempted to investigate shopping cart abandonment, there are two major absences from these prior studies (1) the studies did not focus on the subjects who had an intention to buy and (2) the studies did not take into consideration cultural differences. This study attempts to answer the question: Are there differences between Americans and Taiwanese in terms of reasons for not completing an intended online purchase? In addition, this study also focuses on the subjects who indeed visited a website with an intention to buy instead of just browsing for information.

LITERATURE REVIEW

Online Shopping in the United States

Online purchasing in the United States comprises nearly 40% of global Internet purchases, which is the largest retail online sector in the world (Datamonitor, 2010). Pew Internet and American Life Project (2008) reported that the number of Internet users purchasing products online increased 20% from 2000 to 2007, while e-commerce revenues had grown nearly five times during the same time. In the United States, Internet adoption at home increased from 62.2% in 2002 to 69.6% in 2008 (Talukdar and Gauri, 2011).

A recent study has reported that the number of Internet users in the U.S. has almost doubled over the last eight years to approximately 220 million in 2008 (Hannah and Lybecker, 2010). However, not all consumers are turning to the Internet for shopping. While the number of Internet users who have made an online purchase at one time is more than half, this does not explain the disparity between the number of visits websites record and the number of actual purchases made online. One report shows that although a website may receive millions of visitors, only about 3% of those visits result in a purchase (Betts, 2001). In addition, another study also reported that about 65% of online shopping carts are abandoned before a purchase is completed (O'Neill, 2001).

One explanation of these occurrences is that the majority of consumers are going online to window-shop and plan on making their purchases offline (Forsythe, 2003). Research is seen as a valuable tool by consumers in their decisions to buy products, but the Internet is not seen as the necessary method of purchase. The Internet and its online capabilities are generally seen as a research tool by consumers, as the Internet is capable of disseminating a large amount of information conveniently. Consequentially, although online capabilities include the ability to complete a purchase transaction, a good portion of consumers utilize the Internet to find information about a product and then use the information at a physical shopping location.
Physical locations have the contrasting capabilities of providing sensory perception information for the consumer to use in their purchasing decisions that the Internet is seen as

incapable of satisfying (Shim, et al., 2001). A physical location can provide more in the way of direct social interaction with others and of entertainment through the process of shopping amongst physically present objects for a consumer (Shang, et al., 2005). Despite the benefits the Internet may provide in terms of online shopping, consumers may simply be using the Internet as a research tool, not a purchasing medium, to better inform themselves about products in order to make their purchases offline.

In a study conducted at a university in the South-western United States by Kim and Eastin (2011), the study identified a significant relationship between shopping motivations and exploratory information seeking, impulse buying, as well as a significant relationship between exploratory information seeking and impulse buying. This study also identified significant relationships between pre-purchase online communication and post-purchase online communication, pre-purchase browsing time and pre-purchase online communication as well as, pre-purchase browsing time and online buying frequency. The data showed that perceived credibility of a product by other consumers is positively related to both online buying frequency and pre-purchase online communication.

Using the Theory of Reasoned Action (TRA), Cha (2011) analyzed subjective norms as an antecedent determinant of behavior influencing the online shopping intent of college students. The study asserted that subjective norms have a positive association with purchase intent of both real and virtual items by college students, which was shown as having a significant relationship. This suggests that the more social influence purchasing something online possesses, the more likely they are to complete the purchase. The study also found that the TAM constructs did not influence the intent to purchase virtual items. It also found that security concerns did not influence purchase intent either. Instead, subjective norms and male gender were the significant factors determining the purchase intent of virtual items. Additional research by Chen and Cheng, in their 2009 study of online shopping intentions, confirms the assertions of TRA by making four modifications to the DeLone and McLean model and demonstrating a relationship between satisfaction and behavioral intention and perceived use.

Online Shopping in Taiwan

Lee and Lin (2005) conducted an Internet shopping survey of Taiwanese students. The constructs they tested included the positive correlation between trust, site design, reliability, personalization, and responsiveness to service quality and customer satisfaction by ways of influencing the intent to purchase. The results demonstrated that all the constructs tested affirmed a positive correlation to service quality and customer satisfaction on the intent to purchase except personalization. These findings suggested that in Taiwan, personalization was not a significant factor in the decision to buy. Chin and Kao (2009) conducted online shopping research in Taiwan by measuring the four dimensions of process quality including design, information accuracy, functionality, and ease of use to establish the importance of process quality as a factor that may build customer loyalty. Their research confirmed similar findings with regard to process quality and outcome quality having positive direct influence on customer satisfaction, although behavioral intentions remained unaffected.

Additional research conducted in Taiwan includes the importance of logistics in online shopping and its influence on customer loyalty (Huang, Kuo, and Xu, 2009). This study

determined that the performance of logistical services demonstrated a positive effect on loyalty and indirectly influenced loyalty through customer satisfaction. Liang (2009) studied the critical factors influencing young Taiwanese online shoppers and developed a prediction model based on the results of this study. The prediction model is targeted to Generation Y shoppers for use by the retailers who target this shopping demographic. Risk aversion, convenience, brand reputation, interaction function, promotion, services for members, trust, and site quality all influenced the Generation Y online shoppers' decision to purchase online. These motivational factors should be considered during marketing plan development for online retailers. The motivations to adopt the use of e-payment systems in Taiwan have been investigated by way of comparison to Vietnam (Lin & Nguyen, 2011). They conducted a survey of Taiwanese e-payment users to determine the moderating effects of the Technology Acceptance Model (TAM) and the Personal Innovation in Information Technology (PIIT) construct. The research demonstrated that the TAM model was consistent and that the Taiwanese are more prone to adopt e-payment systems than the Vietnamese. The factors that influenced e-payment adoption in Taiwan were related to culture, affluence, and education level.

Consumer acceptance of the Internet as a distribution channel in Taiwan as studied by Cheng, Sheen, and Lou (2006) revealed that the TAM factors significantly influence positive attitudes towards the Internet as a distribution channel. Perceived security risk showed no influence on consumer attitudes or usefulness perceptions of the Internet as an online distribution channel. They also found that a positive attitude toward online distribution can influence actual use of an online distribution channel.

Cultural Considerations

Culture has long been recognized as an important factor shaping consumer behavior in offline shopping scenarios (Gong, 2009). Hence, one would expect that culture would also shape consumer behavior in an online shopping context. Culture is not an easy concept to define, but there are definitions that have been developed. For example, Matsumoto (1994) states that culture is the degree to which people share attributes, values, beliefs, and behaviors. Perhaps the most popular definition of culture that has been used by many is that of Hofstede who defines culture as "the collective programming of the mind which distinguishes the members of one group from another" (1984, p.21).

In his work, Hofstede (1984) identified four dimensions of culture. The first dimension is power distance, defining as the extent that less powerful members of an organization accept that power is distributed unequally. The second dimension is individualism, which refers to the degree to which individuals emphasize self-interest over that of the group. The third dimension is that of masculinity, which attaches importance to goals such as career and material success versus social goals such as relationships and helping others. The fourth dimension is uncertainty avoidance. This dimension addresses the degree to which people of a society feel uncomfortable with uncertainty and ambiguity.

While Hofstede's work was first applied to human resource management, it is now increasingly used in business and marketing studies (Yoon, 2009). Different cultures respond differently to situations (Fenech and O'Cass 2001; Park and Jun, 2003). This study attempts to examine which factors influence the online shopping perception between these two groups,

Americans and Taiwanese. Data was collected to analyze their overall view of the Internet as a secure vehicle for purchasing goods and/or ordering services. The results should help e-businesses gain an understanding of these factors and thus direct their efforts to tailor the websites to integrate features that satisfy the needs of their target markets.

Shopping Card Abandonment

According to a study of customer behavior in abandoning purchases, it was found that in order for a purchase to be likely, but not completed, there had to be an initial desire for the product and an emotional connection that turned negative and impeded the decision to complete the purchase (Barnes, King and Breen, 2004). In essence, one of the first obstacles that businesses face in physical and online venues is the converting of a viewer to a customer. The intent to buy or purchase a good or service is the initial hurdle. The next obstacle is maintaining the intent of a potential customer to complete a purchase. Chou, Kang and Cheon (2006) found that high perceived uncertainty contributed most to shopping cart abandonment by Anglo college students.

Engendering trust is one aspect of maintaining the intent to purchase by consumers. Trust is seen as a major component of consumer willingness to fully participate in e-commerce by fully completing an online transaction. Several studies have found that trust of the business' online presence was listed as a key element in the decision to make a purchase online (Grabner-Krauter and Kaluscha, 2003). Rajamma, Paswan and Hossain (2009) found that a user's perception of risk is an aspect of online shopping that marketers must overcome to build trust and reduce shopping cart abandonment.

Research by Chau, Hu, Lee and Au (2007) suggests that customers weigh the benefits of providing personal information to an online vendor in terms of the risks of providing such information during the purchase process. The use of privacy seals, availability of refunds, security certificates, and product were important to customer's perceived level of trust.

Gold (2007) also reported a study conducted by the Vividence Corporation, a leader in Customer Experience Management (CEM) products and services. The company evaluated the experiences of 719 consumers as they used shopping carts at e-commerce websites. According to this study, the top ten reasons for shopping cart abandonment are: (1) high shipping prices (72%), (2) comparison shopping or browsing (61%), (3) changed mind (56%), (4) saving items for later purchase (51%), (5) total cost of items is too high (43%), (6) checkout process is too long (41%), (7) checkout requires too much personal information (35%), (8) site required registration before purchase (34%), (9) site is unstable or unreliable (31%), and (10) confusing checkout process (27%).

Another study also examines what factors influence shoppers who have initial intentions of purchasing to change their minds and leave the website without completing a purchase. The results report that the top five factors contributing to the reasons why customers leave websites without purchasing are: (1) I like to see the actual product before buying, (2) I was not sure that the site provides the best price, (3) shipping prices were too high, (4) I did not like to register before checking out the product, and (5) I did not find the desired product (Changchit and Cutshall, 2011).

Although several studies have attempted to investigate shopping cart abandonment, there is an absence of prior studies examining what influence, if any, culture has on shopping cart abandonment. Beyond recognizing the abandonment phenomenon exists, it is important to understand what role culture plays in making shoppers abandon their online shopping cart. This study, therefore, aims at examining the cultural differences between Americans and Taiwanese in terms of what factors influence shoppers who have initial intentions of purchasing online, but ultimately change their minds, abandon their online shopping carts, and leave the website without completing a purchase.

RESEARCH METHODOLOGY

A direct survey was used to collect the data for this study. The survey questions are compiled from previous study questions pertaining to consumer behaviors (Alomaim, et al., 2003; Joines, Scherer and Scheufele, 2003; Kohli, Devaraj and Mahmood, 2004; Koivumaki, 2001; Koyuncu and Lien, 2003; Lin, 2003; Posnock, 2004). The survey consists of fifty-eight (58) questions. Twenty (20) questions were asked to gather information on subjects' perception about online shopping. Twenty-two (22) questions were designed to examine why subjects leave the website before completing the transaction. For these 22 questions, the survey asked subjects to refer to the most recent website they visited with an intention to buy, but decided to leave without actually buying. Two (2) two questions ask for expected benefits subjects have for online shopping. One (1) question asks whether subjects prefer online shopping or physical store shopping. The remaining thirteen (13) questions ask for subjects' demographics.

The survey was developed with five-point Likert scaled questions. Answers to the scaled questions ranged from "strongly disagree" to "strongly agree" as end points. Subjects were asked to rate their level of agreement with each item as a reason that may have caused them to leave a website without buying. To validate the clarity of these questions, three professors and three researchers were asked to read through the survey questions. Revisions to the survey were made based on the feedback received.

For the American subjects, the surveys were administered to random shoppers at local malls and to students at a South-western United States university. Three hundred and eighty-six (386) subjects completed and returned the survey instruments. However, forty-two (42) subjects do not have an experience conducting an online transaction. They are thus excluded from the data analysis. Details on the subjects' demographics are provided in Table 1 below.

Table 1: Subjects' Demographics (Americans)

Gender					
Male: 178 (51.74%)		Female: 166 (48.26%)		No Answer: 0 (0.0%)	
Age (in years)					
Under 18: 1 (0.29%)	18-24: 274 (79.65%)	25-34: 45 (13.08%)	34-44: 14 (4.07%)	45 up: 10 (2.91%)	No Answer: 0 (0.0%)
Highest Education					
Less than High School: 4 (1.16%)	High School: 271 (78.78%)	Bachelor: 60 (17.44%)	Graduate: 6 (1.74%)	No answer: 3(0.87%)	
Employment Status					
Yes: 259 (75.29%)		No: 83 (24.13%)		No answer: 2(0.58%)	
Income					
Less than $20,000 249 (72.38%)	$20,000- 40,000 57 (16.57%)	$40,000-60,000: 15(4.36%)	Greater than $60,000: 17(4.94%)	No Answer: 6(1.74%)

DATA ANALYSIS AND DISCUSSION

This study aims at identifying the cultural differences between online shopping perceptions of American and Taiwanese subjects. Subjects were divided into two groups, American (344) and Taiwanese (254). Statistical t-tests on the means were conducted on subjects' responses to the question "Overall, I prefer to shop online than in the physical store". The compared results are presented in the Table 3 below:

Table 3: T-Test - Two-Sample Assuming Unequal Variances

Overall, I prefer to shop online than in the physical store	American	Taiwanese
Mean	3.680758017	3.236220472
Variance	1.050564336	0.845165105
Observations	343	254
Hypothesized Mean Difference	0	
df	574	
t Stat	5.560938774	
P(T<=t) one-tail	2.05835E-08	
t Critical one-tail	1.647512593	
P(T<=t) two-tail	4.11671E-08*	
t Critical two-tail	1.964105441	

* indicates p-value <= 0.05

The results of the t-test show a significant difference between the American and Taiwanese preferences for online shopping. On the average, American subjects prefer online shopping more than Taiwanese subjects.

Additional statistical t-tests were conducted on subjects' responses to 20 questions testing perception factors of online shopping. The results are in Table 4. These results mostly support why more Americans prefer online shopping than Taiwanese. Except the perceived ease of use, the remaining four factors were perceived differently between Americans and Taiwanese. On the average, Americans perceive higher positive experiences, better security, and lower uncertainty with online shopping than Taiwanese.

It is also interesting to note that on the average, Taiwanese perceive higher benefits of online shopping than Americans. However, according to the result shown in Table 3, more Americans prefer online shopping than Taiwanese. This finding may indicate that of all the five factors, the perceived benefits of online shopping may be the least important compared to other concerns such as security or uncertainty.

Table 4: Consumers' Perceptions with Online Shopping

Factors	Mean: Americans	Mean: Taiwanese	p-value
Perceived Benefits of Online Shopping	3.27	3.42	0.0026*
Perceived Ease of Use of Online Shopping	3.72	3.66	0.2312
Past Experience with Online Shopping	3.85	3.36	0.0000*
Perceived Security of Online Shopping	2.97	2.75	0.0007*
Perceived Uncertainty of Online Shopping	3.14	3.78	0.0000*

* indicates p-value <= 0.05

Additional data were also collected from subjects to examine the reasons why they did not complete the purchase transactions although they have visited the websites with an intention to buy. The results are demonstrated in Table 5 below.

Table 5: Reasons for not Completing Purchase Transactions

Reasons	Average	
	American	Taiwanese
I did not have enough time to complete the purchase.	2.45	2.80
I did not find the desired product	**3.22**	3.18
I did not find the information about shipping	2.54	2.57
I was not sure that the site provides the best price	**3.40**	3.37
The pages took too long to download	2.66	2.70
The site was confusing	2.68	2.85
Shipping prices were too high	**3.33**	**3.59**
Taxes were too high/ not expect to pay tax	2.63	2.93
I hesitated to provide credit card information	3.03	**3.52**
The checkout processes requires too much information	3.04	**3.61**
I did not like to register before checking out the product	**3.38**	**3.60**
The site did not accept credit cards	2.24	2.87
The site did not accept checks	2.38	2.45
Total cost of items were too high	3.02	3.49
I would like to contact customer service for more information	2.70	3.42
I was afraid of receiving wrong product	2.70	2.82
I was afraid that product might not arrive on time	2.95	3.31
I like to see the actual product before buying	**3.45**	**3.87**
I did not like the design of the website	2.54	2.74
My credit card was reject	1.88	2.37

The top five reasons why American did not complete the purchase transaction are as follows:
1. I like to see the actual product before buying (3.45)
2. I was not sure that the site provides the best price (3.40)
3. I did not like to register before checking out the product (3.38)
4. Shipping prices were too high (3.33)
5. I did not find the desired product (3.22)

The top five reasons why Taiwanese did not complete the purchase transaction are as follows:
1. I like to see the actual product before buying (3.87)
2. The checkout processes requires too much information (3.61)
3. I did not like to register before checking out the product (3.60)
4. Shipping prices were too high (3.59)
5. I hesitated to provide credit card information (3.52)

Comparing the reasons for shopping cart abandonment between these two nationalities, it is very interesting to note that both Americans and Taiwanese share the same three reasons and they are even ranked at the same orders. It is very obvious that the main concerns for them are the lack of the ability to see the actual product as both nationalities rank this concern as

the top reason why they decided to abandon the shopping cart. The other two main concerns that they share are the requirement for registration and shipping prices.

The other two concerns among the top five that Americans have are the uncertainty that they will find the best price online and the inability to find the product they like. Although these two factors were not ranked among the top five for Taiwanese, they seem to be of concern to the Taiwanese as well, ranking high at 3.37 and 3.18, respectively.

The remaining two concerns among the top five that Taiwanese have are the hesitation to provide credit card information and the amount of information required for the check-out process.

In addition to gathering data on the reasons why subjects did not complete the purchase transaction, two questions were also asked to examine what can encourage them to place a transaction in terms of better prices and shipping times. Table 6 below shows the expected discount and the length of lead time subjects expected when shopping online.

Table 6: Expected Discount and Lead Time from Online Shopping

Americans	Taiwanese
On the average, the product is 25.12% cheaper than a physical store	On the average, the product is 57.97% cheaper than a physical store
On the average, the shipping time is no longer than 6.52 days	On the average, the shipping time is no longer than 3.64 days

The results suggest that, on the average Taiwanese expect much higher benefits from online shopping than Americans. This finding also conforms to the findings in Table 1 that more Americans prefer Internet shopping than Taiwanese.

CONCLUSION

This study compares online shopping perceptions between Americans and Taiwanese. The results of the study reveal the factors that cause the shoppers who have initial intentions of purchasing to change their minds and leave the website without completing a purchase.

The findings suggest that American prefer online shopping more than Taiwanese. Further analysis also reveals that this may be due to the fact that Taiwanese perceive less security and higher uncertainty when shopping online.

Additional data from the survey from both populations revealed the top five reasons customers leave websites without purchasing and it is noteworthy that they share the same three reasons: (1) I like to see the actual product before buying, (2) I did not like to register before checking out the product, and (3) shipping prices were too high.

Two concerns of the top five for American subjects that are not among the top five for Taiwanese subjects are (1) the uncertainty that they find the best price and (2) the inability to find the product they like. This result suggests that in order to encourage more American to

buy online, the online businesses may want to include the price comparison feature or price-match policy to give potential customers peace of mind that they are getting the best price. In addition, a feature to gather feedback from the customers about the product they cannot find from the website should be incorporated.

The two concerns of the top five from Taiwanese subjects that are not among the top five from American subjects are (1) the hesitation to provide credit card information and (2) the amount of information required for the check-out process. These results suggest that Taiwanese subjects do not trust the security of the website and highlights the need for online businesses to better design the check-out process. In order to encourage the Taiwanese to buy online, online businesses may need to come up with a fraud protection policy and consider collecting only necessary information via the check-out process. Taiwanese respondents also expect a much better price and shorter delivery time than Americans. These findings suggests that marketers and online businesses in Taiwan may have to offer more in the way of price reductions, delivery options, and security to truly capitalize on the online market potential presented by the Taiwanese population.

This study contributes to current literature by exposing how cultural dimensions influence online purchase intentions of Americans and Taiwanese. More research is needed with respect to cultural differences in online shopping intentions. Research concerning other populations beyond these two would continue to contribute to the growing research area of online retailing and facilitate growth of the online marketplace in terms of creating viable business offerings to a diverse Internet population.

ABSTRACT

This study is about the impact of online banking on customer service delivery in Malaysian banking industry. Due to the challenges of globalization and intensive competition, Banks were compelled to comprehend the services of online banking in order to entice the existing and the potential customers. Although, the level of awareness is relatively high; but still only 64% patronize online banking in Malaysia. It is against this background that this paper seeks to examine the significant factors that may cause online banking to have an impact on customer service delivery with the ultimate aim of either accepting or rejecting any preconceived idea of the researcher. The study employed some hypotheses in order to guide the research in achieving the overall aim of the research as well as testing the stated hypotheses. Behavioral factors such as security, convenience and cost were the main concern of the respondents towards effective service delivery. The study reveals that "Cost" is the major driver of effective service delivery of online banking services in Malaysia. Equally, the study also explores various implications of the research.

Keyword: Behavioral factors, customer service delivery, Kano's Model, Malaysian banking industry, online banking.

INTRODUCTION

A strong online banking services are an important driver in the banking industry for Bank's performance and customer service delivery. It can have a significant effect in supporting economic development through efficient financial services. Aliyu and Tasmin (2012a). As the banking industry becomes global in nature, faces a competitive environment; banks are forced to balance the goals of outreach and sustainability. Thus, online banking may be the instigator of this new environment and the prime mover in terms of providing the potential solution for bank's survival in the near future (Anyasi, et al 2009; Musiime, 2010; Hazlina, et

al 2011a and Hazlina, et al 2011b). Research has proven that, electronic banking services (EBS) are the wave of the future banking by providing enormous benefits to consumers in terms of ease and cost of transactions through online banking (Nsouli, et al, 2002).

Due to little research conducted in Malaysia in the areas regarding accessing the external factors that entice or discourage customers to patronize online banking, there is a strong need for this study to address two major issues,

- The first one is to conduct an empirical study so as to assess the significant factors that may cause online banking to have an impact on customer service delivery in Malaysian commercial banks.
- Secondly, there is a need to examine the relationship between the factors that may affect online banking and online banking services in Malaysian commercial banks.

By understanding the basic factors that encourage customers to patronize online banking, this will go a long way in reaping the benefits of online banking and also for banks to remain competitive and profitable in the long run.

FACTORS INHIBITING ONLINE BANKING ADOPTION

Behavioral (external) factors are the important determinants of online banking adoption as disclosed by Rahmath, *et al.,* 2011. Behavioral factors pertaining to convenience, security, cost, prior experience and volume of transaction where the focus of this study as they have a reciprocal influence on customer service delivery (Suganthi, 2010; Ombati, 2010 and Ahmad, 2011).

- Cost: - is one of the major factors that influence consumers' adoption of innovation. Aliyu & Tasmin (2012a), stated that for consumers to use new technologies, the technologies must be reasonably priced relative to alternatives. Otherwise, the acceptance of the new technology may not be viable from the standpoint of the customer.

- Security is another very important factor in determining the decision of customers to use online banking. Aliyu & Tasmin (2012b), identify “security” as an important characteristic from a customer's perspective on the adoption of innovation.

- While, convenience is considered to be an influential factor for the use of online banking. Still, there is a positive relationship between convenience and service delivery vie online banking, such as the ability of online banking to meet users' needs using the different feature availability of the services. (Malarvizhi, 2011)

Previous researches reveal that customers are more sensitive to the behavioral factors mentioned above in terms of customer service delivery vie online banking than the internal factors. This means that there is a direct relationship between technology and behavioral (external) factors in the adoption of online banking. Therefore, the level of online banking adoption will directly impact on the degree to which the customers are satisfied, in terms of the behavioral factors (Musiime, 2010). This reveals that effective service delivery on behavioral factors may result to customer loyalty (which impacts their future utilization of online banking patterns) in relation to other factors just like it has on customer satisfaction.

Thus, banks should give high priority to behavioral factors and should consider it as important key drivers towards successful implementation of online banking (Khong, et al., 2006; Nek, et al 2009; Shirshendu and Sanjitkumar, 2011)

CUSTOMER SERVICE DELIVER IN THE BANKING INDUSTRY

According to Parasuraman et al., (1985), the study of customer service delivery has gained interest just after the concern on improving the quality of products and services become increasingly important in the globe. Today, information and communication technology, competition, deregulation and globalization have changed the landscape of the banking industry in such a way that it is characterized based on the services the banks offer to customers across the globe. This is one of the major reasons why the banking industry is among the most intense in deploying high technology innovation. (Drucker, 1985a; Drucker, 1999b and Shoebridge, 2005). It is noticeable that online banking, enabled banks to service customers not only in branches and other dedicated services sites, but also in a myriad of other channels (Lovelock, 1996 and Al-Hawari, et al., 2005).

Thus, delivering effective customer service is indeed an important marketing strategy (Berry and Parasuraman, 1995), but the difficulty in defining customer service delivery in deploying a specific contextual instrument for measuring such constructs represents important constraints for the banks to approach their markets.

A CONCEPTUAL MODEL AND HYPOTHESES

For the purpose of understanding the factors influencing online banking services towards customer service delivery, this paper proposes a conceptual model (see figure 1). This conceptual model is developed based on several previous studies related to electronic banking, behavioral factors, banking application, and customer service delivery.

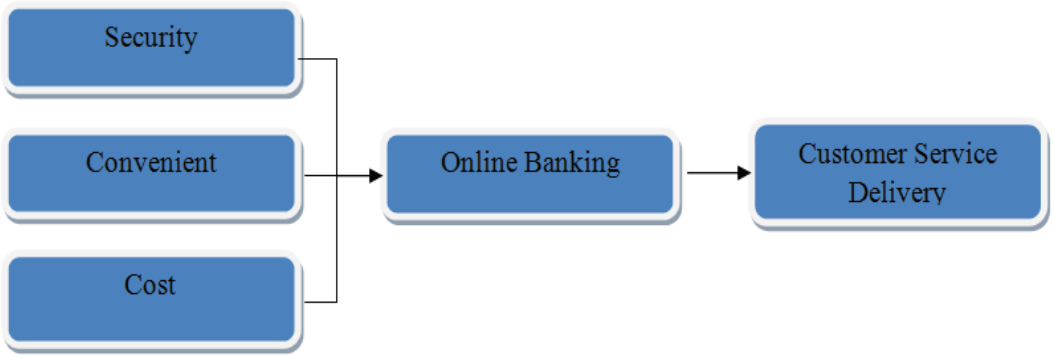

Figure: 1 Conceptual Research Model (Source: Literature Survey, 2012)

The following hypotheses are developed based on the conceptual model and literature review discussed:

- Ho1 There is a significant relationship between cost and online banking in Malaysian banking industry.
- Ho2 There is a significant relationship between convenience and online banking in Malaysian banking industry.
- Ho3 There is a significant relationship between security and online banking in Malaysian banking industry.
- Ho4 There is a significant relationship between online banking and customer service delivery in Malaysian banking industry.
- Ho5 There is a significant relationship between customer service delivery and customer's satisfaction in Malaysia banking industry.

RESEARCH MODEL

The research framework of this study is based on the adaptation of Kano's Model first developed by Professor Kano in 1984. The Kano's model of customer satisfaction seeks to explain how assigning priorities to operational objectives may result in lasting improvements in customer service delivery. Essentially, the Kano's model is used for the classification of product and services based on understanding wishes and the way it affects customer's satisfaction. Kano (1984) suggests a model that helps researchers distinguish between three types of product/service requirements which influence customer satisfaction in different ways when met. Thus, the Kano's model is viewed in the perspective of online banking service on customer service delivery. In fact, Kano's diagram (seen figure 2) shows customers' satisfaction in relation to the product/service level and the quality of service delivery.

In addition, Professor Kano believes that for effective customer service delivery, banks should make sure that the level of service delivery such as security, convenience and cost should meet all of the customers' requirements and not only what the customer states (Bhattacharyya and Rahman, 2004). The essence of choosing the Kano's model in this study is because, the model could provide a unique opportunity for understanding the impact of online banking on customer service delivery and identify the categories of behavioral factors to be managed. Secondly is to support the Malaysian banks in strategizing their decision toward enhancing effective and efficient customer service delivery. Hence, this model shows the best way for putting the fundamental principles of good behavioral factors in place and continually expanding and enriching that set of principles which makes it easy to apply in different situations.

In addition, research has proven that, one of the economic methods to achieve effective customer service delivery in the service industry is through Kano's model which has been registered (Ardhiyani, 2012). The study considers online banking as the major tool of interaction with customers, while behavioral factors such as security, convenience and cost are classified as banking capabilities at the root of effective customer service delivery.

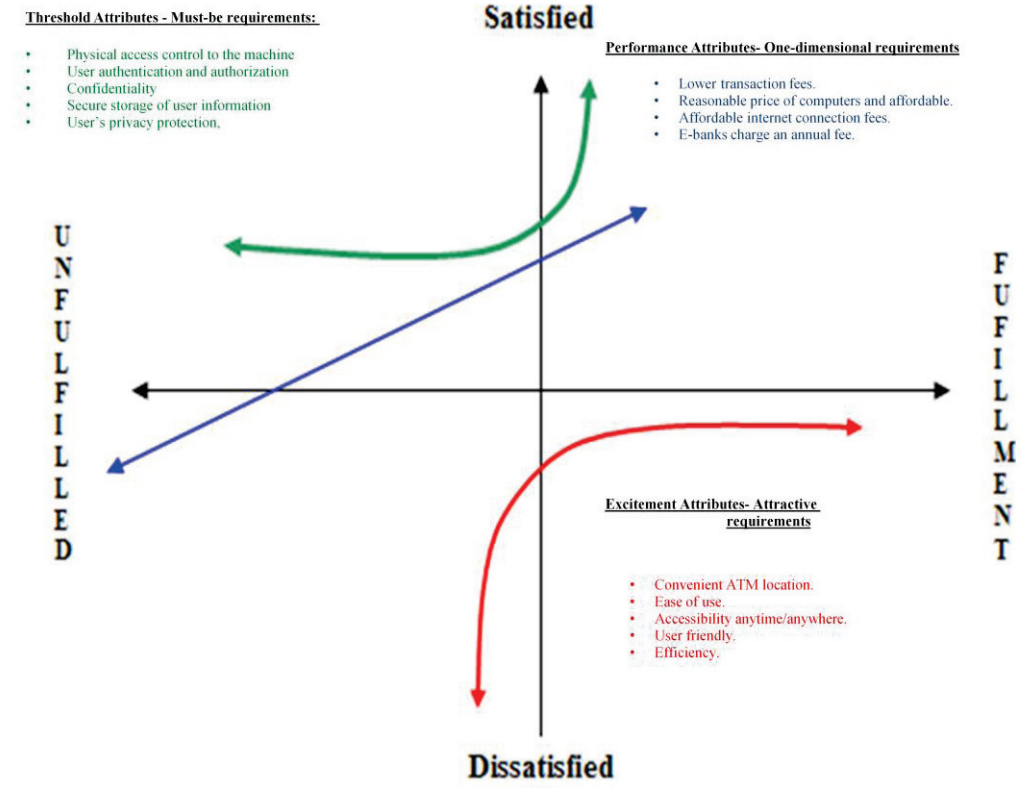

Figure 2: Kano's Model Customer Satisfaction, with Some Modifications (Kano et al, 1984)

METHODOLOGY

The research data was collected through questionnaires base on the various research conducted, in which the questionnaires were modified so that it suite the research's intention towards examining some behavioral factors that influence the service of online banking in Malaysia. The questionnaires contain 40 questions that measure 3 independent variables, one intervening variable and one dependent variable. The research use 8 questions to measure the respondent profile and 6 questions each to answer the customer's perception of security, cost and convenient.

Table 1 Description of questionnaire used

Item	Variable	Sample Question	Source
6	Security	I feel Banks should focus on important aspects of security and privacy of Online banking	Fleming, N. (2011), Abdullah et al.. (2011), Suganthi, (2010) and Poon and Tan (2008)
6	Cost/Price	I feel my bank cost/charges is expensive compared to other banks.	Suganthi, (2010), Poon and Tan (2008) and Felix et al (2011); Felix et al (2011)
6	Convenient	I feel the convenience of Online Banking has an influence on customer satisfaction.	ThotH Thomas et al..(2010),Suganthi,(2010), Poon and Tan (2008)
6	Online banking	I feel there is a need for further enhancement on Online Banking to satisfy customers.	Abdullah et Al..(2011); Ms. Malarvizhi.V (2011), Hazlina et al (2011), Goi, C. L. (2006), Felix et al (2011)
8	Customer service delivery	I feel, the key to success for online Banking lies in knowing customers current and future needs	Musiime, (2010), Hazlina et al (2011)

Source: Field Survey (2012)

The research uses the 5 point Likert-scale to collect the data, ranging from 1= Strongly Disagree, 2 = Disagree, 3 = Moderate, 4 = Agree and 5 = Strongly Agree. Moreover, additional questions were used to determine the respondents' age, gender, race, marital status, level of education and the number of years of being a customer in a particular bank. We also include 2 questions regarding behavioral factors for the respondent to rank the most important to the least important. The study uses the "Friedman non-parametric test" to see whether the respondents rank them differently.

The researchers decided to adopt the convenient sampling techniques because of two reasons:

- It is against the banking ethics to issue out the list and address of their customers.
- It is also against the (BAFIA) policies to obtain the list and address of customers of a particular bank or financial institution. (Ramayah, 2003).

These reasons compel the researchers to visit each bank during working hours to administer the questionnaires to the respondents and collect the response immediately from the customers. A total number of 50 questionnaires were distributed using an intercept survey.

RESEARCH FINDINGS

A total number of 50 questionnaires were distributed, out of which only 37 were retrieved back, in which 7 were incomplete. Thus, 7 questionnaires were discarded and only 30 questionnaires were accurately responded, thereby giving a response rate of 60%.

The profile of the respondent is presented in Table 2, in which the respondent comprised of males 18 (60%) and 12 females (40). This means that male patronize online banking more than their female counterpart. The respondents were between the age of 18 years old and above, whereby 33% are 26-35 years old, 47% are 36-45b years old. The majority of the

respondents are Bachelor and Masters Degree holders, that constituted up to 87%, this indicates that those with less education use online banking services less than the way educated people do in Malaysia. While 80% of the respondents had used the online banking for more than 2 years

.

Table 2 Profile of the respondents

Demographic		Frequency	Percentage
Gender	Male	18	60%
	Female	12	40%
Age	18 – 25 years	2	7%
	26 – 35 years	10	33%
	36 – 45 years	14	47%
	46 – 55 years	3	10%
	Above 55 years	1	3%
Education Level	Sec,school or equivalent	1	3%
	Degree or equivalent	8	27%
	Masters or equivalent	18	60%
	PhD or equivalent	3	10 %
Number of years using Online banking	< 1 year	3	10%
	2 - 5 years	11	37%
	6 -10 years	8	27%
	11 -20 years	4	13%
	> 20 years	4	13%
Marital Status Single	Single	10	33%
	Married	19	63%
	Divorced	0	0%
	Widowed	1	3%

Source: Field Survey (2012)

Sequential regression analysis was used to test the hypotheses, which is to determine the relationship between security, cost, convenience and online banking towards effective customer service delivery in the banking industry. Therefore, to determine the relationship between the independent variables (cost, convenience and security), intervening variable (online banking) and the dependent variable (customer service delivery); the study uses the hierarchical regression, so that it can provide a comprehensive explanation of the conceptual framework.

Table 3 Descriptive statistics

Descriptive Statistics

	Mean	Std. Deviation	N
CSD	4.0208	.93431	30
Cost OB	3.7556	.84615	30

Sec OB	4.1500	.92987	30
OB	3.9667	.90168	30

Source: Field Survey (2012)

From the table above, it can be seen that the Likert-scale is from 1- 5, in which the study consider "Cost" of online banking that has the mean of 3.7556 with the lowest standard deviation of .84615.

Table 4 Correlation

		CSD	CostOB	ConvOB	SecOB	OB
Pearson Correlation	CSD	1.000	.603	.723	.851	.605
	CostOB	.603	1.000	.660	.573	.669
	ConvOB	.723	.660	1.000	.807	.859

	SecOB	30	30	30	30	30
	OB	30	30	30	30	30

Source: Field Survey (2012)

From the table 4 above, the correlation matrix is a first approximation that allows to examine the convergent and discriminant validity of the item measures for each construct. Measures for a construct should relate highly to each other and less highly to measures of other

constructs (Afrouz, 2007). Thus, all the independent variables (Cost, Convenience and Security) are significant in determining effective customer service delivery on the online banking in Malaysia.

Table 5 Model summary

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.863[a]	.744	.715	.49884	.744	25.244	3	26	.000
2	.875[b]	.765	.727	.48799	.020	2.169	1	25	.153

a. Predictors: (Constant), Sec OB, Cost OB, Conv OB

b. Predictors: (Constant), Sec OB, Cost OB, Conv OB, OB

Source: Field Survey (2012)

From the table above, it can be seen that from the first model when cost, convenience and security were added, then (R) of 0.863 was arrived at, while the (R^2) is 0.744 this means that 71.5% of the variability (customer service delivery) is being accounted for (cost, convenience and security), while the adjusted (R^2) is 0.715, which means that the sample size and the predictors are descent enough to determine customer service delivery. The R Square change in the first model as it could be noticed is 0.744 and is also the same with R Square of 0.744, which means that the model has started with no prediction capacity.

In the same vein, when the three independent variables were added, The result got was (R^2) of 0.744, this indicates that the R Square Change is the same thing. The Sig. F Change which is 0.000 < 0.01, this means that the (R^2) is 0.744, adjusted (R^2) is 0.715 and (R^2) 0.744 are statistically significant. From the Anova table we can see that the F Value is 25.244, which corresponded with the F change in the first model with a degree of freedom (df1) 3, which is statistically significant 0.00 <0.01, this mean that all the predictors of model (one) are highly significant in determine customer service delivery vie online banking in Malaysia.

Table 6 ANOVA

ANOVA[a]

c. Predictors: (Constant), Sec OB, Cost OB, Conv OB, OB

Source: Field Survey (2012)

From the summary table above, it can be noticed that the model (two) has a new (R) value (0.875), the increase of the value is as a result of variable (online banking) that is added into the model as the predictor variable. At the same time, the (R^2) 0.765 has also increased to a value of which means that 20% increase as a result of adding online banking in the model as the predicting capacity and this increase is as associated with the F Change Value 2.169 with 1 degree of freedom (df) and the F Change which is 0.00< 0.01 signifies statistically significant.

Table 7 Coefficients

Coefficients[a]

a. Dependent Variable: CSD

Source: Field Survey (2012)

From the coefficient table, it can see that the entire variables in the model one, have a (β =0.168, 0.10 and 0.747, which p < 0.01) this means that the variable are statistically significant. The second model shows that, out of the variables is only online banking that has a negative value of (β-0.292), which is not statistically significant and this means that online

banking has no direct bearing on enhancing customer service delivery in the banking industry. In the sense that customers do value the behavioral factors, such as cost, convenient and security before accepting and utilizing online banking in Malaysia.

ADDITIONAL ANALYSIS

Table 8 Result of non-parametric tests

Selected variables	Mean rank	Ranking
Cost of Online Banking	1.50	1
Convenient of Online Banking	2.02	2
Security of Online Banking	2.48	3

Source: Field Survey (2012)

However, additional analysis was conducted using non- parametric test, for the purpose of this analysis is to investigate the customers concern and to find out the most preferable behavior that really impact on customer service delivery. Malaysian customers ranked cost as the major concern for the customers in online banking. Then, followed by the level of conveniences and the last one of interest to the Malaysian customer is security. The Friedman Test is significant ($\chi 2 = 15.694$, $p < 0.01$).

DISCUSSION OF RESULTS

The primary objective of the research is to examine the behavior factors, such as cost, convenience and security on how they influence online banking in Malaysia toward effective customer service delivery. The study also examines the context of online banking toward effective customer service delivery in the banking industry.

The research has proven that, the context of online banking has no direct bearing in influencing customer service delivery, rather the behavioral factors (cost, convenience and security). This means that customers do value and satisfied with online banking ones the bank charges is low or affordable, the service is convenient or user friendly and their financial transaction is secured. On the same vein, in the long run customers may prepare for normal queuing branch banking ones they perceive the online banking is solely based on normal services rather than on putting into consideration of the behavioral factors (cost, convenience and security). This finding has also supported the findings of Musiime (2010) and Hazlina et al (2011).

The research also shows that, cost of online banking has a more significant impact than convenience and security of online banking toward effective customer service delivery. In addition, the cost of online banking is also a direct mediator between online banking and effective customer service delivery in the banking industry. This means that behavioral factors or external factors, such as cost, convenience and security have a direct impact on effective customer service delivery vie online banking. These findings buttress the finding of Suganthi (2010) and Malarvizhi (2011).

Thus, these findings have become paramount for strategic decision for the management of Malaysian banking industry to understand that, although customers do value online banking but they consider the "cost" as the most priority, followed by the convenience of online banking, then the security aspect of online banking as a gauge on intention to fully utilize online banking. This means that, banks need to develop online banking and other related product and services that are cost affordable across all customers.

However, based on the 5 Likert-scale, the mean value of 3.76 is at the high site. This indicated that majority of the customer do patronise and handle a lot of online banking transaction, which means there is the need for banks to come up with varieties of online banking product at lower cost/charges that may attract more customer, because the higher the turnover of every transaction the higher the profit of the bank, and this can only be possible if there are availabilities of product at a lower cost/charges that will attract huge amount of customers.

Thus, this research is significant in such a way that it has the potentials evidences of using the Kano's Model for effective customer service delivery in the banking industry or other similar service industry.

IMPLICATIONS FOR PRACTICE

- Due to the extensive level of globalization and competition, there is the need for banks to grab this opportunity of online banking, so that to establish wider customer base irrespective of geographical location.
- There is the need for banks to advertise and promote the level of low cost/charges as a marketing strategy to attract more customers to patronize online banking. And this promotion can be through Jingles, Road shows, TV, Radio, Internet etc.
- Moreover, it is hoped that online banking will continue to grow and play a big role in supporting the economy of Malaysia, once there is a support from the Malaysian government by coming up with stiffer sanction that would guide against online banking and other related frauds.

LIMITATION AND SUGGESTION FOR FUTURE RESEARCH

- Time constraint has resulted in getting small sample size.
- The scope of the research is only within Johor State, as such this might not be truly representative of the entire population towards effective customer service delivery via online banking.
- As most of the respondents have not used online banking for quite a long time, this may also not be a true representative of the entire population.
- The key behavioral factors are adopted from the previous research, this mean that it's possible that some vital determinant of effective customer service delivery are left behind in this research.
- This research has provided a road map for effective customer service delivery via online banking, this mean that there is the need to arouse future research on other similar related electronic banking product such as mobile banking, ATM and point of sale's terminal at a different geographical location so that to understand the reaction

of the same behavioral factors (cost, convenience and security). Thus, there is the need to intensify research on electronic banking services.

CONCLUSION

This is a research paper in progress which provides an overview of the impact of online banking services on customer service delivery in the Malaysian banking industry: using the Kano's model. The paper addresses a number of issues identified from the literature. An extensive review of the existing literatures on the impact of online banking services on customer service delivery in the banking industry were discussed.

The paper, therefore, addresses issues related to electronic banking services and behavioral factors as well as customer service delivery. It is clear that advertising alone cannot convince the non-users of Online banking to start using the services. Thus, the finding is encouraging in such a way that it provides some theoretical framework and practical insight to identify the factors and beliefs that influences customer service delivery in the Malaysian banking industry.

ABSTRACT

Purpose: *The goal of this research is to investigate the innovation between buyer and supplier's collaboration in order to create the values. The first one is the research identify that innovation elements between buyer and supplier' collaboration on cost down on the switching costs, new product performance, and create a new market.*
Design/methodology/approach: *This study is focus on the literature review which approaches on the generation the innovation from buyer and supplier's collaboration within value. Nevertheless, the switching casts focus on the transaction cost which builds up the buyer and supplier's relationship. The new product performance generate from the collaboration of buyer and supplier. Furthermore, the employment of buyer and supplier's collaboration to create a new market together. From above, those of outcomes come from buyer and supplier's collaboration on the innovation. It without doubt, after the buyer and supplier's collaboration's value readily lie in their innovation base on the advantage.*
Findings: *From this research, we discuss the value on the innovation that to find out the factors from buyer and supplier's collaboration. There are two points of this study: one is to find out what is the really value from buyer and suppliers' collaboration, the other one is to explore how to innovation from the buyer and supplier's collaboration.*
Originality/Value: *We expect to find further value and the way of innovation work together from buyer and supplier's collaboration.*

Keywords: Innovation, buyer and supplier's collaboration, value

INTRODUCTION

Taiwanese business firms famous on the high technology supply chain management. Yet, they were doing the ODM (Own Designing and Manufacturing) and OEM (Original Equipment Manufacturing) before. This mean they do not have own innovate products and services. Recently, they are prefer to have own brand by themselves. That is pushing they must have to create the new products. That is why this research to do the innovation from the supply chain channels. If they have a very good relationship to does the collaboration from supply chain channels? Recently, business firms focus on the innovation and collaboration with their suppliers. That is why we are going to do the topic for buyer and suppliers' collaboration for innovation.

This research structure is to identify those innovation elements between buyer and supplier' collaboration on cost down on the switching costs, new product performance, and create a new market. The first one, this study is focus on the literature review which approaches on the generation the innovation from buyer and supplier's collaboration within value. Nevertheless, the switching casts focus on the transaction cost which builds up the buyer and supplier's relationship. The new product performance generate from the collaboration of buyer and supplier. Furthermore, the employment of buyer and supplier's collaboration to create a new market together. From above, those of outcomes come from buyer and supplier's collaboration on the innovation. It without doubt, after the buyer and supplier's collaboration's value readily lie in their innovation base on the advantage.

Findings parts: From this research, we discuss the value on the innovation that to find out the factors from buyer and supplier's collaboration in the next step but not from this papers. The reason is the interview companies and their collaborate partners still are looking. However, there are two points of this study: one is to find out what is the really value from buyer and suppliers' collaboration, the other one is to explore how to innovation from the buyer and supplier's collaboration.

The innovation is difficult on the attitude of fail from business firms. If they do the innovation is not successful after they invest the resource. That is many parts can to discovery for this research.

BUYER AND SUPPLIERS' COLLABORATION ON UNNOVATION

The innovation comes from consumers attracted by the newfangled products. How can the firms to recognize the consumers' desires? Business firms can work with their suppliers on this issue. Those follows literature review is going to discuss it:

Sivakumar *et al*., (2011) said that global innovation generation focus on the alliance from any types which to examine the performance. This can explain the innovation need the business firm collaboration together, as like suppliers, buyers and wholesalers. They can collaborate on the materials innovation from suppliers. The suppliers suggest what kind of materials can use for the products in order to add the profits. Another proposes is about the style of new products, suppliers are able to design it, how to manufacture and know the advantage for the factories. This about the processes of manufactured goods on innovation. The other collaboration approach is the buyer look for the collaborate suppliers is not only provide the lone material. The buyer anticipates their suppliers can do integrate materials or semi-finished goods to support them. That can see the larger to larger industrial model to emerge based on their large suppliers from the brand business firms.

Stock *et al*., (2012) suggest the business firms' strategy focus on resources from collaborate culture for innovation. The reason is the firms' collaboration with their business partners can do more things. The collaboration's teams work together on many issues. This is about innovation on which part; it could be the materials' innovation, the products' innovation, and marketing. The firms' suppliers can support it, it will be to discover the new material or design the new products. Furthermore, the business firms' collaboration culture for innovation needs to deeply to practice it. This involves the buyer and suppliers' collaboration's motivation. The buyer and suppliers need to think the negotiation for their collaboration. The other thing is how to integrate their suppliers to do the collaboration. However, the collaboration is able to get more advantage for buyer and suppliers, such as to create the new products and marketing.

Stanko *et al*., (2013) referred three demand-side features which on the switching costs, customer preference stability and network externalities. They found from experiential research the new product development on the innovation regard as the three elements to prove it. The switching cost is effects on the early applicant are better to generate the innovation. When customers trust the business firms from innovate products in order to steadiness and link the networks. This observes from the demand side but have the benefits from supply sides.

Mishra and Slotegraaf (2013) pointed that even scholars reflect why business firms to rely on the poor performance and cannot to do the innovation to increase their competitive advantage. Nevertheless, firms have to identify the value from advantage.

On the other hand, the business firms fear the innovation is not successful so that they don't want to do the innovation sometimes. They consider they spend a lot of resources and then to do the innovation. This is not only the suppliers but also buyer do the collaboration for the innovation. It is without doubt when the firms would like to do the innovation and collaborate firms need to work together. Their research and development employee, purchasers, marketing have to work about it. How do the marketing reflection? How to manufacture the products from new materials? In addition to this, they invest the innovation issues and desire to make out the good result. Yet, it is huge stressful for the innovation team, especially they do not know whether or not successful. That is why Stanko *et al.,* (2013) referred that business firms can get the innovation from a competitive advantage and dissimilar kind of acquirements from the result of innovation. Therefore, business firm must to have the ability to do the innovation in order to get the position advantage. It can be seen, the buyer and supplier collaboration on the innovation is very significant.

COLLABORATION

The buyer and supplier also can works on the innovation; as like Soosay (2008) defined that *"Collaboration in supply chains is important for innovation as partners realize the various benefits for innovation such as high quality, lower costs , more timely delivery, efficient operations and effective coordination of activities".* This can say collaboration increase the supply chain partners do more effective operations on the innovation in order to increase the supply chain management efficient. That is can see from Soosay (2008) referred "*Management was conscious of the need to determine and priorities efforts to save costs and satisfy customers and at the same time collaborate for efficient allocation of resources throughout the supply chain".*It can see the collaboration though the supply chain management is very important and also can create the innovation issues from it.

In addition to this, Perks and Moxey (2011) said *"Product innovation requires the division and sharing of tasks and resources".* When the firms do the innovation for the products and can share their resource for supply chain members. On the other hand their referred that *"This approach leads to high innovativeness of the lead firm, but the network as a whole is not utilized for innovation activities. We find that network partners are unlikely to go beyond what is necessary to carry out specified tasks."* The innovation may not to be a network

because of it is confidential issues within supply chain. Furtherer, Fang *et al*., (2011) explains "*Relationship learning is a special type of interorganizational learning. Interorganizational learning may be based on either collaborative relationship or arm's length relationship".* It will be a special relationship as like they pointed out *"That is, organizations need to excel in both types of innovation instead of focusing on only one at the expense of the other. Therefore, exploring the factors that enable firms to engage simultaneously in both types of innovation is a critical issue"*. Nevertheless, the collaboration is very important within supply chain management.

It is without doubt, Corsaro *et al.*, (2012) said *"Innovation is acknowledged by practitioners, policy makers and academics as a vital element for most companies and nations' competiveness and growth".* The innovation is not only focus on the supply chain channel but also cross the nations. It can to be cross the nations to do the innovation together from supply chain partners.

METHODOLOGY INTENDED FOR CASE STUDY RESEARCH

This research is going to do the case studies survey. The case study referred from Cassell and Symon (1995) comment that *"Case study research consists of detailed investigation, often with data collected over a period of time, of one or more organizations, or groups within organizations, with a view to providing an analysis of the context and processes involved in the phenomenon under study* ". This phenomenon related to the research question in order to find out the research answers. The collected data in case studies depends on the members of the organizations. The case studies include one or two more business to do the survey and then interview and observe their supply chain partners who have some relationship or do the innovation with their bossiness firms. By the way, the interview case studies need to be different business firm and then can do more survey from dissimilar point views. During a period of time, a survey is conducted within the organizations, or the prior data and history are collected in order to analyze the organizations' context and processes.

On the other hand, the case studies can employ to do the quantity and qualitative research method. Yet, this study is going to do the qualitative research. Carson *et al.,* (2001) pointed out the qualitative research methods: in-depth interviewing and convergent interviewing; case-based studies; focus group interviews; ethnographic studies; grounded theory; action research and learning. They referred that case studies usually focus on research problems relating to '*how and why*?' It is more significant to find implications rather than conclusions. The reason for this is that case study research is based on "*how and why*". In addition to this,

they also point that "*Qualitative research is suitable where the research emphasis is on in-depth understanding of how, why and in what context certain phenomena occur; and what impacts upon or influences such phenomena*" (Carson *et al.*, 2001, p.66). It argues about the related compounds, social science and what the research wants to know. Consequently, case study research is descriptive research that integrates and gives details from inside to outside the situation of the cases. The description of the answers to the research questions how and why are not only in a straight line from one to another, but include many phenomenon factors in orders to answer the research questions. It is also linked to many factors that are the findings in case study research.

Yin (2003, p.1) said that *"The case study is but one of several ways of doing social science research. Other ways include experiments, survey, histories, and the analysis of archival information. Each strategy has peculiar advantages and disadvantages, depending on three conditions: (a) the type of research question, (b) the control an investigator has over actual behavioral events, and (c) the focus on contemporary as opposed to historical phenomena".* That is why he said that case study research strategy contributes to the information about individuals and groups, and organizational, social, political, and related phenomena. The case study is focused on relations and processes. As Denscombe (1998) said, it is within a social environment to develop what is the one thing related to the other necessary features and how the other is a variety of things linked. It is not only the internal organizational features but can also be discovered from the external organization in terms of its social behavior.

The strength of case studies is that they can deal with a full variety of evidence from documents, facts, interviews, and observations in a historical study. In addition to this, the case studies collect primary data and focus on the particular organizations in a deeper interview within the context of this research method.

This research is going to finding the buyer and supplier collaboration with innovation, the first need to understand the motivation for buyer and supplier work together and how do they desire to innovation the products or service in order to create the new markets. The second one is to discover how to collaborate with their supply chain partners and what the way to collaborate together in order to find out the model for buyer and suppliers' collaboration from supply chain channels. The final issues to combine the innovation and collaboration elements and then to detection the result for buyer and supplier collaboration from innovation issues in order to fit the research questions and have a findings for practice and academic to review the innovation topic.

LIMITATIONS OF THE STUDY

This research limitation divides to two parts as follow:

The first one is the lack of agreement on theory and fieldwork generalizations from the findings. The reason is Taiwanese business firms famous on the high technology supply chain management. Yet, they were doing the ODM (Own Designing and Manufacturing) and OEM (Original Equipment Manufacturing) before. This mean they do not have own innovate products and services. Recently, they are prefer to have own brand by themselves. That is pushing they must have to create the new products. That is why this research to do the innovation from the supply chain channels. If they have a very good relationship to does the collaboration from supply chain channels? Conversely, the location of geography is limited. The fieldwork has a specific context so that it may not be suitable to generalize the findings to the field of buyer and supplier collaboration for other parts of the world. The presentation of these findings is expected to be of benefit to business firms who wish to increase their buyer and suppliers collaboration for innovation.

Therefore the findings lack more detailed discussion of operations between buyer and suppliers collaboration operations and process. The main limitations of this study are due to the interview time available, making it difficult for the researcher to observe the buyer and suppliers' collaboration for innovation. The other reason is that buyer and suppliers' business firms' work with the innovation topic confidential and the supply chain partners wished to remain anonymous. This meant having some limitations on the data and references presented in the findings sections.

TQM AND FAMILY OWNED BUSINESS: PERFORMANCE AND SUSTAINABILITY

Boon In Tan, Universiti Tunku Abdul Rahman, Malaysia.

Kee Luen Wong, Universiti Tunku Abdul Rahman, Malaysia.

Chee Keong Choong, Universiti Tunku Abdul Rahman, Malaysia.

ABSTRACT

TQM or total quality management is a continuous practicing philosophy that could trace its origin from Feigenbaum in 1951 (Martinez-Lorente et al., 1998) where he defines Total Quality Control (TQC). Whereas Miller et al (2007), summarised the definition of family owned business to be as simple and straight forward as, "one in which multiple members of the same family are involved as major owners or managers, either contemporaneously or over time."). According to Zhang (2000), organizational performance consists of four important dimensions, namely employee satisfaction, customer satisfaction, product quality and strategic business performance. On the other hand, performance could be measured in terms or shareholder returns, growth rate (both profit and revenue), market value of a firm and return on equity etc. It is not easy to single out the growth factor in each enterprise and its driver to assess its performance. In this paper, we assume the firm's performance also implies the growth performance. A better performance of family owned business would be significant as it is widely acknowledged that one of the main objectives of the family owned business is to past down the wealth and business from generation to generation, thus the sustainability objective is of the main agenda for business continuity.

Keywords: Family owned business, TQM, organization performance, sustainability.

.

INTRODUCTION

The search for factors that drive business organizational performance has been one of the key areas where many scholars as well as practitioners have a keen interest and attempts to identify the answer. In the process many answers have been found but many questions just as well have been raised. The truth answers could be as elusive chasing the shadow such as the presence of mediating (for example right strategy and practices) and moderating factors (for example life cycle of organization), or as obvious as everything under the sun such as effective strategy and good management practices. The actual answers are probably lying in the middle.

TQM

TQM, is widely accepted as a continuous practicing philosophy for the improvement of organization. There were many suggestions to which where the origin of TQM or total quality management came from? Martinez-Lorente *et al*. (1998) believe that we could trace TQM's origin from Feigenbaum in 1951 where he defines Total Quality Control (TQC) as:

> "*An effective system for integrating the quality development, quality maintenance and quality improvement efforts of the various groups in an organization so as to enable production and service at the most economical levels which allow for full customer satisfaction*".

In searching for defining the constructs, drivers or dimension to define and the suitable approach toward TQM, many scholars such as by Mehra et al. (2001), Brah *et al*. (2000); and Prajogo and Sohal (2003) have listed out elements such as management structure, (Mehra et al, 2001) quality tools, supplier support, customer orientation and environmental focus; (Brah et al, 2000) top management support, customer focus, employee involvement, employee training, employee empowerment, supplier quality management, process improvement, service design, quality improvement rewards, benchmarking, cleanliness and organization; and (Prajogo and Sohal , 2003) leadership, customer focus, strategic planning, information sharing, process management and human resource focus. In this regards, framework adopted from MBNQA (Malcolm Baldrige National Quality Award), with six TQM constructs for our study (i.e. leadership, strategic planning, customer focus, human resource management, process management and information and analysis) they have been identified as key elements in TQM adoption in both manufacturing and service organizations (e.g. Powell, 1995; Hoang et al., 2006) and at the same time represent the hard and soft principles of TQM discovered in the literature review (e.g. Dale, 1999; Prajogo and Sohal, 2003).

FAMILY OWNED BUSINESS

The importance and influence of family owned business in the trade and economy has gained attention from various segment of the society. For example, according to the statistics from the Family Enterprise Centre, University of Pittsburgh, it is believed, family owned business make up 50% of the GDP (Gross Domestic Product) in the USA and 60% of the country's employment. (Damast, BusinessWeek 2007). And among the emerging economies, Malaysia as an example, 70% of the public listed in Malaysia is family owned. (Amran and Ahmad, 2010). Furthermore, Ibrahim and Samad (2010) stated that the list of the 40 richest Malaysians in 2008 is mainly from the family based business entity; of which, 27 are family based and account for 67.5% of the top 40.

The contribution towards the society from family owned business also received recognition from the academic circle. For examples, some renowned universities have set up research centres which focus on this area. For example Wharton School with their Wharton Entrepreneurship and Family Business Research Centre, IMD with its IMD Family Business Centre and Australian Centre for Family Business, Bond University just to name a few examples.

Chrisman et al (2005) describe that the definition of family business can be anchored from four corners, (1) family's influence over strategic direction of a firm; (2) the intention of the family to keep control; (3) family firm behavior; and (4) unique inseparable, synergistic resources and capabilities arising from family involvement and interaction. On the other hand, Chua et al (1999) defines family business as " a business governed and managed by with the intention to shape and pursue the vision of the business held by a dominant coalition controlled by members of the same family or small number of families in a manner that is potentially sustainable across generation of the family or families." Chua et al (1999) believe

that the definition should take into account of the behavioral and intention aspect of the business, which is viewed to be different from non-family firms. Similarly, based on extensive literature review, Pramodita (1999) proposed that, family business is a business governed and/or managed with the intention to shape and pursue the vision of the business held by a dominant coalition controlled by members of the same family or a small number of families in a manner that is potentially sustainable across generations of the family or families. By these definitions, if the intention is clearly to make the said business sustainable across generations, even the businesses that are not owned but managed by a family with the intention of sustainability across generations, fits into this definition. On the other hand, family that owned and managed a business but without the intention of sustainability across generations are being excluded.

Family Owned Business Performance and Sustainability

There were many research being carried out to assess the performance of a business organisation. Performance could be measured in terms or shareholder returns, growth rate (both profit and revenue), market value of a firm and return on equity etc. In the family owned respect, based on Chrisman et al (2005), it is the intention of the family owner to past down the business to the next generation. And with this, we infer that the sustainability is one motivation factor for the owner to manage the family owned business well for future succession. For the business to be sustainable and complete with succession, the family owned business has to perform well within the competitive market environment (Statfford et. al 1999, Bocatto, Gispert & Rialp 2010).

There were many arguments over the performance of family owned business especially in terms of comparison with non-family owned firms (Gallo, Tapies and Cappuyns, 2000; Anderson and Reeb, 2003; and Miller et al (2007)). The contradictory results are often due to the sample size, sample definition (mainly due to the definition of what constitute family business), stage of organisation life cycle and size, and share of ownership. More often than not, most research find it difficult to really eliminate the external factors such as industry factor, politics and economics or stock market performance to specifically single out the performance or non-performance was solely due to the family factor (Dyer Jr. 2006). On the other hand, Villalonga and Amit (2004) concluded family firms only create value (performance) when the founder holds the main position such as the CEO or Chairman of the company with hired a CEO. They also specifically pointed out the descendant managed family firms have a tendency to destroy value, thus raised the concern of meaningful succession issues when the firms could not last longer than intended. Meanwhile, in a recent report from Ernst and Young (2012), two third of the respondent in a major worldwide survey on family owned business intends to keep the business across the generations. In the same report, one respondent who owns a major construction company in UK opined that sustainability is about succession (continuity) “Sustainability is a complex term with several different aspects. For a start, it is about succession, which is an almost which is an almost a continuous process for a family firm.”

The Sustainable Family Business Theoretical Model

Stafford et. al 1999 proposed a sustainable model that takes into consideration of business success and functionality. The model is summarised below:

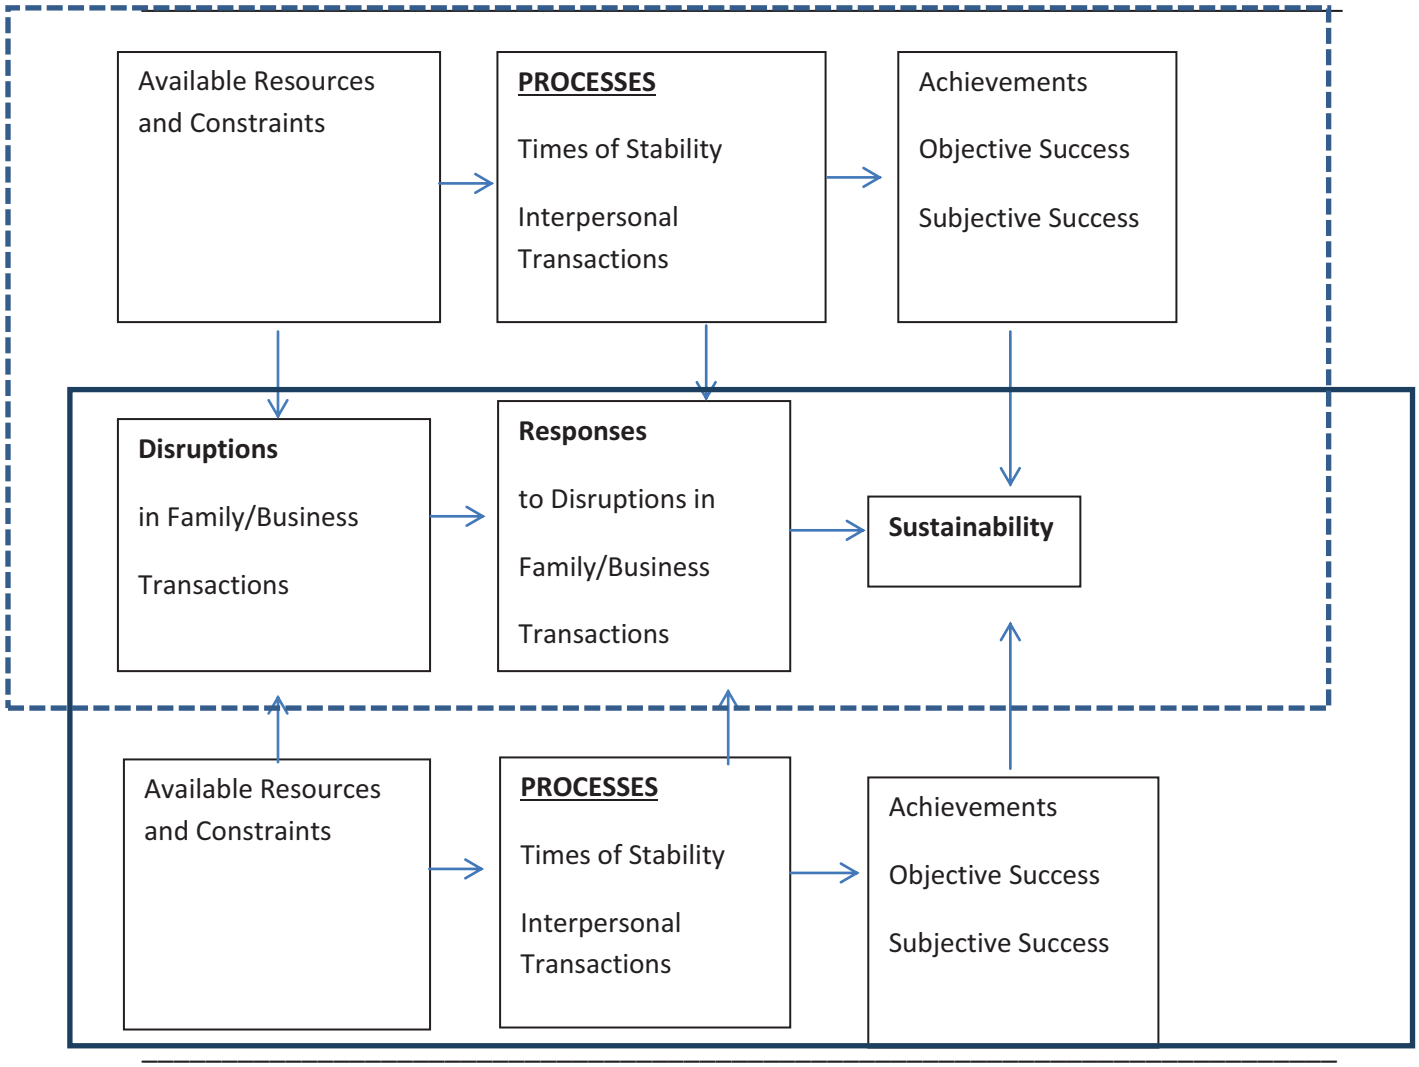

Figure 1: Sustainable Family Business Theoretical Diagram Family

The SFBRM (Stafford Family Business Research Model) theory suggests that it is important to take note of the interaction between personal transactions and resources from the business itself or from the family may facilitate or inhibit family sustainability, especially in the event responses to the disruptions internally (managerial business) and externally (environment). The better the family's reaction through the interpersonal process manage the changes and constraints, the better with the sustainability outcome. It is a model that place importance of the family function as well as business factor in terms of sustainability of the business.

TQM and Family Owned Business Performance

Separately, Tan (2013) has proposed a model showing the relationship between TQM constructs and organizational performance. In the similar context, the organizational context includes family owned business organization.

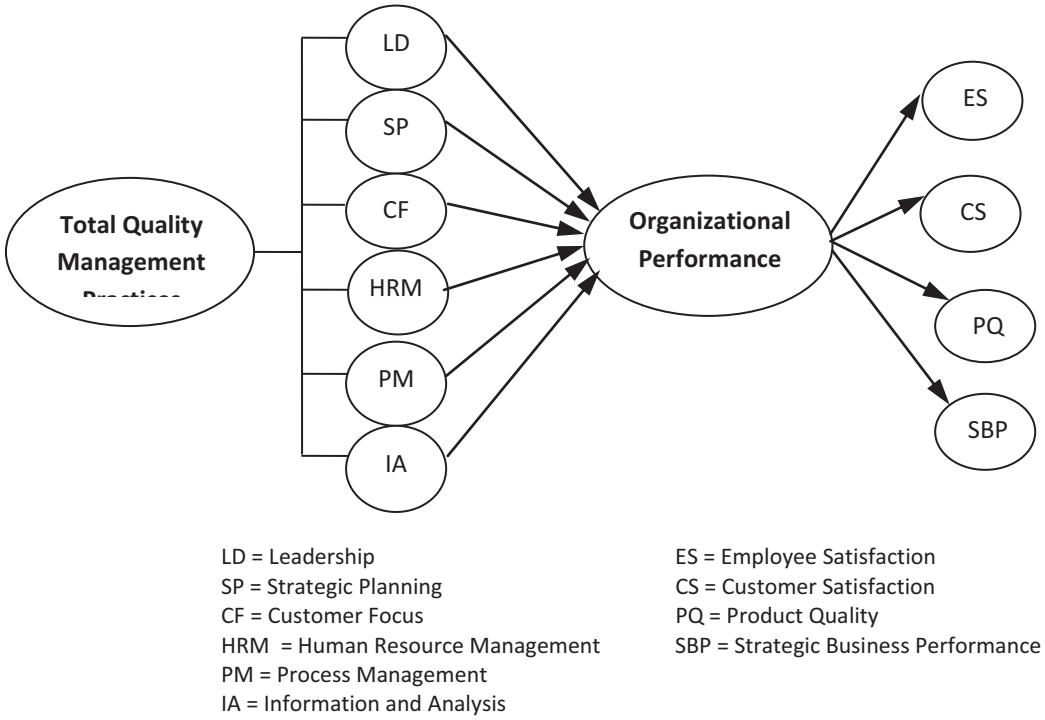

Figure 2: Structural Model of TQM Practices and Organizational Performance

In this proposed framework, it is suggested that the identified six constructs namely leadership, strategic planning, customer focus, human resource management, process management and information analysis have an impact on organisational performance which will be reflected or measured through employee satisfaction, customer satisfaction and product quality and strategic business performance. In an earlier study, Ellington, Jones and Deane (1996) have concluded in their study that family owned firms with the highest performance are also found to be adopting TQM more holistically. In a case study on a big family owned supermarket chain in Spain, Miguel (2012) has also concluded TQM approach has helped the firm to achieve spectacular results with profitable growth as well as able to face challenging situation of economic crisis (from 2008 to 2011).

TQM, PERFORMANCE AND SUSTAINABILITY

From the discussion and literature above, we propose that the following framework for family owned business sustainability with the TQM adoption;

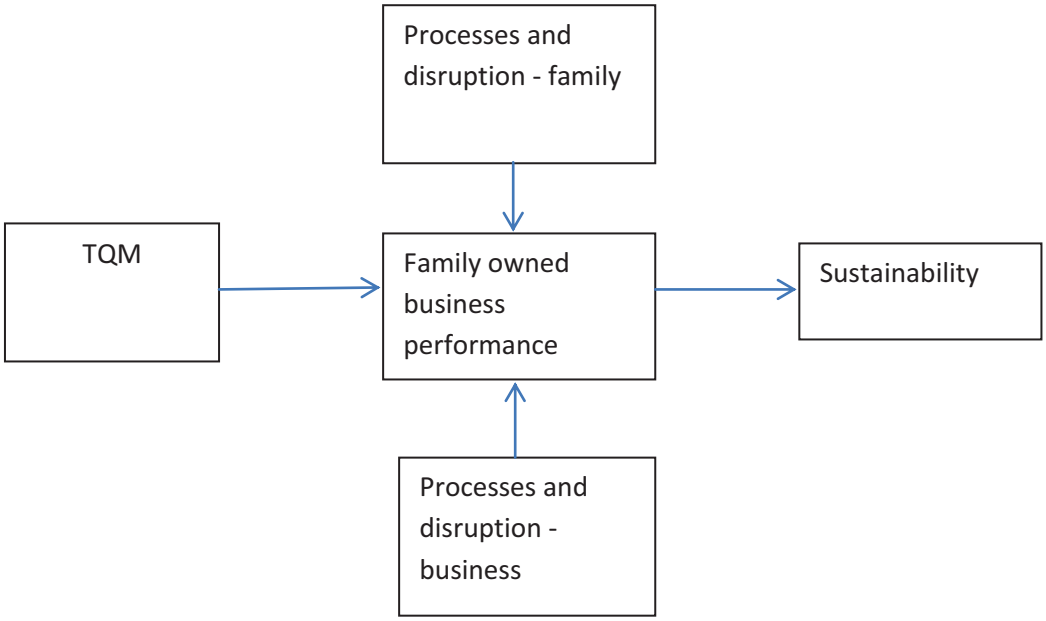

Figure 3: TQM, Family Owned Business Performance and Sustainability

As the family owned business is an entity cannot do without the influence of family element and interact with the resources and constraints in business, the injection of TQM practices to enhance the family owned business performance would provide further avenue for improving the family owned business performance and thus its sustainability. From various research TQM practices are believed to improve the organizational performance

CONCLUSION

One key differentiation of family owned business from the non-family owned business is the uniqueness of succession plan and its sustainability. This paper proposed a framework and TQM as a management tool to further enhance family owned business performance taking into consideration the interaction of family resources and constraints as well as the business resources and constraints to achieve such unique objective (succession and sustainability through better organizational performance). The proposal from this paper is nevertheless needs to be further researched through proving from empirical research and model validation.

ABSTRACT

Purpose: *Customers are typically considered the most important external stakeholders for companies. This study explores how customers are defined by product management and development managers in market-driven development. In addition, customer representation during development is studied.*
Design/methodology/approach: *The literature review of the study focuses on customer definition and involvement in product development context, while the empirical part explores industry practices at managerial level through case projects in selected organisations.*
Findings: *Company management and strategy outline customer definition. Product management collaborates with various stakeholders including marketing, sales, management, direct customers, and end-users in customer definition. Product management was found to be the most important customer representative for product development. However, other information sources are also utilised.*
Research limitations/implications: *The case projects may not be able to offer a generalised picture of the topic. Future work should extend the study to cover more industry sectors and companies at various tiers and regions.*
Practical implications: *Company management and strategy must provide proper guidance for customer definition, and management must ensure that product management teams are appropriately resourced and competent. Systematic way of working and good collaboration among product management, product development, and other internal stakeholders is needed. While focus on selected customers is important, other customers in the value chain must also be considered. Product management and development professionals should also have some direct contact with external customers to ensure proper customer understanding and to tackle problems related to conflicting internal stakeholder views.*
Originality/value: *Past literature emphasises customer orientation, however, it has not adequately addressed how customers are defined and who represents the customers in*

market-driven context. The study findings offer a good reference for companies to improve product development focus.

Keywords - Product development, new product development (NPD), product management, customer, market-driven

INTRODUCTION

Customers are typically considered the most important external stakeholders in product development. Understanding market and customer needs is claimed to be a prerequisite for product success (Cooper, 2011). Customer orientation can be considered part of market orientation strategy together with competitor orientation and inter-functional coordination, and approaches to understand customer needs are proposed in generic product development models (Cooper, 2011; Narver and Slater, 1990; Ulrich and Eppinger, 2000). However, many companies operate in global markets with increasingly complex products and diverse market needs, which demands special attention to methods for fulfilling market and customer requirements.

Product management (PM) aims for customer satisfaction and long-term value for the company via continuous optimisation and renewal of product portfolio. PM consist of various elements, such as product and customer analysis including identification of both stated and unstated customer needs, understanding competitor offerings, roadmapping, strategic management and vision. More operational elements of PM include, for example, product lifecycle management, internal and external collaboration, release planning, and requirements elicitation, prioritisation and management (Lehmann and Winer, 2002; Maglyas *et al.,* 2012).

The objective of requirements engineering (RE) in software development is to ensure a product which satisfies customer and user needs (Kauppinen *et al.,* 2004). Requirements typically come from customers, other stakeholders, and technology related factors. They often change during the project making the nature of RE process iterative (Mottonen, 2009). RE activities cover elicitation, analysis, validation, negotiation, documentation, and management, where elicitation focuses on identifying information sources and requirement discovery (Sommerville, 2005).

In market-driven context products are typically offered to a large number of customers instead of a specific one who decides the functionality. Special needs of market-driven product development (MDPD) include balancing different requirements types, market-pull and technology-push trade-off, and release planning and requirements selection (Fogelstrom *et al.,* 2010). Large number of requirements flow continuously from various internal and external sources, for example, marketing, sales, customer care, users, and customer studies (Gorschek *et al.,* 2012; Kotler and Keller, 2009).

Despite many studies on market and customer orientation (Alam, 2005; Cooper, 2011; Griffin, 2005; Narver and Slater, 1990), past literature has not adequately addressed how customers are defined and represented in market-driven product development. This study explores how product management and development managers define customers in market-

driven development. In addition, customer representation during development is studied. Accordingly, this paper addresses the following research questions:

1. How customers are defined in literature and by product management and development managers in market-driven product development?
2. Who are the customer representatives in development?

This paper addresses the research questions both through literature and empirical study. The literature part focuses on customer definition, role, and involvement in product development. Literature synthesis is presented as a conceptual framework. The empirical study covers industry practices at managerial level through case projects in selected organisations. After the analysis, conclusions are made.

LITERATURE

1. Customers

Customers, also known as clients, purchasers, and buyers, are organisations or parts of it, either a business-to-business (B2B) customers or an end-user consumers, that may benefit from the offering a company provides (Christ, 2009; Peppers and Rogers, 2011). Customers can be current or potential, and all others with problems and needs who seek either product or service solutions (Griffin, 2005). From a manufacturer's point of view, customers include distributors, retailers, and persons who buy products from the retailers (Caplan, 2001).

The customer relationship can be direct or indirect, and the customer may be a paying or non-paying one. Customers may also participate in value creation (Prahalad and Ramaswamy, 2004). Besides external customers, internal customers affect product quality, and should be involved in development early enough (Cooper, 2011; Lukas and Maignan, 1996). Internal customers are important especially for companies operating in international markets, due to limited contact with external customers (Conduit and Mavondo, 2001).

Customers are important source for product development projects, and their input is critical to ensure product success (Alam, 2005; Cohen *et al.,* 2002; Griffin, 2005; Cooper, 2011). Customer input can reduce uncertainty and enable developing foresight to meet customers' future needs better (Un and Cuervo-Cazurra, 2009). Bidirectional communications and joint problem solving with customers enables understanding needs that are difficult to express and developing successful products (Bonner, 2010). However, companies operating in market-driven environment must find the right balance between market-pull and technology-push (Isoherranen and Kess, 2011; Rothwell, 1992). Furthermore, too close relationships with customers may restrict a company to respond to market changes (Sull, 1999).

In addition to immediate customers, expanded customer base and context where the product is used should be considered, as the whole supply chain adoption is a pre-requisite for new product success (Berggren and Nacher, 2001; Jones and Ritz, 1991). Describing expanded customer base and analysing the whole value chain provides understanding beyond direct customer, and may lead to value innovation (Donaldson *et al.,* 2006; Goodrich and Aiman-Smith, 2007; Kim and Mauborgne, 1997). Product end-users must be considered in all cases, but other types of customers and stakeholders may also need to be taken into account (Griffin, 2005; Ulrich and Eppinger, 2000). Customer selection matrix with different segments and type of customers, such as lead users close to the company, is proposed for

choosing the customers to focus on (Alam, 2005; Ulrich and Eppinger, 2000, von Hippel, 1986).

Acquiring useful knowledge from customers is challenging (Alam, 2005; Un *et al.,* 2010). The challenges in business-to-business (B2B) market include large number of parties in the relationship, such as initiators, users, influencers, deciders, buyers and gatekeepers (Kotler and Keller, 2009; Peppers and Rogers, 2011). Furthermore, downstream customers are often seen outside company's control and complicate, for instance, product development and marketing (Hillebrand and Biemans, 2011). Business-to-consumer (B2C) market challenges, in turn, include huge number of individual customers and understanding behaviours of different consumer groups (Kotler and Keller, 2009; Peppers and Rogers, 2011).

2. Product development and customer involvement

Product development transforms market opportunities into production, sale, and delivery of completely or partially new products (Krishnan and Ulrich, 2001; Ulrich and Eppinger, 2000). Product development projects can be classified into research and development (R&D) projects, breakthrough projects, platform projects, derivative projects, incremental improvements, and fundamentally new products (Schilling and Hill, 1998; Ulrich and Eppinger, 2000). Small change projects entail interacting with customers to acquire tacit knowledge about their needs and current product deficiencies. NPD to existing markets, in turn, requires translating customers' unmet tacit needs into product features without an existing product. In NPD to new markets, customer interaction typically takes place only when a prototype is available (Un and Cuervo-Cazurra, 2009).

In terms of customer engagement, product development can be categorised into design for, design with, and design by customers. In design for approach products are designed on behalf of customers, which also characterises market-driven product development (Fogelstrom *et al.,* 2010; Kaulio, 1998). Customer studies, such as interviews and focus groups, are typically utilised in this approach. In design with approach customers can additionally give feedback on the proposed design, whereas in design by approach customers actively participate in the design of their own product (Kaulio, 1998). Customers' role is also seen active in customer co-creation and open innovation (Chesbrough, 2003; Prahalad and Ramaswamy, 2004).

3. Conceptual framework

A company can have a number of external direct customers with different importance. Customer needs are affected by both internal and external stakeholders in the customer organisation. Direct customers may also have customers that can be final customers or intermediaries. Figure 1 illustrates customer definition and representation from product management and development perspective.

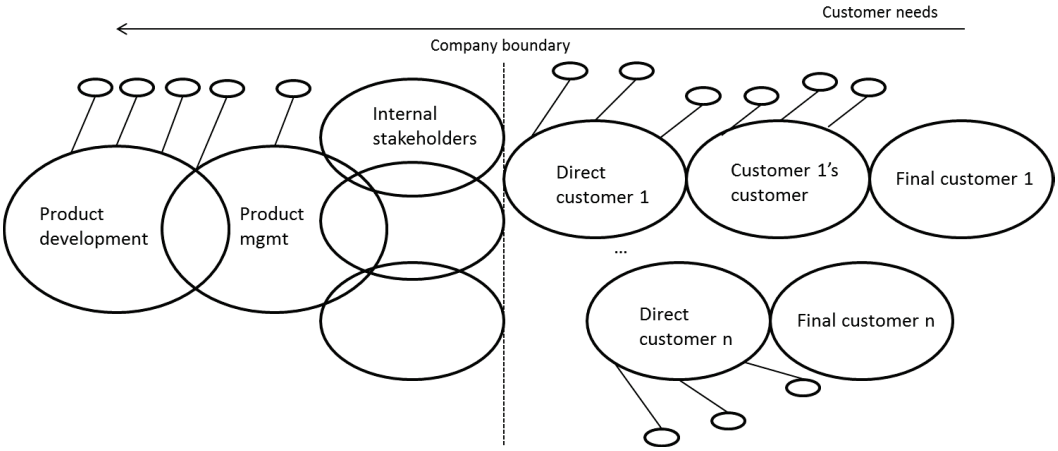

Figure 1. Customer definition and representation from product management and development perspective

Some customers are represented by the company's internal stakeholders, whereas other customers and their needs must be identified by other means. Product management and product development have to take into account many type of customers with different needs. Product management is assumed to have a major role in customer definition and internal collaboration with customer facing functions. In addition, successful requirement engineering is needed to transfer the right requirements, and thus enable creation of products that meet customer needs.

METHOD

The empirical part of the paper is based on two case projects including insights from interviews with mid-level managers. The managers represented both product management and development, and a total of 11 professionals were interviewed (Table 1). The companies were chosen from ICT industry, and one is in B2C and the other in B2B market.

Table 1. List of interviewees in the case projects

Case	Interviewee	Role	Industry experience
A	1	Product management	+10 years
	2	Concept management	+10 years
	3	Product management	+15 years
	4	Software product owner	+10 years
	5	Programme management	+15 years
	6	Project management	+10 years
B	1	Head of product management	+20 years
	2	Product management	+20 years
	3	Product management	+25 years
	4	Technical solution management	+25 years

Case	Interviewee	Role	Industry experience
	5	Platform system design management	+20 years

A semi-structured interview process was used to gain insights of the cases and respondents' thoughts regarding the issues studied. Interview questions are presented in Appendix A. The interviews typically lasted around one hour, and they were recorded and transcribed for analysis. The interview questions were designed to gain each manager's perspective on customer definition and representation in product development. The interviews started with general questions, but included also specific follow-up questions to elaborate on company- and project-specific issues.

The data were analysed using a qualitative approach of reading the interviews several times, each time going deeper into the data to discover connections, patterns, and comparisons. Emerging patterns were structured into more generic categories that helped refine the conceptual framework and define the key concepts. Based on the categorisation of individual cases, a cross-case analysis was performed to find patterns, similarities, and differences between the cases.

EMPIRICAL SURVEYS

1. Case A

Case A is a software project of large ICT company that operates in a global B2C market. The project entailed a software release programme starting from concept development and ending to launch. In addition, the architecture of the software platform used in the final products was renewed. The final products were targeted to specific consumer group, but also wider market, distribution partners, and geographical requirements were taken into account. In contrast to earlier projects in the company, the product definition was started from scratch, and only a core set of features was defined for sales start. In addition, way of working in product development was renewed. This included, for example, specifying testing of new features already in their definition phase, and changing requirement and error database structures to support the new mode of operation. The project can be classified as a market-driven product development project with large number of customers to be served. In terms of size and newness, it was considered a large-scale, radical project. The development model used in the company was based on agile principles.

2. Case B

Case B is hardware and embedded software project of large ICT company that operates in a global B2B market. The project entailed development of new product platform to replace the current solution in the market. The platform is used by the company's business lines, which productise final products to external customers. The final products were focused on selected key customers, but also wider market including different technical and geographical requirements were considered. The product was very complex, and thus the development time was relatively long. The project can be classified as a market-driven product

development project with large number of customers to be served. The project represented a typical platform development project in the company, although it was somewhat larger than usual projects in the organisation. The development model was based on concurrent engineering for hardware components and agile principles for software parts.

3. Project key stakeholders and customer definition

3.1 Case A

In case A, various stakeholders were identified for the project, and interviewees presented many viewpoints for customer definition. Figure 2 illustrates the customer definition in case A.

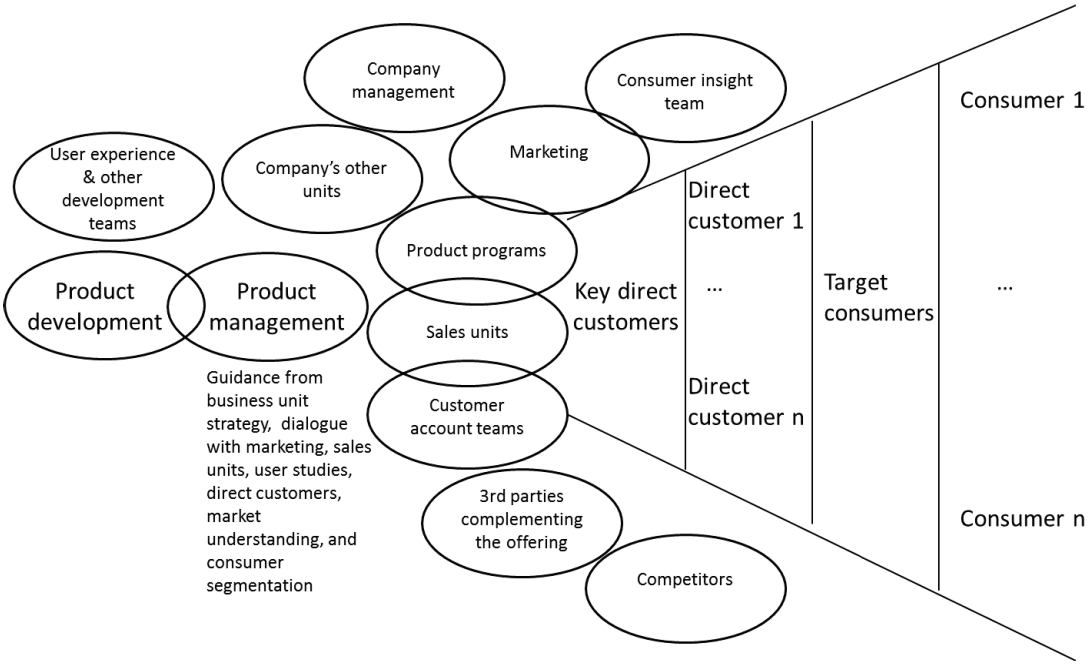

Figure 2. Customer definition from product management and development perspective in case A

Product management representatives saw that key external stakeholders in the project included consumers (product end-users), distribution partners (direct customers), and competitors. In addition, one interviewee pointed out external innovation partners. Regarding internal stakeholders, the research and development (R&D) organisation, sales units, customer account teams, and product programmes using the software were classified as key partners. Marketing and other internal sources for consumer data and competitor information were also seen important. In addition, other company units, such as another business unit and long-term research unit were categorised as key stakeholders.

Representatives from product management highlighted many ways for defining customers. Dialogues with marketing, sales units and regions were considered to be important, and business unit strategy was also seen to provide guidance for customer definition. In addition, the largest direct customers were considered to be important in the customer definition. However, consumers were clearly described to be the most important customer group, and

the definition of consumer customer was assisted by collecting and analysing user databases and studies. Furthermore, company-wide market understanding and consumer segmentation were seen beneficial.

From product development representatives' perspective, key external stakeholders included direct customers, consumers, and 3rd party application developers. Key internal stakeholders, in turn, included product management, product programme using the software, sales units and regions, marketing and the internal organisation dealing with 3rd party application developers. In addition, development teams in different sites, user experience team, and company management were considered as key stakeholders.

Product development representatives saw that customer definition came from product management, marketing, and consumer insight teams. In addition, the management team of the product programme utilising the software, and especially its product manager were considered to be involved in customer definition. Interviewees also mentioned also a "theme person" that illustrated a target consumer, but it was unclear for them who created that theme person.

3.2 Case B

In case B, fewer project stakeholders were identified than in case A, and customer definition was also seen differently. Figure 3 illustrates the customer definition in case B.

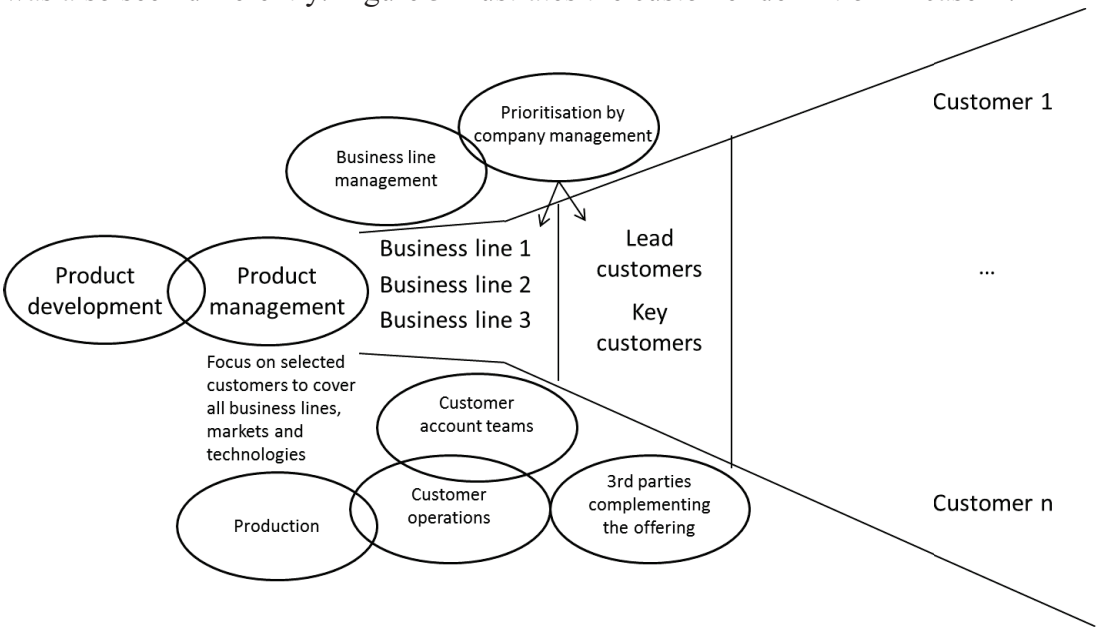

Figure 3. Customer definition from product management and development perspective in case B

For product management representatives, the most important external stakeholders in the project included direct customers and 3rd parties complementing the company's offering. Key internal stakeholders, in turn, were considered to be business lines that funded the development, research and development (R&D) organisation, customer account teams, management, operations taking care of customer installations, and production.

Product management representatives' customer definition included both internal and external customers. The company had three business lines that were considered to be internal customers, and the business lines were prioritised based on sales volumes and growth potential. The company's external customer base consisted of hundreds of direct customers. The company had defined priority markets, and the most important customers were classified as key and lead customers. Customer prioritisation was done by the company management. However, product management representatives saw that there were still too many focus areas, and the priorities were not clear. To ensure sufficient customer understanding, product management had selected 20 customers from the lead customer group for direct connections. In addition to sales volumes, the selection criteria aimed to cover different types of customers, all three business lines, and various geographical and technical aspects.

Product development representatives saw direct customers to be key external stakeholders in the project. Key internal stakeholders, in turn, included product management, business lines, business line management, and portfolio management that facilitated decision making regarding technology choices. Customer prioritisation was acknowledged, but customers' short-term and narrow focuses were considered as challenges from platform development point of view. Regarding internal customers, a lead business line, which might not have the highest business priority but productises the platform first, was also considered important.

4. Customer representation in development

4.1 Case A

In addition to customer definition, the representation of customers was also analysed. Figure 4 illustrates customer representation in case A.

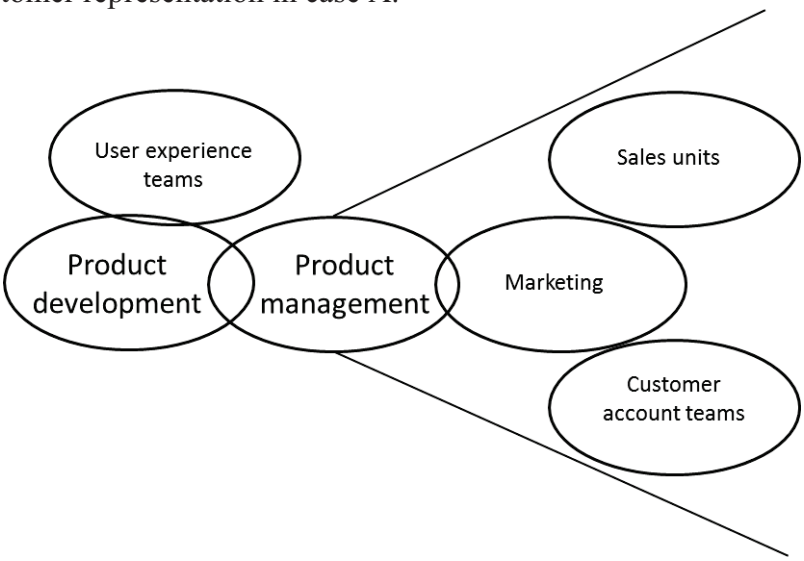

Figure 4. Customer representation from product management and development perspective in case A

Product management representatives saw that product management represents customers for product development. Customer voice to product management, in turn, was seen to come from sales units, customer account teams and other regional contacts, and marketing. In addition, user databases and market surveys were seen as important information sources for

product management to gain necessary knowledge for representing the customers in development.

Product development representatives also considered product management to represent customers, and product management was expected to collaborate with relevant stakeholders to acquire necessary information from the customers. On the other hand, user experience teams were also seen to represent consumer (end-user) view during development, since these teams possessed understanding of detailed product functionalities from usability perspective. In addition, end-user research, analyses, testing, market data, and error databases provided customer related information during development. Finally, in this particular project, requirement database and existing products were checked to identify critical customer features, and these were discussed iteratively with stakeholders close to external customers. Contrary to the previous projects, only a core set of features was defined for sales start.

4.2 Case B

Customer representation was also analysed in case B. Figure 5 illustrates the customer representatives in case B.

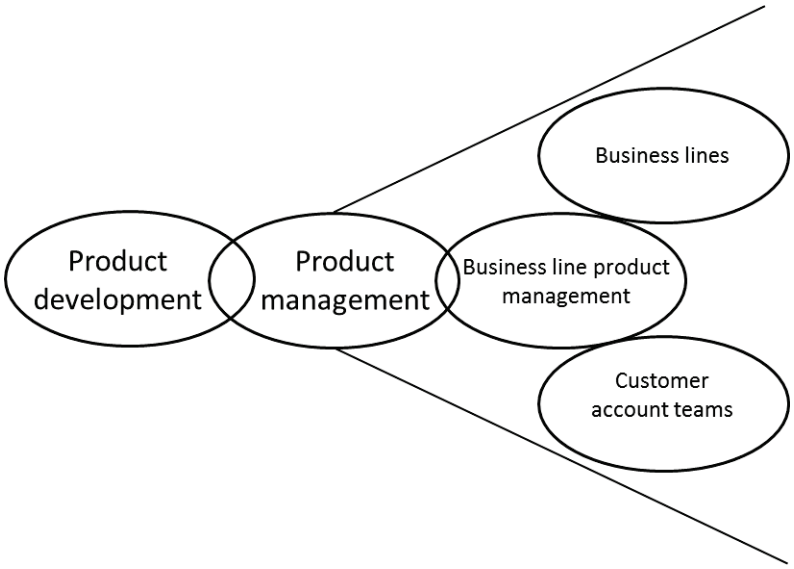

Figure 5. Customer representation from product management and development perspective in case B

As in case A, product management representatives saw that product management represents customers for product development. The customer representatives from product management's perspective consisted of business lines, their product managers, and key customer account teams in contact with direct customers. Tools for customer representation and providing feedback included databases and the relevant contacts in the organisation. In addition to meetings at customers' facilities, key customers also visited the company to discuss special topics directly with product management. Market reports were also used to some extent. Internal customer representation was ensured with business lines' participation in the project organisation. Downstream customers (direct customers' customers) were considered only little, since the direct customers were seen to represent their views anyway.

Product development representatives also confirmed that product management represents customers. This was considered a good arrangement, although it was pointed out that product management has a "challenge to interpret things that customer do not know they want." Discussions, presentations, and excel files were used for communicating customer views, before entering requirements into relevant tools. Regarding internal customer representation, technical management and concept teams with representation from business lines were mentioned.

5. Other findings

5.1 Case A

In case A, product management representatives highlighted the need for technology-push and market-pull balance, since both were considered important. The importance of systematically gathering and using customer related information was also emphasised. User understanding, finalisation of product and features, and differentiation in product implementation were considered important, since similar market data was also available for competitors. In addition, distributing consumer and target group understanding through organisation was considered important. Sufficient face-to-face involvement with end-users was seen lacking currently.

Representatives from product development emphasised that unnecessary handovers between product management and development must be avoided in project definition. Furthermore, testing and verification should be taken into account already in the definition phase. In addition, especially people developing features were considered to benefit from seeing how end-customers use the product. However, this was realised to be too expensive in practice. Individual developers were also recommended to use the products and features they are developing to gain a user perspective.

5.2 Case B

In case B, product management representatives emphasised that customer contacts are extremely important. Talking to key customers also directly was seen as a good practice. Account teams' and customers' views were seen to differ sometimes, since the account teams focus on selling the current products. Furthermore, unclear responsibilities, getting the needed internal commitment and organisation changes were seen as challenges, since internal customers might change during the project. "Gut feeling" in product definition was considered important, since customers were seen to be uncertain on their long-term needs. Involving internal stakeholders early as possible was also recommended, and especially good co-operation between product development and product management was seen critical.

From product development representatives' perspective, understanding customers and deciding how to optimise the product, was considered a challenge. From platform development perspective, better prioritisation in decision making was desired. Time-wise, both external and internal customers' focus was seen different from product development. However, it was pointed out that both current customer issues and long-term needs must be considered.

DISCUSSION

This study indicates that customer definition and representation in market-driven product development is not unambiguous. Product management plays a key role both in customer definition and representation, and must effectively co-operate with many stakeholders to ensure a product that meets customer and market needs while providing business sustainability. Product management must understand the overall picture and has responsibility of the right balance and product priorities, both from customer and business perspective. However, product development cannot transfer the responsibility of customer understanding solely to product management. The right product design involves deciding a large amount of details. In addition, seamless cooperation between product management is required. For example, in case A avoiding handovers between product management and product development in project definition was considered a good practice.

1. Theoretical implications

Literature discusses the importance of customers for product development and presents various definitions of customers (Alam, 2005; Cohen *et al.,* 2002; Cooper, 2011; Griffin, 2005; Peppers and Rogers, 2011). However, customers cannot directly participate in actual development when structural product development processes are used. Furthermore, in market-driven context products are typically offered to a large customer base, which significantly complicates customer definition and representation. The literature review and cases analysed in this study provide new viewpoints on the ways customers are defined and represented by product management and development managers.

The role of product management has been discussed in the literature (e.g. Maglyas *et al.,* 2012). The results of this study indicate that product management plays a key role in customer definition and representation. In addition, co-operations with many internal stakeholders were emphasised in the cases. This is in line with inter-functional coordination (Narver and Slater, 1990) and the role of internal customers (Conduit and Mavondo, 2001), which have been considered important in the context where the case companies operate. The study also illustrates the differences between business-to-consumer and business-to-business markets. In case A, end-users were seen to be more important than direct customers. On the other hand, in case B, downstream customers were considered only little (Hillebrand and Biemans, 2011). Finally, the research is in line with Fogelstrom *et al.* (2010) by supporting the importance of market-pull and technology-push balance.

2. Managerial implications

Creating a successful product requires that target customers are clearly defined. This study indicates that the role of product management is essential in market-driven product development; companies must therefore ensure that product management teams are appropriately resources and competent. Company and business unit strategy should provide proper guidance to ensure that focus and priorities are clear. In addition, product management must collaborate with various stakeholders including marketing, sales, and management in customer definition.

The study results highlighted the importance of internal customers and inter-functional coordination. Managers should target systematic way of working and good co-operation among internal stakeholders to ensure that customer views are taken into account. Forming customer definition should be seen as a dialogue between product management and stakeholders close to the customers. On the other hand, effective co-operation between product management and product development is vitally important too.

Whereas product management is the most important customer representative towards product development, other useful information sources also exist for product development to gain customer understanding for the design decisions. Documentation's role is important, since customer information flows via several stakeholders. Besides internal inputs, product management and development professionals should aim for direct contact with external customers, since proper customer understanding results in better decisions and tackles problems related to conflicting internal views. While focus on selected customers is important, the whole value chain must be considered to create a product that meets market needs.

CONCLUSIONS

The significance of customers as key product developments stakeholders is evident. However, increasingly complex global markets pose challenges for companies to fulfil the market needs. This applies especially when products are offered to a large number of customers instead of a sole one deciding the functionality. The validity of customer information that flows via various stakeholders is also a challenge. This study explores customer definition and representation in market-driven product development.

The results indicate that customer definition in market-driven product development is not unambiguous. Company management and strategy must guide customer definition. Product management plays a key role in defining customers, and companies must therefore ensure that appropriate resources and competences exist within product management teams. Effective co-operation should be targeted among product management and internal stakeholders. Product management was found to be the most important customer representative towards product development. However, product development must also gain customer understanding to ensure the right design decisions. In addition, facing external customers sometimes directly is recommended for both product management and product development professionals.

The limitations of this study include the number of case projects being only two. Recommended future study includes how well the study findings apply to different types of companies and industries. In addition, customer need identification and methods used should be analysed. Finally, prioritisation of unique needs and the relationships between requirements and stakeholders deserve attention.

ACKNOWLEDGEMENTS

The authors express their gratitude to the interviewees in the case companies for their valuable inputs.

APPENDIX

Appendix 1. Interview questions

Background
Tell about your current role and position, and previous experience
What is your company's offering?
- What do you sell, to whom and with whom you co-operate to provide the offering?

What is the role of product development in your company?
- What is your opinion of the right balance between technology-push and market-pull?
- How important is it to consider customer and market needs in development?

About the project
Tell briefly about the case project and your role in it
- Was the development customer-led, collaborative with customer, or market-driven (large number of customers to be considered)?
- Was the project typical full-scale product development project or radical project?
- Was the product development model type waterfall, concurrent, or agile?

About the stakeholders and customers
Who were the external and internal stakeholders in the project?
- Especially, who were the most important stakeholders and customers?
- How do you understand term "customer"?
- Who were the internal customers in your company?

How did you identify the most important customers?
- Who defined the customers?
- Did you use any systematic methods to identify the customers?
- What were the good practices and key challenges?

Who represented the customers in development?
About identifying customer needs (the results not included in this paper)
How did you identify the customer needs?
- Did you collaborate with customers? With whom and how?
- Did you use any systematic methods?
- What were the good practices and key challenges?

Did you utilise the following methods?
- Surveys, interviews, observation, web sites, focus groups, customer discussions and workshops, identifying lead users, becoming a user, customer integration into product development team
- With whom did you use the methods?

Final comments
Do you have any other comments related to this topic?

BIOGRAPHICAL

Jukka Majava works as Doctoral Student in the Department of Industrial Engineering and Management at the University of Oulu. He has research interest in product development, business networks, and supply chain development. His industrial experience includes technology marketing, partner management, project management, and supply chain development at Nokia Corporation.

Jouko Nuottila works as Project Researcher in the Department of Industrial Engineering and Management at the University of Oulu, and his research topic is flexible contracting. He has industrial experience in technology marketing, software product management, and technical support at Nokia Corporation.

Dr. Harri Haapasalo is Dean for Research, Faculty of Technology, and Professor of Technology Management in the Department of Industrial Engineering and Management at the University of Oulu. He has a D.Sc. in Technology Management and a Master's degree in Economics and Business Administration, both from the University of Oulu, Finland. He has research interests in planning, product development, and technology commercialisation. He has authored almost 200 international scientific articles.

Dr. Kris Law obtained her PhD in the field of organisational learning and development, and is currently Lecturer at the Hong Kong Polytechnic University. Prior to this, she obtained a post-doctoral research scholarship for a high-tech supply chain study at the National Taiwan University. Dr. Law has been involved in various research projects in high-tech management and technology management. She has worked on numerous research projects in Pearl River Delta, Taiwan, Thailand, and Europe relating to high-tech entrepreneurship and technological innovation.

ABSTRACT

The fast pace of wireless networks and mobile technologies development has created vast opportunities for financial service providers to render their services via the mobile platform. However, the acceptance of financial mobile services, particularly the mobile payment is still marginally adopted. While most of the research efforts focus on the positive determinants that influence such innovation, however, little attention has been given to understand why Malaysian consumers resist mobile payment services. Acknowledging that mobile payment still meet consumer resistance, this paper aims to examine the barriers that may inhibit the adoption of mobile payment. The study provides a thorough understanding for the service providers to overcome the resistance of mobile payment service.

Keywords: Mobile Payment, Innovation Resistance, Adoption Barriers, Malaysia

INTRODUCTION

M-payment refers to making payment for goods, services, and bills via mobile phone using wireless technology (Dahlberg et al., 2008). Acknowledging the high penetration rate of mobile devices, Yang et al. (2012) foresee mobile payments as important platform for performing financial transactions and also known as the most significant drivers for successful future of m-commerce. As a matter of fact, Juniper research (2010) reported that the worldwide payment values via mobile devices would reach $630 billion in 2014. Thus, it is not surprising that many companies have substantially invested in rendering m-payment services with the aims of higher profits.

A review of the extant literature of m-payment shows that many studies mainly focused on the driving factors of adoption (Yang et al., 2012; Kim et al., 2010; Mallat, 2007). Meanwhile, Sheth (1981) commented that the innovation research suffered from pro-change bias presuming that every innovation is good and should be used by every consumer. In fact, several researches asserted that many innovations are still likely to meet consumers'

resistance (Garcia & Atkin, 2002; Molesworth & Suortti, 2002). In the m-payment context, several researchers found that the adoption is still marginally adopted (Chandra et al., 2010; Dahlberg et al., 2008; Mallat and Tuunainen, 2008). Despite the low adoption of m-payment, the scholar further commented that the reality looks quite different and the circumstance often de-motivate m-payment service providers in rendering the m-payment service (Schierz et al., 2010). The scenario has led to the question as to why consumers resist m-payment.

Hence, this conceptual paper adopts the Theory of Innovation Resistance (Ram & Sheth, 1989) to understand why consumers resist mobile payment services. The conceptual paper begins with the introduction, followed by the review of literatures, proposed research model and hypothesis development. Lastly, the paper ends with the conclusion and implications of the study.

LITERATURE REVIEW

Theory of Innovation Resistance

The main cause of innovation failure is the consumer resistance (Ram & Sheth 1989). Acknowledging that consumers' resistance to innovations has received relatively little from research attention (Szmigin & Foxall, 1998), the theory of innovation resistance plays an important role to explain why users resist innovations. Based on the theory, Ram & Sheth (1989) suggested two barriers to innovation adoption, namely functional and psychological barriers. The functional barriers consisting of usage barriers, value barriers, and risk barriers, whilst, the psychological barriers consisting of tradition barriers and image barriers.

Theory of Innovation Resistance

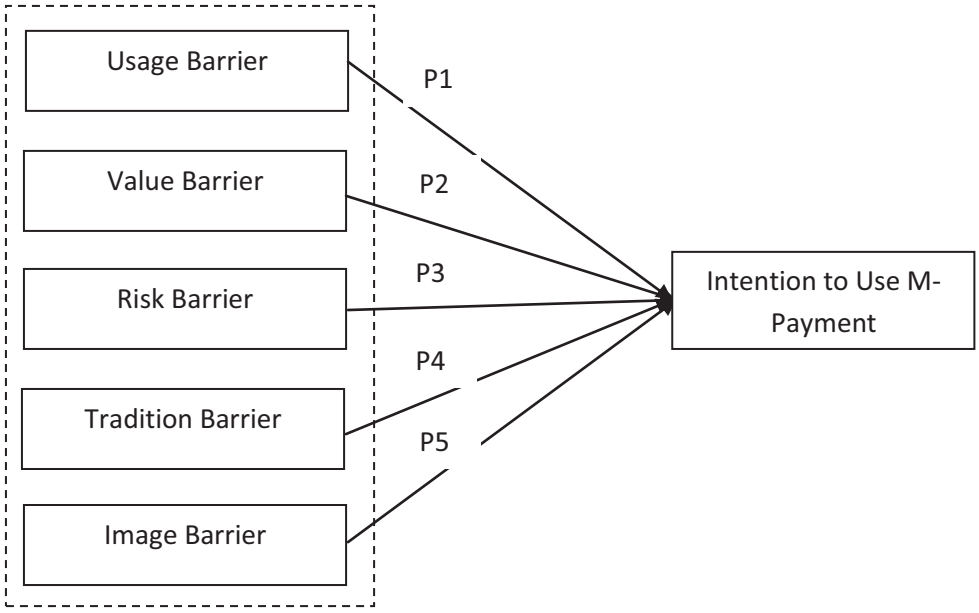

Figure 1: Conceptual Research Framework

HYPOTHESIS DEVELOPMENT

Usage barrier occurs when an innovation is not in lines with user's current workflows, practices and habits which generally lead to consumer innovation resistance (Ram and Sheth, 1989; Sheth and Ram, 1987). In the context of m-payment, compatibility signifies one's ability to integrate the service with their existing behavioral patterns (Lee et al., 2003). In view of slow data transmission and user interface, Laukkanen and Lauronen (2005) commented that making payment through mobile phone is too complex and time consuming. Value barrier, according to Ram and Sheth (1987) refers to performance-to-price value. Compared to alternative solutions, this simply implies that if m-payment services does not offer a strong performance-to-price compared to conventional payment method such as cash and credit card, consumers may not feel motivated to adopt the service. Mallat (2007) also illustrated that the users resist of mobile payment because of its 'premium pricing' The additional charges may be incurred from mobile payment compared to payment by cash. Acknowledging uncertainty inherent in innovations, innovations often lead to certain level of perceived risk (Ram and Sheth, 1989). In view of the wireless setting, the fear of security breaches, identity theft and passive confidentiality are often discouraging users from using the service (Zhou, 2011). "The more risk adverse a subject is, the lower its acceptance and longer the diffusion will take" (Dunphy &Herbig, 1995, pp.203). Tradition barrier simply implies that the change an innovation may affect one's routines. In another words, the high tradition barrier will exist when the innovation is contrary to one's societal, social norms, and family values (Ram & Sheth, 1987; Ram & Sheth, 1989). Fain & Roberts (1997) further illustrated that the tradition barrier will occur when performing financial activities through electronic modes are contrary to the way uses used to pay bills. This is particularly true when users opt to have interaction in their payment transaction. Each innovation attains a certain identity from its origins (i.e., product category, country of origin, and the brand). The image barrier comes into place when one's has stereotyped thinking of internet and m-payment services. Thus, we postulated the following propositions:

P1: Usage barrier has significant impact towards use of m-payment.
P2: Value barrier has significant impact towards use of m-payment.
P3: Risk barrier has significant impact towards use of m-payment.
P4: Tradition barrier has significant impact towards use of m-payment.
P5: Image barrier has significant impact towards use of m-payment.

CONCLUSION AND IMPLICATIONS

In sum, the conceptual paper focused on the barriers that inhibit m-payment in Malaysia. Whilst most of the IS studies have concentrated on the reasons for promoting adoption, innovation resistance has been neglected in IS research. Hence, the conceptual paper bridge the gap by adopting the 5 constructs of Theory of Innovation Resistance by Ram and Sheth (1989), specifically usage barrier, value barrier, risk barrier, tradition barrier and image barrier to understand what inhibits the adoption of m-payment in Malaysia. As high investment involved in developing m-payment infrastructures, therefore, it is crucial to assure that the targeted users are essentially use the service. Hence, the paper also provides companies a bigger picture of the rationale in resistance of m-payment services. This enables companies to formulate wining strategies to yield higher level of m-payment acceptance.

THE IMPACT OF TRUST AND STEREOTYPES ON THE TYPE OF DOCTOR – PATIENT RELATIONSHIP A STUDY ON POLISH HEALTH CARE MARKET

Dr Katarzyna Krot, Bialystok University of Technology, Management Department, 16-001 Kleosin,Poland
katarzynakrot@gmail.com

ABSTRACT

Purpose: *The doctor-patient relationship is a crucial element of healthcare. Literature distinguishes between four models of the doctor-patient relationship: paternalistic, shared decision making, interpretative and informed choice. Socio-economic transformations also alter the nature of this relationship. Therefore, the aim of this paper was to investigate the model of doctor-patient relationship and to identify the determinants of this relation.*
Methodology: *The study was carried out in the form on a sample of 208 students in the Podlasie Region.*
Findings: *The model of a doctor-patient relationship preferred by respondents was determined by stereotypes associated with the size of the city where medical services were provided and the gender of the physician, as well as the level of trust for the competence and integrity of the doctor.*
Originality: *Many authors emphasize that the paternalistic relationship is being replaced by the more balanced contacts between the physician and the patient. The study results show, however, that this is not so definite. Many patients still prefer to submit to the authority of the doctor (paternalistic relationship)*

Key words: model of doctor-patient relationship, trust, stereotypes

INTRODUCTION

Medical services are characterized by a high level of uncertainty and risk. Patients lack professional knowledge which would allow them to assess the quality of services obtained (Berry and Bendapudi, 2007). For this reason, they require advice which facilitates making decisions connected with the market (concerning the choice of a doctor), as well as those connected with health. Properly constructed doctor-patient relationship helps to resolve these dilemmas, but also possesses therapeutic value. Changing socio-economic conditions also alter the character of this relationship. It is worthwhile, therefore, to take a look at the model of doctor-patient relationship currently preferred. Hence, the aim of the research conducted for the needs of this article was to stipulate the preferences concerning the doctor-patient relationship and the identification of the factors affecting the character of this relationship. The research, formulated as a random survey, was conducted with 208 students of two higher learning institutions in the city of Bialystok: the Bialystok Technical University and the University of Bialystok. The article was realized as part of a research grant (no. DEC-2011/01/D/HS4/05664) financed by the National Science Center.

THE PHYSICIAN - PATIENT RELATIONSHIP

Medical services are services which the patients require but not necessarily desire and which are connected with a high level of stress and emotional commitment (Berry, Bendapudi, 2007). The doctor-patient relationships can assume many forms depending on the personal and social predispositions of the doctor and the patient (socio-demographic characteristics, professional authority of doctors, the consumerist attitude of patients, professional socialization of future doctors, the currently accepted model of medicine and health), as well as economic factors (changes in the health care system leading to the development of market mechanisms, competition).

Four models of doctor-patient relationships are mentioned by literature: paternalistic, shared decision making, interpretative and informed choice. Every one of these models is connected to a different attitude of the doctor toward the patient (Cullen, 2005). The paternalistic relationship signifies full submission of the patient to the authority of the doctor, who assumes full responsibility for treatment and its results (Szasz, Hollender, 1956). On the opposite side of the spectrum is the informed choice relationship model, in which the physician comprehensively cooperates with the patient and his family in the domains of health education, prevention, diagnosis and medical problem solving. In this relationship the doctor informs the patient about potential treatment possibilities and their effects (including side-effects), but the final decision is made by the patient. This model assumes that the patient is an equal partner in the relationship (Lagerlov et al., 1998). The third type of relationship – the shared decision making, relies on an authoritative position of the doctor, but it is the patient himself who chooses the level of engagement in the decision-making process connected to treatment, and who has the ability to influence the final course of treatment (Elwyn et al., 2000). In turn, the interpretative model assumes that the basis for meeting at the physician's office is the patient's medical history and the doctor only fulfills the role of an advisor (Eriksson et al., 2007). The essence of the physician-patient relationship is subject to dynamic changes. Researchers claim that the paternalistic relationship type, with the dominant role of the doctor, was characteristic of the past (Gruber, Frugone, 2011). Currently, this model is undergoing a transformation in favor of a more equal distribution of the treatment process control and responsibility on both partners. The relationship is, therefore, becoming more like a partnership and more focused on the patient (Hausman, 2004). In a partner relationship the patient is treated more like a customer who receives essential information from the doctor and then evaluates it and makes decisions based on his own needs (Cullen, 2005). Consumerization of health care, growing access to knowledge and education, formation of internet communities concentrated around health problems, cause the relationship between doctor and patient to undergo further changes (Laing et al., 2005). However, results of some studies show that at times the patients prefer the paternalistic model of the physician-patient relationship (Tapp et al., 2009).

The physician-patient relationship and trust

The relationship between the physician and the patient is conditional on many factors lying on both the patient's and the doctor's side, and is the result of interactions occurring between both parties at the doctor's office (Leventhal, 2008; Spake, Bishop, 2009). These factors include: the assessment of a physician's competence (Brown, Swartz, 1989), psychological comfort of the patient (Spake et al., 2003), empathy, understanding, attention and kindness

displayed by the doctor (Winsted, 2000; Ruyter et al., 1999; Gruber, Frugone, 2011), privacy and confidentiality, as well as integrity. These are behaviors which build trust. Trust could be defined as confidence and the expectation that a partner in a relationship will work toward common interests (Gilson, 2003), and that neither of the sides will ever act to harm a partner by using his vulnerable points against the other (Morgan, Hunt, 1994). This also signifies that there is a will to vest personal assets in the relationship with someone else. Trust is the result of positive images which are the outcome of previously shared interactions (Brockner et al. 1997), and the assessment of the level of credibility of a partner in the relationship.

Patients need trust at every phase of building a relationship with a physician and in every model of such a relationship. Trust is the result of the ability to build a relationship. Trust helps patients to openly speak about their problems and to take part in the co-creation of a medical service and effective treatment (Gruber, Frugone, 2011). Trust also allows the patient to believe the information related by the doctors concerning the arrived at diagnosis or treatment method. Only in cases where it is possible to ensure that the information being passed on by a credible doctor is accepted, patients will view the potential relationship as less risky. Trust also determines the atmosphere of the meeting at the doctor's office, ensuring the patient's satisfaction and loyalty, complying with advice, treatments continuation, and, what follows, faster patient recovery (Hall, 2001). Patients, therefore, look for characteristics and benefits of their interaction with a physician in order to regain trust and continue the relationship (Gruber, Frugone, 2011). Trust in a doctor is, therefore, the result of rational as well as emotional reasons. Previous positive patient experiences connected with a skillful solution of a health problem may become a source of trust. However, positive emotions, bond formation and commitment are no less important in gaining patient trust (Dobiegała-Korona, 2009). The changes which are occurring to the current physician-patient relationship do not signify the depreciation of the meaning of trust. Rather, trust is becoming a negotiable element of the relationship and depends on technical abilities, style of communication, knowledge related to the patient and the ability to prove the accuracy of medical decisions (Rowe, Calnan, 2006).

Physician-patient relationship and stereotypes

Research shows that age, gender or the nationality of a physician may influence the relationship and, in effect, the results of treatment (Shaha, Ogdenb, 2006). The study conducted by Cooper-Patrick et al. (1999) indicates that patients who visited a woman doctor assessed the consultation as more mutually active than in the case of a man. In other studies women were viewed as more focused on interpersonal relations, as showing more support and responding to the emotions of relationship partners, while men were more goal-oriented (Nicolai, Demmel, 2007).

On the other hand, McKinstry and Yang (1994) ascertained that the doctor's age has an influence on the assessment of a relationship. It turns out that while older physicians were viewed as more inclined to listen, of being more thorough and of providing a greater feeling of security, younger doctors were seen as having more up to date knowledge, being more willing to explain and clarify medical questions and preferring more informal ties. Similar results were obtained by Shaha and Ogdenb (2006). In their research they confirmed that young doctors, in the opinions of patients, have better technical skills and are more willing to investigate the emotional aspects of patients' state of health. Patients, in contacts with those

physicians, more readily accept and adhere to the recommendations of the doctor, continue treatment more willingly and show loyalty to the doctor, as well as possess greater confidence in his diagnoses.

METHODOLOGY

Studies connected with the preferred model of physician-patient relationship were mainly conducted in the 80's. For some time this area of research has been somewhat neglected, even though socio-economic conditions have changed, which means that the model of the doctor-patient relationship could have also changed. It is therefore worthwhile to return to studying this issue. Hence, the main goal of the research conducted for the needs of this article was to define the preferences concerning the doctor-patient relationship and to identify factors which influence the character of this relationship. As a result the specific objectives of this study are:

- the impact on the individual dimensions of trust (competence, integrity and benevolence) on the preferred type of doctor-patient relationship;
- the impact of stereotypes on the preferred type of doctor-patient relationship;
- determinants of the model of the doctor-patient relationship (regression model)

The main presumption of the study was to assume the patient's perspective, or to verify the relevance of factors connected to doctor trust and the way they were perceived by the patients.

Doctor trust was therefore studied as trust relating to three dimensions most often quoted by literature: competence, integrity and benevolence. Stereotypes, however, were related to the age and gender of the physician and the location of the medical practice (big city vs. small town). Realization of these goals demanded conducting primary research formulated as a random survey. This being a pilot program only 208 second and third year students of two higher learning institutions: the Bialystok University of Technology and the University of Bialystok, participated in the study. This constitutes significant limitation of the research, because of the defined socio-demographic characteristics of the study sample. Table 1 contains the characteristics of the study sample.

Table 1. Structure of the study sample

Place of residence			**Gender**		
	Number	percentage		Number	percentage
city of Bialystok	104	50,0	woman	124	59,6
village	35	16,8	man	84	40,4
up to 50 thousand	48	23,1	**age**		
50-100	15	7,2	under 25	180	86,5
100-200 thousand	2	0,9	25-35	27	12,98
200-300 thousand	4	1,9	36-45	1	0,5

Net earnings calculated per person in a household			Education level		
do 500	22	11,1	secondary	127	61,0
501-1000	62	31,3	licentiate	58	27,9
1001-1500	57	28,8	higher	23	11,1
1501-2000	28	14,1	**University**		
2001-2500	14	7,1	Technical University of Bialystok	74	35,6
above 2500	15	7,6	University of Bialystok	134	64,4

MODEL OF THE PHYSICIAN – PATIENT RELATIONSHIP –STUDY RESULTS

The aim of the research was to define the type of doctor-patient relationship preferred by the respondents. The participants were given a choice of four short descriptions of these relationships corresponding to the four types of relationships: paternalistic, shared decision making, interpretative and informed choice. It is worth notice that the preferences of respondents are very diverse. Most people, 29% of those studied, expect a paternalistic relationship from their doctor, meaning that they declare a full willingness to submit to the doctor, in line with the conviction that "the doctor knows what he's doing" (table 2).

Table 2. Models of the physician-patient relationships

	Number	Percentage
paternalistic	60	29,0
shared decision making	55	26,6
interpretative	36	17,4
informed choice	56	27,0

Source: self study based on research results

However, slightly fewer participants (27%) expected the opposite type of a relationship, the informed choice, in which the doctor cooperates with the patient and his family informing them about various possibilities of treatment and its consequences. Over 26% of respondents decided that they prefer the shared decision making model. Slightly more than 17% chose the interpretive relationship as the preferred type of contact with their physician.

The identification of factors influencing the choice of the model of the physician-patient relationship became the next research objective. A study of literature proves that the course of this relationship is dependent upon the level of confidence placed in a doctor. The respondents, therefore, had the task of defining the level of their trust in doctors in the following spheres: competence, integrity and their trust in the benevolence and good intentions of the doctor. It turned out that most respondents declared a limited level of trust (the majority of answers state that they mainly trust or do not have a defined position, table 3).

Table 3. Level of trust in the physician-patient relationship

	Trust in competence		Trust in benevolence		Trust in integrity	
	Number	Percentage	Number	Percentage	Number	Percentage
definitely yes	6	2,9	5	2,4	10	4,8
mainly yes	148	71,1	104	50,0	105	50,5
neither yes nor no	35	16,8	68	32,7	65	31,3
mainly no	17	8,2	30	14,4	25	12,0
definitely no	2	1,0	1	0,5	3	1,4

Source: self study based on research

Previous research (Shaha, Ogdenb, 2006; Nicolai, Demmel, 2007) indicates that the model of the doctor-patient relationship is also conditioned by the attitudes and stereotypes guiding the patient concerning the gender, age and the location of the doctor's medical practice. Therefore, the respondents, given a choice: woman-man, younger-older, a big city doctor or small town doctor, were asked to indicate a person whom they most trust as a doctor. Almost 24.5% of them stated that they trust a woman doctor more than a man (table 4). For 62% the question of gender of their doctor was irrelevant.

Table 4. Physician stereotypes

	Frequency	Percentage
Gender		
I trust a woman more	51	24,5
it does not matter	129	62,0
I trust a man more	28	13,5
Age		
I trust a younger person more	29	13,9
it does not matter	96	46,2
I trust an older person more	83	39,9
Place of providing medical services		
I trust a small town doctor more	9	4,3
it does not matter	101	48,6
I trust a big city doctor more	98	47,1

Source: self study based on research results

The age of the physician does not influence the level of trust in him with almost half of the respondents (table 3). Among the others, about 40% trust older doctors more and nearly 14% younger doctors more. Slightly more than 47% of those asked declared that they have a higher degree of trust in physicians practicing in a big city than in a small town (table 4). Here as well, for almost half of the respondents the place of practice does not affect the way of perceiving the doctor.

In order to ascertain which factor explains the patients' decisions concerning the preferred type of a relationship with a physician, a multiple regression model was created. In this model „relationship type" became the dependant variable while the three determinants of trust (competence, benevolence and integrity), stereotypes based on age, gender and the place

of practicing medicine, as well as the economic and demographic variables (such as gender, place of residence and net earnings per person per household) were used as independent variables. The first phase showed that some of the factors were statistically irrelevant, therefore, an attempt to correct the model was made. In the final version the model only contains two determinants of trust: trust in the competence and trust in the integrity of a doctor, as well as the place of residence, net earnings per person per household and those variables illustrating stereotypes based on the size of the town where the practice is located and doctor's gender. The coefficient of determination was R2=0.25 while p=0.00000. A detailed model of the parameters is contained in table 5.

Table 5. The regression model

	b	Std. error - from b	p
Independent variable	3,377100	0,583063	0,000000
Stereotype based on size of city where practice is located	0,636064	0,150681	0,000039
Competence trust	-0,332449	0,133434	0,013631
Net earnings per person per household	-0,199391	0,055805	0,000454
Place of residence	-0,154898	0,064264	0,016950
Stereotype based on the physician's gender	0,189626	0,092537	0,041902
Integrity trust	-0,200877	0,114065	0,079933

Source: self study based on research results

It has been proven that the respondent preferred relationship type is determined to a greatest degree by the stereotypes connected to the size of the city where the medical practice is located (p=0.000039). The relationship type also depends on the doctor's competence (p=0.014) as well as trust in his integrity (p=0.079). Curiously, trust in the benevolence of medical personnel did not fit into the model. Demographic and economic variables, such as earnings per person per household (p=0.000454) and place of residence of respondents (p=0.016950), determined relationship type but to a slightly lesser degree.

CONCLUSION

The physician-patient relationship is a key part of providing medical services (Spake, Bishop, 2009; Gruber, Frugone, 2011). This relationship is dynamic in character and may additionally assume a different form, depending on social predispositions of the doctor and the patient as well as on economic factors. Many authors emphasize that the paternalistic relationship is being replaced by the more balanced contacts between the physician and the patient. The study results show, however, that this is not so definite. Many patients still prefer to submit to the authority of the doctor (paternalistic relationship) than to take responsibility for their medical decisions. The all-present informational chaos (available but unconfirmed knowledge provided by the media) urges patients to look for support in persons possessing professional medical knowledge, may be the source of these types of preferences. The changing role of the physician and the patient should inspire research into the factors which substantially influence the preferred model of this relationship. The results of this study

indicate that stereotypes connected to how a doctor is perceived, especially stereotypes concerning gender and location of the medical practice, are strong and statistically vital factors affecting the course of this relationship. It seems that the more favorable perception of women doctors and those from smaller towns is connected to the preference of the paternalistic relationship. The conducted analysis also permits to conclude that the level of trust in the competence and integrity of the doctor also determines the model of the relationship. Curiously, trust in benevolence of doctors turned out to be completely irrelevant in the choice of the relationship. It is worth mentioning that greater trust both in the competence and in the integrity of doctors is connected rather to the paternalistic relationship than to the informed choice relationship. The expectation of a paternalistic approach of a doctor therefore concerns people who demonstrate a high level of trust.

ABSTRACT

This short analysis presents perspective and a holistic method for approaching and measuring customer satisfaction. The Balanced Critical Factor Index (BCFI) method is a measurement tool to indicate which attribute of a business process is critical and which is not, based on the experience and expectations of the company's employees, customers or business partners.

This paper focuses on to detect and define critical business processes and factors, which have influence to effective co-operation and customer satisfaction. The use of a questionnaire is one of the most efficient approaches to gather the required information. Due to the fact that each process has its own attributes and the questionnaires cannot be standardized, but the information from the phase is essential and could be measured. In this study case company's all gathered information will be analyzed and furthermore the BCFI measurement tools will be applied. The original research has been testified that, with the above-mentioned method (BCFI) customer's experience of the "gap" between expected and received service can be easily resolved. Using this BCFI method it is also possible to find easier so called "weak" customer satisfaction indicators, which are not directly obvious. Companies have crucial to take the right decisions upon the areas of business interest. To have it done, the company should have able to made decisions with the right amount of customers needs. The correct allocation and fast adaption of customer's needs with the right amount of standards is a key to competitive advantage. This paper shows use of this BCFI method and how it could help companies to define there's customer's needs and required development target area more specifically.

Keywords: Customer satisfaction; Critical business process; Balanced Critical Factor Index (BCFI); Method.

INTRODUCTION

The objective of this review is to introduce Balanced Critical Factor Index method (BCFI) and it's use in the development and measuring of customer satisfaction. Original research satisfaction survey answers were collected from two years (2010 -2011) and were totally consisted of 357-answerer from 6 different organisation levels. Study's case company is responsible for the material maintenance and sparelogistics for the Finnish Army and it produces these maintenance services, either directly or managed by its subcontractors. Company is also responsible of the systems, which are related to conversion, integration and outfitting work or materials in some advance determinate projects.

How we can describe customer satisfaction?

How we can describe the customer satisfaction? This question could have as many answers as there are respondents. Customer satisfaction can mean very different things among to the answerer. It may include such factors as delivery time, price, conformity, professionalism, or it is generally just a responce to customer' requests. It can also be all of these above mentioned issues or other else factors in a complex mix. The concept of customer satisfaction can be very different in different industrial sectors or even within the same company in the different product lines (Kokkonen 2006.).

General limitation of the customer satisfaction is mostly just thinking that "it comes form a customer on the basis of the needs they are expressed". The starting point for developing customer satisfaction is often not a deep understanding of the needs. Cursory customer orientation may even lead to the situation there companies are adapting and carry out "wrong" customer needs. This situation means that company's strategic planning are even supposed to work up to with customer's wishes. Because neither or party of this, the development of customer satisfaction is in the most cases formed properly "after it has came a serious business development brake". (Storbacka & Lehtinen 2002: 17.).

Measuring of Customer satisfaction?

In general: Customer satisfaction surveys main objective is to measure answerer's satisfaction level of experienced services. Before starting of the measurement process is important to find out some basics: Why you want to carry out chosen measurements? Are they really important and what of these measurements can be really ascertained? In addition to the make successful data analysis, successful customer satisfaction surveys requires right questions with the right scale. Customer satisfaction surveys outcome should be linked to factors, which are most critical to organization's success. A critical success factor is the key business area in the company and that for it must achieve a high level of performance. Organization success can vary and be reliant of many things, but measuring of customer satisfaction should commonly concentrate only a few selected critical success factors[1] (Lönnqvist & Pirttimäki 2006).

[1]Study's case company did not validate used customer satisfaction attributes to use with the BCFI method

- An adequate level of service?

One of the good known implementation of customer satisfaction implementation is Zeithaml's etc. (1985) developed SERVQUAL instrument cluster. This method is based on the idea, that the customer's perception of service quality is best formed when customer ecpectations of service quality are compared to the provided service level. (Zeithaml, V., Parasuraman, A., Berry, L. 1990: 25.). Include to the Zeithaml & Bitner (1996) customer service quality have two level ecpectations what are: desired level of service and observed service level. Desired service level is the level of service that the customer expects to receive. Between those levels is so-called adequate level of the service, which is still acceptable to the customer ecpectations. This acceptable service area may be very different depending from the client and the situation. (The customer's expectations, Zeithaml etc. 1996:76-78).

- The Importance & Performance method

This method is approaching customer satisfaction with importance and effectiveness of the selected service area. This model allows each attribute to be measured with the clear priorities and activities (Martilla & James 1977: 78–79). Used questionaire can be divided to "important" and "not important" according to the customer's experience and each attribute have also "better" or "Worse" value depending of respondents experience. These importance & performance results can be present and interpreted for example by SWOT analysis (Key & Yavas & Riecken 1994: 36–37.). Figure 3. Importantance & Performance review.

USE OF THE BCFI METHOD

Balanced Critical Factor Index (BCFI) method has development in the University of Vaasa 2010. It calculates the standard deviation of the given question attributes. BCFI method can be used to find (from research attributes) the most critical attributes, which may be assumed to be the most importance for formation of organisation, but also the permormance. The BCFI formula takes account all expected values and experienced values into demanded activity or service related. Into Formula placed values "total" is the so-called BCFI value. Question attributes are more significant then BCFI value is closer to the value of zero (0), but also those attributes, which value is considerably higher than the other values are significant. BCFI method produces the best benefit if the past and future values can be calculated separately, but the method is however developed in such a way that these values can be counted separately. Generally BCFI methods divide processing of the material into three phases, which are:

- *The current assessments of the situation and the observation of situation,*
- *Determination of appropriate attributes to find critical factors,*
- *Data analysis with the BCFI method.*

Step one (1) include a preliminary mapping of organization needs. This step aim is to find necessary processes, phenomena, and the people who have influence on the matter. Step two (2) purpose is to identify and define all necessary attributes that are linked to the above matters.

Questions respondents assessments task is to quantify the importance of these attributes with numerical value: in the past and future tense, and this gives the content of its weight. In the third (3) section is data analysis stage which is carried out throughout the following formula[2] Figure 1:

GAP INDEX (GI)	$\left\lvert \frac{(\text{av. of expr} - \text{av. of expc}) * 1{,}3}{10} \right\rvert - 1$
DIRECTION OF DEVELOPMENT INDEX (DDI)	$\left\lvert \frac{(\text{better \%} - \text{worse \%}) * 0{,}9}{100} \right\rvert - 1$
IMPORTANCE INDEX (II)	$\frac{\text{average of expectation}}{10}$
PERFORMANCE INDEX (PI)	$\frac{\text{average of experience}}{10}$
STANDARD DEVIATION EXPECTATION INDEX (SD expc I)	$\left(\frac{\text{SD of expectation}}{10}\right) + 1$
STANDARD DEVIATION EXPERIENCE INDEX (SD expr I)	$\left(\frac{\text{SD of experience}}{10}\right) + 1$
BCFI FINAL FORMULA	$\frac{\text{SD expc I} * \text{SD expr I} * \text{PI}}{\text{II} * \text{GI} * \text{DDI}}$

Fig. 1. The BCFI method formula

- General findings?

All respondents and groups deliver almost same results (shaped curve), when results where compared to each other. All defendants had all the questions very high expected values, which exceeded almost invariably themselves for the success of the estimates, what was given (figure 2. Average expected values and results).

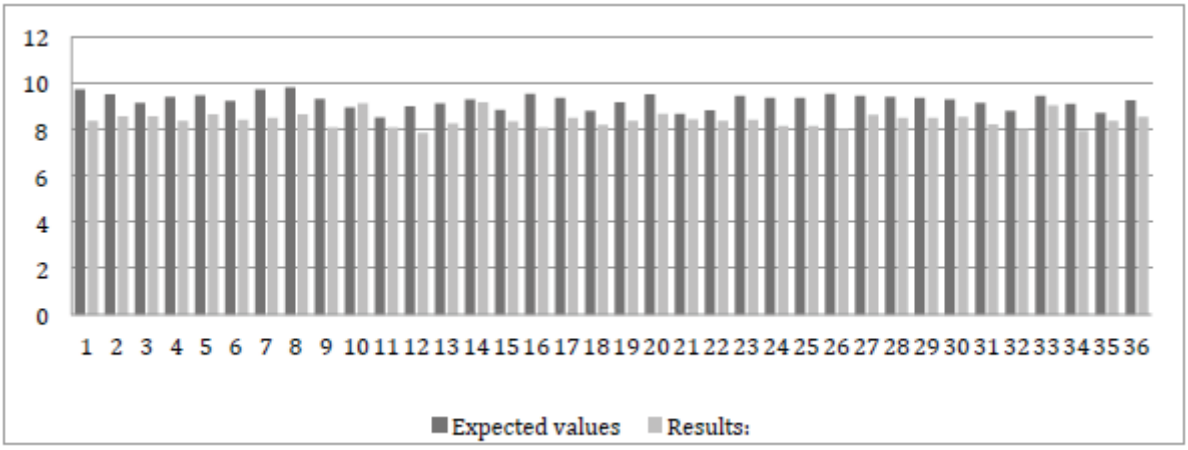

Fig. 2. Average expected values and results

[2] Forss &Takala & Korpi & Golovko 2010

Main results with the BCFI-method?

Questions (1–13) BCFI values are clearly higher than the values of rest of questions. Below is presented organisational management par table, but rest of groups gave very same kind of results. Results' ranging with the BCFI was from ~ 0.10 up to 1.40. (Figure 3. BCFI values).

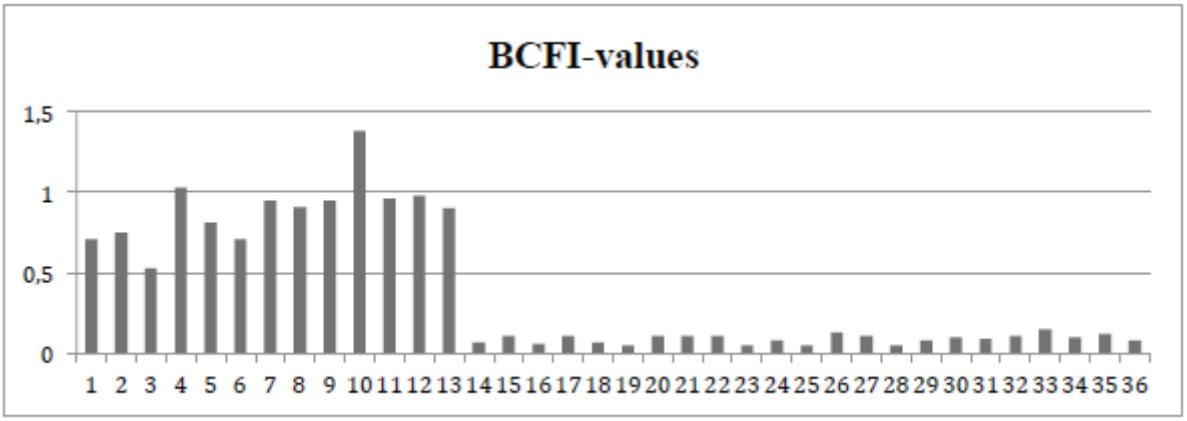

Fig. 3. BCFI values

CONCLUSIONS

If we compare these results to the adequate service areas, more precisely the main target is in the experienced service in quality, availability and delivery. This is interesting because expected and received service levels are where not indicating anything like that? An adequate level of service thinking could lead to wrong conclusions? According to these BCFI values, the customer satisfaction "gap" is not customer service itself or generally lack in all services. These results are now clearly pointing to questions 1–13, which are presented below:

1. The ability to understand the customer's business,
2. Cooperation in general fluency,
3. Operational flexibility,
4. General efficiency,
5. Customer orientation,
6. Goal of activities,
7. Openness and honesty in collaboration,
8. Reliability partner,
9. Observing the Customer needs,
10. Anticipating of changes,
11. Communication and information sharing in general,
12. Communication/ information sharing clarity
13. Continuous development.

- The gap in communication or quality specifications?

Low BCFI values in questions 14-64 could mean that company have erroneously decoded data expectations and management will have a lack of information about the organization. Now seems that, customer is dissatisfied of certain services specifications. There could be too many layers of the organization, which will stop or change the information that comes through from the customer. A main objective in quality specifications may not be a clear and the design of services could be inaccurate or self-design process could have insufficient. The quality of services could not committed to a an sufficient extent and these quality qaps could means that the service separation are not uniform with consistent quality expectations. Questions 14-64 are presented in appendix 1.

- The service delivery gap?

Specifications could be now too complex or rigid and the specifications are therefore not enought accepted. The protocol was not enought to consistent with the company's culture and service delivery was mismanaged. All these delivery involved qaps means that technology or systems do not support all the activities. These results get support from Importance & Performance method, Figure 3: Importantance & Performance review:

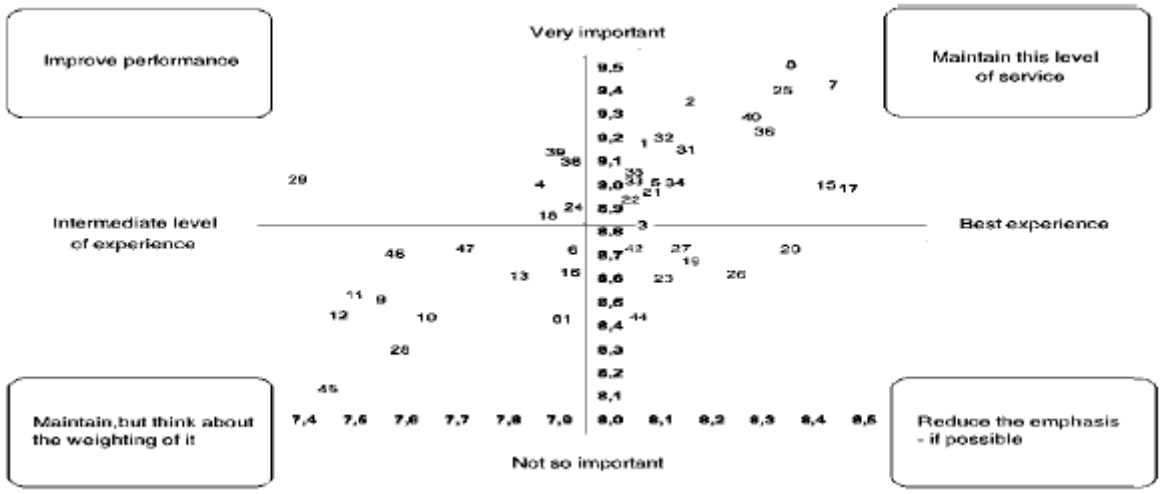

Fig. 3: Importance & Performance rewiev

- Things to be improved?

- Question 4: The efficiency of service,
- Question 18: Service speed,
- Question 24: Change/problem situation management,
- Question 29: Information sharing in missing or problematic deliveries
- Question 38: Delivery capacity,
- Question 39: Delivery accuracy.

RELIABILITY OF THE STUDY

Research empirical material is based on the results of case company's customer satisfaction survey, which was performed by years 2010–2011. Customer Satisfaction wetted a total of 64 questions. Study's original customer satisfaction data was bossible to divide into different levels of the organization and there was also bossible to pick up the same respondents for the years 2010 and 2011. Research defendants there the Finnish Armed Forces maintenance regiments employees. They there grouped by levels of the organization as follows. To verify study's information between survey respondents they were also asked information about the their's position, organization code and post office code. Organization levels where:

1. Management of the organization,
2. Material projects and procurement,
3. Maintenance management,
4. Maintenance and logistics planning and control,
5. Maintenance supervisory responsibilities,
6. General maintenance tasks.

The original survey was performed with qualitative and quantitative methods. Standardized quantitative statistical research methods can be used in variety ways for analyzing data. The numerical values importance conclude are the measured results statistically significant or not significant. Normally the most commonly used significance is 0.05 and separation or dependence can be almost considered to be statistically significant, where $0.01 < p < 0.05$ and significant, when $0.001 < P < 0.01$ (Uusitalo 2001: 82). For testing relationship of variables are commonly used two dimensional testing and this test is based on two or more statistical variable. Suitable method for analyze results is a cross-tabulation, which explains rated effectiveness of two variables against each other, and the Pearson correlation coefficient, which is the most commonly used method. This method can be use to test two or more variables dependencies. In general using only these two methods it is not recommended to made causal conclusions, because these methods shows only the linear dependencies (Heikkilä 2000: 191–202.). In this research study material contained attributes are evaluated with average testing and the standard deviation based on the BCFI method. The significance of the results where obtained, but the difference between dependencies should evaluate by reflecting it to whole framework.

APPENDIX 1:

Question attributes 14-64:

14. What items needs development in general*
15. Services availability?
16. Is communication sufficient?
17. Company's willingness to serve?
18. Speed of service
19. Speed for responding to calls
20. The willingness to listen
21. The ability to understand the needs
22. The ability to find solutions and meet the needs
23. Contract management
24. Change and problem situation management
25. Meaning for you - keeping promises?
26. Meaning for you - ability to receive feedback?
27. Meaning for you - activity in cooperation?
28. Information sharing in a missing or problematic delivery?
30. The availability of services?
31. The quality of services?
32. Performance of services?
33. Conformity of services?
34. Ability to support customer activities in the past year?
35. Company's ability to produce annual ordered services?
36. How would you like company's services develop in the future?
37. Company's ability to deliver ordered goods?
38. Deliveries accuracy?
39. Are deliveries exact?
40. Company's response rate in transformation situations?
41. Flexibility to order and delivery changes?
42. How would you like to improve supplies and logistical efficiency in the future? *
43. Quality of advisory services?
44. Access to education?
45. Billing accuracy/clarity?
46. Complaints handling?
47. How would you like company's support processes developing in the future?*
48. Company's success, overall?
49. A: Are all services produced with the one stop principle?
50. B: Is company a neutral and impartial in producing this one stop principle?
51. Which way would you rather receive company's press releases? By letter or electronically*
52. How company should consider developing of e-services?*
53. Other feedback or suggestions for company? *
54. Do you hope that company will contact you?
55. Which particular things or case?
56 - 57. Best time to contact* (56, 57 where almost same questions)
58. Coverage of services?
59. How company's operation progressed in last the year*
60. How company's support processes developed during the past year*
61. How company's logistics are developed during the past year*
62. How company's services are developed during the past year*
63. How company's customer service or support to services are develop during past year*
64. How company's services support your activities*

ABSTRACT

Purpose: *In Finland, customers often view public business services as being a multifaceted, complex and scattered system. Service providers in sparsely populated areas are facing context-specific challenges as they provide services for their customers. The aim of this study is to describe what kinds of business services are provided for early-stage companies in the sparsely populated case region and to investigate how customers evaluate the importance and success of provided services.*
Design/methodology/approach: *This is a retrospective single case study focusing on a sparsely populated subregion in Northern Finland. The case study devises a four-stage configuration framework to describe the current state of public business services and to reflect the customer experiences related to these services. The study uses semi-structured interviews and surveys for data collection. Multiple perspectives were analysed in the interviews for triangulation.*
Findings: *This study describes public business services, especially for early-stage SMEs, in a sparsely populated region. As a result of this case study, key characteristics of organising public business services in sparsely populated area context are described. The success and importance of the public business services from the service customers' perspective are clarified.*
Research limitations/implications: *This descriptive case study is limited to a single sub-region of a sparsely populated Northern Finland to get an in-depth understanding of the phenomenon.*
Originality/value: *Current literature provides limited information about how to effectively and successfully organize public business services in sparsely populated areas. This study evaluates how services correspond to the needs of the customers and how customers evaluate the importance and success of the business services in the sparsely populated case area.*

Keywords: public business services, sparsely populated area, SME, stage models, growth

INTRODUCTION

According to a recent report (Ministry of Employment and the Economy, 2012), there is a vast number of public business services in Finland. However, the services are complex and scattered from a company perspective. Partly due to project-based funding, the field remains mixed and changes frequently. Services are provided by national organisations, as well as by regional agencies, such as science and technology parks and centres, regional development agencies and incubators.. According to the Evaluation of the National Finnish Innovation System (Veugelers, 2009), Finland´s research and innovation system is complex and fragmented. This concerns a business support system, which small and start-up companies in particular experience as difficult. The challenges particularly affect innovative and entrepreneurial support at regional levels. The support system has overlapping functions and unclear organizational roles between actors. Even if the innovation system as a whole can be seen to work satisfactorily, small, rapid-growth companies are not served well and achieve poorer results.

Entrepreneurship drives the economy of most nations. Small- and medium-sized enterprises (SMEs) are considered an important and integral part of every country's economy; SMEs are the fastest growing sector of many economies and are more flexible and adaptable concerning their structure and their ability to respond more quickly than larger organisations (Tagliavini *et al*., 2001; Yifeng, 2011). On the other hand, compared to large enterprises, SMEs typically have fewer financial resources, less technical expertise and more limited management skills (Blili and Raymond, 1993; Yifeng, 2011). A successful SME sector can be considered a vital part of growth and development in sparsely populated regions. Moreover, in Finland the national strategy is to enhance SMEs.

A company's number of employees, sales and assets indicate business growth; however, management must focus on multiple dimensions in a growing company. The majority of perspectives dealing with company growth are concerned with the factors leading to growth. However, this study deals with the actual growth process. Researchers label this perspective the stages of growth, company lifecycle or configuration perspective (see e.g. Muhos *et al*., 2010; Muhos, 2011). Numerous models have attempted to clarify managerial challenges and priorities in the early stages of companies (see e.g. Churchill and Lewis, 1983; Greiner, 1972). This perspective relates to what growth brings to a company and how to manage a growing company (see Davidsson and Wiklund, 2006; Wiklund, 1998). Growth configuration literature reveals diverse managerial problem configurations specific to the different growth stages.

A simplified four-stage framework, a synthesis of recent stage models (see Muhos *et al*., 201n [in press]), is utilized in this study to explore business services and development activities for early-stage companies provided by public business services. The key characteristics of the framework are presented in Figure 1 below.

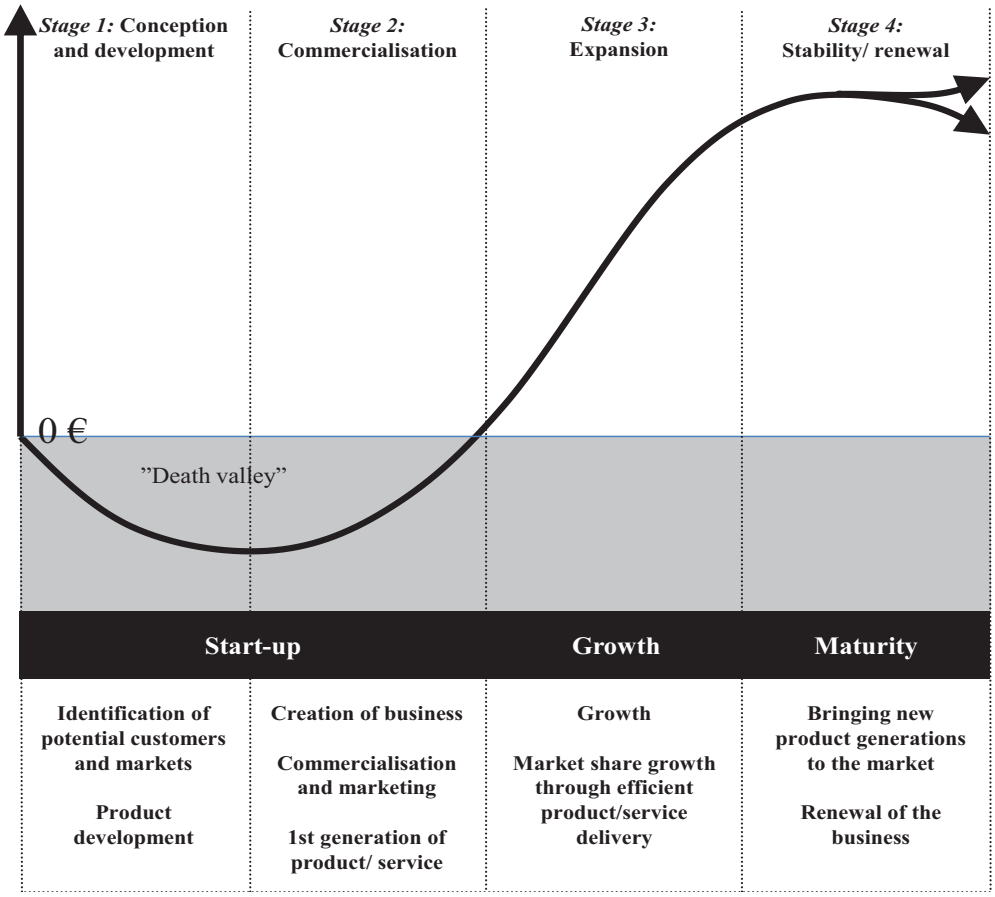

Figure 1: The simplified stage framework

Rurality can be defined in traditional descriptive terms, including the level of population density, the rate of population loss or gain, settlement size, local economic structure and landscape (Stathopoulou *et al.* 2004). Rural businesses tend to be small, and small businesses in rural communities face geo-demographic, socio-cultural and economic concerns. Remoteness brings about transportation challenges as well as increases in manufacturing costs and longer workforce commutes. Low population density may also limit the available skilled labour as well as employment options. The per capita, household income and educational level of rural residents tend to be low in comparison to their counterparts in urban areas, and rural businesses may lack sufficient access to financing. In the European Union (Eurostat, 2012) sparsely populated areas are defined as regions with a population density below a certain threshold; the region is defined as sparsely populated if it has a population density of fewer than 12.5 inhabitants per km². Northern parts of Finland, Sweden and Norway and the majority of Iceland can be defined as sparsely populated areas.

The case region of this study, the Nivala-Haapajärvi subregion, consists of five municipalities: Haapajärvi, Kärsämäki, Nivala, Pyhäjärvi and Reisjärvi, with a total population of approximately 30,000 inhabitants. The area is located in the southern part of Northern Ostrobothnia in Finland. It covers an area of nearly 4000 km2. There are about 1600 companies in the subregion; the majority of them (95%) are micro-sized companies. Industry, services and primary production comprise about 70 % of the jobs. The growing

industrial sectors include the metal and wood products industries. The metal industry, including the construction of metal structures and machinery, equipment manufacturing and mechanical engineering, has strongly increased its workforce in recent years The Nivala-Haapajärvi subregion is the leading region in milk and meat production in Finland. Besides agriculture, forestry has a significant impact on employment in the area as well.

This study's research problem can be condensed into the following research questions:
1. What kinds of business services are provided for early-stage companies in the case region?
2. How do customers evaluate the importance and success of these provided services?

These questions are studied by analysing the supply of services in the case region. By investigating the case, this study explores how public business services are organised in this sparsely populated area and describes the services provided for early-stage companies. In addition to that, the study clarifies how public business services correspond to demands. In addition, the importance and success of the services are evaluated both from the providers' and the customers' perspectives.

METHOD

This is a case study with a holistic strategy; the power of a case study is in clarifying complicated processes and in obtaining new knowledge when the boundaries between a phenomenon and its context are not clearly evident and in which multiple sources of evidence are used (Yin, 1994).

The empirical evidence for this study was collected by interviewing the representatives of NIHAK, which is a business development company of the Nivala-Haapajärvi subregion, and by collecting survey data from the customers of NIHAK. The collected data and the received evidence was further analysed and synthesized.

The first part of the empirical evidence was collected at the end of 2011 and in the beginning of 2012 by interviewing the Chief Executive Officer, the Business Development Manager and the Project Manager of NIHAK. All interviews were conducted using a similar research process and thematic questionnaires. The main thematic sections of the interview are provided in Table 1,

Table 1. The main thematic sections of the interviews

Section	Theme
1	Clarification of the purpose of the interviews
2	Basic information about the organisations and the interviewees
3	General description of the services provided by the organisations and their customers
4	Orientation to the stage framework
5	Stage-specific description of the services provided for SME companies in their early stages
6	Evaluation of the services provided
7	Description of successful cases and best practices

The second part of the empirical evidence was collected during the spring of 2012 by surveys sent to the customers of public business services in the Nivala-Haapajärvi subregion (NIHAK). The internet based survey was sent to 857 companies. A total of 129 responses were received before the survey deadline, the response rate being 15 %. Almost half of the respondents were one-person micro-sized companies. The main themes of the questionnaire are presented in Table 2.

Table 2. The main thematic sections of the questionnaire

Section	Theme
1	Basic information about respondents
2	General evaluation of the public business services and service organisations of the region
3	Description of the emerging needs for new services (general level)
4	Evaluation of the importance and success of public business services provided for early-stage companies (stage-by-stage)
5	Description of the emerging needs for new services for early-stage companies (stage-by-stage)

RESULTS

The Nivala-Haapajärvi subregion (five municipalities, 30,333 inhabitants, 1600 companies) has arranged its business development services via the development company NIHAK, which is operating as a limited company. NIHAK is a municipal producer and its duty is to develop the region, together with its member municipalities and partners, by means of programme-based regional development. The aim of the business development services is to develop several kinds of business activities, excluding primary production in agriculture and forestry, which are the responsibility of other actors/organisations.

Table 3: Description of the Nivala-Haapajärvi subregion

	Nivala-Haapajärvi subregion
Organisation of services	NIHAK
Municipalities	Haapajärvi, Kärsämäki, Nivala, Pyhäjärvi and Reisjärvi
Inhabitants	30,333
Number of enterprises	1600

Interview results

The public business development company NIHAK has 10 employees working with entrepreneurs.

The roles of the personnel are divided in such a way so that the personnel have both a horizontal (thematic) responsibility (e.g. the incubation services and the services of the growing enterprises) and a vertical (local) municipal business development consultation responsibility. In every member municipality, there is a business development manager and an agency where the entrepreneur receives a start-up package containing information on

business development services with the principle of a 'single window' system. The business development managers respond to the business development services in their 'own' municipality, but co-operate with each other as a network, depending on their areas of expertise, for the benefit of the subregion.

The subregion's business development services have been segmented and productised in the NIHAK in the way that commencing enterprises, operating enterprises, innovation enterprises, enterprises becoming international, and domiciliary services are represented each in a group of their own. Based on the interviews, the main content of the service is recognising and understanding the process and the lifecycle stage of the business activity and then offering the right service. Clients receive information from the business development services about such things as start-up grants, business development assistance and loans and securities for loans. Moreover, acquisition and other ownership change-related services are offered. Business development services are confidential and free of charge for clients.

In addition to producing the services, NIHAK is an agent for the services provided by the local, regional and national cooperation partners, including such things as manufacturing studios, premises and international services. In this study's interviews, NIHAK is regarded as an immediate interface between the enterprises, society and the public economy. Several actors participate in the cooperation coordinated by NIHAK. The development companies need personnel to have sufficiently broad know-how and readiness concerning the services offered by the cooperation partners, so that the company's role as an intermediary organisation works. The NIHAK business development managers also act as intermediaries and consultants when they search for a suitable service concept for the client enterprise.

Based on the interviews the proactive nature of the services is pointed out. The business development managers contact the enterprises in the region annually. In the development discussions they make every attempt to understand the enterprise's situation so they can provide sufficient information about the specific services that best fit the company's needs. NIHAK has organized the business services it provides to the many areas of region through its business development managers, which is often the strength of local service and a direct link to broader business service networks.

Services for enterprises in the conception and development phase include general enterprise consultation, enterprise start-up consultation and grants. In addition, business idea development, surveys of grant opportunities, evaluations of profitability, different kinds of plans (e.g. a business activity plan), financial statements, financial planning and applications for financing are offered. There is also an incubation service, which is directed especially to commencing enterprises and young enterprises, as well as for those who start up and develop new business activities and have opportunities to expand. Innovation services, like the protection of innovations and building up development services, suit the enterprises in this phase. Additionally, NIHAK offers with its partners training in enterprising, manufacturing studios, premises and internationalisation services.

A typical case of a commencing entrepreneur is when the business idea and its likelihood of success are first estimated. In connection with the business idea evaluation, possibilities for getting start-up grants are surveyed and applications for such grants are made together with the entrepreneur. Financial needs and potential sources of financing (e.g. a bank and other

funding actors) and the quality are evaluated next. For example, the TEKES (the Finnish Funding Agency for Technology and Innovation) provides financing for the development projects. After the survey and applications the actual business start-up documents are created. At the same time the issues concerning the choice of a company form, its grounds, risks, responsibilities and taxing are reviewed.

Services directed into the commercialisation phase are the incubation, where the enterprise is developed in cooperation with consultants. Targeted training is also available. Often general business development consultation with the right questions for the entrepreneur offers the necessary help for an enterprise. As an intermediary organisation NIHAK has also recommended e.g. the marketing and sales programme offered by the ELY-Centre (The Centres for Economic Development, Transport and the Environment).

NIHAK's role as an intermediary organisation is emphasized when the enterprise being served is in the expansion phase. The expertise of NIHAK is utilized for instance in budget calculation. Typical services offered in this phase are financial planning and applications for financing. Several kinds of challenges become current; the manufacturing is e.g. not able to respond to sales growth. Problems may appear with the production management, quality management systems, financing, working capital, increases in staff and recruitment. To recognise the acute sticking points and bottlenecks, an enterprise may need outside expertise that NIHAK can offer. All internationalisation services, e.g. the shared export secretary service, can also be seen as expansion phase services.

Based on the interviews, the stability and renewal phase is also interesting because some of the enterprises are content with their stability and are not trying to reach growth. Business activity stabilises in this phase, and in the absence of growth desires, there are no longer significant needs for utilising business development services. As far as an enterprise has the desire and the need for a renewal, a stage of expansion with new investment planning may often come up. There may be a need for an expert from outside to help as well. In this phase the change of ownership may become necessary in the enterprise's development. If the entrepreneur is interested in abandoning the enterprise, NIHAK can cooperate in implementing the acquisition. NIHAK can negotiate with the purchasing candidates from outside. In addition, family business succession is promoted.

Business services and development activities for early-stage companies provided by NIHAK are described in Table 4.

Table 4. Business services and development activities provided by NIHAK for early-stage companies

	Stage 1: Conception and development	Stage 2: Commercialisation	Stage 3: Expansion	Stage 4: Stability/ renewal
Nivala-Haapajärvi subregion	- Business plan - Establishing the business - Planning and seeking financing - Developing the business idea - Assessing profitability - Constructing development projects - Business incubation	- Planning and seeking financing - Surveying the business situation and development needs - Building development projects - Training	- Planning and seeking financing -Export specialist services -Trade fair and contact services - Building development projects - Studios as development environments	- Planning and seeking financing - Monitoring the business situation and development needs -Building development projects - Services upon ownership and generational changes

General business consulting and intermediary organisations' actions are included in all cells of the above presented table. The support actions of public business services are not always productised, but they are tailored to customers' needs. Third party solutions are offered when a service portfolio does not meet the specific needs of a customer. These can be offered through the partner networks.

Based on the interviews, the services and the needs of established and start-up companies seem to be fairly similar without any larger gaps. From the perspective of service providers, targets for future development are expressed location services and internationalisation, as well as the surrounding areas for planned large-scale projects. Even though large-scale projects are regionally nearby, for small entrepreneurs and micro-entrepreneurs those major projects are often difficult to participate in. This also applies to internationalisation. For this reason public business services are needed. Business providers are actors that are able to develop the needed skills of the entrepreneurs concerning large-scale projects and internationalisation. Providers see that one focus of future development will also be co-educational institutions. Recently graduated and entrepreneurship-oriented young people are not even necessarily fully aware of the available business services in the subregion.

Based on the interviews, one future development area of NIHAK is the awareness of the services among operating companies. Recently completed reform of the region's business services gathered under NIHAK has increased and clarified the public business services in the region. The threshold to be a customer of public business services has been lowered. Service network operates also thus that the other business service field operators guide customers to NIHAK. For example, start-up companies are directed to the desk of NIHAK by banks to refine their business ideas before applying for funding.

According to the interviews with service providers, feedback from customers has been mainly positive, which indicates that NIHAK has a successful service strategy. In general, those who use the public business services see the need, and those who do not use services criticize necessary of the services. The reason of negative feedback can be negative financing decision or regulatory barriers to business support. According to service providers, public business services are well-known in their area of operations, especially among the start-ups and early stage entrepreneurs.

Business service resources and competence are perceived to be reasonably good, especially in relation to the number of inhabitants and the firms in large cities, which often have better resources. However, additional staff resources could improve service efficiency, which could still further improve companies' growth potential. Based on the interviews, personnel's level of competence is perceived as good, especially since individuals' different competencies and strengths can successfully support each other in NIHAK. The maintenance of personnel´s competence is a horse race that requires constant updates. NIHAK tries to ensure necessary and continuous education and training of personnel, who consist of experienced professionals, many of whom have a business background. Experienced personnel are able to understand the companies' situations and to be customer-focused in all service implementations.

In the analysis between the industries, public business services' current challenge is the health care services sector, which is currently undergoing a major change. The industry is changing e.g. because of ePrescriptions and service vouchers. The task of public business services is to coach and prepare micro-companies to be able to operate and compete in concert with the new regulations and practices of the industry.

Survey results

When analysing the success and importance of the public business services, it is essential to gather information from the customers' perspective as well. Because of the large number of customers, survey research can provide us with a better picture of their opinions and experiences.

Table 5. General evaluation of NIHAK's business services on a scale from 1 to 5 (1= the weakest, 5= the most successful).

	n	1	2	3	4	5	mean
Contact person's knowledge and expertise	87	6	2	25	36	18	**3.67**
Smoothness and ease of cooperation	87	5	3	28	34	17	**3.63**
NIHAK's reputation in the region	85	7	7	32	27	12	**3.35**
Customer orientation	85	5	3	28	35	14	**3.59**
Operational flexibility	84	5	6	25	31	17	**3.58**
Operational efficiency	85	5	7	35	28	10	**3.36**
Operational quality	85	5	5	30	34	11	**3.48**
Continuous development of services.	83	5	5	31	32	10	**3.45**
Sum		43	38	237	257	109	**3.51**

According to the results (Table 5), customers consider different operations of NIHAK as reasonably good. The mean of all quality aspects of operations is 3.51 on a scale of 1 to 5. The most successful area of services is a contact person's knowledge and expertise (3.67). The weakest area among evaluated targets is NIHAK's reputation in the region, although the respondents' average estimate grade (3.35) is not poor. In general, survey data show that every evaluated area of service quality is successful, from the customers' perspective. In addition, all aspects are rated consistently by all customers without major differences.

Table 6 shows how customers evaluate the importance of business services and development activities provided by NIHAK for early-stage companies. According to Table 6, survey respondents consider customers before the establishment as the most important target group of the business services.

	n	1	2	3	4	5	mean
Before the establishment	104	5	7	13	27	52	**4.1**
Conception and development	104	3	8	21	35	37	**3.91**
Commercialisation	103	3	7	21	37	35	**3.91**
Expansion	103	3	8	22	38	32	**3.85**
Stability/ renewal	103	4	10	28	33	26	**3.66**
Sum		18	40	105	170	182	**3.89**

Table 6. Evaluation of the importance of public business services provided for early-stage companies (stage-by-stage), on a scale from 1 to 5 (1= the least, 5= the most).

Service activities done before a company's establishment are rated together as one group, and the mean is over 4. Half of the respondents argue that services done before the establishment are quite important; 50 % of the respondents rated them as a 5 on a scale from 1 to 5. It can also be noted that the importance of the public business services decreases stage-by-stage with the duration of the business.

Table 7 shows how customers evaluate the success of business services and development activities provided by NIHAK for early-stage companies. Services done before a company is established are the most successful, according to the respondents. The services done in the commercialisation and stability stages are rated as the least successful.

	n	1	2	3	4	5	mean
Before the establishment	58	4	6	16	19	13	**3.53**
Conception and development	54	3	7	21	16	7	**3.31**
Commercialisation	50	4	7	20	15	4	**3.16**
Expansion	51	5	5	21	12	8	**3.25**
Stability/ renewal	48	4	7	21	12	4	**3.1**
Sum		20	32	99	74	36	**3.27**

Table 7. Evaluation of the success of public business services provided for early-stage companies (stage-by-stage) on a scale from 1 to 5 (1= the least, 5 = the most).

In general, Table 7 shows that NIHAK has managed to provide quite successful services for companies in different stages of development. The customers´ point of view enhances providers´ understanding of their public business services.

According to the responses to open-ended questions in the terms of the demand and the importance of public business services, financial issues come up concerning the stage before a company's establishment. Balance of the finance is described as an important part of business planning. In the conception and development stage, networking, tax issues and cooperation with fund institutions are considered the most important affairs. In the terms of the commercialisation phase, respondents emphasised the necessity of services concerning marketing skills, target marketing and competition analysis. Based on the responses to open-ended questions, marketing, networking and internationalisation are seen to be the focal concerns of business services for SMEs in the expansion stage. Expertise services and consultancies are emphasised for stability/renewal stage companies, although public services are perceived a least important in this target group.

DISCUSSION

Public business services, especially for early-stage SMEs in the case area, were described based on interviews with providers in this study. In addition, the importance and success of the services were investigated based on these interviews and the survey addressed to customer companies.

Based on the case study interviews, it can be noted that when an entrepreneur with a business activity is a client of the business development services, that entrepreneur's enterprise is almost always in transition. In the positive or negative transitional stages, such entrepreneurs try to utilise public business development services. Grant applications and plans for extensions, projects and investments, as well as budgeting related to those plans, are typical services directed to enterprises engaged in positive transitions. One important function of business service organisations is to act as companions in discussions with entrepreneurs.

The organising of public business services in NIHAK can be described through three main characteristics. First, the services are organised through *important personal relationships*.

The relationship between business service managers and entrepreneurs is essential, as interacting with entrepreneurs on a personal level builds trust. This personalised approach includes responding to the needs of enterprises within a short time period, maintaining contact at least on an annual basis and tailoring services to make them entrepreneur-centred. Second, the *tailoring and productisation of services* is an integral part of the system. Most of the services are semi-structured, which offers the possibility to respond to the specific needs of each client. In addition to agencies' direct services, the services of the partner and network organisations are also offered. The productisation of services is important, especially when addressing the internal needs of the network and the partner organisations. To be able to tailor the services or to use the services of the network, business service managers have to know the existing service possibilities. Third, the services are organised through multiple *intermediary actors* with multiple roles. An organisation offering public business services in a rural area is acting on the interface. It is essential to produce and disseminate information to entrepreneurs, enterprises' staff and collaborating organisations. Agencies' role shifts based on the unique regional development tasks, such as promoting innovation possibilities and other preconditions of the enterprises.

Based on the interviews, several challenges were also pointed out such as internationalisation, attracting private financing and supporting SMEs' participation in the region's specific large-scale building projects (e.g. a nuclear power plant and an international underground physics research centre). Generally speaking, the service providers did not recognize major gaps between services and the needs of companies. They seem to have effectively utilized their networks and external expertise in cases of specific needs. On the other hand, some of them highlighted the need to build a more extensive knowledge base to be able to provide more accurate support for their customers.

The business service providers interviewed in this study emphasised the multi-skills needed of the business development managers so they can respond to local entrepreneurs' diverse needs. According to the survey, NIHAK's strategy has succeeded particularly in terms of personnel knowledge and expertise. Also, based on the survey results, personnel knowledge and expertise was rated as most successful dimension of services. Notable is that the importance of the services decreased towards the maturity stage of development. Thus, 50 % of respondents viewed services provided before a company's establishment as very meaningful, evidenced by their maximum rating of 5.

According to the customers´ responses regarding the general evaluation of NIHAK's business services on a scale from 1 to 5 (1= the weakest, 5= the most successful), it is notable that a rating of 1 was more common than 2. Therefore, it can be assumed that those who were not satisfied with the services were very disappointed. However, a significantly larger proportion of customers rated the services as a 4 or 5.

Based on the customers' responses, the most significant gap between the importance and success of services is in services in the commercialisation stage. A closer look at this gap can be taken by analysing answers to the open-ended questions concerning the commercialisation stage. The respondents see the need for guidance in marketing, financing and understanding the commercial competition at this stage. On the other hand, services for expansion stage companies have the smallest gap between the importance and success of the services. Nevertheless, respondents to the open-ended questions at this expansion stage see the need

for internationalisation services and marketing courses, as well as mentoring and networking services.

In future studies it would be interesting to investigate a larger number of cases with similar backgrounds. The results of this study represent the viewpoint of a public business service organisation and its customer companies in a sparsely populated area. Their viewpoints might differ from those of similar organisations in different business environments because of context-specific variables. It would be interesting to compare these findings to those of a similar analysis made in public business services located in rural areas in other European countries, in the US or in Asia.

ACKNOWLEDGEMENTS

This study is an essential part of the Entrepreneurship Research and Development of RDI in Oulu South Region project. The authors are grateful for the project funding supported by the Council of Oulu Region, the Kerttu Saalasti Foundation, the Nivala-Haapajärvi subregion, the Ylivieska subregion, the Haapavesi-Siikalatva subregion, the Central Ostrobothnian University of Applied Sciences, the Educational Municipal Federation JEDU and the European Regional Development Fund. We highly appreciate the organisations and persons involved in the study who shared their experiences.

BIOGRAPHICAL

Martti Saarela is a Researcher at the Oulu Southern Institute at the University of Oulu. He has a Master of Science in Economics. His primary research interests are finance, stock markets, the development of micro-companies and SMEs in rural areas and regional development. Because of his law student background, his particular research perspective is law and juridical environment. In recent years Saarela has been involved in many projects in the area of regional development.

Eija-Riitta Niinikoski is a Development Manager at the Oulu Southern Institute at the University of Oulu. She has a Master of Arts in Theology. Her primary research interests are regional development, the role of higher education institutions in regional development, internationalisation processes and the development of micro-companies and SMEs in rural areas, and management and leadership of expert organizations. Niinikoski has been the manager responsible for many development projects; she has also been involved in several international projects.

Dr. Matti Muhos is a Research Director at the Oulu Southern Institute at the University of Oulu. He holds a Doctorate in Industrial Engineering and Management. He participates in the editorial processes of several international journals as an associate editor, quest editor and advisory board member. His primary research interests are growth and the internationalisation of technology intensive SMEs including configurations and management viewpoints, the development of micro-companies and SMEs, technology intensive companies, agility, internationalisation processes and technology management. He has worked on several international projects and has written more than 60 publications in the forms of journal papers, book contributions, refereed conference papers and technical papers.

ABSTRACT

This paper uses optimization technique and decision making method to find the optimum location for a group of distribution centers. Two levels of distribution center location have been found out. The first level uses set covering methodology to obtain the location which is the location for regional distribution center. The second level uses Analytical Hierarchy Process to obtain the location which is the location for local distribution center. This problem finds the location for two levels of distribution center for the state of Ohio considering various factors and conditions, primarily focusing on population and income.

Keywords: Two levels of distribution center location problem, location problem with population and income considerations

INTRODUCTION

Many models have been developed for the design of distribution center location which has provided valuable information about location problems, but this research offers a unique discernment for solving location problems as a completely distinct approach has been adopted. In this thesis, a multi-product single manufacturing facility is assumed. This facility wants to have two levels of distribution centers (DC); 1) Regional DCs (RDCs) 2) Local DCs (LDCs). The location of RDC is found out using set covering methodology and the location of LDC is found out using Analytical Hierarchy Process (AHP). A new modified model from the original model has been developed for set covering and AHP. Then some extension to both the models also has been discussed and evaluated. Set covering is a facility location problem which helps in determining the minimum number of facilities to cover maximum demand. The set covering formulation is given as [1]:

$$\textit{Minimize } z = \sum_{j=1}^{n} C_j X_j \qquad (1)$$

$$\text{Subject to} \quad \sum_{j=1}^{n} a_{ij}X_j \geq 1,\ i = 1 \ldots m \qquad (2)$$

$$X_j = \{0, 1\},\ j = 1, \ldots\ldots, n \qquad (3)$$

Analytical Hierarchy Process is a decision making tool to solve multi-level hierarchical problems. It was introduced by Saaty [2]. The AHP divides the problem in picture into three levels [3]:

1) Define a goal for resolving the problem.
2) Define objectives for achieving the goal.
3) Determine evaluation criteria for each objective.

This research consists of two levels of distribution center, one at regional level and other at local level. The inspiration to have such a kind of system for distribution center was inspired by the theoretical concept of hub and spoke system. The very basic hub and spoke model is used as a prototype for the distribution network which is the most important part of this research work. A pure hub and spoke system consists of a hub and many spokes [4]. A hub usually performs activities like reassembling, and redirecting parts [4]. Spokes act as a connection between customers and hub [4]. In this research, for the first level of distribution system the manufacturing center is acting as a hub and RDC is acting as a spoke. For the second level of Distribution system the RDC is acting as a Hub and LDC is acting as a spoke.

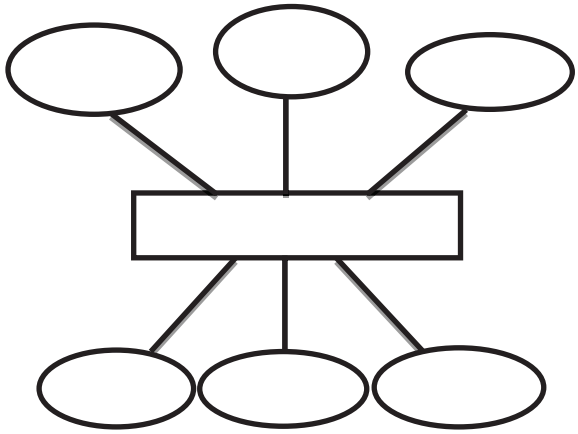

Figure 1: Hub and Spoke for the first level of distribution system

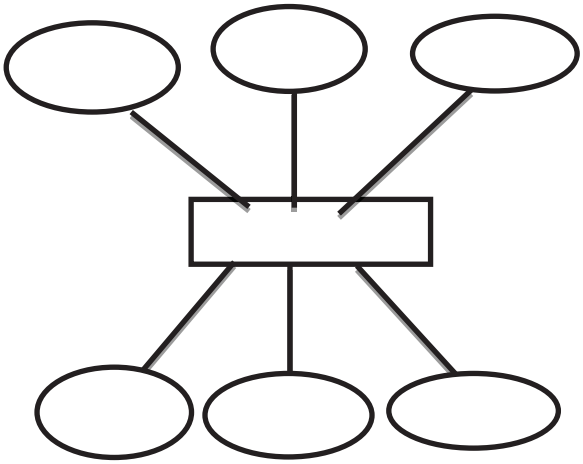

Figure 2: Hub and Spoke for the second level of distribution system

1. Objective

The main objective of this research is to determine two levels of distribution centers, one at regional level and the other at local level. The local distribution center (LDC) will assist regional distribution center (RDC) and will be located around the RDC. This problem is specifically a location and a selection problem where location of distribution centers and their number will be decided. This problem is inspired by a food company located in Jackson, Ohio which was looking to locate certain number of distribution centers nationwide, but this problem is limited to only in the state of Ohio.

2. Background

The two level arrangement of distribution center is usually observed in many distribution networks like a hub and spoke system where the mail is sent to some centralized system, and then from there they are dispatched to their destinations [5]. This type of system has been successfully implemented in the airline industry [5] and in various logistics network [4]. Big Corporations, like FedEx, have also implemented Hub and spoke type of model because of the various advantages that it has to offer [5].

Set covering focuses on covering all the demand with a minimum number of sites [1].Since the problem in this research is to cover the maximum area possible, set covering was thought to be an effective method, as this method assumes that there is some critical coverage distance or time within which demands need to be taken care of if they are counted as covered [1]. Set covering has numerous applications such as in locating emergency facilities, school, police station, distribution center etc. The location models are characterized into four types and one of them is discrete model[6]. Under discrete location model there are three more categories and one of the categories is Covering based models [6]. The covering based model is further divided into set covering, max covering and P-center [6]. Out of the three covering based models we are using

set covering model in this thesis which covers all the demands with minimum number of sites [6].

AHP is used for decision making in engineering applications, where both the quantitative and qualitative factors are taken into account and decision is made after evaluating a number of pertinent criteria [7]. The idea of using AHP for making decision for DC location came from the paper by Saaty [8]. The author describes AHP as a theory of measurement through pairwise comparisons and based on judgments [8]. According to the author it's the best tool for decision making. The ranking system for preference scale has been taken from this paper specifically. There are many papers on AHP using different preference scale, but the preference scale used in this paper has been used as Saaty has proved the validity of this scale in his paper.

Few studies have combined set covering and AHP to improve solutions. This research will use a unique approach to combine AHP and set covering to decide the best location of distribution center. The approach in this research is different from traditional approaches where either of the method is used to improve the solution, like in the research paper by Hwang, where public facility is located first by using AHP approach and then to improve this solution set covering is used [9]. However, in this research set covering will make sure that first whole region is covered and AHP will make sure that a certain region is covered.

3. Reasoning Behind The Three Way Methodology

The food company sells certain kinds of products which are affordable by all income groups. The Product line which is affordable can still be categorized in three income level groups. The categorization of the food products is a assumption for this research purpose.

a) Low priced products: These types of products are used by the lowest income group. The middle income can use these types of products and the highest level income may not use these types of products at all.

b) Mid-range priced products: The specialty of these types of products is that it can be used by all income groups.

c) High priced products: These types of products are usually used by high income groups.

For our research problem we will be dealing with Mid-range priced products which can be sold in each and every region and to all income groups. The following are the reasons for adopting the three way methodology for these types of problems:
1) Since we are dealing with mid-range price products which are affordable by all the income groups, therefore it is taken into consideration that such products can be sold in each and every region and so this reason forms the basis of clustering the Ohio state based on directions, so that a group of counties lies in the same direction.
2) Since in this research we are trying to sell mid-range priced products, which can be sold in every region, set covering is applied which will make sure that each and every region is covered

3) AHP is applied to locate LDCs around each RDC, since the coverage has already been taken care by set covering there may be other criteria which are required to be considered while setting up LDCs around each RDCs like cost, labor, distance so that not only every region is covered but certain conditions are also satisfied while setting up LDC taking local factors and characteristics into account.

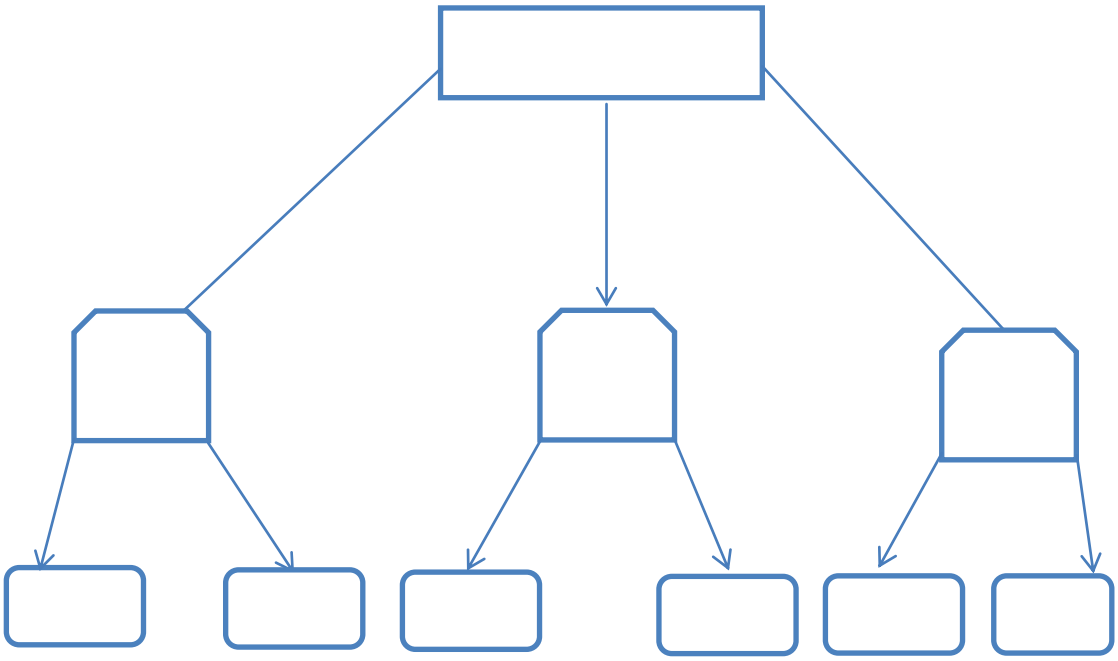

Figure 3: Hierarchical representation of the problem.

METHODOLOGY

The following methods will be adopted to solve this problem. The methods are summarized in the following steps:
1) The two level hierarchy of distribution center is inspired by hub and spoke model. The regional distribution center and local distribution center consists of two level of distribution center.
2) The very first step would be to divide the state of Ohio into certain number of regions based on geographic directions and population.
3) The Step # 2 will divide the state of Ohio into some number of regions.
4) After regional division, set covering methodology would be applied to locate a RDC in each of these regions.
5) Once the location of RDC is determined, the next step would be to determine some number of LDC around each of RDC using AHP.
6) The methodology can be described in more detail in the following way:

a) The map of Ohio state is used for this research purpose which is divided into counties. Regional division is done for the map.
b) The state of Ohio is divided in such a way that each region has a population range between 1.5 million to 3 million as it is assumed that each RDC or group of RDCs can serve at the most population in the above defined range.
c) The regional division is done based on population and considering adjacent counties and nearby counties. If the population for a group of counties together lies in the range between 1.5-3 million then that group forms one region.
d) After the regional division, set covering is used in that particular region to find RDC or groups of RDC. Population, income and distance are the deciding factors to obtain the location of RDC which is incorporated in the set covering formula.
e) After obtaining the location for RDC, LDC is found out using AHP technique which will be the interface between RDC and customers. Various factors are taken into consideration while solving AHP.

1. Formulation

Set covering formulation: The new set covering Formulation was derived. The formulation is as follows:

$$Minimize\ z = \sum_{j=1}^{n} F_{ij}X_j + \sum_{j=1}^{n} C_jX_j \qquad (1)$$

$$Subject\ to \quad \sum_{j=1}^{n} P_{kj}X_j + \sum_{j=1}^{n} I_{kj}X_j + \sum_{j=1}^{n} D_{kj}X_j \geq 1, \qquad (2)$$

$$k = 1..m$$

$$X_j = \{0, 1\}, j=1, ..., n \qquad (3)$$

Equation (1) minimizes the total cost.

Equation (2) describes the constraints. These constraints make sure that each of the counties is at least covered by one occupied county where RDC will be located.

Equation (3) is the decision variable which takes the value 1 or 0.

If a county is satisfying a given condition, which is also a potential RDC site then its value will be 1 else 0 where

F_{ij} : (Distance × Cost required needed to cover that distance). The distance would be from manufacturing facility to potential RDC site. Thus F_{ij} is basically the cost associated

to cover the distance between manufacturing facilities located in Jackson to the potential RDC site. This is a fixed cost and not a one-time cost.

C_j : The fixed cost associated to operate the RDC. This cost is also not a one-time cost. The cost may include electricity cost, labor cost, taxes, maintenance cost etc.

i : Manufacturing Site

j : Potential Distribution Center location

The explanation for equation (2) is explained below:

$$\sum_{j=1}^{n} P_{kj}X_j \; + \sum_{j=1}^{n} I_{kj}X_j \; + \sum_{j=1}^{n} D_{kj}X_j \; \geq \; 1,$$

$$k = 1..m$$

k: county
j: potential RDC site

Here, P is population of the county k that can be covered by potential distribution center j if a condition is satisfied. Conditions for different regions will be different. Here the county itself is the potential RDC site too. Therefore k and j both are counties except for the fact that j is the county which will be acting as a potential RDC site.

If population lies within a certain range for the particular region then the condition will be satisfied if

$$\underline{P_{kj}} = 1$$
Else
$$\underline{P_{kj}} = 0$$

I is Income of county k such that the income lies within a certain range so that it can be covered by potential distribution center j. Conditions for different regions will be different. Here the county itself is the potential RDC site too. Therefore k and j both are counties except for the fact that j is the county which will be acting as a potential RDC site.

If the income lies within a certain range for the particular region,

then $I_{kj} = 1$
Else
$I_{kj} = 0$

D is the distance between a county k and potential distribution center j such that the distance lies within a certain range so that it can be covered by potential distribution center j. Conditions for

different regions will be different. Here the county itself is the potential RDC site too. Therefore *k* and *j* both are counties except for the fact that *j* is the county which will be acting as a potential RDC site.

If the distance lies within a certain range,

then $D_{kj} = 1$
Else
$D_{kj} = 0$

1) Analytical Hierarchy Process: The hierarchical diagram is created in this process.

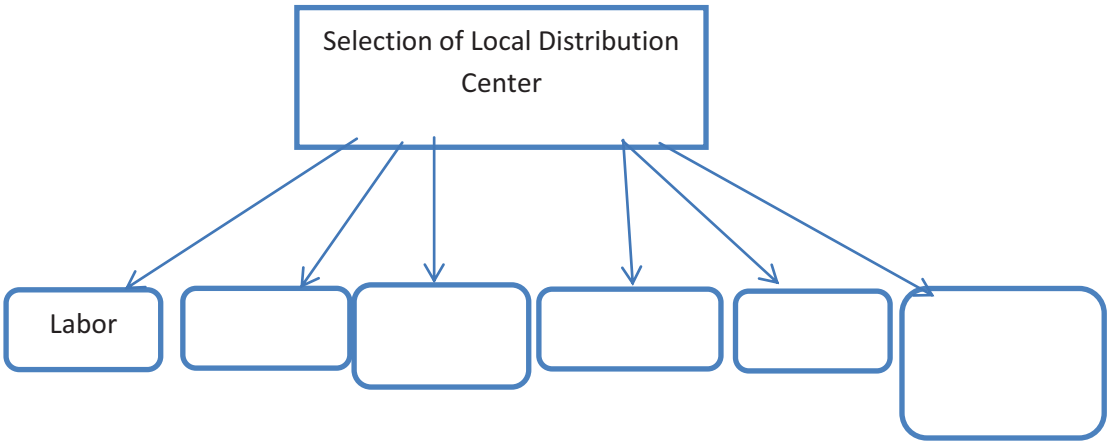

Figure 4: Criteria Level Representation

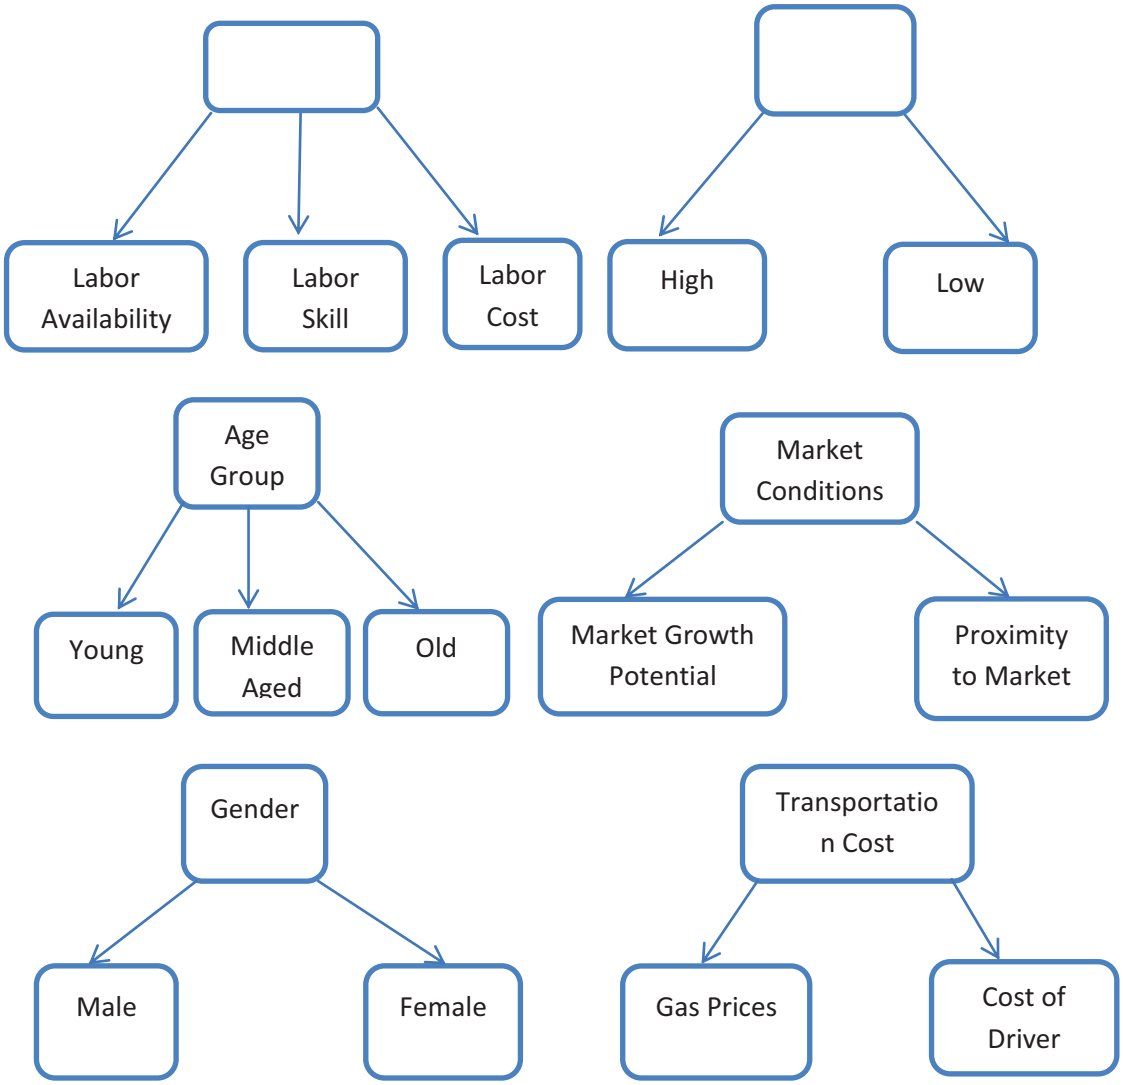

Figure 5: Sub-Criteria Level Representation.

The following steps will be implemented to solve AHP:

a) Calculate weight for each criteria w.r.t each DC and then calculate final composite rank for each of the DC's.
b) Calculate weight for each sub-criteria w.r.t each DC and then calculate final composite rank for each of the DC's.
c) Add the composite scores for criteria and sub criteria level to get the final rankings for the LDC
d) Add the composite scores for criteria and sub criteria level to get the final rankings for the LDC.

2. Extension for set covering model

The new set covering formulation can still be modified to have one more additional constraint

$$Minimize\ z = \sum_{j=1}^{n} F_{ij}X_j + \sum_{j=1}^{n} C_jX_j \quad (1)$$

$$Subject\ to \quad \sum_{j=1}^{n} P_{kj}X_j + \sum_{j=1}^{n} I_{kj}X_j + \sum_{j=1}^{n} D_{kj}X_j + \sum_{j=1}^{n} M_{kj}X_j \geq 1 \quad (2)$$

$$k=1 \ldots m \quad (3)$$

$$X_j = \{0, 1\}, j=1, \ldots\ldots, n$$

As can be seen in equation (2), a new constraint was introduced M_{kj} which is market conditions.

The data was obtained for the following:

a) Investment climate
b) Number of business starts
c) New & Expanding facilities.

The data for the above three information were combined together to obtain the final Market condition situation for each of the county. The above mentioned data was obtained for each of the counties from Ohio Department of development website[10].

3. Weight Based Set Cover Model

The formulation will be modified to the following:

$$Minimize\ z = \sum_{j=1}^{n} F_{ij}X_j + \sum_{j=1}^{n} C_jX_j$$

$$Subject\ to \quad w1 * \sum_{j=1}^{n} P_{kj}X_j + w2 * \sum_{j=1}^{n} I_{kj}X_j + w3 * \sum_{j=1}^{n} D_{kj}X_j + w4 * \sum_{j=1}^{n} M_{kj}X_j \geq 1$$

$k = 1, \ldots\ldots, m$

$X_j = \{0, 1\}, j=1, \ldots\ldots, n$

where w1+w2+w3+w4=1

w1, w2, w3, w4: weights allotted to each of the constraint.

4. Extended AHP Model:

The three extended models are developed for AHP, they are:

1) Model 1: Multiplying weights for criteria, sub-criterion and county w.r.t sub-criterion to obtain final composite scores for each region.
2) Model 2: Adding the weights for each county w.r.t sub-criterion to obtain the final ranking in each region.
3) Model 3: Add the composite scores for criteria and sub-criteria to obtain the final ranking.

RESULT

The map of Ohio is shown below with all the eighty eight counties and division into five regions after the regional division. The counties in red are RDC and the counties in yellow are LDC for that particular region. The location for RDC and LDC are obtained after solving the set covering and AHP formulation in section 2.1.

The following conclusions can be drawn from the results obtained by solving different set cover models:

The answers obtained by the new model and the model consisting of M_{kj} constraint gave more or less the same answer. However, when weights were introduced the answers differed to some extent from the previous two models.

The following conclusion can be drawn after solving four different AHP models

1) The answers obtained by the AHP model and Model 1 are to some extent similar, though not completely.
2) The answer given by Model 2 largely differs from the AHP model and Model 1. The county location obtained seems to be unreasonable as the locations are almost near to each other which won't be able to cover the complete region.
3) The answer given by Model 4 is different from all the models.

ABSTRACT

The demand of energy in Thailand has significantly increased for the past 10 years. Volunteer company as one of the subsidiary company of Thailand National Oil and Gas Company, has responsible to respond to serve country's energy demand in order to minimize import expense. Upstream Business Company like volunteer company is responsible to find the natural resources and energy to supply the country demand. Company is also in High-risk industry which one major accident may result operation disruption and impact to the country e.g. gas supply shortage to power plant and cause electricity shortage in Thailand. On the other hand, it may cause major reputation damage, multiple fatalities, environment contamination and financial loss to company and society. Hence, safety is one of the most important areas to make sure operation run smooth and prevent those from happening. The evolution and focus of safety have improved from 1980s, 2000s to early 2010s in Technology, System and Culture areas respectively. In Thailand, safety culture is very new and many companies fail to create the effective safety culture. Volunteer company has focused on safety culture (people) from the past 5 years due to root/underlying causes of the incident come from human factor. Volunteer company tailor made safety culture maturity model of 5 levels, Pathological, Reactive, Calculative, Proactive and Generative, from industry best practice along with strengthens safety management system in order to reduce incident and prevent Major accident in operation. Volunteer company launched safety culture questionnaire to identify company status to all employee in 2011 and result come with they are in level 3 (Calculative). Once the safety culture level has been clarify, it is easier to use proper tools and techniques to create a culture change, Volunteer company come up with 5 years roadmap to create a culture change from 2011 – 2015 with aspiration to achieve Generative level. As result of Volunteer company safety culture improvement shown indirectly from reduction in "Lost time injury frequency" (LTIF) and "Total recordable injury rate" (TRIR) from safety statistics, severity of the case has been reduced and operation run smoothly without any major accident.

INTRODUCTION

From 2009 – 2011, the overall Thailand energy consumption (Petroleum products, Natural gas, Coal, Lignite and etc) was higher than country production. Hence, Government has to import them and related product to meet the demand which increasing rapidly for instance only one-third of hydrocarbons demand satisfied by domestic resources (Department of Mineral Fuels, 2011) In past decade, Thailand boost production capacity of its already strong manufacturing section particularly heavy industries, including auto manufacturing, metalworking and petrochemicals factories. Those require substantial amounts of energy, which far exceed what country can produce (The report Thailand, 2012). Moreover In 2011, Thailand oil and gas consumption is ranked 19th and 25th among overall country or 1.2 % and 1.1% respectively of the world consumption which higher than neighbor country (BP, 2011). In 2013, Thai government concerns about energy consumption and promotes energy saving campaign in order to prevent electric shortage on April which is the highest rate of electricity usage in year round. They concern that there might not be enough gas to supply power plant due to annual maintenance of major gas supply sources from international country in the same period of time. There are many national and international companies e.g. Chevron, BG, PTT Group and Total investing Oil and Gas business in Thailand for instance, exploration and production in gulf of Thailand and Andaman sea, Refinery in Rayong province and Marine base in Songkla province. Volunteer company, a national Oil and Gas Exploration and Production Company (Upstream) subsidiary of PTT Group, play an important role and responsible to find energy sources from domestic and international to serve country's energy demand. If there are any major incidents in Volunteer company operation for instance explosion in well head platform, major leak or corrosive in 32" pipeline may cause unplanned shutdown and delay in energy supply to production source. One of those outcomes are electricity shortage which impact many stakeholders in Thailand for example; Automobile industry may need to lower production, higher price of Oil and Gas which cause general product more expensive and cut electricity in some area. As the result of, Oil and Gas industries especially upstream in Thailand are continued to expand to sustain country demand in future.

Table.1. Energy, inputs and consumption from 2009 – 2011 (BOI, 2012)

Energy consumption ('000 bpd)	2009	2010	2011
Production	849.8	989.2	1017.5
Import (net)	922.0	1000.6	1016.5
Consumption	1662.6	1782.9	1845.5

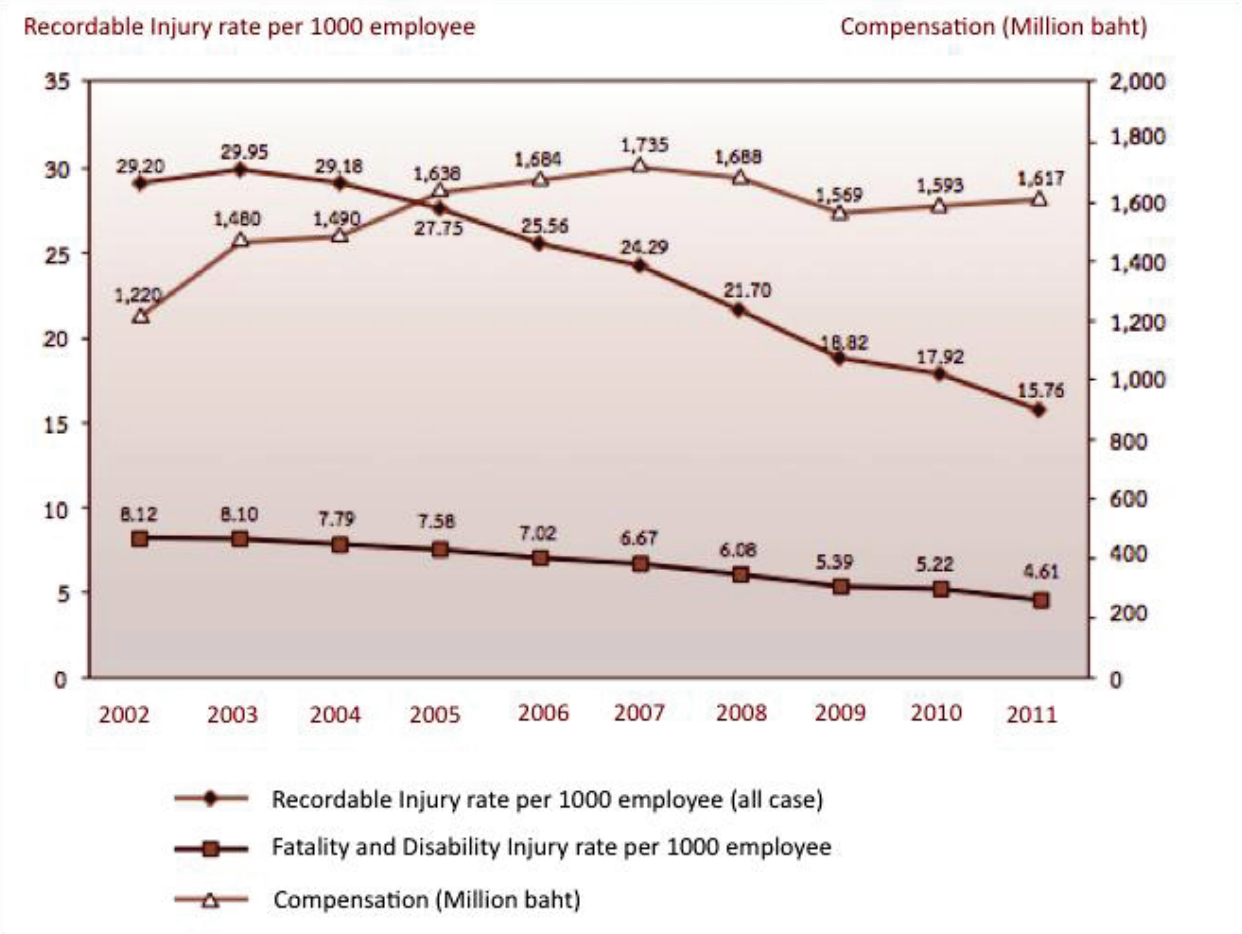

Table.2. Recordable injury rate vs Compensation of Thai Employee (Ministry of Labour, 2012)

In broad industry, accident injury trend in Thailand has reduced from 29.20 in 2002 to 15.76 in 2011 but the compensation has increased from 1,220 to 1,617 million baht as the severity of the accident increased e.g. fatality, disability and lost work day case. Thus, injured employee can claim the compensation with government agency as one of the law requirement. One of the reasons the compensation is high because government agency cannot control the large scale accident and government management (public sector) responsible area divide into province, district and sub-district level. Moreover, they have overlapping responsible area and office of their own with complicate hierarchy system. When large scale accident happen e.g. Refinery explosion, Major oil and gas leak and terrorism, government (public sector) cannot immediate respond and communication has been complicated. Thus, injury severity has unnecessary increased with higher the injury claim compensation. As the result, public sector cannot respond to medium to large-scale accident on time and making the company to rely on their own safety, risk and crisis management system and coordinate with other organization in their neighborhood in order to mitigate the incident which may be escalated.

There are many study of safety culture for high-risk industry e.g. nuclear, aviator and petrochemical in Europe, America and Middle East. On the other hand in Thailand, There is no theoretical or empirical for safety culture in Oil and Gas Company in Thailand and yet safety

culture still new in this country. In 1980s (table.3), the first approach (technique) for organization to reduce their accident rate by developing technology such as hardware and design to keep hazard away and prevent employee from entering the line of fire. Second is system approach, when technology is well implement in organization, which has been focused in early year of 2000 to improve employee capability using knowledge and training, conduct risk assessment, Plan Do Check Act (PDCA) by Deming and implement management system such as ISO: 9001, ILO-OSH 2001 and OHSAS: 18001. Organization using the standard and certificate as a business competitiveness as the number of certified company is increasing each year as more than 1.2 million certification of ISO 9001 and 14001 worldwide (ISO, 2009). On the contrary accident still happens to organization that improves their technology, hardware, compliance, competency using technology and system approach. Organization can control the safety equipment, engineering design; competency of employee and management system but culture and behavior cannot be controlled. The third is culture approach that focuses on leadership, safety attitudes and people.

Compare to Thailand industry, in 1980-90s, Occupational health and safety were not significant to production and quality since many industries aimed to maintain highest productivity as much as possible and the legislation was not fully enforcement by the government in term of safety management system. On-site improvement of engineering design, operating equipment and personal protective equipment (technology) were adopted in early age of Thailand industry. In 1999, government issued the first safety management system named “Thailand Industrial Standard (TIS:18001)” which referred BS880:1996 and BS OSHAS:18001. As result of Thailand incident trend were downward since 2003 but compensation rate was vice versa shown that only technology and system were not enough. Hence, improvement on safety culture in Thailand industry is needed in order to improve organizational behavior toward safety and accountability to individual work.

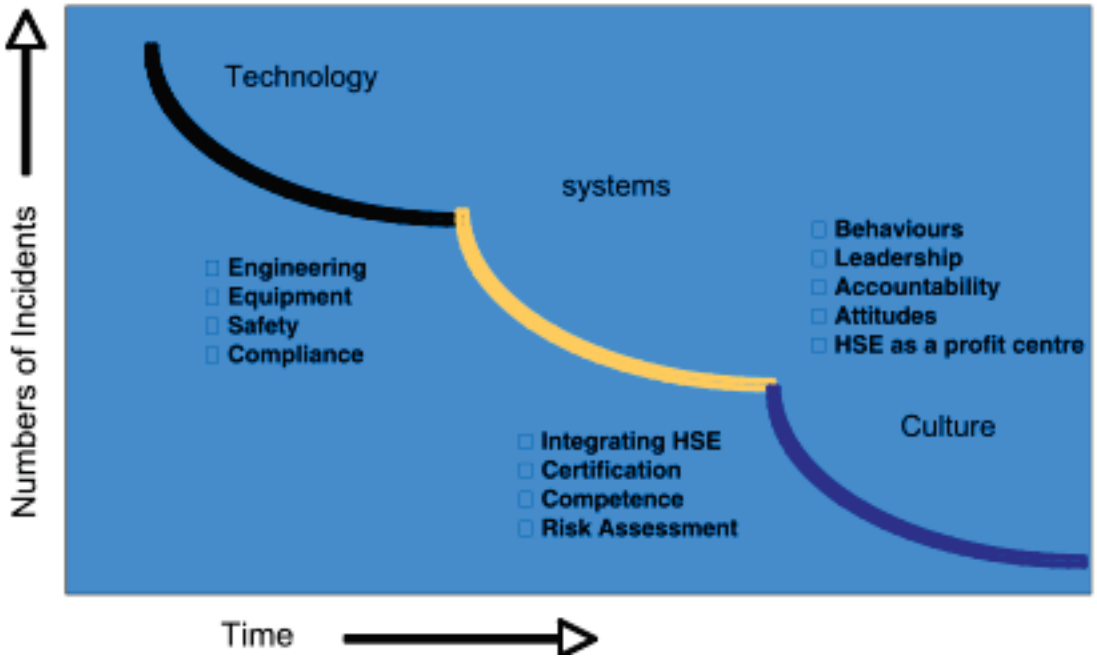

Table.3. Developmental line, culture becomes the next wave after system safety (Hudson, 2007)

The word "Safety culture" is originated after the Chernobyl disaster, nuclear industry, in 1986 as the behavior of employee can impact the outcome of safety performance (Flin et al. 2000). Failure to implement and sustain high level of safety performance in high-risk industry can cause disaster to their company, environment, and neighbor. In oil and gas industry, safety culture has been concerned since Piper Alpha disaster, which the consequence of the accident caused; company both reputation and financial damage in long term. In 2009 there were Montara accident, PTTEPAA, caused large contaminate to the environment, marine and wildlife. Moreover in 2010, there were Macondo in the Gulf of Mexico, BP failure from lesson learnt from Texas refinery accident in 2005 (15 fatality and more than 150 employee injured), which failure in process safety and human error can caused major accident event (MAE) as result of 11 men died and 17 injured, one of the largest oil spill in the history to environment, impact to social around the area and more than $17.7 billion have been spent on many years of response activity (BP, 2010). Those accident root causes come from poor safety culture & human error, cost cutting, integrity and reliability, core competency and wrong decision-making.

There are many definition of safety culture as the following;

- Safety culture has been described as the collective values and attitudes of the people in the organization; "It is the way we do things around here" (Changing mind, 2000).
- Safety culture can be simply defined as the attitudes, values and beliefs that underpin "the way we do things here" (OGP, 2010)
- The safety culture of an organization is the product of individual and group values, attitudes, competencies and patterns of behavior that determined the commitment to, and the style and proficiency of, an organization's health and safety performance. (ACSNI, 1993)

Reason (1997, 2007) also proposed that an organization with an effective safety culture: has systematic safety information, reporting culture, culture of trust among people, organization flexibility and willingness and competence to draw the right conclusions from its safety system. Reason also identified safety culture characteristics, which are;

- An informed culture-one in which those who manage and operate the system have current knowledge about the human, technical, organizational and environmental factors that determine the safety of the system as a whole,
- A reporting culture; a culture in which people are willing to report errors and near misses,
- A just culture; a culture of "no blame" where an atmosphere of trust is present and people are encouraged or even rewarded for providing essential safety-related information- but where there is also a clear line between acceptable and unacceptable behaviour and,
- A flexible culture which can take different forms but is characterized as shifting from the conventional hierarchical mode to a flatter professional structure.
- A learning culture – the willingness and the competence to draw the right conclusions from its safety information system, and the will to implement major reforms when the need is indicated

To identify and measure safety culture in organization safety climate is one of the tools which Flin (2001) mentions that safety climate can be regarded as a predicator for safety performance.

Safety culture impact both directly and indirectly to improve safety performance for instance, employees concern their safety and others may result in less lost time injury (LTI) and total recordable injury (TRI) in operation, poor quality inspection pass due to "it should be alright" or bad culture will be less as result of better process safety performance e.g. less fire and explosion. There are many researchers and organization implement safety culture model in order to improve safety performance. In this paper, safety culture framework and associate dimension for case study will discuss later part of the paper. In each model, there are dimension and organizational aspect shown in following table;

Table.4 Example of safety culture model, dimension and organizational aspect

Safety culture model by	Safety culture dimension/Organizational Aspect
Kao, C. S. (2008)	Safety Commitment and support, Safety attitude and behavior, Safety communication and involvement, Safety training and Competence, Safety supervision and audit, Safety Management system and organization, Accident investigation and emergency planning, Reward and punishment and benefit
Filho, A.P.G (2010)	Information, Organization learning, Involvement, Communication, Commitment
Lawrie, M (2006)	Commitment to HSE and care for colleagues, Balance between HSE and profitability, Workforce interest in competency and training, Work-site job safety techniques, Purpose of procedures, Repercussion and feedback after accidents, audit and reviews
Jirisuka (TMAP-EM, 2011)	Organizational for S&H management, S&H action plan, Implementation, Two-way communication, Education and training, Emergency action guide, Contractor management, System audit, System review, Document management
IAEA safety culture model*	Policy level commitment: State of policy, management structures, resources, self regulation Managers' commitment: definition of responsibilities, definition of control of safety practices, qualifications and training, rewards and sanctions, audit, review and comparison Individuals' commitment: questioning attitude, rigorous and prudent approach, communication
Total safety culture model*	Person: knowledge, skill, ability, intelligence, motives and personality Behavior: complying, coaching, recognizing, communicating, demonstrating Environment: equipment, tools, machines, housekeeping, heat/cold, engineering, standard operating procedure
Business excellence model of	Leadership, Policy and strategy, People Management,

Safety culture model by	Safety culture dimension/Organizational Aspect
safety culture*	Resources, Processes, Customer satisfaction, People satisfaction, Impact on society, Business results
System model of safety culture*	Leadership and support, Awareness, Responsibility and control, Competence and safe behavior, Reinforcement and support from SM process

**Remark: data from (KAO, 2008)*

Olive (2006) has stated the strong safety culture characterized by several traits as the following;

- Commitment to the improvement of safety behaviors and attitudes at all organizational levels
- Organization structures and atmosphere to promotes open and clear communication
- A propensity for resilience and flexibility to adapt effectively and safely to new situations
- A prevailing attitude of constant vigilance

In order to measure or assess organization safety culture can use three different approach based on time focus, information needed and methods (Guldenmund, 2010). The first approach is academic (anothropological) to focus things from the past by collecting qualitative information based on fieldwork, ethnographical-inspired methods (observation, documentation analysis, personal interview and open discussion in groups). The second approach is analytical (psychological) to measure the present by collecting the qualitative information on the safety climate based on scales and questionnaire. Safety climate can be regarded as a snapshot of organization's safety culture and also a predictor for safety performance (EU-OSHA, 2011). According to NRCWE, it is recommended to conduct a safety culture questionnaire with support from top management, clear direction, all staffs participate and committed during the process, voluntary and transparency. The last approach is pragmatic (experience based) to measure the future by using the safety culture maturity (level) based on behaviourally anchored rating scales (BARS)

Safety Culture is a part of safety management system (SMS) which generate vary safety culture characteristics based on national culture, organization culture, industry type and leadership style (OSHA, 2011). SMS is vitally important for all industries. Without good management system and priority to safety, a safe working environment cannot be achieved in our organization. Hence without SMS in organization, it is impossible to implement systematic system to enhance safety performance in organization e.g. ISO: 14001, OHSAS 18001 and ILO-OSH 2001 to comply with country minimum regulation and for business competitive purpose.

"Safety management may be defined as the aspect of the overall management function that determines and implements the safety policy. This will involve a whole range of activities, initiatives, programs, etc., focused on technical, human and organizational aspects and referring to all the individual activities within the organization, which tend to be formalized as Safety Management System" (SMS) (Papadakis, 1997)

SMS may comprised with many elements and activities such as incident reporting system, investigation system, risk management, safety culture development, process safety and safety organization. Those elements may be law requirement in some country to ensure SMS in organization. There are tools for SMS to determine hazard and prevent the accident and process safety failure from happening for example, Swiss cheese model and Bow-tie analysis. Those tools are using to identify the barriers (e.g. organization, task, environment, equipment and people) and mitigation plan if accident happens. The consequence of the incident can lead to major accident. Implementing SMS is the most efficient way of allocating resources for safety since it not only improves working conditions, but also positively influences employees' attitude, behavior and safety culture (Fernández-Muñiz 2007). By improve SMS, it will reflect organizational structure and process which driven by safety culture to generate safety performance measured by safety indicator (Guldenmund, 2010).

Safety Culture Maturity Model

After the Chernobyl disaster in 1986, safety culture has been highlighted in high risk industry and studied by many researchers. The first stage of study, the type of safety culture has been identified into 3 stages which are pathological, calculative/bureaucratic and generative. Pathological is care less about safety and failure is covered up, bureaucratic/calculative level is the safety is just in place and organization feel comfortable on what they have even they can improve. Generative stage, safety behavior is fully integrated into employee's mind and everything they do. (Westrum & Adamski, 1999; Westrum 1991; Weick, 1987) Later on, safety culture has been extended into 5 level which reactive and proactive have been add into it. (Reason, 1997) As they aim to broaden the framework, more suitable to classification for better implementation to organization and improve the organization through increase the safety culture maturity level. In depth research of 5 levels has been defined and conducted to Oil and Gas industry in more detail set of descriptions of different type of different safety culture e.g. communication, organization attitudes and behaviors. The validation has been made with interview of senior oil and gas company executives.(Hudson, 2001; Parker, 2006). This model has been later successfully implemented to the royal dutch/shell company as "Heart and Mind program" in 2007 and is one of the best practices in oil and gas industry which aims to identify the maturity level of the organization toward the safety. Moreover, it has been highlighted into OGP report and EU-OSHA in 2010 as recommendation for safety culture improvement.

In this study, the analytical approach has been selected by developing the safety culture questionnaire to provide the surface feather of employee's perception and attitude toward safety culture. This approach is to align with company direction to measure safety culture level in order to adjust company strategic short and long-term plan to improve their safety culture and performance in organization level. Once the safety culture has been identified, gap analysis should be conducted to create a plan or roadmap in order to shift culture to proactive or generative level. The survey is designed based on International Association of Oil and Gas Producers report No. 435 (OGP, 2010), which has been used successfully by other oil and gas major to identified and evaluated particular cultural level, best practices in E&P industry e.g. hearth and minds program (Shell, 2007) and also from the academic "A framework for understanding the development of organizational safety culture" (Parker et al., 2006).

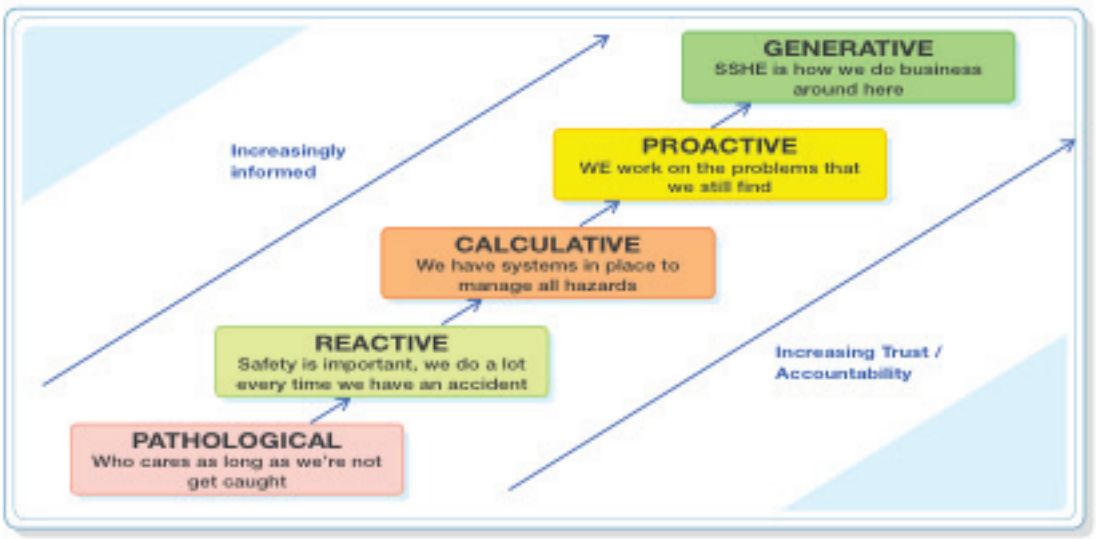

Figure.1. Safety Culture Maturity Model (Hudson, 2001)

The model used is HSE Culture ladder by "International Association of Oil and Gas Producer" (OGP), the concept has supported by Hudson (Fig.1, 2001) that define safety culture maturity model into 5 levels;

- Pathological organizations believe that individuals, typically at lower levels, cause accidents. They implement only what is mandatory, including required checks and audits. Most HSE tools are ineffective at this level, as HSE is considered an obstacle to operations. Pathological organizations respond to clear regulatory requirements, if enforced, and implement HSE programs only as needed to avoid prosecution.
- Reactive organizations consider HSE important but believe that most problems lie within the lower levels of the workforce. Organizational and individual HSE management skills are at a basic level, suggesting that HSE tools should also be simple. Tools appropriate at this level are those that address problems obvious to both management and the workforce. Tools that relate to issues that have not yet caused actual accidents are difficult to justify. Reactive organizations value those tools that bear a clear relationship to a visible issue.
- Calculative organizations believe in the value of systems in managing HSE performance and the use of a large number of tools and training. The focus on the tools is usually through analyzing metrics rather than their effectiveness i.e. number of people trained rather than an assessment of their competence. HSE professionals are seen as the drivers for the use of HSE tools and are primarily responsible for HSE performance.
- Proactive organizations consider HSE a fundamental ("core") value and leaders at all levels genuinely care for the health and well being of the staff and contractors. Such organizations understand the role of management system failures as primary causes of incidents. Information, including data related to potential consequences (near misses) as well as actual incidents, is used to identify suitable performance targets.
- Generative organizations have a high degree of self-sufficiency and strive to understand their entire operating environment. Tools that are chosen and used by the whole

organization are preferred. Mandatory tools may be counter-productive, suggesting lack of trust. Everyone feels free to highlight both real and potential issues. Workers feel empowered to resolve HSE issues, and leaders provide the support needed.

Importance of SMS and safety culture toward Sustainability development in Organization

Volunteer company received policy from Mother Company in 2011 in order to improve safety culture in organization (as one of the key success to create effective SMS). By improving the safety culture, it can benefit both direct and indirect to organization e.g. preventing major accident, increase employee morale and strengthen safety environment in operation. Moreover, Mother and volunteer company set target of moving into fortune 100 in 2012, by creating sustainable development in organization, which comprised of business, social and environment concern, aims for ISO 26000, to be listed in Down Jones Sustainability Indexes (DJSI) Company and have transparency in Global Reporting Initiative (GRI). To create sustainability and ISO 26000 in organization, company has to put importance into occupational health, safety and safety culture as they have direct impact with social progress, economic and environment e.g. labour standard, human right, revenues, shareholder return and spill prevention. For example, OHSAS 18001 and ILO-OSH: 2001 have focus on Occupational health and safety (OH&S) for manufacturer and producer perspective. They concerns much on how to improve the organization SMS and eliminate the hidden risk in operation based on the "Plan Do Check Action" (PDCA) by Deming. On the other hand, those are sub element in creating an overview of ISO: 26000 which highlighted in clause: 6.4 Labour practices, 6.4.6 Health and Safety at work and 6.4.7. Human development and training in the work place. To create a systematic ISO: 26000, SMS can be viewed as one of the prerequisite to build a solid foundation of OH&S, once it has been strengthen, expanding to consumer side is easier via social contribution as one of the ISO:26000 element.

Moreover, they have to follow each country legal and obligation requirement (clause 4.3.2) for employee who work in the company to have a safety working environment for instance, proper personal protective equipment, known hazard in working area, competency training depend on job and accident prevention. Hence, CSR can provide framework to OHS and other relevant aspect in ISO: 26000 such as clauses 6.3 Human rights, 6.4 Labour practices and 6.5 the environment. Moreover it can remind OH&S of its' importance that are usually forgotten in organization.

To be socially responsible means to think beyond just law requirement, by investing in human capital and managing relationships with the social stakeholders that are affected by consequences of the firm's decision. OH&S can being conceived as an integral, essential part of CSR. In development state of CSR, the more organization wants to improve its social reputation; OH&S can be considered as one of the instrument for CSR development. (Montero, J.M., 2009). The importance of CSR can be seen in 90% of top companies in Fortune 500 have invested in this section. (Kotler & Lee 2004) By having SMS as a prerequisite, it cannot guarantee to achieve creating sustainability development in organization because it comprise with other as well. On the other hand, effective safety culture (Proactive and Generative) can reflect effective SMS which cannot be achieved with only one or two aspect but all together. (table.3)

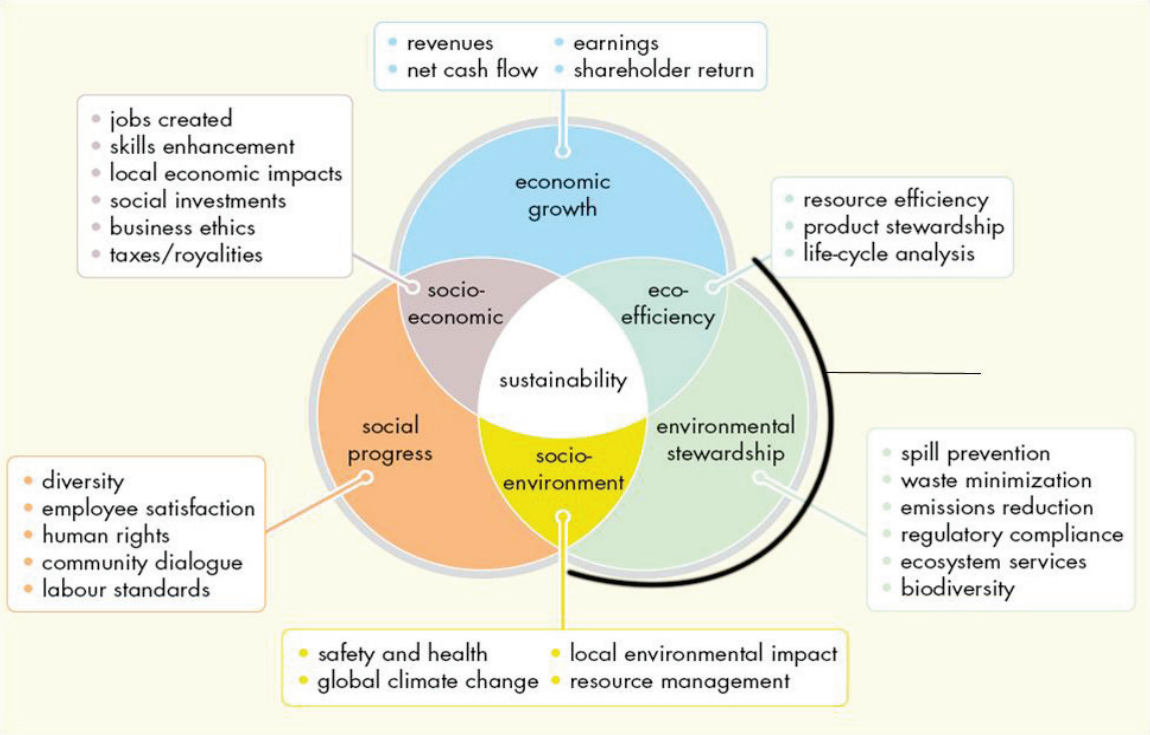

Figure.2. Volunteer company Sustainability framework (Volunteer, 2011)

This study is to confirm if "OGP Report No.435: A guide to selecting appropriate tools to improve HSE culture" are applicable and suitable for Oil and Gas industry for Upstream business in Thailand and others country subsidiary or not. Since developing safety culture in one national level may be fail to apply the same benefit in other countries (Hudson, 2007). One company, headquarter in Thailand, has volunteered for the study. The study has conducted more than 150 sessions of safety culture questionnaire in 10 locations (head office, operation site, drilling rigs, construction and exploration site) in 4 countries (Thailand, Oman, Algeria and Myanmar). Each session has 10-15 minutes of introduction on how to answer the questionnaire (likert scale, 1. pathological to 5. generative), and the explanation on each question. The result of 2,251 employee participated including safety personnel. There was 74% of target group participation across the company. The questionnaires break down into quanlitative description of each safety culture maturity state. Those based on 7 elements of company safety management system. The survey collects the age, year of experience, job position and etc. The score for each location are different depending on culture in each country and organizational culture evolution which has three stage; Founding and Early Growth, Midlife and Maturity/Decline (Schein, 2004)

Chronological SMS implementation of Volunteer Company

Regarding from table.3, trend of accident has been reduced and mitigated from 3 key areas of improvement from past to present of Technology, System and Culture (Hudson,2007). Comparing to volunteer company, it has continuous improved in safety, security, health and environment since 1994 in order to comply with international standard and industry trend.

Improvement can also categorize into 3 specific areas base on table.3 and examples are the following;

Table.5. SMS improvement of volunteer company based on Hudson model (2007)

Technology	System	Culture
1994: Establish HSE and Audit department to make sure compliance in organization	1996: Strengthen HSE internal system via compliance, audit and HSE risk assessment	1996: Developed Internal HSE Awareness survey and continuous promote
1995: Establish HSE management system, policy, committee	1996- present: provide HSE training for corporate level	2003-present: Benchmarking safety performance with OGP and peers to motivate to top quartile E&P company
1995- present: improved operation via new technology investment and hardware improvement e.g. invest new equipment and man-machine separation, close loop system and hazardous material treatment	1997-present: Implemented SSHE Management system to in line with OGP, ISO:14001, ISO 9001, ISRS and OHSAS 18001	2006 – present: Implement Behavior based safety, Felt leadership, Step change in Safety, Safety toward sustainability and life saving campaign, enhance safety leadership and commitment, safety line responsibility
1996- present: Issued corporate HSE standards, procedures, and guideline	2010: Conduct Corporate Risk profile via risk assessment	2011 - present: Introduce and implement safety culture maturity model and safety culture questionnaire with result

As high-risk industry, volunteer company cannot independently improve only one category and wait until it shows an improvement result. As the result of failure in one category implementation can significantly reflect others e.g. failure in audit and compliance in maintenance and inspection safety critical equipment can result in explosion and plant shut down. Therefore incident trend can reduce with good combination of technology, system and culture in organization. Organization safety culture can look deeper in to safety culture maturity level from pathological to generative. High level of organization safety culture require certain level of technology and system e.g. audit with peers assist and benchmarking performance with international organization (OGP, 2011)

FRAMEWORK

OGP report No.435 gives us the HSE culture ladder, which generate into 5 levels e.g. pathological, reactive, calculative, proactive and generative. The report provides the description and tool guide to improve HSE culture in each HSE culture. To identify the organization HSE safety culture or safety culture maturity level, safety culture questionnaire is needed. The survey developed from OGP report, Heart and Mind program, and academic research (Parker et al.,

2006, Hudson, 2001). The 7 dimensions have been chosen to match organization SMS, referred to ISO:18001 and easy to recognize by employee. The description for each dimension (attribute in survey) describe as the following;

- Leadership and Commitment: Top-down commitment and Safety, security, health and environment (SSHE) culture essential to the success of the SSHE management system
- Policy and Strategic Objective: Corporate intentions, principles of action and aspirations with respect to SSHE
- Organization, Resources and Documentation: Organization of people, resources and documentation for sound SSHE performance
- Evaluation and Risk Management: Identification and evaluation of SSHE risks, for activities, products and services and development of risk reduction measures
- Planning and Operational Control: Planning the conduct of work activities, including planning for changes and emergency response
- Implementation and Monitoring: Performance and monitoring of activities, and how corrective action is to be taken when necessary
- Audit and review: Periodic assessments of SSHE management system performance effectiveness and fundamental suitability

In each dimension there are sub element standard to support every hierarchy level e.g., Corporate oversight, roles and responsibility, due diligence, contractor management, risk management, training and competency, permit to work, operational safety and asset integrity management. The framework is based on OGP report, literature review(Parker et al., 2006) and "Heart and Mind" program from Shell and with volunteer company – HSE division validation.

METHOD

International Association of Oil and Gas Producers (OGP) report No:435

The report provides tools which can be used to improve HSE performance in each safety culture maturity level from pathological to generative. 15 HSE tools from OGP report e.g. reporting/recording HSE information, incident investigation, HSE management system (ISO: 9000, ISO: 14000 and OHASA: 18000), questionnaire and survey, were selected to match with company SMS as the starting point for develop safety culture questionnaire.

Table.6. Example of HSE tools in each safety culture maturity level (OGP, 2011)

	Tool type	Description	Pathological	Reactive	Calculative	Proactive	Generative
1	Reporting and recording HSE information (incidents & near misses)	Mandatory reporting	→	→	→	→	→
		Anonymous reporting		→	→	→	
		Confidential reporting			→	→	
		Open (non-confidential) reporting			→	→	→
2	Incident investigation and analysis	Incident investigation (mandatory)	→	→	→	→	→
		Root cause analysis			→	→	→
		Proactive analysis				→	→
3	Auditing	Professional audits	→	→	→		
		Benchmarking			→	→	→
		Management system audits			→	→	
		Management site visits		→	→	→	→
		Peer assists				→	→

Selecting certain tools is likely to be ineffective and given negative feedback to wrong HSE culture. For example, Manager and supervisor HSE training maybe ineffective in low safety culture level comparing prioritize training to workforce level, anonymous reporting HSE information may require for reactive and calculative level rather than open reporting which suitable for proactive and generative organization. The higher of safety culture level in organization, the better and easier of safety improvement it can be as employee and supervisor are positive for improvement. While low level of safety culture level see the same situation as negative auditing their performance and checking their operation.

Management acceptance

Volunteer company bought Royal Dutch/Shell Group's entire Thailand upstream petroleum assets in 2003. After merged with Shell, company continuously adapts and improves their SMS along with their personnel as the result of current SMS has tailor from both companies. When firstly introduced the safety culture maturity level to HSE personnel, there were no resistance toward the concept and theory as the company SMS of 7 dimensions (elements) are much alike with Hearts and Mind program with long history of Shell implementation and more than 10 years of academic research. Top management understands and supports the concept of improve organization safety culture level by knowing where they stand in safety culture ladder first and create the roadmap toward improvement

.

Questionnaire

Questionnaire has been implemented from OGP report No.435, Shell best practice in E&P business of Heart and Mind program and academic researches. 20 questions have been selected

and developed with each information dimension, 1-5 ranking scale from pathological to generative. The survey package not come only the questionnaires but also combines with many items e.g. understanding and developing safety culture in organization to show its importance toward safety and corporate strategic objective, CEO message to show top management support, correlation between safety performance and behavior base safety, objective of safety culture questionnaire and its life cycle how to improve after getting the result.

Pilot test

Pilot test has been conducted and validated with HSE division before the campaign launch. The questionnaire, 20 questions, has been presented in Corporate HSE division monthly meeting and asked to fill up and comment the survey. Members are from many disciplines for instance; Occupational health and safety, Safety engineer, technical safety, environment engineer, operational safety, safety advisor and analyst with experience range between 1 – 35 years in safety field. Few adjustment and comment have been identified to the survey in order to comply with organization. Overall feedbacks from HSE division are positive and results are practical in volunteer E&P organization to find the state of safety culture maturity level. The reliability testing for questionnaire with 20 items had conducted by using cronbanc's alpha and the result shown in Appendix A, Table 11. Attribute 1, 4, 6 and 7 had acceptable reliability coefficients. While attribute 2 and 3 shown the coefficients is below 0.6 but could not be improved by removing any of the items.

Respondents

The safety culture questionnaire has been supported and kicked off from Management Committee level to encourage employee to participate in this survey. The roadmap has been made, follow and continuous promote 1-2 months before the survey conducted in all 10 location for both onshore and offshore operating asset, construction site, drilling rig, exploration and seismic in both domestic and international country. 150 plus session were conducted with 2,251 employee participated as 74% of target group participation across the organization.

RESULTS

Organization safety culture maturity level

The average corporate score of the questionnaire is 3.33 or calculative level that describe in 7 attributes of company safety management system and 20 questions. Volunteer company has improved their safety performance continuously as result shown in lost time injury frequency (LTIF) and total recordable injury rate (TRIR) which better result benchmarking with OGP and other peers. The changing perspective of top management toward to HSE is there was major accident in gulf of Australia, 2008 that caused significantly impact on financial, reputation, and production to company. As organization see the current status of safety culture maturity, in each element and attribute require different methods, actions and time for improvement. The result shown that the 3 lowest score are safety talk, who check SSHE in daily basis and benchmarking with 11%, 10% and 6%. This reflect the organization culture which before the questionnaire

conducted, each location concern about safety that related to their task and tools for knowledge sharing and centralization e.g. tools box talk, hazard reporting campaign, corporate statistics were in place but been put aside and insignificant. In additional, safety talk requires leadership and support from top management to be role model for subordinate to follow; communication and who in charge have to be clear and visible.

Bad example of management in production informal comment toward safety

> "When accident happens, it is not a job for front line but corporate safety to investigate and create a countermeasure, conduct a gap analysis and report for us. We have other task to complete not this."

This shown bad and traditional conflict between safety and production issues as production team has no safety concern and poor knowledge. In multi-national organization, if lines of responsibilities have no safety ownership in their work, it is very hard to maintain safe environment in their operation and priority in safety is insignificant. Safety culture maturity level cannot be improved without solving this problem. Head of safety division of volunteered company stated that for this problem management perspective can be changed by reflecting their safety performance indicator e.g. lagging and leading indicator in corporate level to their KPIs, why still accident happen when all SMS are all in place?, Safety leadership and importance from line of responsibility is needed (HSE Division, 2011).

Result comparison: Safety culture questionnaire vs OGP: HSE tools

From figure1 and table.3 shown the importance of safety culture, which categorized into 5 levels and company cannot improve safety culture independently without good technology and management system in place. To identify safety culture maturity level in organization, safety culture questionnaire is necessary to measure organization safety culture level. Then to move up safety culture level in organization, understanding on each tools to improve culture along with proper SMS and technology are fundamental. Good safety culture in organization can assist implementing sustainability and ISO 26000 easier as it related in figure2 for instance company revenue and stakeholder return increase due to cost reduction in facility report due to explosion accident and recuperation cost to employee decrease. Moreover, OGP provide 15 HSE tools, which effective and accepted for each safety culture maturity level for instance HSE risk management and situation awareness. To validate volunteer company safety culture questionnaire result with OGP tools is necessary to confirm whether company uses the appropriate tools with their safety culture level or not.

From table.5 provide with matching OGP HSE tools with safety culture questionnaire attributes, average safety culture maturity result, volunteer company current tools and comparison result. The results from safety culture questionnaire are applicable to OGP report and can measure safety maturity level of volunteer company in Thailand. Moreover, it shown that volunteer company develops SMS and tools match with their safety culture level.

Safety culture maturity stage of each location

Volunteer company is a large multi-national organization in many countries. The safety culture maturity for corporate level and each operating location has been measured by safety culture questionnaire. Each location's job scope is different and safety management system and culture has developed by management level, safety manager with corporate HSE division assistance. There are old and new locations that have different of safety history and services year from 2-30 years. Those have been tested by pearson correlation to find the relation between safety culture maturity level and location service year and found the result is not correlate ($n= 10$, $r= 0.19$, sig 2 tail = 0.58, $p>0.05$). Long length of service with poor safety culture maturity level can reflect in poor management leadership, misdirection of safety culture, insignificant of safety performance, bad safety attitude of supervisor and employee level.

DISCUSSION

Different from other safety culture questionnaire

The survey has been launched with HSE division annual campaign, to identify corporate safety culture maturity level, and strong commitment from CEO. Moreover, it is not just send the survey with description and waiting for respondent rate, it has been explain by engineer e.g. what is the survey for, each element description and way forward, in small group sessions (approx 30 persons) with 150 sessions in 10 different locations. Top management are very positive for this survey and greatly support for this activities for instance top management are the first group completed the survey, employee can use their non-busy working time to attend the survey session, pilot testing with HSE division, can be use as employee safety KPI and promoting the campaign, it is sure not get good participation and result in the survey without their support. This method of surveying all employees are different from Hudson & Willeke (2000) conservative method that only focuses evaluation by manager than operators and supervisor as they better calibrate the result. The conservative method can give us the overview result of safety culture but to drive and create culture shift, result from everyone in organization are needed.

Uncertainty

The survey result found that in some location or division, especially employee in front line level, may bias to this survey as the result was off the group. The discussion has been made with that location management level to verify the data whether there are actually work related issues or not. Result found that there are some sensitive matters with welfares, personal negative attitude toward safety officer. 1% of sample size has been excluded from result analysis due to uncertainty of the answers given.

Analysis

From the result shown the company position of safety culture maturity is in calculative level. Each element categorized into each job position and location shown in percentage. Those can give feedback on how corporate will to tackle this problem to improve employee's mindset to

higher level. HSE division needs to create a visible leadership and support to all employee level in order to show that they are not relying on each location safety management system but also from corporate level. From survey result shown the area they should focus on e.g., procedures corporate oversight in organization level, improve SMS in specific location, create more standard and procedures in each specific job.

Not only the result shown where organization stand in the safety culture maturity level, HSE division can also use results of the survey to adjust their long term plan and roadmap in order to create an effective culture shift in organization. Certain techniques use effectively in one safety culture maturity organization is not guarantee to be successful in other lower culture level as they have not reached certain level of maturity (Flemming, 2001; OGP report, 2011). As company knows where they stand in safety culture ladder, they have to be more focus on contractor management for those safety culture maturity levels lower than the company itself. As contractor cannot meet maintain the safety standard and level as company itself which need more supervision working in company area.

First stage: Volunteer company capability develop from Pathological – Calculative

In founding and early growth stage, volunteer company established in 1992 as National Exploration and Production Company. From safety culture questionnaire reveal the stage of maturity level of volunteer company at level 3 Calculative. We can assume that in total of 19 years since the company has founded, safety culture has been continuously improved and can trace back their performance shown by safety statistics. Each stage of maturity level has different on how employee act and respond to each tool e.g. the quality of incident report and investigation result are based on the maturity level; just to complete the report in low level and more detail and conduct root cause analysis in higher level. In safety culture maturity model; each step is comprise of safety attributes categorized into 3 key areas as indicated in Table.3 and we can confirm the development of safety maturity level of volunteer company from chronological improvement for 3 keys area with EU-OSHA and OGP validation. The higher safety culture maturity in the organization, the more complexity and relationship between each attribute are. From pathological to reactive (capability improvement), safety are in place but not well constructive as organization tends to be in Founding and Early stage of life cycle and importance of SMS is insignificant comparing to production and quality. Moreover, blame culture and hidden report when incident happen are likely to be seen on this stage due to production and profitability are more important than safety and culture themselves. By implementing standardization and essential technology in each industry help establishing SMS into the system in early stage e.g. ISO 18001, TIS 18001 and ILO-OSH: 2001. On the other hand, calculative to generative (maturity improvement) require good combination of technology, system, positive culture and time for organization to recognize the importance of safety together with management. On this stage, even organization invests more into technology and system, culture is not likely to significantly improve as the first 2 stages due to improvement should focus on people interact with technology and system. By lacking one another of key areas, safety culture cannot move to another step. The better safety culture maturity level in organization, the better employees are willing to change to improve safety in operating site and cares for their colleagues.

Volunteer company roadmap to create culture shift from Calculative to Generative

From safety culture questionnaire/climate survey in 2011, the result shown volunteer company is in Calculative level (level.3). To create a culture shift from calculative into proactive and even generative, volunteer company creates 3 years plan roadmap to enhance the safety culture in prior to next survey. It can summarize into 5 actions as the following;

1. **Safety moment in all meeting**

The result from safety culture questionnaire shown the safety talk is the lowest score among all questionnaire. This reflect poor safety awareness in the organization with mean = 2.93 and standard deviation = 1.11. To change organizational behavior toward safety talk, safety team has to create a safety talk database for everyone usage. Corporate safety encourage before every meeting start, it should begin with safety talk or sharing to all member. It can be information sharing either work or non-work related to build up safety awareness in corporate and operation level. Safety team has taken serious action of being representative of safety talk in early stage of the campaign using Top-down approach in every management committee which led by CEO, conducted twice a month or more. Once management understands and use to the safety talk, implementation in lower level is easier with their support. From this change of employee and management in safety talk in broad organization, it took at least a year to see the improvement for volunteer company. Moreover, safety talk has been indicated as one of the element in annual safety key performance indicator for leading indicator of all management in organization to ensure its effectiveness in top-down approach.

2. **Safe and Happy workplace**

This action aims to create common understanding of "safety is everybody's responsibility" via different communication route internally e.g. visualize safety policy and campaign and technical information board in various location in headquarter and operating asset. It also encourage employee to report on "good" and "to be improved" regarding behavior, equipment and process by using "Safety observation card", "Hazard reporting card" and transparency in incident reporting. The succession of this action depends on how employees see the campaign as encouragement to improve not finding and line of management see this action as positive action not negative. Hidden reports, ignorance to improve and change are likely to happen if employee and line of management have negative feeling and blame culture in organization. Moreover, in this action, corporate safety should develop a campaign to improve safety in organization for incident statistics, increase employee awareness and create a common understanding and also roll out the campaign in corporate level and in each operating location.

3. **Safety Cares and Safety Share**

Information and Knowledge management has been highlighted in this action. Internal communication has been improved with intranet to be center of information sharing for safety policy, standard, procedure and guideline with highlight activities. In addition, safety has become part key activities in organization e.g. operational excellence, sustainable development, corporate

communication, risk management, project and technical review. This is to put safety into every related campaign as to make it visible to employee and put into the beginning of design phase in every project to make sure it comply with safety requirement. The result of safety culture questionnaire shown employee in the head office has the lowest score among all location. This is a stereotype of office work e.g. human resources, financial, and planning division. Those always have safety awareness lower than operating level due to the nature of working environment are different. To create a culture shift in organization, this area needs to be improved by using safety line partner concept to strengthen safety information sharing and communication between each division in company. The concept is to have a safety representative for each division to summary each month safety performance, way forward, area of improvement and receive feedback as two-way communication to improve safety performance and raise safety awareness in corporate level. Moreover, in high risk division e.g. construction, drilling, and production; corporate safety will provide them with safety advisor to make sure all risky activities are comply with safety requirement.

4. Safety is a license to operate

Volunteer company is in high-risk industry, they do not tolerate any mistakes because it signifies the future and prosperity of the organization. This is to ensure best practice to comply with corporate safety management standard for instance safety due diligence, competency assessment and safety technical audit. Company's growth has continuously increase not only in domestic but also international since 1992. Employee and contractor tend to exposure with risk in climate change; rush work, tight schedule and unfamiliar atmosphere. To comply with SMS, implement of safety document e.g. standards, procedures and guideline must cover all operation for employee to understand the nature and caution of each work beforehand and following the given instruction. Those aim to minimize the risk as low as possibly e.g. commissioning, decommissioning, drilling and seismic. In low safety culture maturity level, the importance of standards, procedures and guidelines are shown only when incident or unexpected event is occur in the system and clarification is needed. On the other hand, in higher level, employee tends to comply with them and always conduct risk assessment when there are changes in the system. When all documents are in place, safety corporate has to roll out to everyone in the organization in order to have common understanding and create a compliance culture. To confirm whether operating level use standard, procedure, guideline or not, safety expert and line of management have to conduct audit and review periodically. Moreover, corporate safety has introduced leading indicators to all employees as one of the annual safety KPIs as to preventing unexpected event from happening as lagging indicator, e.g. LTIF, TRIR and LOPCR, provide area of improvement in each operating location.

5. Safety mindset

In this action aims to improve the safety culture in organization and understand the safety target and goal of incident-free organization in the future. To have everyone understand the same safety languages, training course provided by corporate safety is required to all employee in organization. The course is to show importance of safety culture, raise employee safety awareness, and understand the existing tools, safety as prerequisite by the government for each

country and SMS in organization. Company benchmarks safety performance with peer in domestic & international level and comparing to "International Association of Oil and Gas producers" (OGP). Therefore, it is to motivate both employee and management to drive company to achieve top quartile performance in global level. Moreover, corporate safety statistics has been updated to CEO and top management in every management committee meeting to raise awareness and caution in safety situation. If accidents are trending upward, CEO, corporate safety and line of management will send the alert notification to all stakeholders to be aware of the situation and line partner will close monitoring the operation level to prevent incident for reoccurrence.

CONLUSION

The safety culture maturity has been identified and organization learns its own position for developing future implementation plan. The result from safety culture questionnaire and implementation of "OGP Report No.435: A guide to selecting appropriate tools to improve HSE culture", best practice from E&P industry and academic research are practical in Volunteered Thailand E&P company and their subsidiary with good positive feedback from top management and HSE personnel. Research team and HSE division agree that top management leadership is very important and to make it visible to front line level require an effective communication e.g. SMS and behavior base safety mini-road show from corporate, safety commitment from line of responsibility, tools box talk and importance of good safety statistics result. When safety is a common thing in everyday operation, employees are easier to say what is wrong their normal routine and willingly to keep safe working environment and behavior. Moreover, line responsibility is important as safety is not only a task for corporate HSE to maintain the good safety performance but line management should take ownership all in their task. Those are included into volunteer company roadmap to create a culture shift to another level which all actions have been tailor made according the gap shown in safety culture questionnaire result. 5 actions in volunteer company roadmap may different in other organization and country due to focus area and culture are different. Roadmap aims to increase safety awareness for employee in different methods and many communication channels under the concept of development technology, system and culture together. Hence, to improve a culture with the same technology and system will take a long journey to complete. There are no prerequisites for each action; it can be implemented at the same time with other action as proper. We can monitor the result of the implementation by looking at the lagging indicator for instance incident rate after kick off the campaign. If the root cause/underlying cause are still human factor/error, it mean we have to trace back on what component we are missing. e.g. "does enforcement in some safety issues are necessary for change?", "do we need more top management leadership and commitment?" and "why injure person act like that and the motive behind his act?". By monitoring not only the incident but other area in action plan e.g. participation in safety campaign and compliance to safety standard can act like a small adjustment in order to create an high level of safety culture level in organization. In 2012, the roadmap helps volunteer company to improve their safety performance to be the best in their history of LTIF, TRIR and incident severity has been reduced. There are limitations for this study; the study has conducted to only one volunteered upstream business in Thailand. More company needs to test if framework will practical in other E&P company and broaden into other industry in Thailand or need to revise in any element.

INVESTIGATING THE PERCEIVED OF E-LEADERSHIP STYLE CHANGE AND ITS CONSEQUENCE IN VIRTUAL CONTEXT

Kai-Tang Fan, Lunghwa University of Science and Technology
Email: ktfan021@gmail.com

ABSTRACT

The main purpose of this study was to test the prescriptions for virtual leadership and leadership style change, based on the situational leadership theory. This study first manipulated virtual leadership by using email in accordance with transformational and transactional leadership theory. Then, this study investigated the possibility of changing leadership style and examined its effects on leadership effectiveness.

This research employed a 2x2x2 factorial experiment design to investigate the impacts of virtual leadership style (transformational vs. transactional), leadership style change (transformational to transactional/ transactional to transformational/ pure transformational/ pure transactional), and control mechanism (process-oriented vs. outcome-oriented) on leadership effectiveness. 130 undergraduate students served as virtual team members that were required to use a Web-based group decision support system to support their teamwork.

The results indicated that perception of transformational or transactional leadership style and leadership change was significantly stronger in accord with the assigned situation. Further evidence revealed that the interaction effect of leadership style change and control mechanism on leadership effectiveness were also significant. Corresponding to the situational leadership theory, the leadership matched with control mechanism led to higher leadership effectiveness relative to the mismatched condition. This research yield important inferences regarding the situational leadership in virtual context. The suggestions and contributions of this study as well as the managerial implications are also presented.

Keywords：Virtual leadership, Leadership style change, Situational leadership theory

INTRODUCTION

Virtual collaboration is a relatively new trend in knowledge-based society. It offers a wide range of potential benefits to organizations (Townsend, DeMarie, & Hendrickson, 1998; Powell et al., 2004). The increasing popularity of research has focus on examining many aspects in virtual context (Powell, Piccoli, & Ives, 2004). For instance, Microsoft often uses virtual teams to support major global corporate customer sales and post sales services (Jarvenpaa, Leidner, & Pearlson, 1995). How do people cooperate in virtual context? People who works in virtual context are most typically consisting of groups of geographically and/or temporally dispersed members who accomplish their work primarily via information and telecommunication

technologies (Ocker, 2005; DeSanctis & Poole, 1997; Jarvenpaa & Leidner, 1999; Lipnack & Stamps, 1997; Powell et al., 2004), such as computer-mediated communication (CMCS) and group decision support systems (GDSS) that may help facilitate the group problem solving processes and improve the decision quality.

Past research have identified that leadership is vital for team effectiveness in virtual context (Kayworth & Leidner, 2001/2002). Some theorists believed that leadership can be classified into transformational and transactional leadership (Burns, 1978), and the transformational leadership is vital for many behavioral outcomes (e.g., Avolio, Waldman, & Einstein, 1988; Avolio, Bass, & Jung, 1999; Bass, 1985; Yammarino & Bass, 1990; Bass, 1998; Shin & Zhou, 2003). For example, Sosik, Kahai, and Avolio (1998) conducted a laboratory study with one hundred fifty-nine undergraduate students to examine the effects of transformational leadership on creativity. The results showed that higher level of transformational leadership showed more creative performance, such as idea elaboration, flexibility in idea generation, and proposals of original solutions.

Traditionally, organizations or teams mostly rely on face-to-face (FtF) meetings in problem solving process (Ocker, 2005). Leaders can communicate with subordinates through multiple modes of face-to-face conversation, such as paraverbal (tone of voice, inflection, voice volume) and nonverbal (eye movement, facial expression, hand gestures, and other body language) cues (Warkentin, Sayeed, & Hightower, 1997). For that reason, leaders can also deliver important message or information to subordinates simultaneously. Unlike traditional teams, most virtual workers may have to communicate and work synchronously or asynchronously through computer-mediated communication systems (CMCS) or such technologies as telephones, e-mail, audio/video/data conferencing, electronic voting and collaborative writing (Coleman, 1997). Therefore, the implementation of virtual collaboration will pose significant challenges for organizations, especially leadership (Kayworth & Leidner, 2001/2002).

Avolio, Kahai, and Dodge (2000) argued that the nature of leadership is fundamentally the same, whether in FtF or virtual context. Amabile, Schatzel, Moneta, & Kramer (2004) noted that in FtF teams, leadership behavior does influence subordinates perceptions, in turn, influence creativity; however, in virtual context, several researchers (e.g., Mcgrath & Hollingshead, 1994; Nunamarker, Briggs, & Mathews, 1995; Sosik, Kahai & Avolio, 1998) indicated that the role of leadership in promoting subordinates' creative performance in GDSS groups has been largely ignored. For virtual teams, information and communication technology (ICT) often limits communication media and hence provides less effective support for the group problem solving processes. Lee (1994) considered e-mail to be a rich media and was capable of supporting managers' exercise. Leaders in virtual context can lead or give their subordinates feedback through emails, even though it is not conductive to immediate feedback (Lee, 1994). For this reason, e-mail may be an appropriate communication medium, since it can delay the feedback timing, let leaders to deliberate the message they want to deliver, and determine which style and timing to unroll their leadership or feedback. As a result, leadership behavior and the leading content would be separated by the nature of virtuality, and in turn, enrolled by e-mail.

Despite the benefit of virtuality and e-mail, the research that has identified or suggested the enrolling of e-leadership behavior and the e-leading content in virtual teams remains inconsistent (Avolio, et al., 2000). For example, Purvanova and Bono (2009) compared the effects of transformational leadership in both face-to-face and virtual context and revealed that the effects of transformational leadership on team performance were stronger in virtual context. On the contrary, Kahai, Sosik, and Avolio (2003) conducted a laboratory experiment to study the effects of leadership style, anonymity and rewards on creativity-relevant group process and outcomes in electronic meeting context and revealed that transactional leadership was associated with greater group efficacy and satisfaction with the task and higher solution originality than transformational leadership.

Researchers who believe in contingency perspective states that effective leaders may adopt or change their leadership style in accordance with the nature of task and environmental condition (Lee-Kelley, 2005). As Hersey and Blanchard (1982) originally proposed, situational leadership theory predicts an optimal combination between leadership style (relationship-focus and task-focus) and subordinate attribute. Thompson & Vecchio (2009) proposed that there will be a three-way interaction that represents the relationship between leader considerateness, leader structuring, and follower developmental level in account for the follower outcomes of job performance and attitudes. Although they could not find a robust evidence to support the above most widely-known Situational Leadership Theory (SLT); however, some major textbooks still noted several distinct strengths that SLT possesses (Northouse, 2007). By following the contingency perspective, this study tried to adapt the guidelines proposed by SLT to virtual context and explored the leadership effectiveness under match and mismatch scenarios.

Leadership research in virtual context

The virtualization of work environments is supported by emerging collaboration technologies and driven by a global workforce that is required to handle complex tasks. Therefore, communications among team members can easily get side tracked and people involved often lack clear understanding of why certain things happened and how decisions were made (Warkentin et al., 1997). In addition, information is not shared immediately and interpretation of information is often distorted (Kayworth & Leidner, 2001/2002). Many researchers have found that leadership plays a very important role in the effective functioning of virtual collaboration (Hiltz & Turoff, 1976, 1985; Hiltz, Dufner, Holmes, & Poole, 1991), especially in the creation and interpretation of advance information technology (Avolio, et al., 2000). On top of paying attention to work environments and organizational climate, leaders also need to coordinate project tasks and facilitate the group process to achieve teams' goals (Kayworth & Leidner, 2001/2002). In addition, they also believe that effective leaders in virtual context would exhibit higher levels of behavioral complexity than leaders of face-to-face condition (Kayworth & Leidner, 2001/2002).

In virtual context, leaders can use email or other means to convey the expectations and requirements to subordinates by specifying how their performance will be measured and rewarded (Bass & Avolio, 1990). If subordinates are found not contributing to the required works, warning messages will be sent to them hoping that their improper behaviors may be

corrected. Kayworth & Leidner (2001/2002) created 13 virtual teams, each composed of 5 to 7 members from 3 universities, they found that the most effective leaders were those who communicated regularly, answered team member questions, provided feedback, gave directions, and approached the members with a cordial yet assertive tone. Besides, they found that virtual team leaders were very effective when they acted in a mentoring role and exhibited a high degree of understanding (empathy) toward their team members. Thus, leaders in virtual context should be sensitive to work schedules, care for all subordinates, appreciate their subordinates' opinions and suggestions, and communicate to their subordinates. For example, Sosik, Kahai, and Avolio (1998) conducted an empirical study of the effect of transformational and transactional leadership on team creativity when an anonymous electronic brainstorming tool was used. In this study, 159 college students formed 36 groups. Results showed that there is a positive correlation between transformational leadership and creativity.

Kayworth & Leidner (2001/2002) proposed some guidelines for effective leaders. For instance, leaders have to exhibit a high degree of understanding (consideration) toward their team members, care for all members, and appreciate their team members' opinions and suggestions. They also have to monitor or lead their team members follow the initial guidelines. However, how leaders behave themselves in accordance with the above principles still under explored, especially in virtual context. According to information richness theory, communication media vary in the capacity to process rich information and face-to-face (FtF) is the richest one (Daft & Lengel, 1986). Nevertheless; in virtual context, workers are geographically dispersed and have to coordinate their tasks across different time zones. Consequently, they have no choice but to seek for other media instead of FtF meeting to support their daily work, and e-mail seems the most commonly used channel for communication among dispersed heterogeneous team members (DeSanctis, Wright, & Jung, 2001).

Although Daft & Lengel (1986) argued that e-mail is a lean medium because it lacks the capability for immediate feedback, uses only a single channel, tends to be impersonal, and incurs a reduction in language variety, Lee (1994) indicated that richness or leanness is not an inherent property of the e-mail medium but an emergent property of the interaction of the e-mail medium with its organizational context. Team leaders can actively lead their team members through delivering meaningful messages in e-mail (Lee, 1994). However, what leadership style should leaders express in accordance with the control mechanism through email in virtual context is worth of further investigation.

Leadership style and control mechanism in virtual context

Studies have found that leadership styles in fact have impacts to the creativity of individual, particularly transformational leadership has more positive impact to many crucial outcome variables (Avolio, Bass, & Jung, 1999). Transformational leadership may improve subordinates interactions and trust; moreover, it can also encourage subordinates to share ideas or knowledge with each other. Kayworth & Leidner (2001/2002) also indicate that the leaders who simply demand their team members to finish the task without providing encouragement and response may lead the team into an unstable process and mediocre performance. In addition, Sosik, Kahai & Avolio (1998) conducted an empirical study of the effect of transformational and transactional

leadership on team creativity when an anonymous electronic brainstorming tool was used. There were 159 college student subjects in 36 groups. The result showed that transformational leadership will encourage the followers to challenge status quote and antiquated methods when their leaders motivate them intellectually. They will discover new issues and problems to fulfill their curiosity and imagination.

In addition to the leadership style, the control mechanism in virtual context is also vital to the leaders (Piccoli & Ives, 2003; Piccoli, et al., 2004). Piccoli & Ives (2003) divided the control mechanism into process-oriented and outcome-oriented. The process-oriented focused on the designing and structuring of working process. The outcome-oriented; however, focused on how leaders controlled their subordinates performed in the end (Ouchi, 1977, 1979; Piccoli & Ives, 2003; Snell, 1992). Purvanova & Bono (2009) indicated that the contextual effects may not be the same for all leaders, in other words, leaders may alter their leadership style to match the context. According to the perspective of personal trait, leaders may not expect to behave different style across situations. Interestingly, some studies testing the above consistency-specificity behavior leads to confounding results. Some researches stated that leaders behave consistently across situations (e.g., Albright & Forziati, 1995; Zaccaro, Foti, & Kenny, 1991); however, others found that leaders behave vary by context (Barrow, 1976; James & White, 1983). Based on the above discuss, this study expected that leaders in virtual context will vary their style in accordance with the specific control mechanism. In this case, leaders in virtual context will alter their leadership style to adapt to the situation. However, there were no previous evidences had clearly illustrated the relationship between leadership style and control mechanism, especially in the virtual setting. Thus, the purpose of the present study is tried to address this issue by investigating the consequences of leadership styles (transactional vs. transformational) and control mechanism (process-oriented vs. outcome-oriented) in virtual context and further examining how the subordinates feel if leaders changed their leadership style, both in the match or mismatch conditions.

METHODS

Sample

Undergraduate students enrolled in management accounting courses (n = 70) and human resource management courses (n=61) at two private university, located in central and north Taiwan, participated in this experiment for 20% course credit, respectively. Participants were randomly assigned to 32 four-to-five-member virtual teams. These teams were assigned as (Kahai, et. al., 2003) which had no prior interaction or co-operation experience or any expectation of future interaction. In the case of some groups, there were some participants not showing up for the online discuss every day, from the first week till the sixth week. Thus, only 114.participants contained for the further analysis. The average team size was 3.56.

Task Assignment

Each team was assigned to serve as a consulting team and asked to solve the same consulting project. For the project assignment, team members had to read the assigned management case,

developed by Wu, Hsieh, and Wan (2008), collected by Taiwan Management case center (TMCC). In addition, the confederates (served as team leader) were asked to use transformational or transactional leadership style with process-oriented or outcome-oriented control mechanism to manage their team member in accordance with their discussion. Participants were asked to follow their leader's direction to participate 6 weeks online meeting and discuss about "How to revise the performance evaluation system based on the balance score card perspective," supported by a Web-based group decision support system to complete their teamwork (consulting project) during 6 weeks. After the experiment, they are required to submit a five-to ten-page report.

Research Design

This study used a 2 (transformational/transactional) x 2 (constant/change) x 2 (process-oriented/outcome-oriented) factorial repeated-measures design, with style change used as a within-groups factor. The experimental groups were randomly assigned across the leadership and control conditions while ensuring even distribution. There were 4 groups in every Leadership x Control cell. Each group discussed the same consulting project within two stages: on in the first fifteen days (before leadership change) and the other in the following nineteen days (after leadership change). The number of participants in this study did not permit perfectly counterbalancing across leadership and control conditions. The effects of each participants' effort and how they value this research were controlled statistically.

Research assistants (served as confederate leaders) set up all agendas in advance and ask all participants to receive a one week period creative support system training to ensure that they were all familiar with the Teamspirit system. After training, all participants were asked to participate in 5 related meetings during 6 weeks by using Teamspirit to support their teamwork, and requested to submit a 5-10-pages final report in the end.

The confederates led the task exhibiting transformational or transactional leadership style in accordance with process-oriented or outcome-oriented control. The instructions and descriptions email consisting of some behavioral comments representing transformational or transactional leadership styles were formed based on the literature regarding the transformational and transactional leadership theory (Avolio, et. al., 1999; Kahai, et. al., 2003). Before participants discussed online, the confederates typed their scripted comments into the leading email and delivered to each participants at assigned times, which were different across process-control or outcome-control conditions. For the manipulation on control mechanism, based on Piccoli & Ives (2003), to manipulate the process-oriented control condition, the confederates typed their comments in advance and email to the participants to inform or notify whether they perform will or not in the online discussion every day. As to the manipulation of outcome-oriented control condition, the confederates only informed the participants how to discuss online on Monday and notify the participants to finish their online discussion on Thursday.

According to previous virtual team leadership studies (e.g., Hambly, et. al., 2007; Kahai et., al., 2003), the transformational leader's instructions and comments emphasized understanding and appreciating each participants' needs and viewpoints within group, and stimulating each other's

efforts to be creative and constructive by proposing questions, sharing new ideas, and approaching old situations in new ways (Kahai et., al., 2003). The transactional leader's instructions and comments emphasized what the group was expected to do and the rewards or punishments (course credits) it would receive on when they finishing their discussion and achieving the expected performance (Kahai et., al., 2003). After the first fifteen days' discussion, some participants under leadership change conditions will received their confederates change their leadership style from transformational into transactional or from transactional into transformational, started from the sixteen days till end. In addition, no matter under what conditions, the control mechanism will keep constant. After the five weeks online discussion, participants were asked to submit a five-to-ten pages report.

TABLE 1 Experimental Design

			Control Mechanism	
			Process-oriented	Outcome-oriented
Leadership Style	Constant	TF to TA	EG 1 (4 groups)	EG 5 (4 groups)
		TA to TF	EG 2 (4 groups)	EG 6 (4 groups)
	Change	Transformational (TF)	EG 3 (4 groups)	EG 7 (4 groups)
		Transactional (TA)	EG 4 (4 groups)	EG 8 (4 groups)

Measures

Manipulation checks. Individual-level of questionnaire items were employed to check the leadership, the leadership style change, and control mechanism manipulations. The leadership manipulation was checked using 5-point scale items ranging from "5 = strongly agree" to "1 = strongly disagree" adapted from the revised MLQ-5X (Avolio, et al., 1999). Perception of transformational leadership was measured with a 13-item scale and the perception of transactional leadership was measured with a 5-item scale. Since one of the primary goal of this study was to investigate whether the subordinate will perceive the change on leadership style, this research conducted six times measures from the beginning to the sixth week, with 5-point "strongly agree" to "strongly disagree" response format. The coefficient alpha of transformational leadership style form the first measure to the sixth measure were ranged from .82~.91. The coefficient alpha of transactional leadership style form the first measure to the sixth measure were ranged from .83~.95. In addition, the leadership style change was checked by comparing the subordinates' 6-times perception on the transformational and transactional leadership style.

The manipulation check on the control mechanism was measured not only by asking the participants how many times did they receive the email from their leaders within a week but also asked what is the main concern of their leader, focus on process or focus outcome? *Where 1 = absolutely outcome, 2 = not sure, 3 = absolutely process*.

Leadership effectiveness. This research followed Conger, Kanungo, and Menon (2000), used reverence for the leader (REV), trust in the leader (TRU), and satisfaction with the leader (SAT) to assess the leadership effectiveness. The REV was measured by a three-item scale developed by Conger, et. al. (2000). The TRU was measured by a three-item scale and was taken from Bass (1985) and Bulter (1991). SAT was also measured by three items based on Bass (1985). Since our purpose was to investigate whether the subordinate will perceive the change on leadership style and examined the effects of leadership change on leadership effectiveness, this research conducted six times measures from the beginning to the sixth week, with 5-point "strongly agree" to "strongly disagree" response format. The coefficient alpha of REV form the first measure to the sixth measure were ranged from .78~.86. The coefficient alpha of TRU form the first measure to the sixth measure were ranged from .80~.89. The coefficient alpha of SAT form the first measure to the sixth measure were ranged from .87~.95.

Web-based group problem solving system: Teamspirit

The design and structuring of group decision processes have been shown to be an important element for teams, particularly distributed ones to succeed. We have designed and implemented a Web-based problem-solving system, i.e., a Web-based GDSS in this study, called TeamSpirit. It was specifically designed according to group problem solving processes (identify problems, create/design solutions, implement solutions or systems) and techniques and was intended to be used by members of virtual teams to support their creative problem solving processes over the Web (Chen, Liou, Wang, Fan, & Chi, 2007). Each problem solving process should follow the next three stages, idea generation, idea consolidation, and idea evaluation, besides, each stage was designed some implement tools to support divergent and convergent thinking in the creative problem solving process.

The teamspirit closely followed the Creativity Problem Solving (CPS) processes and tools commonly used in general problem solving and decision making developed over time. The CPS program was initially developed by Osborn (1963) and later modified by many other researchers (e.g., Torrance et al., 1978; Isaksen et al., 1994, 2000). It is a complete program based on such a tripartite model of creative process. The key concept of the CPS is to separate the idea generation stage from the idea evaluation stage so that bizarre, uncommon ideas may have a chance to enter into our attention before they are pruned out. Facilitators and participants only need to use Web browsers to manage meetings or participate in meetings. TeamSpirit is developed in ASP.NET using Visual Basic .NET as the implementation language. The TeamSpirit system can be deployed on a computer running Microsoft Windows 2003 Server with Internet Information Server (IIS) and Microsoft .NET Framework SDK installed.

RESULTS

Table 2 and 3 present scale means and standard deviations among each experimental condition for the measures of leadership style and leadership effectiveness.

Manipulation checks

Individual-level responses to the leadership, style change, and control mechanism items were analyzed with ANOVA. The results revealed that participants led by transformational leadership perceived significantly higher level of transformational leadership style, whether before style change ($M = 3.65$ vs. 3.04, $p < .001$) or after style change ($M = 3.48$ vs. 3.10, $p < .01$). On the contrary, participants led by transactional leadership perceived significantly lower level of transformational leadership style, whether before style change ($M = 2.97$ vs. 3.35, $p < .001$) or after style change ($M = 2.93$ vs. 3.39, $p < .001$).

Perceptions of receiving leaders' email during week 2 to week 6 were significantly more in the process-oriented control condition than in the outcome-oriented condition ($M = 1.98$~2.98 vs. $M = 1.71$~1.94, $p < .001$). In addition, the perceptions of the main concern of their leader during week 2 to week 6 were significantly higher in the process-oriented control condition than in the outcome-oriented condition ($M = 2.01$~2.52 vs. $M = 1.61$~2.14, $p < .05$).

The impact of leadership style, style change, and control mechanism on leadership effectiveness

Table 4 shows descriptive statistics for the leadership effectiveness in each of the cells in the study's design. MANCOVA was employed to examine the impact of leadership style, style change, and control mechanism on leadership effectiveness. The leadership (B), control mechanism (C), and style change (D), B x C, A x D, B x D, C x D, and B x C x D, were served as independent variable and the relationship between effort and course credit (A) was served as covariate and were entered simultaneously. Table 5 shows summary MANCOVA results on the reverence for the leader (REV), trust in the leader (TRU), and satisfaction with the leader (SAT).

The results showed that leadership style did moderate the effect of control mechanism on the reverence for the leader [$F(3,114) = 4.73$, $p < .01$], trust in the leader [$F(3,114) = 6.84$, $p < .001$], and satisfaction with the leader [$F(3,114) = 5.03$, $p < .01$]. Further, the MANOVA indicated a significant three-way interaction of leadership, style change, and control mechanism on the reverence for the leader [$F(3,114) = 3.51$, $p < .05$], trust in the leader [$F(3,114) = 3.03$, $p < .05$], and satisfaction with the leader [$F(3,114) = 5.47$, $p < .01$]. Figure 1 was graphic representation of the above two-way and three-way interaction. As shown in the figure, the strongest interaction relationship between leadership, style change, and control mechanism were observed. To sum up, leadership did moderate the effect of control mechanism on the reverence for the leader, trust in the leader, and satisfaction with the leader. Analysis of simple effects indicated that in the process-oriented condition, transformational leadership leads higher level of leadership effectiveness than transactional leadership. In the outcome-oriented condition, transactional leadership leads higher level of leadership effectiveness than transformational leadership. Further, if the transformational leadership in accordance with process-oriented control and the transactional leadership in accordance with outcome-oriented control are the matched conditions and the others were mismatched conditions. In this case, leaders who change their style from match to mismatch conditions did decrease the level of leadership effectiveness, and leads that changes their style from mismatch to match conditions did increase the level of leadership effectiveness. Thus, the results supported the expected relationship, that is, leaders in virtual context will vary their style in accordance with the specific control mechanism.

DISCUSSIONS

The purpose of the present study tries to investigate the match and mismatch conditions between leadership styles (transactional vs. transformational) and control mechanism (process-oriented vs. outcome-oriented) in virtual context and further examining how the subordinates feel if leaders changed their leadership style, from match to mismatch conditions, and vice versa. The results show that leaders in virtual context will vary their style in accordance with the specific control mechanism. From the results, leadership style and control mechanism have impacts on leadership effectiveness. We speculate that the contingency-specific perspective and the nature of virtual context may be the major factors contributing to such findings.

Contingency-specific perspective

Early behavioral approaches to leadership suggest that effective leaders are those who engage in two basic activities: initiating structure and consideration (Bass, 1990; Rambo, 1982). Initiating structure refers to task-related activities, whereas consideration relates to the extent of care and concern for subordinates (Scott & Walker, 1995). Transformational leaders emphasize the vision and human relations aspect (consideration) of team function. They expressed great care, concern, and understanding toward members. When virtual workers perceived being understood and cared by their leaders, they felt free to express their ideas. Therefore, leaders adopt process-oriented control with transformational leadership style might lead subordinates feel that they are in a safer and more considerate environment, thus, enhance leadership effectiveness. In contrast, leaders with transactional leadership style in process-oriented condition might lead their subordinates feel pressure and uncomfortable thus decreases leadership effectiveness. In brief, this study revealed that leaders could have the flexibility in managing their subordinates in virtual context. The findings were more consistent with the previous literature on cross-situational consistency and specificity, which indicated that leaders should adapt their leadership style in response to situational demands (e.g., Hill & Hughes, 1974; James & White, 1983; Purvanova & Bono, 2009).

Nature of virtual context

Whereas virtual context undoubtedly face similar as traditional working environment, we argue that these dispersed work groups may also face unique issues. This stems from the belief that the CMCS (such as, group support systems, e-mail, internets, and intranets) used to link virtual workers across time, space, and organizational boundaries represent fundamentally new types of mediums “with their own advantages, disadvantages, social dynamics, problems, and opportunities” (Hiltz & Turoff, 1985). That virtual collaboration lack of a social context may alter or hinder the process through which virtual workers develop trust (Jarvenpaa, Knoll, & Leidner, 1998). As a result, virtual communication through CMCS may appear out of context and without focus (Warkentin, Sayeed, & Hightower, 1997), resulting in lost meanings, distortion, and misinterpretation. Workers are in such environments, they need their leaders to give them feedback, telling them what to do and telling them what have not done. Leaders through communication exhibited strong authority to achieve team goals, yet, at the same time, members were able to catch the team goal. Moreover, leaders gave the pressure to those who had not

participated or who did not perform well might push them to spend more effort to do the work. This might be the reason why transactional style in accordance with outcome-oriented control could increase subordinates show more reverence, trust, and satisfaction with the leader.

Implications

In light of the interest findings from this study, three crucial contributions were drawn. First, this study moves the current virtual leadership researches form face to face working environment to virtual context. Second, this study further specifies the discussion regarding leadership style and control mechanism. Third, this study advances the emerging study of virtual leadership by exploring the effects and the possible consequences of leadership change on the relevant outcome.

Some valuable findings have emerged from this research. First, leaders in virtual context should give some guidance or directions to their members with more concerned, understanding, and empathy wordings during the whole working process would not only increase members' willing to propose their ideas but also earn their respect, trust and satisfaction. Abundant of previous theories and empirical studies have verified that leadership styles indeed can increase leadership effectiveness whether in traditional team settings (Avolio, et al., 1999) or virtual context (Kayworth & Leidner, 2001/2002). Moreover, Jarvenpaa and Leidner (1999) have indicated that transformational leaders can build relationships among team members and to increase mutual trusts via written communications, which, in turn, is critical to team performance. However, there is little empirical study that exactly illustrates how leaders behave and motivate their members in virtual context. This research might give some hints for leaders to choose their leadership style and control oriented in virtual context.

Limitations and Suggestions

Our study has several limitations. First, since our findings are based on a limited sample, and all the subjects are all students, this may restrict our ability to generalize these results to other settings. Second, these findings may only be applicable to cultures similar to those represented by the subjects of this study, and the results may be different from global virtual teams that have members coming from many countries. Future studies should seek to identify how the characteristics of virtual leadership may vary across a variety of cultures. Third, we employed a simple assignment, whereas, in business environment, employees have to use their domain knowledge to solve more difficult problems than the assignment used in our experiment. Fourth, because our teams were comprised of different classes from the undergraduate students, subgroup formations occurred privately was possible. Such subgroup interaction might have had beneficial or negative consequences for the virtual works. We did not study the formation of subgroups, but this is another interesting area for future research.

ABSTRACT

Purpose: *Each activity in a project must be clearly defined and specified with when to start, how much time is required for completion and when to finish. It is vital that the time estimates for each work obtained be realistic in order to produce a good schedule for meeting deadlines and avoiding unnecessary project costs. This paper aims at evaluating the effectiveness and accuracy of the time estimator.*
Design/Methodology/Approach: *As tracking signal, a widely used method in forecasting domain, has alarming ability in detecting structural changes in time series by responding to out-of-control signals, it is, therefore, strongly suggested to be employed in monitoring the time estimation of critical tasks, through which the effectiveness and accuracy of the time estimator is accordingly evaluated.*
Findings: *In this paper, it was found that although the total time of a project was well estimated and met, the quality of the time estimation was still not good enough. Therefore, the estimator must take special attention to assign more realistic time and more appropriate personnel in the critical tasks that were detected out-of-control. By doing this way, he/she can perform his/her job better and get to know the employees better and better.*
Originality/Value: *Though tracking signal has been widely used in monitoring the performance of a forecasting model, it is the first time in this paper that it is addressed to be used in evaluating the accuracy of a job performance.*

Keywords: Time estimation, accuracy evaluation, monitoring critical tasks

INTRODUCTION

Project management in the business and industry fields is defined as managing and directing time, materials, personnel and costs to complete a particular project in an orderly economical manner and to meet established objectives of time, cost and technical results (Spinner, 1992). The management usually involves in using one or several techniques such as network planning, cost analysis, personnel allocation, and management by objectives, etc. Among

them, network planning has been considered the most popular (Spinner, 1992). Usually being used to plan, schedule and control a project consisting of a group of interrelated activities, network planning is especially useful for those projects which have a well-defined starting point and a well-defined objective. It has several applications in practice, for example, construction projects, administrative programs, maintenance operations and any other series of activities that, when combined, can form a complete program with a start and a finish (Spinner, 1992).

There are three phases in the project management cycle: planning, scheduling and control. In planning phase, it is critical to determine what activities must be done in completing a project, their sequence and interrelations which are then often presented on an arrow diagram; whereas, in the scheduling phase, timing aspects of each work are carefully considered. Each activity must be specified with when to start, how much time is required for completion and when to finish. It is vital that the time estimates for each work obtained be realistic in order to produce a good schedule for meeting deadlines and avoiding unnecessary project costs. The time estimates can be either done along with the initial diagram to make proper adjustments based on pre-defined objectives or modified after the project begins to identify if there is a delay in the work that will extend the duration of the project or the work is progressing faster than expected.

The network diagram normally uses a single time for each work. The time estimate, usually determined by an experienced person, is the amount of time that the work will require under a specified set of conditions. As suggested based on personal experience, the estimate is usually biased and may be higher. In order to offset this bias, three time estimates, including optimistic, normal and pessimistic, are used to create one time estimate as per the equation (1).

$$Time\ estimate = \frac{Optimistic\ time + 4 * Normal\ time + Pessimistic\ time}{6} \quad (1)$$

Normal time is the time that would be most frequently required if the work were repeated many times under the similar conditions. While optimistic time is the shortest possible time required for completing a work under the assumption that everything goes one as planned, for instance, material deliveries are on time as scheduled, machines operate without major breakdowns, personnel perform work within work standard, etc., pessimistic time is the maximum possible time required for completing the work in the worst situations; particularly, delayed deliveries, accidents, bad weather, and so on (Spinner, 1992).

Spinner (1997) pointed out that the three-estimate approach can cause the expected time to be biased toward the pessimistic time which is usually overly pessimistic; thus, the method is used only when the results from one time estimate are probably unrealistic.

Once a project is carefully planned and scheduled, monitoring its activities is of importance to keep it under control. By comparing the start and finish schedule with the actual performance, certain warning signals may arise for further investigation and corrective actions. Some activities may be behind schedule and some may be ahead. In order to compensate the lateness in some activities to keep the project on target, there is frequently an effort to adjust the timing of other critical ones which may lead to a certain revision of the

entire project plan depending on the severity of the timing problem. However, when critical jobs are finished ahead of schedule, future critical ones need checked and rescheduled if required. These are the fundamentals of monitoring a project performance. Therefore, it can be said that good estimates reflect not only the capability and level of experience of the in-charge person but also his/her level of knowing the actual ability of the employees' performance and result in less adjustment in the schedule during the project cycle. But, there has hardly been any research in evaluating how good the time estimates for the whole project are as well as how efficient the performance of the employees is. Thus, this paper aims at using tracking signals to evaluate the effectiveness and accuracy of the estimator in terms of assigning time estimates.

This paper is organized as the following. Section 2 discusses the use of tracking signals. An empirical study is presented in Section 3 to illustrate the applicability of tracking signals. Conclusion makes up the last section.

REVIEWS ON TRACKING SIGNAL

In monitoring the forecast errors, tracking signal is usually employed due to its alarming ability in detecting structural changes in time series by responding to out-of-control signals (Snyder and Koehler, 2006). Providing accurate and unbiased estimate is the ultimate endeavor of any forecasting issues (Wisner et al., 2008; Chary, 1995). Inaccurate and/or biased estimate is one of the main factors making substantial increase in both operational and opportunity costs to the involved organizations that use the forecast result being significantly different from the actual figure. Forecast error is actually the difference between the observed and the forecast as expressed in equation (1).

$$\varepsilon_t = OV_t - FV_t \tag{1}$$

where ε_t, OV_t and FV_t respectively denote the forecast error, the observed value and the forecast value at the period t.

Forecast bias, the tendency of a forecast to be consistently higher or lower than the actual can be expressed in cumulative forecast error (CFE) and mean absolute deviation (MAD), shown in equation (2). They are two among several indexes usually used to measure the forecast accuracy (Wisner et al., 2008).

$$\begin{aligned} CFE_t &= \sum_{i=1}^{t} \varepsilon_i \\ MAD_t &= \left(\sum_{i=1}^{t} |\varepsilon_i| \right) / t \end{aligned} \tag{2}$$

The ratio between CFE and MAD is named as tracking signal (TS) which was developed by Page (1955). It is a widely used tool to check the forecast bias (Wisner et al., 2008; Wallace and Stahl, 2002). Several scholars have thoroughly accessed and improved it (Gardner, 1985; Li et al., 2012). Brown (1959) suggested a new definition of the tracking signal by defining it as the quotient between the simple cumulative sum of errors and the simple smoothed MAD. The Brown's tracking signal (BTS), given in equation (3), is commonly employed in practice nowadays (Li et al., 2012).

$$BTS_t = CFE_t / SMAD_t \quad (3)$$

where $SMAD_t = \alpha|\varepsilon_t| + (1-\alpha)SMAD_{t-1}$ denotes the simple smoothed MAD at the period t. In the denotation, α is a smooth parameter $(\alpha \in [0,1])$ and the initial value SMAD is assumed to be zero (Chary, 1995).

By using tracking signal, forecast errors can be efficiently monitored with a control chart with two control limits (upper and lower) which represent the track where the errors should go (Mele et al., 2001). If a signal falls outside the control limits, the forecast is considered biased, either under or over-estimated (Li, 2007; Chary, 1995); hence, further investigation is needed (Wisner et al., 2008). Ideally, the value of tracking signal is either zero or close to zero (Stevenson, 2005; Khanna, 2007). With these characteristics, tracking signal is, therefore, strongly suggested to achieve the objective stated previously. The control limits under the method are set as the following.

Under the Brown's method, with the assumption that the errors are normally distributed with a mean of 0 and a standard deviation of σ, the relationship between σ and MAD is given by $\sigma \approx 1.25MAD$ (Lawrence et al., 2009). As such, if the control limits for BTS are set at ±3.75 which is equivalent to $\pm 3\sigma$, the probability of an out-of-control signal is only 0.27% (Montgomery, 2009). Practically, the value of the control limits ranges from ±4 to ±8 be considered acceptable in some particular circumstances (Li, 2007; Wisner et al., 2008).

This approach can be employed in various applications. As an example, in this paper, it is used to evaluate the accuracy of the time estimator in a project.

EMPIRICAL STUDY

In our study, we followed a specific project at a well-known company which specializes in manufacturing electronic devices in Kaohsiung industrial park, Taiwan. Its research and development (R&D) department is in charge of not only improving the performance of its current products but also searching for, designing and testing new products. Because several functions of an organization concurrently are obligated with the planning and implementation of research and development projects and basic scientific researches as well as the execution of the clients-commissioned technical services responsible for internal and external customers, the majority of the members are in charge of a different proportion of research and development projects, basic scientific researches and technical service tasks. There is only one leader who assigns the in-charge person with time estimation for each task. He is called time estimator. Due to the fact that R&D department is in charge of various activities, whose execution time can be as short as a few hours or as long as up to three months or more, the time estimator sometimes has some errors in his estimation. In order to improve his capability and working experience in the time estimation, it is quite important to track the accuracy of his estimation. Therefore, we suggest using the tracking signals to detect any abnormal situation where his estimation is significantly different from the actual observation.

In the project, there were 20 critical tasks to be conducted within 240 hours. Each of the tasks was expected to be completed within "expected time" as shown in Table 1. However, due to the knowledge and skills of the engineers, some tasks were finished sooner but some were

later than expected. The actual completion time of each task is named as "observed time", also shown in Table 1. In this paper, for the ease of comparison the performance of the tracking signal under different α values, we consider it under the α values of 0.20, 0.25 and 0.30. The relevant values are plotted on a control chart with the control limits of ±3.75 as shown in figure 1.

Table 1. Tracking signals under different α values

Task No.	Expected time *(hours)*	Observed time *(hours)*	ε	CFE	α = 0.20		α = 0.25		α = 0.30	
					SMAD	BTS	SMAD	BTS	SMAD	BTS
1	4	4	0	0	0.00		0.00		0.00	
2	11	10	1	1	0.20	5.00	0.25	4.00	0.30	3.33
3	7	10	-3	-2	0.76	-2.63	0.94	-2.13	1.11	-1.80
4	10	12	-2	-4	1.01	-3.97	1.20	-3.32	1.38	-2.90
5	4	6	-2	-6	1.21	-4.97	1.40	-4.28	1.56	-3.84
6	9	6	3	-3	1.57	-1.92	1.80	-1.67	1.99	-1.50
7	18	18	0	-3	1.25	-2.40	1.35	-2.22	1.40	-2.15
8	26	23	3	0	1.60	0.00	1.76	0.00	1.88	0.00
9	8	12	-4	-4	2.08	-1.92	2.32	-1.72	2.51	-1.59
10	14	12	2	-2	2.07	-0.97	2.24	-0.89	2.36	-0.85
11	20	16	4	2	2.45	0.82	2.68	0.75	2.85	0.70
12	12	14	-2	0	2.36	0.00	2.51	0.00	2.60	0.00
13	5	10	-5	-5	2.89	-1.73	3.13	-1.60	3.32	-1.51
14	15	18	-3	-8	2.91	-2.75	3.10	-2.58	3.22	-2.48
15	12	10	2	-6	2.73	-2.20	2.82	-2.12	2.86	-2.10
16	8	10	-2	-8	2.58	-3.10	2.62	-3.05	2.60	-3.08
17	20	22	-2	-10	2.47	-4.05	2.46	-4.06	2.42	-4.13
18	15	14	1	-9	2.17	-4.14	2.10	-4.29	1.99	-4.51
19	10	8	2	-7	2.14	-3.27	2.07	-3.38	2.00	-3.51
20	12	5	7	0	3.11	0.00	3.31	0.00	3.50	0.00
Total	240	240								

Based on the tracking signals in Table 1 and Figure 1, there are five, four and three out-of-control points detected, respectively to the α values of 0.20, 0.25 and 0.30. Although the total project time was strictly met, the estimation was not really good enough. The estimator should pay more attention to the characteristics of each task and assign appropriate engineers to perform the task efficiently. Furthermore, it is easily found that the smaller value of α, the smoother the tracking curve and the more out-of-control signals. Hence, it is suggested that if the estimator is qualified as really experienced, we should set the α value small so that it can give more tolerance of the abnormal estimation; whereas, larger α value is more suitable for senior estimator.

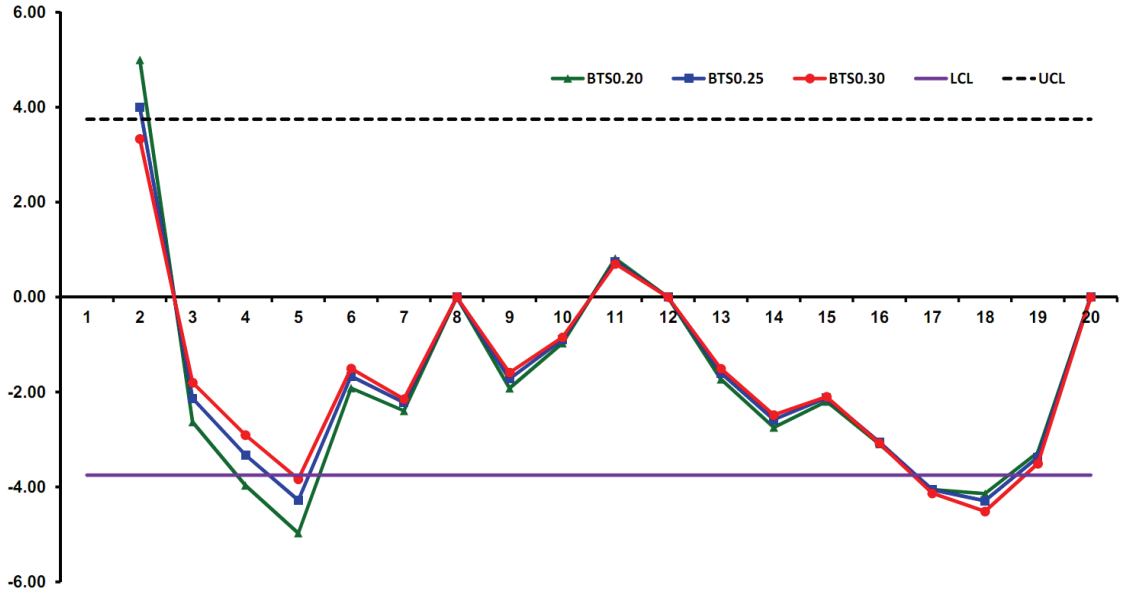

Figure 1. Tracking signals under α values 0.20, 0.25 and 0.30

CONCLUSION

Keep track on the time performance of employees in a project is critical because any out-of-control issue will affect the whole timeline of the project. There are some circumstances where the employees already try their best but they still can't meet the time target and there are other ones where they can easily achieve the set goal. These happen because of the inaccuracy of the time estimation and personnel assignation given by an estimator and/or his/her shortage in well knowing the actual capability of the employees. In order to evaluate the effectiveness and accuracy of the estimator in performing his job, it is suggested that we should keep monitoring the time estimation of critical tasks by using tracking signal method. In this paper, with a practical example, it is found that although the total time of a project is well estimated and met, the quality of the time estimation is still not good enough. Therefore, the estimator must take special attention to assign more realistic time and more appropriate personnel in the critical tasks that were detected out-of-control. By this way, he/she can perform his/her job better and get to know the employees better and better.

Abstract

We suggest a scheme to solve a time dependent vehicle routing problem in Bangkok. In fleet transportation, we usually prefer routes aiming to minimize the number of vehicles and the total distance. However, traffic congestion has significant impact on cost and time for transportation. As traffic information in Bangkok is provided real-time in the internet, we can collect congestion levels of roads and estimate travelling times of vehicles. Based on time-dependent shortest paths between locations, we determine a route of each vehicle to minimize the total travel time, while all vehicles depart from a depot together.

Our preliminary result based on the sampled data is further presented. The change of traffic situation causes ineffectiveness of routes based only on minimizing the total distance. Solving the routing problem using the traffic information can help reduce the total travel time. This study could be further applied to verify and improve the performance of logistic process.

Keyword: Vehicle Routing, Time dependent, Traffic, Logistics, Optimization

INTRODUCTION

We study a time-dependent vehicle routing problem in Bangkok based on available traffic information. In a standard routing problem, we aim to minimize a number of required trucks and the total distance to travel from a distribution center to customers. Nuangrit (2007) studied the case for convenient stores in Thailand and suggested his solving algorithms. He also mentioned a limitation as the travel time can be simply calculated by the constant speed limits of roads.

In fact, traffic congestion significantly varies during a whole day in a big city like Bangkok and has an impact on the actual travel time and the delay of vehicles. Therefore, the time-dependent vehicle routing problem should be studied. Although the real traffic situation can

be different from the available information used for planning, the result could help us obtain a routing schedule which is more realistic for time and resource management.

Nowadays, traffic information becomes widely accessible in the internet. In Bangkok, there are several providers e.g. Intelligent Traffic Information Center (www.iticfoundation.org), Traffy(www.traffy.in.th), TSquare Traffic (https://app.rtic-thai.info/tsquare), Longdo Traffic (http://traffic.longdo.com). These systems collect and present information from various sources like probing data from buses, taxis, fleets and passenger cars. In addition, they present congestion levels of roads obtained from Bangkok Metropolitan Administration (http://www.bkktraffic.com).

Moreover, Traffy is a research project to estimate and report traffic information under National Electronics and Computer Technology Center (NECTEC). First, Traffy system collects data from similar sources as mentioned. Also, the system gets accident reports from traffic police and images from CCTV located around Bangkok. After data processing, traffic information is reported on social media like Twitter and Facebook. Programmers can further develop an application using Traffy API (Application Program Interface). Its output files consist of XML, HTML, JSON, CSV and JS.

In this paper, we apply Traffy API to store samples of traffic information in our database. Congestion levels on roads are used to estimate the speed of a vehicle and a travel time. Afterward, we solve a time-dependent shortest path problem as traffic changes from time to time. That means we determine a path using minimal time to travel between any two points. This path can change depending on a departure time. For example, we could prefer another path to avoid congestion during rush hours.

After that, we solve a vehicle routing problem (VRP) to find out customer visits of each vehicle with respect to capacity constraint. We assume a sample of the location of convenient stores in the urban area. There are several advanced techniques for solving a large scale vehicle routing problem. In this preliminary research, we apply a software tool named Drools Planner version 5.5 to solve our small cases. Note that the software has been recently renamed to OptaPlanner (www.optaplanner.org). We assume all vehicles departing from a distribution center at the same initial time. We focus on minimizing the total travel time for all vehicles based on the obtained time-dependent shortest paths between customers. We have not yet considered a departure time of each vehicle as another decision variable. Otherwise, we could select the most suitable initial time for each vehicle depending on traffic situation.
Section 2 reviews algorithms or methods to solve both time-dependent shortest paths and vehicle routing problems. The methods using in this paper are discussed in Section 3. Computational results are shown in Section 4 before ending with conclusion.

LITERATURE SURVEY

In this section, we show some research articles related to solving a time-dependent shortest path and a time-dependent vehicle routing problem (TDVRP). In a map containing all roads and intersections, we need first to determine a shortest path from one point to another. We mainly have to calculate the shortest paths between a distribution center and all customers.

Dean (2004) studied a property of this problem and summarized several shortest path algorithms for a time-dependent network in both continuous and discrete time cases. Dehne and Omran (2012) focused on two types of the time-dependent FIFO network, the availability of the links with their change over time and the cost of using the link. Moreover, Liang Zhao et al. (2011) presented a novel generalized A* algorithm and an ALT algorithm using an appropriate estimator to reduce computation time. Their methods are more suitable especially for a large network than a normal Dijikstra algorithm.

The vehicle routing problem consists of a number of vehicles with its own capacity. There are customer demands to be supplied by a distribution center. We need to find a route representing customers that each vehicle has to visit. The problem aims to minimize a number of vehicles and total distance, while the capacity constraint must be satisfied.

Kumar and Panneerselvam (2012) presented a survey on the vehicle routing problem and its variants. They introduced several algorithms based on exact methods, heuristic approaches, meta-heuristic, and hybrid method. Their study showed that only few researchers use hybrid methods to solve a vehicle routing problem due to the time needed to find the optimal solution will be prohibitive. Rousseau and Gendreau (2002) applied the operator for searching on large neighborhood. They used the pruning and propagation techniques of constraint programming to achieve more efficient search.

As the time-dependent vehicle routing problem is NP-Hard as a generalization of the travelling salesman problem which, several solving methods and heuristics are developed. For example, Potvin et al. (2004) introduced an algorithm to calculate the travel time. Figliozzi (2009) suggested how to construct a route and re-route according to the traffic congestion. Balserio et al. (2011) applied Ant Colony Optimization. Moreover, Kim and Jeon (2010) introduced Genetic Algorithm and Mathematical Programming for make decision with the traffic congestion.

METHODOLOGY

We describe here three main procedures applied to solve our problem. First, traffic information from Traffy has to be estimated in order to calculate a travel time. Then, we select the Dijikstra algorithm modified for finding a shortest path in a time-dependent network. Finally, our method to solve the TDVRP is briefly discussed. In this preliminary step, simple algorithms used in this paper are not yet appropriate for solving very large scale cases.

1. Processing traffic information from Traffy

Traffy API allows us to check traffic status by executing a command Get Traffic Congestion. This API returns three levels of Traffic congestion which consist of high, medium and low. The website of Intelligent Traffic Information Center (www.iticfoundation.org/node/41) suggests a possible range of velocity for roads in a city: High status represents a speed lower than 15 km/hr, Medium status represents a speed between 15-25 km/hr, Low status represents a speed more than 25 km/hr.

To determine a travel time from these congestion levels, we need to assume that the High, Medium, and Low status equivalent to 15 km/hr, 25 km/hr, and 60 km/hr, respectively. Each location in a map is represented by its latitude and longitude. Thus, a distance between two nodes is approximately determined by using the Eucladian norm. Thus, a travel time depends on the distances and congestion levels of roads needed to travel along.

2. Solving Time-dependent Shortest Path

To determine a shortest path from a source node to a destination node, Dijikstra's algorithm is one of standard algorithms. Its computation based on constant values of distances between nodes. However, in a time-dependent network we need to consider a travel time which varies according to current values of congestion levels. Thus, the travel time for each time interval can be different.

Figure 1 shows a modified Dijkstra's alogrihm given by Dean (2004). This algorithm determines $EA_{si}(t)$ which is a shortest path from a source node s to any destination node i, when leaving from the source node at time t. At the beginning, $EA_{si}(t)$ is initialized with a large value. The search explores from the start node to all nodes in neighborhood. To maintain a minimal value, the algorithm finds out whether there exists a better path visiting other node j before going to node i, $a_{ij}(EA_{si}(t))$. Note that this algorithm might not be efficient enough for solving a large network.

Initialization
  For all i ϵ N\{s}: $EA_{si}(t) \leftarrow \infty$
  $EA_{ss}(t) \leftarrow t$
  S $\leftarrow N$
Main Loop
  While S $\neq \emptyset$
    Select i ϵ S minimizing EA_{si}(t)
    S $\leftarrow S\backslash\{i\}$
    For all j such that (i,j) ϵ A
      $EA_{si}(t) \leftarrow \min \{EA_{si}(t), a_{ij}(EA_{si}(t))\}$

Figure 1: Dijikstra's algorithm for solving time-dependent shortest path

3. Solving Time-dependent Vehicle Routing Problem

Drools Planner is a library platform written in Java to solve planning and scheduling problems. It has several internal heuristics and metaheuristics based on score calculation. Many examples are included, e.g. vehicle routing problem, nurse scheduling, bin packing. We further modify its VRP example to calculate a departure time of each node and use a time dependent shortest path for optimization process. Available optimization techniques are applied.

First, a construction heuristic builds a pretty good initial solution in a finite length of time. This initial solution may not be feasible but can help metaheuristics to finish the solving process. In our case, the First Fit Decreasing is applied to allocate the most difficult planning entity/variable first since it is critical to fit in our limited resource. Other remaining entities have less degree of difficulty and could be allocated later.

Afterward, local search starts searching from the initial solution to find out a better one. A number of moves for each solution are evaluated before the best move is applied. The program searches until reaching termination criteria like timeout. Tabu list is also used to improve the hill climbing process and avoid the search getting stuck in local optima.

COMPUTATION RESULTS

The traffic network obtained from Traffy consists of 450 nodes. Figure 2 shows the locations of these nodes and the connected links in red color, while actual roads are in yellow color. We notice that the links obtained from Traffy are not completely connected like a real road network. On some roads traffic information are still missing. Thus, we have to create additional links and assume that the congestion levels of these links are always low.

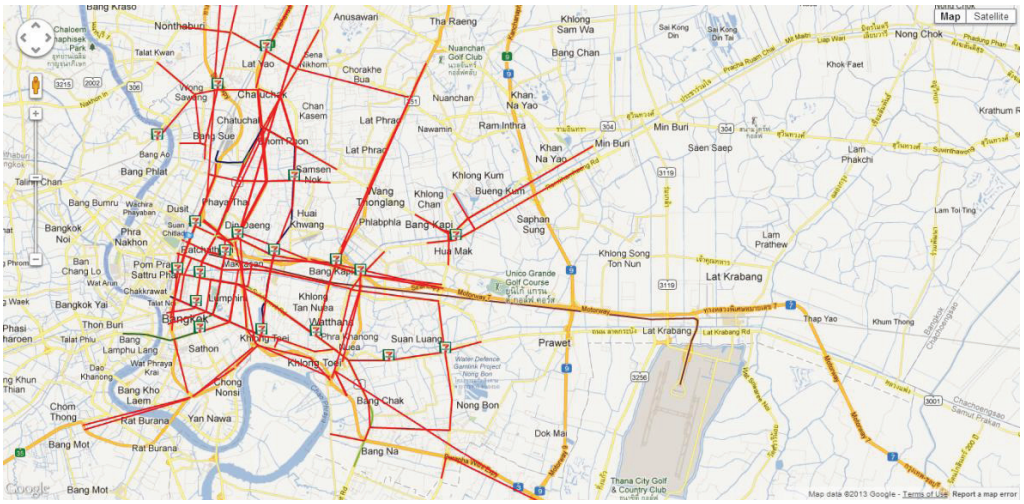

Figure 2 – Available Traffic Information on Links highlighted by Red Color

Moreover, we select 19 nodes around the city center to represent locations of convenient stores. As our primary objective is to minimize a number of required vehicles, we found that three trucks are needed to support the total demand of all stores. The sample data used in our experiment was taken every 30 minutes on Monday, March 11, 2013 between 5.00-9.00 a.m. We assume congestion levels do not change during the 30-min interval.

Table 1 compares two solutions finding routes with the minimum total travel distance and the minimum total travel time. In the first case, we achieve an optimal solution based on the selection of paths using only a shortest distance. The second case applies traffic information to select a path with a shortest travel time. In both cases, all vehicles have to leave from a distribution center at the same initial time. Drools planner and Dijkstra's algorithm need together around 5 minutes to achieve the solutions.

Table 1 – Comparison of Solutions: Minimizing Total Distance and Minimizing Total Time

Vehicle	Route Minimizing Total Distance		Route Minimizing Total Time	
	Total Distance (km)	Total Time (min)	Total Distance (km)	Total Time (min)
1	41	199	64	225
2	71	198	121	383
3	43	338	32	106
Sum	196	735	217	714

The route with minimizing total time clearly requires less travel time, while its total travel distance becomes larger. However, the difference is not so much because we assume low congestion levels for additional links created to fulfill missing traffic information. The program can always avoid roads with traffic congestion. Also, our primary objective limits us to always use three vehicles for both cases. The vehicles still have to significantly travel across the city.

We can notice also that it is better to estimate the travel time of each vehicle by using traffic information. When the constant speed of 60 km/hr is assumed for all links, the obtained travel time becomes significantly different from the reality. For example, we cannot expect the vehicle 1 spends just 41 minutes to cover its travel distance of 41 km. The traffic information can help predict when each truck can come back to depot and become available for next delivery.

CONCLUSION

Our research solves a vehicle routing problem based on real traffic information. We suggest a scheme to collect and interpret congestion levels from the available resource in the internet. The Dijkstra's algorithm is applied to determine a time-dependent shortest path. In this work, we still assume that all vehicles have to leave a depot at the same time, while a fastest path is selected depending on a current arrival time of each node. Drools planner further solves a vehicle routing problem to minimize the total travel time.

The computation results verify that it could be more efficient to apply a route using less travel time. Although vehicles have to travel longer distance, they can return to a distribution center earlier and can be reused for other deliveries. That means we can reduce the size and fix cost to operate the fleet.

The impact of wasting time could be higher when the number of store increases and transportation during the peak rush hour is inevitable. However, the cover areas, reliability and accuracy of traffic information are still main limitations and have to be evaluated more in practice.

In the near future, the quality of information could be further improved by the service providers since there are more vehicles sharing their location signals to traffic centers via smart phones and a modern mobile network. In addition, our methods to solve a time-dependent shortest path and a time-dependent routing problem have to be improved to achieve better solutions especially for a large network.

ABSTRACT

Purpose: *We present a comprehensive framework of the key determinants of the stability in strategic alliances (SAS). Herein the relationship of triad: trust, knowledge sharing and stability is digged dramatically.*
Design/ methodology/approach: *We propose a dynamics framework of stability in SAS based on a review of the literature. The game theory concept is adopted in the conceptual framework. The simulation is based on the system dynamics and characterizes how the constituent elements of the strategic alliance behave.*
Findings: *The major finding of this paper is that result from the literary verbal analysis can be transferred into a dynamics model which can be used to fulfill determinants of the stability of strategic alliance.*
Practical implications: *Based on the framework, a number of propositions are developed to facilitate empirical research on trust, knowledge sharing and stability in SAS. Managerial implications from the framework are also discussed.*
Originality/ value: *The value of this paper is literary verbal analysis can be transferred into a dynamics model which can be used to fulfill determinants of the stability of the strategic alliance. We find out that in case of low trust and high level of the un-balance knowledge sharing the strategic alliance became extremely unstable and vise versa.*

INTRODUCTION

Among the various factors impinging upon making a decision in an uncertain environment, fear and trust are surely crucial ones. Several models for trust have been proposed in the literature preview. Trust, defined as one party is confident that the other party in the exchange relationship will not exploit its vulnerabilities, become a potential variable in research on inter-organizational relationships. Scholars draw on theoretical concepts such as transaction costs, relational governance, and transaction value (McEvily and Zaheer, 2006) just only to explain the positive effects of trust on the success of strategic alliances.

Knowledge, unlike to traditional production-related factors such as labor, capital, and land, has become the key element in the development of enterprises (Gravier et al., 2008) . At the same time, technology innovation is often implemented on a large scale, and involves large systems and socialized cooperation, which means companies will have to stand high costs; the limited

resources of a single enterprise prevent it from satisfying the demands of technological innovation (Ruckman, 2009). The technology innovation alliance (Jiang et al., 2008b) is considered as the main driver of enterprise cooperation in the knowledge economy era. Because of it not only enables access to capital, technology, talent, and information on technology innovation, but also enables new knowledge transfer and the acquisition of complementary resources by effectively using and reintegrating the superior resources of member firms (Butler, 2008, Dussauge et al., 2004) state that given the strategic alliance's inherent properties. Alliance instability is caused by the unplanned alteration of goals, contracts, and control modes in the allied process, as well as by disintegration and mergers (Inkpen and Beamish, 1997). It may also pertain to significant conducts, such as alterations in strategic direction, agreement renegotiation, ownership or governance construction, and changes in cooperative relationship, that influence alliance performance (Yan and Zeng, 1999). The contradictory evolutions of cooperation and competition, structural rigidity and strategic flexibility, as well as short-and long-term goals lead to instability in alliance operations and management(Das and Teng, 2000a, Ernst and Bamford, 2005). Contractual relationships, mutual trust, organizational learning, benefit distribution, and cultural differences also significantly affect alliance stability (Gil and Passino, 2006, Jiang et al., 2008a). To maintain competitive advantage sustainably, firms must embrace knowledge sharing and learning, for which the Strategic Alliance has provided a good opportunity.

We suggest that the possibility of an influence of trust needs to be investigated to clarify our understanding of the role of trust in stability of strategic alliances (SAS) and the associated recommendations with regard to the development of knowledge sharing in SAS under system dynamic perspective. This research is based on a game theory principle (Das and Kumar, 2009) and characterizes the maintenance of strategic alliance

Therefore, this paper may contribute significantly to the field as it develops a dynamic game theoretic model to analyze the interaction of knowledge sharing and trust has on the stability of strategic alliance and characterizes how the constituent elements of the strategic alliance behave. The value of this paper lies in the transformation of verbal model into a quantified simulation model and we learn result from the simulation.

LITERATURE REVIEW

1. Knowledge sharing and trust

Based on the resource-based view (RBV), knowledge sharing and competitive advantage are the competence of a strategic alliance. Heterogeneity and immobility are at the heart of the RBV. For example, the RBV suggests that an industry may be heterogeneous in terms of the resources they control and these resources are imperfectly mobile across firms (Barney, 2001). This essentially suggests that resources are valuable in and of themselves, driving the choice of strategy and that competitive advantage is derived through a combination of unique organizational resources in obtaining virtual monopoly positions in their respective markets (Prahalad and Hamel, 1994). (Das and Teng, 2000b) suggest that the RBV has rarely been applied in examining strategic alliances. They argue that the RBV provides an appropriate

framework for examining alliances as essentially they are formed to gain access to other fir m's valuable resources.

According to (McGee, 2012), alliances enable partners to gain access to each other's resources temporarily and with more flexibility than mergers and acquisitions. The two related but distinct motives for a firm to consider forming a strategic alliance are to obtain resources of others and to retain and develop its own resources by combining them with others' resources. Resources are sometimes classified as property-based resources, which have clear property rights and in which a firm's ownership is absolute and protected by law, and knowledge-based resources, which cover tacit skills and knowledge involved in technological, managerial, and organizational resources. In this paper, we mention to the knowledge-based resources – knowledge sharing effected by the trust in SAS.

The intensification of resource sharing and inter-partner learning within strategic alliances makes trust between alliance partners even more crucial which is why inter-party trust plays an important role within successful strategic alliances (Luo, 2002). The rationale is that when alliance partners have high levels of trust in each other, they will be more likely to be committed to, and persist with, knowledge sharing.

2. Structural Cooperation and Motivational Cooperation

One source of instability in a strategic alliance arises because a partner relationship necessarily involves a situation analogous to the "prisoner's dilemma". In the "prisoner's dilemma" involving a cooperative relationship, betrayal or deviation yields a greater payoff than does cooperation for each firm; therefore, both firms choose betrayal and, as a result, the payoff for each is low. Two conceivable ways of maintaining a strategic alliance exist, namely, the "structural cooperation approach" and the "motivational cooperation approach" (Zeng and Chen, 2003).

The "structural cooperation approach" attempts to resolve the dilemma by changing the payoff structure of the game. Put simply, "changing the payoff structure" means applying some penalty to a player who chooses to deviate. Adding a penalty provides an incentive to choose cooperation. In this sense, such methods attempt to maintain a cooperative relationship through the adoption of a penalty system. For this reason, we call methods that change the payoff structure "structural cooperation." Thus, structural cooperation becomes effective when partners behave opportunistically.

The "motivational cooperation approach" attempts to resolve the dilemma intrinsically, or voluntarily, without using any structural means. Motivational cooperation becomes effective when the game is repeated infinitely, as well as when the expected payoff is sufficiently high. First, in a finitely repeated game, betrayal is optimal for each player, even if the game is played a thousand times. Even if a cooperative relationship continues until the 999-th trial, betrayal is preferred by each player in the final trial, because there is no need to consider the future. Since it is known that deviation will occur in the final trial, the best strategy is deviation from the beginning to the end, whenever the number

of trials is finite. Therefore, in the finitely repeated case, both players choose to deviate, and no cooperative relationship arises. However, in the infinitely repeated case, it is beneficial for both sides to select a cooperative strategy if certain conditions are fulfilled. This fact is generally known as the "Folk Theorem"(Arend and Seale, 2005). The Folk Theorem also makes clear that, if the expected future payoff is sufficiently high, it is more advantageous to select a cooperative strategy than to deviate via betrayal.

That is, even if penalties for betrayal are adopted as an institution, there is no guarantee that all parties to the alliance will comply with it. Rather, it becomes necessary to monitor compliance and to put the penalty system into effect in the case of noncompliance. These activities naturally require some expense. Moreover, if the expense resulting from the implementation of the penalty system exceeds the amount of the additional gain generated by cooperation, it becomes meaningless to create such a system and impose regulations such as monitoring and penalty enforcement. In practice, it is not possible to monitor a business partner accurately. Therefore, it is difficult to maintain a cooperative relationship through structural cooperation.

3. Trust and stability of Alliance

Numerous studies have acknowledged that trust formation is crucial for maintaining strategic alliances. For example, Child and Faulkner (1998) have pointed out that trust is crucial for the success of alliances (joint ventures). The others has clarified empirically that trust between joint-venture partners is crucial for the maintenance of long-term relationships.

"Trust" is defined as "the expectation that the other party will behave cooperatively towards one's self in a situation where there is potential for one's self to suffer losses if the other party behaves selfishly (Das and Teng, 2001b). Deterrence-based trust occurs when a partner is trusted because he will incur a large loss in the case of betrayal. Calculus-based trust occurs when a partner is trusted because he expects to receive a large benefit in the future as a result of his cooperation. In the contexts of these two types of trust, it is difficult to calculate the changes in the gains or losses that occur as uncertainty increases; thus, these concepts differ from a concept of "trust" whereby the partners cooperate, even if they find themselves in an uncertain situation.

4. System Dynamics

System dynamics is a technique for simulating the behavior of complex social systems and was originally an application of automatic control theory (adopted from engineering fields) to issues in the social sciences. Under system dynamics, the simulation of system behavior is carried out in order to elucidate a certain phenomenon in a complex social system; this task is accomplished by using a simplified system created by selecting the things thought to be key factors driving the phenomenon, and by clarifying the causal relationship of these factors. We develop the SD model of an arbitrary job-shop consisting of eight workstations (m = 8) of products. In SD discipline, the model is usually presented as a

stock-flow diagram that captures the model structure and the interrelationships among the variables (Sterman, 2000). The stock-flow diagram is translated into a system of differential equations, which is then solved via numerical simulation. The embedded mathematical equations are divided into stock equations (state equations), which integrate the net flow into a stock, and flow equations (rate equations), defining the inflows and outflows among the stocks as functions of time. Fig. 1 illustrates the generic stock-flow diagram. The SD model is developed using the Vensim software package.

One distinguishing feature of system dynamics is that it facilitates learning about dynamic systems that vary over time. Note that time discrepancies exist in the relationships among factors in real-world systems, as well as differences in the speed of effects. Another distinguishing feature is that system dynamics facilitates learning about complex systems that incorporate feedback. This feature is useful because the relationships among factors in real-world systems are typically not one way.

More technically, complex time-series systems are modeled using simultaneous difference equations or simultaneous ordinary differential equations, and problems are solved by supplying initial values for those equations.

CONCEPTUAL MODEL

The figure illustrates the causal relationship model of the triad: Unbalance in knowledge sharing; Stability in Strategic Alliance and Trust:

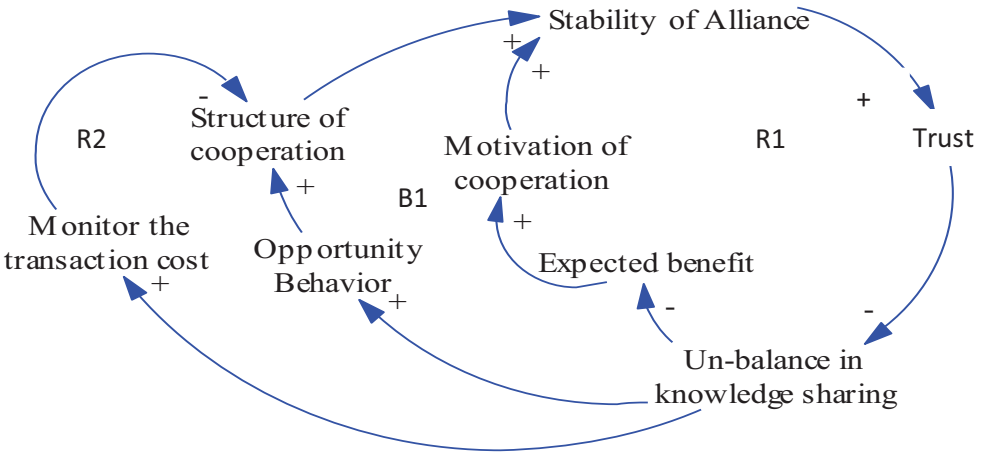

Fig. 1 Causal Relationship Model Concerning the Stability of Strategic Alliance

Figure 1 illustrates a causal relationship model of the factors that affect the stability of a strategic alliance. The model comprises three reinforcement loops (Rl, R2, B1).

Loop Rl

This reinforcement loop comprises un-balance in sharing knowledge, expected payoffs, motivation of cooperation, the stability of the strategic alliance and trust.

Trust in the workplace has been shown to have a strong and robust influence on a variety of organiza-tional phenomena, including job satisfaction, stress,organizational commitment, productivity, and, most relevant to the current research, knowledge sharing(Kramer, 1999, Levin and Cross, 2004). Therefore, if trust is high, then un-balance in sharing knowledge decreases. Outcome expectations that are related to reward systems (Bartol and Srivastava, 2002) are also important factors influencing the decision to share knowledge. According to the economic exchange theory, individuals will behave by rational self-interest, thus, knowledge sharing will occur when its outcomes exceed its costs or are as expected (Constant et al., 1994). This is why practitioners emphasize incentive systems for successful knowledge management., outcome expectations imply that, members of SAS believe that they would receive extrinsic benefits such as monetary rewards, promotion, or educa-tional opportunity from their knowledge sharing, then they would develop a more positive attitude toward knowledge sharing (Bock and Kim, 2002, Kankanhalli et al., 2005). On the other hand, un-balance in sharing knowledge decreases, the expected payoffs increase.

According to the equity theory of motivation, those who perceive themselves as being treated unfairly will be motivated to restore a sense of equity. Similarly, a partner firm, which foresees an inequitable pattern of payoffs, may expect itself or its partners to behave discordantly in the future(Das and Teng, 2001a). If one partner feels that the other partner gains too much from the alliance as compared to its own gain, it may begin to commit itself less, notwithstanding its own stake. As the expected payoffs increase, motivational cooperation increases. It leads to motivational cooperation increases, the stability of the strategic alliance increases. Therefore, the stability of the strategic alliance increases, trust will increases. As trust increases, un-balance in sharing knowledge decreases. Moreover, the stability of the strategic alliance is reinforced through the repetition of this cycle.

In contrast, as the previous research mentioned above we can propose the assumption as following: if trust is low, then un-balance in sharing knowledge increases. As un-balance in sharing knowledge rises, the expected payoffs decrease. As the expected payoffs decrease, motivational cooperation decreases. As motivational cooperation decreases, the stability of the strategic alliance increases. As the stability of the strategic alliance increases, trust decreases. As trust decreases, un-balance in knowledge sharing increases. In addition, the instability of the strategic alliance is reinforced through the repetition of this cycle.

Loop R2

This reinforcement loop comprises un-balance in sharing knowledge, the cost of transaction monitoring, structural cooperation, the stability of the strategic alliance, and trust.

Trust in the workplace has been shown to have a strong and robust influence on a variety of organiza-tional phenomena, including job satisfaction, stress,organizational commitment, productivity, and, most rel-evant to the current research, knowledge sharing(Kramer, 1999, Levin and Cross, 2004). Therefore, if trust is high, then un-balance in sharing knowledge decreases. Outcome expectations that are related to reward systems (Bartol and Srivastava, 2002) are also important factors influencing the decision to share knowledge. According to the economic exchange theory, individuals will behave by rational self-interest, thus, knowledge sharing will occur when its outcomes exceed its costs or are as expected (Constant et al., 1994, Jiang and Hao, 2011). As the monitoring transaction cost decreases, structural cooperation increases. As structural cooperation increases, the stability of the strategic alliance increases. As the stability of the strategic alliance increases, trust increases. As trust increases, un-balance in knowledge sharing decreases. The stability of the strategic alliance is reinforced through the repetition of this cycle.

Based on the above literature review, we describe the causaul loop as followed, if the trust is low, the un-balance in sharing knowledge increases. As un-balance in sharing knowledge increases, the monitoring cost increases. As the monitoring transaction cost increases, structural cooperation decreases. As structural cooperation decreases, the stability of the strategic alliance decreases. As the stability of the strategic alliance decreases, trust decreases. As trust decreases, unbalance in knowledge sharing increases. The instability of the strategic alliance is reinforced through the repetition of this cycle.

Loop B1

This balance loop comprises un-balance in sharing knowledge, opportunistic behavior, structural cooperation, the stability of the strategic alliance, and trust.

As suppoting by previous research, if trust is high, the un-balance in sharing knowledge decreases. As un-balance in sharing knowledge decreases, opportunistic behavior decreases. As opportunistic behavior decreases, structural cooperation decreases. As structural cooperation decreases, the stability of the strategic alliance decreases.

On the other hand, as the stability of the strategic alliance decreases, trust decreases. As trust decreases, the un-balance in sharing knowledge increases. As the un-balance in sharing knowledge increases, opportunistic behavior increases. As opportunistic behavior increases, structural cooperation increases. As structural cooperation increases, the stability of the strategic alliance increases. As the stability of the strategic alliance increases, trust increases. As trust increases, un-balance in sharing knowledge decreases. In this case, therefore, the stability status of the strategic alliance becomes unstable, sometimes increasing and sometimes decreasing, through the repetition of this cycle.

SIMULATION MODEL AND OPERATION

Figure 2 illustrates the simulation model using Vensim (software for simulating system dynamics). The adopted simulation model is qualitative, not quantitative. The numerical values

chosen are all fictitious. Building a more complex model incorporating delay effects or complementary variables lowers the explanatory power of the model. Therefore, the model used for this analysis is simple. The model comprises three features: stocks, flows, and connectors. A stock is a variable that accumulates value as time passes. A flow is a variable that causes a stock to increase or decrease as time passes. A connector indicates the causal direction between variables. There are eight stock variables in the model: the stability of the strategic alliance, motivational cooperation, structural cooperation, the expected payoffs, trust, un-balance in knowledge sharing, opportunistic behavior, and the monitoring cost. There are also eight flow variables in the model, which include the changes in motivational cooperation, structural cooperation, the expected payoffs, trust, environmental uncertainty, opportunistic behavior, and the monitoring cost.

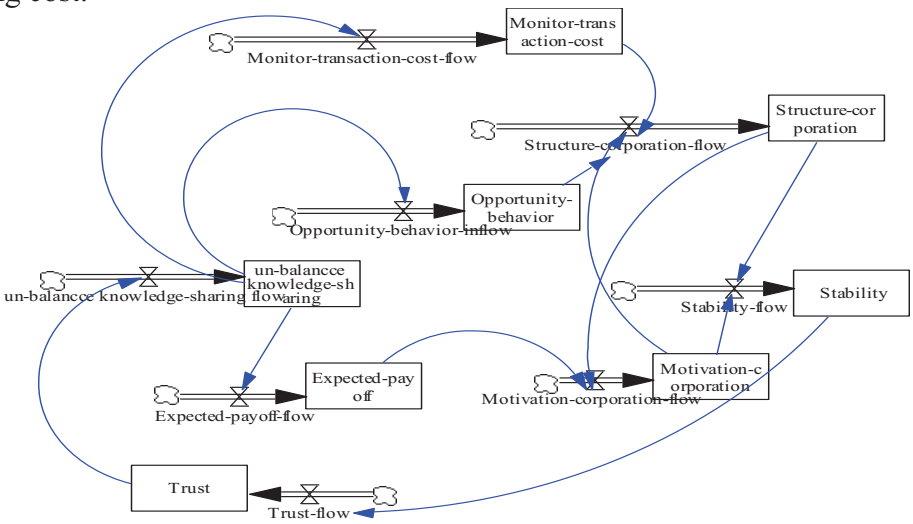

Fig. 2 Stock and flow structure of exploratory system dynamics model

Aas formulated, is that all the numerical values used are fictitious; this fact makes it more likely that the measured results will be large. To resolve this potential problem, it is necessary to prevent the numerical stock values from inflating by restricting all of the numerical flow values to fall within a certain constant range. Therefore, the original data are first transformed using a probit. Then, 0.5 is subtracted from them; this value ensures that all of the original data remain within the range from - 0.5 to 0.5. Thus, if an original datum is equal to zero, the transformed datum is still equal to zero. However, the greater the original datum is relative to zero, the closer the transformed datum comes to 0.5. Similarly, the smaller the original datum is relative to zero, the closer the transformed datum comes to - 0.5.

RESULT

The aim of the study was, primarily, to examine the relationship of triad: trust, knowledge sharing and stability of a strategic alliance. Besides, the motivation cooperation and on structure cooperation are observed how these impact changes over time. However, all of the data and coefficients are fictional; therefore, we established the following two patterns: (1) a high degree

of trust and low un-balance know sharing and (2) a low degree of trust and high un-balance knowledge sharing.

The initial values of the variables other than un-balance in knowledge sharing and trust are set to zero, which represent the state in which the respective variables are neither high nor low.

Scene 1: High trust, low level of the un-balance in knowledge sharing

We conduct this simulation by setting the initial value for trust at 10 and the initial value for un-balance in knowledge sharing at - 10. That the initial value for trust is 10.

Subsequent variations in the trust value indicate variation in trust. In addition, that the initial value for unbalance in knowledge sharing is - 10 indicates, that it is, in fact, close to 0.5; thus, unbalance in knowledge sharing is extremely low in this case.

Figure 3 illustrates the simulation results. First, only motivational cooperation (line 3) increases, while structural cooperation (line 2) decreases. This motion reflects the fact that a trade-off exists between motivational cooperation and structural cooperation. The stability of the alliance increases because the increase in motivational cooperation is greater than the decrease in structural cooperation. This result is in accord with the general prediction that cooperation tends to arise more easily in situations where trust between partners is high and the knowledge sharing is stable.

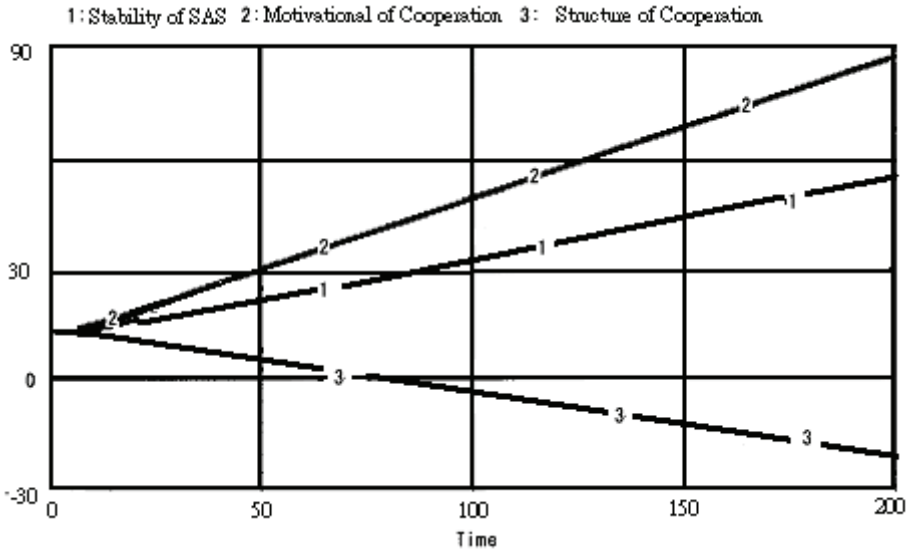

Fig. 3 Simulation result for stability of SAS with high trust, low level knowledge sharing

Scene 2: Low trust, high level of un-balance in knowledge sharing

We stimulate this simulation by setting the initial value for trust at - 10 and the initial value for level of un-balance of knowledge sharing at 10. That the initial value for trust is - 10 means, based on Formula 1, that it is, in fact, close to - 0.5; thus, trust is almost non-existent in this case.

In addition, that the initial value for un-balance of knowledge sharing is 10 indicates, that un-balance of knowledge sharing is extremely high. Figure 4 illustrates the simulation results. First, structural cooperation (line 2) increases about time 40, at which point it decreases. Then, after a time of about 170 has elapsed, it becomes negative. That is, after time 170, structural cooperation causes instability of the strategic alliance, rather than stability. On the other hand, motivational cooperation (line 3) decreases until about time 40, at which point it increases. After time 170, it becomes positive. That is, after time 170, the stabilization of the strategic alliance is promoted. However, the stability of the alliance always takes a negative value between time zero and time 210, and is itself extremely unstable. After time 210, it tends to increase with increases in motivational cooperation. In other words, if cooperation has not resolved by time 210, then the cooperative relationship thereafter becomes stable. This variation may occur in part because the maintenance of a long-term relationship leads to the formation of relational trust, a reduction in un-balance in knowledge sharing, and an increase in motivational cooperation.

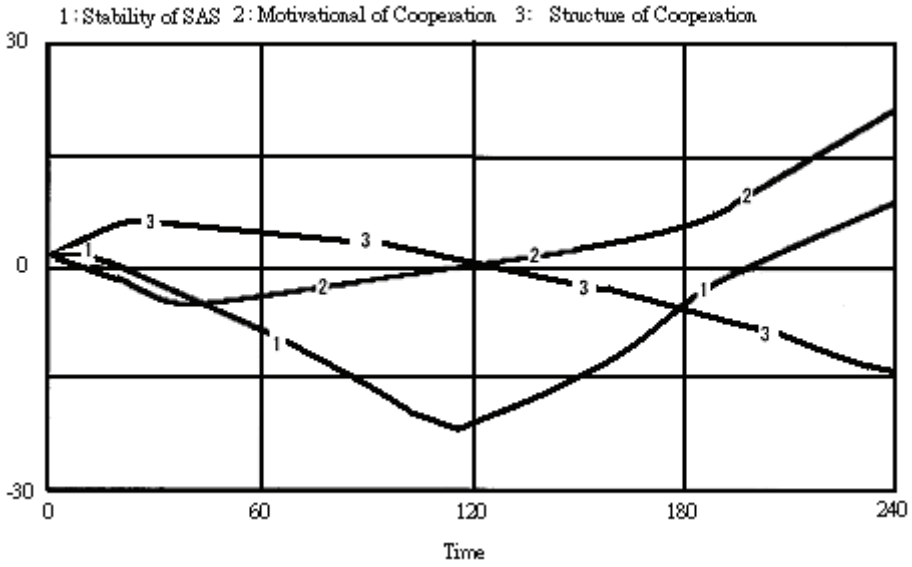

Fig. 4 Simulation result for stability of SAS with high trust, low level knowledge sharing

However, the stability of the alliance always takes a negative value between time zero and time 210, and is itself extremely unstable. After time 210, it tends to increase with increases in motivational cooperation. In other words, if cooperation has not resolved by time 210, then the cooperative relationship thereafter becomes stable. This variation may occur in part because the maintenance of a long-term relationship leads to the formation of relational trust, a reduction in un-balance knowledge sharing, and an increase in motivational cooperation.

CONCLUSION

In this paper, we have considered an analytic framework for the management of strategic alliances over the long term, and have conducted simulations using system dynamics. First, in this regard, we considered the implications of game theory, which provides a theoretical framework by which to examine the stability of the strategic alliance. Then, based on this

theoretical framework, we constructed an analytic model characterizing the stability of the strategic alliance. The key components of this model include motivational cooperation, structural cooperation, opportunistic behavior, a monitoring cost, expected payoffs, unbalance in knowledge sharing, and trust. We pointed out that these form a dynamic system involving feedback.

The major finding of this paper is that result from the literary verbal analysis can be transferred into a dynamics model which can used to fulfill determinants of the stability. We find out that in case of low trust and high level of the un-balance in knowledge sharing the strategic alliance became extremely unstable and vise versa. Based on this analytic model, we designed a simulation model using system dynamics. Assuming two scenes, namely high trust with low unbalance in knowledge sharing and low trust with high unbalance in knowledge sharing, we investigated how the stability of the strategic alliance, structural cooperation, and motivational cooperation behave over time. We found that stability with respect to a strategic alliance can be achieved through motivational cooperation in the case of high trust and low un-balance knowledge sharing. In the case of low trust and high un-balance knowledge sharing, we found that the strategic alliance became extremely unstable. Moreover, when a cooperative relationship is continued in this situation, despite the instability, the possibility exists that it will become stable due to the presence of motivational cooperation.

The contributions of this paper are presented as an analytic framework relating to the maintenance of a strategic alliance, a topic that has previously not attracted much attention. We have also demonstrated, based on the results of our simulations using system dynamics, that motivational cooperation is an effective means of maintaining the stability of the strategic alliance. The research also extend to some future works as following.

Firstable, the presented analytic model is not only a basic model, and more detailed variables should have been incorporated. For example, as trust formation factors, it would be useful in future research to consider partner reputation and the existence of past cooperative relationships.

Secondable, our simulations using system dynamics have been based only on fictitious numerical values. A highly practical simulation model could, in the future, be designed after the relationships between variables had been determined, based on a survey and a multivariate analysis of its results. Thirdly, we have not considered the issue of environment recognition. This paper has not incorporated the recognition patterns of companies themselves, which discriminate between environments, or the environmental uncertainty that exists within companies. With regard to the uncertainty of the external environment, it is conceivable that recognition scence differ across companies. In the future, these points too will need to be considered.

ABSTRACT

Purpose: *Enterprise Resource Planning (ERP) systems are implemented to control the processes developed by the organisation through analysis of the allocation of resources within the firm. Although the benefits of implementing such systems have been determined, research on the relationship to firm performance has been limited to case studies and very specific papers based on some financial measures.*
Design/methodology/approach: *A survey is used to collect data. Empirical analysis utilises Structural Equation Modelling (SEM).*
Findings: *This investigation aims to study the appropriateness of ERP benefits to the firm's competitive priorities, based on the assumption that this appropriateness is what is responsible for its impact on firm performance measures. The results confirm the positive relationship of the benefits in operations, management and IT infrastructure that implementing an ERP system provides for the firm's competitive priorities.*
Originality/value: *The study confirms that there is a positive relationship between these benefits and a higher level of key performance measures, and that competitive priorities sometimes act as a mediator of this relationship.*

ABSTRACT

Purpose: *The aim of this paper is to present a new methodology to enrich the analysis over data cubes in an OLAP system, allowing the system to add semantic interpretation to the query results adapted to the final user.*
Methodology: *Defining a semantic translation of a given value regarding a concrete range of values can be done by means of fuzzy logic. In the case of querying data cubes, the possible combinations of dimensions, levels and aggregation functions makes this range different for each query, so a static interpretation is not valid. We propose a way to supply a semantic interpretation that adapts itself to the query considering the granularity and the semantic of the used function.*
Findings: *We propose a mechanism that allows the representation of different semantic interpretations in data-cubes, in addition to their adaptation when querying. With it users are automatically provided with personalized and elaborated results that are adapted and really meaningful for their individual requirements. In addition, the mechanism allows an individual (the meaning of a value is independent of the other values) or comparative interpretation (the semantic compare each value with the others in the query).*
Practical Implications: *The accessibility improvements achieved allow the creation of simpler interfaces and improve the query over data-cubes from mobile devices allowing the user to interpret the results without needing to review all the values for the queries.*
Originality/Value: *As far as the authors know, there are proposals to interpret values in a natural way for user, but none of them are able to adapt it to the structure of the query and the functions used, so the user is limited to the considered cases. In our approach, the system will adapt the semantic after each query, providing the user with an easy and interpretable result. Even more, the system can adapt the results to different users in a very simple way.*

INTRODUCTION

Everyday more enterprises and big organizations require advanced methods providing managers with elaborated and comprehensible information. It is especially relevant in the cases of organizations working over OLAP systems due to the immense amount of information that is stored using datacubes.

This problem is relatively recent so there are not a lot of proposals that face this problem. Most of the existing techniques are focused on presenting the information to the user in a comprehensible language for him/her; i.e. in natural language. This is the case of the linguistic summary methods, that analyze great amount of data to provide the user with results of the "Q of the X verify the property Y" structure, where Q is a quantifier. However this is not enough when the user needs the result of the query to be semantically meaningful.

An example of this situation takes place when a manager of a group of health centers has to evaluate the performance of the medical doctors. This manager may query about the number of patients that are attended by a given doctor, obtaining, as a result the number of 15 patients per day. This value doesn't show whether this doctor works a lot or, otherwise, attends to very few patients. Therefore, it would be necessary to perform the query comparing the results with the attendance values of the other medical doctors working at the same center. With it the manager may get the conclusion that all the staff at the same center have a similar productivity; however, he/she still doesn't know if it is a good productivity or not: the value obtained doesn't have the same meaning if the health center attends to a small population than if it is at a big crowded city. Hence, to know if this number is appropriated, it would be necessary to perform a query comparing this value with the ones of the medical doctors working at other health centers with similar characteristics. In other words: 15 patients/day may be a good rate in a small center (where the productivity uses to be medium) but a bad rate in a big hospital (where the average productivity uses to be high or very high).

In this example the same user has performed three different queries over the same data but with distinct purposes, each requiring a different interpretation according to the granularity of the information with which this data is compared.

The research field closer to the problem of the meaning of the queries is, as mentioned above, the linguistic summary field. According to Bouchon-Meunier, B. & Moyse [1], proposals in this scope can be categorized in two groups. On the one hand can be found the proposals using fuzzy logic quantifiers [2-8], on the other hand, proposals based on nature language generation NLG [9-14].

Nevertheless, all of these techniques doesn't take into account the granularity of the information and just tell the user "how many of the X verify Y", when what the user really wants is to analyze the same data item from different points of view (alone, compared with a small set or with a bigger set) each with a different meaning.
This is why in this paper we introduce the concept of *Semantic Interpretation* of the results of queries on a datacube. To this purpose in section 2 we present the multidimensional model used as reference, whereas in section 3 we describe the notion of *semantic interpretation*.

MULTIDIMENSIONAL MODEL

The base for the semantic interpretation is a multidimensional model to store the data and query it. In this section we briefly present the model. A detailed definition can be found in [16,17].

1. Multidimensional Structure

In this section we present the structure of the fuzzy multidimensional model.

Definition 1. A dimension is a tuple $d=(l,\leq_d,l_\perp,l_\top)$ where $l=\{l_i,\ i=1,...,n\}$ so that each l_i is a set of values and $l_i \cap l_j=\emptyset$ if $i\neq j$, and $\leq_d$ is a partial order relation between the elements of l. $l_\perp$ and $l_\top$ are two elements of l so that $\forall l_i \in l\ l_\perp \leq_d l_i$ and $l_i \leq_d l_\top$.
We denote *level* to each element l_i. To identify the level l of the dimension d we will use $d.l$. The two special levels $l_\perp$ and $l_\top$ will be called *base level* and *top level* respectively. The partial order relation in a dimension is what gives the hierarchy relation between the levels.

Definition 2. For each dimension d the domain is $dom(d)=\bigcup l_i$.

Definition 3. For each l_i the set

$$H_{l_i} = \{l_j / l_j \neq l_i \wedge l_j \leq_d l_i \wedge \neg\exists l_k \quad l_j \leq_d l_k \leq_d l_i\} \tag{1}$$

We call it *set of children of the level l*.
Definition 4. For each l_i the set

$$P_{l_i} = \{l_j / l_i \neq l_j \wedge l_i \leq_d l_j \wedge \neg\exists l_k \quad l_i \leq_d l_k \leq_d l_j\} \tag{2}$$

And we call it *set of parents of the level l*.
Definition 5. For each pair of levels l_i and l_j so that $l_j \in H_{l_i}$ we have the relation

$$\mu_{ij} : l_i \times l_j \rightarrow [0,1] \tag{3}$$

We call it *kinship relation*.

The degree of inclusion of the elements of a level in the elements of their parent levels can be defined using this relation. If we use only the values 0 and 1 and we only allow an element to be included with degree 1 by a unique element of its parent levels, this relation represents a crisp hierarchy. If we relax these conditions and we allow to use values in the interval [0,1] without any other limitation, we have a fuzzy hierarchy relation. This allows the representation of several hierarchy relations in a more intuitive way. Furthermore, this fuzzy relation allows the definition of hierarchies in which there is imprecision in the relationship between elements in different levels. In this situation, the value in the interval shows the degree of confidence in the relation.

Definition 6. For each pair of levels l_i and l_j of the dimension d so that $l_j \leq_d l_i \wedge l_j \neq l_i$ we have the relation $\eta_{ij} : l_i \times l_j \rightarrow [0,1]$ defined as

$$\eta_{ij}(a,b) = \begin{cases} \mu_{ij}(a,b) \quad if \quad l_j \in H_{l_{ii}} \\ \bigoplus_{l_k \in H_{l_i}} \bigoplus_{c \in l_k} (\mu_{ik}(a,c) \otimes \eta_{kj}(c,b)) \quad in \quad other \quad case \end{cases} \tag{5}$$

Where $\oplus$ and $\otimes$ are a t-norm and a t-conorm respectively or operators from the families MOM and MAM defined by Yager ([15]), that include the t-norms and t-conorms. We call this *extended kinship relation*.
This relation gives us information about the degree of relation between two values in different levels inside the same dimension. To obtain this value, it considers all the possible paths between the elements in the hierarchy. Each one is calculated aggregating the kinship relation between elements in two consecutive levels using a t-norm. Then the final value is the aggregation of the result of each path using a t-conorm.

Definition 7. We call *fact* to any pair (h,α) where h is a m-tuple over the domain of the attributes we want to analyze, and $\alpha \in [0,1]$.

The management of uncertainty in the facts is carried out using a degree of certainty with each one. This degree of certainty allows us to use values in analysis that can be interesting to the decider but imply imprecision.

Definition 8. An object of type *history* is the recursive structure

$$H = \begin{cases} \text{Ø} \\ (\text{A}, \text{l}_\text{b}, F, G, H') \end{cases} \tag{7}$$

Where
- Ø is a special symbol.
- F is a set of facts.
- l_b is a set of levels $(l_{1b},...,l_{nb})$.
- A is an application from l_b to F
- G is an aggregation operator.
- H' is a structure of type *history*.

Definition 9. A datacube is a tuple $C=(D,l_b,F,H,A)$ so that $D=(d_1,...,d_n)$ is a set of dimensions, $l_b=(l_{1b},...,l_{nb})$ is a set of levels so that l_{ib} belongs to d_i, $F = RU\text{Ø}$ where R is the set of facts and Ø is a special symbol, H is an object of type *history*, and A is an application defined as $A : l_{1b} \times ... \times l_{nb} \rightarrow F$.

If for a $\vec{a} = (a_1,...,a_n)$ we have $A(\vec{a}) =$ Ø, this means that there isn't defined a fact for this combination of values.

Definition 10. We say a datacube is *basic* if $l_b = (l_{1\perp},...,l_{n\perp})$ and H= Ø.

2. Operations

Once we have the structure of the multidimensional model, we need the operations to analyse the data in the datacube. In this section we present the normal operations (roll-up, drill-down, slice, dice and pivot) over the structure proposed. In section 3 we present an example of the application of these operations over a multidimensional schema.

Definition 11. An aggregation operator G is a function $G(B)$ where $B = \{(h,\alpha)/(h,\alpha) \in F\}$ and the result is a tuple (h', α').

The parameter that operator needs can be seen as a fuzzy bag ([6]). In this structure there is a group of elements that can be duplicated, and each one has a degree of membership.

Definition 12. For each value a belonging to d_i we have the set

$$F_a = \begin{cases} \bigcup_{l_j \in H_{l_i}} F_b / b \in l_j \wedge \mu_{ij}(a,b) > 0 & \text{if} \quad l_i \neq l_b \\ \{h / h \in H \wedge \exists a_1,...,a_n A(a_1,..,a,...,a_n) = h\} & \text{if} \quad l_i = l_b \end{cases} \tag{11}$$

The set F_a represents all the facts that are related to the value a.
With this structure, the basic operations over datacubes are defined: *roll-up*, *drill-down*, *dice*, *slice* and *pivot* (see [16] for definition and properties).

SEMANTIC INTERPRETATION

In this section we present the inclusion of semantic interpretations in the fuzzy multidimensional model and the query process using them. Next section presents the structure of the semantic interpretations. Section 3.2 studies the aggregation functions related to the semantic of the results. The last section presents the process of the query.

1. Structure

A *Semantic Interpretation* (SI) is a structure associated to each fact. Its elements are:

- $L=\{L_1,...,L_m\}$: a set of linguistic labels over the basic domain. The set doesn't have to be a partition but this characteristic is desirable.
- $f_a(L,c)$: a function to adapt the labels in L to a cardinality c. As c can be a fuzzy set the function has to be able to work with this kind of data. The function f_a has to be continuous and monotone.
- $G=\{G_1,...,G_n\}$: a set indicating the aggregation functions that keep the semantic interpretation.

Multiple SI can be associated to each measure. On each fact we have to store as a metadata the cardinality associated to the value. This cardinality means the number of values that were aggregated to obtain this value.
When a value is going to be shown, the system applies the semantic interpretation to translate the value into a label. In this process we can differentiate two different approaches:

1. *Independent interpretation.* In this situation each value is studied without considering the context (the rest of the values) so we obtain an independent interpretation of the value. In this case, the cardinality to adapt the labels is the one stored in the value.
2. *Relative interpretation.* In this case, the values are compared with the other facts in the query so the interpretation is relative to the complete query. Hence the cardinality to adapt the labels depends on the complete set of values. In this case, the system calculates the average cardinality of all the values and uses this cardinality to adapt the labels.

2. Aggregation functions

Aggregation functions have an important role in the query process and in the semantic of the results. In this section we will study the different aggregation function types we can find according to the cardinality of the results and if a change of semantic occurs.

Let be a set of value $V=\{v_1,...,v_m\}$, of which set of cardinality is $C=\{n_1,...,n_m\}$, considering these two factors, we can classify the functions in three categories:

1. *Aggregators.* These functions aggregate the values and the cardinality is the sum of the cardinalities of each value:
$$c = \sum_{i=1}^{m} n_i$$
The only aggregation function that satisfies this behaviour is the SUM.
2. *Summaries.* In that case, the functions take a set of values and obtain a value that summarizes the complete set. Then the cardinality has to represent the average cardinality of the values.
$$c = \frac{\sum_{i=1}^{m} n_i}{m}$$
Most of the statistic indicators are in this category (maximum, minimum, average, median, percentiles, etc.).
3. *Others.* These functions represent a complete change of the semantic of the values so the result has to be considered in a new domain. In that case, the cardinality should be established to 1.
$$c=1$$
In this category we find functions like the variance or the count.

Once we have studied the aggregation functions we have all the elements to show the query process with the semantic interpretations.

3. Query process

In this section we present the query process considering the use of the SI. We can differentiate two phases on the query process: the OLAP query over the datacube and the report with the results. In both phases the SI are involved in a different way. Let show the process on each one:

1. *Query over the datacube*. In this phase is where the values/cardinalities are calculated. Inside this process we have to calculate the metatada of each one so, in the next phase, the values can be shown using the SI. The cardinality is calculated over each value considering the aggregation function used as shown in section 3.3.
In this process the system has to control whether the semantic has changed or not. On each value the system checks if the aggregation function used is in the set *G* of each *SI*. If the function is not included, then this *SI* is deleted. In next phase (the report) the user can only use the *SIs* that satisfy this restriction.
2. *Report*. Once the query has finished the result is shown to the user in a report. In this process the user has to choose the way to represent the values (the *SI* to use) and the interpretation (independent or relative as shown in section 3.1). After these steps, the

system adapts the labels of each value using the f_a functions and the right cardinality (the absolute or the average).

LEARNING THE f_a FUNCTIONS

In the previous section we have presented the query process using SI. One of the phases adapts the labels in L so they are fitted to the new cardinality. This process is carried out using the f_a function. The quality of the result will depend on this function, so an important point is the process to define it.
Asking the user for that function is not always possible because most of the times the user is not able to use a mathematical expression to define his/her interpretations. This is why we propose to learn the functions, following the next steps:

1. First we ask the user for an interpretation over the basic domain so we can define the set L of labels over it.
2. To learn the function now the system runs some queries over the datacube showing the results.
3. For each query the system asks the user to associate a label of L to the value. The system then stores the associations and the cardinalities of each value.
4. With these associations the system tries to fit a function that satisfies the interpretation with the corresponding cardinality. In this process, the system will try continuous and monotone functions to adapt the labels. If the fitted function has good quality (the adapted labels correspond to the labels associated by the user) the process ends. In other case, the process goes on but to point 2 to show more queries so the system gets more data to fit the function.

EXAMPLE

In this section we will present a small example to show in detail the proposed method. Let us suppose we have a simple datacube with only two dimensions (time and centre) and only one measure (number of patients). The hierarchies for both dimensions are shown in Figure 1.

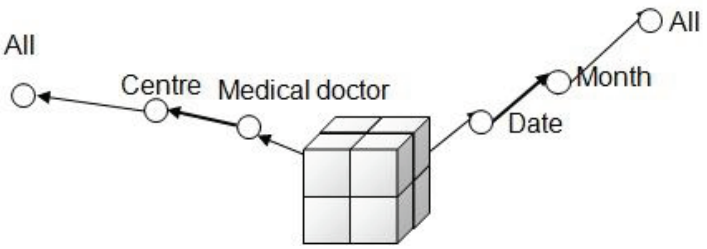

Figure 1: Example datacube

For the measure we define a *SI* indicating if the number of patients attended by a doctor is *Low*, *Normal* or *High*. At base level (doctor and day) the fuzzy partition is shown in Figure 2.

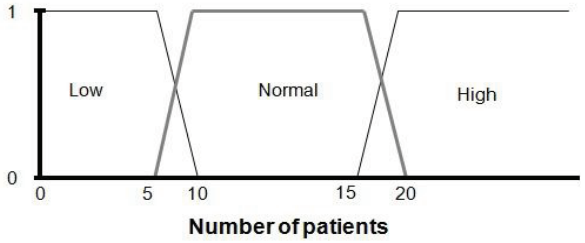

Figure 2: Fuzzy partition over the measure Number of Patients

The *SI* is valid for aggregations like sum and average. The last aspect to define is the f_a function. In this example we suppose that it is lineal and just multiply the points of the fuzzy label by the new cardinality (e.g. if Low is defined as (0,0,5,10) for one doctor in a day, for two doctors the label will be (2x0,2x0,2x5,2x10)=(0,0,10,20)).

Let us suppose that we have two centres with different size. One (*C1*) is placed in a city and there are 500 medical doctors in the staff. The second one (*C2*) is placed in a small village and only 10 doctors are working in that centre. If a manager asked the system to calculate the number of patients attended by both centres each month we can get a table like that

Table 1: Query result

Centre	Month	Patients
C1	January	125.000
C1	February	130.000
...	...	...
C2	January	4.200
C2	February	5.000
...	...	...

The table shows very different results for each centre and it is not easily interpretable due to the differences in the size of each one. Applying our proposal we obtain the label that best represents each value.

For centre C1 we have to calculate the cardinality of the result so we can adjust the labels. We have the data defined to doctor and day so, for each month we have to aggregate the values for 500 medical doctors and 20 working days for month. Therefore the cardinality is 500x20=10.000. We adjust the fuzzy partition for this new cardinality as shown in Figure 3. In the case of centre *C2* then the cardinality is 10x20=200 (Figure 4).

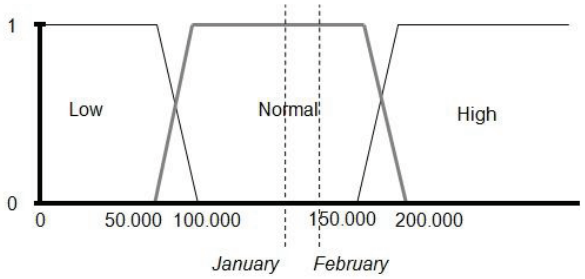

Figure 3: Labels adaptation for query for centre C1

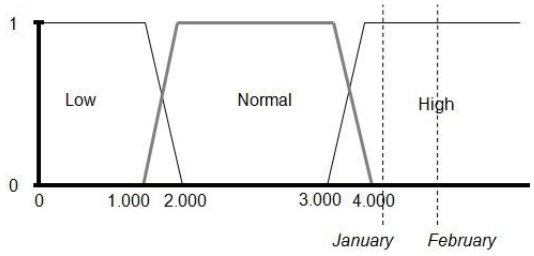

Figure 4: Labels adaptation for query for centre C2

In the figures 3 and 4 we have indicated the values for the Table 1, so we have the labels associated to each result. In Table 2 we have added the label associated to each value.

Table 2: Query results using Semantic Interpretation

Centre	Month	Patients	***Label***
C1	January	125.000	*Normal*
C1	February	130.000	*Normal*
...	...	...	...
C2	January	4.200	*High*
C2	February	5.000	*High*
...	...	...	...

As can be seen using the *Semantic Interpretations* in the example it is appreciated how the values are adapted so the user has the interpretation (the meaning) of the values directly.

CONCLUSIONS

In this paper we have introduced the new concept of *Semantic Interpretation,* that provides the OLAP systems with the new capability of querying about the same given item with different purposes obtaining in each case a result with a different meaning. With our proposal, the semantic of the results of the query can be distinct and adapted to the needs of the user, by taking into account the granularity of the information considered.

We also have formalized the concept of *SI* and provide the formulation to apply over a multidimensional model using the normal OLAP operations.

ABSTRACT

Purpose *– The purpose of this paper is to develop a novel two-stage model for promoting the effect of rule generation based on rough set. In order to improve traditional rough set method, the novel two-stage model adopts new kernel intuitionistic fuzzy clustering (KIFCM) to promote performance of rough set theory. Moreover, the e-learning customer data set in Taiwan is also examined for demonstrate the effectiveness and practicality of model.*

Design/methodology/approach *– In this paper, the authors present a new kernel intuitionistic fuzzy rough set model which combines novel KIFCM with rough set. The rule generation can divide to two stages for effective rule generation. In the first stage, KIFCM can utilize the advantages of kernel function and intuitionistic fuzzy sets to cluster raw data into similarity groups. In the second stage, the rough set theory is employed to generate rules with different groups. Finally, based on decision rules of rough set with different groups the results of system can be obtained and analyzed for users.*

Findings *– The novel rule generation model adopts pre-process, which is KIFCM clustering technique, can effectively assist traditional rough set in promoting the performance. In analysis of e-learning data set, the empirical result indicates that proposed novel rule generation model can outperform traditional decision models.*

Practical implications *–This novel two-stage model can provide a new and effective technique for data mining, database system, ..., etc. Furthermore, in the research, proposed model also practically was applied to analyze and model customer's tendency in e-learning platform with proper decision rules.*

Originality/value *– The rough set theory has widely used in dealing with data mining and classification problems. This research proposes a construct of novel two-stage model which can effectively improve traditional rough set theory by using KIFCM clustering technology in the first stage. Real e-learning data set also is employed for demonstrate the effectiveness and practical. Based on the empirical result, the novel two-stage model can be evidenced that can actually apply in real information platform.*

Keywords: Rule generation, rough set, kernel intuitionistic fuzzy clustering, e-learning

INTRODUCTION

Rough set theory (RST) (Pawlak, 1982; Pawlak, 1991) is useful in analysis of inconsistent decision tables composed of attribute value data about many objects. The RST is a mathematical tool to deal with vagueness and uncertainty. In RST we can extract the minimal attribute sets without deterioration of quality of approximation, and minimal length decision rules corresponding to lower or upper approximation. This approach has been one of fundamental important in artificial intelligent (AI) especially in the fields of machine learning, knowledge acquisition, decision support system, medical information, and pattern recognition. Table 1 summarized some developments of rough set-based rule generation technology since 2000.

Beynon et al. (2000) used variable precision rough set (VPRS), which suggested by Ziarko (1993a, 1993b), to analyze expenditure on elementary and secondary education at the US state level. The standard linear discriminant analysis (LDA) also was employed in the same example. The result show the VPRS has good performance in classification accuracy index and indicates that rules based on rough set may be evaluated in various ways, some of which are analogous to certainty factors in standard rule-based method. Khoo and Zhai (2001) proposed an integrated prototype system (RClass-Plus) that combines rough set theory, genetic algorithms and Boolean algebra, for inductive learning. The prototype system was validated using the state of machine case that result shows the RClass-Plus has better capabilities, which are respectively dealing with uncertainty and inconsistency, simple and concise rules induction, and extracting complete rules, than iterative

dichotomiser 3 (ID3) (Quinlan, 1986), learning from examples based on rough sets (LERS) (Grzymala-Busse, 1992), and rough-set-based approach for classification (RClass) (Khoo et al., 1999). Mak and Munakata (2002) reviewed and compared the rule extraction capabilities of rough sets with neural networks and ID3. This research indicated the rough set method offers much better explanatory capability than the neural network method and distills the data into a set of simple and usable rules. In new Product entry decision case the result also shows the rough set can obtain better performance in predictive accuracy index than neural networks and ID3. Pal et al. (2003) proposed a Rough-fuzzy multilayer perceptron (Rough-fuzzy MLP) with modular concept using a genetic algorithm to obtain a structure network suitable for both classification and rule extraction. Four compared methods, which are *Subset* method (Fu, 1993), *M* of *N* method (Towell and Shavlik, 1993), X2R (Liu and Tan, 1995), and decision tree-based method C4.5 (Ross Quinlan, 1993), were also examined in vowel, pat, medical data sets. The effectiveness of the Rough-fuzzy MLP model is extensively demonstrated in these data sets. Hou and Huang (2004) used fuzzy variable precision rough set approach to manufacturing process. The induced rules are compared with the rules by the traditional rough set. The fuzzy rough set approach, being less sensitive to noisy data, induces better rules than traditional rough set approach. Tseng et al. (2005) used rough set to predicting quality characteristic in machining operations. The results indicate a higher accuracy over traditional the tradition multi-nominal regression and general discriminant methods. Pattaraintakorn et al. (2006) proposed an ordinal prediction based on rough sets and soft computing which illustrates the formulation of more meaningful rules using the notion of ordinal prediction. The results are the rules that are constructed from the interval antecedents and are able to predict intervals rather than unique values of the target function. Wang et al. (2006) used rough set attribute reduction algorithm that employed particle swarm optimization (PSO) to find minimal rough set reducts, and compared with neural networks, decision trees and a fuzzy rule extraction algorithm based on Fuzzy Min-Max Neural Networks (FRE-FMMNN). The result shows that reducts found by rough set attribute reduction algorithm were more efficient and generated decision rules with better classification performance. Inuigchi and Miyajima (2007) proposed a rule induction based on rough set from two decision tables. The research pointed out decision rule is positively supported by a decision table and does not have any conflict with the other decision table and a second level decision rule is positively supported by both decision tables. Hong et al. (2007) proposed a hybrid fuzzy rough set system using fuzzy lower and upper approximations transform each quantitative value into a fuzzy set of linguistic term. The certain and possible rules are then generated based on these fuzzy approximations. Teoh et al. (2008) proposed a hybrid fuzzy time series model for stock index forecasting based on cumulative probability distribution

approach (CPDA) and rough set rule induction. Two empirical stock markets (TAIEX and NYSE) were used as evaluating database, and two methodologies (Chen, 1996; Yu, 2005) are used as comparison models. The result shows hybrid fuzzy time series model has outperformance in the two examples. Qian et al. (2008) proposed a rule extracting algorithm based on the converse approximation which can be named REBCA is designed to extract decision rules from a decision table. Fan et al. (2009) proposed an incremental rule-extraction algorithm based on the previous rule extraction to resolve there aforementioned issues, and successfully applied in lager database. Ma et al. (2009) proposed a classification algorithm named Rule Generation based on Classification Attribute (RGCA) to deduct negative and positive rules. The results show the classification accuracy of RGCA algorithm is better than traditional positive based algorithm in examples of Machine learning databases. Luo and Zhong (2010) used rough set data mining method for knowledge acquisition and decision-making reasoning method, and applied in Medical Expert Diagnosis System (MEDS). Othman et al. (2011) developed a data mining approach of integrated-rough-set-and-genetic-algorithm based rule discover from digital protective relay's resident event report. This integrated approach has been proven to be an exact manifestation of real operation characteristics hidden in the event report, and has better performance than decision tree based analysis. Shi et al. (2012) adopted rough sets theory to reduce features and associate rule mining in KANSEI Engineering. The case of mobile phone was examined and indicated that rough sets theory can obtain better performance than orthogonal method. Huang et al. (2013) proposed incremental rough set theory based rule induction and applied to customer preferred estimation in the cell phone purchase.

Observation of past research of RST can be concluded some phenomenons (1) Recently RST can effectively apply in various areas. (2) RST can obtain better performance than some popular method such as decision tree (ID3 and C4.5), and neural networks. (3) Some researches proposed hybrid RST-based methods which can successfully improve performance of RST.

This paper therefore aims to develop a novel two-stage model for promoting the effect of rule generation based on novel KIFCM and RST because accurately generating decision rules can effectively discover and construct domain's knowledge. In the first stage, clustering technology is utilized to classify the pattern datasets. This research develops a novel KIFCM which can be evidenced obtains good performance in numerical example. The results of this novel clustering can roughly class similar pattern into the same group. This stage can effectively reduce complexity of pattern datasets. Based on the results of stage one, the RST, which has been widely applied in the rule generation, is employed as the main rule generation technology in stage 2. With different groups, RST can further obtain better performance. Furthermore, this research adopts two types numerical example to examine proposed novel two-stage model.

The rest of this paper is organized as follows. Section 2 presents the main construct of novel two-stage model for rule generation, and introduces novel KIFCM and RST respectively. Section 3 depicts machine learning datasets and real e-learning case, experimental results, and compares

with various models. Section 4 presents the research summary and conclusions.

NOVEL TWO-STAGE MODEL

The design construct of novel **two-stage** model. This model main adopts kernel intuitionistic fuzzy clustering and rough set in stages 1 and 2, respectively. Firstly, KIFCM can utilize the advantages of kernel function and intuitionistic fuzzy sets to cluster raw data into similarity groups. Traditional fuzzy clustering techniques could not effectively solve multi-variables or nonlinear problems. Kernel-based methods have attracted great attention and have been applied in many fields (Vapnic, 1998; Graves and Pedrycz, 2010; Lin et al., 2011; Zhang and Chen, 2004). The kernel-based method involves performing an arbitrary nonlinear mapping data from the original dimensional feature space to a higher dimensional space, called kernel space. In the kernel space the original data may apply classifiers. The use of kernels has received considerable attention because kernels make it possible to map data onto a high-dimensional feature space in order to increase the representation capability of linear machines. Moreover, KIFCM incorporates another uncertainty which is the hesitation degree that arises while defining the membership function. When hesitation degrees are used for determining precisely membership function because Yager class of IFSs (hesitation degrees) can assist to amplify differentiation of clusters, this is done to maximize the good points in the class. The KIFCM can obtain the advantages of both.

Secondly, the rough set theory is employed to generate rules with different groups. Rough set is a powerful tool to solve vagueness and uncertainty problems, which is suitable to analyze quantitative attributes and qualitative ones. A principle task, in the rough set of rule generation, is to compute reducing relative to a particular kind of information system, the decision system. Finally, based on decision rules of rough set with different groups the results of system can be obtained and analyzed for users. The illustration of novel kernel intuitionistic fuzzy rough set model is shown in Figure 1:

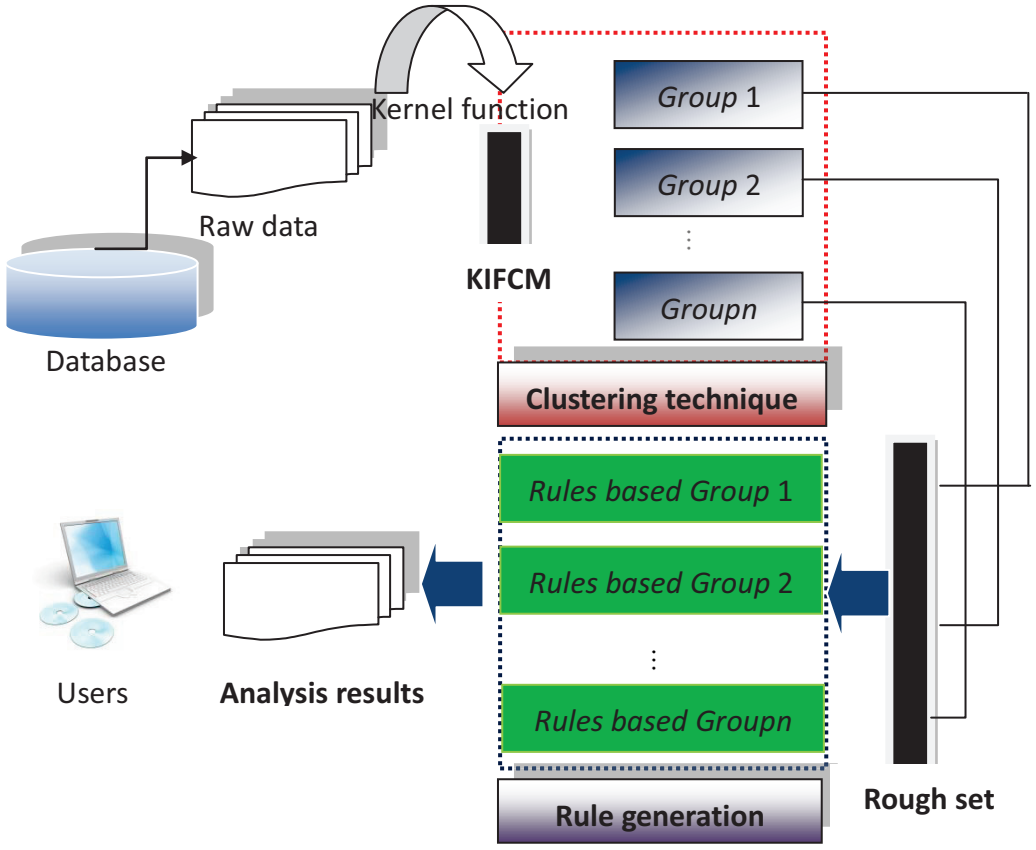

Figure 1. The structure of two-stage model for rule generation and extraction

The procedures can be described as follows.

Step 1: The data of selected variables can be obtained from a database. These selected data are based on expert opinion.

Step 2: (Stage one) In the first stage, the fuzzy clustering methods: novel KIFCM can be employed, help to define similar pattern into groups. These groups approximately represent the pattern that may have common variables and similarity characters; based on the groups, the pattern datasets can reduce interactive complexity.

Step 3: (Stage two) In the second stage, the two-stage model uses the RST to rule generation in various groups. The RST model can generate and discover decision rules in various groups, and subsequently provide more creditable rules and analysis.

Step 4: This research adopts three measuring index. Firstly, accuracy rate (J_1) can be introduced as following:

$$J_1 = 100 \times \frac{N_{correct}}{Data_{total}} \quad (1)$$

where $N_{correct}$ is number of correct classification of data, and $Data_{total}$ is total number of data. Second, coverage rate (J_2), and a comprehensive index (J), which is equal to $J_1 + J_2$, to measure the performance. The coverage rate can be formulated as following:

$$J_2 = \frac{N_{coverage}}{Data_{total}}, \quad (2)$$

where $N_{coverage}$ is number of coverage data by generating rules.

1. Kernel intuitionistic fuzzy *c*-means clustering algorithm

Clustering analysis involves the discovery of a data structure and partitions a data set into a number of subsets with correlated data. Clustering was widely applied in several fields, such as taxonomy, geology, business, engineering systems, medicine, and image processing (for example, Bezdek, 1981; Yang, 1993; Honda and Ichihashi, 2004; Kohonen, 1997; Liu and Wang, 2007). FCM is one of the most widely employed techniques. In FCM and fuzzy clustering concepts, the membership function of clusters can be defined based on a distance function, and thus, the degrees of memberships may express the proximity of the data to the multi-cluster centers. The proposed KIFCM considers the kernel function and IFSs that the KIFCM attempts to maximize the good points in the kernel space. The procedures of KIFCM can be described as following:

***Step*1 (Input parameters)**: The input parameters are number of clusters to classify (c), parameter in updating the clustering membership functions (m), parameter of Yager's intuitionistic fuzzy complement (α), number of epochs to carry out (k), parameter of Gaussian kernel (σ), and tolerance for the solution accuracy (δ) respectively.

***Step* 2 (Generating initial membership and center):** By the KIFCM, the initial memberships of the data $\boldsymbol{x}_i$, $i = 1, \ldots, N$, with the crisp input-output to the clusters j ($j = 1, \ldots, c$) are generated randomly and denoted as $U(k) = [\mu_{ij}^{(k)}]_{N\times c}$ ($k = 0$) under $\sum_{\forall j} \mu_{ij}^{(k)} = 1 \forall i$. By generating randomly

memberships of the data in KIFCM, the center $C_j^{(k)}$ can be easily calculated.

***Step* 3 (Calculating objective function)** : With a data set $\boldsymbol{x}_i$, KIFCM, the modified objective function of the fuzzy c-means using the kernel space and IFSs need to be minimized. Therefore, KIFCM minimizes the following designed objective function:

$$J_{KIFCM} = \sum_{j=1}^{c}\sum_{i=1}^{N}\left(\mu_{ij}^{(k)}\right)^m \times \left\|\varphi(\boldsymbol{x}_i), \varphi(C_j^{(k)})\right\|^2 \quad (3)$$

where $\left\|\varphi(\boldsymbol{x}_i), \varphi(C_j^{(k)})\right\|^2$ is the Euclidean distance between $\varphi(\boldsymbol{x}_i)$ and $\varphi(C_j^{(k)})$, and $\varphi(\boldsymbol{x}_i)$ and $\varphi(C_j^{(k)})$ are the kernel spaces of $\boldsymbol{x}_i$and $C_j^{(k)}$, respectively. The squared distance is computed in the kernel space using a kernel function, as follows (Shen et al., 2006; Zhang and Chen, 2003):

$$\left\|\varphi(\boldsymbol{x}_i), \varphi(C_j^{(k)})\right\|^2 = K(\boldsymbol{x}_i, \boldsymbol{x}_i) + K(C_j^{(k)}, C_j^{(k)}) - 2K(\boldsymbol{x}_i, C_j^{(k)}) \quad (4)$$

In previous research, the Gaussian kernel was employed almost exclusively because the kernel function can obtain better performance with a Gaussian kernel function (Graves and Pedrycz, 2010). The Gaussian kernel can be expressed as $K(x_i, x_j) = \exp(-\left\|x_i - x_j\right\|_2^2 / \sigma^2)$. Therefore, with a Gaussian kernel function, the designed objective function can be written as

$$J_{KIFCM} = 2\sum_{j=1}^{c}\sum_{i=1}^{N}\left(\mu_{ij}^{(k)}\right)^m \times (1 - K(\boldsymbol{x}_i, C_j^{(k)})) \quad (5)$$

***Step* 4 (Updating membership and center)** : The optimization of the partition matrix U involves the use of Lagrangian multipliers, leading to the expression

$$\mu_{ij}^{(k+1)} = \frac{(1/(1 - K(\boldsymbol{x}_i, C_j^{(k+1)})))^{(1/(m-1))}}{\sum_{h=1}^{c}(1/(1 - K(\boldsymbol{x}_i, C_h^{(k+1)})))^{(1/(m-1))}} \quad (6)$$

To incorporate intuitionistic fuzzy properties in the kernel fuzzy c-means algorithm, the hesitation degree is calculated initially by $\pi_A(x) = 1 - \mu_A(x) - (1 - \mu_A(x)^\alpha)^{1/\alpha}$., and the intuitionistic fuzzy

membership values are obtained as follows:

$$\mu_{ij}^{(l+1)*} = \mu_{ij}^{(l+1)} + \pi_{ij}^{(l+1)} \tag{7}$$

where $\mu_{ij}^{(l+1)*}$ denotes the intuitionistic kernel fuzzy membership of the *i*th data in the *j*th class.

By Eq.(7) in KIFCM, the prototypes $C_j^{(k+1)*}$ with the Gaussian kernel function can be written as

$$C_j^{(k+1)*} = \frac{\sum_{i=1}^{N} \mu_{ij}^{(k+1)} K(x_i, C_j^{(k+1)}) x_i}{\sum_{i=1}^{N} \mu_{ij}^{(k+1)} K(x_i, C_j^{(k+1)})} \tag{8}$$

***Step* 5 (Terminational condition)** : The cluster center is updated simultaneously with the *U* matrix. As in traditional FCM, KIFCM optimizes the objective function by continuously updating the membership functions and centers of clusters until $\left\| U^{(k+1)} - U^{(k)} \right\|$ is less than the threshold δ.

A numerical example is examined in the section for comparison of various clustering algorithms. In numerical example, the study generated 10 random points for *Cluster* 1 and 50 random points for C*luster* 2. The *Cluster* 1 multivariate normal distribution with mean vector was [1 5], and the covariance matrix sigma was $\begin{bmatrix} 1.500 & 0.866 \\ 0.866 & 2.500 \end{bmatrix}$. The *Cluster* 2 multivariate normal distribution with mean vector was [5 3], and the covariance matrix sigma was identical to that of *Cluster* 1. Figure 2(a) shows the original random data points of example. The remainder of Figure 2 displays the cluster results of KM, FCM, and KIFCM with the cluster centers displayed in Figure 2. Figure 2 also labels key data points by the red cycle in example. Table 2 shows the comparison of the accurate rate and center points of KM, FCM, and KIFCM. KIFCM obtain the best accurate rates which is equal to 1. The KIFCM algorithms could correctly class the data set. The cluster centers C_1 and C_2 of KIFCM algorithm can be searched lower and more right than traditional KM and FCM. These phenomena may be evidence that the results of example can obtain better performance when using kernel functions and IFs techniques.

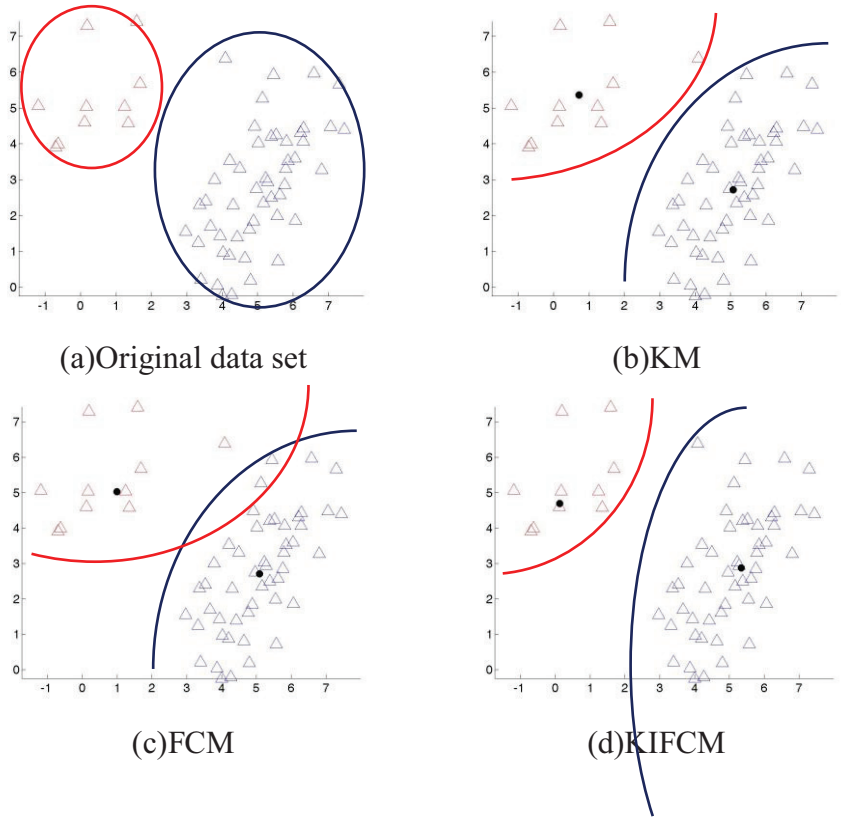

Figure 2. Illustration of the original data set and results of examplewith various clustering algorithms.

Table 3. Comparison of various clustering algorithms in synthesis data set.

Method	Parameters	Accuracy rate (J_1)	Center points
KM	c=2	0.98	C_1=(0.71, 5.36), C_2=(5.06, 2.71)
FCM	c=2, m=2	0.98	C_1=(0.98, 5.03), C_2=(5.09, 2.70)
KIFCM	c=2, m=2.33, σ=165.76,α= 4.95	1.00	C_1=(0.12, 4.68), C_2=(5.33, 2.87)

2. Rough set theory for rule generation with KIFCM clustering

Rough set theoryis a mathematical approach for handling vagueness and uncertainty in data analysis. Rough sets aim at forming an approximate definition for a target set in terms of some definable sets, especially, when the target set is uncertain or imprecise. A rough set is

characterized by a pair of precise concepts, called lower and upper approximations, generated using object indiscernibilities. Some basic concepts in the rough set theory can be found in Pawlak (1982) and Pawlak (1991). In RST, the most important problems are the reduction of attributes and the generation of decision rules. In rough set theory of rule generation, principal task is to compute reducts relative to a particular kind of information system. Instead the lower and upper approximations of all decision concepts are computed and rules are induced. The rules are categorized into certain and approximate (possible) rules depending on the lower and upper approximations, respectively. This RST of rule generation can be described below.

Let $E=<U, A>$ be a decision table with F and $D=\{d_1, d_2, \ldots, d_l\}$ its sets of condition and decision attributes respectively, where U is a nonempty finite set called the universe and A is a nonempty finite set of attributes. An attribute a can be regarded as a function from domain U to some value set V_a. Divided the decision table $E = <U, A>$ into l tables $E_i = <U_i, A_i>$, $i=1, \ldots, l$, corresponding to the l decision attributes $d_1, \ldots, d_l$, where $U = U_1 \cup \ldots \cup U_l$ and $A_i = F \cup \{d_i\}$ where $d \notin F$ is the decision variable D.

Let $\{x_{i1}, \ldots, x_{ij}\}$ be the set of those objects of U_i that occur in E_i, $i=1, \ldots, l$, and in this research the set, which can be defined $X_c = \{x_{ci1}, \ldots, x_{cij}\}$, has been divided c clusters by novel KIFCM. Based on results of KIFCM, the same group objects of X_c have similar characters which can effectively assistance rule generation of RST.

***Step* 1. (Determining indiscernibility relation)** Let $a \in A$, $P \subseteq A$. A binary relation I_P, which can be called the indiscernibility relation, can be defined as following:
$I_P = \{(x, y) \in U$: for every $a \in P$, $a(x) = a(y)\}$.
Then, $I_P = \cap_{a \in P} I_a$. If $X_c \subseteq U$, the set $\{x \in U: [x]_P \subseteq X_c\}$ and $\{x \in U: [x]_P \cap X_c \neq \varnothing\}$, where $[x]_P$ denotes the equivalence class of the object $x \in U$ relative to I_P, are called *P-lower* and *P-upper* approximation of X_c in E and denote by $\underline{I}X_c$ and $\overline{I}X_c$ respectively. If X_c is *P-definable* then $\underline{I}X_c = \overline{I}X_c$; otherwise X_c is *P-rough*.

Example I: Consider the university of discourse $U = \{x_{c1}, x_{c2}, x_{c3}, x_{c4}, x_{c5}, x_{c6}\}$ and I is any equivalence relation in I_P which partitions U into $\{\{x_{c1}, x_{c2}, x_{c4}\}, \{x_{c3}, x_{c6}\}, \{x_{c5}\}\}$. The for any subset $X_c = \{x_{c1}, x_{c2}, x_{c3}, x_{c4}\}$ of U, $\underline{I}X_c = \{x_{c1}, x_{c2}, x_{c4}\}$ and $\overline{I}X_c = \{x_{c1}, x_{c2}, x_{c3}, x_{c4}, x_{c6}\}$. Figure

3 displays the lower and upper approximations of set X_c.

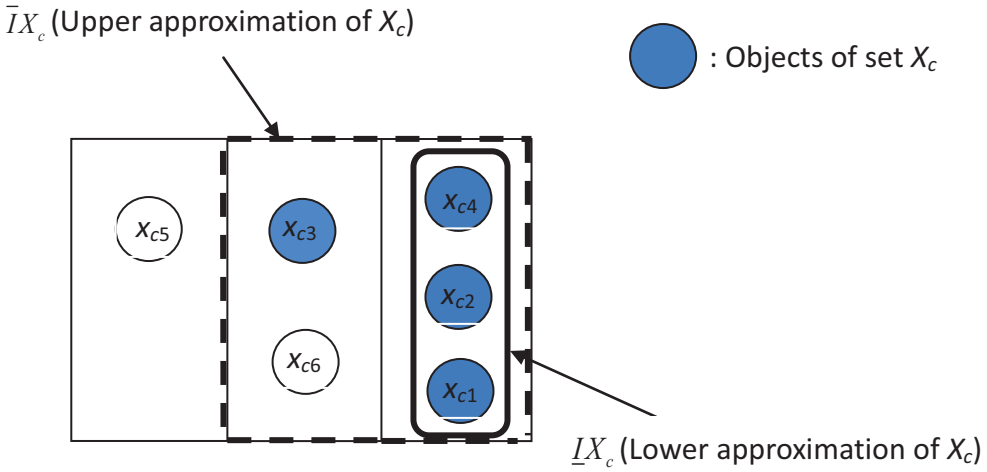

Figure 3 Illustration of the lower and upper approximations of set X_c. (Pawlak et al., 1995)

The *P-positive* region of X_c can be defined $\{x_{c1}, x_{c2}, x_{c4}\}$ and the *P-negative* region of X_c can be defined $\{x_{c5}\}$. On the other hand, consider a subset $Y_c = \{x_{c3}, x_{c5}, x_{c6}\}$, $\underline{I}Y_c = \{x_{c3}, x_{c5}, x_{c6}\}$ and $\bar{I}Y_c = \{x_{c3}, x_{c5}, x_{c6}\}$. The $\underline{I}Y_c = \bar{I}Y_c$, hence Y_c can be defined as *P-definable*.

***Step* 2. (Dispensable and indispensable attributes)** Let $f \in F$. A attribute f is dispensable in E, if $POS_{(F-(f))}(D) = POS_F(D)$; otherwise attribute f is indispensable in E. Where $POS_F(D)$ is $\bigcup_{X_c \in I_{d_i}} \underline{F}X_c$ and $\underline{F}X_c$ is the lower approximation. If all $f \in F$ are indispensable, f is an independent.

***Step* 3. (*Reduct* and *CORE*)** A *reduct* is the minimal attribute subset preserving the condition. If the E is independent and $POS_i(D)$, a set of attributes $I \subseteq F$ can be called a *reduct* of F. $CORE(F)$ can be defined the set of all attributes indispensable in F.

***Step* 4. (Discernibility matrix)** Now for each $reductP = \{p_1, \ldots, p_k\}$, a discernibility matrix $M_{d_i}(P)$ can be defined as follows (Banerjee et al., 1998):

$$f_{ij} = \{a \in P: a(x_{ci}) \neq a(x_{cj})\}, \qquad (9) \qquad \text{for } i, j = 1, \ldots, n.$$

For each object $x_{cj} \in x_{ci1}, \ldots, x_{cib}$, the discernibility function $k_{d_i}^{x_{cj}}$ can be defined as following:

$$k_{d_i}^{x_{cj}} = \bigcap \{ \bigcup (f_{ij}) : 1 \le i \ j, \le n \ j, < i \ f_{ij} \neq \varnothing \} \qquad (10)$$

Where $\bigcup(f_{ij})$ is the disjunction of all members of c_{ij}. Then $k_{d_i}^{x_{cj}}$ is brought to its conjunctive norm form (c.n.f).

Example II (Ganesan et al., 2007) Consider the knowledge representation system given $F = \{a, b, c, d\}$ and $D = \{E\}$ which are condition and decision attributes respectively, and based on KIFCM the clustering results of objects $\{\{x_{11}, x_{12}, x_{13}, x_{14}\}, \{x_{25}, x_{26}, x_{27}\}\}$ can be obtained. The discernibility matrix can be shown as Figure 4.

	a	b	c	d	E
x_{11}	1	0	2	1	1
x_{12}	1	0	2	0	1
x_{13}	1	2	0	0	2
x_{14}	1	2	2	1	0
x_{25}	2	1	0	0	2
x_{26}	2	1	1	0	2
x_{27}	2	1	2	1	1

Group 1 Group 2

	x_{11}	x_{12}	x_{13}
x_{12}	—		
x_{13}	b, c, d	b, c	
x_{14}	b	b, d	c, d

	x_{25}	x_{26}
x_{26}	—	
x_{27}	c, d	c, d

Figure 4. Illustration of the discernibility matrix based on clustering technique KIFCM.

Here, the elements of discernibility matrix can be shown in "OR" which means the element $\{b, c, d\}$ can be shown $b \vee c \vee d$. Further, the entire matrix can be written by using the connective AND.

Two-stage model for e-learning data set

In this section a real dataset of enterprise was examined. The customer data set of e-learning comes from one of famous enterprise in Taiwan. Figure 5 displays the process of real information platform with novel two-stage model in E-learning enterprise. Six conditional attributes 'Sex', 'Age', 'Academic', 'Department', 'Location', and 'Occupation' were selected, and number of instances are 669. The all conditional attributes has been coded by valued for effective executing generation rules which can see in Table 7, for instance, minimum of 'Academic' is '2' which means 'National Tsing Hua University'. Table 4 shows the dataset extensively included various instances. Decision attributes can be divided six categories which are 'Civil service examinations', 'Matriculation examinations', 'Tying examinations', 'Certification examinations', 'Learning lifelong', and 'employment examinations' respectively. These determines of categories were based on database of E-learning enterprise.

Table 5 displays the measuring indexes of the KM+RST, FCM+RST and KIFCM+RST models with different *Cluster* values in E-learning dataset. The results show that the KIFCM+RST model with c=3 can derive higher comprehensive index values of 0.71 in E-learning dataset. From the sensitivity analysis provided Table 5, the KIFCM+RST model alsoagain demonstrates good, stable performance. Therefore, KIFCM+RST model can also be recommended as an alternative rule generation model in the E-learning dataset.

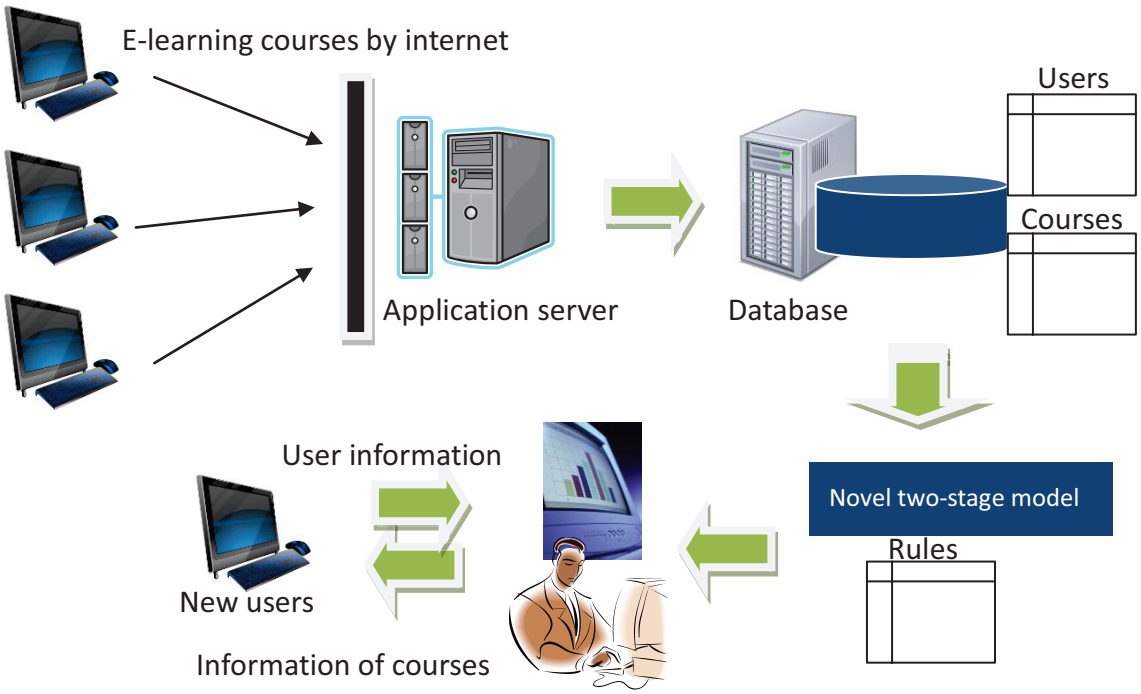

Figure 5. The process of real information platform with novel two-stage model in E-learning enterprise.

Table 4. Summary statistics and information of attributes with E-learning data sets.

Title	NO. of instances	Predictive attributes	Attributes Statistics				NO. of class
			Minimum	Maximum	Mean	Standard deviation	
E-learning	669	Sex	1: Male 2:Female				6
		Age	11	50	32.2	5.81	
		Academic	2	190	47.91	35.63	
		Department	1	178	99.31	49.81	
		Location	100	932	488.44	267.59	
		Occupation	1:Student, 2:Nonstudent				

Table 5. Testing measuring indexes of the KM+RST, FCM+RST and KIFCM+RST models with

different *Cluster* values in E-learning dataset.

Date set	Method		Accuracy rate (J_1)	Cover rate (J_2)	Comprehensive index (J)	Average of comprehensive index	No. of rules	CPU time (Minute)
	The 1st stage (KM, FCM, and KIFCM)+ The 2nd stage (Rough set)							
E-learning	KM	c=2	0.15	0.09	0.24	0.31	487	25.95
		c=3	0.18	0.20	0.38		486	21.68
		c=4	0.12	0.21	0.33		482	22.23
	FCM	c=2, m=2	0.16	0.10	0.26	0.31	487	27.85
		c=3, m=2	0.16	0.14	0.30		487	27.85
		c=4, m=2	0.18	0.21	0.39		483	24.05
	KIFCM	c=2, m=2, σ=150,α=11	0.33	0.31	0.64	0.68	519	45.29
		c=3, m=2, σ=150,α=11	0.33	0.38	0.71		522	54.40
		c=4, m=2, σ=150,α=11	0.32	0.38	0.70		535	111.59

Table 6 also shows the performances of the three models in the E-learning dataset. Proposed novel two-stage model can be proved has better performance than ID3 and standard RST with measuring indexes in the E-learning dataset. As results of Machine learning datasets proposed two-stage forecasting outperformed the other models in E-learning dataset, and the preprocess clustering mechanism (KIFCM) can effectively promote performance of RST.

Table 6. Comparison of the testing measuring indexes with various methods in E-learning dataset.

Date set	Method	Accuracy (J_1)	Cover rate (J_2)	Comprehensive index (J)	No. of rules	CPU time (Minute)
E-learning	ID3	0.14	0.17	0.31	104	1.65
	Rough set	0.16	0.19	0.35	486	27.51
	Two-stage model	0.33	0.38	0.71	522	90.98

CONCLUSIONS

This study developed a novel two-stage model for promoting the effect of rule generation based on rough set. The real e-learning customer dataset in Taiwan was examined. This real case can evidence the novel two-stage model can actually apply to real information platform. The success of the novel two-stage model can be attributed to the fact that the novel fuzzy clustering technology can effectively improve performance. Future studies may consider using various data preprocessing techniques to improve the performance of the proposed model.

ABSTRACT

Purpose: *Tourism has been considered a complexly integrated and self-contained economic activity but it is one of the biggest industries in many countries. This paper aims at finding an accurate forecasting model in order to make the tourism industry grow stably.*
Design/methodology/approach: *However, the determinants of the international tourism demand are not fully identified; therefore, in this paper, it is strongly suggested to use Grey forecasting model which is widely used to deal mainly with the problems of uncertainty with few data points and/or poor information which is said to be "partial known, partial unknown". In order to improve the accuracy of the model, an improved & accurate forecasting model FGM is created by combining the Fourier residual modification with the traditional Grey model GM(1,1).*
Findings: *FGM(1,1) had a very low mean absolute percentage error (MAPE) of 1.5755% in the case of monthly international tourist arrival in Taiwan. And therefore, it is selected to forecast the inbound tourism demand in Taiwan for the time being.*
Originality/value: *Though many researches have been conducted in employing Grey forecasting model and Fourier residual modification, they are revisited and applied in the case of the international tourism demand in Taiwan.*

Keywords: Tourism demand, Grey forecasting, Fourier modification

INTRODUCTION

Tourism is considered an integrated and self-contained economic activity but it hasn't been supported by a strong economic theory (Lagos, 1999). Tourism is also a complex activity which includes a strong inter-relationship among different dependable sectors in the economy; such as economic, transportation, commerce, social & cultural services, political and technological changes, etc., (Lagos, 1999). It was concluded that understanding of the variables that influence the demand for international tourism could help policy-makers a lot in planning growth strategies for the tourism industry (Habibi et al, 2009).

However, there has been no standard measure to represent "international tourism demand". It was suggested that international tourism demand be measured in terms of the number of tourist arrival, tourist expenditure (tourist receipts) or the number of nights tourists spent (Witt et al, 1995; Ouerfelli, 2008). But, due to the complexity in collecting the data of tourist expenditure and the number of nights tourists spent, tourist arrival has been widely used as an appropriate indicator of international tourism demand in many researches (González & Moral, 1995; Morley, 1998; Lim and McAleer, 2001; Kulendran and Witt, 2001; Tan et al. 2002; Song and Witt, 2003; Song et al., 2003; Dritsakis, 2004; Naude & Saayman, 2005; Ouerfelli, 2008; Habibi et al, 2009). Therefore, in this study, the monthly arrival of international tourists to Taiwan is used to denote the international tourism demand in Taiwan.

Moreover, the determinants of the international tourism demand are not fully identified. As per González & Moral (1995), they could be tourism price (including the cost of travel to and the cost of living for the tourist at the destination), the price index, the income index, marketing expenditures, demographic and cultural factors, the quality-price ratio, etc., Whereas, Witt & Witt (1995) listed them as population, origin country income or private consumption, own price (including the cost of travel to and the cost of living for the tourist at the destination- same as González & Moral (1995)), substitute prices, one-off events, trend, etc., But Hsu & Wang (2008) approached with some marketing aspects which were tour prices, distribution channel of the travel agents, traveller's income. Besides, many of the determinants are neither easily measured nor collected due to their availability. This conclusion is found in different papers written by González & Moral (1995), Witt & Witt (1995), Lagos (1999), Habibi et al. (2009).

Due to the above limitations in collecting relevant data of international tourism demand in Taiwan, it is therefore suggested to use Grey forecasting approach which has been widely employed in different areas due to its ability to deal with the problems of uncertainty with few data points and/or "partial known, partial unknown" information, to predict the demand. The residuals from the conventional Grey model are then modified with Fourier series to form a new one. These two models are then compared based on their accuracy indicators and the best one is selected to forecast the international tourism demand in Taiwan.

LITERATURE REVIEW

1. Grey Model

Grey theory offers a new approach to deal mainly with the problems of uncertainty with few data points and/or poor information which is said to be "partial known, partial unknown" (Hsu & Chen, 2003; Liu, 2007). The core of the theory is the grey dynamics model which is usually called Grey model (GM). The Grey model is used to execute the short-term forecasting operation with no strict hypothesis for the distribution of the original data series (Wang et al, 2011). The general GM model has the form of GM(d,v), where d is the rank of differential equation and v is the number of variables appeared in the equation. The basic model of Grey model is GM(1,1), a first-order differential model with one input variable which has been successfully applied in many different researches. It is obtained based on the following procedure.

Step 1: Suppose an original series with n entries is $x^{(0)}$:

$$x^{(0)} = \left\{x^{(0)}(1), x^{(0)}(2), x^{(0)}(3), \ldots, x^{(0)}(k), \ldots x^{(0)}(n)\right\} \quad (1)$$

where $x^{(0)}(k)$ is the value at time k $\left(k = \overline{1,n}\right)$.

Step 2: From the original series $x^{(0)}$, a new series $x^{(1)}$ can be generated by one time accumulated generating operation (1-AGO), which is

$$x^{(1)} = \left\{x^{(1)}(1), x^{(1)}(2), x^{(1)}(3), \ldots, x^{(1)}(k), \ldots, x^{(1)}(n)\right\} \quad (2)$$

where $$x^{(1)}(k) = \sum_{j=1}^{k} x^{(0)}(j)$$

Step 3: A first-order differential equation with one variable is expressed as:

$$\frac{dx^{(1)}}{dt} + ax^{(1)} = b \quad (3)$$

where a is called developing coefficient and b is called grey input coefficient. These two coefficients can be determined by the least square method as the following:

$$[a,b]^T = \left(B^T B\right)^{-1} B^T Y \quad (4)$$

where

$$B = \begin{bmatrix} -\left(x^{(1)}(1) + x^{(1)}(2)\right)/2 & 1 \\ -\left(x^{(1)}(2) + x^{(1)}(3)\right)/2 & 1 \\ \cdots & \cdots \\ -\left(x^{(1)}(n-1) + x^{(1)}(n)\right)/2 & 1 \end{bmatrix} \qquad Y = \left[x^{(0)}(2), x^{(0)}(3), \ldots, x^{(0)}(n)\right]^T$$

Therefore, the forecasting equation for GM(1,1) is expressed as:

$$\hat{x}^{(1)}(k) = \left[x^{(0)}(1) - \frac{b}{a}\right] e^{-a(k-1)} + \frac{b}{a} \qquad \left(k = \overline{1,n}\right) \quad (5)$$

Based on the operation of one time inverse accumulated generating operation (1-IAGO), the predicted series $\hat{x}^{(0)}$ can be obtained as the following:

$$\hat{x}^{(0)} = \left\{\hat{x}^{(0)}(1), \hat{x}^{(0)}(2), \hat{x}^{(0)}(3), \ldots, \hat{x}^{(0)}(k), \ldots, \hat{x}^{(0)}(n)\right\} \quad (6)$$

where $$\begin{cases} \hat{x}^{(0)}(1) = \hat{x}^{(1)}(1) \\ \hat{x}^{(0)}(k) = \hat{x}^{(1)}(k) - \hat{x}^{(1)}(k-1) \qquad \left(k = \overline{2,n}\right) \end{cases}$$

2.Fourier Residual Modification Grey Forecasting Model

GM(1,1) model can perform better if it is modified with Fourier series (Hsu, 2003; Guo et al, 2005; Kan et al, 2010; Askari & Fetanat, 2011; Huang & Lee, 2011). The procedure to obtain the modified model (hereafter called FGM(1,1)) is as the following.

Based on the predicted series $\hat{x}^{(0)}$ obtained from the GM(1,1) model, a residual series named $\varepsilon^{(0)}$ is defined as:

$$\varepsilon^{(0)} = \left\{\varepsilon^{(0)}(2), \varepsilon^{(0)}(3), \varepsilon^{(0)}(4), \ldots, \varepsilon^{(0)}(k), \ldots, \varepsilon^{(0)}(n)\right\} \tag{7}$$

where $\varepsilon^{(0)}(k) = x^{(0)}(k) - \hat{x}^{(0)}(k) \qquad \left(k = \overline{2,n}\right)$

Expressed in Fourier series, $\varepsilon^{(0)}(k)$ is rewritten as:

$$\varepsilon^{(0)}(k) = \frac{1}{2}a_0 + \sum_{i=1}^{F}\left[a_i \cos\left(\frac{2\pi i}{n-1}k\right) + b_i \sin\left(\frac{2\pi i}{n-1}k\right)\right] \qquad \left(k = \overline{2,n}\right) \tag{8}$$

where $F = \left[(n-1)/2 - 1\right]$ called the minimum deployment frequency of Fourier series (Huang & Lee, 2011) and only take integer number (Hsu, 2003; Guo et al, 2005; Askari & Fetanat, 2011). And therefore, the residual series is rewritten as:

$$\varepsilon^{(0)} = P.C \tag{9}$$

where

$$P = \begin{bmatrix} \frac{1}{2} & \cos\left(\frac{2\pi\times1}{n-1}\times2\right) & \sin\left(\frac{2\pi\times1}{n-1}\times2\right) & \cdots & \cos\left(\frac{2\pi\times F}{n-1}\times2\right) & \sin\left(\frac{2\pi\times F}{n-1}\times2\right) \\ \frac{1}{2} & \cos\left(\frac{2\pi\times1}{n-1}\times3\right) & \sin\left(\frac{2\pi\times1}{n-1}\times3\right) & \cdots & \cos\left(\frac{2\pi\times F}{n-1}\times3\right) & \sin\left(\frac{2\pi\times F}{n-1}\times3\right) \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ \frac{1}{2} & \cos\left(\frac{2\pi\times1}{n-1}\times n\right) & \sin\left(\frac{2\pi\times1}{n-1}\times n\right) & \cdots & \cos\left(\frac{2\pi\times F}{n-1}\times n\right) & \sin\left(\frac{2\pi\times F}{n-1}\times n\right) \end{bmatrix}$$

$$C = \left[a_0, a_1, b_1, a_2, b_2, \ldots, a_F, b_F\right]^T$$

The parameters $a_0, a_1, b_1, a_2, b_2, \ldots, a_F, b_F$ are obtained by using the ordinary least squares method (OLS) which results in the equation of:

$$C = \left(P^T P\right)^{-1} P^T \left[\varepsilon^{(0)}\right]^T \tag{10}$$

Once the parameters are calculated, the predicted series residual $\hat{\varepsilon}^{(0)}$ is then easily achieved based on the following expression:

$$\hat{\varepsilon}^{(0)}(k) = \frac{1}{2}a_0 + \sum_{i=1}^{F}\left[a_i \cos\left(\frac{2\pi i}{n-1}k\right) + b_i \sin\left(\frac{2\pi i}{n-1}k\right)\right] \tag{11}$$

Therefore, based the predicted series $\hat{x}^{(0)}$ obtained from GM(1,1), the predicted series $\tilde{x}^{(0)}$ of the FGM(1,1) is determined by:

$$\tilde{x}^{(0)} = \left\{\tilde{x}^{(0)}(1), \tilde{x}^{(0)}(2), \tilde{x}^{(0)}(3), \ldots, \tilde{x}^{(0)}(k), \ldots, \tilde{x}^{(0)}(n)\right\} \tag{12}$$

where $\begin{cases} \tilde{x}^{(0)}(1) = \hat{x}^{(0)}(1) \\ \tilde{x}^{(0)}(k) = \hat{x}^{(0)}(k) + \hat{\varepsilon}^{(0)}(k) \qquad \left(k = \overline{2,n}\right) \end{cases}$

In order to evaluate the accuracy of the forecasting model, the residual error (ε) and its relative error ($\wp$) are used (Guo et al, 2005; Liang et al, 2008). ε and $\wp$ of an entry k are expressed as:

* Residual error: $\varepsilon(k) = x^{(0)}(k) - \hat{x}^{(0)}(k) \qquad \left(k = \overline{1,n}\right)$

* Relative error: $\wp_k = \left|\varepsilon(k)\right| / x^{(0)}(k) \qquad \left(k = \overline{1,n}\right)$

However, there have been some other important indexes to be considered in evaluating the model accuracy. They are:

+ The mean absolute percentage error (MAPE) (Hsu & Chen, 2003; Guo et al, 2005; Hsu & Wang, 2008; Kan et al, 2010; Chang & Liao, 2010; Askari & Fetanat, 2011; Tsaur & Kuo, 2011; Huang & Lee, 2011; Li et al, 2011) (MAPE is also known as the average relative error δ (Hua & Liang, 2009; Ma & Zhang, 2009)):

$$MAPE = \frac{1}{n}\sum_{k=1}^{n} \wp_k$$

+ The post-error ratio C (Hua & Liang, 2009; Ma & Zhang, 2009):

$$C = \frac{S_2}{S_1}$$

where: + $S_1 = \sqrt{\frac{1}{n}\sum_{k=1}^{n}\left[x^{(0)}(k) - \bar{x}\right]^2}$ *where* $\bar{x} = \frac{1}{n}\sum_{k=1}^{n} x^{(0)}(k)$

+ $S_2 = \sqrt{\frac{1}{n}\sum_{k=1}^{n}\left[\varepsilon(k) - \bar{\varepsilon}\right]^2}$ *where* $\bar{\varepsilon} = \frac{1}{n}\sum_{k=1}^{n}\varepsilon(k)$ $\varepsilon(k) = \begin{bmatrix} x^{(0)}(k) - \hat{x}^{(0)}(k) \\ x^{(0)}(k) - \tilde{x}^{(0)}(k) \end{bmatrix}$

The ratio C, in fact, is the ratio between the standard deviation of the original series and the standard deviation of the forecasting error. The smaller the C value is, the higher accuracy the model has since smaller C value results from a larger S_1 and/or a smaller S_2.

+ The small error probability P (Hua & Liang, 2009; Ma & Zhang, 2009):

$$P = p\left\{\frac{\left|\varepsilon(k) - \bar{\varepsilon}\right|}{S_1} < 0.6745\right\}$$

The higher the P value is, the higher accuracy the model has since P value indicates the probability of the ratio of the difference between the residual values of data points and the average residual value with the standard deviation of the original series smaller than 0.6745 (Ma & Zhang, 2009).

+ The forecasting accuracy ρ (Ma & Zhang, 2009): $\rho = 1 - MAPE$

Based on the above indexes, there are four grades of accuracy as stated in Table 1.

Table 1: Four grades of forecasting accuracy

Grade level	*MAPE*	*C*	*P*	ρ
I (Very good)	< 0.01	< 0.35	> 0.95	> 0.95
II (Good)	< 0.05	< 0.50	> 0.80	> 0.90
III (Qualified)	< 0.10	< 0.65	> 0.70	> 0.85
IV (Unqualified)	≥ 0.10	≥ 0.65	≤ 0.70	≤ 0.85

EMPIRICAL STUDY

The historical data of the international tourism demand in Taiwan is obtained from the monthly statistical data published on the website of Ministry of Transportation and Communication R.O.C (MOTC) from January 2001 to September 2011. The tourism demand is referred to the number of monthly arrivals of international tourists to Taiwan. There are totally 129 observations which are used to build GM(1,1) model. The GM(1,1) model is found as

$$\hat{x}^{(1)}(k) = 24073272.64e^{0.0075324(k-1)} - 23873472.64 \qquad (14)$$

The predicted series is as in the column GM(1,1) of Table 2. From the residual series of GM(1,1) model, the forecast values under FGM(1,1) is obtained as illustrated in column FGM(1,1) of Table 2.

Table 3 briefly demonstrates the evaluation indexes of each model with its power in forecasting the international tourism demand in Taiwan.

Table 3: Summary of evaluation indexes of model accuracy

Index / Model	MAPE	S1	S2	C	P	ρ	Forecasting power
GM(1,1)	0.160251	94388.05	44932.53	0.47604	0.87	0.839749	***Unqualified***
FGM(1,1)	0.015755	94388.05	4222.04	0.04473	1.00	0.984245	***Excellent***

From Table 3, with the low MAPE value of 1.5755%, it can be concluded that the FGM(1,1) outperforms GM(1,1). Therefore, it is strongly suggested to forecast the international tourism demand in Taiwan.

CONCLUSION

Combining the Fourier residual modification to the traditional Grey forecasting model GM(1,1) results in a highly accurate forecasting model named FGM(1,1). Particularly, in the case of the international tourism demand in Taiwan, despite of the hard assessment of relevant data about its determinants, FGM(1,1) has proved to follow closely and well fit the actual figures with the very low value of MAPE. Highly precise forecasting result will help the policy-makers and related organizations in the tourism industry to arrange enough facilities and human resources for high seasons and also make regular maintenance and training in low seasons just for a stable growth of the industry.

ABSTRACT

Purpose *Taguchi provided some useful tools such as various orthogonal arrays, interaction tables, linear graphs, etc. for planning fractional factorial experiments and had many successful application cases in quality engineering (Taguchi, 1986). However, many research articles explored the methods that were used to construct those tools and tried to improve them. The aim of this article is to develop a new tool to substitute the uses of Taguchi's orthogonal arrays and interaction tables.*
Design/methodology/approach *Using a number representation system whose base is a power of 2, Tsai (1999) developed an easy algorithm for obtaining multi-factor interaction columns in geometrical designs, which serves as theoretic background for the development of a new tool.*
Finding *Based on the algorithm of base 4, in this article we propose a Basic Quaternary Design Table (BQDT) which is a 4 by 4 squared matrix with entries of both decimal and quaternary column numbers. A BQDT has a nice structure of confounding relationships so that users could identify multi-factor interaction columns in a straightforward manner without looking up tables. The advantages of the proposed BQDT include (1) it serves as an efficient tool for column assignment problem; (2) it can substitute the use of Taguchi's interaction table; (3) it is visually appealing such that the users can easily recognize some special designs.*
Originality/value *Both geometrical design matrix and the BQDT can be used jointly to plan a two-level fractional factorial experiment without looking up tables, which can substitute the uses of Taguchi's orthogonal arrays and interaction tables when run size n is a power of 2.*

Key words: Geometrical design, Quaternary, Taguchi's interaction table
Classification: Research paper
Subject Area: Quality improvement and management

INTRODUCTION

Taguchi's orthogonal arrays are useful tool for planning fractional factorial experiments and have many successful application cases in quality engineering (Taguchi, 1986). For planning an experiment, Taguchi provided some useful tools such as various orthogonal arrays (or design matrices), interaction tables, linear graphs, etc. and adopted the column assignment method in which the required factors are assigned to appropriate columns of a given orthogonal array. However, many research articles explored the methods that were used to construct those tools and tried to improve them (Bullington, et al., 1990; Kacker, et al., 1991).

The geometrical design (G_n) proposed by Plackett & Burman (1946), which is the same as a regular Hadamard matrix when the run size of n is a power of 2, can be constructed easily by using a consecutively doubling method without any computation or looking up tables; that has a practical advantage for uses and overwhelms the use of Taguchi's orthogonal arrays. Taguchi's interaction table is a n by n triangle matrix with the entries of two-factor interaction columns, where n is the number of run size of an orthogonal array. The table can be used to find multi-factor interaction columns efficiently; however, its size becomes larger as n increases so as to create a big burden for uses by looking up lager tables.

The aim of this article is to develop a new efficient tool based on geometrical designs to substitute the uses of Taguchi's orthogonal arrays and interaction tables. Using a number representation system whose base is a power of 2, Tsai (1999) developed an easy algorithm for obtaining two-factor or multi-factor interaction column in geometrical designs. Based on the results of base 4, a Basic Quaternary Design Table (BQDT) is proposed in this article for planning two-level fractional factorial experiments. The content is organized as follows: geometrical designs and the number representation algorithm for 2fi are stated first, then a BQDT is proposed and its wordlength pattern is discussed, finally some special designs using the BSDT with visually appealing are presented and discussed.

GEOMETRICAL DESIGNS

A doubling method was given by Plackett and Burman (1946, p313): If A is orthogonal,

$\mathbf{B}=\begin{bmatrix}\mathbf{A} & \mathbf{A}\\ \mathbf{A} & -\mathbf{A}\end{bmatrix}$ is also orthogonal and has double the order of A. Note that B can be expressed as $B=[A_L, A_R]$, where $A_L=[A, A]'$, $A_R=[A, -A]'$, and A_R is called "fold-over" by Box and Wilson (1951). Starting from G_2, geometrical designs (GD's) can be obtained by the successive doubling method as follows:

$$\mathbf{G}_2=\begin{bmatrix}1 & 1\\ 1 & -1\end{bmatrix},\quad \mathbf{G}_4=\begin{bmatrix}\mathbf{G}_2 & \mathbf{G}_2\\ \mathbf{G}_2 & -\mathbf{G}_2\end{bmatrix}=\begin{bmatrix}1 & 1 & 1 & 1\\ 1 & -1 & 1 & -1\\ 1 & 1 & -1 & -1\\ 1 & -1 & -1 & 1\end{bmatrix},\ \text{and}$$

$$\mathbf{G_8}=\begin{bmatrix}\mathbf{G_4} & \mathbf{G_4}\\ \mathbf{G_4} & -\mathbf{G_4}\end{bmatrix}=\begin{bmatrix}1 & 1 & 1 & 1 & 1 & 1 & 1 & 1\\ 1 & -1 & 1 & -1 & 1 & -1 & 1 & -1\\ 1 & 1 & -1 & -1 & 1 & 1 & -1 & -1\\ 1 & -1 & -1 & 1 & 1 & -1 & -1 & 1\\ 1 & 1 & 1 & 1 & -1 & -1 & -1 & -1\\ 1 & -1 & 1 & -1 & -1 & 1 & -1 & 1\\ 1 & 1 & -1 & -1 & -1 & -1 & 1 & 1\\ 1 & -1 & -1 & 1 & -1 & 1 & 1 & -1\end{bmatrix}.$$

Similarly, all geometrical designs with higher orders such as G_{16}, G_{32}, G_{64}, etc. could be obtained easily by hand writing, or by using "Excel" functions such as "copy" and "replace" without any computation. Note that a geometrical design is the same as Hadamard matrix when its run size is a power of 2.

NR ALGORITHM FOR 2FI IN GD'S

Tsai (1999) showed that the doubling method has a nice recursive property for obtaining two-factor interactions (2fi's). By observing the basic matrix of doubling $\begin{bmatrix}1 & 1\\ 1 & -1\end{bmatrix}$, the 2fi of $\begin{bmatrix}1\\1\end{bmatrix}$ and $\begin{bmatrix}1\\1\end{bmatrix}$ is $\begin{bmatrix}1\\1\end{bmatrix}$; $\begin{bmatrix}1\\-1\end{bmatrix}$ and $\begin{bmatrix}1\\-1\end{bmatrix}$ is $\begin{bmatrix}1\\1\end{bmatrix}$; $\begin{bmatrix}1\\-1\end{bmatrix}$ and $\begin{bmatrix}1\\1\end{bmatrix}$ is $\begin{bmatrix}1\\-1\end{bmatrix}$, respectively. This property is well preserved during the process of doubling. If a geometrical design is partitioned as left-half and right-half parts such as $G_{2n}=[A_L, A_R]$, where $A_L=[G_n, G_n]'$, $A_R=[G_n, -G_n]'$, then three confounding relationships can be observed as follows:

(1) The 2fi column of any two given columns in A_L remains in A_L.
(2) The 2fi column of any two given columns in A_R remains in A_L.
(3) The 2fi column of any two given columns of which one is in A_L and the other one is in A_R remains in A_R.

Namely, the basic rule for 2fi is "left by left → left"; "right by right → left"; "left by right →right", or in short A_L x A_L → A_L; A_R x A_R → A_L; A_L x A_R→ A_R. This rule can be easily extended to higher order interactions.

Based on a number representation system whose base is a power of 2, Tsai (1999) proposed an efficient method, called NR method, for obtaining the 2fi column. Let E denote the 2fi column of two given columns C and D, namely, $E=T_n(C,D)$, then the NR method for quaternary case is stated as below:
1. Convert two given column numbers C and D into digits with base 4.
2. Compute $E=T_n(C,D)$ digit by digit according to the basic confounding relationships in G_4 such as $T_4(1,2)=3$; $T_4(1,3)=2$; $T_4(2,3)=1$; $T_4(0,j)=j$; $T_4(j,j)=0$, $j=0,1,2,3$.
3. Convert the resulting digit numbers with base 4 back to a decimal digit number.

Two numerical examples are given below:

a. $T_{16}(9,14)=T_{16}([21,32])=[13]=7$;
b. $T_{128}(13,99)=T_{128}([0031],[1203])=[1232]=110$.

BASIC QUATERNARY DESIGN TABLE

Based on the above NR algorithm for the quaternary case, since its basic confounding relationship $T_4(i,j)$, i, j=0,1,2,3 is quiet straightforward and is almost memory free, we can easily construct a "Basic Quaternary Design Table (BQDT)" as in Table 1.

Table 1. A Basic Quaternary Design Table (BQDT) for G_{16}.

0 (00)	4 (10)	8 (20)	12 (30)
1 (01)	5 (11)	9 (21)	13 (31)
2 (02)	6 (12)	10 (22)	14 (32)
3 (03)	7 (13)	11 (23)	15 (33)

This is a two-level geometrical design with 16 runs, say G_{16}, in which all sixteen columns are arranged in a 4x4 square table, the entries of 0 to 15 are decimal column numbers while the entries in the parentheses are corresponding quaternary column numbers. The usefulness of this BQDT has two aspects: (1) the required factors can be assigned directly to corresponding columns to form a fractional factorial design; note that the column 0 is an identity column which cannot be assigned any factor; (2) any multi-factors interaction can be obtained naturally according to the basic confounding relationships in G_4, for example, the 2fi of column 9 (21) and column 14 (32) is column 7 (13). Therefore, applying the basic confounding relationships in G_4, we can obtain the 2fi of any two given columns in a straightforward manner without looking up any interaction table. In other words, the BQDT can substitute the use of Taguchi's interaction table in a more natural way.

WORDLENGTH PATTERN OF BQDT

Maximum resolution (Box & Hunter, 1961) and minimum aberration (Fries & Hunter, 1980) are two important criteria for choosing a good fractional factorial design, in which the wordlength patterns (WLP's) are required for comparisons. A defining relation is a word of letters (factors) denoted by 1, 2, 3…(or A, B, C…) and the number of letters in a word is called as its wordlength. A 2^{n-p} fractional factorial design d with n factors is uniquely determined by p independent defining relations (words) which generate the defining contrast subgroup. Then, the wordlength pattern of a design d is defined as the vector $WLP(d)=[A_1(d), A_2(d), \ldots, A_n(d)]$, where $A_k(d)$ is the number of length-k words in the defining contrast subgroup. In this section, we will discuss the most often used length-four and length-three words, respectively.

Assume that 15 factors are assigned to columns 1-15 in a saturated 2^{15-11} design and a BQDT (G_{16}) is used to obtain both A_3 and A_4. To facilitate the presentation, let j-th column set be denoted by C(j) = {(j,0), (j,1), (j,2), (j,3)} while i-th column set is denoted by C(i) = {(0,i), (1,i), (2,i), (3,i)}. By using combinatorial method, all four-factor interactions (4fi's) confounded with the identity column (column 0) will be identified first, and they are classified into five different categories. Note that column 0 is also assumed as one factor and is included in the analysis.

(a) Column and row: There are 8 4fi's in three column sets and three row sets, for examples, $T_4(10,11,12,13)=00$; $T_4(03,13,23,33)=00$.

(b) Pair in each of two column sets: Consider a pair factors are in each of two column sets, for example, in column sets 0 and 1, (00,01,12,13), (10,11,02,03), (00,11,02,13), (10,01,12,03), (00,11,12,03), (10,01,02,13) confounded with column 0. There are $\binom{4}{2}=6$ combinations for four column sets, and 6 4fic's are in each combination, therefore 6x6=36 4fic's are obtained in subtotal.

(c) Pair in each of two row sets: Similar to column sets above, 36 4fic's are obtained in subtotal. For example, in row sets 0 and 1, (00,10,21,31), (01,11,20,30), (00,11,20,31), (01,10,21,30), (00,11,21,30), (01,10,20,31) confounded with column 0.

(d) 2x2 Square: There are 6 2x2 square in any two column sets, for example, in column set 0 and 1, (00,01,10,11), (00,02,10,12), (00,03,10,13), (01,02,11,12), (01,03,11,13), (02,03,12,13). Thus, there are 6 combinations for four columns sets, and 6 4fic's are in each combination, therefore 6x6=36 4fic's are obtained in subtotal.

(e) Latin Square: Similar to a Latin Square, each factor can only be shown up once either in a row or a column, example, (00,11,22,33),(01,10,23,32), (02,10,21,33), etc. There are 4!=24 4fic's in a 4x4 Latin Square.

In total, there are 8+36+36+36+24=140 4fi's in a BQDT with 16 factors including column 0. If a four-factor interaction (4fi) contains the identity column (column 0) then it is a length-3 word, otherwise it is a length-4 word. By fixing column 0 in five categories, the number of length-three words is equal to A_3=2+9+9+9+6=35; while the number of length-four words is equal to A_4=6+27+27+27+18=105.

SOME SPECIAL DESIGNS

Chen, Sun and Wu (1993) provided a catalogue of two-level and three-level fractional factorial designs with small runs, the additional column numbers other than independent columns are reported and the design numbers are arranged as [k-p.i] in the given tables. Two special designs will be adopted to illustrate the use of a BQDT, and how to construct other alternative designs. For a BQDT with run size n=16, the left-half part contains columns 0-7 while the right-half part contains 8-15.

(a) Even MA Resolution IV designs

The series of $\mathbf{2_{IV}^{4-1}}$, $\mathbf{2_{IV}^{8-3}}$, $\mathbf{2_{IV}^{16-11}}$, $\mathbf{2_{IV}^{32-26}}$,... has twice as many runs (n=2k) as factors (k) and are even minimum aberration (MV) resolution IV designs, in which each of k-1 alias sets contains k/2 2fi's. Table 2 shows an example of k=8 in [8-4.1], factors are assigned to columns {1,2,4,5,8,11,13,14}, each of 7 blank columns contains 4 2fi's, and W=(0,14,0,0,0,1). Table 3 shows another similar even MA resolution design in which factors are assigned to columns 8-15 in the right-half part, each of 7 blank columns in the left-half part contains 4 2fi's, and with the same W=(0,14,0,0,0,1).

Table 2. The design of 2^{8-4} with even MA resolution IV in [8-4.1].

Table 3. The similar design of 2^{8-4} with even MA resolution IV.

00		20	30
		21	31
		22	32
		23	33

(b) Maximal number of Clear 2fi's

In Wu and Chen (1992), any two-factor interaction (2fi) that is not aliased with any main effect or other 2fi's is called "clear". Table 4 shows that 8 factors are assigned to columns {1,2,3,4,5,6,7,8} in [8-4.6], the 2fi of any two factors in left-half part remains in left-half part; the 2fi of column 8 with any column in left-half part remains in right-half part. Obviously, seven clear 2fi's in columns 9-15 are clear. Table 5 shows that if column 8 is replaced by any one from columns 9-15 in Table 10, then the design also have seven clear 2fi's in right-half part.

Table 4. The design of 2^{8-4} with seven clear 2fi's in [8-4.6].

00	10	20	
01	11		
02	12		
03	13		

Table 5. The similar design of 2^{8-4} with seven clear 2fi's.

00	10		30
01	11		
02	12		
03	13		

Above all, Tables 2, 3, 4, and 5 show that the BQDT is visually appealing in which some special patterns and confounding relationships exist for special designs. This highlights another advantage of BQDT over the Taguchi's interaction tables.

CONCLUSIONS

A Basic Quaternary Design Table (BQDT) was proposed as a new tool for an experimenter to plan a two-level fractional factorial design, in which all required factors can be assigned directly into the corresponding columns of the table. The BQDT has a nice structure of confounding relationships so that users could identify any interaction columns in a straightforward manner without looking up tables. The length-three or length-four words of the BQDT are classified into five categories. Besides, some special designs such as even minimum aberration resolution IV or maximal clear 2fi's could be constructed easily with the

help of a BQDT. Note that one of the key advantages to the practical users is that the BQDT is visually appealing. Furthermore, the BQDT can be extended to a large case in the future research.

ACKNOWLEGEMENT

SCENARIO PREDICTION OF JAPANESE SOFTWARE INDUSTRY THROUGH HYBRID METHOD

Yasuo Kadono, Tokyo University of Technology, Japan
kadono@media.teu.ac.jp

ABSTRACT

This paper aims at considering the possibility of the future scenario predictions of Japanese software industry through hybrid method. Thus, we try to preliminarily develop a new research framework by connecting the data obtained by large-scale fact-finding investigations, the statistical analyses results using the dynamic modeling, and the future scenarios of Japanese software industry through the simulation. First, we designed a large-scale social survey of the enterprise software industry in Japan, administered it, and developed a measurement tool of the software engineering capabilities with Ministry of Economy, Trade and Industry (METI). Second, we empirically verified that the human resource development of the IT firms improves the operational software engineering capabilities, and that the enhancement of the software engineering capabilities tends to improve the business performance of the IT firms in long term using the dynamic modeling. Third, we are trying to visualize the future scenario of Japanese software industry through the agent-based simulation.

This research includes the following original characteristics of academic research and expected results. First, the research suggests the guideline of the global technological strategy for Japan's software industry to ensure sustainable competitive advantage through the connection among large-scale social surveys, statistical analyses, and future prospects. Second, the research is a challenge for evidence-based visualization of industrial growth scenario by integrating society's intellectual caliber, which has evolved individually, such as fact-finding investigation conducted with METI, management theory, statistical analyses, and social simulation models. Third, the research has a possibility of evolving of the methods of designing for management of technology as a national strategy, from the viewpoint of management of technology, such as scale of players, technology paradigm shifts, global competitions and collaborations. Fourth, the methods through the connection among large-scale social surveys, statistical analyses, and future prospects, developed in the software industry in Japan can be expanded to any other sectors in any countries.

Keywords: software industry, innovation, social survey, statistical analysis, agent-based modeling

INTRODUCTION

Many companies in Japan that use enterprise software have not been fully satisfied with the quality, cost, and productivity of software that IT vendors deliver, or the speed of delivery. At the same time, IT vendors in Japan are facing drastic changes in their business environment, such as technological innovations and new entrants from emerging countries, e.g., China and India. Also, there are particular issues that are present in the IT industry in Japan, such as vendors relying on multilayer subcontractors and legacy business models that depend on

supplying custom-made applications for the domestic market. In fact, in 2009, the information service industry was a 10.5 trillion yen market in Japan, of which 7.6 trillion yen was for software development and programming. In 2009, orders for software totaled 6.4 trillion yen, accounting for 60.3% of the entire information service industry, while the software products market was 1.2 trillion yen (METI, 2010).

In order to meet these challenges in Japanese software industry, this paper aims at considering the possibility of the future scenario predictions of Japanese software industry through hybrid method by connecting large-scale social surveys, statistical analyses using the dynamic modeling, and the future scenarios of Japanese software industry through the simulation. First, we designed a large-scale social survey of the enterprise software industry in Japan, administered it, and developed a measurement tool of the software engineering capabilities with Ministry of Economy, Trade and Industry (METI). Then, we empirically verified that the human resource development of the IT firms improves the operational software engineering capabilities, and that the enhancement of the software engineering capabilities tends to improve the business performance of the IT firms in long term using the dynamic modeling. Second, we try to visualize the future scenario of Japanese software industry through the agent-based simulation.Then, we preliminarily developed a new research scheme to connect large-scale social surveys, statistical analysis results, and visualizing the future scenario of Japanese software industry.

LARGE-SCALE FACT-FINDING INVESTIGATIONS ON SOFTWARE ENGINEERING CAPABILITIES IN JAPAN

In order for the IT industry in Japan to meet the challenges as mentioned above, an important step is to understand how software engineering capability as a core competence for the industry is significant for achieving medium- and long-term success. Therefore, we designed a research survey on software engineering capabilities and administered it in 2005, 2006, and 2007, in collaboration with METI and Information-Technology Promotion Agency, Japan (IPA).
The objectives of the research were to:

- assess the achievements of the software engineering discipline, as represented by IT vendors in Japan, and
- better understand the mechanisms of how software engineering capabilities relate to IT vendors' business performance and business environment.

To achieve these objectives, we developed a measurement tool called Software Engineering Excellence (SEE), which can be used to evaluate the overall software engineering capabilities of IT vendors consisting of the seven factors: Deliverables, Project Management, Quality Assurance, Process Improvement, Research and Development, Human Resource Development, and Customer Contact based on interviews with industry experts and the literature searches (Barney, 2007; Carnegie Mellon University, Software Engineering Institute; Fujimoto, 2003; IEEE, Computer Society, 2004; Porter, 1980)
.
We introduced two other indicators as well: Business Performance and Business Environment. Business Performance indicates the overall business performance of individual IT vendors, such as profitability, growth, productivity, and efficiency of the management. Business Environment expresses the company profile and structure of an IT vendor, e.g.,

origin of vendor, number of software engineers, average age of employees, business model, customer base, and corporate culture.

In the 2005 survey, there were 55 valid responses, a response rate of 24%, for the 2005 survey; and in the 2006 survey, there were 78 valid responses, a response rate of 15%. In the 2007 SEE survey, responses were received from 117 companies, with a total of 100 valid responses, a response rate of 10%. In the 2007 SEE survey, the sample size of each type of vendor, i.e., maker-turned, user-turned, and independent, was large enough to perform stratified analysis.

STATISTICAL ANALYSIS RESULTS ON RELATIONSHIPS BETWEEN SOFTWARE ENGINEERING CAPABILITIES AND BUSINESS PERFORMANCE

After collecting data from vendors in 2005, 2006, and 2007, we calculated the standardized factor loadings of the seven factors - Deliverables, Project Management, Quality Assurance, Process Improvement, Research and Development, Human Resource Development, and Customer Contact - through confirmatory factor analysis, based on the responses received to the questions relevant.

Regarding the cross-section analysis, on the basis of the data collected from 78 firms in SEE2006, we succeeded, by a trial and error method, in constructing a well-fitted path model (CFI = 1.0), where all the existing path coefficients are significant at the 5% level through the use of a atructural equation model (Bollen, 1989). We found that superior Deliverables and Business Performance correlate significantly with effort expended, particularly on Human Resource Development, Quality Assurance, Research and Development, and Process Improvement (Kadono, Tsubaki and Tsuruho, 2008).

In terms of the panel analysis results of software engineering capabilities, we integrated 233 valid responses to the SEE surveys received over three years into a single database and identified 151 unique IT firms, consisting of 42 maker-turned vendors, 33 user-turned vendors, and 76 independent vendors. Then we conducted panel analyses of the seven SEE factors, using the three years of data, to clarify what influence SEE factors have within a year, year-to-year, and mid-term. Based on the results of the panel analysis, our first observation is that most SEE factors in one year have significant positive influences on the same factors the next year. Second, within a year, there are three paths to improving the level of Deliverables, i.e., through Project Management, Quality Assurance and Research and Development. Third, some SEE factors have significant positive influence diagonally on different SEE factors in the following year. Fourth, there are some negative paths, implying that efforts put toward a particular factor do not pay off the duration of our research. Even so, these efforts might be expected to exert longer-term positive effects on other SEE factors (Kadono, 2011).

To understand the long-term relationships among the software engineering capabilities and business performance of the representative IT firms in Japan, we conducted longitudinal analyses on standardized software engineering capability scores of three surveys and ten-year business performance from 151 firms (Meredith and Tisak, 1990). Through the panel analyses, we found that IT firms maintaining high levels of deliverables, derived from high levels of human development, quality assurance, project management and process

improvement, tend to sustain high profitability, while IT firms with high levels of project management and customer contact tend to be highly productive and increasingly improve the productivity in the long-term. Concerning business performance, profitable IT firms tend to be stable and this tendency accelerates progressively due to the enhancement of deliverables and R&D. However, productive IT firms are not necessarily profitable likely because of the multi-layered industry structure in Japan (Kadono and Tsubaki, 2012).

NEW RESEARCH FRAMEWORK OF FUTURE SCENARIO PREDICTION

To consider the possibility of the future scenario predictions of Japanese software industry, we try to preliminarily develop a new research framework by connecting the data obrained by large-scale fact-finding investigations, the statistical analyses results using the dynamic modeling, and the visualization of future scenarios of Japanese software industry through the simulation.

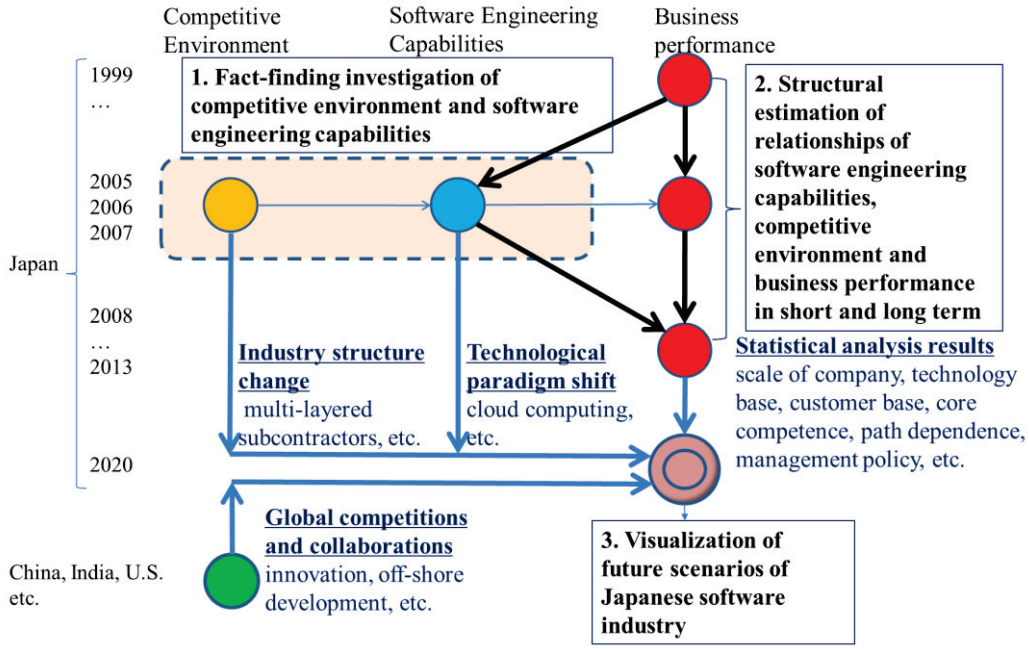

Figure 1: Connection of large-scale fact-finding investigations, statistical analyses and visualizing the future scenario of Japanese software industry

First, we try to understand the whole structure of the current Japan's enterprise software industry from the viewpoint of scale of company, path-dependency, software engineering capabilities, technological base, and customer base based on the fact-finding investigation and statistical analysis results as descrived above. Second, regarding Japan's enterprise software industry structure, we hypothesize that it is an unstable based on multi-layered industry structure consisting of large-scale system integrators, mid-sized software houses, and small temporary manpower companies. Third, the advanced technology paradigm is coming from the U.S. and other countries over the years, e.g., mainframe computer, client-server architechture, personal computer, internet, cloud computing. And Japan's enterprise software industry has fallen behind the U.S. and others. In other words, we think it predictable what advanced technology paradigm is coming next except the timing of the arrival from the

abroad. Fourth, global competitions and collaborations, such as off-shore developments in China, India, and other countries, have become active increasingly.

Then, we try to predict the future industry scenarios in 5-10 years, considering such four factors as statistical analysis results, industry structure changes, technological paradigm shifts, and global competitions and collaborations through the agent-based simulation (Epstein and Axtell, 1996). Here, we need to carefully experiment on the speed of the penetration of new technological paradigm into Japanese market, and the speed of changes of the cost structure in emerging countries as well as the improvement of communication levels between Japanese IT user companies and offshore vendors.

We preliminarily observed the tradeoff between the cost and the communication levels of IT vendors in Japan and China through the agent-based simulation (Kadono, 2011). This study aims at the preliminary assessment of the future software industry structure in Japan from the viewpoint of the influence of offshoring in China based on surveys on software engineering capabilities of Japanese IT vendors with the METI. Through the agent-based simulation model mainly focusing on customer's price preference and communication quality with customers, Japanese vendors can possibly lose their share of the market if Japanese customers prefer the lower prices offered by offshore vendors. The results suggest that Japanese vendors should improve their communication skill to realize the customer's requirements for the quality of enterprise software while avoiding the cost competition with the Chinese vendors and considering the customer's price preference. Otherwise, some Japanese vendors within the current multi-layered software industry culture will not survive in the drastically changing Japanese market.

CONCLUSIONS AND FUTURE WORK

This paper aims at considering the possibility of the future scenario predictions of Japanese software industry through hybrid method. Thus, we try to preliminarily develop a new research framework by connecting the data obrained by large-scale fact-finding investigations, the statistical analyses results using the dynamic modeling, and the future scenarios of Japanese software industry through the simulation.

This research includes the following characteristics of academic research and expected results and implications. First, the research suggests the guideline of the global technological strategy for Japan's software industry to ensure sustainable competitive advantage through the connection among large-scale social surveys, statistical analyses, and future prospects. Second, the research is a challenge for evidence-based visualization of industrial growth scenario by integrating society's intellectual caliber, which has evolved individually, such as fact-finding investigation conducted by METI and IPA, management theory including resource-based view, competitive threats, and the competitive advantage of nations, statistical analyses like dynamic covariance modeling, and social simulation models. Third, the research has a possibility of evolving of the methods of designing for management of technology as a national strategy, through visualization of optimistic to pessimistic scenarios. By doing this, we do not intend to prospect the future scenarios of the industry precisely, but we pursue deeply understanding the complex and multifaceted issues to be managed by policymakers and leading companies in the software industry in Japan, from the viewpoint of management of technology, considering scale of players, technological paradigm shifts, and global

competitions and collaborations, and so on. Fourth, the methods through the connection among large-scale social surveys, statistical analyses, and future prospects, developed in the software industry in Japan can be expanded to any other sectors in any countries.

We would like to extend our research to include the following future work:
- More precise estimation of population of software industry in Japan,
- More simulation analyses on the speed of the penetration of new technological paradigm into Japanese market, the speed of changes of the cost structure in emerging countries, and the improvement of communication levels between Japanese IT user companies and offshore vendors.

ABSTRACT

The objective of this research is to study tool wear condition monitoring in tapping process on CNC machining center machine by using fuzzy logic, to determine the status of cutting tool and the suitable time of changing tool before the tool failure or damage on work piece. The input data that were used in fuzzy logic system obtained from three sensors signal include a spindle current, force and vibration sensor. Fuzzy C-mean clustering and neural network were used to guide in the development of membership function. The status of tool was identified by crisp output values from fuzzy logic system. The results showed fuzzy logic can be used to monitor the tool wear. The performance of fuzzy system based on the number of input data sets and validation of expert in fuzzy rules.

Keywords: Tapping Process, Fuzzy Logic, Tool Wear, Fuzzy C-mean Clustering, Neural Network

INTRODUCTION

Tool wear condition monitoring is important for all metal cutting, such as in tapping process, tool wear or tool breaking has affect to quality of thread and it is difficult or unable to fix it. Then early replacement of tool before tool wear or tool breaking may be safe production loss. There are many techniques are used in monitoring of tool wear. It can be categorized into direct methods and indirect methods. Direct methods require direct measurements from the tool, while the indirect methods utilize cutting parameters such as force, vibration, sound, temperature and power measured during the cutting process. Although the direct methods are likely to be more accurate but it is not feasible in automated machining processes. So the indirect methods are preferred over the direct methods in this field (Aliustaoglu *et al*., 2009).

For indirect methods, fuzzy logics is used extensively to analysis about tool wear and tool condition such as in turning process (Ren *et al.,* 2011), in milling process (Kim and Jeon, 2011; Huang and Chen, 1998) and drilling process (Biglari and Fang, 1995). Other than tool wear and tool condition fuzzy logic can use in applications of data selection for machining parameters with different material and tools type (Hashmi *et al*., 1998; Hashmi *et al*., 2000). These studies showed that fuzzy logic is successful to use in many field of metal machining.

This paper proposes a fuzzy logic model for tool wear condition monitoring in tapping process. In this work has two main stages, the first stage is data collection from sensor signal and adjustment to input to fuzzy system, the membership function and rule base of fuzzy system are designed as show in the second stage.

EXPERIMENTAL SETUP AND DATA ACQUIREMENTS

The first stage, Makino Model BMC60 3-axis CNC milling machine was used in tapping process. A force transducer was mounted on mounting plate under work piece to measured force, accelerometer was mounted on a mounting clip near work piece to measured vibration and current of spindle motor was measured by power logger. The experimental setup as shown in Figure 1. Tap size M6x1 was used in experiment. Machining parameters were set as spindle speed at 200 rpm, feed rate at 200 mm/min and tapping dept 15 mm. The signal of each sensor as shown in Figure 2. The data from each sensor were analyzed to statistical parameters such as mean, maximum, minimum and root mean square (RMS) etc. These statistical parameters were input in to fuzzy modeling.

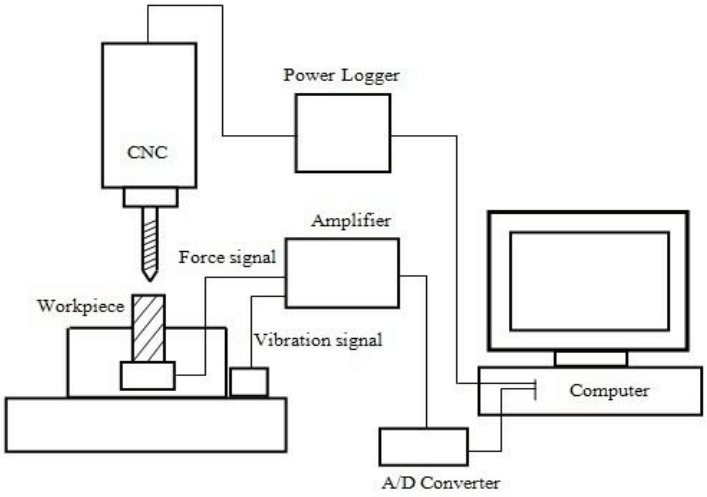

Figure 1. Experimental setup.

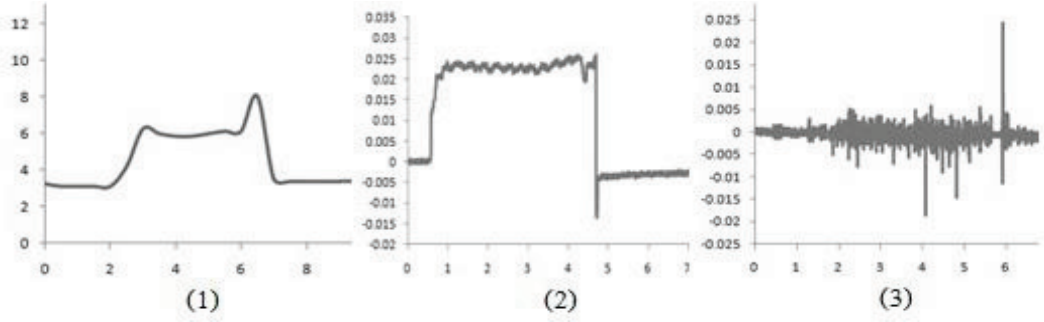

Figure 2. Current (1), Force (2), and Vibration (3) signal.

FUZZY MODELING

In second stage is the development of fuzzy logic system. There are two models of fuzzy system, the first model is the fuzzy system for each sensor that refer to mamdani fuzzy system, and the second model is the fuzzy system for sensors fusion that uses refer to fuzzy system. The output of each sensor was weighted by decision about the important of each sensor before sent to sensor fusion model. Figure 3 shows fuzzy modeling. The statistical parameters of each sensor were sent to input of mamdani fuzzy system and output of mamdani system were sent to input of sugeno fuzzy system. For final output from sugeno fuzzy system is the decision about status of tool.

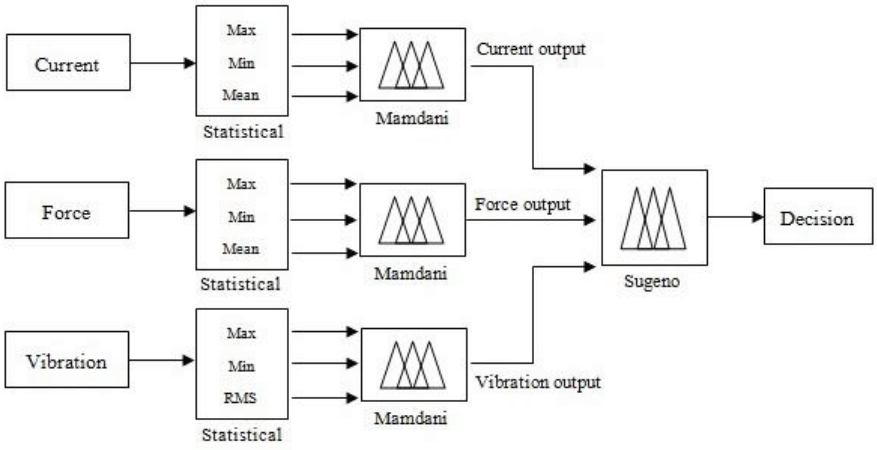

Figure 3. Fuzzy modeling.

1. Fuzzy variable

In mamdani fuzzy system, the inputs and outputs of fuzzy system are explained in fuzzy sets that defined by linguistic terms such as LOW, MEDIUM and HIGH etc. For sugeno fuzzy model the inputs of fuzzy system are explained as same as mamdani fuzzy system, but the output of sugeno fuzzy system is explained with function or constant output (Meesad, 2009). Input and output of fuzzy systems as shown in Table 1.

Table 1. Fuzzy sets for input and output of fuzzy system

Mamdani		Sugeno	
Input (Statistical parameter)	Output (Tool Condition Decision)	Input (Mamdani output)	Output (Wear rate)
LOW MEDIUM HIHG	Normal Tool Warning Tool Failure Tool	LOW MEDIUM HIHG	0.2 0.4 0.6 0.8 1.0

2. Membership functions of fuzzy sets

The structure of fuzzy set and membership function was done manually based on human knowledge or using data-driven technique (Ren *et al*., 2011) such as rank ordering, data clustering, neural networks and genetic algorithms etc. (Meesad, 2009: Ross, 2010). In this work, fuzzy c-mean clustering method was used to calculate center of data in fuzzy sets and calculate membership value for data in fuzzy sets. For development of membership function, the shape of membership function was defined by human expert or use curve fitting technique such as neural network. In this work, neural network fitting tool was used to fit curve between data and membership value from fuzzy c-mean clustering, the result of curve was compared with standard membership function because standard it is easy to calculate output. For example of membership function development can see in Figure 4. The results of comparing were chosen Z S and Gaussian membership function.

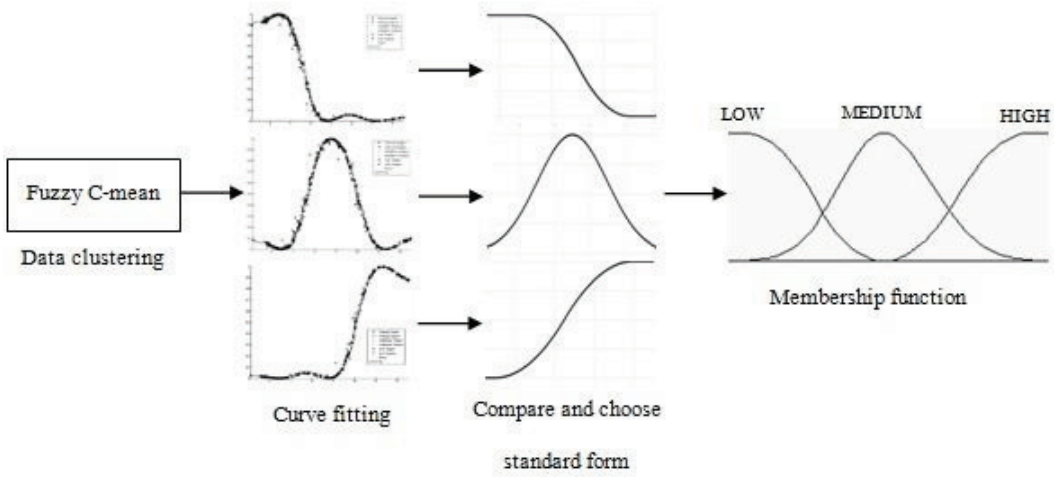

Figure 4. Membership function development.

3. Fuzzy rule-based

The fuzzy rules were defined by if-then rule. They were constructed in the form as:

If (Input1) is … and (Input2) is … and (Input3) is … Then (Output) is …

For example, the rule of mamdani fuzzy system was followed:

If (Min) is LOW and (Max) is LOW and (Mean) is LOW Then (Tool Condition Decision) is Normal Tool.

The rule of sugeno fuzzy systems was followed:

If (Current) is HIGH and (Force) is HIGH and (Vibration) is HIGH Then (Wear rate) is 1.0.

The relationship between inputs and outputs in fuzzy systems was defined based on human expert and engineering knowledge. The number of fuzzy rules in a fuzzy system was related to number of inputs and number of fuzzy variable (Biglari and Fang, 1995). The maximum number of ruled can calculated by the follow equation (Aliustaoglu *et al*., 2009):

$$Z = M^P \quad (1)$$

In this equation, Z is number of fuzzy rules, M is number of input of fuzzy systems and P is number of fuzzy. In this work, there are three inputs of each sensor fuzzy model and three fuzzy variables. Therefore, the maximum number of rules is 27 rules. However, in any cases that have many rules, it is reasonable and efficient to use fewer rules by screening out of impossible rules (Biglari and Fang, 1995). Fuzzy rules of each sensor and sensor fusion model as shown in table 2 and 3 respectively.

Table 2. Fuzzy rules for each sensor model (mamdani)

Min	Max	Mean/RMS		
		LOW	MEDIUM	HIGH
LOW	LOW	Normal Tool	Normal Tool	Warning Tool
	MEDIUM	Normal Tool	Warning Tool	Warning Tool
	HIGH	Warning Tool	Warning Tool	Warning Tool
MEDIUM	LOW	Normal Tool	Warning Tool	Warning Tool
	MEDIUM	Warning Tool	Warning Tool	Warning Tool
	HIGH	Warning Tool	Warning Tool	Failure Tool
HIGH	LOW	Warning Tool	Warning Tool	Warning Tool
	MEDIUM	Warning Tool	Warning Tool	Failure Tool
	HIGH	Warning Tool	Failure Tool	Failure Tool

Table 3. Fuzzy rules for sensor fusion model (sugeno)

Current	Force	Vibration		
		LOW	MEDIUM	HIGH
LOW	LOW	0.2	0.2	0.4
	MEDIUM	0.2	0.4	0.6
	HIGH	0.4	0.6	0.6
MEDIUM	LOW	0.4	0.4	0.6
	MEDIUM	0.4	0.6	0.8
	HIGH	0.6	0.8	0.8
HIGH	LOW	0.6	0.6	0.8
	MEDIUM	0.6	0.8	1.0
	HIGH	0.8	1.0	1.0

4. Fuzzification and defuzzification

Fuzzification is the process of making input data (crisp input) to be the input of fuzzy system (Ross, 2010). Next the input of fuzzy were sent to fuzzy rules and analyzed to fuzzy output. Output of fuzzy system were calculated to output data (crisp output) that used to control systems or decision in any systems by defuzzification method. There are many types of defuzzification in fuzzy system such as centroid, bisector, mean-of-max, weighted-average and weighted-sum etc. In this work, centroid was used in mamdadi fuzzy system and weighted-average was used in sugeno fuzzy system.

RESULTS AND DISCUSSION

The outputs from each sensor fuzzy model and sensor fusion model are showed in Figure 5-6 respectively, it should be a monotonically increasing function which not realizable because of the measurement noise and uncontrolled variable. However, the sensor fusion model with weighting the importance of input data can improve results. For example, in tapping process spindle speed and feed must be related. So spindle current and tapping force are important to monitoring tool wear while vibration is supported to detect about the smooth of cutting. But when looking about quality of signals, high quality signals should be important than low quality signals.

For example in model testing, while in tapping process, the data that measured and analyzed from instruments will sent to calculate in fuzzy model. There are six cases of data in tapping were used to test in this work. The results of model testing as shown in table 4.

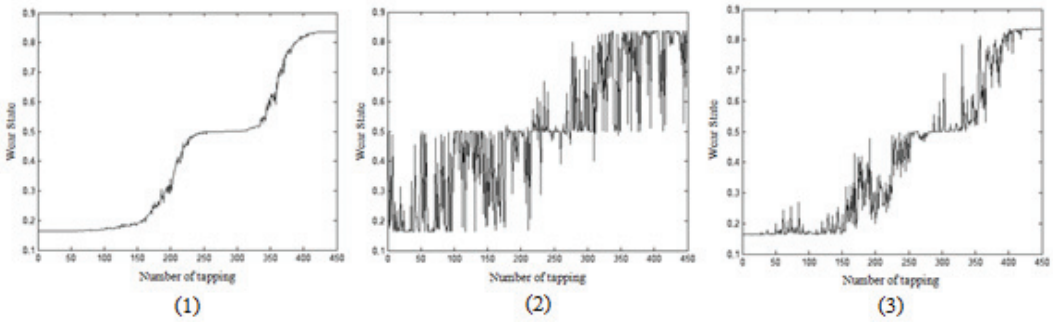

Figure 5. Current (1), Force (2), and Vibration (3) crisp output of mamdani fuzzy.

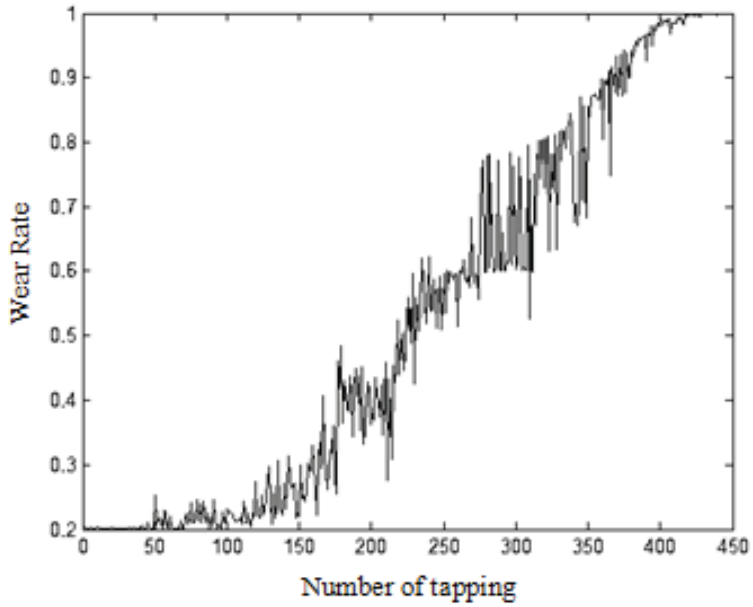

Figure 6. Crisp output of sugeno fuzzy.

Table 4. Results from model testing

Case No.	Sensor	Measurement Data Input			Fuzzy Decision Output	Tool Condition Decision
		Min	Max	Mean/RMS		
1	Current Force Vibration	6.7389 0.0329 -0.0083	7.8299 0.0359 0.0074	7.0766 0.0345 0.0012	0.2325	Normal Tool
2	Current Force Vibration	7.3570 0.0281 -0.0120	8.4408 0.0314 0.0118	7.6170 0.0294 0.0018	0.3313	Normal Tool
3	Current Force Vibration	9.7284 0.0458 -0.0273	10.6798 0.0535 0.0270	9.9719 0.0504 0.0038	0.7708	Warning Tool
4	Current Force Vibration	9.7441 0.0525 -0.0404	10.5621 0.0558 0.0368	9.9521 0.0546 0.0048	0.8169	Warning Tool
5	Current Force Vibration	12.4969 0.0482 -0.0476	13.1789 0.0502 0.0493	12.7049 0.0492 0.0071	0.9998	Failure Tool
6	Current Force Vibration	12.5242 0.0644 -0.0525	13.4792 0.0670 0.0482	12.8891 0.0658 0.0063	1.0000	Failure Tool

The results of fuzzy model explain the status of tool such as, the value closed to zero explains the status of tool is workable, whereas the value closed to one that explains the status of tool is nearly to failure. This value is applied to use in decision-making programs. From results table, tool conditions are set by fuzzy decision output as shown Table 5. For a suitable point of tool changing, operator should be sets a fuzzy decision value of tool changing as one.

Table 5. Tool condition decision setting by fuzzy decision output

No.	Fuzzy Decision Output	Tool Condition Decision
1	0-0.6	Normal Tool
2	0.6-0.85	Warning Tool
3	0.85-1.0	Failure Tool

CONCLUSION

Fuzzy logic can be used to monitoring tool wear in tapping process. The model of fuzzy logic is not complicate and easy to understand. Output from fuzzy logic can apply to use in automatic control or real-time monitoring tool. Fuzzy c-mean clustering and neural network can help expert to develop fuzzy sets and membership function. The matching of expert and data-driven technique can make credibility of fuzzy model more than using only expert opinion. The performance of fuzzy model could be improved by using more data sets of tapping and more input parameters such as feed motor current, machine sound, or tapping torque etc.

ABSTRACT

The study is dedicated to understand the effects of Internet banner ad and the users' perceptions. A lab experiment was used to study the effects of language, product involvement, shape of ad, and type of ad. The subjects were college students in Ecuador. Each experimental website contained a banner ad. The ad was for either a high-involvement product (a smartphone) or a low-involvement product (a news magazine). The type of ad (display ad with photograph vs. text-only, Google-style search ad), shape of ad (horizontal vs. vertical ad), and language of the ad (English vs. Spanish) varied for each type of website. The high-involvement product was seen as significantly more appealing than the low-involvement product, regardless of the type of ad. An interaction suggested that the high-involvement product was seen as somewhat more appealing if advertised with display ads rather than text-only ads; the low-involvement product was slightly more appealing if advertised with text-only ads. Both products – but especially the high-involvement product – attracted higher ratings if advertised with Spanish-language ads rather than English ads. Finally, products were seen as somewhat more appealing if advertised on 'congruent' websites, where the advertised product was similar to the theme of the website (e.g., a smartphone that plays videos advertised on a video website; a news magazine advertised on a newspaper website).

DEVELOPMENT OF MRP FRAMEWORK FOR JOB SHOP ENVIRONMENT

Sakurat Intrto, Department of Industrial Engineering, Faculty of Engineering, Kasetsart University

Pornthep Anussornnitisarn*, Department of Industrial Engineering, Faculty of Engineering, Kasetsart University
***Corresponding author: fengpta@ku.ac.th**

Material Requirement Planning (MRP) is the tool often used in operation management by production planner - plan the material procurement by type, required timeframe and quantity. The tool helps production planner to calculate the material requirement accurately and timely. However, material requirement planning is suitable for production environment like assembly line or Flow Shop. In the production environment like job shop or process layout where there are variation of products produced in the system, typical MRP framework struggles with resource requirements calculation such as machine hours, number of operators etc. in order to provide the accurate completion date.

Therefore, this research intend to develop an enhanced version of Material Requirement Planning by factoring in the flow of production process while creating production calculation using Microsoft Office Excel was developed to address this issue. From the analysis of efficiency in calculation table of the enhanced production table by considering only the overload, the researcher found that the overload yielded from new calculation table is more than traditional table. Moreover, when the percentage of overload is reducing, it still yields the overload number as well.

ABSTRACT

Over the past three decades, data quality/ information quality (DQ/ IQ) is emerging into a possible distinct discipline. As the research overlaps with other disciplines or research fields such as IS, Marketing, Computing Science, etc., it is important to identify the core characteristics of DQ/IQ research and to study its development over time. Although scholars have make contribution to the identity of DQ/ IQ research through qualitative and quantity approaches, there is lacking of a more objective approach that comprehensively studies the identity and evolution of DQ/ IQ research.

In this study, Latent semantic analysis (LSA) approach was used to identify the core areas and evolution of DQ/IQ research field. Relevant keywords from selected 317 journal papers and conference proceeding papers during 1976 through 2012 were analyzed. We identified five core research areas of DQ/ IQ that have emerged from the research literature in the last 36 years: (1) assessment of DQ/ IQ; (2) computing and technological aspect of DQ/ IQ; (3) DQ/ IQ system application; (4) organizational level impact of DQ/IQ; (5) data process management of DQ/ IQ. By examining the evolution of DQ/ IQ research over the past 36 years, we found that the core areas have remained stable, but the topics within each core area appeared and disappeared over time. We conclude that DQ/IQ research has remained relatively stable by focusing on the DQ/IQ research cycle of data/ information management: technology → application → process management → assessment → impact. Insights and suggestions are discussed and presented finally for future research.

INTRODUCTION

Over the past three decades, DQ/IQ has become an important research field which has made significant contribution to the MIS academic discipline. There are various topics in this field, including technical oriented topics such as database related technical solutions for data quality, behavior oriented topics such as data quality impact, web and environment oriented topics such as data quality in the context of computer science and IT [1]. According to the senior editors of the *ACM Journal of Data and Information Quality,* after develop from different relevant disciplines, DQ/IQ research has been shifting to a more unified and distinct discipline. However, as the research field overlaps with other disciplines or fields, it is badly needed to identify the core characteristics of DQ/IQ and to study its development over time.

It is the strong and distinct identity that makes a continuous development and success of the discipline [2, 3].

This research focuses on the identification of core topics and themes in DQ/IQ field. In addition, we aim to trace the evolution and development of DQ/ IQ research over the past 30 years. In this research, we applied latent semantic analysis (LSA) to identify the core areas and evolution of DQ/IQ field by analyzing keywords of 317 full-text DQ/ IQ research papers that were found through a structured approach recommend by Webster and Watson (2002) [4].

The rest of this paper is organized as follows. In the next section, we review the current literature from three aspects: topics, frameworks and identities. Then, we describe the application of LSA and data collection process. Thirdly, results are analyzed. At last, conclusion of key findings, limitations were discussed and directions for further research were suggested.

LITERATURE REVIEW

The topic of identification of disciplines has been discussed for a long time. Sidorova et al. (2008) used LSA to determine the intellectual core of the IS discipline and examined the evolution of IS research over time, and posit IS among the business disciplines. They identified five core research areas: (1) information technology and organizations; (2) IS development; (3) IT and individuals; (4) IT and markets; and (5) IT and groups. In addition, the five core areas remained quite stable, but the specific research themes in the core areas have changed greatly over time [5].

Same as the identity research on IS discipline, scholars have made contribution to the identity of DQ/ IQ research through qualitative and quantity researches on categorize/ clustering DQ/ IQ's research dimensions, topics, and themes. Wang et al. (1995) did a qualitative research to analyze the state-of-art of DQ and developed a framework of DQ research by analogizing product manufacturing and data manufacturing adapted from ISO 9000 [6]. The framework includes seven elements: (1) management responsibilities; (2) operation and assurance costs; (3) research and development; (4) production; (5) distribution; (6) personnel management; and (7) legal function. However, the seven elements are not sufficient to characterize DQ/ IS research and are difficult to be used [1]. Through the qualitative research of 171 papers published form 1995 to 2005, Lima et al. (2006) came up with the conclusion that the relationship between IS and DQ/ IQ research is parallel, and then developed the conceptual maps of DQ research with three high-level perspectives of DQ research: the organizational, behavioral, and operational views, which have detailed conceptual map of relationships between keywords and clusters for each perspective [7]. Ge and Helfert (2007) did a comprehensive review of information quality research review, proposing three major areas of DQ/ IQ research: information quality assessment, information quality management and contextual information quality, which qualitatively built a framework of DQ/ IQ research and emphasized the characteristic of this research field [8]. Madnick et al. (2009) qualitatively introduced a framework for DQ/ IQ research along two dimensions: topics and methods, and provided several representative papers to illustrate relevant topics and methods [1]. The authors also provided intuitive and commonly used keywords to describe each topics, which helps people to characterize individual papers and determine which topics it will belong to.

Recently, Blake (2010) did a quantitative research to identify core topics and themes on DQ/ IQ. He analyzed the abstracts of 324 data quality and information quality papers, and used LSA to analyze all the abstracts of these articles. The author concluded that this research consists of six core topics and fifteen core themes of data quality and information quality research [9]. Blake (2010) also pointed out that future research should focus on the evolution of DQ/ IQ research over time [9].

Although the research on the identity of DQ/ IQ research has had considerate large sum of research contributions, there are several limitations of the former research. First of all, the qualitative researches objectively lead, determined, or recommended the structure, core areas, topics, and methodology of DQ/ IQ research through manual statistical analysis, which may neglect the subject perspective that start from the mathematical analysis of published paper. However, quantitative research using LSA can provide a different perspective to look into the DQ/ IQ research [9]. Secondly, the recent quantity researches of DQ/ IQ are not sufficient, for example, the evolution of DQ/ IQ research over the past twenty years should be studied to find the trend of this field [9].

The next section introduces the methodology of LSA to identify core DQ/ IQ areas and corresponding themes through a quantitative way.

METHODOLOGY

1. Introduction of LSA

The main idea behind LSA is to collect all of the contexts within which words appear, and to establish common factors that represent underlying concepts [5, 10]. The main purpose of LSA is the reduction of dimensionality of original data through singular value decomposition (SVD). SVD is a form of factor analysis applied to a t by d term-document matrix.

In order to process the unstructured data efficiently in LSA, it has to be transformed into a structured form (i.e., vector/matrix). The normal method is the term frequency and inverse document frequency (TF-IDF) transformation. TF-IDF transformation or quantification is a term-frequency based mechanism by which a sequence of words (e.g. a sentence, an article) can be transformed into a structured quantified vector. The raw term frequencies are refined to the product $wij = tfij * idfi$, where $idfi = \log2(N/ni) + 1$, where N is the number of documents in the collection, $tfij$ is the raw term frequency of term i in document j, ni is the term frequency of term i in the entire collection of documents, and the inverse document frequency (IDF) $idfi$ serves as a metric of rarity of term i in the entire collection of documents. Thus, the occurrence of rare terms is promoted and the influence of more common non-stop words is discounted. Then, the term frequencies are typically normalized so that the sum of squared transformed frequencies of all term occurrences within each document is equal to one. Hence, a document can be represented as a vector of term frequencies.

However, the original vectors of term frequencies are usually highly dimensional. Singular value decomposition (SVD) is utilized to reduce the dimension of the original document vectors. By SVD, a $t \times d$ matrix $\mathbf{X}$ can be expressed as $\mathbf{X} = \mathbf{TSD}T$ where $\mathbf{T}$ and $\mathbf{D}$ are both orthogonal and S is diagonal. If X is a $t \times d$ matrix of terms by documents containing the raw

or weighted term frequencies, **TS** is called the factor loadings for terms and **DS** is the factor loadings for documents. Interestingly, **T** is the $t \times r$ matrix of eigenvectors of **XXT** (term covariance), **D** is the $d \times r$ matrix of eigenvectors of the square symmetric matrix of **XTX** (document covariance), and **S** is an $r \times r$ diagonal matrix containing the square roots of eigenvalues of both **XXT** and **XTX**, where r is the rank of **X**. By retaining a proper number of significant factor k, X can be represented by its least squares approximation **X**' = **T***k***S***k***D***k*, which not only reduces the dimensions of some corresponding matrices but also filters some noises in the original representation.

In order to promote the significance of more important terms and discount the significance of less important terms, factor rotation technique is often adopted to achieve this. Usually, the term loadings **L**T = **T***k***S***k* is rotated into **L**T**M** and the document loadings **L**D = **D***k***S***k* is rotated into **L**D**M** by multiplying them by a rotation matrix **M** according to some term structure simplification. A representative factor rotation method is called the varimax rotation [5].

2. Data Collection

To build our corpus, the keywords are chosen from relevant DQ/ IQ journal articles and proceedings of conferences central to the data quality research using a structured approach recommend by Webster and Watson (2002) [4].

(1) We use "Information Quality", "Data Quality", "Quality of Data", and "Quality of Information" as keywords to search papers published on the leading journals in IS discipline before July 2012 in date. Journal databases ABI/Inform (ProQuest) was used to identify relevant articles in the top five leading journals from MIS Journal ranking (2011) by Association for Information Systems, including MISQ, ISR, CACM, MS, and JMIS. In addition, we reviewed all the available papers on proceedings of International Conference on Information Quality (ICIQ) from 1995 to 2007, which is the only international conference specifically targeting DQ/ IQ field with a reputation for quality.

(2) We go backward by reviewing the citations for the articles identified in step 1 including Information Quality framework and/ or instrument to determine prior articles we should consider.

(3) We go forward by using Web of Science to identify articles citing the key articles identified in the previous steps to determine which of these articles should be included in the review.

Through these three steps, we have collected 317 full-texts DQ/ IQ related papers

3. Pre-processing

LSA begins with treating keywords of each article as a set of unstructured words. The text of the keywords of 317 articles were processed with several routinely used pre-processing steps such as stop words removed and stemming prior to latent semantic analysis [11].
Stop words. After numeric values and punctuation were removed, the following step is to remove stop words. Stop words are usually meaningless and not useful for the analysis.

Stemming. Stemming can transform these words which share a same root term to a related form in order to increase identification of similar words and avoid redundancy to reduce processing time at the same time. For example, stemming might transform "contribute", "contribution", "contributing", "contributes" and "contributed" all to the same root term "contribut". For our analysis we used the Snowball stemmer, which is an implementation of a popular stemming algorithm.

RESULT

1. An Overview of Different Factor Solutions

The result of LSA analysis was used to find semantically related terms and their loadings on each factor. Just like general factor analysis, each factor was related to its high loading terms and documents, which are both necessary to interpret the corresponding factor. For each factor, high loading terms and documents which are sorted by absolute loading value are selected to help interpret and label the factor. All factor solution can be proved meaningful by a reasonable factor interpretation. Examination of different factor solution suggests that the body of DQ/ IQ can be aggregated at different level, in other words, different factor solution reveals different aspect of the DQ/ IQ discipline.

Combined with the reference of earlier empirical studies and the result of different factor solution, we finally chose five factors for topics and fifteen factors for themes in order to have the most meaningful representations.

A meaningful view of the intellectual core of the DQ/ IQ discipline are provided by five research topics, and each topic can be represented through several research themes. Four of the five factors containing the solution can be interpreted as the problem-oriented research, examining the application, assessment or impact of one or some specific research issues; they include (1)assessment of DQ/ IQ, (3) DQ/ IQ system application, (4) organizational level impact of DQ/IQ, and data process management of DQ/ IQ (5). (3) DQ/ IQ system application examines the specific applications in the practice of DQ/ IQ research; from its corresponding research themes (see Table 1), this research topic focuses primarily on the improvement of data quality in systems, entity resolution application, corporate house-holding and supply chain, entity resolution application. (5) Data process management of DQ/ IQ examines how to process information as well as data effectively in the management of DQ/ IQ. Here, the research themes focus on DQ/ IQ standardization, measure tool and processes management. At the next level, (1) assessment of DQ/ IQ examines how to assess the quality of information and data in practice. Here, research focuses on information quality measurement model, metrics and assessment, user satisfaction and IS success. Next, (4) organizational level impact of DQ/IQ focuses on the implications of DQ/ IQ research use for organizations, such as the effect of DQ/IQ on business processes, and the impact of DQ/ IQ investments on organizational performance. Research at this level has also focused on business practices related to the impact of DQ/ IQ, such as security and trust, as well as the cost-benefit analysis of DQ/ IQ.

While these four research areas are problem-oriented, the fifth distinct research area, (2) computing technology of DQ/ IQ is technology-oriented. It examines the computing technology itself, and how it processes to improve DQ/ IQ. Here, the research tends to be

more technical in nature, largely focusing on the following themes, including entity identification, database and programming method, DQ/ IQ in network analysis technology, as well as data integration and clean.

According to the interpretations of the five research topic, the intellectual core of the DQ/ IQ discipline can be summarized into problem-oriented research and technology-oriented research, which specifically are the application, process management, assessment and impact of specific DQ/ IQ issues in practice, as well as how computing technology is processed and applied on DQ/ IQ.
In the following section, we will discuss how the topics and themes of DQ/ IQ research have varied over time.

2. Dynamics of IQ and DQ research

To examine the dynamics of DQ/ IQ research, we account total number of publications in different period of time in 15 research topics identified above and calculate the proportion of each topic in corresponding period. The time periods are chosen as 1990- 1999, 2000- 2009, and 2010- 2012 (as our data collection was ended in 2012). This analysis indicates the focus and popularity of changing research topics in different time periods, which provides an evidence of the evolution of DQ/ IQ research. The result is in Table 1.

Figure 1 examines the proportion of total number of five areas' publications and Figure 2 examines the proportion of each theme. (1) Assessment of DQ/ IQ accounts for the largest attention of researchers, and (3) DQ/ IQ system application ranks the second. Figure 3 shows the proportion of each area in different time period, which indicates the popularity of each area in different times. We can see from Figure 3 that most of the five areas remain constant over 30 years. Specifically, the proportion of (3) DQ/ IQ system application and (4) organizational level impact of DQ/IQ grew steadily over time; (1) assessment of DQ/ IQ and (5) data process management of DQ/ IQ first grew from 1990s to 2000s, but fell down slightly in 2010s. The last research area, (2) computing technology of DQ/ IQ experienced a dramatic fluctuation over time, however. It fell from 1990s to 2000s sharply and grew significantly when time came to 2010s.

Table 1. Areas and Topics in Different Times

Area	Topic	1990s	2000s	2010s (part of)
1. assessment of DQ/ IQ	user satisfaction and IS success	0.12	0.08	0.10
	information quality measurement model	0.12	0.18	0.10
	metrics and assessment	0.04	0.06	0.00
2. computing technology of DQ/ IQ	entity identification technology	0.04	0.00	0.04

Area	Topic	1990s	2000s	2010s (part of)
	database and programming method	0.04	0.05	0.10
	DQ/ IQ in network analysis technology	0.12	0.06	0.08
	data integration and clean	0.12	0.00	0.05
3. DQ/ IQ system application	data quality improvement in systems	0.04	0.00	0.05
	corporate house-holding and supply chain	0.04	0.14	0.09
	entity resolution application	0.12	0.05	0.10
4. organizational level impact of DQ/IQ	security and trust	0.00	0.04	0.00
	cost-benefit analysis	0.08	0.07	0.05
	operation and decision system	0.04	0.08	0.14
5. data process management of DQ/ IQ	measure tool and processes management	0.12	0.15	0.10
	DQ/ IQ standardization	0.00	0.05	0.00

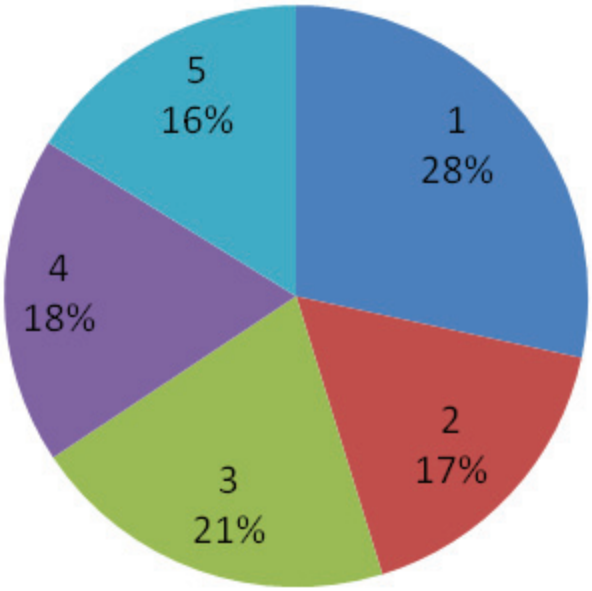

Figure 1. Ratio of Each Area

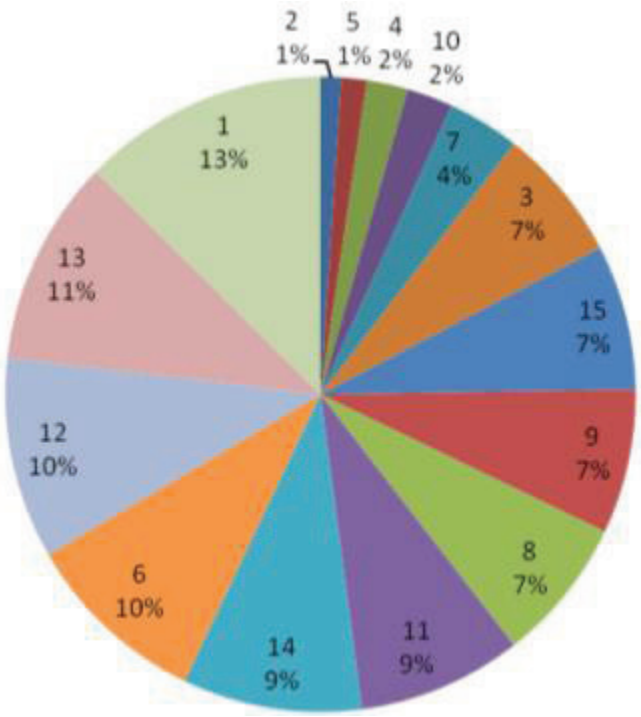

Figure 2. Ratio of Each Topic

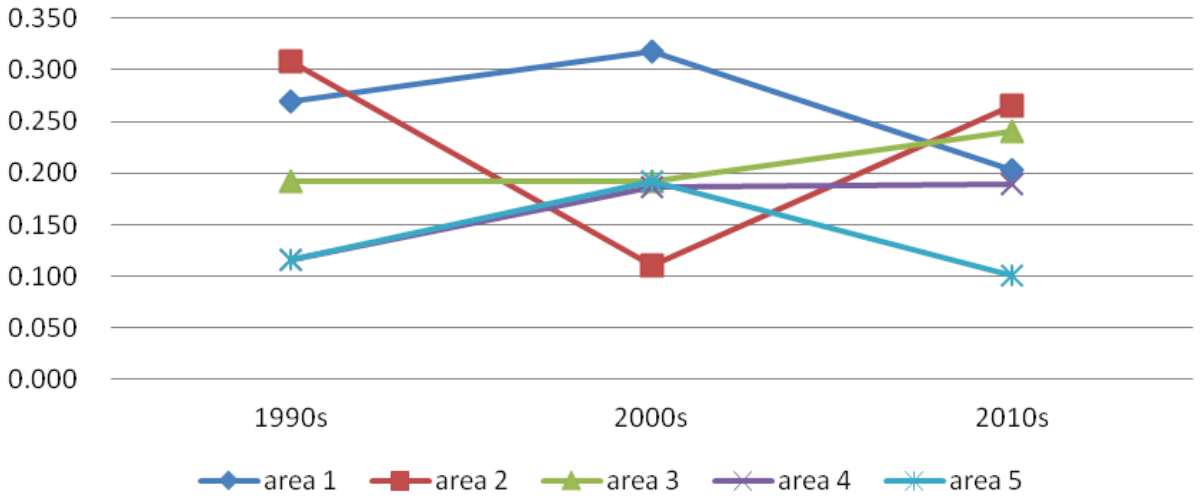

Figure 3. Dynamics of Research Areas

Examination of cross-loadings of 5 research areas and 15 research topics shows that the focus topics in some research area in different time period changes (see Table 1). For example, in (2) computing technology of DQ/ IQ, database and programming method was the focus topic in 1990s and 200s, and was replaced by database and programming method in 2010s. In (3) DQ/ IQ system application, the topic of corporate house-holding and supply chain was not popular in 1990s, but gained the largest focus in 2000s. Similarly, operation and decision system in (4) organizational level impact of DQ/IQ gained continuous increasing attention over time and has grown into the focus topic of this area. Implications of significant changes in the five research areas are examined in the next part.

DISCUSSION

The focus areas in DQ and IQ research changes over time as the landscape of data quality in research and data quality in practice changes quickly [9]. To identify the evolution of DQ/ IQ research, we need to examine the dynamic changes and focus shifts in the five core areas identified above. In this part, we discuss about the changes in DQ/ IQ research over the last 30 years, based on the results of our former part.

Firstly, the examination of dynamics of five research areas shows that although some of the areas fluctuated in the past 30 years, the areas remained stable over time. DQ/ IQ research is tightly combined with technology and management [1]. The raise and falls in one research area provides research space for other areas, for example, the development of DQ/ IQ research technology promotes the application, assessment, and data process management, and change the impact of DQ/ IQ, while the application encourage the improvement of technology and data process management. The five research areas form a cycle of DQ/ IQ research: technology → application → process management → assessment → impact → new demand of technology. In addition, the uptrend of (3) DQ/ IQ system application and (4) organizational level impact of DQ/IQ shows that DQ/ IQ research has changed from monotonous areas of computing technology and assessment to more balanced areas that also focus on DQ system application and impact. The combination of technology and management, and the movement from technology toward process-related and managerial

issues makes DQ/ IQ research more identifiable from IT, computing science, and other management research [1, 3].

Secondly, we can explore the results of each research area, the significantly changing of the topics, to find the dynamics characteristics. The result indicates that although many topics remain stable over time, such as user satisfaction and IS success, DQ/ IQ in network analysis technology, and measure tool and processes management, there are some interesting and important changes. We can see from Table 1 that the topic of information quality measurement model accounts for the largest amount of publications in DQ/ IQ research, which is one of the core concerns of DQ/ IQ field. However, examining the dynamic development of this topic, after going up from 1990s to 2000s, this topic fell down sharply through 2010s (from 18% to 10%). This suggests that after ample study of measurement of DQ/ IQ model in 2000s, researchers have gradually reached a consensus of how to measure data quality or information quality. The focus of (1) assessment of DQ/ IQ is shifting to user satisfaction and IS success, which take more factors into consideration other than measurement to assess DQ/ IQ.

Main computing technologies of DQ/ IQ evolved over time, too. Database and programming method gains more and more concern over three period of time and finally ranks the top concern in 2010s among these four technologies, while data integration and clean fell sharply. The result suggests that as computing technology evolves, more and more researches focus on improving database and programming method to study DQ algorithm and solve DQ problems.

In the area of organizational level impact of DQ/ IQ, topic of cost-benefit analysis declined while topic of operation and decision system increased over time, which indicates that more and more organizations accept the necessity and significance of DQ & IQ, and impact of operation and decision system for DQ solution are becoming more and more popular while the cost-benefit issue has reached an agreement.

CONCLUSIONS, LIMITATIONS, AND DIRECTIONS FOR FUTURE RESEARCH

In this paper, we attempted to reveal the intellectual core and corresponding research dynamics of DQ/ IQ research. The key contribution of the paper is that we applied latent semantic analysis to identify and interpret the five core topics of DQ/ IQ and fifteen research themes to identify DQ/ IQ research. In order to better understand the trend of DQ/ IQ research, the evolution of this field in the past three decades was also discussed.

It is also important to point out several limitations of our study. First, we used keywords instead of full texts or abstracts, which may loss of information. Second, since factor labeling was done by researchers, it is hard to avoid the limitation of subjectivity biases. In addition, our sample was consisted by certain mainstream journal articles and conference proceedings which may limit the scope of our study.

Our research is a quantitative methodology based on latent semantics analysis. Our future work may consider the combination of earlier qualitative empirical studies and the method in our paper, eliminating the shortcomings of the empirical studies and adding their advantages. By comparing the two methods, we can try to propose a comprehensive and complementary

approach to address the DQ/IQ topic identification. Besides, our sample covers most of mainstream journal articles and conference proceedings such as ICIQ, CACM, MISQ, JMIS, etc. Some of them are oriented for North American, while some focus on European research. In this paper, we do not take this locality distinction into consideration. Maybe, a comparative study of North American versus European DQ/IQ research identities could be an interesting direction for future research.

For future research, researchers can explore new research topics, such as new technology and management to ensure semi-structured and unstructured data quality, cross impact of DQ/ IQ on individual and organizational, and so on. In addition, the cycle of these five core topics need more theoretical and empirical study to confirm.

In conclusion, the core view of DQ/ IQ in research as well as in practice is changing quickly overtime. As the development of discipline research and information technology, organic combination of DQ/ IQ and other disciplines will become a new main trend, and also bring new research challenges at the same time. We hope our study of DQ/ IQ discipline can enable new scholars to efficiently gain an understanding of what DQ/ IQ research is and identify potential areas of interest in a clearer and easier way.

ABSTRACT

Purpose: *A proposed analytical model in this research analyses the corresponding angles of the strategic triangles (Prospector, Analyzer, and Defender). The model compares the angle differences between the strategy and resource triangles with opinions from different management groups of informants. It was found out that NSCFI model more scientific comparing to formal ones through validation. The objective of this study is to analyse a Finnish manufacturing case company's operational competitiveness. Operational strategy is a vital element that supports businesses corporate strategies. The strategic decision-making is essential in operational competitiveness to generate quality decisions that would affect the successfulness of strategy formulation in manufacturing and sales.*

Methodology: *The research is based on two methods; Manufacturing Strategy Index (MSI) and Sense and Respond (S&R). MSI detects the preferable strategy type and derives the proportions of importance between quality, cost, time and flexibility. Whilst, S&R analyzes dynamic business strategies and deviates influence on each attribute on the same four performances as in MSI.*
Findings: *The instruments used for data collection are questionnaires custom made for the company. Calculations based on the MSI questionnaire resulted in medium high values for the Prospector strategy both for past- and future orientation. S&R calculations regarding the past orientation resulted in low values for all strategy types, except P-NSCFI for Analyzer.*
Originality: *The managerial implication of this research is that it is critical for enterprise managers to adjust the direction of operations strategy according to consistency between operation strategy and resource allocation. Concerning the future orientation, we find high values for Analyzer and medium low to high values for the Prospector and Defender groups. The results would indicate that the case company has turned from a former strategy that was not clearly defined towards a highly Analyzer characterized business strategy.*

Key words: Sustainable Competitive Advantage, Sense and Respond, Manufacturing Strategy Index, Operations strategy, Case study

INTRODUCTION

As the rapid development of global economics, manufacturing enterprises are trying to find out a survival path to be stable in the competitive market and get benefit as much as it can be. Many manufacturing companies took convey and analysis to help managers make decision. It is undoubtedly that quantitative analyzing will provide management more assistance with numerical data. The idea has been modified by changing both denominator and nominator with rational level values in previous SCFI formulas (Liu, et al., 2011). Takala draw out the idea of using triangles to comparing operations strategy and resource allocation. The NSCFI model was developed by Liu and the new model accurately the S&R theory and trend research into the study. This proposed model further improves the accuracy and stability of NSCFI modeling and evaluating business strategic decision-making process, based on feedback on case studies using NSCFI. Through analysis of this case study it can be find out that to some degree several Sense & Response models have similar results, however the NSCFI give managerial implication with high accuracy comparing to formal ones.

This paper analyses the corresponding angles of the strategic triangles (Prospector, Analyzer, and Defender) and compare the angle differences between the strategy and resource triangles with opinions from different management groups of informants. In addition, this study develops a new S&R model named new critical factor index (NSCFI) model which based on formal models refers to CFI, BCFI, SCFI. And it is critical for enterprise managers to evaluate whether the operations strategy supports their resource allocation then it is more efficient to make decisions. The proposed analytical model created in this research provides benchmarking to BCFI and SCFI base on testing the hypothesis with the NSCFI model.

According to Takala (2013), the case study from one Finnish manufacturing company provided validation of the NSCFI model is the best until now. However, it needs to be proved in a large number of case studies and this case company is just one of our study area. In this paper, our validation comes from different departments of one Finnish company which initially a smaller Finnish company offering logistic services and products for the metal industry but has recently been acquired (purchased) by a bigger Finnish manufacturing company. This company is the world's leading professional related manufacturer, a wide range of business, including manufacturing and processing industries, shipbuilding, ports and terminals. The analyzing result has been taken from company managers´ operations feedback.

The structure of this paper is as follows. Section 2 introduces the study objectives. Section 3 reviews the latest related studies. Section 4 describes the methodologies. Section 5 draws findings of this study. Section 6 discusses the managerial implications, research limitations and also recommendations for future research.

LITERATURE REVIEW

Johnson describes strategy as 'the direction and scope of an organization over the long-term, which achieves advantage in a changing environment through its configuration of resources with the aim of fulfilling stakeholder expectations' (Johnson at al. 2005). Mintzberg states that strategy is organization's future plan, a position in specific markets, a pattern of its performance and a tactic to left behind its competitors (Mintzberg, et al., 1998).

Companies construct their strategies in many ways. They can compete either on cost, quality of products or services, high levels of customer service or customizing their products and services to fit individual customer needs. The operations function therefore must respond to this by providing the capabilities needed to fulfill the market requirement. In some ways this is a 'translation' task because the techniques and language used by marketing managers to understand the requirements of markets are different to the language and techniques used by operations managers to manage their productive resources. Slack and Lewis (2002) defined operations strategy as the pattern of decision which shape the long term capabilities of any type of operations and their contribution to overall strategy, through the reconciliation of market requirements with operations resources. The main vision of each company is to have an operational strategy that will keep the company growing. One of the key features of such strategy is the one that gives a way towards a unique strategic position in the market. According to Skinner (1986), the new competitive environment forces manufacturing companies to have a quick response to market demands, deliver high quality products, and the industrial system have to be flexible to new materials and customer needs. Therefore, continuous innovations are needed if the company wants to continuously growing and remain profitable over time. A well formulated strategy would help companies to allocate their resources wisely according to their capabilities and shortcomings in a dynamic environment.

Miles & Snow topology (1978) is a dominant framework of the strategy types. They have developed a comprehensive framework which states that the strategy type can be detected depending on the fixed proportions between RAL Model elements (Quality, Cost,

Time/Delivery, and Flexibility). According to this framework, there are four different groups; prospectors, defenders, analyzers and reactors. Prospector strategy is the one that always looking forward for opportunity to lead the industry through innovation. Defender strategy tries to maintain their current customer by taking advantage in cost to create a stable market. Analyzer strategy is an intermediate between defender and prospector strategy which tries to balance between quality, cost and time. Reactor strategy has no sense of aims or vision. Under this strategy, the decisions are taken in order to respond to immediate problem.

METHODOLOGY

Two methodologies apply in this case study: Manufacturing Strategy Index (MSI) and Sense and Respond (S&R). MSI refers to the operations strategy whereas S&R refers to resource allocation of a company. Both methodologies have a two-sided orientation: Past and future. Attributes are to be assessed for the situation during the past 3-5 years as well as the expectations for the future 3-5 years or equivalent dimensions. In this case study, informants were asked to assess the situation before and during the economic crisis of 2008/2009. Data was gathered by sending questionnaires to two white-collar employees of the case company. The first questionnaire covered the MSI criteria while the second set of questions asked for the attributes in Sense and Respond.

1 Sense and Respond (S&R)

The term ‘Sense and Respond’ as a business concept first appeared in the 1992 *Management Review* article by Stephan H. Haeckel. Originally a label describing a desirable type of organizational behavior, it evolved over the next six years into a post-industrial managerial paradigm, incorporating a set of concepts, principles, prescriptions and tools for creating and managing an adaptive enterprise. (H. Haeckel 1999)

According to Ivan Golovko (Golovko, 2012), 'Sense and Respond' is a scalable managerial framework developing ability to adopt improvements. To further describe S&R, it's important to mention the current framework used by organizations, 'Make and Sell'. This lower level framework will not allow organizations to operate as competitive as possible nor will they compete in the fierce and constantly changing business environment. Mr. Golovko describes S&R as "converting threats into opportunities, drawbacks into strengths."

The Sense and Respond questionnaire is used to analyze dynamic business strategies. In the S&R questionnaire you deviate accordingly to the influence of an attribute on Quality, Cost, Time and Flexibility of the business performance process. The main criteria (Quality, Cost, Time and Flexibility) have their sub-criteria, which leads to better understanding of RAL Model. (Figure 1)

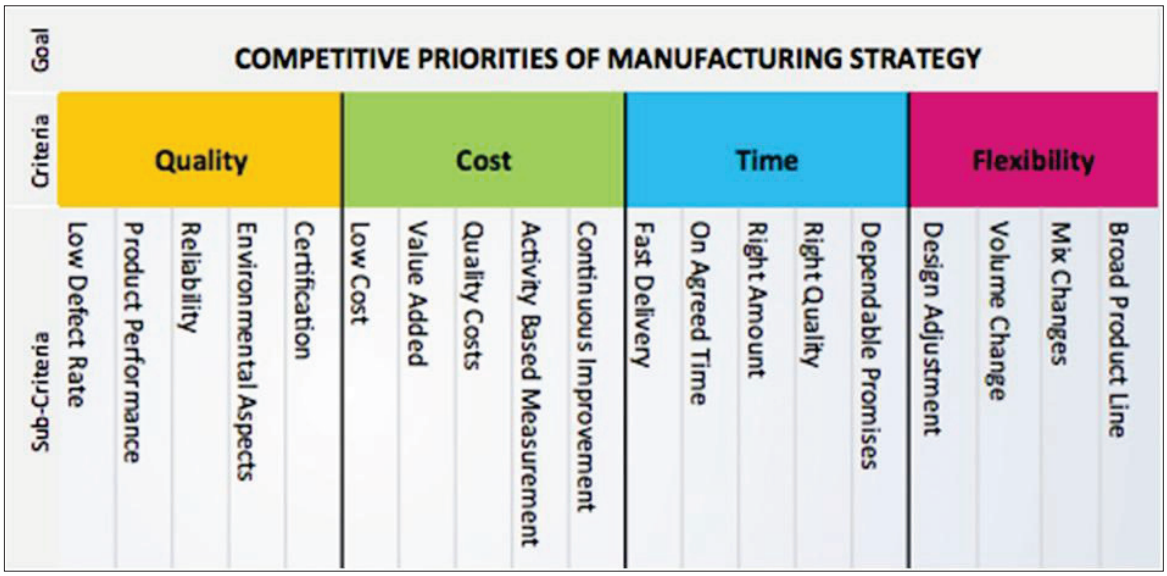

Figure 1: Basic elements of RAL model

The S&R was utilized by Ranta and Takala (2007) by introducing critical factor index (CFI) to develop the operative management system. After introducing CFI, the S&R model has develop with three stages, which are called CFI, BCFI and SCFI model. The three models have common parts and the different parts are the numerator. The S&R model is used to analyze CFI of case companies.

The S&R questionnaire had 32 attributes to value. Quality had 7 attributes, Cost had 10 attributes, Time had 7 attributes and Flexibility had attributes of 8.

Please answer to all attributes to form a useable answer. ATTRIBUTES	Experiences	Expectations	Direction of development, experiences (past) X			Direction of development, expectations (future) X			Compared with competitors X		
	(1-10)	(1-10)	Worse	Same	Better	Worse	Same	Better	Worse	Same	Better
RESOURCE INPUTS IN MULTI-CRITERIA OPERATIONS STRATEGY											
Quality											
Time											
Cost											
Flexibility											

Figure 2: S&R questionnaire

2 Manufacturing Strategy Index (MSI)

MSI is described as the method of detection of the preferable strategy type. The method implies the key elements of RAL model and derives the proportions of importance between Quality, Cost, Time and Flexibility.

The MSI questionnaire uses pairwise comparison of criteria on a scale reaching from 9 on the left hand side to 9 on the right hand side, with a neutral choice of 1 in the between the two

criteria. The full questionnaire consists of 6 top-level questions and 36 detailed questions. For this case study however the MSI survey was limited to the 6 top-level questions.

KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	LAATU (Q)
KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	TOIMITUS (D)
KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)
LAATU (Q)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	TOIMITUS (D)
LAATU (Q)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)
TOIMITUS (D)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)

Figure 3: MSI top-level questions

To evaluate the answered MSI questionnaires, a model was built using the Expert Choice software. With this model, the priority weights of the criteria were calculated depending on the answers given by the company informants. With the priority weights at hand it is then possible to detect a company's strategy type according to the typology by Miles & Snow (1978), which defines the Prospector, Analyzer, Defender and Reactor business strategy types. For example a high priority weight would be an indicator for a Prospector strategy.

RESULTS AND ANALYSIS

1 Sense and Respond

The Sense and Respond questionnaire included 32 attributes within Quality (Q), Cost (C), Time (T) and Flexibility (F). However, the attributes for operation strategies were not equal. Attributes were divided as follows: Q: ten, C: eight, T: eight and F: seven. Since the questionnaire was custom made in advance, no attributes were equally compiled. In other words, no attributes were left out of the calculations. Hence, this may affect the results.

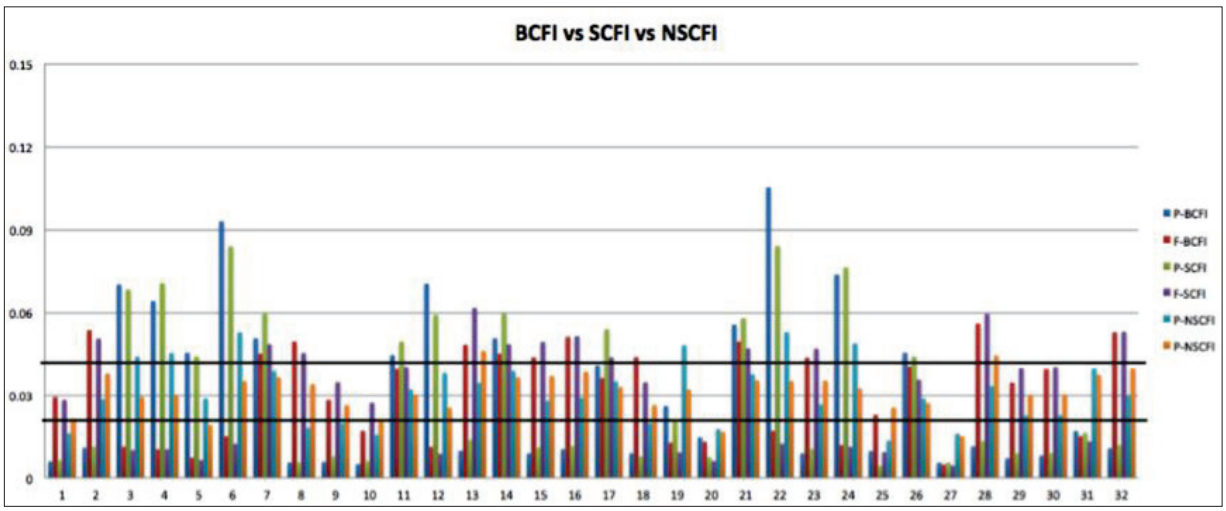

Figure 4: Results of BCFI, SCFI and NSCFI

Figure 4 shows the collected Sense and Respond data from the case company. This is an illustration of the trend for how critical factors change and develop directions. The Figure shows the calculated S&R results of past and future values using BCFI, SCFI and NSCFI models. The range of the attributes are divided into three parts; over resourced, balanced and under resourced. Therefore, if an attribute falls between the range of ⅓ and ⅔ of the average resource level, it is considered balanced. An attribute that is in the range lower than ⅓, is considered under resourced. In this case, average level is 100%/32=3,125%, which means that the judging values are 2,083% and 4,167%. This means, that any attribute lower than 2,083% is under resourced and any attribute higher than 4,167% is over resourced. The resource levels are marked with black lines in Figure 4.

A comparison of past and future BCFI, SCFI and NSCFI can be seen in Table 5. In Table 5, the attributes were analyzed one by one.

Table 5: Comparison of Past and Future BCFI, SCFI and NSCFI

Attribute	P-BCFI	F-BCFI	Trend	P-SCFI	F-SCFI	Trend	P-NSCFI	F-NSCFI	Trend
1	Under	Good	Better	Under	Good	Better	Under	Good	Better
2	Under	Over	Worse	Under	Over	Worse	Good	Good	-
3	Over	Under	Worse	Over	Under	Worse	Over	Good	Better

31	Under	Under	Worse	Under	Under	Worse	Good	Good	-
32	Under	Over	Better	Under	Over	Better	Good	Good	-

Table 5 shows how the attributes change from before economic crisis to during economic crisis. There is comparison of results of past and future values using three different S&R models (CFI, BCFI and SCFI) which are based on analysis of 32 attributes one by one. The trend clearly shows how any specific attribute alters from past to future. When the value of an attribute in both before and during are good, the trend is considered to be unchanged and marked with "-". Values, which change from good to other, will show that the trend is worse. However, if values change from other to good, the trend is better. When values are either lower or higher, it is still recognizable to determine their direction. For instance, if two values are over resourced and the latter value is lower, then the direction is better and vice versa.

When comparing the results, a summary can be made that all values are valid. Looking at the trends for BCFI and SCFI, most of the attributes are marked as "Better" while NSCFI have almost the same amount of attributes marked with "Better" and "Same". The trend for before and during NSCFI is showing good results. Many attributes have shown 0 index values the reason behind this is zero standard deviation in the collected data, which is expected commonly. So from the 0 index value no real situation can be analyzed. But still the original CFI model is considered to be a benchmark to interpret the critical factors.

The BCFI and SCFI proved to be helpful for solving above mentioned problem and more interpretations can be made from the results. The addition of one to the standard deviation by the developer of BCFI, which results in standard deviation becoming one, avoiding the zero SD. For SCFI using root mean square to avoid zero standard deviation is enough. These formulas are shown in Figure 5 below.

Name	Model
CFI	$CFI = \frac{Std\{experience\} \cdot Std\{expectation\}}{Imprtance\ index \cdot Gap\ index \cdot Development\ index}$
BCFI	$SD\ Expectation\ index = \frac{Std\{expectation\}}{10} + 1$ $SD\ Experience index = \frac{Std\{experience\}}{10} + 1$ $BCFI = \frac{SD\ Expectation\ index \cdot SD\ Experience index \cdot Performance index}{Imprtance\ index \cdot Gap\ index \cdot Development\ index}$
SCFI	$SCFI = \frac{\sqrt{\frac{1}{n} \cdot \sum_{1}^{n} [experience(i) - 1]^2} \cdot \sqrt{\frac{1}{n} \cdot \sum_{1}^{n} [expectation(i) - 10]^2} \cdot Performance index}{Imprtance index \cdot Gap\ index \cdot Development\ index}$

Figure 5: CFI, BCFI and SCFI formula

The inconsistent results in CFI than BCFI and SCFI shows that critical factor index as the benchmark cannot be considered correct in real case study analysis. So, the derived formulas such as BCFI and SCFI are alternative options. This case study analysis also showed that the results of BCFI and SCFI are more consistent than the CFIs. From discussion with the case company inconsistent results can be verified which one is right and which one is wrong.

The feedback and discussion from the case company can verify if one is evaluating right. However, in this case the feedback from the case company is confidential.

2 Manufacturing Strategy Index (MSI)

Two informants from the case company answered the two questionnaires for MSI. When answering the questionnaire, the informants have marked the situations before the economic crisis of 2008/2009 with a green color. The situation during the crisis is marked with a red color. Informant number one did not provide answers concerning the situation before the crisis, due to the fact that his employment in the case company started after the crisis. Hence, informant number one had not been working there long enough to access the situation before crisis.

Table 6: MSI answered by Informant 1

KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	LAATU (Q)
KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	TOIMITUS (D)
KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)
LAATU (Q)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	TOIMITUS (D)
LAATU (Q)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)
TOIMITUS (D)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)

Table 7: MSI answered by Informant 2

KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	LAATU (Q)
KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	TOIMITUS (D)
KUSTANNUKSET (C)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)
LAATU (Q)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	TOIMITUS (D)
LAATU (Q)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)
TOIMITUS (D)	9 8 7 6 5 4 3 2 1 2 3 4 5 6 7 8 9	JOUSTAVUUS (F)

As the tables show, there can be seen which strategy types the case company has been focusing on before and during economic crisis. The strategy type derives the proportions of importance between Quality (Laatu), Cost (Kustannukset), Delivery (Toimitus), and Flexibility (Joustavuus). The answers of the informants are quite similar when comparing the answers during the economic crisis. Since only informant number two could state the importance of Q, C, D and F before economic crisis, there is no other answer that could be compared with it. Each result displays a high priority on Quality, followed by Delivery and Flexibility while putting little value on Cost. This order is consistent in between both Informants and in case of Informant 2 it even remains the same for the assessment before and during the economic crisis.

The MSI results shows that the case company, both before and during economic crisis, focused on the importance of Quality as their main strategy type. When calculating the integrated values, a weight of 1⁄3 was given to Informant 1 and 2⁄3 was given to Informant 2. It was decided to put more weight on Informant 2 due to the facts that he provided a full set of data and had more working experience in the case company compared to Informant 1. In the case of Informant 1, who was not able to assess the situation before the economic crisis, missing data was left blank and calculations for integration were adapted. Therefore, there is a 100% weight on Informant 2 for integrated P-MSI values.

Table 8: Integrated values of MSI

	Integrated values			
	Q	C	D	F
P-MSI	0,529	0,068	0,254	0,150
F-MSI	0,550	0,068	0,247	0,136

Table 8 shows the integrated values of the MSI results. Past Manufacturing Index for Q, C, D, and F, should have a value equal to one and Future Manufacturing Index for the same proportions should as well have a value equal to one. As can be seen in Table 9, both P-MSI and F-MSI have the same importance for the proportions, only some small changes in the values.

Table 9: Strategy type Prospector, Analyzer and Defender

	P	A	D
P-MSI	0,947	0,961	0,902
F-MSI	0,950	0,916	0,906

Considering the strategy type regarding to MSI-results, there can be seen that Analyzer is the strongest strategy type before economic crisis. However, the strategy type changes during the economic crisis from Analyzer to Prospector.

3 SCA

The integrated MSI- and S&R-results were put into the SCA-calculation. The sum check was true for each variable. SCA values shall be between 0 and 1. Values close to or greater than 0.97 can be considered as high. Values reaching from 0.93-0.97 are further referred to as “medium high” and values <0.93 as “low” values.

Table 10: Sum check and P, A, D results for SCA

	Q	C	T	F	Check	P	A	D
P-MSI	0,484	0,071	0,283	0,162	TRUE	0,941	0,896	0,898
F-MSI	0,550	0,068	0,247	0,136	TRUE	0,950	0,916	0,906
P-BCFI	0,275	0,275	0,055	0,394	TRUE	0,908	0,902	0,908
F-BCFI	0,298	0,298	0,326	0,078	TRUE	0,935	0,973	0,935
P-SCFI	0,314	0,297	0,067	0,322	TRUE	0,914	0,893	0,912
F-SCFI	0,303	0,286	0,354	0,056	TRUE	0,942	0,984	0,941
P-NSCFI	0,264	0,250	0,217	0,268	TRUE	0,906	0,986	0,904
F-NSCFI	0,261	0,247	0,304	0,188	TRUE	0,913	0,985	0,912

SCA calculations derived from the MSI questionnaire (indicated with green background color) resulted in medium high values for the Prospector strategy and low values for the other groups, both for past- and future-orientation. The tendency in the MSI-based SCA values towards the Prospector group is supported by the MSI priority weights, which have a high emphasis on

quality. High priority weights on quality are typical for a Prospector strategy with quality being a crucial point for this type of strategy (Golovko 2012: 14).
Calculations based on the S&R questionnaire regarding the past orientation resulted in low values for all strategy types, except P-NSCFI for Analyzer. Concerning the future orientation, we find high values for Analyzer and medium high to low values for the Analyzer and Defender groups. These results would indicate that our case company has turned from a former strategy that was not clearly defined towards a highly Analyzer characterized business strategy.

Table 11: Angle results and MAPE, RMSE and MAD values

α	β	γ	α Degree	β Degree	γ Degree	Check	MAPE	RMSE	MAD
1,037	1,025	1,079	59,444	58,714	61,842	TRUE			
1,023	1,055	1,064	58,615	60,430	60,955	TRUE			
1,045	1,051	1,045	59,881	60,240	59,879	TRUE	0,935	0,958	0,968
1,059	1,024	1,059	60,657	58,687	60,656	TRUE	0,931	0,955	0,965
1,040	1,060	1,042	59,577	60,737	59,686	TRUE	0,928	0,951	0,965
1,060	1,021	1,061	60,712	58,521	60,767	TRUE	0,930	0,952	0,964
1,071	0,998	1,073	61,369	57,165	61,466	TRUE	0,935	0,958	0,968
1,069	1,003	1,070	61,226	57,465	61,309	TRUE	0,901	0,933	0,951

These angles more correctly reflect the way of business strategy implementation. The sum check was true for all angles. Calculations may have the outcome that the company has to change its operations strategy. Using SCA-method can bring stability, flexibility, and sustainability for the organization and enlarges its performance and competitiveness. With the result from this research the case company can forecast their future strategy and business performance.

4 Business environment and study expectations

In this research BCFI method was used to find critical attributes for a new start up business of a global company. The purpose was to identify the development actions needed and to prioritize resources for these measures. The second goal for the study was to recognize attributes with unclear goal setting and to emphasize the need for these to be clarified by the management.

The organization in focus is under change from R&D project to business process. The goal of the study was to collect expectations of different organizational groups and to highlight attributes that are considered as critical for the business development. These findings are taken into account when making decisions for strategic actions to follow.

In the core of the business is a material handling service which is executed by delivering a special tailor-made automated storage device for the customer company. Device is at the customer's disposal against fixed monthly fee that includes the storage system, support for the service and software development. The research covered supply department that manages platform, procurement, production and delivery activities.

FINDINGS

The questionnaire included 32 questions covering all supply activities and management attributes. Moreover some of the questions aimed to show up expectations about how the supply organization should support research and development. In this case the supply team cannot focus only on process development, but has a role to support R&D activities as well.
Nine questionnaires were sent and eight of them were responded. The data was handled in three groups, based on the organizational position of the respondent. Three answers were received from the board members, two from supply management and three from team leaders of other activities inside the business. When estimating the final actions results from all the three groups were taken into account.

Table 12: Attributes in questionnaire

Question Category	Atrribute number	Attribute
Production and material flow	1	Assembling functions are effective with minimized waste in the process
	2	Quality of assembling is homogenous and modules are compatible
	3	Asset risk of the material flow is being controlled and reported regularly
	4	The supply chain is quickly able to react on changes in market demand
	5	The needs of R&D are well considered within the production process
	6	Current receivables are on an optimized level when compared to deliveries
	7	Risks concerning stock and assets within material flow are under good control
Product platform	8	There is always available reliable cost information about the product
	9	New features developed by the R&D are utilised rapidly
	10	The product cost structure and it´s development are transparent
	11	Including new features to the manufactured product is cost-effective
	12	Production version and R&D version are clearly separated when sustaining delivery ability
Delivery and mounting process	13	Ability to deliver the system for test run within one working day is the target
	14	System deliveries are carried out precisely on the day confirmed for the customer
	15	Delivery process is budgeted and the budget is controlled in order to ensure cost efficiency
	16	The company brand is visible during each delivery process
	17	Mounting a system is managed in accordance with the company brand
	18	Delivery ability of the product covers also export markets
Support for product development	19	Supply actively joins developing the product
	20	Assembly applies the system in production
	21	Company's own production is used as a reference and a tool for sales activity
	22	Supply takes part in developing process control tools for the product
	23	Information security is taken into account within the scope of all operations
Supply management	24	Safety at work is strongly emphasized and kept in mind at all levels of production
	25	Communication between R&D and production works well
	26	Information about future deliveries is actively spread in order to maintain operational readiness
	27	Activities are well organized with clear definitions about employee responsibilities and authorities.
	28	The organisation values process discipline, only serious causes justify violating the process structure
	29	The information produced is reliable
	30	Professional skills of the employees are maintained and improved actively in accordance to job descriptions
	31	The company's ERP guarantees good support for the process
	32	Customer needs and wishes are thoroughly taken into consideration throughout the delivery

1 Critical attributes

The main findings of the research is related to cost and asset control. When starting a new business, the big challenge is how to make the right structural decisions to enable the expected growth. Three top critical attributes concerned risk management in stock and asset control. BCFI indicated these issues critical in both board and supply management results. In the results of the

team leaders' group the status was more unclear, but in overall results these attributes were considered critical.

In the results it can be seen that the board pictures the startup already in a bigger size. Expectations to grow are on a high level. With the current low volumes asset risks are not significant and there is a risk that the operating strategy does not focus on the process structure as closely as required. In this case growth is most likely to happen and the scale can be altered in a very short time. Quick change with low functionality of process operations might block the growth. Practically this sets a need to build consumption based material flow and process with good tools for parameter control to direct activities effectively.

2 Unclear attributes

Most significant finding within unclear attributes was that the organization did not have a unified vision about the schedule of making the business ready for export markets. This issue rose up in the discussion when the results were presented to board. This can be seen directly from the BCFI index values as well.

Other issues within unclear findings where related to product lifecycle and process parameter management activities. This means that the organization needs to clarify its' methods and processes concerning goal communication and production version management. When ramping up a business it is important to keep the product and the process updated matching the goal while simultaneously ready to support the changes needed.

Table 13: BCFI results

	BCFI Index			BCFI Ranking inside the group			Attribute Critical Level		
Attribute Number	Top management	Supply Management	Team leaders	Top management	Supply Management	Team leaders	Top management	Supply Management	Team leaders
1	1,175	1,110	1,509	4	5	27	Rather critical	Rather critical	Unclear
2	1,823	1,508	1,498	29	30	25	Unclear	**Very unclear**	**Rather unclear**

CONCLUSIONS

Results were used for strategic planning for the year 2013. The main focus now is to prepare processes for profitable growth to be ready for the expected period of growing fast. Actions are taken to improve process control tools and accuracy of asset management. The target is to create consumption based material flow with an agile parameter control.

Other important finding was the need of common understanding about the right timing when to start piloting export cases. Before starting to prepare going abroad maturity of operating processes and device have to be developed to a good level. If maturity is too low, the risk of loosing control of costs begins to grow too high. Basing on this study, the board has now generated a strategic plan and a realistic schedule about when to aim towards the export markets. This study has shown the value of BCFI method in investigating the status of an organization. With this method it is possible to produce numeric information about how well communication functions within organizational hierarchy or between teams. Also the level of understanding strategic communication and the way the different actions are linked to it in order to achieve the common goal can be measured.

Table 14: Action categories for attributes

Atrribute number	Attribute	Actions needes
1	Assembling functions are effective with minimized waste in the process	Make a plan about actions needed
2	Quality of assembling is homogenous and modules are compatible	Define targets as soon as possible
3	Asset risk of the material flow is being controlled and reported regularly	Make a plan about actions needed
4	The supply chain is quickly able to react on changes in market demand	No actions needed
5	The needs of R&D are well considered within the production process	Describe actions needed
6	Current receivables are on an optimized level when compared to deliveries	Make a plan about actions needed
7	Risks concerning stock and assets within material flow are under good control	Make a plan about actions needed
8	There is always available reliable cost information about the product	Define targets as soon as possible
9	New features developed by the R&D are utilised rapidly	Describe actions needed
10	The product cost structure and it´s development are transparent	No actions needed
11	Including new features to the manufactured product is cost-effective	No actions needed
12	Production version and R&D version are clearly separated when sustaining delivery ability	Define targets as soon as possible
13	Ability to deliver the system for test run within one working day is the target	Describe actions needed
14	System deliveries are carried out precisely on the day confirmed for the customer	Define targets as soon as possible
15	Delivery process is budgeted and the budget is controlled in order to ensure cost efficiency	Make a plan about actions needed
16	The company brand is visible during each delivery process	No actions needed
17	Mounting a system is managed in accordance with the company brand	Describe actions needed
18	Delivery ability of the product covers also export markets	Describe actions needed
19	Supply actively joins developing the product	Describe actions needed
20	Assembly applies the system in production	No actions needed
21	Company's own production is used as a reference and a tool for sales activity	Define targets as soon as possible
22	Supply takes part in developing process control tools for the product	Describe actions needed
23	Information security is taken into account within the scope of all operations	No actions needed
24	Safety at work is strongly emphasized and kept in mind at all levels of production	No actions needed
25	Communication between R&D and production works well	No actions needed
26	Information about future deliveries is actively spread in order to maintain operational readiness	Define targets as soon as possible
27	Activities are well organized with clear definitions about employee responsibilities and authorities.	No actions needed
28	The organisation values process discipline, only serious causes justify violating the process structure	No actions needed
29	The information produced is reliable	No actions needed
30	Professional skills of the employees are maintained and improved actively in accordance to job descriptions	No actions needed
31	The company's ERP guarantees good support for the process	No actions needed
32	Customer needs and wishes are thoroughly taken into consideration throughout the delivery	Describe actions needed

DISCUSSION

This study examined a case company's behavior towards operational strategy before and during the economic crisis in 2008–2009. The study was analyzed by the corresponding angles of the strategic triangles. Along with the study, a new S&R model, named NSCFI, was developed based on previous models. To verify a case study of this character, it is essential to acquire proper feedback from the case company in order to ensure the results.

It is vital for managers to have knowledge of their company's operational strategy. By understanding operational strategy, companies will allow themselves to make correct decisions that will have a positive influence on the companies' long term capabilities (Slack and Lewis, 2002). The method presented in this paper will help organization leaders to gain control over the strategic focus. Research shows, that this study has given the best validation yet known for NSCFI model. Hence, it is significant to prove this model in a larger scale of case studies.

The results indicate that the case company went from having a somewhat diffuse approach on strategy to a clear and profitable approach. If companies do not have a common vision for strategy, it might mean that resources are misspent. Before the economic crisis, the company's strategy was scattered between Prospector, Defender and Analyzer types of strategy. However, the Analyzer strategy type had the strongest numerical values both before and during the economic crisis. On the other hand, towards the crisis the Analyzer strategy type emerged clearer than any other. In other words, the company changed its strategy focus into one unified orientation where a balance between quality, cost and time was achieved (Miles and Snow, 1978).

It is important to remember the fact that one of the informants was only able to give insight on the situation during the economic crisis. Furthermore, the Sense and Respond questionnaire consisted of an uneven amount of attributes for each proportion. A last limitation is the relatively high inconsistency ratio for one of the informants' answers in the MSI questionnaire. All these factors, along with a larger number of informants could have an impact on the result of this case study.

ACKNOWLEDGEMENTS

The authors wish to acknowledge Prof. Josu Takala and Assoc. Prof. Liu Yang for their valuable comments and guidance for making this paper to happen. The authors also would like to thank Alexander Mäntylä (v98949@student.uwasa.fi), Patricia Kronman (v98945@student.uwasa.fi), Andreas Kreuzer (v98944@student.uwasa.fi) and Afnan Zafar (v98960@student.uwasa.fi) for their remarkable effort in analyzing and interpreting the data and preparing the report.

MINING IT BUSINESS TEXTS TO ANALYZE TECHNOLOGY TRENDS

Sumali J. Conlon, Department of MIS, School of Business Administration, University of Mississippi University, USA
Email: sconlon@bus.olemiss.edu

Lakisha L. Simmons, Department of Information Systems Management, School of Business Administration, Belmont University
Email: lakisha.simmons@belmont.edu

ABSTRACT

Purpose: *The aim of this research is to use a text mining technique to analyze IT business documents semi-automatically to find information about, for example, the evolution of products/services firms produced over time, what new businesses they were interested in investing in, how they improved their products, and what other businesses they merged with.*
Design/methodology/approach: *We analyze online text documents semi-automatically using natural language processing (NLP) techniques such as collocation analysis, sub-language analysis, and information extraction. These techniques are used on a collections of business documents, accumulated over a long period of time, to yield important insights.*
Findings: *Using a huge amount of documents collected in a long period of time, we are able to find business trends of the IT businesses.*
Research limitations/implications: *The documents we use are still limited, for future research, more documents and new techniques should be applied.*
Practical implications: *This research can reveal, for example, the evolution of products/services firms produced over time, what new businesses they were interested in investing in, how they improved their products, and what other businesses they merged with. This information can help to trace firms' strategic evolution. In addition, financial analysts frequently get information from business reports in order to evaluate the financial position of the companies they are interested in. An analysis of how information in financial documents evolved over time can therefore help in studying changes in a firm's financial health.*
Social implications: *Similar techniques can also be applied with other types of documents in other domains such as social sciences to understand the social issues better.*
Originality/value: *Much research has been done using text analysis techniques in several areas such analyzing product reviews, clustering data, etc. However, this research analyzes business data to study business trend which has not been done earlier.*

A VALUE ASSESSMENT MODEL FOR SUSTAINTABLE SMART CITIES

June Wei, College of Business, University of West Florida, Florida, USA
Email: jwei@uwf.edu

ABSTRACT

A smart city applies information and communication technologies (ICTs) to planning, designing, building, and operating city infrastructures in order to improve life quality and economy. It covers many aspects in a city such as utility, public transportation, education, healthcare, entertainment, and city governances via using ICTs. Benefits that a smart city can offer include resource optimization on identification of mismanagement, quick disaster recovery and fast emergency responses via real-time data evaluation, better service quality to citizens and organizations, and efficient city administration.

Motivated by the apparent lack of literatures in the area of an exploratory study on value assessment in building smart cities, this paper aims at developing a value assessment model for smart cities (VAMSC) based on value theory. Specifically, it first developed a theoretical model for assessing smart cities value based on value theory and mean-end analysis method, which includes means and fundamental value objectives. The means objectives are developed based on a strategic value assessment model and the fundamental objectives are based on an engagement assessment model. This assessment model includes four levels: Level 1 - smart information and communication infrastructure (objectives in Privacy, Security, Social Networking, and Technology such as Internet of Things, RFID, and Cloud Computing); Level 2 - smart organization infrastructure (objectives in Education, Transportation, Utility & Sanitation, Healthcare, and Social & Entertainment); Level 3 - smart governmental infrastructure (objectives in Economy, Legal & Law, and Policy & Regulation); and Level 4 - smart environmental infrastructure (objectives in Green Environment and Social Harmony).

Second, a survey is developed to measure these mean and fundamental objectives. Data was collected from 283 subjects using the stratified sampling method. Multivariate statistical analysis such as factor analysis was used to analyze data. The findings show that a 6-factor instrument that measures means objectives and 4-factor measures fundamental objectives. Third, a relative-weighted assessment method was proposed to assess the value level of smart cities based on the results derived from data analysis. Finally, recommendations and guidelines are presented to assist city administers and decision making for building and operating a smart city. The results of this research will provide strategies on how to transform cities into smart cities by accelerating the adoption of smart technologies and smart systems. The paper also will assist city administrators and top level managers when they make decisions on building a smart city and to improve people's living quality in a city. Managerial and practical implications are also presented.

One limitation of this research is that subjects were recruited from one country. With the advanced ICTs, a smart city moves to globalization to deliver high quality services to citizens and organizations. A smart city across countries based on global ICTs creates an even high level of value. The future research will develop a cross-cultural value assessment system for building and operating cross-cultural smart cities for global users by considering risks inherited from cultural differences.

ABSTRACT

E-service has changed securities market trading patterns. At present, securities dealers mainly provide an internet ordering mode and mobile ordering services, while past trade patterns are mostly based on Internet ordering as the main trading mode. With increasingly powerful mobile phone functions and stable development of the current 3G systems, the willingness of investors to adopt has significantly increased. Hence, this study adopted the Analytic Network Process (ANP) to evaluate the demand on the mobile ordering services of securities dealers to learn about the mobile ordering structure, demands, and concerns of securities dealers.

The study expects to explore the service contents and switching costs of the mobile ordering structure and compare factor importance and mutual influence of service contents and switching costs. The findings can be provided to the system development industry as a reference. It is expected to allow system developers to better understand the demands of securities dealers in the mobile ordering service structure in the future.

Keywords: Mobile Ordering, CRM (Customer Relation Management), Switching Costs, Analytic Network Process (ANP)

INTRODUCTION

Huang (2009) proposed that the rise of the network has delivered immediacy and convenience, as mobile finances can efficiently provide financial services by providing securities dealer customers with complete investment tools, investment information, and customer services. According to Wen et al. (2009) indicated that flow of information uses the Internet as a circulation pipeline, where mobile phone services play a very important role, as a website can provide 24-hour services online. Therefore, the use of websites for finance and investment is the current trend. Contemporary mobile Internet service is not subject to environmental restrictions or time limits, and more importantly, the users do not need to rely on a computer to enter the virtual world of the Internet. With the continuous advancements of mobile communication equipment, mobile Internet service is gradually accepted and recognized as important by investors. Learning historical data, customer background, investment preferences, and other information of the customers, according to the system information, allows enterprises to provide customized services or commodities to customers and build good relationships. Shih (2010) pointed out that the mobile financial and investment services can create a unique service for customers.

With the rapid maturity of the application environments of mobile platforms, securities firms have become gradually concerned about the mobile ordering market. In response to such a developing trend, securities dealers are actively building and perfecting mobile ordering platforms and importing the CA (Certification Authority) certificate mechanism to expand the range of applications of electronic ordering from desktop computers to smart phones. The securities industry should consider how to build a mobile ordering system for better operating performance, which simultaneously considers customer switching costs, in order to attract more customers to mobile ordering. This study plans to collect the mobile ordering service status information, as provided by securities dealers, to explore the significance and relevance of the factors affecting mobile ordering as reference indicators for planning mobile ordering services of securities dealers.

LITERATURE REVIEW

1. Mobile communications system

The mobile ordering system used in this study is a 3G wireless communication system. The currently designed software of securities dealers is aimed at 3G systems, as they are faster and more stable than 2G systems in transmission. The range of a 3G system is wide; therefore, the 3G system is believed to be more suitable by telecommunications companies for mobile ordering systems.

2. Switching Costs

Constantinides (2002) argued that there are some extra costs when switching from e-commerce to mobile commerce, and the costs of mobile commerce is higher than e-commerce. Kim (2004), Grzybowski (2008), Maicas (2008) and Maicas (2009) proposed that switching costs exist in various products and services, including airlines, financial services, and mobile telecommunications. The reason for the switching costs is the customer intention to change suppliers and the cause of switching is reduced satisfaction and loyalty to

the supplier. Porter (1980) argued that, the cost of changing from an original supplier to a new supplier can be regarded as "one-time switching costs". Mattews and Murray (2007) pointed out when switching suppliers, the switching costs consist of financial and non-financial costs, the switching of service relationships will result in switching obstacles. Meanwhile, service providers may create customer inertia by using switching costs to maintain the service relationship between the consumer and the original supplier to obtain more benefits.

According to Matthews and Murray (2007), in addition to the financial and non-financial costs, consumers are faced with uncertainties in time, psychology, and emotions, as brought when switching to a new service provider. As suggested by Burnham (2003) and Cheng (2007), switching costs is a type of one-time costs generated in the face of supplier switching. Hsin and Su (2009) argued that switching costs include time, money, and energy. Klemperer (1987), Klemperer (1995), Matthews and Murray (2007), and Burnham (2003) pointed out that, switching costs can be divided into Transaction costs, Learning costs, and Contractual costs. Switching costs refer to the perceived potential risks, lost revenue, and consumed energy when switching suppliers. The existence of switching costs grants enterprises with stronger market power to allow them to obtain higher prices in the market, reduce product or service quality, and establish entry barriers, thus, gaining abnormal returns.

3. Customer Relation Management (CRM)

The financial services industry can be roughly divided into banking, insurance, securities, and other industries. In the securities industry, customer transactions are characterized by the highest repeated purchase rate; therefore, excellent CRM systems can bring excellent financial performance to the enterprises. Therefore, the introduction of CRM is regarded as a trend in the financial industries. The mobile ordering system can be set according to the demands of investors, meaning the investor mobile ordering system has a high level of customization. CRM is person-to-person marketing. Securities dealers can learn customer preferences and provide customers with necessary information from transaction records to maintain good customer relations. Pyals and Payne (2001) applied information technology in CRM to better enhance the utility value. Hishamuddin (2007) pointed out that, with the rapid development of information technology after 2000, the concept of CRM emerged. Ortega (2008), Lassar et al. (2008), Renart (2008), Coltman (2007), and Zineldin (2006) had different definitions of CRM. According to Payne and Frow (2005), the definitions of CRM can be divided into three types: 1) CRM as a special technology of a solution scheme; 2) CRM as a kind of solution technology of integrated service, with the customer as the orientation; 3) CRM as an integrated method to manage customer relations, and therefore, creates value for shareholders. Information technology is only a part of CRM.

RESEARCH METHOD

In this study, by applying the method of ANP, three experts were invited to review the content of the questionnaire content in order to remove any inappropriate dimensions. There are a total of 2 dimensions, 6 guidelines, and 7 factors. The modified questionnaires were then sent to eight experts to determine the relevance between dimensions, guidelines, and factors.

Table 3-1 Expert questionnaire dimensions

Dimension	Operational definition
Service contents	Means account management, ordering system, system settings, and other functions, to provide investors with the function of mobile (ordering) securities service.
Guidelines	Operational definition
Account management	Means the provision of queries of information relating to entrusted turnover, inventory, bills, and equities
Ordering system	Means the installation of the ordering software in the general 3G handsets (java) for ordering.
System settings	Means personalized features, such as setting the font size, timeout ordering dial-up, and connection setting charges according to user preference
Dimension	Operational definition
Switching costs	The perceived additional costs spent when the customer (investor) suspends the existing trading relationships and selects a new securities dealer.
Guidelines	Operational definition
Procedural costs	Refers to economic costs of risk, assessment of cost, learning costs; this type of switching costs are mainly related to spent time and effort.
Factor	Operational definition
Learning costs	Refers to the time and energy costs of the investor learning new relevant capacity or technology to make more effective use of new products.
Economic risk costs	Refers to the uncertainty costs caused by possible negative results when the investor selects a new securities dealers in the case of insufficient information; the involved risks include: performance risk, financial risk, and facilitate risk.
Evaluation and search costs	Time and effort in the search and analysis of the investor to make replacement decisions

Guidelines	Operational definition
Financial costs	Consists mainly of benefit loss costs and financial loss costs. This type of switching costs and the actual measurable financial losses are related.
Factor	Operational definition
Initialization costs	The cost of time and psychological cost of the investor in the initial period of establishing a relationship with the new securities dealer or using a new product.
Benefit loss costs	The cost resulted by the economic benefits generated by continuous contracts or relationships with the existing securities dealer lost when switching, for example: transaction fees discounts.
Monetary loss costs	In addition to the cost of purchasing the new product, it includes all the financial expenditures generated by switching the securities dealer, or the costs generated at the initial period of switching the securities dealer.
Guidelines	Operational definition
Relation type costs	Consists mainly of the personal relational loss costs and brand relationship loss cost. This type of switching costs is caused by the psychological and emotional discomfort caused by damage to the relationship through the loss of recognition.
Factor	Operational definition
Personal relational loss costs	The emotional loss caused by damage to the recognition and connection with the business staffs of the original securities dealer after the switching to the new securities dealer.

Source: compiled by this study

This study found that CRM of securities dealers is very difficult. It is suggested that parts of the costs to maintain CRM be transferred to other departments, or the training costs of CRM talents be saved to feed back to investors in order to create a win-win situation. In the future, the inter-industry alliance of insurance or banking industries can be promoted to enrich the information of "account management" to provide investors with more diversified information. At present, most of the information provided by the securities dealers is the same. In the future, according to the needs of the investors, customized information can be established to provide differentiated services. At present, most mobile ordering systems can be used with the help of a mobile phone. In most cases, for customers using mobile ordering, preferential fees of the mobile phone may reduce their switching rate and help improve the revenues of the securities dealers. For the securities dealers, the rise of mobile ordering can reduce the human resources costs of the securities dealers. Through an e-ordering system, the securities dealers can reduce the number of employees and operating costs to enhance profits.

ABSTRACT

Purpose- *Import-export activities normally require the involvement of different sectors needing proper plans to make the trade-flow stably grown. This paper is aimed at establishing an accurate forecasting model for trade volume.*
Design/methodology/approach- *In this study, a new forecasting model named ARIMAF/ SARIMAF was proposed by combining the Fourier series with the conventional ARIMA/ SARIMA forecasting model.*
Findings- *In the cases of historical data of the volumes of imported and exported air cargo in Taiwan, SARIMAF(3,1,1)(1,1,1)$_{12}$ and SARIMAF(2,1,3)(1,1,1)$_{12}$ models were found fitting well with the mean absolute percentage error values of 0.0104 and 0.0096, respectively. Using these two models, the monthly volumes of air cargo in Taiwan in 2012 are predicted.*
Originality/value- *The using Fourier series to modify the residuals of the traditional ARIMA is first proposed in this paper.*

Keywords: Fourier residual modification, ARIMA, forecasting air cargo volume

INTRODUCTION

International trade is defined as the exchange of goods, capital and services across national borders or territories, which usually takes the most important share in the gross domestic products in many countries around the world. It has become one of the most critical factors to develop the national economies and the nations themselves, because most of their resources need rearranged and reallocated for better performance through export activities; also, the countries could have what they need for their people as well as for building their internal powers through import activities. Without international trade, the goods and services available in a nation are limited to what can be produced within its border; some certain goods/services become superfluous if the nation has comparative advantages, whereas, some turn into scarce for consumption and development.

Import and export, two basic activities in international trade, normally require the involvement of many different sectors from purchasing, manufacturing, inventory, transportation, distribution, etc., especially the engagement of the customs authorities in both countries. Therefore, it is of great significance to have appropriate planning from macro to micro levels so that the trade flow can develop affluently among nations. In order to have proper plans, an accurate forecast of the volume of imported-exported goods becomes compulsory.

In predicting the volume of containers used in international trade, many researchers used conventional regression methods only which disregard non-stationary relationship among the volume of containers and the macro-economic variables possibly resulting in the spurious regression forecasting models (Chou et al, 2008).

Autoregressive Integrated Moving Average (ARIMA) model is one of well-known models dealing with time series. And in order to enhance the accuracy level of this model, in this study, a new approach to minimize its residuals is suggested by modifying them with Fourier series. This modification results in a new model, hereinafter called ARIMAF. An empirical study of air cargo in Taiwan is conducted to compare the accuracy of the two mentioned models so as to find out an appropriate one for forecasting the volume of imported and exported air cargo in Taiwan.

LITERATURE REVIEW

1. ARIMA Model

ARIMA model was first introduced by Box and Jenkins in 1960s to forecast a time series which can be made stationary by differencing or logging. A time series may have non-seasonal or seasonal characteristics. Seasonality in a time series is defined as a regular pattern of changes that repeats over S time-periods. With a seasonal time series, there is usually a difference between the average values at some particular times within the seasonal intervals and the average values at other times; therefore, in most cases, a seasonal time series is non-stationary. With a seasonal time series, it can be made stationary by seasonal differencing which is defined as a difference between a value and a value with lag that is a multiple of S.
A non-seasonal ARIMA model has the form of ARIMA(p,d,q) while the seasonal ARIMA model comes in the form of SARIMA(p,d,q)$(P,D,Q)_S$, where:

- p is Auto-Regressive term.
- d is Integrated term.
- q is Moving-Average term.
- P is the number of seasonal Autoregressive order.
- D is the number of seasonal differencing.
- Q is the number of seasonal Moving Average order.
- S is the time span of repeating seasonal pattern.

“Auto-Regressive” term refers to the lags of the differenced series appeared in the forecasting equation and “Moving Average” term refers to the lags of the forecast errors. A time series differenced to be made stationary is said to be "integrated". “Integrated” term refers to the difference levels to make a time series stationary.

The overall procedures of ARIMA (SARIMA) methodology are: (1) identifying the possible models; (2) fitting the models; and (3) testing for their adequacy & reliability before being applied to forecast (Hanke & Wichern, 2005).

** Step 1: Identifying the possible models*

- By using the Auto-Correlation Function (ACF) graph, the stationarity of the time series can be easily determined. If the lag values of the graph cut off fairly quickly or die down fairly quickly, the time series is considered stationary; otherwise, it isn't. If the series is not stationary, it should be differenced gradually until it is considered stationary. Then, the d value in the ARIMA(p,d,q) is obtained. The values of p and q are determined based on ACF and Partial Auto-Correlation Function (PACF) graph as in table 1.

Table 1: Determine the p & q parameters by using ACF and PACF graph

Model	ACF	PACF
AR(p)	Dies down fairly quickly	Cut off after lags p fairly quickly
MA(q)	Cut off after lags q fairly quickly	Dies down fairly quickly
ARMA(p,q)	Dies down fairly quickly	Dies down fairly quickly

- Examine the patterns across lags that are multiples of *S* to identify seasonal terms. Judge the ACF and PACF at the seasonal lags in the same way.

** Step 2: Fitting the model*

Once a tentative model is selected, its parameters are then estimated. Therefore, this stage is also called "Estimating the model".

** Step 3: Testing the model for adequacy*

The model adequacy is tested by considering the properties of the residuals. The residuals must have normal distribution and be white-noise (also known random). This test can be done with one of the following ways:

- Ljung-Box Q statistic:

$$Q_m = n(n+2)\sum_{k=1}^{m}\frac{e_k^2}{n-k} \qquad (1)$$

where: e_k is the residual autocorrelation at lag k
n is the number of residuals
m is the number of time lags includes in the test

If the p-value associated with the Ljung-Box Q Statistic is smaller than a given significance, the model is considered inadequate. Otherwise, it is appropriate for further application.

- Testing the normal distribution of the residuals by considering the normal probability plot and testing the white-noise of the residuals by considering its ACF and PACF graphs

where individual residual autocorrelation should be small and its value is within $\pm 2/\sqrt{n}$ from the central point of zero.

2. Fourier Residual Modification ARIMA Model (ARIMAF)

In order to improve the accuracy of forecasting models, the Fourier series has been successfully applied in modifying the residuals in Grey forecasting model GM(1,1) (Askari & Fetanat, 2011; Guo et al, 2005; Hsu, 2003; Huang & Lee, 2011; Kan et al, 2010) which reduces the values of RMSE, MAE, MAPE, etc., Thus, this good methodology should be considered in the case of ARIMA (SARIMA) model.

The procedure to obtain the modified residuals from ARIMA (SARIMA) model with Fourier series is as the following.

Suppose an original series with n entries is $x=\{x(1),x(2),x(3),\ldots,x(k),\ldots,x(n)\}$ and its predicted series under ARIMA (SARIMA) is $\hat{x}=\{\hat{x}(1),\hat{x}(2),\hat{x}(3),\ldots,\hat{x}(k),\ldots,\hat{x}(n)\}$; then, its residual series ε is defined as:

$$\varepsilon=\{\varepsilon(1),\varepsilon(2),\varepsilon(3),\ldots,\varepsilon(k),\ldots,\varepsilon(n)\} \qquad (k=\overline{1,n}) \qquad (1)$$

where $\varepsilon(k)=x(k)-\hat{x}(k) \qquad (k=\overline{1,n})$

Now, let's consider a sub-series ε^* as:

$$\varepsilon^*=\{\varepsilon(2),\varepsilon(3),\ldots,\varepsilon(k),\ldots,\varepsilon(n)\} \qquad (k=\overline{2,n}) \qquad (2)$$

Expressed in Fourier series, $\varepsilon(k)$ is rewritten as:

$$\varepsilon(k)=\frac{1}{2}a_0+\sum_{i=1}^{D}\left[a_i\cos\left(\frac{2\pi i}{n-1}k\right)+b_i\sin\left(\frac{2\pi i}{n-1}k\right)\right] \qquad (k=\overline{2,n}) \qquad (3)$$

where $D=\left[(n-1)/2-1\right]$ is called the minimum deployment frequency of Fourier series (Huang & Lee, 2011) and only take integer number (Askari & Fetanat, 2011; Guo et al, 2005; Hsu, 2003).

And therefore, the residual sub-series ε^* is rewritten as:

$$\varepsilon^*=P.C \qquad (4)$$

where

$$P=\begin{bmatrix} \frac{1}{2} & \cos\left(\frac{2\pi\times1}{n-1}\times2\right) & \sin\left(\frac{2\pi\times1}{n-1}\times2\right) & \cdots & \cos\left(\frac{2\pi\times D}{n-1}\times2\right) & \sin\left(\frac{2\pi\times D}{n-1}\times2\right) \\ \frac{1}{2} & \cos\left(\frac{2\pi\times1}{n-1}\times3\right) & \sin\left(\frac{2\pi\times1}{n-1}\times3\right) & \cdots & \cos\left(\frac{2\pi\times D}{n-1}\times3\right) & \sin\left(\frac{2\pi\times D}{n-1}\times3\right) \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ \frac{1}{2} & \cos\left(\frac{2\pi\times1}{n-1}\times n\right) & \sin\left(\frac{2\pi\times1}{n-1}\times n\right) & \cdots & \cos\left(\frac{2\pi\times D}{n-1}\times n\right) & \sin\left(\frac{2\pi\times D}{n-1}\times n\right) \end{bmatrix}$$

$$C=[a_0,a_1,b_1,a_2,b_2,\ldots,a_D,b_D]^T$$

By using the ordinary least squares method (OLS), the values of $a_0,a_1,b_1,a_2,b_2,\ldots,a_D,b_D$ are

obtained from the equation of:

$$C = \left(P^T P\right)^{-1} P^T \left[\varepsilon^*\right]^T \tag{5}$$

Then, the predicted residual $\hat{\varepsilon}(k)$ is now easily achieved based on the equation (3) as:

$$\hat{\varepsilon}(k) = \frac{1}{2}a_0 + \sum_{i=1}^{D}\left[a_i \cos\left(\frac{2\pi i}{n-1}k\right) + b_i \sin\left(\frac{2\pi i}{n-1}k\right)\right] \tag{6}$$

So, based on the predicted series $\hat{x}$ obtained previously, the predicted series $\breve{x}$ from the Fourier residual modification of ARIMA model (SARIMA) is determined by:

$$\breve{x} = \left\{\breve{x}(1), \breve{x}(2), \breve{x}(3), \ldots, \breve{x}(k), \ldots, \breve{x}(n)\right\} \tag{7}$$

where
$$\begin{cases} \breve{x}(1) = \hat{x}(1) \\ \breve{x}(k) = \hat{x}(k) + \hat{\varepsilon}(k) \qquad \left(k = \overline{2,n}\right) \end{cases}$$

In evaluating the model accuracy and comparing models, there are important indexes to be considered, such as:

- The mean absolute percentage error (MAPE) (Askari & Fetanat, 2011; Chang & Liao, 2010; Guo et al, 2005; Hsu & Chen, 2003; Hsu & Wang, 2008; Huang & Lee, 2011; Kan et al, 2010; Li et al, 2011; Tsaur & Kuo, 2011):

$$MAPE = \frac{1}{n}\sum_{k=1}^{n}\frac{|x(k) - v(k)|}{x(k)} \qquad \left(k = \overline{1,n}\right)$$

where $v(k)$ is the predicted value of entry k $\left(k = \overline{1,n}\right)$ (so, $v(k) = \hat{x}(k)$ in ARIMA model or $v(k) = \breve{x}(k)$ in SARIMA model).

+ The post-error ratio *C* (Hua & Liang, 2009; Ma & Zhang, 2009): $C = \frac{S_2}{S_1}$

where: + $S_1 = \sqrt{\frac{1}{n}\sum_{k=1}^{n}\left[x(k) - \bar{x}\right]^2}$ *where* $\bar{x} = \frac{1}{n}\sum_{k=1}^{n}x(k)$

+ $S_2 = \sqrt{\frac{1}{n}\sum_{k=1}^{n}\left[\varepsilon(k) - \bar{\varepsilon}\right]^2}$ *where* $\varepsilon(k) = x(k) - v(k)$ *and* $\bar{\varepsilon} = \frac{1}{n}\sum_{k=1}^{n}\varepsilon(k)$

The smaller the *C* value is, the higher accuracy the model has since smaller *C* value results from a larger S_1 and/or a smaller S_2.

- The small error probability *P* (Hua & Liang, 2009; Ma & Zhang, 2009):

$$P = p\left\{\frac{\left|\varepsilon(k) - \bar{\varepsilon}\right|}{S_1} < 0.6745\right\}$$

The higher the *P* value is, the higher accuracy the model has since *P* value indicates the probability of the ratio of the difference between the residual values of data points and the average residual value with the standard deviation of the original series smaller than 0.6745 (Ma & Zhang, 2009).

- The forecasting accuracy ρ (Ma & Zhang, 2009): $\rho = 1 - MAPE$

Based on the above indexes, there are four grades of forecasting accuracy as stated in table 1.

Table 1: Four grades of forecasting accuracy

Grade level	*MAPE*	*C*	*P*	ρ
I (Very good)	< 0.01	< 0.35	> 0.95	> 0.95
II (Good)	< 0.05	< 0.50	> 0.80	> 0.90
III (Qualified)	< 0.10	< 0.65	> 0.70	> 0.85
IV (Unqualified)	≥ 0.10	≥ 0.65	≤ 0.70	≤ 0.85

METHODS

The historical data of the volume of imported-exported air cargo in Taiwan are obtained from the monthly statistical data published on the website of Ministry of Transportation and Communication R.O.C (MOTC) from January 2002 to December 2011. There are totally 120 observations of monthly volume of imported air cargo and exported air cargo of Taiwan.

The data are used to establish relevant ARIMA (SARIMA) and ARIMAF (SARIMAF) models which are then tested for their accuracy before they are used to predict the volume of imported-exported air cargo in Taiwan in year 2012. The volumes of imported and exported air cargo are respectively named as IMP and EXP variables.

To deal with ARIMA (SARIMA) model, computer software called Statistical Package for the Social Sciences (SPSS) is used whereas Microsoft Excel is used to deal with the Fourier residual modification.

Firstly, using SPSS program, time series plots are examined for the seasonality feature before coming up with ARIMA (SARIMA) models. After an appropriate model is selected, it is then used to calculate the predicted values of the observations to figure out its accuracy level and its residual series as well.

Secondly, in order to increase the accuracy level of the ARIMA (SARIMA) model, the residual series is modified with Fourier series as expressed in section 2.2. At the end of this stage, a modified residual series is obtained for the next step.

Thirdly, with the modified series, a predicted series under ARIMAF (SARIMAF) model is calculated as stated in equation (7). This predicted series will be used to determine the actual residuals from ARIMAF (SARIMAF) model for evaluating its accuracy.

Finally, a comparison between the conventional ARIMA (SARIMA) model and ARIMAF (SARIMAF) model is conducted to prove that ARIMAF (SARIMAF) model is better than ARIMA (SARIMA) model.

EMPIRICAL STUDY

1. The Volume of Imported Air Cargo in Taiwan

1.1 ARIMA model

The data of the volume of imported air cargo are tested and show that the original data set of IMP is not stationary but seasonal. However, at one degree of both non-seasonal and seasonal difference, the series becomes stationary. Figure 1 shows that there are two possible SARIMA models for IMP: $SARIMA(1,1,1)(1,1,1)_{12}$ and $SARIMA(3,1,1)(1,1,1)_{12}$.

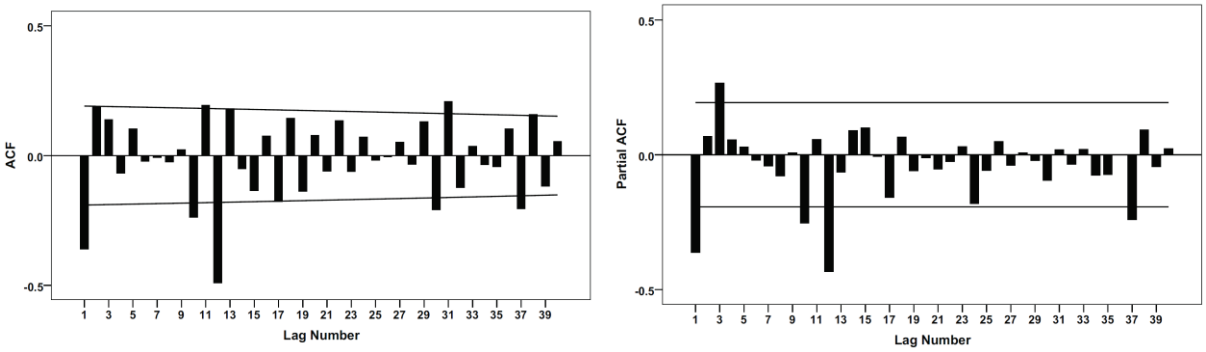

Figure 1: ACF and PACF of IMP at one degree of both non-seasonal and seasonal difference

The summary statistics for the two SARIMA models are shown in Table 2.

Table 2: Summary statistics of 2 SARIMA Models for IMP

	Model Fit statistics				Ljung-Box Q(18)		
Model	R-squared	RMSE	MAPE	MAE	Statistics	DF	Sig.
$SARIMA(1,1,1)(1,1,1)_{12}$	0.728	2876.656	0.0585	2273.735	13.263	14	0.506
$SARIMA(3,1,1)(1,1,1)_{12}$	0.736	2861.977	0.0567	2208.193	8.428	12	0.751

Based on the significance of Ljung-Box Q statistic in Table 2, the two models are all adequate to do the forecasting of IMP. However, $SARIMA(3,1,1)(1,1,1)_{12}$ is finally selected because it has lower MAPE. Figure 2 & Figure 3 illustrate that the residual of $SARIMA(3,1,1)(1,1,1)_{12}$ is really white noise.

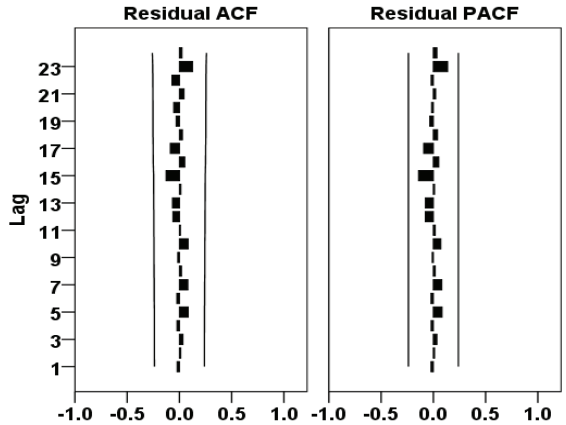

Figure 2: Noise residual ACF and PACF from SARIMA(3,1,1)(1,1,1)$_{12}$ of IMP

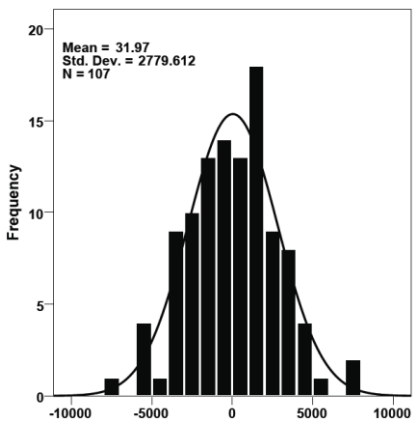

Figure 3: Noise residual from SARIMA(3,1,1)(1,1,1)$_{12}$ of IMP

1.2 Fourier residual modification ARIMA model (ARIMAF)

From the residual series of $SARIMA(3,1,1)(1,1,1)_{12}$, a Fourier modified residual series is calculated as per the procedure mentioned in section 2.2. With this modified series, the forecasted values of IMP based on Fourier residual modified $SARIMA(3,1,1)(1,1,1)_{12}$ model ($SARIMAF(3,1,1)(1,1,1)_{12}$) are obtained based on the equation (7).

Table 3 briefly demonstrates the evaluation indexes of each model with its power in forecasting the volume of imported air cargo in Taiwan.

Table 3: Summary of evaluation indexes of model accuracy

Index / Model	MAPE	S1	S2	C	P	ρ	Forecasting power
$SARIMA(3,1,1)(1,1,1)_{12}$	0.0567	5387.86	2766.59	0.5135	0.8148	0.9433	***Qualified***
$SARIMAF(3,1,1)(1,1,1)_{12}$	0.0104	5387.86	466.76	0.0866	0.9907	0.9896	***Very good***

Based on the indexes in Table 3, it is concluded that Fourier residual modification has improved the forecasting accuracy level of the conventional SARIMA model. Therefore, it is suggested to use $SARIMAF(3,1,1)(1,1,1)_{12}$ model for forecasting the volume of imported air cargo in Taiwan. For the monthly volume in year 2012, the forecasted values based on this model are as in column forecasted imports (FIMP) of Table 6.

2. The Volume of Exported Air Cargo in Taiwan

2.1 ARIMA model

The data of the volume of exported air cargo are tested and show that they are not stationary but seasonal. However, at one degree of both non-seasonal and seasonal difference, the series becomes stationary. Figure 4 shows that there are six possible SARIMA models for EXP:

$SARIMA(1,1,1)(1,1,1)_{12}$ $SARIMA(2,1,1)(1,1,1)_{12}$ $SARIMA(3,1,1)(1,1,1)_{12}$
$SARIMA(1,1,3)(1,1,1)_{12}$ $SARIMA(2,1,3)(1,1,1)_{12}$ $SARIMA(3,1,3)(1,1,1)_{12}$

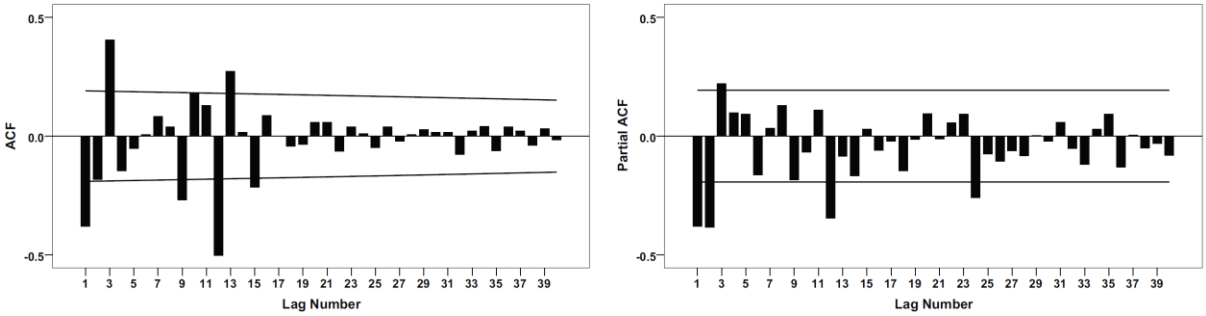

Figure 4: ACF and PACF of EXP at one degree of both non-seasonal and seasonal difference

The summary statistics for the six SARIMA models are shown in Table 4.

Table 4: Summary statistics of 6 SARIMA Models for EXP

Model	Model Fit statistics	Ljung-Box Q(18)

	R-squared	RMSE	MAPE	MAE	Statistics	DF	Sig.
$SARIMA(1,1,1)(1,1,1)_{12}$	0.658	5073.341	0.0662	3488.019	21.031	14	0.101
$SARIMA(2,1,1)(1,1,1)_{12}$	0.690	4850.421	0.0636	3350.076	10.295	13	0.670
$SARIMA(3,1,1)(1,1,1)_{12}$	0.691	4870.054	0.0637	3344.354	10.104	12	0.607
$SARIMA(1,1,3)(1,1,1)_{12}$	0.687	4899.883	0.0635	3340.522	11.123	12	0.518
$SARIMA(2,1,3)(1,1,1)_{12}$	0.692	4885.260	0.0633	3326.270	9.567	11	0.570
$SARIMA(3,1,3)(1,1,1)_{12}$	0.693	4901.227	0.0633	3326.662	9.250	10	0.509

Based on the significance of Ljung-Box Q statistic in Table 4, the six models are all adequate to do the forecasting of EXP. However, $SARIMA(2,1,3)(1,1,1)_{12}$ and $SARIMA(3,1,3)(1,1,1)_{12}$ have the lowest values of MAPE & MAE and Figure 5 to Figure 8 show that their residuals are really white noise; thus, they are finally selected. The residual series from these 2 models are modified with Fourier series in the next stage. After that, one of them will be finally selected based on their MAPE & MAE values.

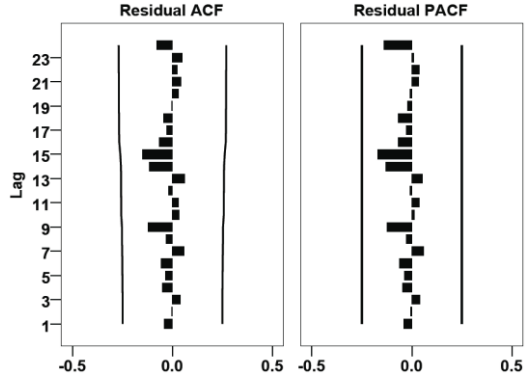

Figure 5: Noise residual ACF and PACF from $SARIMA(2,1,3)(1,1,1)_{12}$ of EXP

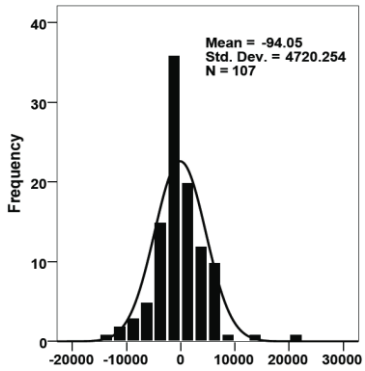

Figure 6: Noise residual from $SARIMA(2,1,3)(1,1,1)_{12}$ of EXP

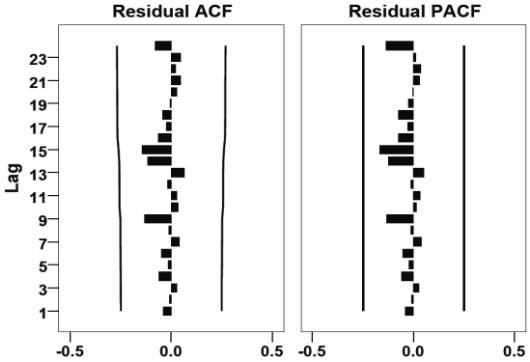

Figure 7: Noise residual ACF and PACF from $SARIMA(3,1,3)(1,1,1)_{12}$ of EXP

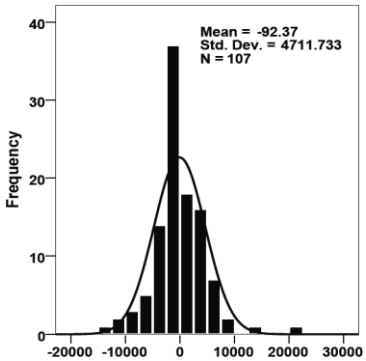

Figure 8: Noise residual from $SARIMA(3,1,3)(1,1,1)_{12}$ of EXP

2.2 Fourier residual modification ARIMA (SARIMA) model (ARIMAF- SARIMAF)

The two residual series of $SARIMA(2,1,3)(1,1,1)_{12}$ and $SARIMA(3,1,3)(1,1,1)_{12}$, are now modified based on the algorithm of Fourier series in section 2.2. These two modified series are then applied to equation (7) to adjust the forecasted values of EXP based on $SARIMAF(2,1,3)(1,1,1)_{12}$ and $SARIMAF(3,1,3)(1,1,1)_{12}$ models, respectively.

Table 5 briefly demonstrates the evaluation indexes of each model with its power in

forecasting the volume of exported air cargo in Taiwan.

Table 5: Summary of evaluation indexes of model accuracy

Index / Model	MAPE	S1	S2	C	P	ρ	Forecasting power
$SARIMA(2,1,3)(1,1,1)_{12}$	0.0633	8464.63	4698.12	0.5550	0.8505	0.9367	***Qualified***
$SARIMAF(2,1,3)(1,1,1)_{12}$	0.0096	8464.63	568.35	0.0671	1.0000	0.9904	***Very good***
$SARIMA(3,1,3)(1,1,1)_{12}$	0.0633	8464.63	4689.67	0.5540	0.8411	0.9367	***Qualified***
$SARIMAF(3,1,3)(1,1,1)_{12}$	0.0096	8464.63	597.56	0.0706	1.0000	0.9904	***Very good***

Table 5 shows that $SARIMAF(2,1,3)(1,1,1)_{12}$ with the post-error ratio C value of 0.0671 outperforms $SARIMAF(3,1,3)(1,1,1)_{12}$ and other two SARIMA models in forecasting the volume of exported air cargo in Taiwan. As a result, $SARIMAF(2,1,3)(1,1,1)_{12}$ is selected. The forecasted values of the volume of exported air cargo in year 2012 based on this model are demonstrated in column forecasted exports (FEXP) in Table 6.

Furthermore, the indexes in Table 5 clearly show that the conventional SARIMA models gain much higher accuracy once their residuals are modified with Fourier series. Along with the case of the volume of imported air cargo discussed in section 4.1.2, it is now affirmably concluded that Fourier residual modification considerably enhances the accuracy level of SARIMA model. Thus, the volume of imported-exported air cargo in Taiwan should be forecasted with SARIMAF models instead of the traditional SARIMA models.

Under SARIMAF models, the forecasted values of the monthly volume of imported and exported air cargo in Taiwan in year 2012 are respectively summarized in column FIMP and FEXP. Consequently, the total monthly traffic of air cargo is illustrated in column FTAC of Table 6.

Table 6: Forecasted volume of air cargo in Taiwan with SARIMAF model (Unit: MT)

Volume / *Month*	*Forecasted imports (FIMP)*	*Forecasted exports (FEXP)*	*Forecasted traffic of Air-cargo (FTAC)*
January	37,573	37,268	74,841
February	27,835	27,715	55,550
March	37,435	48,135	85,570
April	42,485	45,834	88,319
May	38,321	43,861	82,182
June	39,073	47,472	86,545
July	46,409	50,504	96,913
August	42,991	48,013	91,004
September	37,762	42,935	80,697
October	40,955	69,157	110,112
November	40,902	34,222	75,124
December	35,708	32,230	67,938

CONCLUSION

ARIMAF/SARIMAF models, which are created by combining the traditional ARIMA/ SARIMA model with the Fourier residual modification, has been proved to be a good model in forecasting the volume of imported-exported air cargo in Taiwan. In this empirical case, it is strongly suggested to use $SARIMAF(3,1,1)(1,1,1)_{12}$ for the import volume and $SARIMAF(2,1,3)(1,1,1)_{12}$ for the export volume due to their low values of MAPE 0.0104 and 0.0096, respectively, which prove that the forecasted values follow closely to the actual figures. These accurate forecasting models will help the authorities and related industries in Taiwan make appropriate plans for the stable development of Taiwan international trade by air.

Fourier residual modification has been successfully applied to the fundamental form of Grey forecasting model GM(1,1) and the ARIMA/ SARIMA models; therefore, it is thought to work well with other forecasting models as well. Further researches on this application should be conducted before the suggestion is firmly verified.

THE CIVILIZATIONAL DETERMINANTS OF POLAND'S DEVELOPMENT

Elżbieta Mączyńska, Warsaw School of Economics, email: ela4@wp.pl

ABSTRACT

Prospects for the further civilizational development and success of Polandhave their source in the characteristics, quality, and dimensions of Poland's socio-economic potential, which still remains inadequately used. The progress made during the over twenty-year long transformation of the economic system and the implementation and strengthening of the market economy clearly shows Poland's great capacities in terms of the economy and the intellectual base. This is clearly reflected by statistics. The recent global recession, which Poland managed to avoid as the only country in the European Union, has paradoxically emphasized Poland's economic advantages. Unfortunately, this situation is often perceived as an outlier rather than a manifestation of the growing power of Poland's economy, which is evidenced by many comments on the topic published, among others by international research centres. Of late, however, more and more opinions have been appreciative of the deeper foundations of Poland's success. One example is a recent comparative study carried out by IHS Global Insight, which shows that Poland did not give in to the global recession and, being the largest country among the new EU members, represents a relatively strong economic potential. The strength of Poland's economy is not, however, popularly acknowledged, especially since the term "polnische Wirtschaft" was historically used in a pejorative sense, implying Polish mismanagement. However, this term is gradually growing obsolete for many reasons, mostly related to the characteristics, quality, and size of Poland's socio-economic potential. To date, this potential has not been properly used, which also testifies to the substantial scale of the untapped reserves.

Key words: economic order, crisis, punctuated equilibrium, Poland, civilizational development, knowledge-based economy, wisdom-based economy

INTRODUCTION

Under conditions of massive turmoil in the global economy and increasing manifestations of the economics of impermanence, it seems extremely risky, or even irresponsible, to offer any predictions, especially for events decades ahead. One has to take into consideration the rising incidence of Taleb's "black swans," i.e., phenomena which are commonly believed to be impossible to occur (Taleb 2007). The complexity of this issue has been proved, among others, in the debate "What economists think about the future" (Kleer, Mączyńska, and Wierzbicki, eds. 2009, pp. 72–98). Due to the unprecedentedly dynamic technological development as well as and technical, economic, financial, social, and political innovations, the world economy is becoming increasingly unstable and "moveable," while successive waves of innovation lead not only to desirable "creative reconstruction" or creative destruction, but also to the kind of destruction that produces irreversible or difficult-to-reverse, far-reaching social, economic, environmental, and spatial consequences, radically changing the situation of people, enterprises, institutions, and whole countries. These turbulent changes call for profound reflection on creativity and destruction in the economy.

This is all the more important since, in spite of various global initiatives undertaken to mitigate the disproportions and distortions in the economy, so far no country can boast a fully satisfactory and lasting solution to these problems.

The first decade of the 21st century will go down in economic history as a period of unusually sharp disagreements as to the role of economic theory and socio-economic policy in the face of the mounting, hardly solvable problems of global proportions—the Gordian knots of the contemporary world. A particularly serious issue is the state of punctuated equilibrium in various fields of life and the resulting dangers for the sustainable, harmonious development of the world. While economists do not fully agree as to the hierarchization of particular threats in terms of their gravity and as to their exact nature, they tend to concur that the most dangerous are the demographic ones, resulting from the extremely rapid growth of the world's general population coupled with the failing birth rates and the dynamically accelerating process of population aging in the developed countries. This, in turn, has an adverse effect on civilizational progress. Hence, the decisive importance of socio-economic policy, which is a derivative of the adopted framework of the socio-economic system. Systemic issues continue to give rise to disputes, primarily pertaining to the role of the state in the economy, but also to the role of particular economic theories or schools in shaping it. Admittedly, controversies and discussions on this subject have been going on since time immemorial, but recently they have become spectacularly heated ("What Went Wrong …" 2009). The titles of publications devoted to this subject speak for themselves, proving the dysfunctionality of economics in solving major social and economic problems (Krugman 2008, 2009a; Lucas, 2009; Cochrane 2009; Leith 2009; Gomulka, 2009; Skidelsky 2009). Currently, we are witnessing a difficult and very controversial debate about the necessary changes in the role of 21st-century science, business, and politics in solving the major problems of the contemporary world.

It is assumed in this paper that attempts to deal with these issues face barriers arising from the fact that the socio-economic policy has not been well adjusted to the challenges resulting from the ongoing global civilization breakthrough, which is reflected in the industrial civilization being superseded by a new economy and its new, still undefined model. Thus, as the underlying causes of the difficulties in satisfactorily resolving socio-economic problems are unconventional, they also require unconventional strategies. However, the undertaken actions are predominantly typical of the passing industrial model (Toffler and Toffler 1996; Beck 2002; Toffler 2003; Rifkin 2003). "Marx would have a good laugh"—thus Italian philosopher Antonio Negri comments on these phenomena, adding that "The funny thing is that when the world is changing, we stick to models from 100 years ago. Financial capital leads to a new accumulation, and so to new social differences and the new poor, while joint stock companies embody the communism of capital" (interview with A. Negri 2010). But the politicians and managers who are trying to find a remedy pay insufficient attention (whether consciously or not) to contemporary trends in the global economy resulting from the civilization breakthrough. The effectiveness of undertaken actions is determined by their adaptation to the conditions of the breakthrough, the civilization of knowledge, and the related new requirements. This also applies to the model of the economic system. These issues are not adequately reflected or appreciated in the global or local socio-economic policies. This has been confirmed both by research and by expert debates, which have shown that meeting the most pressing challenges of the 21st century will require close cooperation between scientific communities, politicians, businesses, and governments. A leading

participant in this debate, Dennis L. Meadows, who co-authored *The Limits to Growth*, argues that "we could discuss solutions to problems of the future at will, but if we do not act differently than in the past, nothing is going to change." (Science...2009).

Under such conditions, a civilization of knowledge does not become synonymous with a civilization of reason and wisdom. The past experiences of the global economy show a significant dichotomy between knowledge and wisdom. The main challenge is thus to counteract this dichotomy. In the case of Poland, this challenge is twofold. First, it is necessary to catch up with more developed countries in terms of R&D investment and, second, to intensify the rational implementation of the globally available knowledge resources with a focus on socio-economic welfare. To meet this challenge, Poland's unused development potential must be activated, which is also a prerequisite for the elimination of barriers to development. But knowledge alone is not enough; the other key element is strategic wisdom. What is also needed is some futurological reflection free of the ubiquitous short-termism, or the prioritization of short-sighted objectives.

POLAND'S UNUSED POTENTIAL

Prospects for the further civilizational development and success of Poland have their source in the characteristics, quality, and dimensions of Poland's socio-economic potential, which still remains inadequately used. The progress made during the over twenty-year long transformation of the economic system and the implementation and strengthening of the market economy clearly shows Poland's great capacities in terms of the economy and the intellectual base. This is clearly reflected by statistics. The recent global recession, which Poland managed to avoid as the only country in the European Union, has paradoxically emphasized Poland's economic advantages. Unfortunately, this situation is often perceived as an outlier rather than a manifestation of the growing power of Poland's economy, which is evidenced by many comments on the topic published, among others by international research centres. Of late, however, more and more opinions have been appreciative of the deeper foundations of Poland's success. One example is a recent comparative study carried out by IHS Global Insight, which shows that Poland did not give in to the global recession and, being the largest country among the new EU members, represents a relatively strong economic potential. "Poland's economy grew even amid the global recession. The largest economy from the new European Union (EU) members played a key stabilizing role during the global recession and avoided falling into recession itself. The modest increase of unemployment during 2009—while nominal wages were still rising—goes a long way toward explaining the relative strength of Poland's economy. Nonetheless, what pulled the trick was the combination of robust internal demand and the zloty's depreciation between July 2008 and January 2009, which improved Poland's trade balance a great deal" (*PlanEcon Monthly Report* 2010, p. 38).

The strength of Poland's economy is not, however, popularly acknowledged, especially since the term "polnische Wirtschaft" was historically used in a pejorative sense, implying Polish mismanagement. However, this term is gradually growing obsolete for many reasons, mostly related to the characteristics, quality, and size of Poland's socio-economic potential. To date, this potential has not been properly used, which also testifies to the substantial scale of the untapped reserves.

The socio-economic sources of Poland's comparative advantage include:

a) A large market potential and growing domestic demand generated by a population of over 38 million.
b) An increasing gross enrolment ratio (GER), and thus a greater percentage of population with higher education, which encourages productivity and social mobility. (GER for higher education has increased from 12.9% in the academic year 1990-1991 to 52.7% in academic year 2008-2009).
c) A historically conditioned ability to respond flexibly to threats and to changing circumstances (Polish people are famous for their ability to improvise), and thus openness to new trends, which increases the possibility of taking advantage of the opportunities offered by the civilization breakthrough and the emerging new economic model, including virtualized economy (Wikinomics).
d) Intensification of infrastructural investments (e.g., using EU subsidies), which generates investment multipliers and translates into additional growth impetus for gross domestic product—a measure of national wealth.
e) Multiplier effects that may be brought about by the development of the housing sector (this is inevitable due to the underdevelopment of the sector and the concurrent rising housing aspirations of Poles, which implies a potentially large housing demand). In the future, this may constitute an additional strong driving force behind the economy.
f) Poland's economically advantageous central geographical location, which aids the intensified development of various forms of foreign investment, international consortia, IT centres, etc.
g) The climate and natural resources, with the increasingly likely prospects of finding new natural resources and energy.
h) Cultural factors, founded on Poland's historically high cultural position in Europe and in the world, marked by openness to new trends and tendencies in various areas of life, which is always conducive to economic development.
i) The still underused but rising potential of Poland's tourism (not only due to the economic development, but also to climate change) and the untapped growth potential of the tourism industry as an important sector of the economy.
j) The potential of "backwardness rent" and the possibility of "leapfrogging" in various fields, i.e., moving immediately to a higher stage of development passing over the intermediate stages which the developed countries had to go through in the past. This is possible by using other countries' experience to shorten the time of achieving a higher level and by learning from the mistakes of others to reduce the risk of error.

At the same time, unfortunately, Poland is not free from serious threats to harmonious, sustainable socio-economic development, the principal ones being:

a) Demographic threats: population aging and the processes of depopulation (forecasts indicate that by 2050 Poland's population may decline from over 38 million today to 31 million, a drop of 7 million).
b) Rising public debt and difficulties in achieving sustainable public finances (this is closely associated with demographic threats and increased spending on pensions and health care).
c) Dysfunctions in the development and implementation of the research potential, resulting in many valuable discoveries "leaking" from Poland (e.g., the invention of the blue laser, etc.).

d) Inefficiency of legislation and law enforcement, including an inefficient judiciary system and excessively long judicial proceedings.
e) A dysfunctional political system with the electoral cycle syndrome, which is harmful to the economy due to the priority of election objectives over macroeconomic and socioeconomic efficiency. This reinforces the widespread phenomenon in democratic systems that can be aptly summarized with the phrase "efficiency has no electorate." The syndrome of a short electoral cycle and the resulting predominance of a short-term perspective is coupled with neglecting the strategic thinking culture, and is not conducive to investing in the economy, which in turn would require a long-term perspective.

Of course, there are other positive and negative factors affecting Poland's socio-economic condition and its prospects. Given Poland's current situation, the most important thing would be to draw proper conclusions from the historical lessons and also from errors committed in other countries (following the principle: "learn from the mistakes of others, and you won't have time to make our own"). It is also important not to waste Poland's potential, and especially human and intellectual resources, which are the most valuable. Two centuries ago, during the period when Poland was under foreign rule, Polish poet and geographer Wincenty Pol said: "You praise the foreign and ignore your own, you do not know what you own," and unfortunately this reflection still seems to be valid. At about the same time, Juliusz Słowacki, another great Polish national poet Wincenty Pol (1807-1872), wrote of his country: "You were the nations' peacock and parrot / Now you are a handmaid of other peoples." [Pol. W, "*Kraj*..]. Currently, Poland stands a great chance of making these bitter, historical reflections obsolete. However, this largely depends on the effectiveness of long-term socio-economic policy, which is far from being right. Hence the importance of actions aimed at rationalizing the political and governance systems. While transnational regulations (including those adopted in the EU) seem favourable, of decisive importance is the model of socio-economic system existing in a particular country. Despite the provisions of the Polish Constitution (Article 20) and of the Treaty (Constitution) of the European Union stating that the model to be pursued is the social market economy aimed at balancing economic and social progress, the adopted objectives have not been achieved in this matter, which is a barrier to the development of a civilization of knowledge and making wise use of it.

A CIVILIZATION OF KNOWLEDGE VERSUS A CIVILIZATION OF WISDOM

The notion of a civilization of knowledge, just as that of a knowledge-based economy, is controversial and treated by many scholars as not very precise. Man's actions (not only economic ones) have always been guided by some knowledge. But over the past few decades, the above notions have come to be regarded as the central concepts used to describe the modern world. A civilization of knowledge and a knowledge-based economy are such categories in which knowledge becomes a "universal substitute" shifting other elements of the productive potential into the background. Today, knowledge has become a kind of universal "machine tool" whose immense potential has been spectacularly proved by the genesis and development of such businesses as the Google search engine and the Facebook social networking service.

At the same time, one of the most embarrassing faults of the civilization of knowledge seems to be, paradoxically, a growing dichotomy between knowledge and wisdom, as it was already

mentioned. This dichotomy was quite bluntly exposed by José Ortega y Gasset in his timeless 1929 book entitled *La rebelión de las masas* (*The Revolt of the Masses*): "The characteristic of the hour is that the commonplace mind, knowing itself to be commonplace, has the assurance to proclaim the rights of the commonplace and to impose them wherever it will" (Ortega y Gasset, 2002, p. 15). Indeed, there are signs that the said "hour" is still going on. Despite the unprecedented and unquestionable progress in knowledge, science, and technology, knowledge has not been satisfactorily translated into social welfare. One of the manifestations of the substitutional potential of knowledge is, unfortunately, also the substitution of knowledge for reason. This process is taking place despite the fact that knowledge is rapidly aging given the ongoing, increasingly dynamic changes and that badly used and badly managed knowledge can lead to disaster. The consequences of the absence of wisdom in the use of knowledge may be indeed disastrous. This has been proved by numerous highly undesirable processes and actions that can spread in an amazingly easy manner, demonstrating the absence of reflection, wisdom, responsibility, or long-term prudence in low and high ranking decision-makers, including those on the top.

A globally punctuated ecological, economic, demographic, and political equilibrium is both a symptom and a result of the deficit of wisdom (Thurow 1999, p. 17).

Today's dysfunctions in the use of knowledge are the subject of many analyses, the number of which has surged in the aftermath of the global crisis that began in the US in 2007–8. One of them is the latest book by John C. Bogle, *Enough. True measures of money, business and life*, and another Joseph Stiglitz's *Freefall: America, Free Markets, and the Sinking of the World Economy* (these books have been translated into Polish and published by the Polish Economic Society). These publications highlight the existence of areas of menacing disequilibrium in the modern world generated under the paradigm of the knowledge-based economy and the neoliberal doctrine with its inherent short-termism, or "the terror of short-term earnings" (Stiglitz 2010, p. 320 et seq.).

This is further aggravated by dysfunctions in the measurement of knowledge and the economic results and standing of companies. Paradoxically, although this is a fundamental issue both in economic theory and practice, there are many contentious issues, irregularities, and even distortions leading to the misrepresentation of economic performance. These weaknesses are manifest at all levels of economic activity, including the measurement of gross domestic product—the most synthetic metric of economic output. By the nature of things, all problems connected to the measurement of business results add up in GDP. The global crisis is a spectacular manifestation of the irregularities in the measurement of business performance partially caused by a distorted image of the business standing and results of companies, especially those in the financial sector. This found dramatic expression in a report by the US Senate Commission investigating "the anatomy of a financial collapse," prepared and published in April 2011 under the direction of Carl Levin and Tom Coburn (*Wall Street and the Financial Crisis* 2011). The report states that a key role in the outbreak of the financial crisis was played by the investment bank Goldman Sachs. Its actions call into question the entire system underpinning the functioning of Wall Street. The bank has been criticized in very harsh terms and its products have been compared to "chips in a giant casino." Many well-known economists, including member of the British House of Lords Robert Skidelsky (2009), explicitly say that the global crisis was the result of large-scale irregularities and erroneous appraisal of assets by private banks and rating agencies.

The dominance of "externality" in the measurement of value, the dominance of herd behaviour, actions guided by imitation, and the marginalization of the "internal" foundations of value are becoming a characteristic trait of our times, where glitz and superficiality prevail over deeper reflection, insight, or even responsibility. This also applies to the valuation of businesses, as evidenced by the well-known principle that "a company is worth as much as a potential buyer is willing to pay for it." In his 2009 book published under the provocative title *Why Not Socialism?* Professor of Political Philosophy Gerald Allan Cohen finds the fact that valuation of labour and products is exclusively conditional on the subjective assessment of the interested parties to be a major affliction of capitalism hindering the proper use of the potential of knowledge, and especially of intellectuals' creative capabilities and reflection (Cohen 2010, p. 93).This was also stressed by Rainer Hank in his somewhat ironic commentary to this book: "That is why in capitalism the highest salaries are not paid to even the wisest philosophers (and perhaps that's why so many of them have become socialists), but to people like Mark Zuckerberg, who dropped out of college to establish his 'social networking site'" (Cohen, 2010, Sozialismus,... p. 93)

German philosopher Peter Sloterdijk, referring to the dilemmas of understanding value, comes to the surprising conclusion that the real hero of our times is Harry Potter. "Well, the Harry Potter novels present a world without reality frontiers. This kind of primer has convinced a whole generation of readers to discover the wizard in themselves. Interestingly, the English word *potter* denotes *a pot-maker*, and that is a craftsman who produces hollow containers. Only losers today still believe in work, while the others try to do magical potter things and let their structure financial products fly" (interview with P. Sloterdijk 2009). This assertion, full of bitter irony, points out the risks arising from violations of proportion and an imbalance between profit and the amount of work put in. "It is this disparity that has left a stamp on the way people thought in the past decades. They wanted to escape the real world where most people got mediocre salaries working 40 hours a week while you could join the ranks of the super-rich by doing some magic for a couple of hours. Thus, we have invented a dangerous mode of computing. Commonplace equations have been replaced by extravagant arithmetic. This ruins the sense of adequacy. Our understanding of cause and effect relationships and a sense of proportion have been destroyed" (ibid.).

Economists are also accused of misinterpreting the works and ideas of Adam Smith to the effect that the market actors are exempt from the requirement of moral reflection. If pursuit of one's own selfish interests—led by the invisible hand—ultimately results in social welfare and the "wealth of nations," then all that we must care for and all that we should do is to make sure that we are pursuing our own interests. This approach results in the marginalization of the moral and ethical aspects of economic life, which in turn is a source of various forms of destruction and disequilibrium. Entities with excessively confrontational attitudes may precipitate undesirable phenomena and threats, especially that competition often stops short of destruction. Unfortunately there is ample evidence that the same can be said of knowledge and destruction. If knowledge is not to be used destructively, it must be accompanied by wisdom.

The above seems to fully corroborate the postulate made long time ago by Antoni Kukliński at the Forum of Strategic Thought held by the Polish Economic Society (Kukliński 2011, pp. 65–68) to shift from a paradigm of knowledge-based economy to a paradigm of wisdom-

based economy. Kukliński wrote: "I would like to formulate a controversial postulate that the old paradigm of knowledge-based economy be creatively destroyed and replaced with a new paradigm of an economy based on wisdom. . . . In formulating the postulate to creatively destroy the old paradigm, we do not seek to denounce the great achievements of the knowledge-based economy between 1990 and 2010. Indeed, these achievements have provided the foundation for creating a new incarnation of the knowledge-based economy of the 21st century. However, these achievements are not a sufficient condition for us to successfully encounter the 21st century enigma. . . The epitaph of the old paradigm of knowledge-based economy should be the subject of fascinating and controversial academic reflection, which carries a great potential of innovative solutions in the process of encountering the 21st-century enigma. Albert Einstein's observation that 'imagination is more important than knowledge' should be interpreted anew" (ibid.). It cannot be excluded that the postulate to shift to a new paradigm may be regarded as purely verbal effort because it does not indicate tools for operationalization. However, even a verbal approach to this problem is important as words have strength in their own right and can become deeply ingrained in the mind. This is an appeal to dare to be wise. The validity of such an appeal cannot be questioned. Even if it is regarded as a utopia, it is certainly a highly useful one. Therefore, it will not remain without an impact on reality. The postulate to replace the paradigm may constitute an important beginning of a debate on the rationalization of the model of social development" (Kukliński 2011; Mączyńska 2011).

In the face of global dysfunctions in the civilization of knowledge, Poland, thanks to its "backwardness rent," has a chance to "leapfrog" this model of civilization and arrive at the stage of the civilization of wisdom. This would allow Poland to use its potential in an optimum way, without the dysfunctions and abuse characteristic of the more developed economies in this respect.
Antoni Kukliński's postulate to replace the paradigm of knowledge-based economy with wisdom-based economy corresponds to the "Wise Poland" decalogue for knowledge-, skill-, and entrepreneurship-driven society announced by Michal Kleiber in February 2011. The decalogue comprises of 10 postulates, the implementation of which should form the foundations for a strategy of the country's innovative development (interview with M. Kleiber 2011).

PARADIGM OF WISDOM-BASED ECONOMY AND ECONOMIC ORDER

The global economic collapse triggered by the financial crisis has not only stimulated discussion about the legitimacy of the financial system in its present form, but also intensified the ongoing debate on the future of capitalism, the role of the state, and the best socio-economic system to promote social and economic welfare. Therefore, an open question remains as to what kind of strategy and economic system would promote social rationalization. Despite theoretical disputes about the economic system, the principle of competitiveness remains unchallenged. However, the dogma of free market and free market competition leads to its distortion and limitation.

Due to the overwhelming scale of punctuated equilibrium and its complex global consequences, we still lack convincing concepts and strategies to solve this problem. Strategic reflection is a necessary condition for the shift from the paradigm of knowledge-based economy to the wisdom-based paradigm, which has been postulated in the face of the

dysfunctional civilization of knowledge. In a situation of increasing global uncertainty, this reflection should be aimed at identifying the main threats to the development of civilization, such as the consequences of global disequilibria in many areas (including the demographic, environmental, and financial spheres).

When the world is unpredictable and full of "black swans," strategic reflection should primarily focus on the identification of the main development trends and, most importantly, on the least predictable areas of risk.

Analyses of the global turbulence point to errors in the economic system policy. For example, Nouriel Roubini underscores that the crisis will determine future solutions, creating a tomorrow with a specific economic system.[1] Hence, the still open question about the optimal shape of the economic system and the future of the Anglo-Saxon neoliberal laissez-faire model of capitalism that predominated prior to the global crisis (ibid., p. 4). The literature stresses the need for systemic changes aimed at reducing the risk of crisis-like threats. Renowned German economist Peter Bofinger wonders whether it is possible to save the free market model of economy and why it is now necessary to have a strong state (Bofinger, 2010).

Currently, increasing emphasis is given to the argument that the primary sources of dysfunction in a knowledge-based economy largely lie in systemic errors, such as the uncritical acceptance of the neoliberal doctrine in economic system policy making. Characteristically, such opinions are shared also by those who until recently advocated that doctrine. One of them is Jeffrey Sachs, who argues that: "We were trapped between two voluntaristic utopias. One of them sanctifies the market and the other—society. The majority of people were led to believe that the government could not help them, and even if it promised to do so, it would still waste everything. Now much time will pass by the time they realize anew that there can be neither good society nor an efficient economy without a strong state" (interview with J. Sachs 2009). A similar opinion is expressed by Bofinger (2010), who stresses the importance of an efficient balancing of the roles of the state and the market in the economy.

On the other hand, Maciej Bałtowski (2009, p. 7) observes how capitalism is dangerously evolving towards socialism, which brings to mind the argument of Joseph Schumpeter (1942) about the transition of capitalism into socialism. However, as opposed to Schumpeter, who said that capitalism was not going to survive and the ongoing transformation of capitalism into socialism was determined not by its failures but by its successes, Bałtowski points out to capitalism's failures. He says that "over the last several dozen years free market capitalism has been evolving towards a system incorporating certain characteristic features of the socialist economy, even though this peculiar evolution may have been hard to notice at a first glance" (Bałtowski 2009, p. 2), which is manifest in the "doctrinal foundations of the economic system." At the same time, Bałtowski warns that too much faith has been put in the dogma of global regulation of the economy. He states that certain general conclusions should be drawn from the experience of the socialist economy concerning the way the global

[1] "In fact, we believe that understanding and managing crises requires a more holistic and eclectic approach than is perhaps customary. It's necessary to check ideology at the door and look at matters more dispassionately. Crises come in many colors, and what works in one situation may not work in another."—From the introduction to Nouriel Roubini's book (2009, p. 6).

regulators function. First of all they should focus their activity not on substituting the market—which always leads to various adverse effects—but on reducing market failure. If the global regulator is convinced of its wisdom and omnipotence and does not curb its constructivist inclinations and excessive anthropological optimism, it will doubtlessly end up in a position similar to the central planner in a socialist economy. The only way out, it seems, is to let the global regulators act in accordance with the logic of the market or "marktkonform," as it is proposed by the German theory of the social market economy.

This assumption is all the more important because it refers to the constitutional model of the Polish economy, that is, the social market economy. In view of the dysfunctions of the political and economic order which have emerged in the wake of the global crisis, the idea of the social market economy becomes even more attractive. It is founded on ordoliberal theory, which in turn refers to the notion of "ordo," dating back to the ancient *Imperium Romanum.* The essence of the notion lies in designing an order which would suit the human nature and ensure economic sustainability. The current financial crisis has to some extent proven the relevance of the social market economy. Characteristically, the crisis has hit the mightiest markets of the capitalist world, and primarily the USA and Great Britain, while countries with the so-called Nordic economic system, using the social market economy in practice, have been less affected and "politicians from both right and left could learn from the Nordic countries" [*The Nordic countries.The next supermodel*, 2013, p. 11]

Although opinions on the social market model of economy are quite controversial, analysis of its features indicates that it offers a chance to lay solid foundations for the coherence and sustainability of social and economic development. The social market economy is characterized by holism, or comprehensive consideration of the individual components making up the extremely complex structure of the political and economic order. However, a prerequisite for the effective implementation of the ordoliberal concept of the social market economy is its adjustment to the ongoing unprecedentedly dynamic technological, social, and economic changes, including globalization.

CONCLUSIONS

The "punctuated equilibrium" and volatility, so characteristic of the modern-day world, force us to seek new theoretical concepts and solutions focused on accessing the civilization of knowledge. Priorities include reduction of the dichotomy between knowledge and wisdom and a symbiosis of economic, social, and ecological development. A model for such a symbiotic approach is provided by the principles of the social market economy. They are not new, but their relevance seems to be more and more apparent in the light of the current developments. But also this model needs to be adjusted to the changing economic conditions, and to the (partially globalization-driven) shifts in power and decision-making competence.

Future will show whether and to what extent the holistic concept of the social market economy turns out to be useful. Instead of offering a straightforward answer, I will respond with Thurow's question "How is a capitalistic system to function in a brainpower era when brainpower cannot be owned?" (Thurow, 1999, p. 29).

Such an approach to this issue entails further questions: "What model of a political and economic order would be best suited to the optimum use of brainpower?" and "What role in

this process of change is to be played by economic theory and particular 'economic schools'?" These questions are the more important as economic theory and economists are blamed for the dysfunctions of the economy and for not having predicted and prevented the present crisis.

These are open questions for further reflection and discussion. The necessity of such a discussion—taking into consideration some futurological reflection—is becoming increasingly apparent. Even though Fukuyama's notion of "the end of history" and the neoliberal doctrine by definition marginalize futurism, leaving the future to be regulated by the free market mechanism, it seems that now—given the world's problems—the need to think about the future and act for its sake as well as the need to embrace a strategic thinking culture are gaining increased recognition. Today Francis Fukuyama no longer stands so firmly by his convictions, critically assessing the "foreign finance fetish," saying that "one of the paradoxical consequences of the 2008–9 financial crisis may thus be that Americans and Britons will finally learn what the East Asians figured out over a decade ago, namely, that open capital markets combined with unregulated financial sectors is a disaster in the waiting" (Fukuyama 2011).

In the context of Poland's economy, civilizational development requires wise strategies and a wise socio-economic system that would ensure holistic reconciliation of economic, social, and environmental issues.

ABSTRACT

Purpose: *In most companies achieving or delivering quality product or service becomes a complex task especially when setting up a new production process; every time focusing on project completion, meeting deadlines and quality check at the end of the production.*

Two types of quality checks can be applied to reduce the complexity of the project, i) quality control (QC) - which is established for monitoring and continuously check the output and performance of a product at an operational level, and ii) quality management gates (QG) – which are used for decision making that impacts the outcome of the project.

Among these two concepts QG concept is one of the most established approaches to address the described quality issues. In this paper, we attempt to explain QG with an example to understand the supportive tools that are required for a successful implementation of quality gate at the project execution phase.
Design methodology/approach: *The approach described in this case conceptualizes the process of implementation of quality gate to manage the quality performance of the project process flow.*
Research limitations: - This specific time bound research is limited to the implementation of QG only since development of the electronic quality gates needed sufficient time to validate for including the corrective measures after feedback was received to come to the desired outcome of the research.
Research implications: *The findings of the exploratory study can offer valuable insights and recommendations as how the quality gate can be implemented, its necessary supportive tools, how to go about into electronic format, and its benefits.*
Originality/value: *This conceptual research provides comprehensive idea to implement the quality gate in projects by step-by-step procedures to have the best quality management to evaluate and deliver the best project to the customer. It provides immense idea to other researchers and industrialists to choose a right quality management tool.*

Key words: Project Management, WBS, Scheduling, Quality Gate, QG, Business Process Management.

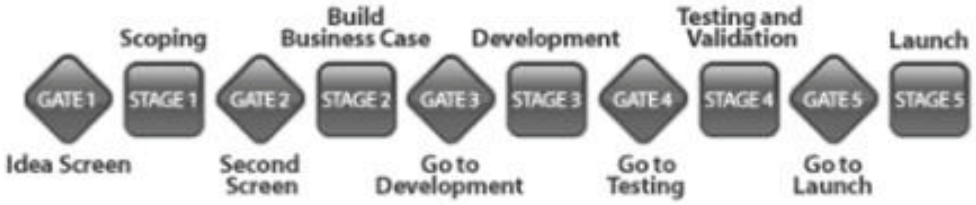
INTRODUCTION

Based on various obervations, and ideas collected from a group of firm managers, In 1986, Robert Cooper proposed the of stage-gate model, to help the firms to reduce the failure posibilities in the product development process, which would help the firm managers to devlier a desired quality product (Cooper, Winning at New Products, 1986). Later in 1960s, NASA implemented "phase review process" which is more alike to stage-gate model which is developed by Cooper (12Manage, 2007), (Cooper, Third-generation new product processes, 1994). There are three different gate process were identified and by the industrial experts to enhance the quality outcome of a project. They are i) Stage Gate, ii) Process Gate and Quality Gate.

1. Stage-gate

For development of product process, state-gate model is the powerful tool, which gives a well-structured and well-organized flow in the project. In stage gate, the project is splits into series of "Stages" and "Gates" as shown in the figure 1. The stages include a) scoping, b) build business case, c) development, d) testing and validation and e) launch of the final product.

Figure 1: Stage-Gate Process



Source: (Stage-Gate:Your Roadmap for New Product Development)

The Stage-gate model increases the work commitment to the assigned project and it also helps to eradicate bias in process validation, between the human conscious or subconscious prediction and confirmation. A stage-gate model can be used as a guide to formalize a model for the entire process to fulfill the desired objective of the project by break down the project into number of possible process to identify and analysis the new suitable process ways and provides new ideas for the further business improvement. In case of non-satisfactory level on increasing levels of commitment, the particular process has to be evaluated and act as a backward feedback loop for more analysis (Barringer & Gresock, 2008).

2. Process Gate

The Process Gate approach is related to the project management, decision making process and the continuous work flow to endorse quality. It is used to address the defect at process stage so that same defect should not be passing that manufacturing station.

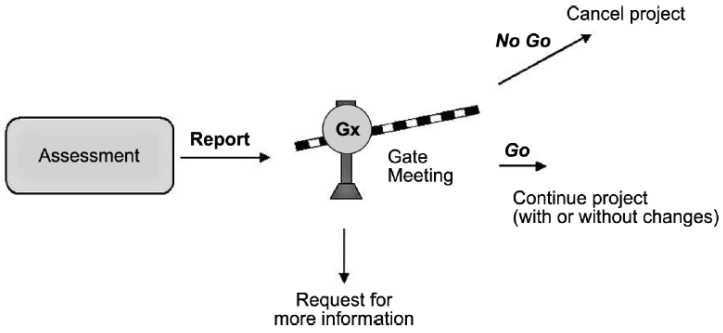


Figure 2: Process Gate
Source: (Chao & Ishii, 2004)

3. Quality Gate

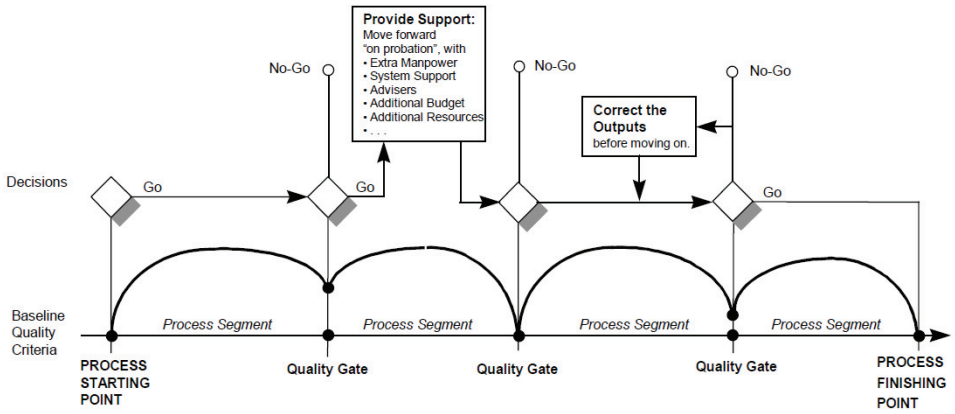

Figure 3: Quality Gate process
Source: (Introduction to Quality Gates, 1998)

A Quality Gate (QG) interfaces between project steps having a collection of quality completion criteria. The QG would be the defined phases and activities between the breakdown of the project work as shown in the figure 3. Each activity has to be passed through the QG for the release for next project activity, by gone through the evaluation of the previous process by means of fixed criteria. It has a check list of items involved in an activity of a project. Also at QG, detail analysis of defect, present status for defect etc. is also displayed.

TYPES OF QUALITY GATES

There are two types of QGs which are defined for different purposes to make control of the quality at operating level and at management level, namely Quality Control Gate and Quality Management Gate (Introduction to Quality Gates, 1998).*Quality Control Gate* are used for monitoring the product quality performance and outcome of the product within the operations process. Here the operational process of a product is divided in to number of possible activities, at the end of the each activity the product passes through the quality check. *Quality Management*

Gate are established for the decision making process which will control the outcome of the project with the desired quality. Here the project is divided in to number of possible activities such as designing, drafting, production, finishing according to the fixed target, timeframe and deadline. At the end of the each activity the product passes through a list of quality criteria which defines the specified output performance specifications, from this at management level decisions will be made to assure alignment between performance and expectations of the final outcome of the project.

CONVENTIONAL QUALITY CONTROL METHOD AND THE QUALITY GATE

Time, cost and quality are the three project management constraints; each is interrelated and impacts with one another. Among these three constraints, quality aspect is something tangible to inspect and becomes the issue at the last stage of any project and affects the whole process time as well the cost involved. There are other quality controls tools such as six sigma, kaizen (continuous improvement), statistical process control (SPC), quality assurance (QA), process capability index, etc. but these tools become most probably towards the final inspection stage. Of course inspection is one of the quality check point but it doesn't reduce the quality problems at the process stage, rework, time and cost incurred. To avoid this (Edwards, 1986) and (Juran & Gryna, 1980) enlightened the concepts of x of quality by mass inspection is not economical because it permits wasteful practices and it should be more economical to do things right the first time. The project planning and control tools offers little help to manage quality and also very few specific tools are there to help the project manager in terms of scheduling, monitoring and control project quality as well the cost to integrate quality into project management process.
In a project, one has to first identify the various activities/major process involved and then breakdown the process/activities according to the major involvement by function area. This given a clear idea about the life cycle of the project and they identified the milestones which are accountable for meeting costs, time and quality criteria. Each milestone carries a sufficient criteria i.e. check list that helps the project manager to control the quality of the project lifecycle at the early stage (Aaron, Bratta, & D, 1993).

An innovation for an integrated organization is based on two approaches, product lifecycle roadmaps and QG. Roadmaps are a sort of project layout where multi-disciplinary groups of peoples involved as team with a guiding framework to achieve a common goal. Planning, Implementation, Knowledge management, Product life cycle are the four major steps to accomplish a cost effective task on time. These four steps provide guidance and structure to the project execution, and lead to project innovation by controlling these steps.

The next method, QG, is sourced from quality controlling and is a list of pre-defined quality criteria which has to be satisfied before each activity is passed to the next to continue. This QG is an opportunity of early intervention in the development stage of a business project activities and it avoids the error, changing requirements and communication problems between the customer and the supplier and QG acts a single like a traffic light system, with that the Project manager or project supervisor can easily identify the bottleneck of the project (Giebel, Esmann, Preez, & Jochem, 2008).

QG is the predefined quality acceptance criteria reviews that can be used throughout any project lifecycle. QG might involve more paperwork but still this strategic management tool is fully customizable. The clearance of one QG would leads to the passage of project to the next gate, unless the IT project manager and a senior executive reviews the problems occurred in that particular gate for the free flow process throughout the entire project. For example, the project manager of a large CRM project faced a problem during the product development phase. The flow of activities involved designing the architecture to configuring and customizing the CRM application by the developers. Since there was no database support and with unassigned IP address, the impact in project timeline was not correctly measured. If the project manager had utilized the QG processes, he could have detected much earlier at the design phase the timeline of the project. Hence, QG needs to be integrated with both the development & deployment process of an IT projects. IT companies such as AT&T, Lucent Technologies and others have implemented QG successfully for their project development cycle (Charvat, 2003).

The implementation of QG requires some basic supportive project management tools like work breakdown structure, product breakdown structure and scheduling tools to stream line the QG approach into a project. Let's see how these supportive tools contribute the effectiveness for the implementation of QG.

PROJECT MANAGEMENT

Project management is the basic requirement for planning; organizing, managing, leading, controlling and monitoring the available resources like raw materials, time, money, manpower etc. so as to achieve the specific goals. Scope, time, budget and quality are the key challenge to achieve all the project goals. These constraints could be optimized by adopting predefined project management tools. Figure 4 shows the flow of project management process involved in any project.

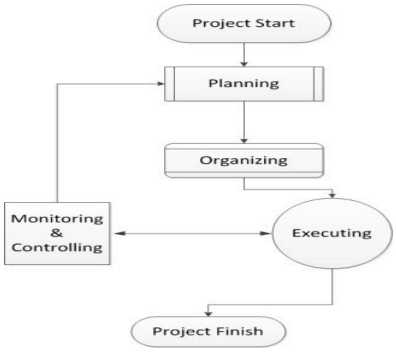

Figure 4: Project management process flow chart

Projects should have a continuous improvement in the project management process for the longer run and the project management has to be integrated and should relate with the goals of an organization. Also the time and resources allocated for project may be limited, so the maximum utilization of these time and available resources guarantees the project success (Ayas, 1997) and (Bachy & Hameri, 1997).

Project management practices helps to avoid the interdependencies of under-recognized and under managed work tasks and promotes "one time event" that increases the ongoing performance improvements by minimizing the inter-relationships between individual work tasks and other project mechanisms. A unified project management approach emphasizes the required project information to pass to all the project participants and provides a unifying influence in the continuous flow of work without any distractions or confusions in the path of continuous improvement of a project (Froese, 2010). In addition to that the project management defines the time period and cost required to complete the project and deliver the product on time. The tools like cause and effect diagrams, delay analysis would give the gaps where the process has to be strengthened (Chao & Ishii, 2004).

Additional tools such as WBS, Gantt chart, Critical Path Method (CPM), SWAV (used to identify the bottlenecks or conflicts during the entire scheduling period) and PERT technique are the supportive tools for the efficient outcome for a QG.

1. Planning

Work break down structure (WBS): The breaking down of a single task into multiple levels of tasks to reduce the complexity of the process and to speed up the project to complete with the desired quality on time is defined as Work break down structure. As such, the task is broken into several possible small tasks and provides a clear cut idea about the whole process of the project and reduces the complexity in it. Work breakdown structure provides a set of criteria for distinguishing between the hierarchical levels. It is an influential tool for a successful organization (Ayas, 1997). WBS has to be the first plan of any project, and then a detailed study has to be carried out about the product and the project site. Product breakdown structure, assembly breakdown structure (ABS) and organizational breakdown structure (OBS) are the basic structures used to derive an efficient work breakdown structure which are the required and necessary tools has to be prepared before initiating any project (Bachy & Hameri, 1997).

Product breakdown structure (PBS): PBS is an effective tool which categorized the complex components of a final product in a hierarchical form. It is similar to work breakdown structure. PBS comprises the complete product components list or sequence flow of product information represented in a data (tree) structure (figure 5) and also it comprises the technical description of manufacturing, machining, and quality control for all the all elementary parts (Bachy & Hameri, 1997).

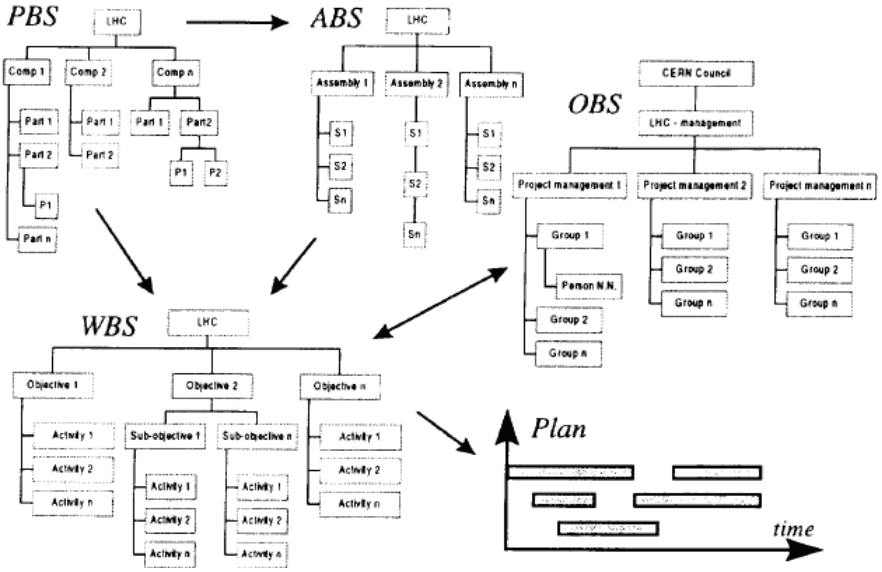

Figure 5: Preparatory process for a project [Source: Bachy & Hameri, 1997]

The main difference between product breakdown structure (PBS) and work breakdown structure (WBS) is that just product and work. The PBS entails the physical and functional elements of a product whereas WBS focuses on the number of works involved in a project. WBS is designed as per the PBS in any project along with that organizational breakdown structure (OBS) and assembly breakdown structure (ABS) are also took part in building a perfect Work breakdown structure (WBS). The figure 5 shows the clear picture about the implication of these three breakdown structures to arrive a perfect project plan.

2. Organizing

Project Scheduling: Project scheduling is the process of organizing and committing to decide, how to make use all the resources like manpower, time and budget between a varieties of possible tasks. It can be simply say that project scheduling is an established timetable consists of start and finish time of a project. Scheduling is mainly focus on time availability for a project and its maximum utilization to accomplish the task. The purpose of scheduling is to minimize the time and cost with the available resources like manpower, equipments, raw materials etc. to maximize the production efficiency. As per (Chen, Ling, & Chen, 2003), scheduling for a large project especially for a new product development (NPD) process is a challening task and requires potential knowledge and determination.

Scheduling can be done by two ways, forward and backward. Forward scheduling is to determine the time required to start the project to the end date or due of the project. In case of backward scheduling, it is just reverse of the forward scheduling, it determines the planning the tasks from due date of the project to the start date of the project. In QG approach forward scheduling is most likely in use. A schedule maker should have a well-designed work breakdown structure and product breakdown structure before start creating a project schedule; this would help the scheduler to create an effective estimate for each task with available resource list for each task.

Activity networks, Gantt Chart technique are the basic project scheduling tools and also scheduling could be done with the help of project scheduling software packages available in the market such as Microsoft project, Prime avira by Oracle, these two applications are the most user friendly and most efficient, apart from these two there are other software packages are available in the market such as Clarizen, Genius Project, Daptive PPM etc.

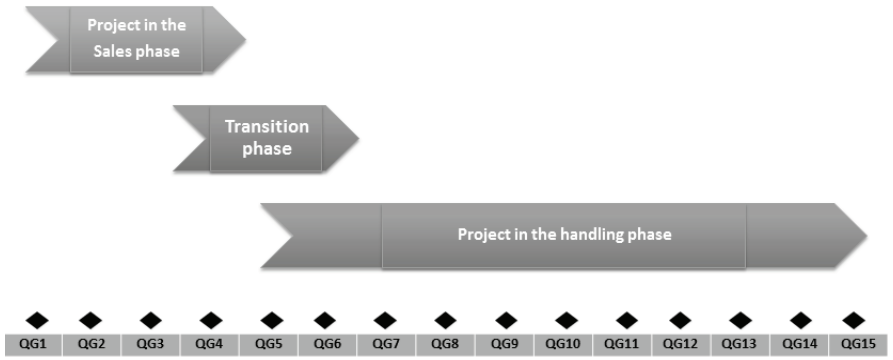
IMPLEMENTATION OF QUALITY GATE

A project is a plan or proposal for a desired goal and it has a group of activities which has a starting point and an end point and it deals with the 4M's (Man, Money, Material and Machine). While implementing a QG in a project, the project has to be broken into possible small activities. Per se a project could be divided into three [1]phases right from receiving a project from customer to the end i.e. delivering the product or service to the customer are like:

1. Sales (Order booking) Phase
2. Transition Phase
3. Order Handling Phase - Project definition, Design, Production, Equipment installation and Commissioning

In an overview a project consists of various activities to accomplish the task, parse there are fifteen activities involved right from customer enquiry to product delivery and commissioning of the project. These activities are divided into three phases i) sales, ii) transition and, iii) project handling. All the three phases has to be undergone through the QG. There are nearly fifteen QGs, in that first four QGs falls under the project sales phase, and the remaining eleven QGs falls under the project handling phase. As shown in the figure 6.

Figure 6: Overview of sales and order handling Quality Gate



Each stage has their unique activities to complete the task and transfer the project to the subsequent activities. For example the sales stage has the activities of customer inquiry, general conditions, specifications customer input), cost estimation & risk assessment (customer input) and negotiations. Once these sales activities are done then the sales department has to move the

[1 Phase: it's a separation of group of activities involved in a project]

project to the next process called project execution. In such a way the project has to undergone through the above said six stages to fulfill its destiny.

1. Quality gate in sales (order booking) phase

In sales phase covers right from getting an order to confirmation of the order until handover the order to the project execution phase to start the project. The QG in the sales phase has to be followed and recorded by the sales and marketing departments. The QG in the sales phase is clearly shown in the figure 7. If there is any issue in this part the order will not enter in to the project execution phase, so that no project has to be executed in the project execution phase without the clearance from the sales phase. This helps to avoid the loss of production in case of unconfirmed or un-clarified projects.

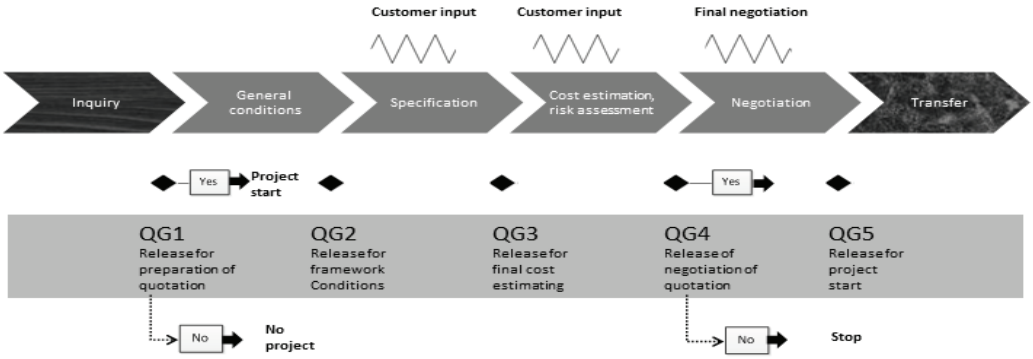


Figure 7: QG in project sales (order booking) phase

2. Quality gate in transition phase

Transition phase is just transferring the approved project to the production or manufacturing department with the required specifications, budget constraints, time frame and other documents. These documents also go through the gates to avoid the unnecessary confusion or unclear information to start a project. If the information is unclear then the project would not go for the project execution phase to start the project and it would be return to the sales department for the clearance.

3. Quality gate in order handling phase

The graphical representation of order handling phase is shown in the figure 8 which clearly explains the passage of different projects in the QG; here the QG from QG5 to QG15 are falls under the order handling phase. That is after the order has confirmed and passed through the QG in the sales phase the order has been released for the project start by the sales people to the project management people. In each and every quality a set of document called checklist regarding previous activity has been recorded and filed in the project folder for the further references. The light indicator in the figure signs the completion of QGs in that particular activity of the project, here the project has successfully passed up to the QG number 12. The QG 13 is

under process and the red sign indicates the QG14 and QG15 are yet to be completed. This helps to track the project whether it moves along with the schedule of the project. If any delay/problem occurs in a particular activity, it helps to find the solution easily and it eliminates the repetitive of work of the whole process. By referencing the previous QG was the projects had been passed through the project manager can easily identifies the location within a less time. That's why all the QGs must be documented in the folder once the project passed through that particular QG. The main advantage of this QG is that if any problem occurs in an activity the subsequent QG will not allow the project to move on to the next activity of the project. So the accuracy of the project can be achieved.

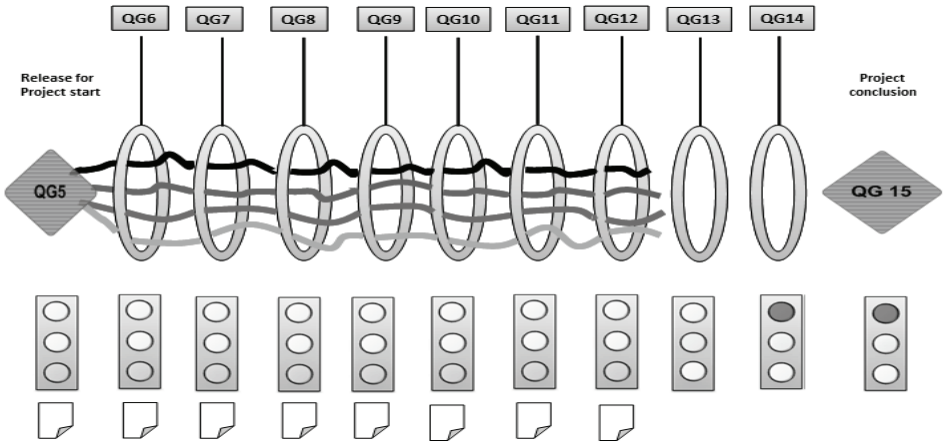

Figure 8: Overview of Quality Gate at project execution phase

4. Field and task-overlapping

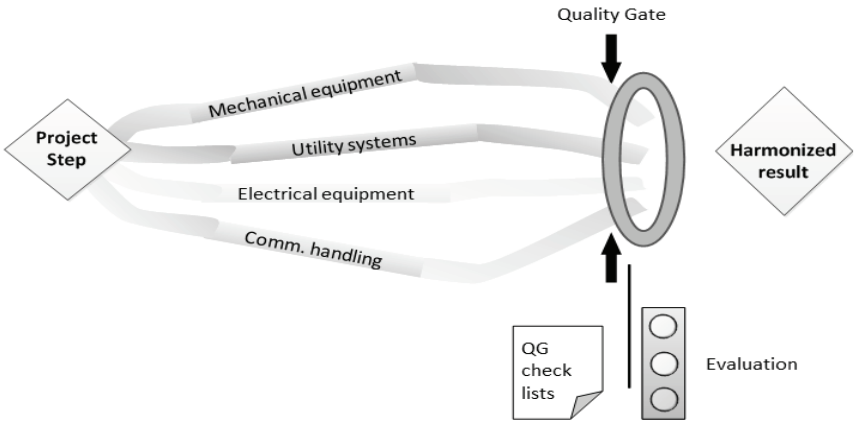

Figure 9: Field and task-overlapping

Each and every activity has some sub-activities to accomplish the particular activity of a project. The result of each activity would be a harmonized of different sub-activities. For example let's take an activity called detailing. This activity may be sub divided into basic engineering of mechanical equipments, electrical equipments, utility systems and commission handling, and

also for detail engineering of mechanical equipments, electrical equipments, utility systems and commission handling etc. The QG checklist has these sub-activities list for the evaluation to give a harmonized result of an activity.

QUALITY GATE NORMS

- As a rule, the QG must be applied in all projects for which SDE bears the overall project responsibility.
- In selected QG, section-specific items are contained as separate parts in the check lists.
- In small-scale projects it may be possible to skip certain QGs. The decision on this is taken by the project management in coordination with the project principal.
- The signed QG records must always be stored as .tif or .pdf files in the basic project folder of the respective project under "QG".
- When subsidiaries participate in the project, they shall be involved in the implementation of the QGs

PROCESS TO IMPLEMENT THE QUALITY GATE

The major steps in the process to implement the QG include: First - build a WBS with a Product breakdown structure (PBS) and Assembly breakdown structure (ABS); Next prepare a complete time schedule with the available resources and budget; Thirdly, set up the QG criteria; Fourth, train project team members; Fifth, implement QG, and finally take corrective actions.

BENEFITS OF QUALITY GATE

Some of the major benefits of QG include: helps project manager to take a quick decisions, avoids the poor or underperformed ideas in the path of continuous project improvement, provides product success with the desired quality and prevents the poor outcome and redirects to corrective actions; increase the participation and motivation of employees towards the project goal, reduces the communication barriers or unnecessary confusions, effective utilization of resources to achieve the quality and benchmarks, takes complete control of quality, cost and time and also enables prioritization and focus.

CHALLENGES IN QUALITY GATE

Some of the major challenges include increased paper work, extra work load for employees to revise or review all the documents and process before passing on to next step, additional time for the employees to learn a new strategic tool and proceed through lengthy quality criteria.

APPLICATION OF QUALITY GATE

The following table 1 shows some of areas where QG were implemented.

Table 1: Application of Quality Gate

IT Industry	IT Projects (Charvat, 2003) Software Development (Ambartsoumian, Dhaliwal, Lee, Meservy, & Zhang, 2011) & (Youn, 2011)
Construction Firms	Architecture, Engineering, Constructions and Facility Management (Froese, 2010)
Industry with more partnering and alliances	[Cooper, 2006]

CONCLUSION

Quality is the satisfactory index for a product to the customers. The control of inter dependable factors of cost, quality and time are carried out by various quality management techniques, such as six sigma, kaizen, statistical process control, quality assurance, process capability index etc. These quality tools help to prevent defects and to increase quality at the end of the production process, which includes the cost of rework, rejection, manpower and time. As such QG would bring down the time of searching the project back records, easy to identify the problem at early stage, reduces the cost of rework, increase the accuracy and effective projects to their clients. Moreover it gives a standardized format to carry out a project to define specific standard requirements. By computerizing the QG process would reduce the usage of paperwork and record keeping and floor space. While computerizing QG, and inter-relate with the scheduling software package would give the better outcome.

ABSTRACT

Purpose: *Virtual product development teams are geographically dispersed and cross-functional, but yet they work on highly interdependent tasks by communicating electronically in work groups. This among other issues presents new challenges for the management of knowledge transfer. Based on literature, communication methods and practices that are widely used in ordinary work settings are not effective in virtual settings. New competencies and management procedures are needed. The present project uses qualitative methods to study what are the most significant challenges that affect knowledge transfer in virtual work settings in NPD. It is essential for the firms to "know what they know" and use that knowledge effectively, the size and geographic dispersion make it especially difficult to locate existing knowledge and use it where it's needed. This is why new information on knowledge transfer is needed.*
Methodology: *Qualitative case study that studies and describes the complex issue of managing virtual NPD.*
Findings: *This study provides information about major challenges for knowledge transfer in virtual NPD.*
Theoretical background: *Knowledge Management, Communications and Work- and Organizational Psychology.*
Originality/value: *This study discusses about the ways of leading experts and knowledge transfer in virtual NPD.*

Key words: Virtual Organization; Virtual Knowledge Transfer; Knowledge Management; Virtual Competencies

INTRODUCTION

Within few years more than 1,3 billion people will work in virtual organizations, therefore it is important to understand this development and these work environments characteristics better. (Johns and Gratton, 2013). There are a lot of mixed results whether technology effects and how does it effect on knowledge sharing, therefore more knowledge on virtual collaboration is needed. (Li, 2010; Faraj *et al.,* 2011.) In the world where everything is connected, and changing, the ability to adapt, learn and the ability to renew have become the most important factors of each organization and individual. (Lohikoski, 2011.) Research should therefore focus on understanding how virtual organizations respond to the tensions that arises in constantly and rapidly changing environments.

Success of knowledge workers is crucial to the performance of knowledge-based organizations, which form the basis of our global economy, therefore this study is very significant. There is a need for qualitative studies on this topical area in order to enhance the quality of knowledge management (KM) also in a case company. The above discussion can be condensed into the following research questions:

1. How is knowledge transfer in virtual NPD identified in the literature?
2. What are the major challenges in virtual knowledge transfer in the case project?

Case study organization is a leading global enabler of telecommunications services. With its focus on innovation and sustainability, the company provides a complete portfolio of mobile, fixed and converged network technology, as well as professional services including consultancy and systems integration, deployment, maintenance and managed services. It is one of the largest telecommunications hardware, software and professional services companies in the world.

RESEARCH PROCESS AND METHODS

Research process was started by an extensive literature review in virtual organizations, including cultural issues, communications, virtual work environment´s structure and knowledge transfer theories. Theoretical foundations lie mostly on knowledge management, work- and organizational psychology and human resources management.

Literature review was synthetized on chapter 3.5 and on a table “Characteristics of Virtual NPD according to the literature.” Theoretical basis was outlined and research questions formed for the semi-structured interviews in a case company. Actual study was conducted by qualitative semi-structured interviews, which builds on openness of unexpected. Semi-structured interviews make it possible to find new things and to keep a flexible design that can bring out the nuances and the meanings in a complex, tacit process of managing experts. Managing experts in virtual work environment especially is an area where new information is needed. To ensure exploration, qualitative method is the most appropriate method for conducting a study. (Marshall and Rossman, 1999). Figure 1 represents the research process.

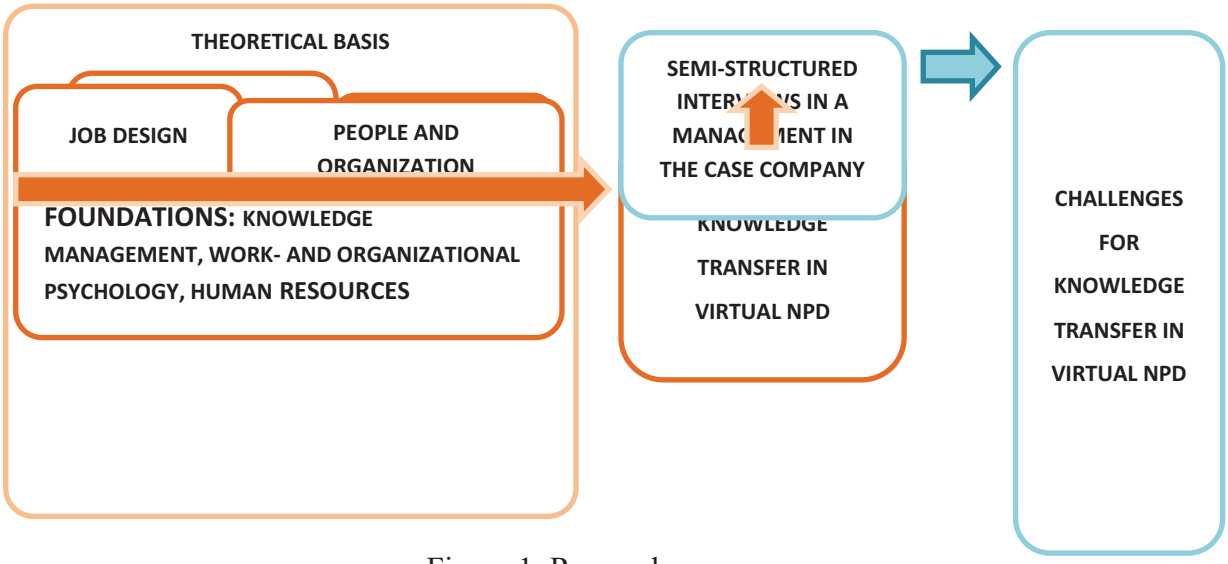

Figure 1. Research process

Study focused on level four managers within a case company. Managers´ work positions are e.g. Head of Product management or Head of Radio Platform Programs. Five of the manager´s position is in R&D, two were in Product Management and one manager´s position is in sales organization. All of their teams are globally dispersed including virtual communication on daily basis in various different locations. These managers had work experience of 14-28y and their work experience in virtual projects was between 10-20 years. According to the results there was a lot of diversity what comes to rating the challenges and in other issues concerning effective knowledge transfer in virtual organization.

VIRTUAL NEW PRODUCT DEVELOPMENT (NPD)

Virtual product development teams are geographically dispersed and cross-functional, but yet they work on highly interdependent tasks. This among other issues presents new challenges for the management of both explicit and tacit knowledge transfer. (Zigurs, 2003.) Global virtual teams are generally matrix-managed, culturally diverse and communicating mainly by using ICT. These virtual teams change form and dissolve rapidly due to rapid changes in a market. These team members also work for several different projects with competing priorities, therefore there are many risks involved when it comes to project deliveries on time. (Daim *et al*., 2012.)

Competition at the market has increased enormously and Cooper (2001) suggests following ingredients for the success: new technologies, intelligence, mobility and speed. Business environment is changing rapidly, which means opportunities can´t be missed. Pace of new product innovation has sped up and it has become increasingly important to leverage existing in-house competencies, resources and capabilities into new product projects. In global companies the only way to establish these kinds of teams rapidly is to form a virtual product development team. Modern technology can integrate mechanisms and systems and in this way provide a suitable platform for sharing internal and external resources. (Riege, 2005).

1. Knowledge and knowledge transfer

Communication and knowledge transfer are very closely linked together, effective communication enhances knowledge transfer and vice versa. Effective knowledge transfer can be achieved by integrating project requirements over organization boundaries. This can be done by providing guidance and standardized way of transferring knowledge, linking transferring processes together, creating a database for managing requirements and of course using the right transfer method for each purpose. (Distanont *et al*., 2012). There are many types of knowledge in literature, but in this study focus is on explicit and tacit knowledge. Explicit knowledge is formal knowledge that is easy to transmit between groups and individuals as Nonaka and Takeuchi (1995) has studied. Explicit knowledge is usually represented in a form of specifications, codes, numbers or different kinds of formulas. Explicit knowledge comes from tacit knowledge and this conversion of knowledge needs special attention especially in product development. Explicit knowledge can be seen as a source of competitive advantage.

However, tacit knowledge is personal knowledge, insights, know-how and deep understanding of contexts and it is usually hard to communicate formally to others. It develops in extended periods of time and therefore is highly personal and unique. Thus it is needed within organization to convert tacit into explicit knowledge and therefore secure competitive advantage in innovation and new product development. (Nonaka and Takeuchi, 1995.) Tacit knowledge is implicit used by organization members at their work and at making interpretations on their world in general. It is hard to pronounce, because it can mainly be used in action when doing tasks at work. Only human beings led by tacit knowledge have the capability to generate new knowledge. (Choo, 1998). Brown and Gray (1995) here: Choo (1998), adds that tacit knowledge means intuition, judgement and common sense – capacity to accomplish tasks without questioning everything. With groups, tacit knowledge can exist in relationships and distinct practices and social networks that emerge over time. It has been studied that sharing and finding relevant information becomes very difficult if the number of members exceed two hundred or three hundred. Stock of all the knowledge in an international company´s is scattered in offices and plants, complex mix of products and services is vast. It becomes very challenging for the expert to find what he needs. In summary: Knowledge is valuable only if it is accessible. (Davenport and Prusak, 2005.)

2. Tools for knowledge transfer

Johns and Gratton (2013) present that there are several platforms, where it is possible to have the company of other professionals. Company´s responsibility is to offer technologies that support higher achievement. Malhotra *et al.* (2007) outline that there are several ways when sharing knowledge virtually. Most companies have different kinds of cloud services, a virtual database, which can be far more than just a storage place for documents. Virtual living team rooms (Ms. LotusNotes) might be used in sharing knowledge, there are also company specific virtual meeting tools that can be used. However it is crucial that there are common rules about versioning the documents, about sharing and not sharing materials and about when to comment and communicate on team´s work.

Structure of meetings and virtual projects knowledge sharing is very important in virtual organizations. Organizations have discovered that the closer the work technology is to one´s own personal use of devices the faster new technology is adopted. (Johns and Gratton, 2013.) Virtual organization member´s patterns of communication: "when, why, how, how often and with whom they communicate?" can reveal a lot organization´s communication practices. These micro-interactions shape dynamic negotiation of member´s multiple interests and expectations. (Im *et al.*, 2005.)

3. Communication and virtual competencies

Many uses of technological resources are socially constructed between customers, internal and external functions. Considering this, technological change makes virtual organization´s operating environment very complex system where everyone is influenced by others. (Foss and Robertson, 2000). All the communication processes are influenced by people´s routines, which don´t operate in isolation. Organizational virtual capability is something which relates to integration and joint operation of routines. In this way organization is an effective operator that transforms the employee into the collective and makes it possible to generate more knowledge and skill and in this way give an unique character to the organization and to an individual. (Metcalfe and James, 2000). Badrinarayanan and Arnett (2008) go beyond that stating that team members of successful virtual NPDs develop superior decision making skills, perform future activities more efficiently and in addition to that, become more competent in acquiring, disseminating and processing information.
Anantatmula and Kanungo (2010) stresses the point that virtual teams and organizations need highly skilled individuals that need to participate extensively in conversations (good communication skills), having trustworthy behaviour (credibility) and having collectivist value (culture). According to Wang and Haggerty (2009) there are four factors that effect on individual virtual competencies:

- Early face to face meetings and training can help overcome the problems in technology
- Increasing technology skills and general familiarity with lean media.
- Assimilating other employee´s backgrounds
- Creating interpersonal relations with team members.

Research suggests that virtual team members cannot rely on simply transferring their behavior in traditional teams and expect to be successful in virtual environments. Explicit training in communication practices across different cultures and what constituted a timely response between the international teams are essential in making that virtual team a success. (Zigurs, 2003.) Success in current work environment and in a future requires employers that support and encourage employees work preferences. Employers also need to customize work environment so that it motivates and engages different personalities working together. (Johns and Gratton, 2013.)

Goodwill is hard to observe virtually, expectations about actions and the actions themselves need to be made as explicit as possible. Common set of procedures and communication norms are needed to prevent misunderstandings. Absence of communication norms lead members communicating his/her own ways, which doesn´t necessarily mean good knowledge sharing practices and distrust starts to develop. (Malhotra et al., 2007).

4. Virtual team´s job design

In virtual organizations structure is a fluid object, which is more like a dynamic space than a typical organization structure. In virtual organizations boundaries, norms, participants, artifacts, interactions continually change all the time. All organizations change, but these kinds of organizations change all the time. (Faraj et al., 2011.) Job design has been frequently researched in HRM sciences and it has been important variable for organizations that benefit from employees´ sharing knowledge. It is a crucial part of organization structure and it basically means the following things: identifying the relevant tasks and activities and allocating them across employees in a way that allows expert´s specialization fully to benefit organization. (Foss et al., 2009.)

There is a causal chain leading from certain kind of job design leading to particular job characteristics that have an impact on employees´ motivation to share knowledge. That all effects knowledge sharing behaviors of employees´. Organizational and group knowledge sharing are usually based on individual behaviors and their drivers. (Parker and Wall 1998, here: Foss *et al.* 2009) According to Riege (2005), in order to achieve continuous growth in business, knowledge-sharing practices need to become a day-to-day procedure. Successful sharing and goals depend on the three main factors: motivation, organization structure and modern technology. Flat and open structures make transparent knowledge flows possible and that provides culture of learning. Also strategy and goals are easier to link to people´s daily lives and in this way provide clear directions and feedback processes.

5. Cultural issues and collaboration

Schein (1996) presents that culture is a set of basic tacit assumptions about how the world is and ought to be. Culture is a group of people that share and determines their perceptions, thoughts, feelings, and, to some degree, their overt behavior. Cultures arise within organizations based on their own histories and experiences. It manifests itself at three levels: the level of deep tacit assumptions that are the essence of the culture. Also the level of espoused values reflecting group´s wishes to be ideally and what it wants to be publicly. Finally there is the day-to-day behavior that represents a complex compromise among the espoused values, the deeper assumptions, and the immediate requirements of the situation.

Any strategic plan must begin with clear goals, but especially in virtual organizations it´s crucial to focus more on collaboration, because it is the foundation of innovating faster and better. This kind of a purpose in mind right decisions can be made and leadership becomes more effective. (Johns and Gratton, 2013). Also Distanont et al. (2012) offer solutions to better human related knowledge transfer in collaboration. First it is important to organize face-to-face communication, especially at the beginning of the project. It also crucial to improve stakeholders´ skills, enhance social relationships between team members and assign right people to the right project. Knowledge sharing depends on the quality of informal and formal conversations between employees, and it is the organizational culture that decides how and with whom these conversations take place. (Paghaleh et al., 2011).

According to Kankanhalli et al., (2007) special characteristics of virtual work need to be identified and made known to team members through training to avoid conflict and to secure effective work along the project. Where possible cultural diversity could be minimized by

through appropriate selection of virtual team members, also in high-complexity tasks functional diversity can be enhanced to promote discussion about work tasks. Tasks conflicts need to be resolved integratively or distributively in order to improve performance. Giving feedback and quick response to the work well done is crucially important in virtual work environment. Possible conflicts in virtual teams are broadly categorized into two main types: relationship and task-based conflicts. Relationship based conflicts involves issues like mutual dislike, personality clashes and general annoyance of among team members. Some conflicts can be severe for team´s performance, but other´s can actually help team to perform better. Especially task-related conflicts seem to be more common and more severe in virtual organizations than in traditional teams. Task-related conflicts are usually based on functional differences caused by different backgrounds, assumptions and understanding based on their previous training and experience. (Kankanhalli et al., 2007.)

ISSUES EFFECTING KNOWLEDGE TRANSFER IN VIRTUAL ORGANIZATIONS BASED ON LITERATURE

Table 1, 2, 3 and 4 summarizes the main characteristics of knowledge transfer in virtual organizations latest research by using Distanont et al´s, (2013) solutions to overcome challenges in knowledge transfer. These classifications of this theory are based on division of Management, Working Process, Communication and Transfer Process as figure 2 represents:

Figure 2. Overcoming challenges in knowledge transfer. (Distanont et al., 2013).

Table 1. The main characteristics of knowledge transfer in virtual organizations in Management

Establish and maintain trust Special attention for mechanisms and communication processes in establishing trust is needed. Cognitive-based trust is the most relevant type of trust in virtual context.	Bergiel *et.al*, 2008; Malhotra *et al*.,, 2007; Denni *et a*l., 2013; Anantatmula & Kanungo, 2010; Holste and Fields, 2012; Atkinson and Butcher, 2012; Mitchells and Zigurs, 2009; Maude, 2011; Peters and Mantz, 2007; Han and Harms, 2010; Holton, 2001;
Conflict resolution strategies Potential issues causing conflicts should be acknowledged and strategies for proper conflict resolution methods should be planned beforehand.	Bergiel et. al, 2008; Zigurs, 2003, Maude, 2011; Kankanhalli *et al*.,, 2007; Holton, 2013;
Strong leadership Leader´s presence, support, control and motivation skills are needed in virtual collaboration. Shared goals, clear communication and competence in managing experts is needed.	Bergiel *et al.* 2008; Faraj *et al.,* 2011; Malhotra et. al, 2007; Dennis et.al., 2013; Snowden and Boone, 2007; Zigurs, 2003, Luther and Bruckman, 2011; Merat and Bo, 2013; Ivan *et.al.,* 2012; Cooper *et.al*., 2004, Goh, 2002;
Rewarding and feedback Rewarding and feedback processes need to be planned and established to support virtual collaboration and goals.	Malhotra *et.al*., 2007; Dennis *et.al*., 2013; Snowden & Boone, 2007; Zigurs 2003, Lam & Lambermont-Ford , 2010; Kankanhalli *et.al*, 2007; Cooper *et. al.,* 2004; Goh,2002;
Job satisfaction Virtual environment can cause feeling of isolation and lack of social contact, also multitasking and fluid working roles can in some cases decrease satisfaction at work.	Dennis *et al*., 2013; Kankanhalli *et al.*, 2007;
Less hierarchy and social conventions In virtual organizations structure is a fluid object and interaction is easier and less formal in virtual context.	Faraj *et al*., 2011; Lam and Lambermont-Ford , 2010;
Recruitment of talented employees Virtual environment enables recruitment of talented employees without changing geographical location. Moving away from home country isn´t necessary.	Bergiel *et. al* 2008; Holton, 2001; Faraj *et al.,* 2011; Ivan *et al.,* 2012;

Table 2. The main characteristics of knowledge transfer in virtual organizations in Communication

Virtual communication Effectiveness in task related communication is stronger in virtual environment. Dislike isn´t revealed in virtual discussion and cultural differences aren´t so significant.	Gressgård, 2011; Hardwick *et.al*, 2013; Wang and Haggerty, 2009; Badrinarayanan and Arnett, 2008;
Communication skills Verbal, written, oral, cultural knowledge and language skills are needed in order to ensure efficient communication between parties. Goal is usually to generate action, change or create common understanding.	Bergiel et.al, 2008; Holton, 2013; Faraj *et al*., 2011; Malhotra *et al,* 2007; Dennis *et al.,* 2013; Snowden and Boone, 2007; Maude, 2011; Luther and Bruckman, 2011; Cooper *et al*., 2004;
Members are knowledge transfer agents Networking virtual organization is possible across time, location and organizational boundaries.	Wang and Haggerty, 2009; Johns and Gratton, 2013; Zheng *et al*., 2011; Hardwick *et al*., 2013; Ivan *et al.,* 2012;

Table 3. The main characteristics of knowledge transfer in virtual organizations in Transfer process

Technology Modern technology can integrate mechanisms and systems and in this way provide a suitable platform for sharing internal and external resources. Technological failures can risk project deliveries on time.	Gatlin-Watts *et al.,* 2007; Badrinarayanan and Arnett, 2008; Cooper, 2001; Goh, 2002;
Multiple time zones & geographical dispersion Multiple time zones can be a challenge in a global multicultural company, when there is a need for shared meetings.	Bergie *et. al*, 2008, Badrinarayanan and Arnett, 2008; Faraj *et a*l., 2011; Dennis *et al*., 2013; Zigurs 2003; Li, 2010; Kankanhalli *et al.,* 2007;
Virtual competencies Virtual social skills, virtual media skills, Ict - skills and virtual self efficacy.	Wang and Haggerty, 2009; Faraj *et al,* 2011; Dennis *et al*., 2013; Luther and Bruckman, 2011; Foss & Robertson, 2000; Kankanhalli *et al*., 2007; Zigurs 2003,

Table 4. The main characteristics of knowledge transfer in virtual organizations in in working process

Training for virtual work is needed Characteristics of virtual collaboration should be acknowledged and training provided to enhance communication among team members. The sense of "we" rather than sense of "I" needs attention.	Zigurs, 2003; Kankanhalli *et al*, 2007; Han and Harms, 2010;
Relationship building and teaming Relationships and roles between team members need to be planned, identified and evaluated.	Gatlin-Watts *et al*., 2007; Holton, 2013; Wang and Haggerty, 2009; Faraj *et al*, 2011; Malhotra *et al*., 2007; Dennis *et al*., 2013; Snowden & Boone, 2007; Senge *et al*. 2007; Zigurs 2003; Kankanhalli *et al*., 2007; Greer, 2008; Goh,2002:
Passion, creativity and originality of multicultural team members Cultural and personality issues need to be considered and planned when forming teams, sharing tasks, communicating and giving feedback.	Bergiel et. al, 2008; Johns & Gratton, 2013; Holton, 2001; Badrinarayanan & Arnett, 2008.; Gressgård, 2011; Gatlin-Watts et al., 2007; Faraj *et al*., 2011; Luther and Bruckman, 2011; Dennis *et al.,* 2013; Li, 2010; Snowden and Boone, 2007; Maude, 2011; Kankanhalli *et al*., 2007; Gressgård, 2011;
Effective new product development New product innovation has become increasingly important and rapid in its nature. In-house competencies, resources and capabilities need to be leveraged into new product projects. In global companies this is done by modern communication technology in virtual product development teams.	Badrinarayanan and Arnett, 2008.; Gressgård, 2011; Luther and Bruckman, 2011; Kankanhalli *et al*., 2007; Cooper *et al*. , 2004;
Temporary convergence Human and Ict -related delays need to be planned and taken into consideration when planning a virtual project.	Faraj *et al*., 2011; Li, 2010; Zigurs 2003,
Tacit knowledge transfer Face to face meetings are needed and knowledge transfer in virtual collaboration needs extra attention.	Holton, 2013; Wang and Haggerty, 2008; Dennis *et al.,* 2013; Zigurs 2003, Distanont *et al.* 2012; Hardwick *et al*., 2013; Wang and Haggerty, 2009;

EMPIRICAL STUDY

Empirical study in a case company was conducted by semi-structured interviews in April 2013. Seven informants were chosen, based on their availability and ability to contribute the study from the management team of 20. Interviews took place in company ´s premises. Four of the informants´ positions within a company are e.g. Head of Program Management in R&D, two are Heads of Product Management and one informant´s title is Head of Sales. Informant´s ages were from 41 to 51 years. Two of the informant´s educational background

was M.Sc. Eng. and five were B.Sc. Eng. Informants had work experience from 18-28 years, from which 10-20 was in virtual organizations. Questions for the interviews were sent to informants beforehand. Each interview lasted from 35 up to 50 minutes and they were recorded and transcribed.
After the interview, informants were asked to rate the challenges in virtual knowledge transfer in a scale of 1-5 (1= no challenge, 2= minor challenge, 3= average challenge, 4= significant challenge, 5= major challenge). Challenges were added, calculated and summaries were made from each topic. As a main finding you can see the great variety and relatively big differences in opinion within informants. Main findings of the challenges are represented in figure 3.

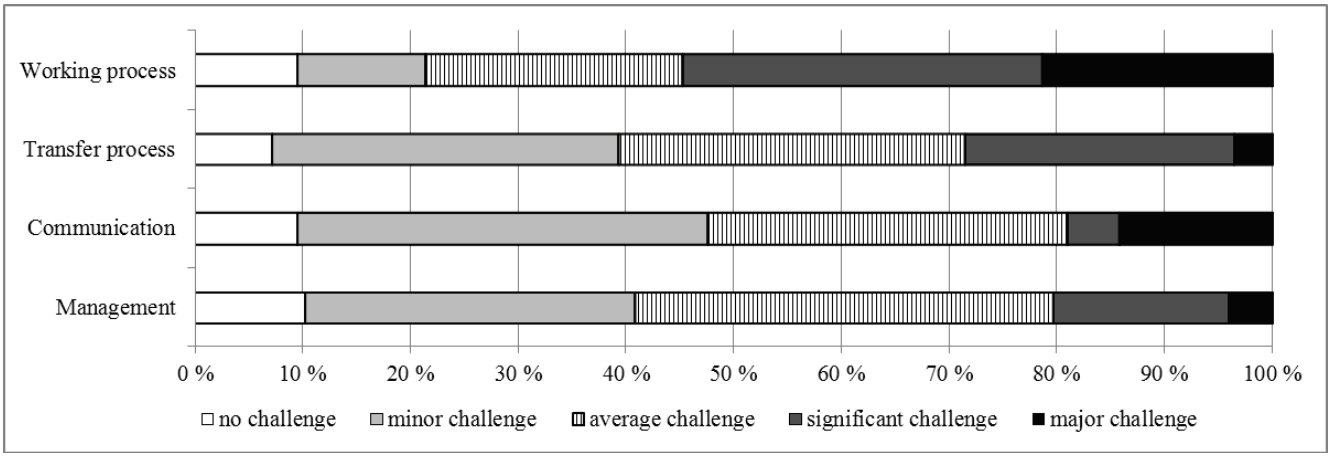

Figure 3 . Summary of challenges in knowledge transfer in virtual NPD.

1. Challenges in management

Trust has a very significant role in virtual NPD according to all informants. Trust develops in face to face communication according to over half of the informants. Some informants presented that trust can also develop also over time when communication is frequent and happens on regular basis. Above that informant C emphasizes the role of accurate information and expertise:

”It is definitely so that if you trust someone, you don´t have to double check the issues from other sources. If I tell something, then I know its valid, but if you receive information and you don´t know or trust the sender of a message, then you need to double check. In my experience… I´ve got a hunch when something isn´t right and whether that information can be used or not. So: Trust matters, and it only comes with time.”

Trust issues were rated everything from minor until major challenge. Informant E saw only minor challenges in trust, and what is standing out from informant E´s answers is that he relies strongly on fact -based communication and professional competence:

“If you trust someone, you tell more openly about things. All the facts will be discussed. There are all kinds of trust, but competence related trust is received by your own actions and by your performance at work. The fact that you have earlier taken care of things reliably and successfully is one thing. Well, that is The Most Important thing.”

Informants that saw trust as an average challenge, emphasized more formal documentation and structure of messages, or importance of phone calls instead of face to face conversations. Informant that saw trust as a major challenge emphasizes strongly face to face communication instead of just using fact based formal communication via ICT. Figure4 presents the challenges in management:

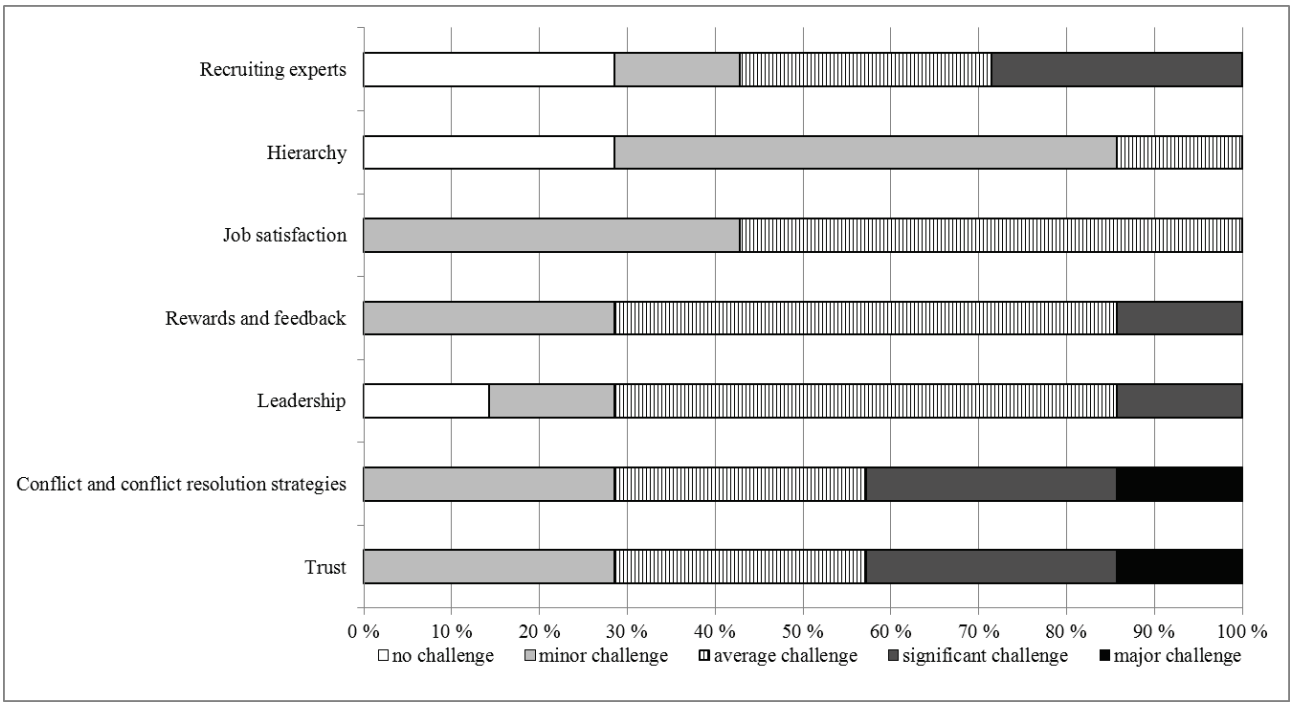

Figure 4. Challenges in management

Conflicts and conflict resolution strategies were marked mainly as average or significant challenge, but one informant considered conflicts are a major challenge and one informant as minor challenge. All informants mentioned competence related conflicts between sites the most common issue behind conflicts like informant G describes:

" I´d say conflicts are based on professional pride and identity. Sometimes there can be kind of a "invented here –attitude" that is basis for conflicts. You don´t want to transfer knowledge or something like that. It has something do with power, but I can´t understand or define that, because power is something you definitely don´t get with that kind of behavior. It is manager´s responsibility to solve those issues by building trust again."

Other issues causing conflicts were time differences, which make it difficult to find time for meetings together and also availability of relevant information becomes more difficult. What is interesting is that there aren´t conflict resolution strategies available and therefore managers are mainly the negotiators and mediators in solving conflicts. One informant mentioned co-operation teams and projects, which have been able to solve conflicts in the past. According to one informant, conflicts could be avoided by preventive actions e.g. proactive information sharing and by having shared discussions. Two informants mentioned importance of fact- based conversations in solving conflicts like informant E presents:

"Well, I start solving these issues fact-based, that what has gone wrong, what is the problem and start from there. We check the issue and see what is behind that conflict. Then all the people that are involved get together so that everyone has the same information, same knowledge and same right to give comments. So no mediators, we solve those conflicts together, only based on facts."

Generally leadership was seen as an average challenge, but what was interesting and very descriptive of this study as a whole, was the fact that there were altogether 24 different kinds of characteristics mentioned when informants were asked about qualities of a good virtual leader. Almost all informants said that most important skill is an ability to lead people, four mentioned that active and frequent communication is important, but after that was more variety. Informants mentioned skills and characteristics like written and oral communication skills, honesty and integrity, availability 24/7, professional competence, openness and prioritizing skills. Informants also mentioned e.g. strategy knowledge, trust, supportiveness and decision making skills and innovativeness and an ability to see the big picture.

These managers seem to do their work very personally with their own unique ways and experience. All the views in characteristics of a good manager mean that further studies on this topic are needed. Also availability 24/7 issue was mentioned by all informants at course of the interviews and it seems like some better knowledge on combining professional and personal life might be needed in order to enhance virtual leader´s job satisfaction and efficiency. Two informants said at the interview that they find it difficult to leave the office during the day 8-16, even if there was a chance to take care of some personal issues while working. Successful work in virtual organizations is hard to define, because it is hard to measure. In literature there are views that emphasize successful combination of work and home and views that are concentrated on performance metrics at work. (Muna and Zennie, 2010.) Further studies in successful combination of professional and personal life are also needed.

2. Challenges in communication

When informants were asked about the qualities of effective virtual communication, they mostly pressed the importance of taking the message receiver into account. Also planning the content and outlook of the message right was mentioned important. Decisions and information letters need to be written and sent ad hoc according to almost half of the informants. Only few mentioned the importance of clear and succinct e-mails, which is a significant part of virtual communication according to the theory. Also 12 other qualities of good communication were mentioned, which means there is a variety of different ways and variety of different kinds of practices when communicating virtually. Communication is a very crucial factor in manager´s work as informant B states. According to him, most delays in NPD are based on communication problems:

"Communications are the biggest, or communication problems are the biggest causes for failures, when failures appear in any project. If something is wrong somewhere, it is usually based on challenges in communication. Often about 80% of problems arise when people don´t know something or it has been a communication problem."

One informant had participated in virtual communication training and he had evaluated his own virtual communication competence more than others. Also training issue was seen as a bigger challenge with this informant, which might mean that he is aware of the issues concerning virtual collaboration and connection of virtual communication competencies. This same informant mentioned that lack of face to face communication is a minor challenge, where those that evaluated their own virtual communication competence weaker than others´ saw that lack of face to face communication is a significant or a major challenge. Communication training is also discussed in working processes. Figure 5 represents challenges in communication category:

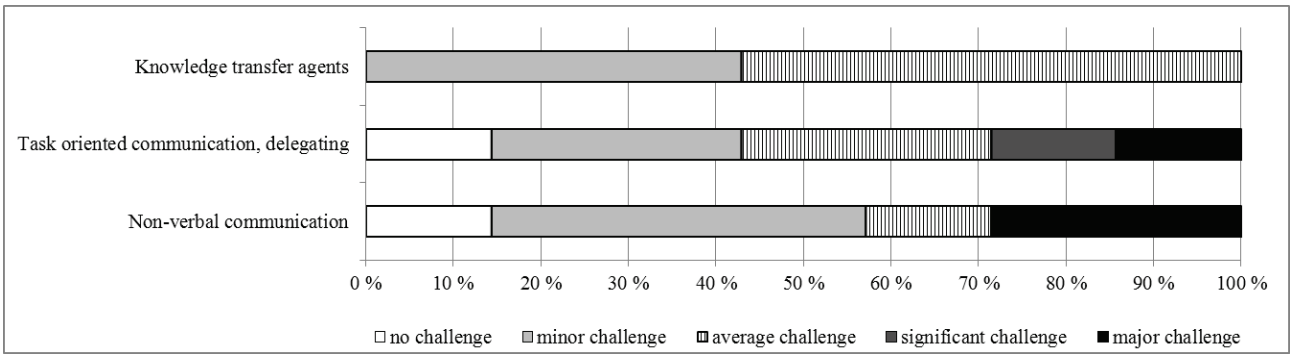

Figure 5. Challenges in communication

3. Challenges in transfer process

All informants stated at the interviews that there are problems in ICT they use, but when rating the challenges, there was a lot of variety. It is surprising that it seems like informants had accepted the unbalanced situation with task-technology-structure fit. There are tools for social interaction and networking, but they are not used according to these informants due to many of reasons, but most importantly lack of time. They also didn´t see those tools beneficial and useful to their work. There are also problems with availability and reliability of some virtual meeting tools.
In rating the challenges, ICT was marked as a significant challenge, as an average challenge and as a minor challenge, but some informants saw no challenges at all. In generally informants said in the interviews that there are too many tools and people don´t seem to know where to find relevant information like informant A describes:

“E-mail is the most common tool and it is ok. In meetings we use Webex, so we show slides, but it is unstable tool, but when it works it´s fine.. Then we have Team Site, Community Site, My Site etc.. but I don´t know about those.. You never know where anything is. They have brought in new tools and it has become a mess. I mean those tools work, but from the user perspective it takes too much time to think where and when is the data and communication of some project or a person. I mean idea is good, but implementation is undone. Kind of a culture that we start doing something and then we over do it. It is hard to find the “golden mean”.

Virtual communication competencies were an interesting issue. All informants gave higher ratings to challenges in virtual competencies to themselves than to others.

Time differences and geographical dispersion were also mentioned by all informants, however it was surprising that time differences weren´t any greater challenge. Three informants mentioned that it can even be a benefit e.g. in testing new products. When working day ends, it starts in another location and testing products can be made continuously and effectively in this way. Figure 6 summarizes the challenges in knowledge transfer process:

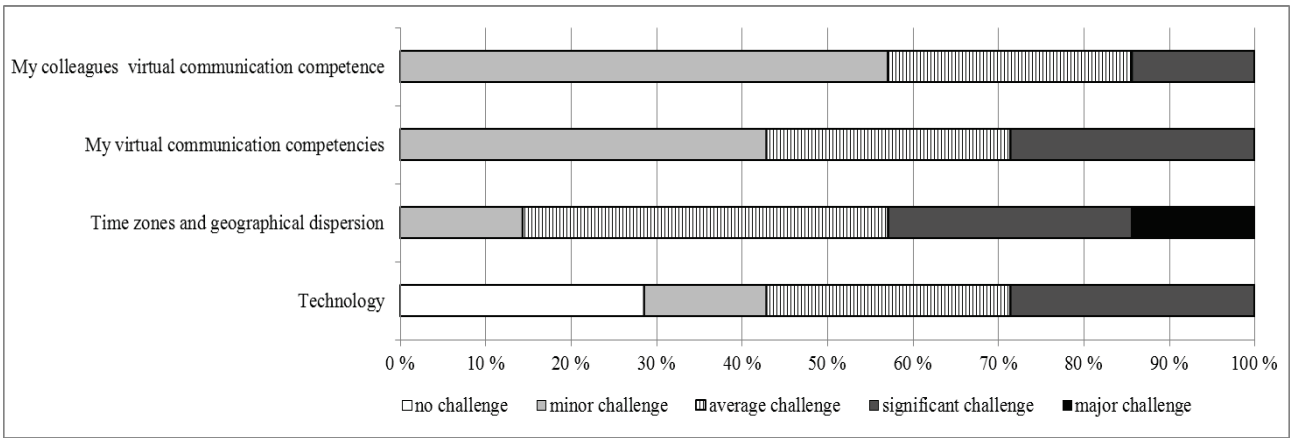

Figure 6. Challenges in knowledge transfer process

4. Greatest challenges are in working processes

From managers´ perspective the most challenges are found in issues concerning working processes. In working processes the relationships, tacit knowledge transfer, effective NPD, and temporary convergence were the most challenging issues as described in figure 7.

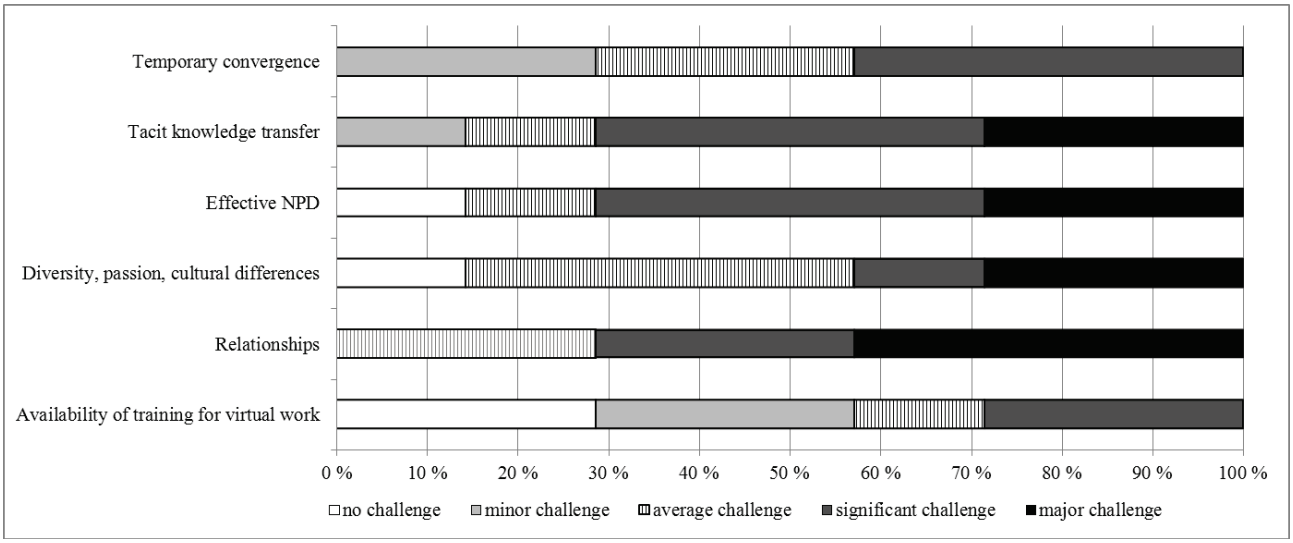

Figure 7. Challenges in working process

Greatest challenges in working processes were found in building and maintaining relationships within multicultural virtual environment, which was stated as a average, significant or major challenge by all except one informant, who stated that it isn´t a challenge

at all. All informants were familiar with cultural differences and all informants mentioned that they are considering cultural issues when sharing tasks and giving feedback. All informants had lived abroad and/ or participated cultural training. Informant F describes the importance of taking the message receiver´s background into consideration when sharing tasks, doing follow ups and giving feedback:

"Delays in a project happen because sometimes a person simply doesn´t know what to do, so communication hasn´t been good enough. So then we come to the issue, how important the successful virtual communication is. If you know who the person is, you know how to communicate the issue clearly, then you do the follow up to see that is it going anywhere and what direction is it going. Then depending on the culture, the feedback conversation is different with each individual. Other cultures can´t take feedback, but you just have to get the message through somehow. Those faults and failures need to be fixed."

In virtual projects in this field of business innovating fast is crucial. Therefore effective collaboration is needed and leading effective virtual teams is possible, if cultural issues are taken into consideration. (Johns and Gratton, 2013). Success in any collaboration between people and organizations is based on quality of relationships that shape cooperation, trust, mutuality and joint learning. It is important to have face-to-face meetings first, like informant C states:

"If we have met face to face, for some reason trust develops even after the first meeting and after that sharing knowledge is easier. If we haven´t met at all, there always is a risk that people stay in silos."

According to these managers everything can be handled virtually, except negative personal issues, redundancy notices and critical feedback meetings, but it was also stated by half of the managers, that if you have met face to face even once, everything can be handled virtually after that. What is interesting is that according to one informant, everything can be handled virtually. Face to face conversation isn´t necessarily needed at all.

Building relationships within teams, the practices varied even more. Most informants stated that quality and characteristics of team co-operation isn´t evaluated. Some informants said that in economically tough times there hasn´t been recreational team building events, however one manager mentioned that creative and strong team leaders can organize low budget team building events in any times. There were also other ways to enhance team´s performance e.g. horizontal interaction with cross-review, monthly information sharing meetings for formal and informal communication and voluntary informal communication. In summary, there aren´t official procedures in evaluating team building and performance, team building practices are based on each manager´s personal experience and preferences and evaluation is only done if team fails or performs exceptionally well.

Challenges in virtual NPD divided opinions: most informants stated that virtual organization structure makes NPD more difficult like informants E and B present**:**

"Of course we always hope that everything would be done in one site. It has been noted that it is the clearest and simplest way to do it. Then only support from other sites, but that isn´t always in balance with us. So I can say that NPD suffers a bit. There always is some kind of

tension when you don´t know the people. There are new people here and there..and when you don´t yet have experience in working with these people, it takes time, more time for these designers to build trust and to create and to prepare things, so there´ll always come surprises..."(E)

"Well, it does effect.. We haven´t been able to make it and in this moment we have projects that are just plain chaos and they´ve been divided into six, seven even eight different sites. So you can imagine what kind of challenges there are when it comes to sharing information, communicating, sharing work packages, negotiating and integrating… So in my opinion it is mission impossible and virtual Npd shouldn´t even exist." (B)

However some informants thought that virtual NPD is a strength and built-in this business, like informant G suggests:
" First of all, when it comes to developing complex products like this, there are only very few places in a world where you can find all the needed competencies within same walls, so basically we are forced to this kinds of geographical dispersiveness. Then the virtuality helps us to develop these kinds of products, we can make them together. So virtuality is built in and all the sites and teams and organizations compliment each other. For some reason, in a world... there are these kinds of knowledge centers..."

Availability and participation in communication training wasn´t seen challenging among the informants. Most informants had participated communication training a long time ago. Only few informants mentioned training portal, and only one named relevant virtual communication classes that are available. Almost all informants hadn´t participated virtual communication classes at all. One informant stated that he hadn´t participated any communication or virtual communication classes and he didn´t even know if there is such training available. Importance and meaning of virtual communication training clearly isn´t recognized.

In summary, there is a lot of variety in manager´s perspectives in a complex multicultural environment. Less than half of the informants thought that virtual NPD is strength, mainly because of a inbuilt wide social network and contact surface globally. Rest of the informants thought that innovativeness can decrease and time differencies can cause inefficiency and difficulties in decision making. Informants that saw virtual NPD beneficial, stated that it is possible when preparations for virtual meetings are made in advance and time differences are taken into consideration when making plans.

Virtual NPD work is sometimes done also at home, which means that combining work and home successfully is needed in virtual work. Successful virtual work is beneficial to the company, but it is also beneficial to the manager working in virtual projects. According to Badrinarayanan & Arnett (2008), team members of successful virtual NPDs develop superior decision making skills, perform future activities more efficiently and also become more competent in acquiring, disseminating and processing information.

CONCLUSIONS

Research suggests that virtual team members cannot rely on simply transferring their behavior in traditional teams and expecting it to be successful in virtual environments. (Zigurs, 2003.) New kind of communication competencies for virtual collaboration is needed. Communicating without proper training to virtual collaboration leads people into communicating with their own ways, and that can lead to development of distrust. (Malhotra et al., 2007.) Organizational knowledge sharing improves, if personal networks are respected and organizations take part in improving them. In such case also cross-cultural knowledge sharing can be improved. (Li, 2010.)

This research´s validity is in studying by qualitative methods the complex issue of knowledge transfer in virtual NPD. Informants had relatively long history in virtual organizations, which is important when collecting this kind of research data. In this study it was surprising, how much diversity there are within managers that operate in a same company. This research confirms the fact that traditional ways of communication might not work in best possible ways when leading experts in virtual organizations. Challenges and problems are recognized in human related issues, but the connection between virtual communication competencies and relationship building and tacit knowledge transfer hasn´t been recognized.

More information on virtual competencies in organizational and individual level is needed and on their meaning and role in efficient and successful knowledge transfer process. Also characteristics of leadership and role of trust on knowledge transfer should be studied further in virtual organizations. Limitations of this study include analysis of only one company. Further studies in characteristics of virtual competencies and virtual leadership are needed in order to enhance the quality of work and job satisfaction of employees in global virtual organizations.

ABSTRACT

Purpose: *Numerous stage models have attempted to clarify management priorities during the early stages of companies. However, a need for more focused and context-specific studies exists. This study seeks to clarify the early stages of technology- intensive companies in Southern California. To summarise the research questions, the authors ask: What early stages do technology-intensive companies face based on empirically based stage literature? How do the experiences of managers in early-stage technology-intensive companies relate to assumptions of such stage framework? What viewpoints should be considered when using stage framework in context of Southern California?*
Design/methodology/approach: *To answer these questions, this retrospective multiple case study devises a four-stage framework describing early stages of technology-intensive companies and reflects it through nine case studies. The study utilises sequential incident technique (SIT) and semi-structured interviews in data collection. Three perspectives were analysed in each case company for triangulation purposes – one from company management, one from operations management, and one from marketing management.*
Findings: *The applicability of the framework will be clarified in this study; moreover, an analysis of context-specific viewpoints will be provided. It is necessary to recognise these viewpoints when using this framework in Southern California.*
Research limitations/implications: *The research focus of this study is limited to the context studied. This limits the applicability of the explorative and descriptive results to other contexts.*
Practical implications: *The results of the study may be effectively used in intermediary organisations and companies as framework for predicting the early-stages of technology intensive companies.*
Originality/value: *The context specific viewpoints and their affect to the early stages of company have not been broadly studied - this study takes the context into account and provides new insights into growth-management of technology-intensive companies in the studied context.*

Keywords: stages of growth; growth process; Southern California; sequential incident technique; technology-intensive companies;

INTRODUCTION

Firm growth and development have been studied extensively in the last decades, and the literature in this area includes many perspectives, such as the static equilibrium theories (see e.g., Coase 1937), stochastic models (see e.g., Gibrat 1931), transaction cost theories (see e.g., Williamson 1975), economics of growth theories (see e.g., Penrose 1959), resource-based theories (see e.g., Penrose 1959)), evolutionary theories (see e.g., Nelson & Winter 1982), organisational ecology theories (see e.g., Hannan & Freeman 1977), strategic adaptation theories (see e.g., Sandberg & Hofer 1982), motivational theories (see e.g., McClelland 1961), and configuration theories (see e.g., Greiner 1972), among others. Most of the perspectives presented above are concerned with the factors leading to growth. However configurations (or company life-cycle or stages of growth) (see e.g., Muhos *et al.* 2010, Muhos 2011) perspective have instead attempted to clarify managerial challenges and priorities in the early stages of companies (see e.g., Churchill & Lewis 1983, Greiner 1972). This perspective relates to what growth brings to a company and how to manage a growing company (see Davidsson & Wiklund 2006, Wiklund 1998). Growth configuration literature reveals diverse managerial problem configurations specific to the different growth stages.

The main findings of the fourteen recent empirically based stage models focusing on technology-intensive companies have been synthesised to a self-evaluation framework (Muhos 2011). To test the findings, empirical cases in different cultural business contexts needs to be studied. Doing so will allow analysis of gaps between the reality and the stage models and will highlight potential paths for further development of these models. This study aims to describe the early development stages of technology-intensive companies in the Southern Californian business context.

The research problem is condensed into the following research questions: What do early-stage technology-intensive companies face based on recent empirical literature? How do the experiences of managers in early-stage technology-intensive companies relate to assumptions of such stage framework? What viewpoints should be considered when using stage framework in Southern Californian context?

This is a retrospective multiple case study with holistic research strategy – the study utilises Sequential Incident Technique (SIT), a specific form of Critical Incident Technique (CIT) (Edvardsson & Roos 2001, Fisher & Oulton 1999, Flanagan 1954).The following definitions figure prominently in this analysis. We define an early-stage technology-intensive firm in three parts: first, a technology intensive firm is an independently owned research- and product development-intensive company whose continuous aspiration to valuable, rare and inimitable knowledge in technology leads to new or enhanced products and services (see Salonen 1995, Tesfaye 1997). Second, the term early refers to the newness of the firm; according to Storey & Tether (1998) a new firm is not more than 25 years old. Third, the term stage corresponds to a unique configuration of variables, e.g., strategies, problems and priorities that growing firms will likely face (see e.g., Coad 2007, Hanks *et al.* 1991, Miller &

Friesen 1984). The term configuration applies to the clusters or frameworks of common variables used for analysis of stages.

This study addresses scholars interested in the process perspective on company growth and development. The study may also function as a useful guide for those responsible for company growth and development polices, those considering investing in a defined group of companies and the owners and managers of growing companies. In the theoretical part of this study the current state of configurations literature is presented. In the empirical part of the study the nine case companies from the Southern California are described and their experiences of growth reflected through stages framework to identify parallel and context specific viewpoints. Finally, this study analyses the applicability of the framework to the cases of Southern California and describes the context specific issues.

EARLY STAGES OF GROWTH – THE SELF EVALUATION FRAMEWORK

Table 1. Early stages of technology-intensive companies – assumptions of the self-evaluation framework

Stage	Stage description/assumption codes
1. Conception and development:	Newly established firm is owner-dependent (1-A1). The objective is product and/or technology development (1-A2) and establishment of an early customer base (1-A3). The main activities relate to the business idea (1-A4), identification of a market (1-A5) and resource mobilisation (1-A6). Development of a working prototype is started (1-A7). The management is informal, flexible and creative (1-A8); communication is face-to-face (1-A9), and the owner makes the decisions (1-A10). Organisation functions as a product-development team (1-A11). Cash flow falls into the red due to lack of product at this point (1-A12).
2. Commercialisation	Stage begins with the early-reference customers (2-A1). Objective is creation of a business and commercialisation of the product (2-A2). Stage is characterised by early manufacturing (2-A3), marketing (2-A4) and initial technical challenges (2-A5). Company learns to make the product and to produce it (2-A6). Management style is participative (2-A7) and coordinative (2-A8). Owner and/or small number of partners dominate the nucleus of the administrative system (2-A9). Resource generation and survival are key issues (2-A10). Amount of negative cash flow decreases (2-A11).
3. Expansion	At this stage, manufacturing and technical feasibility and market acceptance lead to high growth (3-A1) and constant change (3-A2). Main objective: manage the company toward growth and increase market share by marketing and manufacturing the product efficiently and in high volume (3-A3). Company needs to produce, sell and distribute the product at an increasing volume (3-A4) while taking care of efficiency and effectiveness through structures and processes (3-A5). New customers and new market channels require constant attention (3-A6). Personnel problems result from high growth (3-A7). Owner and/or entrepreneurial team are central,

Stage	Stage description/assumption codes
	though a sense of hierarchy increases (3-A8). Budgets are moderately used for communication (3-A9). More specialised functions considered and added (3-A10). Positive cash flow increases rapidly (3-A11).
4. Stability/renewal	Company faces a slowing growth rate (4-A1) and intense competition in maturing product market (4-A2). Effort needed to launch a second generation of the product and for effectiveness and efficiency issues (4-A3). Identification of new markets is essential for company renewal (4-A4). However, cost control and productivity become main concerns (4-A5). Resulting product generation and profitability improvements maintain growth and reasonable market share (4-A6). Owner usually supported by or replaced by a professional manager or a management team and professional management systems are added (4-A7). Strategies, rules, regulations and procedures are standardised and formalised (4-A8). Employees become specialised, non-risk-takers (4-A9). Specialised functions are added (4-A10). The stage is characterised by a decreasing growth of cash flow (4-A11).

The above described framework functions as a reference framework for this study. The authors use this framework to reflect and analyse the experiences of managers during the stages of early growth.

THE METHOD

This present research takes the form of a retrospective multiple case study. According to Yin (1989, p.23), "a case study is an empirical inquiry that: investigates a contemporary phenomenon within its real-life context; when the boundaries between phenomenon and context are not clearly evident; and in which multiple sources of evidence are used".

The study analysed nine case companies located in Southern California using sequential incident technique (SIT) and semi-structured interviews implemented during autumn 2012. Three managerial viewpoints were opened in each case company for triangulation purposes – one from company management, one from operations management, and one from marketing management. The case study follows guidelines set by Yin (1989). In an overview of CIT methods, Gremler (2004) recognises several variants of CIT including SIT, created to take the sequential character of the process studied into account (see Stauss & Weinlich 1997). Case studies using SIT clarify the main sequences of the process under analysis prior to the collection of the data. This is advantageous if the process has already been defined empirically. In this study, the critical incidents are reflected in the sequential framework presented in the theoretical part. The case reports are based on ten separate case studies.

THE CASE STUDIES

The cases are summarised in the following table 2:

Table 2: The case companies

Case	Established	Technology	N. of employees	Sales (M$)	Assets (M$)
A	2009	Software	11	1,3	2,9
B	2010	Health care technology	16	2,0	20,0
C	2009	E-commerce solutions	18	2,0	6,0
D	2003	Intelligence software	15	0,5	0,4
E	2008	Investment software	16	0,7	3,0
F	2008	Recycling solution	65	12,0	250,0
G	1995	Diversified technology	30	5,7	2,5
H	2009	Biotech	7	0,3	4,5
I	2005	E-commerce solutions	24	18,9	1,6

Case1 - Case 9 descriptions (to be completed before submission of final paper…)

Summary of the parallel/ contradictory aspects related to the framework (to be completed before submission of final paper…)

DISCUSSION

The applicability of the framework will be clarified in this study; moreover, an analysis of context-specific viewpoints will be provided. It is necessary to recognise these viewpoints when using this framework in Southern California.

As an answer to *the first research question* the meta-analytical synthesis, four-stage stage self-evaluation framework for early-stage technology intensive companies is presented. The stages include: conception and development, commercialisation, expansion and stability/renewal. Table 1 presents these stages in detail. This study used the synthesis as a set of assumptions to test on ten case studies. Using the nine case studies, the authors answer *the second research question* using SIT. We analyse nine cases from Southern California to test how the experiences of the managers related to the assumptions of the framework. The results of the analysis will be presented in detail in the final paper. The results evaluate the applicability of the framework for context of Southern California by analysing the proportions and content of parallel aspects in relation to the assumptions of the framework. *The* study's *third research question* clarifies the contradictory (fresh), context-specific viewpoints of the stage framework from Southern Californian perspective. The fresh context specific viewpoints will be described to answer the third research question.

The research focus of this study is limited to the context studied. This limits the applicability of the explorative and descriptive results to other contexts.

ACKOWLEDGEMENT

The authors are grateful for the project funding supported by the Council of Oulu Region, Kerttu Saalasti Foundation, Haapavesi-Siikalatva subregion, Nivala-Haapajärvi subregion, Ylivieska subregion, Central Ostrobothnian University of applied sciences, Oulu University of applied sciences, Educational Municipal Federation JEDU and the European Regional Development Fund. We highly appreciate the support received for this study from University of California, Rady School of Management, La Jolla, CA, USA. Further, we highly appreciate the companies and persons involved in the study to share their experiences.

ABSTRACT

Today's concern and problem for most of the companies is the way of surviving and prospering in current and future periods of time in the marketplace.Sustainable competitive ability can be one of the ways of adaptation to the global business and rapid environment requirements.Operational competitiveness is not easy to be sustainably improved because of unpredictable environment situations, such as continuous increasing customer needs, global competitive environment, rapid and unpredictable changes in government policy, company crisis during significant changes etc. However, it is possible to make adaptive adjustments on operations strategy level in dynamic business environment and to become competitive enough compared to the competitors. The purpose of this paper is to define and assess sustainable competitive advantage and the direction of development in housing business. It can be analyzed by three core factors, i.e. Sense and Respond (S&R) methodology, Analytical Hierarchical Process (AHP) as well as Sustainable competitive advantage (SCA) method. This study also focuses on applying S&R method in order to optimize operational competitiveness as well as defining the competitive priorities of the case company. The analysis results show the critical areas in different departments of the case company, which can help the managers to make quick decisions. In addition, they reveal that during the crisis the resource allocation is continuously changing and therefore the operation strategy of the case company is not well defined as well as competitive advantages are not enough sustainable.

Keywords: Sustainable Competitive Advantage, Competitive priorities, Operation strategies, Housing business, Sense and Respond, Analytical Hierarchical process

INTRODUCTION

The aim of operations strategy is providing a broad framework for defining how it prioritizes and utilizes its own resources to have a sustainable competitive advantage in the marketplace. Competitiveness is the ability and performance of an organization to offer products and/or services that can meet market needs and requirements, the ability to react faster compared to your competitors to the market changes and needs (Krugman, 1994). Although most of the companies show their own goals from the aspect of customer satisfaction or level of quality, their primary aim is to be better than their competitors. One of the methods to gain a competitive advantage is by developing the current functions of operations management in a more effective way than their competitors. Moreover, the developing of production process will bring more benefits and competitive edge for a company.

The purpose of this paper is to define and assess sustainable competitive advantages and the direction of development in housing business. Analysis of the operational competitiveness will be held by three core factors: Sense and respond (S&R) methodology, Sustainable Competitive Advantage (SCA) method and Analytical Hierarchical Process (AHP) method. The term Sense and Respond (S&R) first appeared and defined as a business concept in 1992 by Haeckel (1992). However the S&R thinking was developed by Bradley and Nolan (1998) and Markides (2000) in order to have a possibility and method to analyze the dynamic of business performances and strategies. Critical Factor Index (CFI) and Balanced Critical Factor Index (BCFI) models in S&R method are introduced to optimize strategic adjustments, which can give supports during the fast strategic decision-making process, and in addition they provide the information about critical attributes which should be strengthened. S&R method is presented as a questionnaire, which was sent to the case company, where five departments were participating in the survey.

According to SCA, Rautiainenand Takala (2003) defines it as “risk level (probability in percentage) for that the operations strategy should essentially be improved to sustain the operations performance competitiveness during the period considered”. The developing of SCA goes by integrating reciprocally global operations strategy with resource allocations. This method includes the validation based on several methodologies: Manufacturing Strategy Index (MSI) (Takala et al., 2007) and method of detection of a company’s preferable strategytype through utilization of S&R methodology.

RESEARCH METHODOLOGIES

Operation strategies

Raymond Miles and Charles Snow (1978) identified and developed a new strategy typology from the study of business strategies which is based on the new product development and penetration and adaptability to new markets or to uncertain competitive environment. Companies compete differently in the market as they estimate their environments on a distinctive basis and make resource allocation decisions based on these views. Miles and Snow (1978) classified business units into four strategic types, such as prospector, analyzer, defender and reactor.

Prospector is a strategy in which a company continually innovates and improves the product by finding and exploiting new market opportunities. This competitive strategy is considered to be as a creator of changes in the market place. They are able to respond quickly to existed or early signals concerning areas of opportunities and are keen to be the first in entering into a new product/market area (Flouris and Oswald, 2006).

Analyzer is a strategy, which helps organizations to keep the high level of competency by analyzing and imitating the competitive advantages of other organizations. Analyzer company is thought to be intersection of defender and prospector strategies. Analyzer can take some good ideas from prospector strategy and as a result successfully implement them in the marketplace. There is a necessity in flexibility as well as stability in the business processes and market (Daft, 2008).

Defender is a strategy in which company is looking for market stability and tends to have a narrow product market. Compared to prospectors, the main concern of defenders is stability and economy. This strategy does not search for new market places, tries to keep the current customers. They pay attention primarily on internal efficiency and controlling the high-quality of production process for already existed customers. Therefore defender companies become highly dependent on their narrow product/market area. In order to protect its domain, defender companies use lower prices, high quality of products and better delivery (Flouris and Oswald, 2006).

Reactor is strategy which does not have a consistent strategic plan or plan about the means of competing in the marketplace. According to sustainable competitive advantage, reactor strategy is not recommended as a competitive strategy. It is passive in dealing with most issues such as responding to environmental threats and opportunities. As long as a top manager does not define a strategic plan or explicit mission, vision or goals, as a result company acts in order to meet immediate and important for this moment needs (Daft, 2008).

Competitive priorities

Looking at operations strategies from companies' perspective, it can be seen that different organizations in different sectors of industry focuses on different competitive priorities and capabilities. The main idea of success in operations strategy plan lies on identifying, prioritizing the choices and in guidance the ensuring trade-offs. Moreover, the decision making in the company is primary based on market needs and requirements. According to Slack et al. (2004) four competitive priorities are defined, such as quality, cost, time and flexibility.

Quality advantage means "doing things right", but the things which will be done in a right way will vary according two directions: design quality and process quality. Design quality means the set of features which product and/or service has. It is something that a customer finds very easy to make his/her own conclusions and judgments about product and/or service. While process quality is vital as well as design quality because it is related directly to the quality inside the operations and it can lead to cost reduction and dependability increase. If the company makes fewer mistakes during the operation process, then the less time will be spend for fixing these mistakes and less dissatisfaction and confusion will be spread inside the company.

Companies in which main competitive advantage is cost usually follow the elimination of all waste. If there is a low cost in production processes of goods and services, the lower price can be presented as a result to final customer. However, such a situation does not always guarantee profitability and success for a company (Chase et al., 2007).

Time can be related to quick delivery and delivery in time. Being competitive enough in the market means that the company has ability to deliver more quickly the product or service rather than its competitors. Quite simple rule that the faster the company delivers the product or service, the faster customer buys it and consequently will return to buy more. It can be reached by quick inside respond to external customers: fast decision-making, movement of material, and information. Also, delivery in time brings to the company the dependability for the organization and respect and satisfaction from customers (Slack et al., 2004).

Flexibility as a competitive advantage means the ability of the company to produce different types of products, improve the current product, and introduce new products to market and quick respond to customer need and requirements. According to internal aspect, flexible operations can also bring following advantages: speed up response, time saving, and dependability maintaining (Slack et al., 2004).

Sense and Respond method

As a business concept sense and respond (S&R) was firstly described in 1992 by Haeckel (1992) in Management Review article. However, S&R thought was developed further by Bradley and Nolan (1998) and Markides (2000) in order to analyze and describe dynamic business strategies. This method is based on the tools which can help to handle company's future obscurities. In other words, S&R helps companies to expect, foresee, adapt and respond to continually changing environment situations. The method evaluates business operations and customer needs in the organization, which does not mean that it shows the future incomes. The main idea of this method is to react to signals as fast as possible and also to see the weakened, continually changing or stable business attributes of the company.

Rautiainen and Takala (2003) were developed S&R questionnaire method based on the S&R methodology. Further developing made by Ranta and Takala (2007) paid attention on controlling and evaluating the company's internal and external attributes from experience and expectation perspective. The main role of this questionnaire is to develop a fast and reliable way of defining market needs and to react to those requirements in such a way that current important attributes are developing and changing towards right direction.

The questionnaire includes two forms: one evaluates the company's daily operations (OP), and the other one – company's activities in a more general level (BSC). Operational form evaluates Knowledge & Technology Management, Processes & Work flows as well as organizational and information systems. The aim of this form of the questionnaire is to define the critical factors which effect on production process of the company. Balanced score card (BSC) questionnaire defines and evaluated the company's external structure, internal process, learning and growth, trust and business performance. According to Kaplan and Norton (2005) a BSC helps the companies to answer into tree critical performance questions such as

how customers see the company in general; what must we distinguish in ourselves; how can the company continue to improve, develop and create additional value.

The results can be indicated as "traffic lights". For example, red attributes mean that they are critical and need to be reviewed again and put some resources. Green indicates that the attributes are in order. Yellow attributes mean that results are scattered and respondents have different understanding and view about the situation in the company. Balances Critical Factor Index (BCFI) which was developed from Critical Factor Index (CFI) is considered to be one of the main tools in detection of the critical factors.
CFI diagram includes such indexes which need to be calculates: gap index, average of expectations, average of experiences, importance index, performance index, direction of development past and future, CFI, BCFI and Scaled Critical Factor Index (SCFI):

$$\text{Gap Index} = \left| \frac{Avg\{experience\} - Avg\{expectation\}}{10} - 1 \right| \quad (1)$$

$$\text{Direction of development index} = \left| \frac{Better\% - Worse\%}{100} - 1 \right| \quad (2)$$

$$\text{Importance index} = \frac{Avg\{expectation\}}{10} \quad (3)$$

$$\text{Performance index} = \frac{Avg\{experience\}}{10} \quad (4)$$

$$\text{SD expectation index} = \frac{Std\{expectation\}}{10} + 1 \quad (5)$$

$$\text{SD experience index} = \frac{Std\{experience\}}{10} + 1 \quad (6)$$

$$\text{CFI} = \frac{Std\{eperience\} * Std\{expectation\}}{GapIndex * DirectionOfDevelopmentIndex * Important Index} \quad (7)$$

$$\text{BCFI} = \frac{Std\{experience\} * Std\{expectation\} * PerformanceIndex}{Importance Index * GapIndex * DirectioOfDevelopmentIndex} \quad (8)$$

$$\text{SCFI} = \frac{\sqrt{\frac{1}{n} * \sum_{1}^{n} [experience(i) - 1]^2} * \sqrt{\frac{1}{n} * \sum_{1}^{n} [expectation(i) - 10^2} * PerformanceIndex}{Importance Index * GapIndex * DevelopementIndex} \quad (9)$$

The most important indexes are CFI, BCFI and SCFI because they help to find the critical attributes and areas of the company. BCFI can be considered as the same index as CFI but it is calculated by performance index. Moreover, BCFI is the most useful and used index in order to define the most critical factors which have significant influence on the whole company's performance. SCFI index main aim is to solve the problems that happen when the respondent sample is too narrow and limited.

The value of these critical indexes can be interpreted in such a way that all attributes with a value below one can be considered to be critical and put more resources on it. The more value is going into the direction of zero the more critical attribute is. The value one means that the attribute is an optimal whereas the attribute with value above one is considered to be "high performer". However the "high performer" does not necessarily mean that there is a high performance in this area, it only indicates that expectations are met by the experience and the direction of development is higher than then one

Sustainable Competitive Advantage method

According to Peteraf and Barney (2003) the "company has a competitive advantage when it is able to create more economic value than the marginal (break-even) competitor in its product market". Competitive advantages in the company have two characteristics as temporary and long lasting periods of time. Based on resource logic, when the company has a sustained competitive advantage then it means creating more economic value than the marginal firm in the marketplace while other companies or competitors cannot copy and implement these benefits in its strategy.

The sustainable competitive advantage does not focus only on a company's competitive positions which are already existing and operating in the marketplace. According to Baumol, Panzar and Willing (1982) a company's competition is considered to contain not only its current competitors, but also there should be enough attention on the potential competitors, which will enter a marketplace at some future date.

In order to implement and identify sustainable competitive advantage (SCA) in the company, the S&R method with operations strategies and AHP with calculated competitive priorities are used. SCA can provide the basis of implementations of highly competitive operations strategy for managing the business situation in the marketplace.

In order to calculate SCA there three methods are used: MAPE, RMSE, and MAD. If SCA is between 0 to 1, and there are more SCA resulting value, situations is the better.

MAPE (absolute percentage error): SCA = 1- SUMi (ABSi ((BS-BR) / BS)) (10)
RMSE (root means squared error): SCA = 1- (SUMi ((BS-BR) / BS)^2)^1/2 (11)
MAD (maximum deviation): SCA = 1-MAX (ABSi ((BS-BR) / BS)) (12)

Analytic Hierarchy Process

According to Saaty (1980) the Analytic Hierarchy Process (AHP) method which allows considering qualitative and quantitative measured to evaluate a big amount of attributes. The main purpose of AHP method which is used in the empirical part is that to analyze questionnaires and calculate the weighting of the main criteria which are competitive advantages, namely cost, quality, time and flexibility. AHP method uses pairwise comparison among all the factors to support decision-making process (Rangone, 1996). It explores the degree of importance of the attributes and the main competitive priorities of the company. In order to be able to answer to use the AHP method, firstly it is necessarily to compare two factors and define the importance of each attribute, i.e. which one is more important and then to weight within the scale from 1 to 9 to indicate in what extent selected factor is more important than the other one. Inconsistence ratio (ICR) should be also calculated because it shows the validity of answers. If the ICR is less than 0.30 then the answers are considered to be valid and reliable and can be used in decision making process.The form of AHP is shown by Figure 1 below:

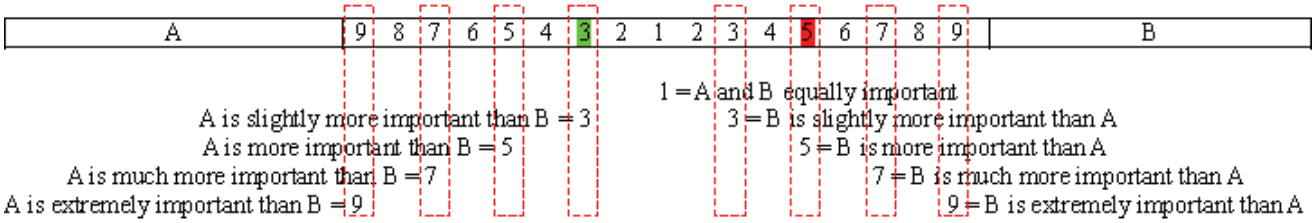

Figure 1. The form of AHP.

Case study

Case company A is a real-estate company established in 1944 and is situated and belonged to the city Turku. It is considered to be as non-profit organization, which has government restrictions concerning to operation profitability. The main idea of this company is providing rental housing. The mission of this organization is to "maintain and promote the welfare by housing means, and to contribute the local success". In addition the vision 2020 is that "A Company is the most attractive and largest of homes in the Turku region; and to provide a comfortable living experience" (Case company's official website).

The main services of case company A are offering safe and acceptable rental homes for people of different life levels, housing counseling property maintenance, care and repair, rent control, and property portfolio development. Moreover, it offers a wide range of houses such as blocks of flats, terraced houses and small private homes in Turku region. The company owns and manages approximately 11000 different types of homes, which are equipped with the basic utilities. The year turnover of the company is about 66 million euros and the general balance includes over 400 million euros. The company's market share includes approximately 10% of all dwelling and around 25% of the entire apartments in Turku region. Consequently, it can be considered as the largest individual dealer in Turku

Data collection and analysis

The data for analyzing and investigating company situation in general as well as defining the critical performance attributes was gathered by opinion survey questionnaire. The questionnaire which was developed by Ranta and Takala (2007) based on S&R method included two types of questionnaire: OP (twenty one attributes) and BSC (seventeen attributes). The questionnaire was sent to five departments of the case company, which are Hallinto, Isännöinti, Johto, Vuokraus and Vuokravalvonta. Based on answers from these departments, the data will be analyzed and interpreted. The quantity of respondents was different in each department. For example, in Hallinto there were only 4 respondents, but in Vuokraus – 9 respondents.

The value of each index in the S&R model can be obtained by such form of questionnaire (Table 1).

Performance attribute	Scale: 1=low, 10=high		Compared with competitors			Direction of development		
	Expectation (1-1)	Experience (1-10)	worse	same	better	worse	same	better
Performance 1								
Performance 2								

Table 1. Format of the questionnaire (adapted from Ranta and Takala (2007)).

RESULTS

It is reasonable to start from tracing similarities in what the case company A expects to achieve in the future period and considers more important attribute or area for the future competitiveness. The comparison of experience and expectation in every department means that it reveals the gap between experience and expectation, where the resources should or should not be put in the future period. As there are five departments were analyzed, it can be noticed that the general trend is that expectation is more than experience. Taking Johto department from the case company A as a basic and main, Figure 2 will demonstrate the gap between experience and expectation in OP questionnaire.

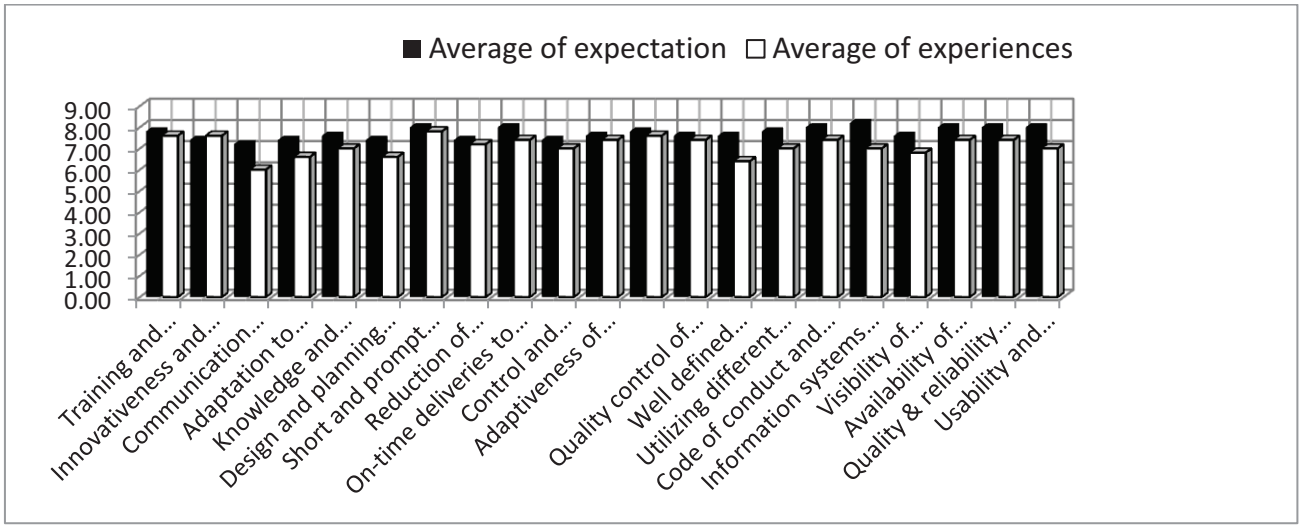

Figure 2. Resources (OP): Expectation vs. Experience in Johto department

The most interesting attributes with the biggest gap between experience and expectation are communication between different departments and hierarchy levels; well defined responsibilities and tasks for each operation; information systems support the business processes. It means that top administration feels that the company A is lacking in the mentioned attributes and expects it to improve in the future. However, there is a gap which means that one attribute (innovativeness and performance of research and development) does not need more resources put into it in the future period.

Figure 3 will demonstrate the gap between experience and expectation in BSC questionnaire.

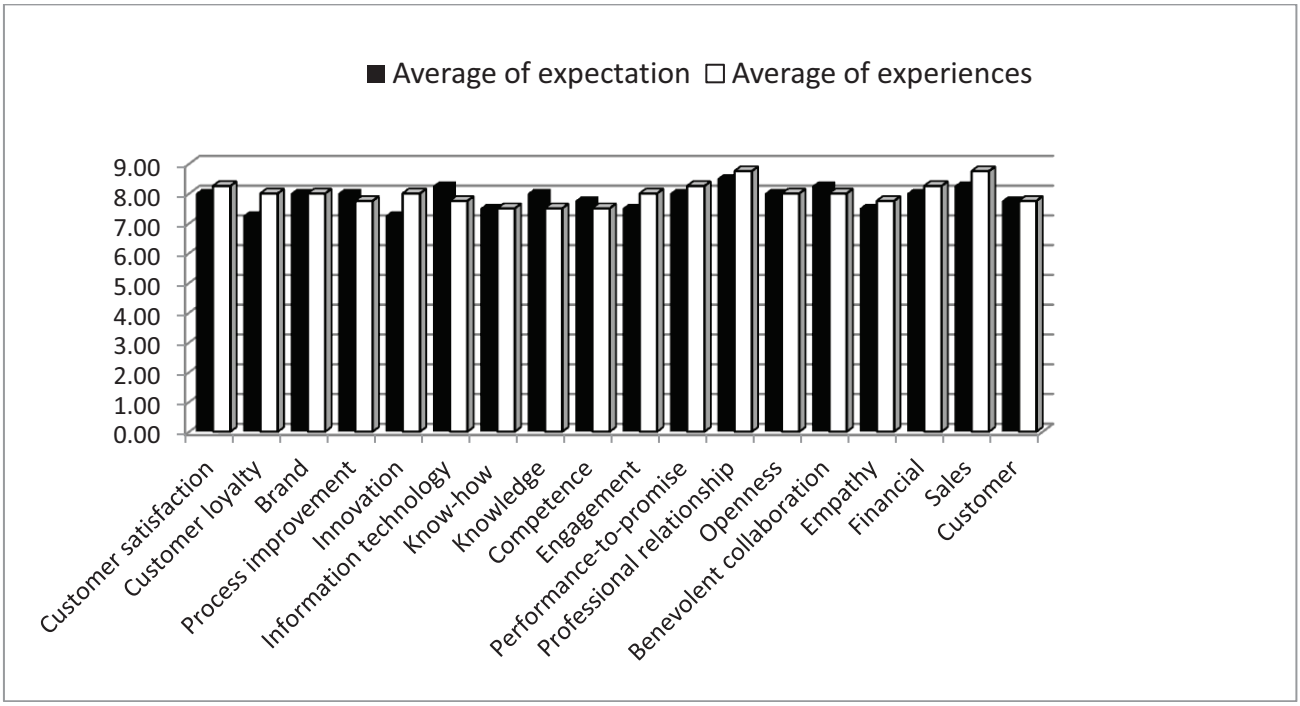

Figure 3. Performance (BSC): Expectation vs. Experience in Johto department

The matches between the expected positive changes for the company can be belonged to such attributes as information technology, and knowledge. On the other hand, it shows that there is no need in considerable improving in such areas as customer loyalty and innovation. In addition, there is no difference between expectation and experience in such attributes as brand, know-how and customer, which means that the resources should be invested continuously in the past.

After making calculations of BCFI in order to define the critical areas and attributes of the company, the general situation is stable and in future will be improved. For example, the following Figure 4 (Resources: OP) and Figure 5 (Performance: BSC) will demonstrate the comparison of BCFI in past and future and the changes of critical attributes into normalized one.

Figure 4 (Resources: OP) shows that in general the situation in future will be improved. However, there will be some unchangeable attributes in future: communication between different departments and hierarchy levels; leadership and management systems of the company; and well defined responsibilities and tasks for each operation. At the same time, in future new critical attributes will appear.
Next figure reveals the same situation as in Figure 4 (Resources: OP): it will be developed and improved. On the other hand, there are still some critical attributes, which will remain critical. They are customer loyalty, know-how, financial and customer. It means that company should pay more attention on such attributes and put more resources in improving and changing them.

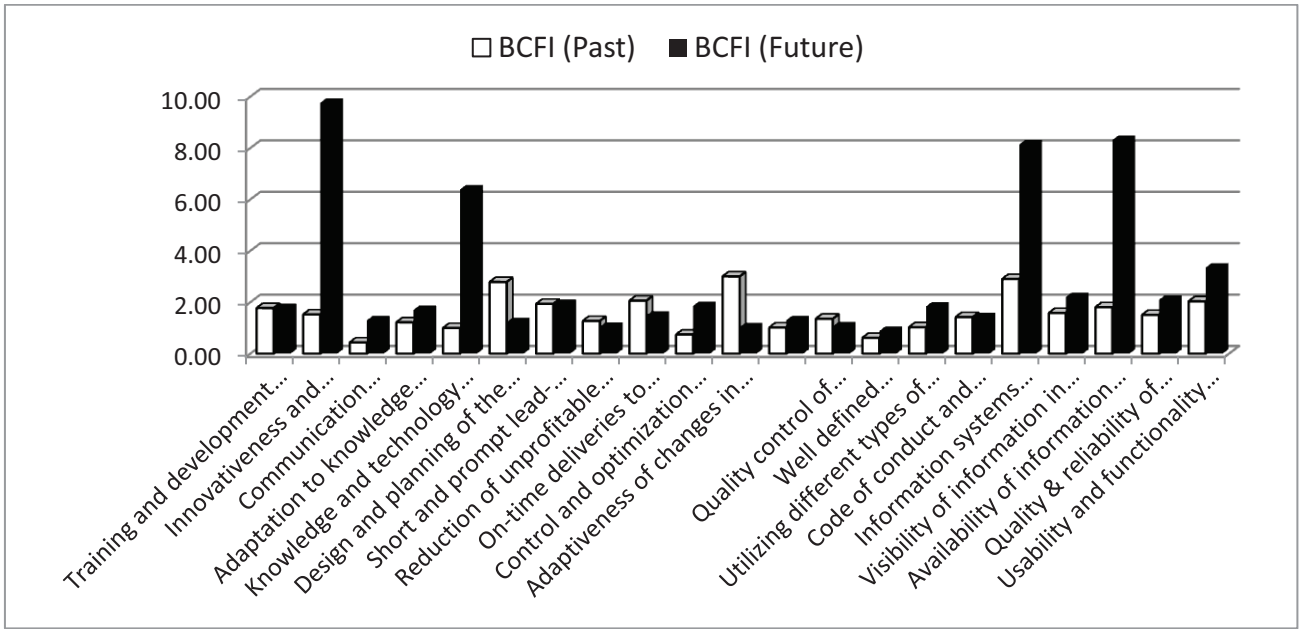

Figure 4. Comparison of BCFI past and future in Isännöinti department (Resources: OP)

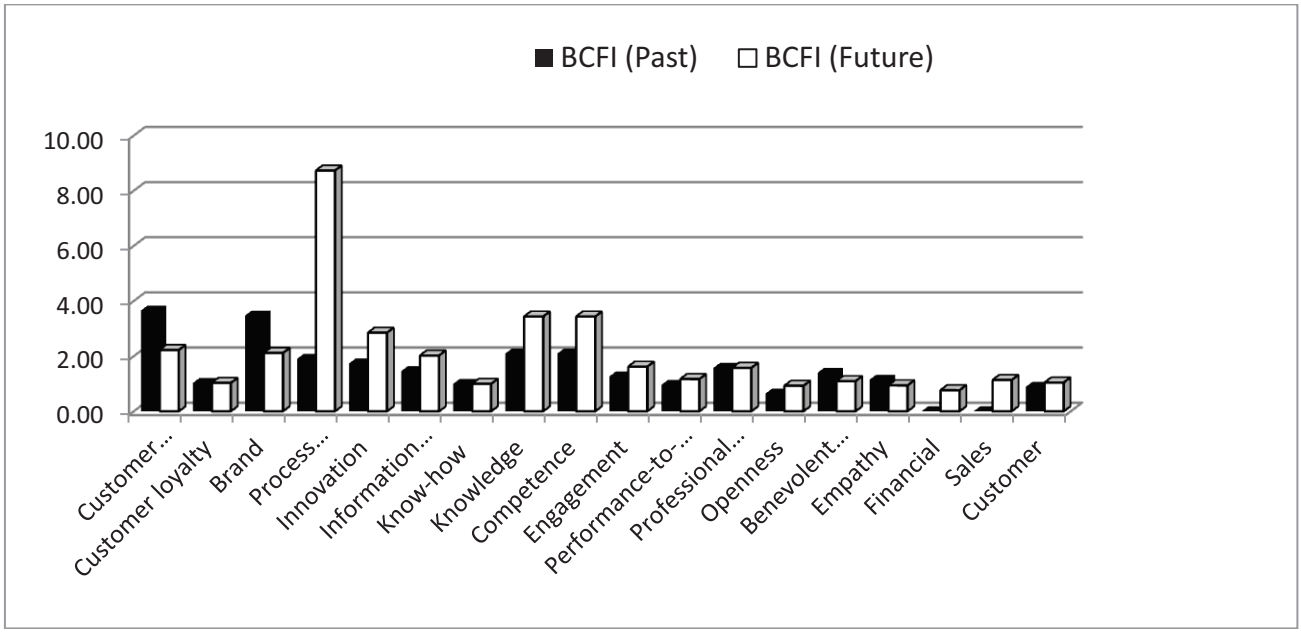

Figure 5. Comparison of BCFI past and future in Isännöinti department (Performance: BSC)

There are three main organizational strategies/types which should be defined as its features can influence on how to solve the problems and to adopt into external environment. These organizational strategies are: Prospector, Analyzer, Defender, and Reactor.

According to the results which were received after analyzing all departments' answers (Past and Future) of case company it was found out that in the Past period departments see the company strategy not in clear vision: balancing between Analyzer, Defender, and Prospector

(Table 2). However, Isännöinti, Vuokraus, and Vuokravalvonta departments are sure in Analyzer as the main operational strategy of the case company A (Table 3).

PAST							
Johto (SCFI)				Hallinto (SCFI)			
Prospector	**Analyzer**	**Defender**	**Reactor**	**Prospector**	**Analyzer**	Defender	Reactor
0.91	**0.92**	**0.92**	**0.92**	**0.93**	**0.93**	0.91	0.92

Table 2. Defining the operation strategy (PAST) based on Johto and Hallinto results

PAST							
Isännöinti (SCFI)				Vuokraus (SCFI)			
Prospector	**Analyzer**	Defender	Reactor	Prospector	**Analyzer**	Defender	Reactor
0.90	**0.98**	0.89	0.90	0.91	**0.98**	0.92	0.91

Table 3. Defining the operation strategy (PAST) based on Isännöinti and Vuorkaus results

On the other hand, in the Future period based on Hallinto, Vuokraus and Vuokravalvontaanswers company's operational strategy is considered to be Analyzer, while Johto and Isännöinti departments' opinions are not clear: balancing between Defender and Analyzer (Table 4).

FUTURE							
Jotho (SCFI)				Vuokravalvonta (SCFI)			
Prospector	**Analyzer**	Defender	Reactor	Prospector	**Analyzer**	Defender	Reactor
0.91	**0.94**	0.93	0.92	0.90	**0.97**	0.92	0.91

Table 4. Defining the operation strategy (FUTURE) based on Johto and Vuorkavalvonta results

In conclusion, general view of company is not in clear vision as different departments see the operational strategy of the whole company in different ways. In Past period case company A is balancing between Analyzer, Defender and Prospector strategies, which means that the whole operational strategy includes some features from each other. While in Future period case company A is clearly Analyzer.

After evaluation and defining the critical areas of the case company A, the next step of analyzing of this company was to define the risk level in all departments by SCA method. There are two periods were taken into the consideration: before crisis (past) and during crisis. Table 5 below shows that Isännöinti, Vuokraus and Vuokravalvonta depertments have highest risks compared to Johto and Hallinto departments, which determine unstable situation before crisis. On the other hand, Table 6 demonstrates that during crisis when some changes are implemented in the company, the risk level increased considerably, which is understandable during company changes and new strategies implementation. However, Vuokravalvonta department has the highest risk level compared to other departments which one of the reasons could be that based on BCFI results company does not invest enough resources in supporting the work of this department. Johto and Isännöinti departments have

about the same risk level, which can be explained as the company's changes have not influenced on these two departments considerably.

BEFORE CRISIS = PAST

Hallinto

Table 6. Comparison of risk levels in all departments during crisis

CONCLUSIONS

The main purpose of this study is to implement sustainable competitive advantage through resource allocation in case company A operating in housing market, which uses the S&R methodology in order to find critical factors in experiences and expectations between different departments and to see the general picture of the company.

In the study it was presentedvarious levels of the organization which are performing in accordance with common strategy. Case company A operates mainly as a Analyzer including other types of operational strategies in the regular housing market – the company is operating in two types of product-market domains: stable and changing; the competitive level of such a combination of strategy focuses on flexibility and cost, while balancing between quality and time. However, in the past it was confusion about the main operational strategy: balancing between Analyzer, Prospector and Defender. Case company aim is to keep strong position in Prospector type of company in social housing market, which requires a lot of work and a lot of changes in the operation level of the company. Prospector type of a company can be considered as a strong competitor performing in such market area without any competitors.

In order to survive within the global competition, the critical attributes should be determined in the company. Since there are many variables involved and the period when the questionnaire was sent is changeable and unstable, the overall situation in future is expected to be improved, even though new critical factors will appear. The better situation can be seen in the Vuokravalvonta, Isännöinti, and Vuokraus departments.

In the final analysis, there were two periods taken into the consideration during the calculation of risk levels by SCA method, where before crisis period generally the whole situation in the company is normalized and stable, while the crisis has started, the risks increased. Crisis brings a lot of changes in the company and therefore the risk level is increasing, which can be appropriate situation. However, the highest risk level is in Vuokravalvonta department, which can be the reason to go deeply into the department performance and to reorganize or to invest more resources into this department.

In the future research, several ideas can be proposed as follows:

- as there were interviews made in 5 departments of the company, not everybody could give appropriate answers to the questions in questionnaire, which might give a wrong picture of business processes of company. Therefore respondents should be chosen more accurate;
- as S&R, AHP and SCA methodologies show only outcomes of the company analysis, but not the reasons why the company is facing the problems and why there are critical factors in there. Therefore, after making the full analysis based on the questionnaire, the interview should be used in order to see the complete process: income – outcome;
- SCA method should be improved by defining one tool and technique for making better calculations and conclusions.

A DEMERIT CONTROL CHART FOR CUSTOMER SATISFACTION SURVEY

Worlaluck Jankrajang, Department of Industrial Engineering, Faculty of Engineering, Kasetsart University, Thailand
Email: worlaluck@eau.ac.th

ABSTRACT

Purpose: *The main purpose of this article is to present the advances of control chart techniques in nonmanufacturing processes. Specifically, we present a new approach to monitor service quality with time. This study uses the performance of the demerit control chart to monitor the negative responses or nonconformities with respect to the service quality characteristic. These charts assign the different weight to each negative responses, regard of the degree of unfavorable.*
Design/methodology/approach: *Applying of the demerit control chart to monitor the customer survey data is discussed. The procedure of constructing the proposed chart is described by a numerical example using data collected in an assessment of library service quality at a private university in Thailand.*
Findings: *The control chart shows one sample that is above the upper control limit this could indicate that an assignable cause affected those quality characteristic. Perhaps those service offered might less than student expectation. Action should be taken to figure out how to address the issues in those items and bring the process back to the in-control condition. Applying of SPC is helpful to promote service quality.*
Originality/value: *In this study, we mention that the method to analyze the nonconforming of survey results by combine the negative responses as "nonconforming" are not applicable. This paper explores new technique in service quality research and the results show that such approach can provide more realistic to monitoring a count of different categories of negative responses.*

ABSTRACT

***Purpose**: Purchasing tourism related products and services have often been limited to either bricks-and-mortar stores or desktop computers. With the growing popularity of mobile devices (m-devices) and technological innovation in wireless networks, mobile tourism (m-tourism) is expected to emerge as the next frontier in the area of mobile commerce. While the development has present consumers with another method in purchasing and ideally realistic for acceptance in the tourism industry, the adoption rate using m-device as another purchasing channel is not widespread among consumers. Likewise, the study on the adoption of m-devices in tourism sector has also been neglected by many academicians although the findings bring immense important in tourism research. Since substantial investments are needed by organizations to develop the infrastructure and building on these critical gaps, the research addresses on the factors influencing consumers' intention to adopt m-devices as another alternative purchasing channel by developing a conceptual framework.*
***Design/methodology/approach:** Given that m-tourism is relatively a new concept, the study adapts the Unified Theory of Acceptance and Usage of Technology (UTAUT) as the main theoretical background since the model can explain up to 70 percent of behavioural intention. Additionally, the study also extends the model with two additional psychological constructs namely Personal Innovativeness in Information Technology (PIIT) and Perceived Enjoyment (PE) with the objective of increasing predictive power. The constructs were added as consumers' purchasing decision is also grounded from the person's characteristic.*
***Research implications:** The conceptual framework provides valuable information to travel related organizations, mobile developers and government agencies when strategizing their mobile marketing efforts.*
***Originality/value**: In additional, the study also extends the applicability of UTAUT in the area of m-tourism from the perspective of an emerging market.*

Keywords: Mobile Tourism, Malaysia, UTAUT, Psychological Science, Mobile Commerce
Classification: Conceptual paper

INTRODUCTION

Purchasing tourism products and services were once confined to either brick-and-mortal stores or desktop computers. However with the technological innovation in wireless networks and as mobile devices (m-devices) become more advanced in terms of processing power (Wong et al., 2012) more consumers are adopting m-devices as a new source of purchasing channel. Hence, for tourism related organizations this represents a new business model and an opportunity to employ mobile tourism (m-tourism) services within the internet (Goh et al., 2010). Langelund (2007) explained that m-devices are an ideal distribution channel in the tourism industry as the functionalities are centered on the travel value chain. Siau et al. (2001) identified four characteristic of m-devices namely ubiquity, personalization, flexibility and dissemination which makes the devices appropriate for the adoption in the tourism industry. Compared with the traditional stores or desktop computers, the adoption of m-devices as another source of purchasing channel can result in significant benefits to consumers and business communities. Scholars like Lu and Su (2009) opined that consumers can shop 'anywhere' and 'anytime' since there is no connectivity interruption. Wong et al., (2012) described that purchasing using m-devices render benefits such as convenience and time saving. Yang (2010) commented on the benefits of personalization and ubiquity using m-devices. Similarly, hotels, travel agencies and other tourism related organizations can adopt to this alternative channel to improve customer loyalty and create additional revenue streams (Kim, Park and Morrison, 2008). The channel can also serve as a strategy to differentiate the organization's product from competitors. Regardless of the contributions, the adoption of m-devices has opened up new business possibilities and has impacted every facet of consumers' lives (Luo et al., 2010). PhoCus Wright, (2013) forecasted that travel booking using m-devices in the United States alone will reach USD$ 25.8 billion by 2014.

While evidence so far suggested that consumers are indeed accessing mobile sites (m-sites) using their m-devices as another channel to book for hotel rooms, rent cars and flights (New Media Trend Watch, 2012), many consumers in Malaysia do not adopt them. In a recent survey released by Malaysia Communications and Multimedia Commission, (a government agency that focuses on the multimedia industry in Malaysia), only 8.8 percent of Malaysian have actually transacted using their m-devices (MCMC, 2012). The survey was confirmed by Chong, Chan and Ooi (2012) whereby Malaysian was reported to access m-devices mainly for information rather than for purchases. The statistics also stated that Malaysia has 36,661,000 m-devices users while the number of 3G subscribers is approximately 10,335,000 in 2011 (MCMC, 2012). With Malaysia's population estimated at 28 millions (Tan, Tan and Ooi, 2011), this shows than an average Malaysian owns more than one m-devices. While such high penetration rate exists, (i.e. the m-device users divided by the total population) surprisingly the actual number of mobile transactions remains low. Malaysia remains an interesting place to study on the adoption of mobile commerce (m-commerce) in view of the low transactions rate and despite having modern telecommunication infrastructures and technologic savvy consumers (Chong, Chan and Ooi, 2012). As browsing travel related products and services on a m-device is different from browsing a website on a computer, practitioners must understand the factors leading to this low acceptance rate in order to create a successful mobile marketing strategy. While there have been numerous work related to online purchases using m-devices, the studies are mainly related to established

markets with little perspective from emerging markets like Malaysia. Furthermore, past researches conducted on m-tourism have often confined to specific viewpoints (e.g., Ahas et al., 2007; Lee and Mills, 2010; Goh et al., 2010; Pesonen and Horster, 2012). Consequently dearth research have been investigated on consumer's intention to purchase tourism related products and services using m-devices. This is puzzling as tourism industry is closely related to a nation's progress as it contributes to the country's economy and general well-being (Goh et al., 2010). Without the viewpoint from the mobile perspective, the study on tourism is considered to be incomplete. In addition, as the platform to develop a successful mobile infrastructure can come up to millions of dollars, tourism related organizations can only reap benefits if consumers are actually adopting to this new technology (Rogoski, 2005). Hence, it is imperative for the present research to study on why consumers adopt or reject a certain Information Technology (IT).

Taking together all of these arguments and the fact that purchasing tourism related products and services using m-device is still a new concept, we decided to modify the definitions proposed by Wong et al., (2012) regarding mobile shopping (m-shopping) in Malaysia and to define m-tourism as "any monetary transactions that is related to the purchases of tourism related products and services conducted using internet-enable mobile phone/smart phone or with connectivity to the wireless telecommunication networks". As online purchases include airline tickets, rental cars and hotel accommodations (Kim, Park and Morrison, 2008), we decided to limit our study from this perspective. The study decided to integrates the psychological science construct with the Unified Theory of Acceptance and Usage of Technology (UTAUT). The integrated model will help to provide a clearer insight on the consumer's acceptance and ultimately helps to improve the quality of services among practitioners. The study offers a set of benefits. Firstly, by understanding how consumers behave online, the study helps practitioners such as travel agencies, hotels, airline organizations, government agencies, mobile developers and other tourism related organizations to further improve on their mobile websites (m-websites) so that they can device a successful mobile marketing strategy. As consumer behaves differently when compared to bricks-and-mortal stores, it is therefore important to understand what motivates them to shop virtually. Secondly, by understanding the needs and motivation leading to consumers to shop for tourism related products and services using their m-devices, the findings can also help to boast the number of tourists' arrival to Malaysia. In sum, the size and contribution of the tourism industry towards the country's GDP and the opportunities to create a number of tourism related jobs presents a considerable potential for the adoption of mobile technology and the rationality why this research should be conducted. The remainder of this paper is structured as follows. First we provide a review on the theoretical basis of our research frameworks. This is followed by the research hypotheses and our proposed research framework. Subsequently we present our implications to theory and practice. Finally the limitation, future research and conclusion are discussed.

A REVIEW OF THEORETICAL MODELS OF INFORMATION TECHNOLOGY ACCEPTANCE

In the field of Management Information Systems (MIS), there are many frameworks that have been developed to predict consumers' intention to accept new IT. The traditional frameworks proposed so far by IT, psychologists and marketing scholars include the Theory of Reason Action (TRA) (Fishbein & Ajzen, 1975), Technology Acceptance Model, (TAM) (Davis, 1989), Theory of Planned Behavior (TPB) (Ajzen, 1991) and the Diffusion of Innovation (DOI) (Rogers, 1995). However, focusing solely on the traditional frameworks may not be adequate in explaining the intention usage. Thus, some of the traditional frameworks have also been integrated to increase predictive powers. The integrated frameworks include the Decomposed Theory of Planned Behavior (DTPB) (Taylor and Todd, 1995), TAM 2 (Venkatesh and Davis, 2000) and UTAUT (Venkatesh et al., 2003). While TAM has been one of the most robust model in the explanation of IT adoptions, the model has limitations in terms of IT predictions.TAM and the extended TAM 2 can only explained up to 40 percent of the system usage (Lu, Yao and Yu, 2006). Given that m-tourism is relatively a new concept in Malaysia, the study decided to adapt the Unified Theory of Acceptance and Use of Technology (UTAUT) as the main theoretical background. According to Yang (2010), UTAUT integrates several competing models such as the TAM, TRA, TPB, DOI, combination of TAM and TPB, PC Utilization (MPTU), motivational model and Social Cognitive Theory (SCT). The model was found to outperform each of the competing models respectively. Venkatesh et al., (2003) in their explanation further commented that the direct determinants of usage intention is predicted by Performance Expectancy (PE), Effort Expectancy (EE), Social Influence (SI) and Facilitating Conditions (FC) while gender, experience, age and voluntariness of use is posited to moderate the usage intention. However as the model can only explain up to 70 percent of behavioural intention (Venkatesh et al., 2003), the present study decided to integrate the framework with two psychological science constructs namely the Personal Innovativeness in Information Technology (PIIT) and Perceived Enjoyment (PE). The constructs were integrated as the motivation to purchase online products and services are influenced by the consumers' characteristic. With the integrated framework, the consumers' intention to purchase tourism related products and services can be better explained. The framework however only includes gender and age as the moderating effect since they have been validated in many IT adoption studies and to exclude voluntariness and experience. Finally, in determining the independent variable, the study decided to adopt intention than actual behaviour since m-tourism is relatively at an infancy stage in Malaysia. Therefore consumers' intention is a better measurement than actual purchase. Moreover, according to Fishbein and Ajzen (1975), there is a strong correlation between intention and actual behaviour. The study was also supported by Davis (1989) in the TAM study whereby behavioural intention is assumed to be a good indicator in predicting actual usage. See figure 1 for the proposed research framework.

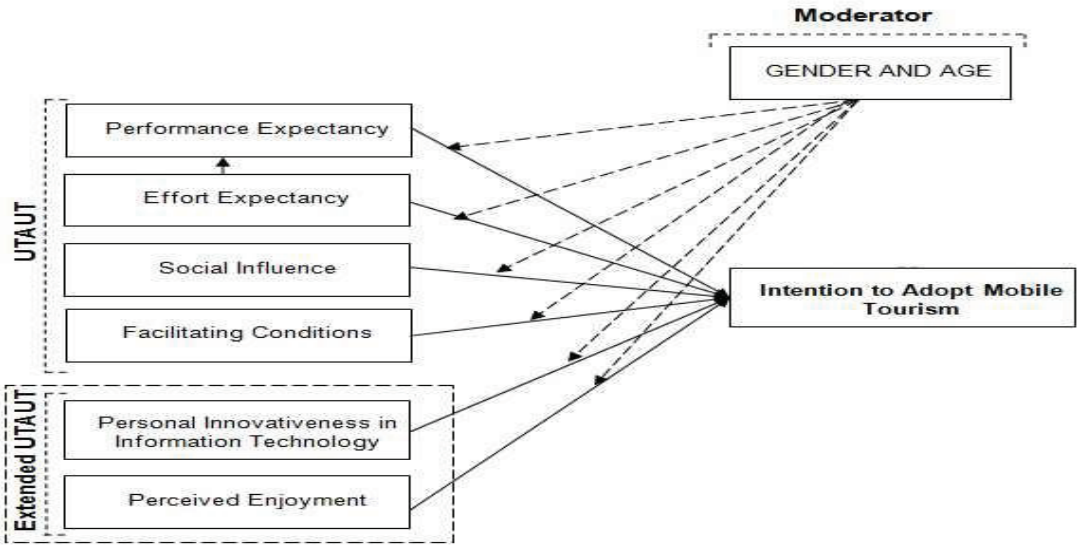

Figure 1 Proposed Research Framework

CONCEPTUAL MODEL AND PROPOSITIONS FOF M-TOURISM

The proposed research framework was drawn from the UTAUT model. The framework has also been extended with two additional psychological science constructs namely PIIT and PE to increase predictive power.

1 Performance Expectancy (PE)

Performance Expectancy (PE) reflects the individual believes whether adopting a particular system will bring benefits in terms of task performance (Venkatesh et al., 2003). The definition is similar with Perceived Usefulness in TAM (Davis, 1989) and Relative Advantage in DOI (Rogers, 1995). Many past studies have found that EE has a significant influence on the intention to use such as in the adoption of mobile services in Finland (Carlsson et al., 2006) and m-shopping in Taiwan (Lu and Su, 2009). Wong et al, (2012) in their study regarding m-shopping in Malaysia, asserts that consumers can shop anytime and anywhere due to the 'portable' and 'always on' features of m-devices. Thus the adoption translates to time saving, convenience and flexibility for consumers while on the move (Shin, 2010; Yang, 2010). If consumers perceived that there are advantages adopting m-tourism when compared to the traditional bricks-and-mortal stores, this in turn will increase the intention to adopt. Thus, the following proposition has been formulated:

Proposition 1: PE has a significant relationship with the intention to adopt m-tourism in Malaysia.

2 Effort Expectancy (EE)

Effort Expectancy (EE) reflects the individual believes that adopting a particular system would be free of effort (Venkatesh, et al., 2003). In view of the strong predictive power, the construct has been adopted in various technology frameworks such as TAM (Davis, 1989) and DOI (Rogers, 1995). EE has also been found to have significant influence in the intention to adopt various IT innovations by many scholars (Carlsson et al., 2006; Gupta, Dasgupta and Gupta, 2008). While m-tourism has beneficial outcomes, consumers may not adopt the innovation if the innovation is complex (Davis, 1989). Hong, Thing and Tam (2006) found that that ease of use is important in the study of wireless environment. M-devices are characterized with limited screen size, short battery life-span, awkward input mechanisms and other ergonomics problem which may create frustration among consumers during transactions (Wong et al., 2012).This may diminish the overall satisfaction of consumers and the perception that the technology is not easy to use. Thus, in order to improve EE, Yang (2010) in his study on m-shopping in the United States stressed on the ease of access and navigating m-sites. Additionally, consumers will adopt m-tourism if the payment transaction is straightforward and easy to learn (Shin, 2010). If consumers experience the simplicity of adopting m-tourism, they are more likely to adopt m-devices as a purchasing channel for tourism related product and services. Thus, the following proposition has been formulated:

Proposition 2: EE has a significant relationship with the intention to adopt m-tourism in Malaysia.

In UTAUT, EE has positive correlation with PE (Venkatesh et al., 2003). The findings was confirmed by many past IT studies such as on mobile data services in China (Lu et al., 2008), internet banking in Turkey (Nysveen et al., 2005) and m-shopping services in the United States (Yang, 2010). In this context of study if consumer feels that m-tourism is easy to use and requires minimum effort to operate, this will lead to a greater expectation of PE and thereby increase the intention to adopt. Thus, the following proposition has been formulated:

Proposition 3: EE has significant relationship with PE in Malaysia.

3 Social Influence (SI)

Social Influence (SI) reflects whether an individual believes that others important to them think they should or should not engage in a particular system (Carolina, Francisco and Bouwman, 2008). SI has been found to affect user's intention to adopt various IT innovations (Lu et al., 2008; Yang, 2010; Chong et al., 2010; Tan et al., 2011) because it helps to reduce the perceived risks (Rao and Troshani, 2007). According to Venkatesh et al., (2003), SI is similar with subjective norm in TRA and can be distinguished between two parts namely the external and interpersonal (Bhattacherjee, 2000). External factors includes media reports such as newspapers, television, radio, internet and expert opinions while interpersonal factors includes opinions from peers, superiors and colleagues (Carolina, Francisco and Bouwman, 2008; Wei et al., 2009). Ooi (2011)'s study found that media influence has less impact when compared to family and friends influence in Malaysia. As m-tourism is relatively a new concept in Malaysia, the rationale goes

that new consumers may shy away from adopting the technology due to uncertainties. Katz (1980) explained that consumers will then consult their social networks on his or her decision to adopt a particular innovation. If the important referents opined that the consumers should adopt, the consumers will be likely to comply. Thus, the following proposition has been formulated:

Proposition 4: SI has a significant relationship with the intention to adopt m-tourism in Malaysia.

4 Facilitating Conditions (FC)

Facilitating Conditions (FC) refers to the individual believes about the availability of resources, knowledge and training to support the adoption of a particular system and is similar with behavioral control (Venkatesh et al., 2003). According to Taylor and Todd (1995) FC has direct influence on the behavioral intention of many IT studies. Yang (2010) found that FC is positive related to the intention to adopt m-shopping in United States using 400 respondents as samples. He explained that consumers are more likely to adopt if they have the knowledge and skills to explore m-websites. In another study, Revels, et al., (2010) found that transaction fees, subscription cost and data services charges affects the adoption of mobile services. The study was supported by Teng and Lu (2010)'s study whereby cost is an important factor in the adoption of PDA phones in Taiwan. In the adoption of m-tourism in Malaysia, the cost may include the 3G subscription fees, transaction fees, handset cost and maintenance cost (Chong et al., 2010). Consumers are unlikely to adopt the particular technology if they do not have the necessary financial resources. Similarly FC also involves the availability of training and supports for consumers (Lu et al., 2008). In this context of study, even if consumers have intention to adopt m-tourism, they are unlikely to adopt the innovation when there are existing barriers. Thus to facilitate usage, the obstacles should be removed (Venkatesh et al., 2003). Hence, the following proposition has been formulated:

Proposition 5: FC has a significant relationship with the intention to adopt m-tourism in Malaysia.

5 Personal Innovativeness in Information Technology (PIIT)

Chang, Cheng and Lai (2005) refer personal innovativeness (PI) as the degree whether an individual is willing to adopt new innovations. Agarwal and Prasad (1998), subsequently adapted PI in the IT domain and proposed a new measurement namely Personal Innovativeness in Information Technology (PIIT). Citrin et al., (2000) stressed that all individuals possessed a certain degree of innovativeness. The explanation goes that individuals with high level of PIIT are usually risk takes, active seekers of new ideas and are more venturesome since they have higher tolerance level towards uncertainty when compared with individuals with lower PIIT (Rogers, 1995; Liu and Li, 2010). Similarly, Lu, et al., (2008) pointed out that when individuals have higher PIIT, they developed more positive perceptions towards usefulness, complexity and compatibility which then contribute to higher intention to adopt. There are numbers of literatures that supports PIIT as an important construct in the study of IT innovations. Using 470 Spanish mobile telephone users as a sample, Joasquin, Carla and Silvia (2009) found that PIIT has significant influence on the intention to adopt m-shopping in Spain. In another study of five

cities across China, Lu et al., (2008) found that PIIT influence the intention to adopt wireless mobile data services using structural equation modelling. Thus, the following proposition has been formulated:

Proposition 6: PIIT has a significant relationship with the intention to adopt m-tourism in Malaysia.

6 Perceived Enjoyment (PE)

Perceived Enjoyment (PE) is the degree to whether engaging a particular system is perceived to be enjoyable in its own right and is regarded as an intrinsic motivation (Venkatesh, 2000). Enjoyment can come in the form of pictures, background music, commercial flash, animations, when consumers search for a particular products or services using their m-devices (Lu and Su, 2009). When the technology is perceived to be fun, this creates favourable attitude to adopt. PE has been found to be significant with the behavioural intention of various IT studies (Teo and Lim, 1999) such as in the adoption of mobile internet (Liu and Li, 2010), PDA phones (Teng and Lu, 2010) and mobile phones (Chang, 2010). In this context of study, when consumers experience the feeling of fun, joy or playfulness (Webster et al., 1993) attributed to the adoption of m-tourism, this leads to positive emotions (Revels, Tojib and Tsarenko, 2010) and promote the intention acceptance. Thus, the following proposition has been formulated:

Proposition 7: PE has a significant relationship with the intention to adopt m-tourism in Malaysia.

7 Moderating effect: Gender and Age

According to Venkatesh et al., (2003) men are task-oriented in nature and like to focus on problem solving (Gefen and Straub, 1997). Thus this explains why men perceived usefulness more important than women. Women on the other hand are affected by the services and emotional traits and as a result, PEOU are more salient for women (Hu, Said and Hu, 2010; Zhang et al., 2009). In the study of UTAUT, gender was found to moderate the effect of EE, PE, FC and SI (Venkatesh et al., 2003). Furthermore in the study of wireless mobile broadband to access games (Ha Yoon and Choi, 2007) and wireless mobile data system (Lu, Yu, Liu, 2006), findings indicated that gender moderates PE and PIIT respectively. In terms of age, the perception of usefulness on the intention to adopt a particular technology is weaker for older consumers when compared to younger consumers (Venkatesh et al., 2003). The rational goes that young consumers are influenced by extrinsic rewards and in this case the usefulness of using a particular technology (Pan and Maryalice, 2010). In the study of UTAUT2, age was found to moderate FC and hedonic motivation (Venkatesh et al., 2012). Thus, the following proposition has been formulated:

Proposition 8: Gender and age moderates all relationships among variables in the research framework.

IMPLICATIONS

The study provides important implications for researchers, travel related organizations, mobile developers and government agencies rendering m-tourism services for Malaysian consumers. In terms of the theoretical perspective, the conceptual framework extends the UTAUT with two psychological science constructs namely PIIT and PE to examine the consumers' intention to adopt m-tourism. We believe that the extended UTAUT can provide richer insights than UTAUT alone. The study also contributed to the existing literature for emerging markets by taking into perspective of m-tourism which is currently a neglected area among scholars. The study has contributed by providing the foundation on the factors that may influence the adoption of m-tourism and bringing new perspectives beyond the traditional IT studies. In terms of managerial implications, as PE might have positive influence on the intention to adopt m-tourism, travel related organizations and government agencies should focus their marketing campaigns by disseminating information on the benefits of m-tourism. One of the benefits of m-tourism is the ability to purchase anytime and anywhere thus resulting to time saving and convenience among potential consumers who are always on the go. The adoption also helps to enhance shopping effectiveness among consumers. Thus in order to create a favourable PE among consumers the strategy is to highlight on the potential advantages of adopting m-tourism in the marketing campaign. Secondly, given that EE might be an important construct in promoting the intention to adopt m-tourism, mobile developers should stress on the friendly interface of m-websites To begin with, the m-sites should have easy navigation system, straightforward hierarchical menu design and should display only the relevant information to avoid clogging the bandwidth. Yang (2010) suggested that the interface should takes into consideration the phone processing speed, thus two different types of interface designs should be created; one for the high end device and another for low end device. As m-tourism will involve payment transactions, the payment systems should not be complicated. M-sites should reflect the convenience of payment and have straightforward registration process. Additional support should also be made available by travel related organizations. For example by providing frequently asked questions (FAQ), step-by-step video guides and caring customer support. Additionally, mobile developers should ensure that the m-devices are user friendly. M-devices can be enhanced with bigger screen size, input mechanisms, memory, battery life span and screen resolution, thereby helping to craft a positive EE perception among consumers. Thirdly in view that EE may influence PE, travel related organisations should ensure that m-tourism is easy to operate with minimum efforts. A simple strategy is by conducting a road show or supplement training programs to teach consumers on how to operate and navigate m-websites. Fourthly, given that SN may exert an important influence on the intention to adopt, they should not be ignored. As the opinion of relatives, friends, mass-medias and colleagues are important, government agencies and travel related organizations can apply two strategies. The first one is by promoting their advertisements at popular social networking sites such as 'Facebook', 'Twitter', 'MySpace' and 'Friendster' and to take advantage of the word-of-mouth marketing strategy. Consumers who help to spread positive words to others using the social networking sites should be rewarded with free gifts, discounts, vouchers and travel coupons. The second one involves the invitation of opinion leaders or celebrities to provide a review or testimonial on the relevant m-sites. By publishing their testimonials this will encourage adoption among non-users. Sixthly, in view that PIIT might be important in this study, the market should be segregated since different consumers require

different benefits when adopting to a particular technology. For example in order to stimulate non-innovative consumers at the early stage, travel related organizations and government agencies should focus their marketing strategy by giving our gift vouchers, rebates or cash back. The right marketing communications should also be tailored for this group to increase their confidence level of a particular technology. In light that PE might be an important variable in the consumers' intention to adopt m-tourism, mobile developers should integrate the element of fun in their m-sites such as by including animated graphics, icons, music, avatar and other entertainment elements. The positioning strategy should portray the elements of happiness and fun. Hence this will create a favourable shopping experience for consumers as they will view m-tourism as an enjoyable experience. Finally in view of the importance of FC to promote the intention to adopt m-tourism, they should be given equal attention. Practitioners and government agencies should organize training courses and provide adequate supports to facilitate consumers' familiarity in operating m-websites. Additionally, mobile developers can help to reduce the cost of adopting m-tourism by offering rebates, partnership with telecommunication companies and any other monetary incentives.

LIMITATION AND FUTURE STUDIES

The study confronts several limitations. The conceptual framework is based on an extended UTAUT which may not be adequate in predicting consumers' intention to adopt a certain IT. In this paper, we did not include constructs such as government supports, perceived risks, perceived trust and etc which may be considered relevant in improving the explanatory power on the consumer's decision whether to adopt m-tourism. Future studies may draw on these constructs. Finally, while the paper provides useful information to mobile developers, travel related organizations or government agencies, the study is conceptual in nature. Thus, future research can extend the scope of study from the quantitative approach such as by using multivariate analysis.

CONCLUSION

The primary objective of the study is to examine on the intention to adopt m-tourism in Malaysia. In view of the benefits of adopting m-devices and the ever increasing number of m-devices in Malaysia, more consumers are expected to adopt m-devices as another source of purchasing channel. Therefore in order to understand what motivates consumers to shop virtually, a conceptual research framework was developed. Since UTAUT can only explained up to 70 percent of usage intention, additional constructs were integrated. The study decided to extend the framework with two additional psychological constructs namely PITT and PE. The framework contributes to the existing body of knowledge for travel related organizations, mobile developers and government agencies by providing richer insights on the strategy to create a successful marketing campaign from an emerging market viewpoint.

**Phatchayathit Jankananon, Faculty of Political Science and Public Administration ,
Chiang Mai University, Thailand**

ABSTRACT

Purpose: *In 2011, Thailand faced its worst flooding of all time. The crucial issue of this disaster is how Thai people responded to the situation. This study traces the reactions to this event from Thai social network users of Twitter and Facebook.*
Design/methodology/approach: *The core data for analysis were tweets from hash tag #Thaiflood and messages posted in Thaiflood Facebook. This study constructed a content analysis platform for collecting data from each selected tweet and post during the period of flooding from September 25, 2012 to October 10, 2012.*
Findings: *The findings principally describe the reaction patterns of posts on Facebook and tweets by twitter. These reactions are presented statistically to provide debt-details in user behavior. They conclude, for example, that on Facebook females (58.4%) are more concerned than males about floods; and on tweeter, messages on flooding were tweeted by only 25.1%, of which many re-tweeted.*
Practical implications: *If possible, government should consider these social networks as a critical tool example in a disaster management plan. This would help in responding immediately to an event, and assist in reducing damage.*
Originality/value: *This study explains interaction between the social network and disaster phenomenon. Furthermore, the results help to provide a fundamental background for the next step of research in this area, such as understanding the phenomenon through the lens of theory.*

Keywords: Social network, Flooding, Disaster management, Thailand

INTRODUCTION

Increasing numbers of social networks are a part of daily life. They help to connect people around the globe via social network applications such as Facebook, Twitter, and MySpace. For instance, Thailand has around 18 million Facebook users (as of April 2013) [I], of which over 12 million are in Bangkok. This ranks Bangkok number one as having the most Facebook users worldwide (as of April 2013) [II]. Social networks have been utilized increasingly by both the public and private sector in order to extend their reach into the general public. For example, hotels in Taiwan employ Facebook as their international e-marketing tool (Hsu, 2012), while the

Chinese government has used Weibo to disseminate information and provide services to its citizens (Liu *et al.*, 2012).

In recent years, the public sector and general public have used social networks to send and receive information during disasters (e.g. Murhpy, 2013; Polen, 2008). Like other countries, Thailand has embarked on using social networks for disaster management. For example, the National Disaster Warning Center uses a website, and in some cases Facebook, and twitter, to inform people about disasters occurring in Thailand and other parts of the world. Therefore, this paper explored social network use during the 2012 flood in Thailand, with the aim to observe how social network users reacted to the event. To this end, Facebook messages and tweets of Thaiflood were examined. Thaiflood was established by a non-government organization, which provided information on floods in Thailand.

RELATED WORK

Social networks such as Facebook and twitter have become important tools for disaster management. They serve as new media for connecting people, who are affected by disaster, and guiding disaster management. Community functions are disrupted generally during a disaster (Abarquez and Murshed, 2004), when the organizations involved can employ social networks in various aspects including disseminating public safety information, sending notifications and emergency warnings, and providing a supplement to a conventional emergency channel for assistance requests (Lindsay, 2011).

As such, various accounts have been reported of Facebook and twitter use for disaster management. Flood information, deriving from government agencies, local councils and new media, was distributed to local residents and travelers via Facebook during the recent 2010/11 Queensland and Victoria floods (Bird *et al.,* 2012). Freeman (2011) examined the use of social networks in the Australian context for providing information during natural disasters. He pointed out the shortcoming of circulating information by traditional methods, i.e. television and radio broadcasts that communicate one-way to citizens, whereas social networks are more dynamic and allow for knowledge sharing. Similarly, Polen (2008) indicated the problem of one-way communication from officials to the general public, as compared to backchannel communication (peer-to-peer communication) using social media that include twitter and personal blog. More advanced use of twitter for disaster management was suggested by Sakaki *et al.* (2010). With the real-time nature of twitter, these researchers could use tweets to predict earthquakes and send notification e-mails to registered users.

According to what is written above, there is still room for investigating the relationship between social media and disaster management. Therefore, this study aimed to explore reaction to the Facebook and Twitter network during a flood situation.

RESEARCH METHODOLOGY

Tweets from hashtag #Thaiflood and messages posted in Thaiflood Facebook were the core data for analysis, collected from September 25 to October 10, 2012. In total, there were 21 Facebook messages and 748 tweets for analysis. The data derived were analyzed by means of content analysis, where the contents of the Facebook messages and tweets were categorized into groups. Statistical analysis was also performed by way of frequency and percentage.

RESULTS AND DISCUSSION

1 Thaiflood Facebook

Overall, 22 messages were posted on the Thaiflood Facebook from September 25 to October 10, 2012 (Table 1). Evidently, the number of messages posted was considerably small both in terms of the number/day, which ranged from zero to three messages/day, and the total number. This clearly indicated a low number of information 'providers' disseminating flood and related information on a relevant Facebook. Nevertheless, the small number of Facebook messages triggered rather wide reactions among Facebook users, who accessed Thaiflood Facebook during the study period. This reaction based on total number of Likes, Comments and Shares, was 8,590, 558, and 2,938, respectively. It was obvious that the number of Likes on the Facebook messages was higher than that of Comments and Shares, because Likes on Facebook are easy to register with just one click.

The results indicate that although there were only 22 posts on Facebook, 12,089 reactions of Likes, Comments and Shares were registered. This also implies that many people see, know, monitor and share information.

Table 1 The Likes, Comments and Shares registered on Thaiflood Facebook messages from September 25 to October 10, 2012

Date	Facebook Message	Number of Likes	Number of Comments	Number of Shares
25 September 2012	Message #1	626	74	477
	Message #2	294	14	140
26 September 2012	Message #1	624	23	39

The post observed on October 1, 2012, was used as an illustrative point for analyzing more details. This post was selected, due to it gaining most attention by having 943 Likes. The picture and message from this post showed a new discovery, in that floods had less effect on rice grown on water. It should be noted that information was obtained from only 500 of 943 Facebook users, who clicked on Like, because of the technical limit set by Facebook. It was discovered that of these 500 users, 292 (58.4%) were female, 189 (37.8%) male, and gender of the remaining 19 (3.8%) was not specified (Table 2). This suggests that women were more concerned than men about floods.

Table 2 Likes on Thaiflood Facebook messages by gender

Gender	Number of Facebook users	Percentage
Male	189	37.8
Female	292	58.4
Not specified	19	3.8
Total	**500**	**100**

Contents of the comments posted on Thaiflood Facebook on October 1, 2012, were analyzed. There were 32 comments in total, of which one could not be included for analysis, due to the privacy setup used by the user. From these 31 comments, it was found that men and women posted almost equally; 15 comments made by men and the rest by women (Table 3).

Table 3 Thaiflood Facebook messages by types of comments and gender

Type of Comments	Number of comments	Percentage	Gender	
			Male Number of comments	**Female** Number of comments
Support	23	74.2	8	15
Critique	6	19.4	5	1
Suggestion	1	3.2	1	-
Argument	1	3.2	1	-
Total	**31**	**100**	**15**	**16**

The comments under question can be grouped into four types: support, critique, suggestion and argument. Comments under the support category (23, 74.2%) were positive reactions from Facebook users. Evidently, most comments fell into this group (Table 3). The users posted comments that supported or praised the Facebook messages concerned; for example, one comment read "*Thai people are excellent!*" This may indicate how users supported Facebook messages for carrying useful data to them and other people. Also, the messages may be thought to contain information that was liked or particularly important.

The six comments (19.4%) posted by Facebook users in the critique category expressed their own opinions of the messages concerned, which may or may not support the information provided. For example, one user commented, "*In the next 25 years, [we] will grow crops on water.*" This comment was a reaction to the news on 'floating' rice, which forced him/her to express an opinion on the possibility of 'floating' crops in the next 25 years. The posts and their statistics hint of people having strong positive reactions to new ways of adapting to life with flooding.

The one comment (3.2%) from a Facebook user in the suggestion category provided ideas based on information contained in the messages under question. This user commented, "*This idea should be promoted in rice farming areas, which are also the water retaining areas; it will be very useful.*" It could be said, therefore, that this user suggested carrying out the idea in other areas, which may be of benefit to others. There was also only one comment (3.2%) in the last category; argument, which contradicted other opinions and carried a negative view. This Facebook user stated, "*We can only do rice farming on the other people's back*." 'One does rice farming on the other people's back' is a Thai proverb, which means taking advantage of other people, and this user used it to express his/her opinion of the information on 'floating' rice farming.

As mentioned above, most comments were assigned to the support category (74.2%). However, with gender taken into consideration, a marked contrast was observed, in that almost all comments posted by women fell into this category, while those submitted by men were scattered across all four categories (Table 3).

Concerning Shares of the Thaiflood Facebook messages posted on October 1, 2012, data were obtained from 161 of 389 Facebook users, due to Facebook's technical limit and users' privacy setup. It was observed that of the 161 users, 92 or 57.14% were female (Table 4). This finding is congruent with that of message Likes, which was clicked more by women than men. This may confirm that women were more concerned than men about the flood and more active in disseminating information.

Table 4 Shares of Thaiflood Facebook by gender

Gender	Number of Facebook users	Percentage
Male	63	39.13
Female	92	57.14
Not specified	6	3.73
Total	**161**	**100**

Shares of Thaiflood Facebook messages normally received comment as well, which also was analyzed. As with comments on Facebook messages, comments on Shares also could be categorized into four groups: support, critique, suggestion and argument (Table 5). It can be seen that 55 comments (43.3%) fell into the support category; and, similar to comments on Facebook messages, women provided more of them than men. Interestingly, the number of critique comments was considerably high; accounting for 52 (41.9%), and second only to support comments. The suggestion and argument comments (5 and 12, respectively) were considerably small in number when compared to the other two categories. In any case, Shares of Facebook messages drew more reactions in terms of comments than Facebook messages (cf. Table 3).

Table 5 Comments on Shares of Thaiflood Facebook messages by types of comments and gender

Type of Comments	Number of Comments	Percentage	Gender		
			Male Number of comments	Female Number of comment	Not specified Number of comments
Support	55	44.3	20	31	4
Critique	52	41.9	31	20	1
Suggestion	5	4.1	3	1	1
Argument	12	9.7	4	8	-

2 Thaiflood twitter

From September 25 to October 10, 2012, a total of 748 tweets were from the hashtag #Thaiflood (Table 6). It was found that the Thaiflood twitter was most active on September 28, 2012, when there were 85 tweets and least active on October 7, 2012, with only 8 tweets. Regarding the information disseminated, the 748 tweets can be classified into four groups (Table 6), as follows; 1) tweets on a flood situation (188 tweets/25.1%), 2) tweets on news relating to flood (441 tweets/58.9%), 3) tweets making announcements or warnings (96 tweets/12.8%), and 4) tweets on the weather forecast (23 tweets/3.2%).

Table 6 Types of Thaiflood tweets

Date	Type of Tweets				
	Flood Situation/ Tweet	News relating to flood /Tweet	Announcement or Warning/Tweet	Weather Forecast/ Tweet	Total Tweets
25 September 2012	15	19	2	2	**38**
26 September 2012	17	29	14	4	**64**
27 September 2012	24	33	7	2	**66**
28 September 2012	35	33	13	4	**85**
29 September 2012	9	6	2	2	**19**
30 September 2012	8	5	1	0	**14**
1 October 2012	15	39	7	2	**63**
2 October 2012	15	36	10	2	**63**
3 October 2012	9	42	10	2	**63**

Date	Type of Tweets				
	Flood Situation/ Tweet	News relating to flood /Tweet	Announcement or Warning/Tweet	Weather Forecast/ Tweet	Total Tweets
4 October 2012	10	60	11	0	**81**
5 October 2012	5	46	8	0	**59**
6 October 2012	5	8	4	0	**17**
7 October 2012	0	7	1	0	**8**
8 October 2012	7	42	1	1	**51**
9 October 2012	8	25	1	1	**35**
10 October 2012	6	11	4	1	**22**
Total Tweets	**188**	**441**	**96**	**23**	**748**
Percentage	**25.1**	**58.9**	**12.8**	**3.2**	**100**

As tweets may be re-tweeted by users, re-tweets also were considered in the information on Thaiflood tweets. As an example, re-tweet activities on September 25, 2012, are presented in Table 7, where it can be seen that on this particular day, 11 users re-tweeted the Thaiflood tweet. Each of these users had followers ranging from 13 to 1,075; 2,539 in total. As such, after the re-tweet had started, 2,539 more people accessed the Thaiflood tweet.

Table 7 Users who re-tweeted the Thaiflood tweet and their followers (25 September, 2012)

Date	Re-tweeted Users	Followers
25 September 2012	Pomipei	648
	Bend_Ny	81
	pleng_golf	16
	Timmynokoto	17
	Chaitheguru	206
	Manovana	14
	FahCaramel	112
	PLOYozoK4	107
	peemulia_near	13
	AcinarYoko	1,075
	CityRabbit9	250
Total		**2,539**

Although Thailflood tweets on flood seemed relatively small in number (25.1%). when compared to news relating to floods (58.9%), Thaiflood twitter could still be considered as the main tweet provider in the event of flood. During the study period, Thaiflood continually provided flood information via its tweets, of which many were re-tweeted, thus helping to spread information quickly to others. This proved once again the potential value of social networks during a disaster like flood.

CONCLUSION

Thaiflood employed Facebook and twitter for circulating information in the event of flood. These social networks showed a wide reaction among the respective users, which can be observed by Likes, Comments, and Shares on Facebook messages, and re-tweets on Twitter. Thus, in the Thai context, where users of Facebook and twitter continue to rise, social networks can provide new channels of communication to the public over the course of disasters. This insight would be of crucial importance to Thai government agencies concerned with managing disasters, as a social network can become a critical tool in disaster management plans. Using a social network that distributes information quickly would help these agencies to obtain immediate responses in the event of disaster, and accordingly help to reduce the damage and loss caused.

"NOVEL SMART MAP" DESIGN FOR THE TOURISM INDUSTRY

Student, Hsin-Jung Lu, Department of Technology and Transportation Management, National Chiao-Tung University, Hsinchu, Taiwan, ROC

**Professor, Lee, Tzong-Ru(Jiun-Shen), Department of Marketing
National Chung-Hsing University, Taichung, Taiwan, ROC**

ABSTRACT

The main function of the NOVEL SMART MAP(NSM) is to assist tourists who come to the Ximending area for sightseeing in Taipei, Taiwan, ROC. With this digitalized map, they can smoothly plan their schedules. The idea of Novel SMART MAP comes from that tourists won't need to spend too much time in searching places to visit in general. The goal of NSM P is to make tourists' use of time visiting local businesses more efficient. There are two characteristics in this modern map: First this map will reduce the probability of tourists wasting time going to a store which is "closed" on the day that they search. If the store is not open, the system will advise tourists to switch to another store with a similar style which is close to the "closed" store. The map provides an available "match" for both restaurant and recreational type businesses. The second advantage of NSM is that the system will tell tourists: when "YOU ARE READY TO GO!" so they do not need to wait in line, for example, to have a table at once in restaurant that they have chosen.

There are two additional functions of this modern map. One is that coupons can be made available for the stores which may not appear by default on the search results of this map, as long as this business is willing to pay for the advertisement service charge. The other additional function is the relevant positions between each spot for the stores are shown in NSM.

Based on the user-friendly and modern-style design of this map, we hope that NSM will attract tourists with that the characteristics and functions of it will bring convenience to those visiting the Ximending area in Taiwan.

INTRODUCTION

As there are many foreigners visiting Taiwan every year, how to make them happy is important. Authors try to put myself in their shoes. If authors were tourists, the more things I can do in one day, the more delight I have. Time saving is a key. NSM can help tourists have a great schedule. In this case, Ximending area is used as example where is noted for heaps of new and odd stuff.

The goal of NSM is to shorten the time of waiting in front of the store (restaurants, nail-decorated shop, cinema etc.) and confusing which way to go. The system can tell you:
˙You complete a feasible match
˙It's time to go!
˙Distance between two places
˙How long you probably have to take

˙The store is “closed” today or not
˙There is another good choice or not
˙Detail of the restaurants and spots

Besides this information, the NSM also appends a full view of Ximending area and numerous coupons by other store owners who want to boost their business.

THEORY AND METHOD

Tourists don’t like to wait and bear too much uncertainty. Just like customers waiting for a restaurant. Waiting time is one of the key satisfaction factors. Customer satisfaction is important because it is usually related to whether customers will repurchase a product (Katz, Larson & Larson, 1991). In the restaurant business, waiting time is an important determinant. Dube, Renaghan, and Miller (1994) claim waiting time will affect customers’ repeat-purchase intention to restaurants. In this case, if customers wait too long for getting seats, they incline not to go to this area for another trip.

In psychological theory, during the waiting period, consumers face uncertainty about how long they have to wait, and experience stress (Bielen & Demoulin, 2007). Some researchers suggest that any information provided during the waiting period can reduce the uncertainty of the wait and lower the level of stress experienced by consumers (Bielen & Demoulin, 2007; Maister, 1985). Moreover, the uncertainty waiting time will influence customers’ emotional responses, and then the customers’ emotional responses will affect their service evaluation to this restaurant (Bielen & Demoulin, 2007).

To eliminate user’s uncertainty, NSM provides enough information (store’s name, address, telephone number, open time, distance, and length of time has to take) and real-time reply as soon as possible. Also the system will update the newest information of existing stores and add some popular tourist attractions, as travelers incline to search for adventure, and novel places which experiences are different from home.(Christine A. Vogt, © 2011 SAGE Publications) NSM system makes use of customer relationship management database to lend users information that is more attractive to them. Just like customization, after you key in personal profile (age, gender, household member, and income), the NSM system will try to offer the map which is suitable for you. In virtue of the fact that people are affected by the environment they are. (Sarah Gardiner, Ceridwyn King, and Debra Grace, © 2012 SAGE Publications)

Customer will be satisfied to have a high quality meal and unforgettable travel. Therefore, tourists are willing to come to Taiwan for another trip and recommend to friends, NSM can also promote tourism industry for countries.

NSM installs GIS system. GIS can help consumers figure out accurate address and location of destination. It helps to compute distance and time that has to take between two spots. Even users don’t know where to go, NSM would advise consumers go to the nearest place by GIS system.

SIMULATION

Miss.A and Mr.B just arrive at Ximending. They don't know how to start their trip, so they ask NSM for advice.

The system will ask user to key in personal profile in order to cater his/her preference.

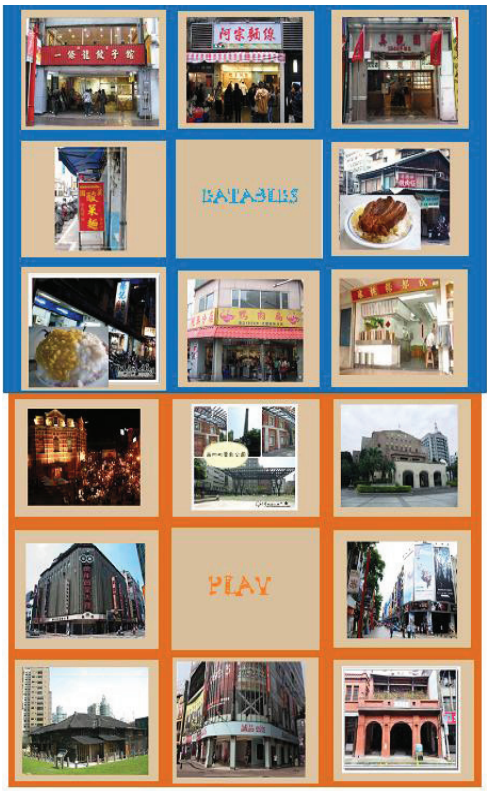

Figure 1

Figure 1 show the main page of NSM system. Users can select one restaurant to have their lunch or dinner on the upper side of the main page, and choose somewhere to play or stroll on the lower side. Then the system will tell you if your mapping is feasible. Miss A wants to eat dumplings, therefore she click the first restaurant.

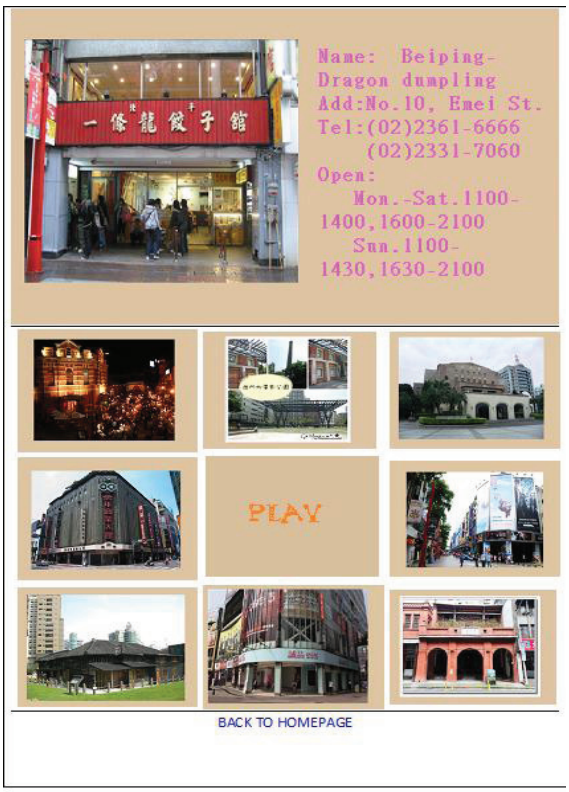

Figure 2

In Figure 2, is the page of “Beiping Dragon Dumpling” restaurant with many choices of interesting scenic spots. Then they can select one beautiful place to have fun. Miss A wants to go shopping. Undoubtedly, she selects the Elite 116 bazaar.

Figure 3

As the match is very well, system will tell you that "Good Mapping!" (Figure3)And NSM will remind you to depart at accurately when the time is suitable. Figure5 shows the outcome. What's more, the system will also show the whole map after you make two targets destinations. The map includes the distance between 2 sites and the distance they have to walk.(Figure4)

Figure 4

Figure 5

The system is not a yes man. If you do a bad match or one of your destination is closed, NSM will pop out this word “switch the order” and “do another choice”. Figure6 show the outcome.

Figure 6

If they don't like the restaurant after seeing the introduction, it's okay to back to home page to get another option. Click the bottom under the pictures (Figure7), and then back to homepage to choose another place to go(Figure8) or change their taste to others cuisine(Figure9).

Figure 7

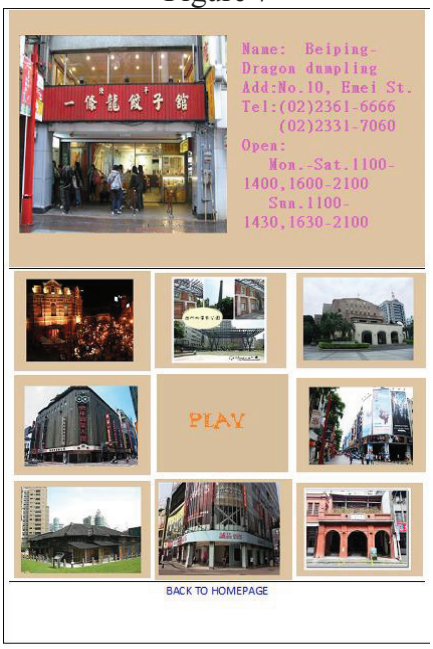

Figure 8

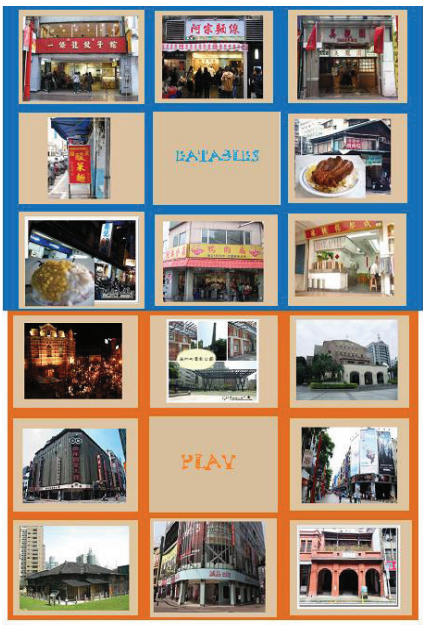

Figure 9

NSM has a full view of Ximending area's map (Figure10). Miss. A and Mr. B don't need to worry about whether they get lost since the map is very clear and simple. Icons on the map are restaurants and resorts which the system advice tourists to visit. (A-G: restaurants; a-g: recreation place)

NSM also provides an additional service that they let others store put their coupons in the system as long as they willing to pay for it. The coupons just like pop ad (kind of advertisement), it will pop out every times after the NSM system changing the page.

With the NSM, Miss. A and Mr. B really have pleasant memory in Ximending area. They decide to go to others area of Taiwan thanks to NSM assistance. Last but not least, NSM system will ask users to fill a feedback form. There are questions such like: "Is the NSM meet your requirement?", "Are you satisfied? ", "Will you come to visit our country by using NSM? ", "Does this system provide convenient service during this trip?", "Are you astonished at NSM system?", etc. All of their personal profile and their choice of destination will be record to CRM, so as to analysis people behavior and improve NSM system.

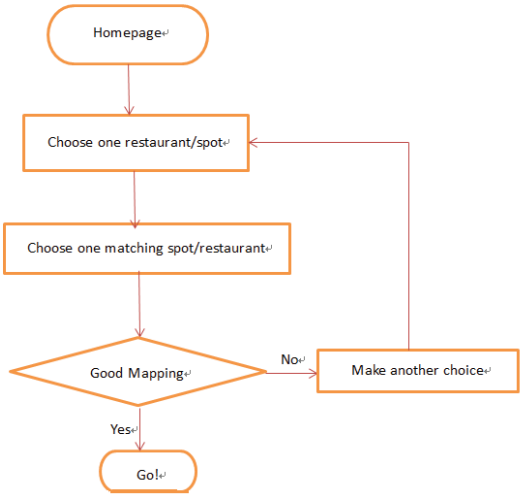
EXTENSION

˙NSM system can apply to any other tourist attractions like Brighton, Okinawa .Etc. This system now focus on the region which is not large. Distance between spots is reachable on foot and by public transportation.

˙Over time, NSM system will become more mature and stronger. NSM can accommodate larger database, so it can use on bigger cities. In the future, you can key in what you want to eat/see/buy, and then NSM start to find out your need and plan your schedule. Or put into your budget cost, and NSM helps you plan the schedule.

SUMMARY

The goal of inventing NSM is to assist tourists and backpacker. With NSM system, scheduling journey is not a problem anymore. NSM can solve all the complicated parts in few seconds to make the trip more feasible. The following flow chart shows how it works:



NSM can reduce the possibility that consumers arrive at a store which is not open. Raising the efficiency can bring more satisfaction to customer, and more satisfaction can boost the tourism industry as they will come to visit our country again. NSM plays an important role in a travel industry. It can bring enormous benefit to tourists and local business.

ABSTRACT

Purpose: *Purpose of this paper is analysis of connections between personality traits and effective functioning on different levels of professional responsibility. The main aim of this study was building a model which could explain in what way personality moderates coping with responsibility stress.*
Methodology: *Two research questions were stated: What personality traits distinguish managers from other groups with personal responsibility of decision (with higher and lower level of responsibility); and: What stable personality and emotional control traits can predict effective professional functioning on different required levels of personal responsibility decision? Three groups of people (N=110), with different level of responsibility were exam: managers – characterised by middle level of personal responsibility, Air Traffic Controllers (ATC) – very high level of personal responsibility and representatives of different occupations with low level. Two questionnaires were used: to measure personality traits (Neo-Pi-R, Costa&McCrae) and emotional control (ECQ Brzezinski).*
Findings: *Comparing of analysed groups shows many significant differences in four of the five big dimensions and specific traits. So, it is possibly to say, that probably only special types of persons can be effective as manager, like as ATC. Also, two path models were estimated. Initial model was poorly fitting the data, but the second one is characterized by very good fit indices. It shows, that some personality traits effect responsibility level directly, and in the highest way - Values. Excitability in general has negative influence on responsibility level.*
Value/oryginality: *The main originality of this paper is comparing managers with ATC group as a specific kind of responsibility. This approach make possible to state conclusions about real role of special personality traits to be effective in coping with stress responsibility.*

Keywords: professional responsibility, personality traits , managers, air-trafic controllers, organizational psychology
Classification: research article

PURPOSE OF THE STUDY

The purpose of this paper is to analyse the connections between selected personality traits and the effective functioning on different levels of professional responsibility.

Management, nowadays, is very difficult. Enterprises functioning in rapidly changing environments require managers to be a special kind of person with the aim of effective coping with challenges.

We can distinguish some specific conditions that make management difficult.

First of all, there are conditions related to global situations. Globalization processes make even quite small firms (SMEs) similar to MNEs, especially during decision processes (Berger *et al.,* 2012, Shimizu *et al.,* 2012), while external conditions change very fast. On the other hand, at a time of global crisis, necessary decisions can be unpopular sometimes, especially for employees, causing managers meeting with many negative emotions which they have to cope with (Mazzei and Ravazzani 2011, Ricard *et al.*, 2012, Metz *at al.* 2012, : Zagelmeyer and Gollan 2012).

The second thing is the expansion of ICT. As a result, managers have more information; and the information, even from other countries, is coming immediately. It is difficult to assimilate and process so many pieces of information; to try to select the important pieces and then make the best decisions for the company (Rei, 2004; Girard, 2005; Rajabzadeh *et al.,* 2012, Tao and Min, 2011, Carlevale 2011).

The third thing is the relationships with a large group of people. In many cases, these relationships have only a business nature, but some of them are not satisfied (due to type of person/personality or, for example, the subject of negotiation). It is also a reason of stress present in a manager's life.

The last thing is the level of personal responsibility taken for a decision. Every manager takes their own, personal responsibility for the effects of a decision they have made. The level of responsibility is related to the level of competence, but being even very competent employee is not enough to effective functioning as manager (Holmlund-Rytkönen and Strandvik 2005). This situation is caused by personality traits, which are very important in understanding a manager's functioning, such as consciousness, openness or possibilities to control emotions (Markowić, 2008; Service nad Carson 2010; Dragoni, 2011).

However, a manager's level of responsibility, especially in small and medium firms, although quite high, is not very high. So it is interesting to see, what personality structure characterises the people who must cope with a very high level of responsibility. It was decided that Air Traffic Controllers (ATC) can be a good control group for managers. The level of responsibility among ATCs is very high, because in the case of a mistake or a wrong decision, there is a real risk of an air crash and human death (Metzger and Parasuraman, 2005).

METHODOLOGY

Among many different factors, which are related to effective management, we can distinguish personality traits. It is known, that they are important, because managers finally take full responsibility for their decision and cope with decision's stress in a way which is characteristic for them. External conditions, quick changes and even technologies and possibilities of getting more information, make the deciding process more stressful. On the other hand, this process must be rather quick, as a response to an actual situation. Managers try to cope with this stress and decision responsibility in a different way and with a different level of effectiveness. The aim of the presented research was an attempt to find specific traits, which allowed managers to be effective in coping with responsibility stress.

Two research questions were stated:

RQ1. What personality traits distinguish managers from other groups with personal responsibility of decision (with higher and lower level of responsibility)? And, as a specific detail: How much personality profiles differ in groups?
RQ2. In what way stable personality and emotional control traits can predict effective professional functioning on different required levels of personal responsibility decision?

To find the answers:

It was decided to examine three groups of people (N=110), which differ in the level of responsibility. The main group was managers – characterised by a middle level of personal responsibility (n=60), and two control groups: one of them was Air Traffic Controllers (ATC) –a very high level of personal responsibility (n=25), and the last – representatives of different occupations (DO) with a low level of responsibility (n=25). Subjects were qualified to participation in that study, by students Agnieszka Trybuś and Magdalena Bogacka-Neugebauer, who also administered tests to the subjects and coded data. Authors want to thank them for their support in this study.

To find personality traits we has decided to use the Costa and McCrae approach, which is well known as the Big Five model, because of its relative stability of traits and, additionally, the possibilities to make cross-culture comparisons. The Neo-Pi-R questionnaire by Costa & McCrae in the Polish adaptation was used to measure personality structure. To examine one's possibilities to control emotions, a short scale was used, which measures internal predispositions to cope with emotional states. This scale was constructed in Poland by Brzeziński, and the basic theory lies among biological approaches.

Statistical analyses were made by using the IBM SPSS 21 statistic programme.

FINDINGS

1. Differences in personality structure

The first step to find answers to the research questions was comparing the personality traits among the three groups.

The first analysed trait was Neuroticism. This personality factor shows emotional stability and susceptibility to experiencing negative emotions.

Tab. 1. Differences between groups in *ANOVA* statistics for Neuroticism trait

	ANOVA		Managers n = 60		ATC n = 25		Others n = 25		Managers – ATCs	Managers - others
Personality Trait	F	*p*	M	SD	M	SD	M	SD	*Post-hoc p*	*Post-hoc p*
Neuroticism	10,486	,000	4,67	2,09	2,84	1,77	5,32	2,12	**,001**	,369
Anxiety	18,515	,000	5,18	2,05	2,68	1,75	5,44	1,47	**,000**	,833
Angry hostility	10,366	,000	4,95	1,57	3,44	2,12	5,60	1,76	**,008**	,306
Depression	7,561	,001	5,10	2,67	2,96	1,99	5,28	2,48	**,001**	,950
Self-consciousness	1,821	,167	5,08	2,28	4,52	1,83	5,64	1,75	,491	,500
Impulsiveness	1,308	,275	6,77	1,93	6,08	2,68	6,16	1,80	,357	,446
Vulnerability	10,922	,000	4,13	1,91	2,76	1,64	5,28	2,15	**,009**	**,035**

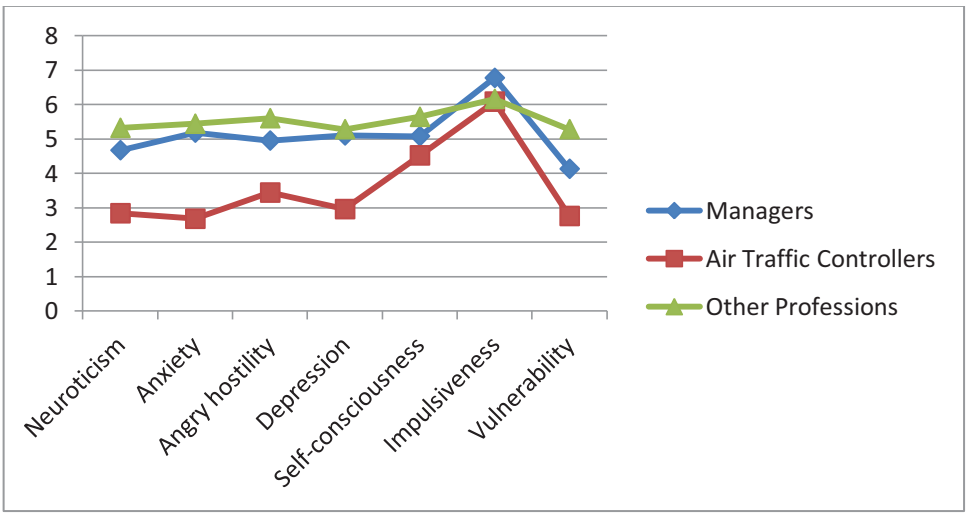

Figure 1. Profiles of Neuroticism in analysed groups

As it is shown in Table 1 and Figure 1 managers are more similar to people with low level of responsibility than to ATCs. High responsibility level requires skills of controlling negative emotions, such as anxiety, anger, irritation, sense of helplessness or guilt. It is also related to a low level of vulnerability, which means the ability to coping with stress effectively with no negative feelings. On the other hand, the level of Impulsiveness (interpreted as being able to control sudden desires of doing something) is quite high in all the groups. It shows that irrespectively of the responsibility level, people need to do something for themselves to reduce stress. This analysis suggests, that in stressful management conditions – related to a higher responsibility – managers should be more similar to ATCs.

The next trait is Extroversion. It is important in effective management because of the necessity of relationships. The profiles of analysed groups are shown in Figure 2.

A manager is a person who should have good relations with subordinates, other managers and people from enterprise's environment with the aim of effective managing. The results of this study confirm, that managers are a group with the highest level of global extroversion. They are friendly people, with a large number of social contacts. At the same time, however, they are assertive, dominative with a tendency to leadership. These traits allow them to be independent in decision making; it is similar in ATCs' profile.

Tab. 2. Differences between groups in *ANOVA* statistics for Extraversion trait

	ANOVA		Managers n = 60		ATC n = 25		Others n = 25		Managers – ATCs	Managers – others
Personality Trait	F	*p*	M	SD	M	SD	M	SD	*Post-hoc p*	*Post-hoc p*
Extraversion	7,586	,001	6,85	2,39	5,60	2,45	4,88	1,62	**,056**	**,001**
Warmth	2,21	,109	5,63	2,35	5,68	2,50	4,48	2,49	,996	,115
Gregariousness	,652	,523	6,12	2,35	5,48	2,80	5,88	1,79	,685	,942
Assertiveness	4,014	,021	6,68	1,88	6,68	2,21	5,36	2,27	1,000	**,021**
Activity	8,506	,000	6,75	1,92	5,36	1,98	5,00	2,25	**,012**	**,001**
Excitement-seeking	7,589	,001	6,73	1,92	5,24	1,74	5,40	2,00	**,004**	**,011**
Positive emotions	3,523	,033	6,72	2,30	6,44	2,43	5,28	2,09	,867	**,026**

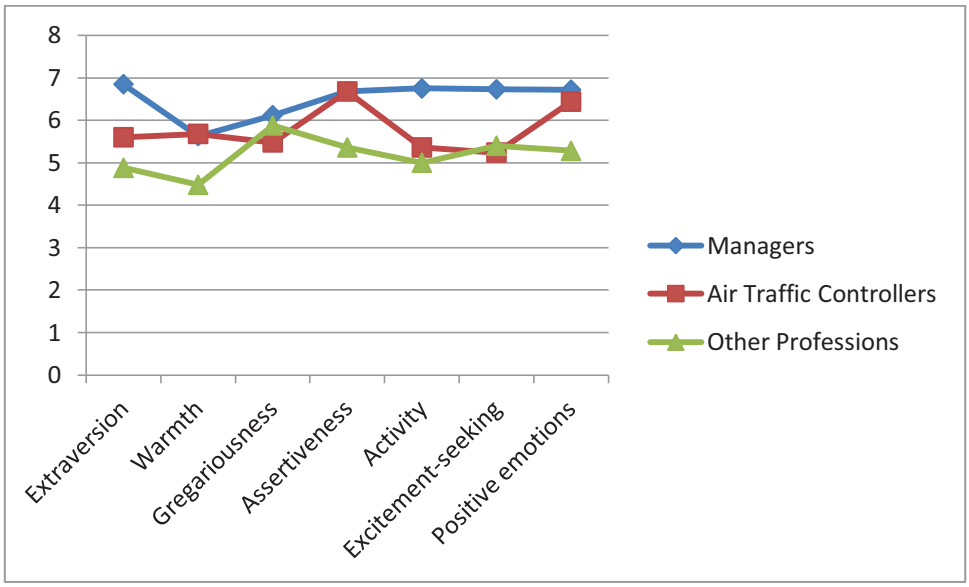

Figure 2. Profiles of Extraversion in analysed groups

But, in contrast to ATCs, not very high responsibility level allows them to be more active (e.g. work under time pressure) and risky. Rapid enterprise changes of the environment sometimes require risky decisions, which are not expected from ATCs. However, a lower level of the Excitement-seeking trait could be an impediment in effective management.

The third analysed personality trait was Openness to experience, for this dimension almost all means (for three groups) are lying above an average level (typically assumed as score between 4th and 6th sten), which suggests that decision making – in a broad sense – requires curiosity, tolerance and a special kind of unconventional thinking.

Tab. 3. Differences between groups in *ANOVA* statistics for Openness trait

	ANOVA		Managers n = 60		ATC n = 25		Others n = 25		Managers – ATCs	Managers – others
Personality Trait	F	*p*	M	SD	M	SD	M	SD	*Post-hoc p*	*Post-hoc p*
Openness	3,800	,025	7,43	1,82	7,68	2,34	6,32	1,73	,853	**,044**
Fantasy	,936	,395	7,05	2,32	7,36	1,93	6,52	2,18	,826	,574
Aesthetics	,336	,715	5,70	1,84	5,72	2,97	6,12	2,20	1,000	,786
Feelings	4,903	,009	7,33	1,92	6,20	2,60	5,92	2,18	**,073**	**,018**
Actions	1,583	,210	7,05	2,47	6,76	2,22	6,12	1,24	,934	***,069***
Ideas	4,682	,011	6,98	1,80	7,88	2,54	6,16	1,80	,145	,195
Values	19,818	,000	7,72	1,57	9,00	1,26	6,08	2,10	**,001**	**,004**

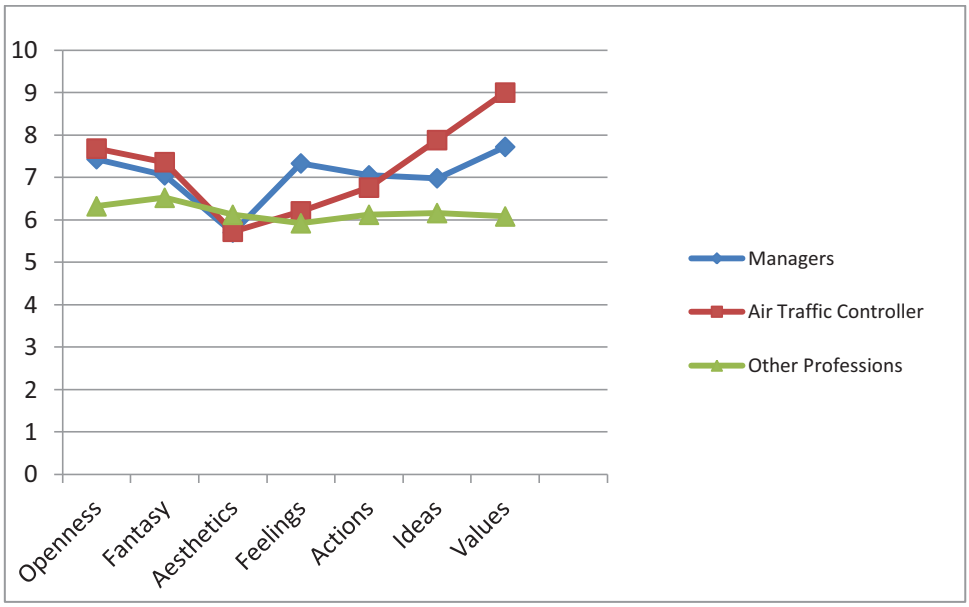

Figure 3. Profiles of Openness in analysed groups

A low responsibility level (in other professions group) is related to a relatively lower openness to experience in all of its factors, and almost all factors have similar averages. With increasing of responsibility profiles come more varied. Managers are similar to ATCs in general Openness trait and in Fantasy, Aesthetic and Action factors. Fantasy is probably important for an anticipation of possible consequences of decisions and makes the managers able of strategy planning. Managers, like ATCs, are also open to seek new possibilities, skills and chances to be better at decision making. Managers have a higher level of feelings, which suggests that they can recognize emotions (both themselves and other people's) and probably use them in management. People of other professions cannot do it well, and ATCs must not follow emotions. A significant difference is also observed between ATCs and managers in Values factor. Managers are less open to values than ATCs, but more than people of other professions. ATCs' high result is probably caused by responsibility for peoples' safety and life. management sometimes requires reinterpreting of constant values (e.g. about HR policy or environmental protection), so an effective manager should be open to new ideas, values or trends to take the most appropriate solution.

The forth analysed personality trait was Agreeableness. It shows the way of interpersonal functioning, positive or negative relationships and tendency to be dependent / independent from others.

Tab. 4. Differences between groups in *ANOVA* statistics for Agreeableness trait

	ANOVA		Managers n = 60		ATC n = 25		Others n = 25		Managers – ATCs	Managers – others
Personality Trait	F	*p*	M	SD	M	SD	M	SD	*Post-hoc p*	*Post-hoc p*
Agreeableness	2,240	,111	4,80	1,96	5,64	2,08	4,44	2,38	,214	,750
Trust	8,281	,000	5,60	2,32	6,96	2,79	4,12	2,47	*,058*	**,035**
Straightforwardness	3,379	,038	5,03	2,41	6,28	1,95	4,76	2,28	*,062*	,870
Altruism	2,976	,055	6,15	2,17	5,84	2,15	4,84	2,56	,833	**,043**
Compliance	6,170	,003	4,83	1,59	6,44	1,80	5,40	2,66	**,001**	,689
Modesty	,126	,882	5,12	2,35	5,00	2,36	4,84	2,29	,976	,873
Tender-mindedness	3,161	,046	4,90	1,94	3,80	2,36	5,12	2,07	*,070*	,896

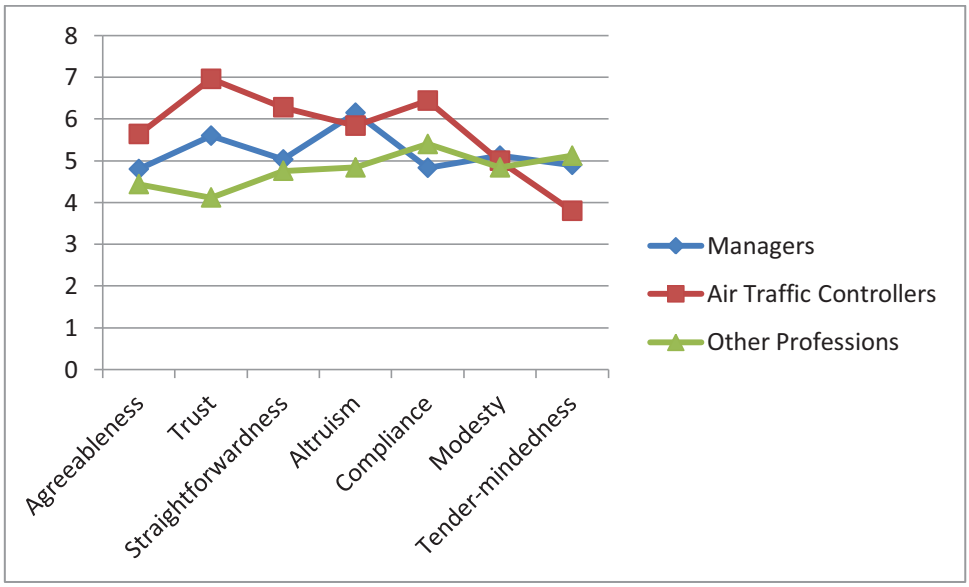

Figure 4. Profiles of Agreeableness in analysed groups

A high responsibility (represented by Air Traffic Controllers) is related to a higher level of agreeableness. ATCs are more straightforward and believe in other peoples' honesty. But, it is worth to note that their work needs such attitudes (e.g. trust towards airplane pilots or cooperate controller). Managers and other professions work in conditions with a lower responsibility, and they also know that nowadays an absolute trust towards everyone can bring negative consequences. ATCs are more able than managers to control angry and aggressive behaviour during interpersonal conflicts, while managers seem to be more dominative and rivalrous. Responsibility is also related to a low tenderness. Feelings or sympathy should not be related to work or decision making due to a possibility of negative consequences. It seems that among managers the level of Tender-mindedness could be lower (now it is the same like other of professions with low responsibility), especially when environment conditions require non-popular decisions.

The last personality trait which was analysed was Conscientiousness. This dimension characterises level of behaviour organizing, motivation to work to goals achieving, tendency to keeping order and beliefs about own competency.

Tab. 5. Differences between groups in *ANOVA* statistics for Conscientiousness trait

	ANOVA		Managers n = 60		ATC n = 25		Others n = 25		Managers – ATCs	Managers – others
Personality Trait	F	*p*	M	SD	M	SD	M	SD	*Post-hoc p*	*Post-hoc p*
Conscientiousness	7,131	,001	6,32	2,27	7,08	2,60	4,72	1,95	,342	**,011**
Competence	21,541	,000	7,15	1,63	8,52	2,08	4,96	2,44	**,011**	**,000**
Order	3,153	,047	6,85	2,43	6,40	2,66	5,40	2,14	,717	**,036**
Dutifulness	5,623	,005	6,17	2,19	7,04	2,57	4,88	2,28	,252	*,053*
Achievement striving	2,442	,092	6,23	2,48	6,64	2,41	5,20	2,27	,760	,176
Self-discipline	4,819	,010	6,00	2,50	7,16	2,70	5,00	2,08	,123	,208
Deliberation	1,034	,359	5,57	2,08	6,12	2,33	6,16	1,82	,507	,458

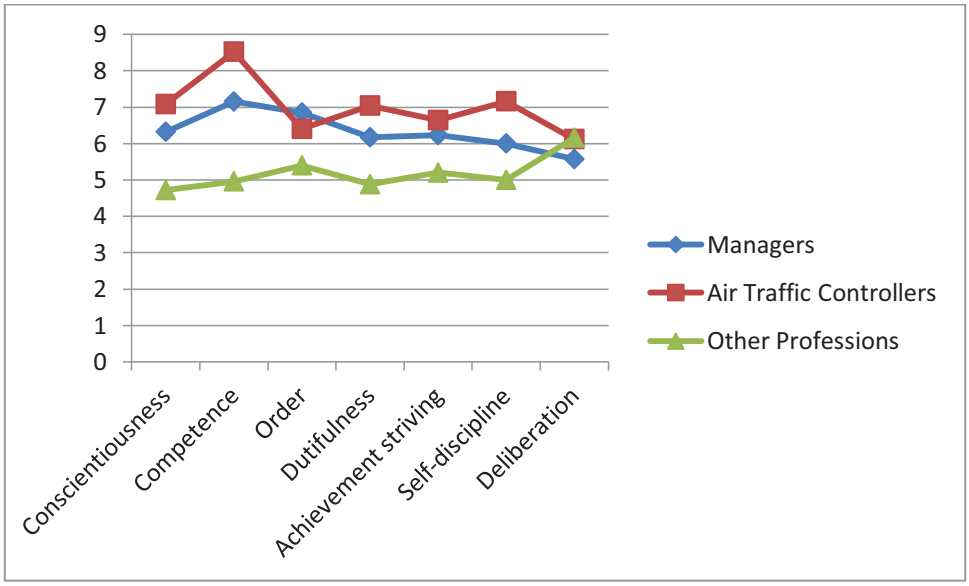

Figure 5. Profiles of Conscientiousness in analysed groups

Conscientiousness differs in the three groups, too.
People of different professions (with a low level of responsibility) have the lowest level of conscientiousness in all factors (excluding Deliberation). The highest responsibility (ATCs) is related to the highest level of the analysed personality trait. The most characteristic factor is Competence, which is the belief about one's possibility to cope with difficult situation. AT Controllers think about themselves as reasonable and effective people, whose decisions are

appropriate to situations. Managers have a bit lower level of Competence comparing to ATCs, but higher than other professions (the difference is significant in both comparisons).

The profiles of ATC and Manager groups are quite similar, and higher than profiles of other professions. It suggests than decision responsibility is related to Conscientiousness dimension.

2. Differences in emotional control dimension.

A special dimension of personality is emotional control. Differences between the analysed groups were found in emotional control: F=50,70, p=.000 for global emotional control possibility. In four of the five components the *p* is lower than .007, and only in one component – Situational control ANOVA is not significant.

Tab. 6. Differences between groups in *ANOVA* statistics for emotional control factors

	ANOVA		Managers n = 60		ATC n = 25		Others n = 25		Managers – ATCs	Managers – others
Emotional control factors	F	*p*	M	SD	M	SD	M	SD	*Post-hoc p*	*Post-hoc p*
Expression control	5,223	,007	50,32	11,16	56,56	7,42	47,32	10,78	**,036**	,453
Emotional - rational motivation	8,939	,000	48,90	10,46	58,44	10,27	53,92	7,04	**,000**	*,083*
Emotional resilience	6,128	,003	55.32	10,77	62,40	6,63	53,04	11,23	**,001**	,772
Situational control	1,069	,347	49,40	11,53	45,76	8,97	49,40	11,25	,346	1,000
Emotional excitability	11,633	,000	45,50	9,55	37,04	9,09	49,84	10,38	**,001**	,146
Emotional control	50,709	,000	52,75	10,33	71,76	6,12	67,76	8,41	**,000**	**,000**

A high responsibility level is related to good emotional control. ATCs are people who have skills to control their emotional expression in physical signs of them, like shaking hands, body movements, laughing or crying. They are also able to control their behaviour during an emotional arousal (both positive and negative). Decisions which they make have rational motives, irrespective of emotions. Managers seems to be more impulsive in their behaviour. Decisions made under the influence of emotions are significantly more emotionally motivated; even low responsibility in other professions is related to a higher level of rational motivating behaviour (statistical tendency).

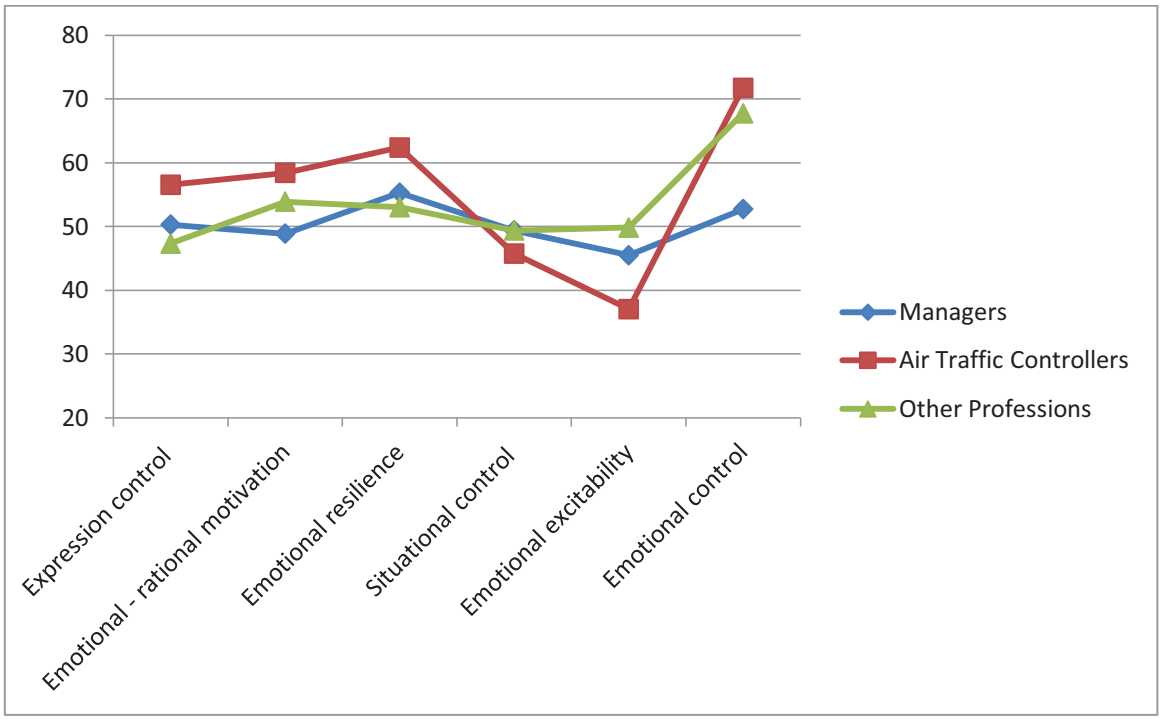

Figure 6 Profiles of Emotional control in analysed groups

A level of Emotional resilience (understood as possibility to act under pressure) among managers is similar to a low responsibility group. It suggests that ability to work without disorganising is more difficult for managers compared to ATCs.
Emotional excitability is also related to responsibility. With increasing responsibility, the level of emotional arousal decreases. This means, that people who have emotional resistance and whose emotional excitability threshold is high – have a possibility to achieve managerial positions. In case of ATCs only such candidates are choosen during recruitment process.
Situational control does not differ groups. Management is generally a situation in which the possibility to control situations, even these with emotional context, is rather small. The way of interpreting these situations is similar for the three groups; the anxiety component is not very high, so coping strategies may occur as often as avoidance behaviours.
Summarising these results we can say, that managers have a significantly lower level of emotional control than ATCs, and they are similar to people with a low responsibility (no significant difference). It means that natural selection in career progression does not provide emotional stability for a manager.

3. Path models explaining responsibility level fit to personality traits

The next aim which was taken was to find traits which can predict the effective functioning on different levels of responsibility. Two path models were estimated.

The first one (Model 1 – Figure 7) was built on the basis of the earlier profile analysis. In this model a set of personality traits (from Big Five subdimensions) explains directly or indirectly (through an emotional – rational motivation or emotional excitability) the responsibility level. This model is poor in terms of fit (Table 7), although it allows us to predict a rather large proportion of responsibility level (about 43%) using its explanatory variables. A closer look at this model shows that the influence of the emotional – rational motivation of the responsibility level is not significant. This led to an improved Model 2 (Figure 8), for which

emotional – rational motivation and its direct explanatory variables were taken out. Therefore, Model 2 is simplified - it includes 5 personality subdimensions instead of 7, and only one additional construct – emotional excitability. Fit of Model 2 is substantially improved compared to Model 1, and is characterized by very good fit indices (Table 7).

In Model 2 five independent variables are correlated. Anxiety has positive correlations with angry hostility and feelings, and negative ones with assertiveness and values. The highest path coefficient is for anxiety and angry hostility: ,43 which means a moderate but significant relationship. Other people's correlation indicators are low, with a clear but rather small relationship.

As it is shown in a model, some personality traits effect responsibility level directly, these are: anxiety, angry hostility, and values. Values and angry hostility are also related to emotional excitability and effect responsibility in an indirect way. Assertiveness and feelings have no direct influence on responsibility level and effect it indirectly by an emotional excitability.

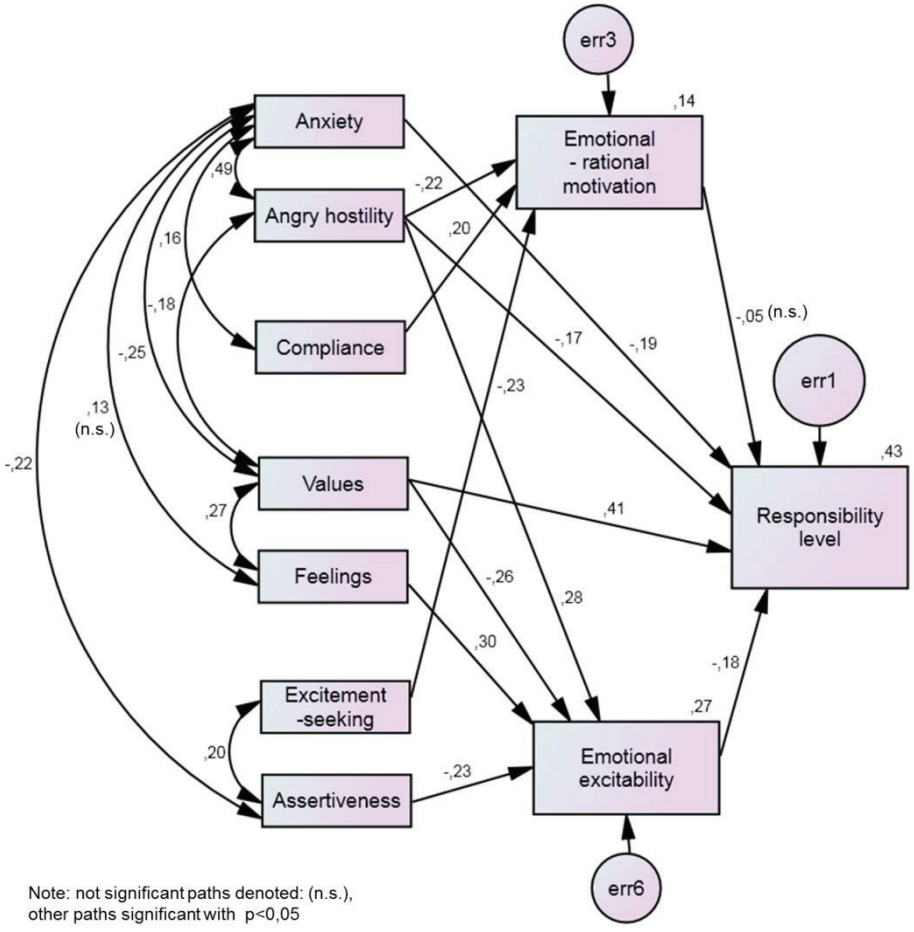

Figure 7 Structure and estimation results of path Model 1

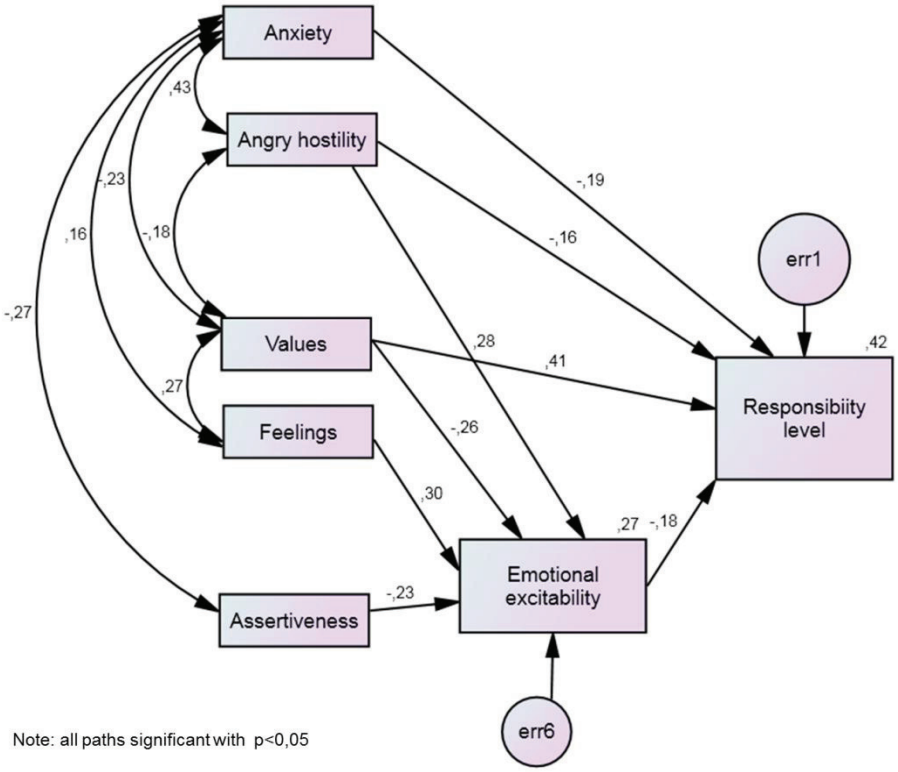

Figure 8 Structure and estimation results of path Model 2

The highest standardised path coefficient is for Values. This trait is understood as tolerance, but from other hand - openness and readiness to discuss different values or seeking other, even not quite accepted solutions. At the same time openness to values and new solutions and being tolerant can decrease emotions when faced with new situations, so emotional excitability level became lower. This two traits can make one's more responsible.

Anxiety is the only one personality trait which effects responsibility level directly in a negative direction. Anxiety persons (even without anxiety disorder) are nervous, full of tension, with a tendency to worry. General anxiety, which is a characteristic for people with high level of this trait, is not appropriate for high responsibly management positions.
Angry hostility with a tendency to experience and react with anger, irritation or hostile attitudes to others makes it difficult to clearly evaluate environmental and human conditions, so management becomes less effective.

Excitability trait is also affected by feelings, angry hostility and assertiveness. Feelings are understood as a sensitivity to one's emotions, which are experienced deeper and in a more differentiated way. A low feelings level suggests that emotional states are less intensive and are only of a little importance. Angry hostility means a tendency to react with anger, frustration and embitterment and these feelings are intensive. An increase of angry hostility is related to the increase in excitability level. The last trait which affects excitability is assertiveness, and its influence is negative. It means that assertive people – being dominative, authoritative and often natural group leaders – do not experience intensive emotions, especially negative, that they cannot control. These four traits explain 27% of an emotional excitability variation. Emotional excitability – in general – has a negative influence on a

responsibility level, which means that easier coming into emotional states (higher results in this scale) is related to poorer responsibility.
Generally, anxiety, angry hostility and values, and also emotional excitability (affected by angry hostility, values, feelings and assertiveness) explain 42% of responsibility variation. This model is fitting the data very well, and is characterized by very good fit indices.

Tab. 7 Estimated models fit measure comparisons

	Measures	Model 1	Model 2
Variance explained	Responsibility level	,433	,417
	Emotional excitability	,273	,274
	Emotional – rational motivation	,142	N/A
Measures of fit	*Chi-square*/*df* (below 2 or 3 better)[a]	2,734	1,147
	p (not significant better)[b]	,000	,330
	GFI (above ,9 is good fit)	,905	,980
	AGFI (above ,8 is good fit)	,791	,920
	NFI (above ,9 good fit)	,734	,951
	RMSEA (,05 or less better)	,126	,037
	PCLOSE (not significant better)[c]	,001	,509
	HOELTER (,05)[d]	61	191
	Conclusion about model fit	*Not acceptable*	*Good fit*

[a] "rules of the thumb" suggested by Carmines and McIver (1981) or Byrne (1989).
[b] for larger samples is often unreasonable to have significant *p*, see Jöreskog (1969).
[c] "p value" for testing the null hypothesis that the population RMSEA is no greater than ,05 indicating close fit - Browne and Cudeck (1993).
[d] Hoelter's (1983) critical N to accept model at significance level of ,05 (with given chi-square statistic and degrees of freedom)

PRACTICAL IMPLICATIONS AND RESEARCH ORIGINALITY

The main originality of this paper is comparing managers with the ATC group as a specific kind of responsibility. This approach makes it possible to state conclusions about real role of special personality traits to be effective in coping with stress coming from responsibility. ATCs are chosen from candidates during long and formal recruitment process, in which personality traits and emotional control are assessed. So it is clearly said what kind of people (understood as a kind of personality) could be working effectively with a very high level of responsibility.

Managers must cope with a quite high responsibility, too, but they became managers in a natural way of career progression, usually no special recruitment procedures were taken. Managers' responsibility for enterprise is higher than responsibility for daily life in the case of other professions, but not as high as for people's life as in the case of ATCs. So it was interesting to check if there are any differences, and, if so (as it was supposed), in which traits managers differ significantly or are similar to ATCs.

Results show that in every analysed dimension there are significant differences in specific traits. It clearly suggests the existence of special structure of personality, which describes each group. So, it is possible to say that only special types of people can be effective managers (such as ATC), because these specific personality qualities are helpful to cope with special decision stress.

An estimated path model is good to predict what personality factors are related to a higher responsibility. So this model can be good as starting point to develop special tool (a scale, a questionnaire or e.g. a structuralised interview) in the aim to check if the person could be effective in coping with a high responsibility.

Nowadays, management is very difficult. We can distinguish specific conditions related to global situation, expansion of ICT , relations with a large group of people and level of personal responsibility for decision. Enterprises functioning in these continuously changing environmental conditions requires from managers to be a special kind of person in the aim to cope effectively with challenges. As a results of the presented study (both path model and profile differences) it is possible to develop methods to find people that tend to become managers, who could be more responsible in their decisions and the probability of making wrong decisions by them could be lower. The comparison of managers with the special group of ATC (which is of a special value for this study) clearly shows what kind of people are managers, and what personality traits should have lower or higher level to be more similar to ATC, especially in traits important in management. These traits can be different depending on the enterprise's size, profile, localization, actual aims and conditions. This is the reason that authors would not list on the specific needed factors and their level. But for every future manager in every kind of enterprise it is possible to make a specific tool to select the person who is most appropriate to the actual enterprise's needs.

THE HIDDEN CULTURAL MANAGEMENT FACTORS IN ENGLISH CRAM SCHOOLS

Shao-hua Chang, Department of Applied English, Southern Taiwan University of Science and Technology, Taiwan
Email: shaohua@mail.stust.edu.tw

ABSTRACT

Cram schools are a huge business in Taiwan, with parents willing to pay thousands of dollars for what they consider an essential service for their children's academic achievement, especially English cram schools. They are especially intense around inner-city schools. However, it is not easy for English cram schools to be successful under the intense competitive environment. Thus, this study would like to investigate the successful management factors of non-chain or non- Franchisee English cram schools by using the categories in Kwok's Three-layered Cultural Model of Tutorial Schools (Kwok, 2001). Each category of this model represents the need of tutees and their parents. However, it is impossible to fulfill all of the customers' requirements. This study also intends to know the priorities of the management factors of the participant cram schools. If a cram school is to remain competitive, service quality and increasing customer satisfaction are crucial.

ASTRACT

Taiwan is located in a subtropical zone where there is a lot of moisture during the rainy season or typhoons. In other words, for most of the year, warm and moist climate are two typical features of Taiwan's environment. This kind of climatic conditions (warm temperature and high humidity) create a suitable environment for the growing of bacteria, germ, mold and insects. Besides destroying books, data files stored on electronic support and paper, it also has a serious impact on human health.
The experimental and statistical analyses of the results of this study show that factors such as the total number of people in a library, library floor area, time of day and floor position within the building, have not been showing causality with the bacterial colony count (CFU/m3).

In fact, the subsistence and reproduction of bacteria, germ, mold and insects, has a relation to temperature independent from its relation to humidity in the library environment. This study suggests that the library's administrative staff should set and control optimum temperature and humidity scrupulously. This would not only improve the staff work efficiency but also maintain paper, books and electronic material in appropriate condition. According to the results of this research, the bacterial colony count (CFU/m3) presents an increasing trend when rising the temperature in the library; furthermore, the bacterial colony count decreases as the humidity level increases. However, when both temperature and humidity are considered at the same time, then the relationship to the bacterial colony count (CFU/m3) has no significance (p value> 0.05). The optimum indoor temperature range for the library is 20°C ~26°C and the optimum range of relative humidity is 40%~60% RH.

GENESIS AND THE PURPOSE

Taiwan is located in the subtropical zone, can get plentiful moisture by rainy season or typhoon. Therefore form and "moist climate environment" and "make warm". According to the documents and materials [1] learn: In the past 100 years (1897- 1997), Average temperature of Taiwan and average relative humidity, differentiate 23 ℃and 80% RH. Moreover in the past 10 years according to Central Weather Bureau (2002- 2011) Its statistical data [2] is learnt: The average temperature of this island of Taiwan and range of average relative humidity, is 22- 23℃ and 77- 79 RH respectively. Temperature and humidity since the past one hundred years of Taiwan in other words, there is no obvious change. Relevant literature point out this kind of temperature is moderate, the climatic conditions of the high humidity, quite suitable for the existence of all kinds of bacteria and multiply [1]. Moreover can learn, suspend the respiratory system that the particle will injure the human body in the air with the documents and materials; One is smaller than 5.7 m and suspend the particle pollutant directly, it is apt to initiate breathing problems such as chronic rhinitis, bronchitis, asthma, pneumonia, etc.. Under suspending the surface of particle and absorbing the sulfur dioxide situation, the injury to the human respiratory system will be faster and serious [3]. Angry glue of living beings (Bioaerosols), in order to suspend one kind of particles, including: Suspend the microorganism in the air (such as virus, bacterium, fungi, mould) And small particle (such as spore, pollen, biological toxin) comes out by little organism release [4,5,6]. These tiny microorganism or small particle can enter the human body via the respiratory tracts as stated above, and then it is healthy to influence the people [7, 8].

Learn, the people exceed 80% in the internal environment activity time of room according to the documents and materials [9, 10, 11]. Lance [12] also proposed the similar investigation result in 1996, studied and pointed out: General people account for 87.2% of time of total life in the time of internal environment of room, the time of another about 7.2% is used in the traffic, about 5.6% are the time of outdoor sports finally. The gradual progress and industrial and commercial activity grow vigorously, can predict the people will stay and increase in indoor time continuously in the future with era. The mankind needs it by breathing to maintain the life, so the people, to "closely bound up indoor air quality" (Indoor Air Quality, IAQ) Pay attention to more and more. But, from before state it can learn, Taiwan helps to climate the environments it survives and multiply all kinds of microorganisms. So no matter oneself is the harmful to human body angry glue of living beings polluted, the muzzle enters building room directly or with personnel, mechanical ventilation facilities situation of entering room indirectly by making, certainly will can hardly be avoided.

How to improve indoor air quality, it is the people, building staff member and relevant units of government in fact, important subject that must be faced scrupulously. And the library is the place where the people often call on. Understand the angry glue of living beings which influences people's health, exist in the state of the library, find out the indoor factor influencing colony thickness of the library, and propose taking precautions against or improving the countermeasure, and then improve the indoor air quality of the library. Except that can ensure using the people to be healthy in the library, offer it outside the comfortable activity space; Can reach and increase working efficiency it with keeping many projects such as the books or file in the hall properly by improving the indoor surrounding air quality of the library.

Originally study as probing into the factor with different floors, period, place property, area of floor, the number of people of use and projects such as the warm humidity, etc. in the hall separately, and with the "impacted taking a sample device" (Buck, Bio-Culture B30120), Collect library living beings angry glue sample in the air, strike at culture medium that suit directly sample, and then received the indoor colony thickness of the library. Learn influence the main factor of the colony thickness to include with the experimental result and statistical analysis materials: Indoor relative humidity, temperature and place use properties. Enter factors such as the total number of person, area of floor period and height of floor of the hall, etc. have not been showing causality with the colony thickness.

RETROSPECT OF LITERATURE

1 The angry glue of living beings takes a sample in the way

To different uses or all kinds of buildings of ' air quality ' (including living beings angry glue distribution situation) ,Quite a lot of research has discussed with the plan extensively already; Also have periodical thesis coming up to a large number, put forward the penetrating opinion and valuable research results [13-43]. Various research results, conclusion and suggestion, the improvement of the air quality of all kinds of place, contribute tall and erectly. This research is summed up and gathered together whole and internationally, experts and scholars who probe into this topic can learn after ever using the research approach, probe into the indoor air quality methods internationally, is mostly probed into by the literature and reviewed beginning, and after putting in order and analyzing relevant materials, with the experiment tactics immediately, collected the angry glue sample of living beings in the air, select the ' culture medium ' suitable for use and train samples. Calculate the angry glue quantity of living beings in culture medium with the microscope afterwards; calculate the angry glue thickness of living beings of 1 m^3 air. Collect method of sample at the experiment, roughly can divide into two, until Shen lower law (CFU / ware) naturally first, In order to strike the law (CFU/ m^3) the second kind.

Because the angry glue of living beings is not distributed in the space of room evenly, it will change to distribute the state as the air current is changed in time or space. So gather some figure in the position, sample of the angry glue of living beings, time of taking a sample, train the way, sampling method and computing technology, will all influence the accuracy [13] of the experimental result. Getting relevant with "Shen lower the law naturally" the two differences:

1. Strike the law: Use and strike the law taking a sample device, it is relatively high to catch the angry glue probability of living beings, comparatively accurate at the time of quantitative analysis. But need special instrument, and take a sample the area is relatively small, time is relatively short that take a sample. Moreover need consider the accuracy of the taking a sample device in addition. For example apparatus correct the issue and maintenance question [13], etc.
2. Shen lowers the law: Generally speaking, Shen fall living beings angry glue total number that law obtain than bump into law to be large naturally. But small living beings angry glue among air, easy to bully, flow, influence more unstable, so unable to control the angry glue of living beings effectively Shen drops to surface of culture medium. Lower the quantity and relate to suspend particle size in angry glue Shenyang of living beings. Learn by experiment Shen fall quantity and microbial particle thickness of air

appears positive correlation. Than bump into law to be loud error to lower law Shen take a sample repeatedly. But Shen lower law take special instrument, easy and simple to handle, take a sample area to be relatively loud. Until "bump into law", quantity examine the result, the trend is identical [13] generally speaking "Shen lower law naturally".

2 Indoor air quality

Because of the angry glue thickness of living beings, is the good and bad important assessment indicator or not of the air quality. And the daily colony thickness of angry glue thickness of living beings is come to weigh. The colony in the air is the taller in thickness, show that there is pathogenic microorganism (such as the bacterium, fungi, virus), small the particle (Such as fungi spore, actinomycetes spore). and the dust). It is the higher, the apteral to initiate respiratory disease to wait for the quantity of the common allergic source. Learn [13] according to the literature, influence the factor of the colony thickness in the indoor air, include: Occupy the indoor personnel's density, building and ventilate the situation, day lighting, temperature, humidity, dust content of taking a breath, suspend the diameter size of particle and surrounding environment state etc. Foreign relevant research group, propose the following important conclusions and propose according to the research results:

1. Indoor colony thickness, the winter that summer exceed; Early exceeding noon late; The building exceeds the one-storey house; Exceed the room in the public place, the fire coal gets warm one gets warm in the family more than air conditioner, the dirty air exceeds and cleans the air [13] (China's Mainland).
2. Indoor colony thickness <1,500 CFU/m^3, belong to the room of the hygiene with "ordinary" state; Indoor colony thickness <2,500 CFU/m^3, belong to the room of the hygiene with ' slightly bad ' state. The patient of waiting room gathers and the quantity is large, in order to ensure clinic people to be healthy, the colony thickness <1,000 CFU/m^3 in the fixed air and should be sterilized regularly. Stipulate the colony thickness of office building and hotel <1,500 CFU/m^3 [13] (China's Mainland).
3. The colony thickness of the hospital <1,500 CFU/m^3, places such as hostel, market, club, theatre, amusement park, subway station, etc. Colony thickness <4,000 CFU/ m^3, the colony thickness in the ordinary hotel, hostel air <2,500 CFU/ m^3, GB/T18883-2002 indoor air quality standard, stipulate the colony thickness is 2,500 CFU/ m3 (China's Mainland) [13].
4. Belong to "clean air" colony suggestion of thickness until (bump into law take a sample). Belong to "ordinary air" colony suggestion of thickness until (bump into law take a sample) [13].
5. Indoor colony thickness <1,000 CFU/m^3 is an indoor air quality minimum exigency, the condition of the indoor air with good quality is the indoor colony thickness <500CFU/m^3 (Hong Kong) [14].
6. The indoor colony thickness in summer ≥ 2,500 CFU/m^3 is regarded as the air (the Soviet Union) polluted [13].

Should protect people to be healthy, as well as for really feasible regulation, China's Mainland and Japan, stipulate the suggestion value of the colony thickness in the indoor air tentatively, as shown in Table 1 [13].

Table 1 the air colony thickness advising value (Mainland China and Japan)

The air cleans degree		Sample method	
		Lower the law in Shenyang naturally (CFU / ware)	Strike the law (CFU/ m^3)
		total number of the colony	
Mainland China	Clean air	≤30	≤1500
	Ordinary air	≤75	≤2500
Japan	Very Clean air	1～2	-
	Clean air	≤30	-
	Ordinary air	31～75	-
	Demarcation line	150	-
	slight pollution	≤300	-
	serious pollution	≥300	-

3 The hurting mould with the insect pest of paper books file [1]

Deposits in books files such as the literature periodical, file file, historical materials, the magazine prevails and consult the books in the library, etc., mostly paper materials, and paper material is mostly organic fibrous quality materials, then the moisture when will absorb the air results in hydrolyzing and reacting but enable the fibrous degradation. So, the paper material is extremely apt to suffer water damage. Secondly, the paper makes up and contains the mould and carries on the necessary nutrient of metabolism course in materials. Moreover the temperature of Taiwan is suitable, the climatic conditions that many rain is moist are quite suitable for the microorganism (mould) Grow and breed, make the paper books file must be faced ' mouldly and rottenly ' with the question, learnt, save the place, the mould that is often found in the paper quality material by the literature, including: Aspergillu, Penicillium, Trichoderma, Chaetomum, Cladosporium, Fusarium and other such as Mucor, Rhizopus, Stemphylium, Stachybotrys, Alternaria , Often on books place of file of storing (such as library). The bacterium appearing, it is suitable for the warm humidity of growing, as shown in Table 2.

Generally speaking, humidity exceed saturation or have liquid environmental terms, the bacterium could grow and breed; Take yeast as an example, the environment that the yeast grows, its humidity is close to the saturation; Secondly the mould utilizes long hypha, expand and obtain moisture range. Therefore when the relative humidity is higher than 70%, the mould can grow well. In view of the above, the mould becomes the main bacterium in “mould and rotten microorganism”.

Temperature is from 5℃to can all find bacteria under 60℃ 70℃environment. The most suitable for the temperature range of growth and lie between at 30℃- 35℃ The growth temperature of the mould about 25℃ Moreover fungus reproduction or growth still relates to environmental pH, take mould and yeast as an example, suitable for growing under the environment of pH 2 - pH 8, but relatively have a partiality for the acid environment, the most suitable acid soda value is pH 5. And bacterium like fortunately neutral or lean towards soda grow under the environment, most suitable sour soda value pH 7.5 slightly relatively.
Learn, cause the “mould and rotten” microorganism making the paper material with rotten degradation with the literature, including the fungi, bacterium and radiating the fungus. Paper a material (such as books and file, etc.). It happen “mould and rotten”, “change color” or “go

bad" should possess by primary condition of three pieces, include: Microorganism exist on room of the internal environment, supply with the nutrient that the microorganism needs (food), suitable and environmental (Temperature, humidity, pH, etc.). So long as destroy any condition into it, can prevent the occurrence of paper books file "mould and rotten". Generally speaking, prevent the occurrence of paper books file the "mould and rotten" include [1]:

1. Isolate the microorganism from books file, prevent happening "mould and rotten".
2. Control environment warm, humidity properly, prevent the mould from growing.
3. Control the warm humidity strictly: Temperature, under 20℃, relative humidity: under 65%.
4. Use physical technology or chemical method (Medicine is dealt with), eliminate the mould.
5. Use oxidant, reducing agent, and the superficial mould spot or corrupt mark of removing the paper quality by way of rinsing.

Save the warm humidity [1] suitable for the mould and grow in the place with material of paper quality of Table 2.

Table 2 suitable for the mould and grow in the place with material of paper quality [1]

genus	species	Suitable for the Temperature and humidity that the mould grows	
		Temperature（℃）	Relative humidity（%）
Aspergillus： temperature：middle humidity：85%, dry live type: 65%	Aspergillus flavus Link	30℃～38℃	80%～86%
	Aspergillus niger var.niger	35℃～37℃ Some over 50℃	80%～88%
Penicillium： temperature：low, under 0℃ Can still endanger the parasite humidity：80%～88%	Penicillium citrinum Thom	25℃～30℃ Some over 37℃	80%～85%
	Penicillium chrysogenum Thom	20℃～25℃ Some lower than -4℃	82%～84%
Trichoderma	Trichoderma viride Pers. ex Gray	Middle temperature	88%
Chaetomum	Chaetomum globosum Kunze	25℃～30℃	90%
Cladosporium		18℃～28℃ Some lower than -7℃ Some over 30℃～32 ℃	88%～94%
Fusarium		4℃～32℃	80 %～100 %

But can't grow up only in order to prevent bacteria or mould, require the paper books file to store the place simply (such as the library) Has adopted the low humidity, because it is apt to make the paper shrink to cross the low humidity, even because the too dry brittle rupture. So propose that should set up the central air system in places such as the stacks, etc., use to regulate the temperature and humidity. Can use the window (case) also for fear of factor of short of moseying, etc. The type air conditioner matches and uses the dehumidifier, reach and keep the permanent wet environment of constant temperature. When it is unable to set up the

air conditioning, storing the place must keep the good ventilation state. Usually suitable temperature: It is 24.4℃-27.7℃ in summer, it is 21.1℃ in winter; Humidity: It is 40%- 70% RH in summer, it is 20- 50% RH [44] in winter.

Except that the microorganism causes danger to the books file in the library, the material also in order to destroy the paper quality of insect is saved to the important members in the place. Pointed out by the literature, even if the insect can enter paper quality materials and save the playground smoothly, want to form the party in groups, must offer its growth and environmental condition bred suitably, just have an opportunity to cause serious danger. And it is suitable for the environment of surviving, except the food (such as books). Outside, the warm humidity is also a key factor. Exceed 25℃ as temperature, most insect can grow and multiply fast, look on as temperature lie between at 15℃- 20℃, will slow down the pace bred; It will influence insect's development [45] at 10℃ that it is low. As for insect's demand for the humidity, will be different to some extent with kind of the insect, some insects need high humidity environment (Clothing fish), but some insects can obtain the necessary moisture from the food directly (Wooden termite of the universe). Learnt by the literature, relative humidity 60%- 80% are suitable for insect's reproduction. As temperature is higher than 25℃, the relative humidity is greater than 70%, as to most insects, will breed and grow fast; As regards humidity, the demand for each kind of insect is not the same. But whole but speech, reduce humidity can reduce [45] probability that insect pest take place.

Therefore can know, the basic principle is low temperature, low humidity to prevent the insect from being of endangering the books and file. But stand in the books keeping, general people and on staff member's position in the hall, besides considering keeping security, should give consideration to personnel's comfortableness. So temperature and the two of humidity can't be too low. The books file is kept the comfortable degree of security and personnel should make the equilibrium. Generally propose temperature is set up at 21±1℃, the humidity must accord with property and state of the paper material, and give and adjust (metal historical relic appropriately: Under 45%; Organic material historical relic: 50%-60%). Should moreover prevent from warmly, the humidity changes by a wide margin, some phenomenon not even of preventing the occurrence of warm, humidity, and use to reduce the situation of damaging books file and take place. Because some humidity apt to multiply microorganism or mould too high, attract edible insect of mould, for example clothing fish, book louse, etc. enter the paper books file and store the place, gnaw the books or file [46].

The fleas are a complete metamorphosis insect, have ovum, larva and pupa and adult are four growth periods. Begin to lay eggs in 1-4 days behind the female flea sucks the blood, the ovum is produced in host's nest (in the nest) and in the nearby floor chink; some fleas can lay eggs in host's hair. The flea ovum development relates to temperature, humidity and adult, a nutritional status, suitable for the temperature of laying egging is above 70% for 18℃- 27℃, humidity; 35℃- 38℃ high temperature will inhibit flea's ovum development, will also limit the flea ovum development [47] to pass low temperature seemly.

According to the literature, Dermatophagoides pteronyssinus like life to make warm (20℃-30℃), (Relative humidity 60%- 80%) in dark environment. Mankind feel comfortable environment (Temperature 25℃, relative humidity 75%). Similarly, it is the Dermatophagoides pteronyssinus optimum condition of existence too. Regard locating in

subtropical Taiwan as example, will it be will it be the beginning and winter autumn late summer for irritation, asthma kind to take place season. Is the literature pointed out, the dust in the environment? The main reason [48] it is the good hair. Does another research point out the dust? With the mankind or animal (cat and dog), scurf, hair coming off support the family; Suitable for temperature of growth its 22℃-26℃, relative humidity 70%- 80%. And about 15℃-30℃ of average temperature in Taiwan room, about 60%-85% of relative humidity on average, so, does the climate environment of Taiwan benefit the Dermatophagoides pteronyssinus growth. Cause the dust? Become one of Taiwanese children's important anaphylactogens [49]. This phenomenon can be verified with the detection data that the municipal health bureau of Taipei will release in 2008. Measure and point out in the data: Do the first grade primary school pupils' anaphylactogens mostly come from "Dermatophagoides pteronyssinus" account for 90.8% [50].

4 Suitable for the warm humidity of the life of human house

Learn, most suitable for the temperature that the mankind lives with relevant literature is 22℃-26℃. The mankind lives or lives think the most comfortable temperature is 24±2℃ in other words. Taiwan is located in the subtropical zone, the average temperature of winter: 15℃-25℃, the average temperature of summer: 25℃-38℃. If look over simply. Taiwan should belong to the country suitable for living with the temperature view. However, Taiwan is surrounded by sea on four sides, belongs to the island type climate, the humidity is originally a bit high. In addition, Taiwan is close to the Pacific Ocean, the location is in monsoon to take; because plum rains, Northeastern monsoon or typhoon of every year, is that Taiwan brings the plentiful rainfall. In addition, the convective rain of Taiwan is vigorous, lead to the fact the humidity of Taiwan remains high, except that movable property or real estate is apt to be decreased by moisture corrosion and water, temperature is suitable for the climate environment a bit high in humidity, become microorganism, bacterium, mould, insect grow hotbed multiplied also, cause the epidemic situation of plant diseases and insect pests to increase [51].

The indoor relative humidity of the building is too high or too low, all exert an unfavorable influence as to living at home. Is the humidity too high, apt to be stale and causing the Dermatophagoides pteronyssinus. No matter the Dermatophagoides pteronyssinus, the Dermatophagoides pteronyssinus excrement, Dermatophagoides pteronyssinus body, the corpse will all become children's anaphylactogen; However, too low for humidity, to people, it is astringent to be apt to cause skin chap, eyes or the universe of nose mucous membrane, easy to be rubbed the static that is produced to shock by electricity. Point out in the literature: The relative humidity of the most suitable life of human house: 45%- 55% RH. Want, let people feel comfortable, can't consider relative humidity take suitable temperature collocate even only. Because the higher temperature is, the more air vapor is. So is the higher for temperature, the relative humidity does not let people feel comfortable until being the lower; Come oppositely to say, the lower temperature is, the higher soon the relative humidity will be. But the too high or pass and low humidity is not good to the health. When the temperature is 35℃, the relative humidity 35% RH will be more comfortable; Centigrade of temperature is at 30℃, the relative humidity 45% RH will be more comfortable; The temperature is at 25℃, the relative humidity 55% RH will be more comfortable. The house humidity relates to human comfortableness, physiology, hygiene and health. Degree is while rising, the human

body releases too much heat with the perspiration. Look on as the environmental relative humidity, the human body is unable with the release heat of the perspiration, will feel uncomfortable. Besides perspiration, the human body can evaporate the internal moisture with skin and respiratory system, use to regulate the body [51]. Influence the skin to evaporate the moisture factor, also relate to environmental relative humidity of the house besides cortex surface state [52, 53]. Temperature and humidity of the climate environment, reciprocation and then the human physiology of influence or quantization indicator of the psychology, in 1959, Thom E. C. [54] Propose: Uncomfortable index Discomfort Index (DI) Concept. Point out and act as (DI) while studying Will feel slightly hot that up to 75- 80, will feel hot and will sweat at 80- 85 will feel hot driving people up a wall when the 85 more than.

Will moreover influence study state and working efficiency of “learner” or “staff members” in the building room respectively when the warm humidity changes. The research results are pointed out [55]: When improving the temperature of indoor air conditioner, can be by method to reduce humidity, to promote indoor personnel's satisfaction. Secondly appropriate to reduce indoor ambient temperature, can raise psychology satisfied reaction and working efficiency. Moreover examined personnel but the speech to studying, under different indoor environmental conditions of warm-heat evil, match 40% of humidity and temperature and 22.0℃ and match 60% of humidity with 22.0℃ of temperature, the warm damp condition in two kinds of rooms, benefit for improving ' working efficiency ' to some extent. And reflect and investigate the result of study and learn, the environmental condition of the best warm humidity is 22.0℃ of temperature in the room according to the psychology, 60% of humidity.

In addition, can still be learnt by this research results, in the same humidity (40%) Under the condition, (28℃> 22.0℃) when the ambient temperature is the higher, One's own satisfaction to the job will be thereupon reduced. Temperature is 22.0 ℃ and 40% and 60% of humidity, for environmental conditions of better warm-heat evil of promoting “working efficiency”. At the same temperature (22.0℃), 40% of humidity and humidity and 60% of the two, the influence on working efficiency has not been showing the difference.

RESEARCH APPROACH

The place of the angry glue of living beings is collected in this research, is one public library in the peach garden county. The experiment measures the reason why the target chooses this particular use of the library, explain and show as follows:

1. The environmental protection administration of executive organ surrounded the indoor air quality proposing value of the letter announcement No. 0940106804 of administration's empty word according to December 30, the 94th year of the Republic of China, the fourth place of “the 1st kind” of item 1, include: “school and educational place, children travel the place, medical place, old man or disability look after the place”. But has not enumerated this kind of place of the “the library”. In order to find out about the library indoor air quality of place of this particular use. This research chooses library as the research object.
2. Except the library can meet general people's curiosity, increase knowledge and substantiate and can study from my essence, the library has already become a part of people's daily life, the wide place that has been liked by nearby residents and often called on now. Worth studying, the contribution degree is high.
3. The library is based on its particular function demand, except that the scale of the

building, set up the position and because in conformity with local government's special requirement, and slightly outside the difference, the planning, design, space of every place dispose and use properties in the library hall, very much the same. After selecting the representative target, its applicability of result of study is relatively wide.

Originally study the department and use “the impacted taking a sample device” (Buck, Bio-Culture B30120), Smoke the air sample breathing in right amount of volume, and assault the sample on the culture medium suitable for fungus growth directly. Train it in the course, train the ambient temperature: 30± 1℃, train time: 48±2hrs, culture medium take a sample medium as TSA (Tryptone Soy Agar) ,Its main component is agar (Tryptone, Soy peptone Nacl, Agar) ; The flow of the taking a sample device: 100L/min; The time of taking a sample: 1min; Take a sample in month: February and April; Take a sample in period: 09:00,12:00, It amounts to three periods of period at 15:00; Take a sample and click the density: Big or small in area according to the floor of floor and determines, every 500- 1,000m2 sets up one is gathered and clicked. Relevant experimental facilities and step show as below:

1. The impacted taking a sample device, as show in fig 1.

Traditional Plate Counts with High Flow Rate *Bioluminescent ATP-assay* *The Sieve Air Sampler*

Figure 1 The impacted taking a sample device, source of the photo [15]: Bioluminescent ATP-assay

2. Experiment step: Plate Count Agar (air sampling) ,Culture medium cultivates the microorganism (Such as fungi), Incubation (48hr) ,calculate the microorganism (Such as the fungi or bacterium), enumeration(CFU/m^3) .
3. The colony is counted: Train the microbial quantity of the ware, fetch $\log_{10}$, count (CFU) for the colony (Colony forming units) .
4. Colony thickness: And then change into the microbial colony thickness (CFU/m^3) via calculating.

RESULT OF STUDY

This research object is one public library in the peach garden county, it was according to period that this library was created in 1923, lie in the special zone of county government of garden of peach, carry on it in the experiment course of microbial colony thickness, must obtain management unit agree, try hard, lower people to be inconvenient outside. Should consider representativeness and integrality of taking a sample. In other words, besides should overcome the human factoring, the necessities and importance of some quantity, etc. that must consider taking a sample in the floor scrupulously, take a sample in the field and take a sample. After considering all subjective and objective influence factors, determine to carry on the date of taking a sample finally: February 24 and April 7; Take a sample in the floor: The

1st floor, the 4th floor and the 5th floor; The place of taking a sample: 7 piece place (Information department, periodical room, reading room for children, seeing and hearing classroom, open-shelf reading room, last room and reading rooms ordinary) ,The samples are lighted 84 altogether.

1. enter the total number of person of the hall and colony thickness are related

Learnt by the experiment materials, it is 467 to enter the total number of person of the hall on February 24, the thickness average of the colony is 104 (CFU/m^3) on the same day, It is 374 to enter the total number of person of the hall on April 7, 2010, the thickness average of the colony is 211 (CFU/m^3) on the same day ,If according to general people's cognition, always thought activity the total number of person was the more in the library, it is the greater to present the angry glue probability of living beings, the colony thickness of April 7 the same day should be higher than February 24. But experimental result happens that the opposite answer appears. If regard thickness average of the colony as the parameter of depending on, count the scale in order to probe into the factor with people, utilize SPSS to learn, personnel count with the thickness average of the colony after counting the software and carrying on LSD multiple comparative analysis, have not been showing the relation ($p> 0.05$) . In addition, even when being the same in case of the same use (area), Adopt user's density ($People/m^2$) when the view probes into the colony thickness, it is also unable to demonstrate and show the relation ($p> 0.05$). The research results that experimental result and literature of this research describe: ' the total number of the colony in the indoor air is influenced by a lot of factors, such as personnel's density of the room ' [13], not all the same.

In fact, no matter any place, propose pondering over the looks corresponding relation of “personnel's quantity” and the two of “colony thickness” from the following two views. First, the angry glue of living beings of outside is the larger in quantity on the spot, and personnel enter internal number of people in the place from outside the more, the probability of internal colony thickness rising of this place thereupon increases. Second, if does not consider the angry glue quantity of living beings of outside of building first, has already had angry glue of living beings as entering the internal personnel in the place, then living beings angry glue quantity in the place, will with enter place personnel increase and increase. In other words, indoor colony thickness, besides relating to outdoor colony thickness, also relate to personal sanitary condition. Suppose the outdoor surrounding air is best in quality, and personnel's hygiene state is good, even more personnel enter the library, the indoor colony thickness will not show the change because of increasing in number of people.

2. Relation between height of the floor and time of taking a sample and colony thickness

Besides special circumstances, general people could reach the other floors through the 1st floor. So is being the same in environmental cases outside, the first floor is people's only way which must be passed, judged the first floor presents the angry glue probability of living beings and higher than the other floors by the convention. But can learn after carrying on LSD multiple comparative analysis according to the experimental result of this research and with SPSS software, there is no direct corresponding relation ($p> 0.05$) in colony thickness and height of floor. Secondly, the angry glue of living beings can be direct or indirect, can be with the morning or in the evening, any time point is entered and stayed in the library. So the

colony thickness, will not show the difference ($p > 0.05$) because of time is different to take a sampling in the library.

3. Relation between the area of floor of floor and colony thickness

This research is in 7 places separately (information department, periodical room, reading room for children, seeing and hearing classroom, open-shelf reading room, last room and reading rooms ordinary) carry on the angry glue of living beings and take a sample, and learn after carrying on LSD multiple comparative analysis with SPSS software, the higher it does not represent colony thickness that the larger the area of floor of floor is. The area size of floor of floor and thickness average of colony, it is being related ($p > 0.05$) that the two have not been showing. This situation can prove by aforesaid living beings angry glue sampling method [13]. Literature point out "small living beings angry glue among air, easy to bully, flow, influence more unstable, so unable to control the angry glue of living beings effectively down". So can learn, the angry glue of living beings fluctuates with the air current, fall in each corner in training wares or ground at random. Generally speaking, receive will to the angry glue probability of living beings the higher when the area is the larger, but there is no absolute relation. For example, as the building opened the muzzle to just face the outdoor high pollution sources, or the personnel who it happened that enter this place are all carriers. Under this situation even the area of place is relatively small; its thickness of colony will also be higher than the floor of building in the place larger in area.

4. The place uses the relation between properties and the colony thickness

Can learn, the top three supreme in thickness of the colony are in the library in order after being analyzed by the experimental result and SPSS software: "periodical room", "the reading room for children" and "open-shelf reading room"; Lowest in thickness with the colony among them, as shown in Table 3.

Regarding thickness average of the colony, consult the room and show the difference nature ($p<0.05$) with the periodical room, reading room for children and open-shelf reading room separately ,As shown in Table 4. To this phenomenon, the administrative staff of the library, should check the place that indoor air quality is worse, whether because the air conditioning causes efficiency to be relatively bad too old; Because to furnish too the crowdedness and space are overly closed, result in ventilating badly. By investigating live that learns, "consult the room" the foreign window has not been furnished the direction parallel to window by the indoor art work or stopping, indoor bookshelf of book case, ventilate and the day lighting state is good, and consult the room and has not offered the desk chair for the persons who read to use, comparatively speaking the time that personnel stay in this place is relatively short.

5. Relation between temperature or humidity and colony thickness

This research takes a sample in the angry glue of living beings in the course, warm humidity ranges in the room are: Temperature: 20.2℃-25℃; Humidity: 49.2%- 69.0%. Analyze that learns according to the experimental result and SPSS software, as shown in Table 5. Act as temperature range in order: Small at 22.1℃, is between 22.1℃ and 23.7℃ and big at 23.7℃, the averages of the colony thickness are: 106.3 CFU/m^3, 154.2 CFU/m^3 and 205.2 CFU/m^3. Moreover this research is with February 24 diurnal average temperature, average humidity (22.1℃, 64.6%) separately And 7 diurnal average temperature, average humidity (23.7℃, 56.1%) in April, Click in the sector that counts the software and analyzes as SPSS, as Table 5 and Table 6 shows. Can be learnt by Table 6, when the block of temperature is between 20.2℃ and 25℃, temperature small colony thickness and large colony thickness at 23.7℃of temperature at 22.1℃, the two have apparent difference nature ($p<0.05$). And is learnt by the statistical data, the big colony thickness at 23.7℃of temperature exceeds the small colony thickness at 22.1℃of temperature. The colony thickness relates to temperature. Rise with temperature colony thickness have trend of increase.

Can be learnt by Table 7, when humidity range is between 49.2% and 69.0%, the humidity is smaller than 56.1% of the colony thickness and humidity and lie between the colony thickness of 56.1% and 64.6%, the two show the difference nature (P<0.05). And the humidity is smaller than 56.1% of the colony thickness and humidity and greater than 64.6% of the colony thickness, the two also show the difference nature (P<0.05). And is learnt by the statistical data, the humidity is smaller than 56.1% of the colony thickness and exceed the humidity and is greater than 64.6% of the colony thickness. If regard colony thickness as the parameter of depending on again, and regard humidity as the independent variable, analyze that learn, humidity and the two of colony thickness have dominance (P<0.05), As Table 8, Table 9 and Table 10 shows. Can learn lie between 49.2% and 69.0% by range as humidity, humidity high colony thickness little while being described above. Return to equation preface to show as follows:

$$y = -0.438x \quad (1)$$

However, while considering the two of temperature and humidity influence the colony thickness at the same time, it is unable to show the relation (P>0.05), As Table 11 and Table 12 shows. Stated, perfectly in harmony or agreement without previous consultation this phenomenon and literature [20]. Whole but the speech, influences the influence factor of colony thickness of the library to use properties by indoor humidity, indoor temperature and field.

CONCLUSION AND SUGGESTION

This research is to regard one public library in the peach garden county as the research object, utilize the assaulting device (Bioluminescent ATP-assay) With the software of statistical analysis (SPSS) Wait for tools, the ones that probe into various factors and colony thickness of library are related. Can learn, the colony thickness of every place of this library is all smaller than 500 CFU/m3 according to the result of study, accord with suggestion value of 1st kind of environmental protection administration. Moreover according to the statistical analysis data, can learn the indoor colony thickness and enter factors such as the total number of person, height of the floor, sampled time, area of floor of the library, etc., it is not related. Colony thickness and ambient air quality of the building in the library, passing in and out the

personal sanitary condition of the people and staff member to have something to do with, influence the main factor of the colony thickness of the library, include: Indoor humidity, indoor temperature and use property.

To place of this particular use of the library, should be by “the safe save of the books file in the library”, “use the people's health with comfortableness” in order to consider the direction. To two aforesaid general orientations, its situation influencing the factor to be numerous and the interaction often take place, pinning down each other. As for safe save of the books file, testing it factor, including mould, fungi, bacterium and radiating fungus causing “mould and rotten”, “change color” or “go bad”, etc. question; Secondly it is clothing fish, book louse and wooden termite of the universe, etc. that regard paper books as the insect of the food, unprincipled to gnaw questions such as the books, etc.. Finally: Whether the warm humidity will cause questions such as the brittle rupture of the paper and making moist, etc. Separately as for the people's health and comfortableness: Except that comfortableness involves the personal adaptive capacity and psychology and experiences subjectively, microorganism and small particle, fleas, dust coming out by little organism release in the air. When all relating to the fact that the people are healthy. Want, give consideration to “books safe save of file” and “health and comfortableness of people” at the same time, and often make the administrator in a dilemma, in a dilemma. Study, learn, can set up appropriate mechanism of management, room temperature and humidity of internal environment control properly, can easily solved up to the result getting twice the result with half the affording aforesaid important problem.

Learn after this research reviews with statistical analysis with the literature, colony thickness, mould (or the bacterium) Survive with breeding, so as to the mould (or the bacterium). It is insect of the food, paper books file that are made moist brittle rupture, personnel in indoor psychology reacting and working efficiency, etc., all relate to warm humidity environment in the library room. The warm humidity is a key factor of influencing every factor described above. The colony thickness presents the trend increased when rising in ambient temperature, look on as the environmental humidity the higher the colony is the lower in thickness. However, if the one that consider the warm humidity to colony thickness at the same time is related, do not have dominance ($p > 0.05$) . Learnt by this result of study, the best temperature range of library is 20℃ - 26℃, and the range of relative humidity is 40%- 60% RH.

BRIDGING COMPETENCE AND CURRICULUM FOR COMPLEX CHANGE

Chi-Cheng Chang, Lunghwa University of Science and Technology, Taiwan
Email: chig@mail.lhu.edu.tw

ABSTRACT

Purpose: *The rapid technological changes prompt a company's supervisors and managers to update their management capabilities in order to stay competitive. Aimed at enhancing low-level supervisors' management capabilities, this study explores the training programs that help improve, and are most compatible with, each specific management competency.*
Design/methodology/approach: *Focused on low-level supervisors in the Taiwanese Mold industry, this study was conducted by means of focus group with the competency indicators, training programs and questionnaire confirmed by 32 experts. Through cluster sampling, supervisors at Taiwanese small- and medium-sized Mold manufacturers were surveyed, and competency indicators were derived from answers stated in the 326 valid questionnaire copies returned (at a 66.53% response rate). Finally, 8 experts were consulted as part of a Gray Relational Analysis (GRA) to identify the priority of training programs that matches each specific competency.*
Findings: *Totally 7 indicators and types of training programs are identified with regard to low-level supervisors' competences, and so were the optimal competency-program combinations. GRA was proved an effective way to solve the ambiguity regarding how a given competency is paired with the training programs.*
Originality/value: *The findings solve the ambiguity regarding how the emerging requirements for management competences, which are resulted from technological advances, are responded with appropriate training programs. The types of training programs identified provide a foundation for on-the-job training. The findings also prove GRA a reliable approach to finding the type of training program most suitable for a particular competency.*

Keywords: Low-level supervisors, Management competence, Training programs, GRA

INTRODUCTION

In the process of corporate operations, the rapidly changing technological aspect keeps generating new requirements for employee competences (Dumas & Hanchane, 2010). It is therefore a challenge for a company's human resources development staff to cultivate new competences, and subsequently ensure productivity and market competitiveness (Holden & Griggs, 2010; Chang, 2012b). Many empirical studies indicate how technological advancements result in extra requirements for an employee's knowledge and skills (Gashi et al., 2010), how training leads to higher corporate competitiveness (Dumas & Hanchane, 2010) and how urgent it is to offer on-the-job training for supervisors. Because training directly improves the trainees' productivity while enhancing their performance in such areas as strategies, organizational decision-making and innovation (Dumas & Hanchane, 2010), it is

extremely important to teach or train supervisors to handle changes by taking appropriate measures, so they may eventually deliver performance at work (Amran *et al*., 2011).

The competences of low-level supervisors determine a company's quality of production, which is closely linked to corporate operating performance (Palvia *et al*., 2010). Such competences can be further divided into core competence, professional competency, management competence, general competence (Lei & Slocum, 1992) and dynamic capability to grasp dynamic environments (Chang, 2012a). Each competence is considered a combination, or a set, of capabilities attached to an individual (Sora *et al.*, 2010). Given the fast-changing technological environment nowadays, it is imperative that managers engage themselves in continuous learning in order to meet the organization's need for sustainable transformation.

It is an important issue to meet the emerging requirements for competences and find training programs that match those needs (Marzo-Navarro *et al.,* 2009). Previous researchers on related topics usually adopted such approaches as expert consultation and survey research. Vincent and Focht (2009), for one, combined expert consultation and the Q-sort method in their exploration of how the training curricula for environmental program managers were designed to match their core competences, while a survey research of Marzo-Navarro *et al*. (2009) examined the gap between competences required by companies and those emphasized in the college curricula. These studies underscored the necessity and benefits of combining experts in a particular field with a quantitative research approach.

Taiwan's highly competitive Mold industry boasts a comprehensive supply chain that comprises 3,416-odd firms and approximately 38,800 employees as of 2006, which also makes mold the largest among the country's metal manufacturing industries (MOEA, 2007). A company will never stay competitive without continuously training its low-level supervisors for improved management capabilities. To expedite the research process, this study's author defined *low-level supervisors*, namely those supervising at the section, shift or division levels (including foremen), as employees whose primarily duties are executing tasks, improving work efficiency, and accomplishing day-to-day assignments. *Management competences* in the present study refers not only to the ability of low-level Mold company supervisors to wisely use organizational resources, but also to the knowledge, skills and attitude that contribute, and add value, to the organization. *Training programs*, on the other hand, are defined as on- or off-the-job educational courses officially offered by a company to its low-level supervisors during the employment contract period, with an aim to bolster those supervisors' management competences in accordance with its production initiatives.

LITERATURE REVIEW

The Mold industry is both technology- and capital-intensive in nature, with a distinctively high value-added ratio. It is safe to say the requirement that low-level Mold company supervisors keep improving their management capabilities is derived from the *endogenous growth model* (Romer, 1986), which suggests a corporate organization's overall capabilities grow in proportion to its individual departments' capabilities (Romer, 1986). In each company department, it is imperative that low-level supervisors as an integral part of production initiatives update their management competences to ensure corporate competitiveness. In an exploration of the *fit* between competences required for a job position

and job assignments on the personal level, Bretz and Judge (1994) put forth the theory of vocational fit. Likewise, Seethamraju (2012) used the fit theory trying to achieve a high degree of correlation between corporate operations and business education curricula. Apparently, it is imperative that the planning of training programs fit the requirements for employee competences.

Indicators of management competences

The effects of technological changes on management practices are exemplified by team-oriented tasks, the "just-in-time" production strategy, and the quality control circle (Gashi *et al*., 2010). Generally speaking, indicators of management competences are summarized from either the structural or the behavioural perspective. Noe (2005), for one, took the structural perspective to identify 6 indicators from the viewpoint of "managing cultural diversity," namely cost, resource-acquisition, marketing, creativity, problem-solving and system flexibility.

For instance, the relationship-management capability from the behavioural perspective has an implicit impact on the *quality* (Palvia et al., 2010). Lyons (2012) mentioned 10 innovative leadership capabilities: problem-framing, opportunity recognition, experimentation, revenue model innovation, valuation of ideas, risk selection, influence without authority, manage ambiguity/conflict, team creativity, and adaptive governance. Meanwhile, thinking/analysing skills, knowledge of management details, applying theory, professional and personal development, team skills are the five indicators to determine whether the learners' competences vary among learning styles (Rodwell, 2005). According to Liu *et al*. (2010), businesses in the manufacturing sector must focus on the management of uncertainties concerning supply and demand in order to develop the mass customization ability.

From the behavioural perspective, this study's author proposed some indicators to measure management competences that help supervisors adapt to an ever-changing environment, as listed in Table 1.

Table 1 Operational Definition of Indicators of the Management Competences of Low-Level Mold Company Supervisors

Primary indicators	Secondary indicators	Definition
(1).Communication/negotiation capability	Listening skills; self-expression skills; negotiation skills	The capability of negotiating with higher-level supervisors, listening to the subordinates, conveying work-related information, and coordinating inter-departmental operations.
(2). Capability as a team leader	The skill of influencing subordinates; the skills of creating the workplace atmosphere; and the conflict management skill	The capability of delegating/monitoring works, setting up work-oriented teams or task forces to ensure the goals are timely achieved, and creating a teamwork-oriented atmosphere in the workplace.

(3). Social-networking capability	The social-networking skills; the skills of motivating subordinates; the skills of incentivising subordinates.	The capability of wisely using social networks, encouraging subordinates to improve production efficiency/quality, and generating benefits for the production initiatives.
(4). Decision-making capability	Planning skills; monitoring skills; problem-solving skills; authorization	The capability to conduct production scheduling, timely solve production-related problems and customer complaints, while in the mean time promoting the efficiency of production line.
(5). Mold-relevant derivative intelligence	Continuous learning; creativity	The ability to win the subordinates' recognition for Mold-related expertise and subsequently achieve management effectiveness; to continuously acquire Mold-related knowledge/skills while applying creativity and innovative thinking to work.
(6). The customer-service capability	The skill of grasping customers' needs; the skills of building relationships; the skills of handling complaints.	The capability of timely responding to, and meeting, customers' needs; making the company more reliable among customers; improving customer loyalty.
(7). The ability to maintain system flexibility	The adaptability to technological evolution; the capability to use high-tech equipment/ tools	The ability to use high-tech equipment, new tools and incorporate production-related needs into plans or designs of new processes in accordance with emerging and ever-evolving technologies.

Types of training programs

Training is considered the source of corporate competitiveness (Dumas & Hanchane, 2010). In response to the changing circumstances, an organization must factor diversity management into the training programs (Danowitz et al., 2009). Topics of the training programs include: 1. organizational theories; 2. human resource management; 3. instruments of gender and diversity management; 4. special methods for organization studies; 5. participatory organizational design; 6. teambuilding; 7. legal regulations for gender and diversity management; 8. personality development; 9. gender and diversity theories; 10. labour market theories from gender and diversity perspectives; 11. project-seminar (Danowitz et al., 2009).

According to Gashi et al. (2010), team-working and quality circles both help corporate managers develop the change-adaptable management competences. Training programs

responding to the need for innovative leadership (Lyons, 2012) include: (1) data and decisions; (2) economics for business decision-making (microeconomics); (3) leading People; (4) problem-finding and problem-solving; (5) financial accounting; (6) introduction to finance; (7) marketing management; (8) leadership communication; (9) operations management; (10) macroeconomics in the global economy; (11) strategic leadership; (12) ethics and responsibility in business.

To sum up, the 7 types of training programs contributing to the management competences include: interpersonal communication, team leadership, problem-solving and analysis, recognition of roles and responsibilities, work instructions, motivation, and executability.

METHODOLOGY

Focus group interviews

The method proposed by Krueger and Casey (2000) was used in the present study. Convenience sampling was conducted to select 32 experts, or supervisors/managers at small- and medium-sized Taiwanese Mold manufacturers who have 15 or more years of work experience and are in charge of on-site management (including 12 mid-level and 20 low-level supervisors). The experts were convened for 3 discussion sessions, where they established management competence indicators while confirming the questionnaire and types of training programs.

The survey research method

Questionnaire development: Based on the literature review and operational definitions of competence indicators, a draft questionnaire was developed and then confirmed by the experts. The questionnaire is made up of 50 questions that involve the communication/negotiation capability (A1-A8), the capability as a team leader (B1-B7), social-networking capability (C1-C5), decision-making capability (D1-D9), Mold-relevant derivative intelligence (E1-E8), the customer-service capability (F1-F7) and the ability to maintain system flexibility (G1-G6).

Data collection: cluster sampling was used to collect data, with the details stated below:

a. Type of Mold firms selected: In this study, four sub-groups (i.e., stamping, plastic moulding, die-casting and forging) of metal mold companies were examined;
b. Percentages of sampling distribution: The percentages were determined on the basis of the number of Taiwan's existing Mold firms and the distribution of Mold employees. The researcher surveyed 92.2% of the employees for Mold firms with fewer than 30 workers; 6.9% for those with 30-99 workers; 0.6%, firms with 100-199 workers; 0.2%, firms with 200-299 workers; 0.1%, firms with more than 300 workers.
c. Distribution of questionnaire: Totally 490 copies of questionnaire were first sent out through post services and then through e-mail. Having reminded, by way of e-mail correspondence, the respondents to send back their copies of completed questionnaire, the researcher received 326 valid copies of questionnaire after deducting those not answered by low-level supervisors. The response rate is 66.53%.
d. Data analysis: Based on the Grey Relational Analysis (GRA) method, the data collected was analyzed to examine how much the management competence indicators are related

to their corresponding training programs. Mid-level supervisors (5) and experts in the field of Mold (3) were selected from small- and medium-sized, Taiwan-based multinational Mold companies as the *experts*, who then answered questions concerning the management competence indicators and their corresponding training programs. The research project was concluded using the GRA proposed by Teng (2003).

RESULTS

Descriptive statistics of the sample

Males and females account for 71.4% and 28.6% of the survey responses, respectively. As far as age is concerned, people aged 31-40 represent the largest portion of the sample (53.2%), followed by those aged between 41 and 50 (28.6%), which suggests that low-level Mold company supervisors are mostly young or middle-aged. People with a seniority of 1 to 5 years account for 16.7% of the responses; 6 to 10 years, 15.9%; 11 to 15 years, 34.9%; 16 years or longer, 32.5%, a sign that a relatively large percentage of Mold company employees have a seniority of 10 or more years.

Reliability and validity of the questionnaire

As far as reliability is concerned, the questionnaire has an overall 0.939 Cronbach's Alpha, with Cronbach's Alpha values for individual questions ranging from 0.936 to 0.939, hence the satisfactory consistency and stability among those items. Meanwhile, the questionnaire was proved to have content validity as the focus-group experts used management competence indicators to make sure it correctly appraised the content intended for measurement in terms of correctness and effectiveness.

Grey Relational Analysis (GRA)

(1). Determining the importance weights

Table 2 shows how the experts (E) prioritized the management competence indicators (on a scale of 1 to 7, 1 being the most important and 7 the least important) according to how important they are. Those indicators include communication/negotiation capability (CA), the capability as a team leader (TA), social-networking capability (RA), decision-making capability (DA), Mold management intelligence (DK), the customer-service capability (CS) and the ability to maintain system flexibility (SA). Table 3 shows how the types of training programs are prioritized, including programs in interpersonal communication (RC), team leadership (TC), problem-solving and analysis (PS), perceptions of roles and duties (RD), work instructions (WC), motivation (EC) and executibility (PC).

Table 2 Prioritizing the Management Competences by Importance

	Indicators	E1	E2	E3	E4	E5	E6	E7	E8
Management competences	CA	2	3	1	1	1	4	1	2
	TA	3	2	6	2	3	1	2	4
	RA	5	4	7	4	5	5	5	3
	DA	4	1	2	3	2	3	3	1
	DK	1	7	3	7	4	2	6	7
	CS	7	6	5	6	6	6	7	6
	SA	6	5	4	5	7	7	4	5

Table 3 Prioritizing Different Types of Training Programs

	Programs	E1	E2	E3	E4	E5	E6	E7	E8
Types of training programs	RC	4	4	7	1	4	6	1	6
	TC	3	3	6	4	5	3	5	3
	PS	1	2	1	2	1	2	3	1
	RD	7	1	2	5	2	1	2	2
	WC	6	5	3	7	6	5	4	4
	EC	5	7	5	6	7	7	7	7
	PC	2	6	4	3	3	4	6	5

(2). Establishing the sequence correlation

Table 4 shows the data was examined using the grey relational analysis software, with *management competences* being the main factor $\chi_i(k)$ and the *type of training program for management competences* being the sub-factor $\chi_j(k)$.

Table 4 Referential and Comparative Sequences Derived from the Grey Relational Analysis

Main factor $\chi_i(k)$ (referential sequence)	Sub-factor $\chi_j(k)$ (comparative sequence)
CA $\chi_{i1}(k)$	RC $\chi_{j1}(k)$
TA $\chi_{i2}(k)$	TC $\chi_{j2}(k)$
RA $\chi_{i3}(k)$	PS $\chi_{j3}(k)$
DA $\chi_{i4}(k)$	RD $\chi_{j4}(k)$
DK $\chi_{i5}(k)$	WC $\chi_{j5}(k)$
CS $\chi_{i6}(k)$	EC $\chi_{j6}(k)$
SA $\chi_{i7}(k)$	PC $\chi_{j7}(k)$

(3). GRA: Take the example of how training programs are connected with 'the communication/negotiation capability'

A. Since the primary data proved to have comparability, a GRA was conducted by using the *communication/negotiation capability* $\chi_{i1}(k)$ to represent the referential sequence and the *type of training program* to represent the comparative sequence.

B. The value of difference sequence was calculated using the formula of $\Delta_{ij}(k)=\left\|\chi_i(k)-\chi_j(k)\right\|$.

C. The formula in (2) was used to calculate the maximum and minimum values, which are 6.0 and 0.0, respectively.

D. Assumed the distinguishing coefficient $\zeta = 0.5$.

E. The grey relational coefficient was calculated using the formula:

$$\gamma(\chi_i(k),\ \chi_j(k))=(\Delta\min+\zeta\Delta\max)/(\Delta_{ij}(k)+\zeta\Delta\max)$$

F. Calculating the grey relational grade: since we assumed ($\beta = 1/8$), we learned that $\gamma(\chi_{\#1}\ \chi_{j1}) = 0.6515$, $\gamma(\chi_{\#1}\ \chi_{j2}) = 0.6228$, $\gamma(\chi_{\#1}\ \chi_{j3}) = 0.7750$, $\gamma(\chi_{\#1}\ \chi_{j4}) = 0.6442$, $\gamma(\chi_{\#1}\ \chi_{j5}) = 0.5234$, $\gamma(\chi_{\#1}\ \chi_{j6}) = 0.4092$ and $\gamma(\chi_{\#1}\ \chi_{j7}) = 0.6344$.

G. Prioritizing the grey relational sequences: $\gamma(\chi_{\#1}\ \chi_{j3}) = 0.7750 > \gamma(\chi_{\#1}\ \chi_{j1}) = 0.6515 > \gamma(\chi_{\#1}\ \chi_{j4}) = 0.6442 > \gamma(\chi_{\#1}\ \chi_{j7}) = 0.6344 > \gamma(\chi_{\#1}\ \chi_{j2}) = 0.6228 > \gamma(\chi_{\#1}\ \chi_{j5}) = 0.5234 > \gamma(\chi_{\#1}\ \chi_{j6}) = 0.4092$.

The types of training program wee then prioritized on the basis of their correlations with the *communication/negotiation capability*, from the highest degree of correlation to the lowest: problem-solving and analysis > interpersonal communication >perceptions of roles and duties> executability > team leadership > work instructions > motivation. The results are shown in Table 5.

Table 5 Prioritizing the Training Program Types According to Their Correlations with the Communication/Negotiation Capability

Type of training program (sub-factor)	CA (main factor)
PS	77.50%
RC	65.15%
RD	64.42%
PC	63.44%
TC	62.28%
WC	52.34%
EC	40.92%

Following that procedure, this study's findings are summarized in Table 6.

Table 6 Priority of Training Program Types by Management Competency

Indicators / Type of training program	CA	TA	RA	DA	DK	CS	SA
RC	65.15% (2)	66.56% (4)	70.98% (2)	56.88% (5)	53.94% (6)	62.60% (4)	59.73% (5)
TC	62.28% (5)	72.50% (1)	83.75% (1)	65.36% (3)	58.84% (4)	57.86% (5)	60.36% (4)
PS	77.50% (1)	69.69% (2)	51.13% (7)	78.13% (1)	58.54% (5)	40.33% (7)	47.02% (7)
RD	64.42% (3)	68.21% (3)	55.04% (6)	77.50% (2)	52.13% (7)	52.90% (6)	57.34% (6)

In Table 6, the types of training-program types are prioritized in accordance with each specific management competency that low-level supervisors are required of, as stated below:

a. The training programs that enhance the *communication/negotiation capability* are prioritized as: problem-solving and analysis > interpersonal communication > perceptions of roles and duties > executability > team leadership > work instructions > motivation.
b. The training programs that enhance the *capability as a team leader* are prioritized as: team leadership> problem-solving and analysis > perceptions of roles and duties > interpersonal communication > executability > work instructions > motivation.
c. The training programs that enhance the *social-networking capability* are prioritized as: team leadership > interpersonal communication > work instructions > executability > motivation > perceptions of roles and duties, and problem-solving and analysis.
d. The training programs that enhance the *decision-making capability* are prioritized as: problem-solving and analysis > perceptions of roles and duties > team leadership > executability > interpersonal communication > work instructions > motivation.
e. The training programs that enhance the *Mold management intelligence* are prioritized as: executability > motivation > work instructions > team leadership > problem-solving and analysis > interpersonal communication > perceptions of roles and duties.
f. The training programs that enhance the *customer-service capability* are prioritized as:

motivation > work instructions > executability > interpersonal communication >team leadership > perceptions of roles and duties > problem-solving and analysis.

g. The training programs that enhance the *ability to maintain system flexibility* are prioritized as: work instructions > motivation > executability > team leadership > interpersonal communication > perceptions of roles and duties > problem-solving and analysis.

DISCUSSION

The rationality of indicators and training programs

Professional knowledge varies among different fields of the Mold industry, and so do the required competences and how training programs should be planned. To meet the requirements stemming from globalization and vertical integration in the Mold supply chain, Taiwanese Mold firms usually design and manufacture products domestically while accomplishing mass-production in China, Indonesia or Vietnam. As for a supervisor's management capabilities, the ability to offer management and guidance to multinational employees (Bird *et al.*, 2010) and cross-cultural management capabilities (Isenhour *et al.*, 2012) are at the core of a *team leader's capabilities*. From the "rationality of indicators" point of view, the survey outcome proved that the indicators fully cover the 7 management competences. Regarding the rationality of training-program types, it has been confirmed with expert consultation that companies are free to incorporate, according to its needs, various topics (e.g., production management, material management, project management, component control and personnel training) into the supervisor training program, hence the expandability.

GRA solves uncertainties in pairing competences and the training programs

The goodness-of-fit test has been adopted as a common statistical approach to examining the *fit*, or testing the consistency of the actually observed and expected/theoretical frequency. GRA is a further application of the Fit theory. When it comes to pairing competences with training programs, the GRA suggests an emphasis on refining process (Chang, 2013b) and thus meets the requirement proposed by Bretz & Judge (1994) that analysis methods should meet the needs of research subjects. The greatest difference between GRA and the conventional statistical methods lies in the fact that the former does not require a sizable sample to calculate how much two sequences of data are correlated (Chen *et al*., 2005). In an attempt to optimize the process of pairing the training programs and competences, GRA contributed to training effectiveness as it solves uncertainties in the connection between competences and training programs.

Making up for the lack of literature

Researchers trying to identify the best competency-program combinations would end up *solving new problems with outdated experiences* if they rely solely on expert consultation and draw inspiration from the experts' experiences. A significant number of quantitative studies were performed in conjunction with the qualitative expert consultation, as exemplified by Marzo-Navarro *et al*. (2009) and Vincent & Focht et al. (2009). In the present study, expert consultation is coupled with the GRA method in order to display the advantages of both qualitative and quantitative research approaches, to quickly obtain the optimal priority of

training programs, and also to effectively reduce the time spent on, and procedure for, pairing the competences and training programs. Results of this study complement research efforts of Marzo-Navarro *et al.* (2009) and Vincent and Focht (2009).

CONCLUSION

Technologies are evolving so quickly that low-level supervisors are forced to constantly update their management intelligence in order to maintain corporate competitiveness. To address the ambiguous relationship between management competences and training programs, this study's author examined low-level Mold company supervisors in Taiwan, using such methods as expert consultation, survey research and GRA to accomplish a research project aimed at identifying the optimal combination of competences and training programs. According to the findings, there are 7 indicators of management competences of low-level supervisors, which in turn have roughly 7 types of corresponding training programs. This study proves GRA an efficient solution to the ambiguous relationships between competences and training programs in a fast-changing corporate environment.

Contributions of this study are that it proved GRA an efficient tool to practice the FIT theory; it makes up for the lack of literature on training effectiveness; it identified the management competence indicators suitable for low-level Mold company supervisors, including their corresponding training programs; it prioritized the training programs for each specific competency expected of the employees, which in turn provides a foundation for planning on-the-job training curricula.

Theoretically speaking, results of this study suggest a "pairing" research approach that is applicable to finding the corresponding training programs for general, core and professional competences. As far as management practices are concerned, this study is focused on the Mold industry, where small- and medium-sized manufacturers are faced with fast-changing technologies. Therefore, any company that needs to change or increase its required competences can draw inspiration from the types of training programs laid out in this study, and then start planning/designing those programs. Regarding the research limitations, the difference in production practices among the subgroups of metal Mold, as well as the difference between small- and medium-sized Mold manufacturers, left this study focused on the *types*, but not *components*, of training programs.

ABSTRACT

***Purpose**: This paper aims to present a fresh idea on how to model and examine the level of sustainable competitive advantage (SCA) with and without knowledge/technology (K/T) effects in a case company's operation by taking the manufacturing strategy's development directions and the efficiency of resource allocation among its attributes into consideration.*

***Design/Methodology/approach**: In this paper, questionnaires are filled by two different managerial groups, company's global business directors (G1) and company's directors in global operation strategies (G2). The analyses based on G1, G2 and G1-G2 (mixed results) are performed and examined as well as the effect of knowledge/technology rankings to observe the differences on how they effect on company's operations strategy and what kind of a strategy type that decision makers might fallow. Besides, the effects of knowledge/technology rankings on SCA risk levels are examined on different case companies to perceive the similarities and differences with our case company. In this case study, the objectives are achieved based on several methodologies: manufacturing strategy index (MSI) (Takala, et al., 2007) and sense and respond (S&R) methodology (Liu, et al., 2011).*

***Findings**: The achieved results through the model are found to be promising corresponding to the feedback from the respondents.*

***Research limitations/implications**: The model is applied only in a medium sized B2B global company that produces power electronics products. Therefore, further tests need to be applied to the model in case of multiple companies from different sizes and areas to figure out the best formula in case of validation of strategic direction (MAPE, RSME or MAD).*

***Practical implications**: As a result of its wide applicability and its ease in arrangement the model has an enormous potential for strategic decision-making process and strategic analysis.*

***Originality/Value**: The model can provide a more dependable possibility of sustainable improvement to the corporate operational excellence and strategy.*

Keywords: Sustainable competitive advantage (SCA), knowledge/technology rankings, manufacturing strategy, sense and respond (S&R), operational excellence, operations management.

INTRODUCTION

The growing role of technology cannot be underestimated nowadays as it brings vast number of opportunities for business development, growth and strengthen of the competitive advantages (Takala, 2012). The advanced technology is the source of profit and competitiveness to enterprises, and at the same time, it is also an important support which helps enterprises adapt market changes. Along with the unceasing renovation of technology of industry, enterprises must continually adapt to the technical requirements of the market.

Although, SCA was not formally defined at the beginning it is first aroused by Porter (1985) that the firms of basic types of competitive strategies can be possessed of achieving SCA. Barney (1991) has made a closer definition by uttering as: "A firm is said to have a sustained competitive advantage when it is implementing a value creating strategy not simultaneously being implemented by any current or potential competitors and when these other firms are unable to duplicate the benefits of this strategy (italics in original)" (p. 102). By the SCA values, one may observe how much the resource allocation supports the company's strategy. Liu states that the main idea lies behind the implementation of SCA is to find the critical attributes in resource allocation trough sense and respond methodology (S&R) and make the improvements that provides to perform dynamic adjustments to enhance the company's strategy in turn (2010).

The view of an organization based on the resource allocation is started by the theoretical reference basis of competitiveness in manufacturing operations (Wernerfelt, 1984). It is aimed to understand whether the right direction of development is selected to make certain that the selected strategy is followed by the corporation by employing resource allocation with dynamic capabilities' point of view. Accordingly, manufacturing strategy index (MSI) (Takala, et al., 2007) and the method of detection of a company's preferable strategy type through utilization of sense and respond (S&R) methodology (Liu, et al., 2011) methodologies are used for the validation.

In this paper, all the analyzes are performed based on 11 interviews with global business directors and directors in global operation strategies in a medium sized B2B global company that produces power electronics products. In its business area, the case company is one of the biggest players focusing on frequency converters.
In this paper, the analyses based on the level of SCA is modeled and examined with and without the effects of K/T in our case company's operation by involving MSI and S&R. Here, two research questions are aroused. First one is how to evaluate K/T effects to SCA and the second one is how valid different SCA models to evaluate K/T effects to SCA are in practice. In the literature review part, great background information is provided for the reader to have a good understanding of the process and in the following part, the required equations are given for the modeling of SCA. Subsequently, analyses are performed and the results are discussed and concluded.

LITERATURE REVIEW

1. Manufacturing strategy

Johnson describes strategy as 'the direction and scope of an organization over the long-term, which achieves advantage in a changing environment through its configuration of resources with the aim of fulfilling stakeholder expectations' (Johnson at al. 2005). Mintzberg states that strategy is organization's future plan, a position in specific markets, a pattern of its performance and a tactic to left behind its competitors (Mintzberg, et al., 1998).
Miles & Snow topology (1978) is a dominant framework of the strategy types. They have developed a comprehensive framework which states that the strategy type can be detected depending on the fixed proportions between RAL Model elements (Quality, Cost, Time/Delivery, and Flexibility). By this framework strategy types are considered to be four different groups, prospectors, defenders, analyzers and reactors. Decision makers stick to one of these strategies at certain times depending on the market condition to avoid crisis from turbulent business environment. Prospector strategy has a definite focus on quality and it endlessly seeks for new market opportunities, defender strategy aims achieving an advantage in cost to create a stable market share and analyzer strategy is considered to be an intermediate one as it focuses on balancing between quality, cost and time.

2. Strategy detection

Each attribute in the list (**Table 1**) is numbered and analyzed in graphs with respect to the order (**Figure 1**). In the last column (**Table 1**), the attributes from OP (Operations) questionnaire are assigned to one of the multiple key categories of RAL model Quality (Q), Cost (C), Time/Delivery (T) and Flexibility (F), depending on their most significant effect (Takala, 2012). These categorizations are performed to integrate Miles & Snow topology into Sense and Respond methodology. According to Thomas L. Saaty: "To make a decision we need to know the problem, the need and purpose of the decision, the criteria of the decision, their sub-criteria, stakeholders and groups affected and the alternative actions to take." (Saaty, 1980).

Table 1. The list of attributes used in Sense and Respond questionnaire

	ATTRIBUTES	
	Knowledge & Technology Management	
1	Training and development of the company's personnel	← Flexibility
2	Innovativeness and performance of research and development	← Cost
3	Communication between different departments and hierarchy levels	← Time
4	Adaptation to knowledge and technology	← Flexibility

5	Knowledge and technology diffusion	← Cost
6	Design and planning of the processes and products	← Time
	Processes & Work flows	
7	Short and prompt lead-times in order-fulfillment process	← Flexibility
8	Reduction of unprofitable time in processes	← Cost
9	On-time deliveries to customer	← Quality
10	Control and optimization of all types of inventories	← Quality
11	Adaptiveness of changes in demands and in order backlog	← Flexibility
	Organizational systems	
12	Leadership and management systems of the company	← Cost
13	Quality control of products, processes and operations	← Quality
14	Well defined responsibilities and tasks for each operation	← Flexibility
15	Utilizing different types of organizing systems	← Flexibility
16	Code of conduct and security of data and information	← Cost
	Information systems	
17	Information systems support the business processes	← Time
18	Visibility of information in information systems	← Time
19	Availability of information in information systems	← Time
20	Quality & reliability of information in information systems	← Quality
21	Usability and functionality of information systems	← Quality

3. Sense and respond

Sense and respond (S&R) is a comprehensively customizable industrial operational strategy to deal with current turbulent business environment. The main idea of 'Sense & Response' philosophy is the execution of the best practices in a turbulent business environment by detecting changes (sensing) and reacting to them properly (responding), in other words, converting threats into opportunities and drawbacks into strengths. Bradley and Nolan (1998) and Markides (2000) developed dynamic business strategies with respected to the S&R thinking. In case of facing frequently changing environmental conditions, companies are able to sense, adapt and rapidly respond due to these dynamic business strategies. The S&R was utilized by Ranta and Takala (2007) to develop the operative management system by introducing critical factor index (CFI). Since then, the S&R model has gone through three stages of development, which are called CFI model, BCFI model, and SCFI model (Liu, 2010).

4. Knowledge/Technology Rankings

Technology provides the opportunity of competitive advantage to a firm and decision makers should integrate this opportunity with their strategy (Marone, 1989). Knowledge/technology requirement section has been added to the Sense and Response questionnaire to gather information about the companies' knowledge/technology rankings. Respondents are required to evaluate each attribute in terms of basic, core and spearhead technologies in percentages while keeping the summation of these three terms to 100%.

Basic technology is referring to technologies commonly used and that can be purchased or outsourced while core technology is referring to company's current competitive technologies and spearhead technology is referring to the technologies focused on the future.
The importance of different technological levels (Basic, Core or Spearhead), in technology-based businesses, affects a lot the strategy implementation by the knowledge required, and supports the company's success in the competitive category chosen. The information is useful as it helps to understand additional ways of performance control and improvement for every listed attribute (Takala, 2012).

5. The method of Judgment on critical attributes

There are three different colors defined for the resource allocation of the attributes; red, yellow and green which represent whether an attribute is under resourced, over resourced or balanced. Here the resource allocation of the attributes is considered to be ideal if it is equally distributed. The whole resource is counted to be 100% and it is divided to the total number of attributes. By this division the average resource level is defined. An attribute is counted to be balanced and takes the green color if BCFI value is between the range of 1/3 and 2/3 of average resource level. For the rest, any attribute which has a lower BCFI value than 1/3 of average resource level is counted to be under resourced and takes the red color, and any attribute which has higher BCFI value than 2/3 of average resource level is counted to be over resourced and takes the yellow color (Liu et al, 2011).

6. Derivation of BCFI K/T

Right after applying the method of judging under resourced and over resourced attributes, the next step is to calculate the values of BCFI K/T for each attribute, depending on the formulas provided below (Table 2). First, the color of the attribute is taken into consideration then the dominating technology for that attribute. The dominating technology is one with a value more than 43%; in case all of the technology levels are less than 43% the one with the highest value is dominating (Takala, 2012).

Table 2. Technology Rankings: General formulas

	RED ATTRIBUTES	**YELLOW ATTRIBUTES**	**GREEN ATTRIBUTES**
Basic technology	**(B)CFI / (B% / 100)**	**(B)CFI * (B% / 100)**	**(B)CFI / (B% / 100)**
Core technology	**(B)CFI * (C% / 100)^2**	**(B)CFI / (C% / 100)**	**(B)CFI * (C% / 100)^2**
Spearhead technology	**(B)CFI * (SH% / 100)^3**	**(B)CFI / (SH% / 100)^2**	**(B)CFI * (SH% / 100)^3**

7. Oulu South Region (OEI)

Oulu South Area is located in Northern Ostrobothnia in the southern part of the province of Oulu. It has three sub-region area of cooperation. The area includes a total of 14 municipalities with a total population of just under 90 000, or about a quarter of the Northern Ostrobothnia population. In 2001, Oulu Southern Regional Ministry of the Interior approved the regional center program three sub-region network-type cooperation areas. The region's development strategy has been prepared in Oulu South 2015 agreement. The contract shall be entered in the main area of development in 2007-2015.

Oulu South is one of the main agricultural areas - the area can be characterized as an industrialized in rural areas, because the region offers a significant extent, the manufacturing industry jobs. The largest industries are agriculture, metals, wood products industry, and information and communication technology (ICT). The regional unemployment rate is among the lowest in northern Finland and the age structure of the population is young. This differentiates from other Finnish Oulu Southern rural areas. Oulu South is a business-friendly area where currently about 4,600 active companies. Of these, about 95% of companies are micro-enterprises. More than a hundred of enterprises with a range of less than 20 Oulu South map numbers of companies and municipalities is shown in following picture:

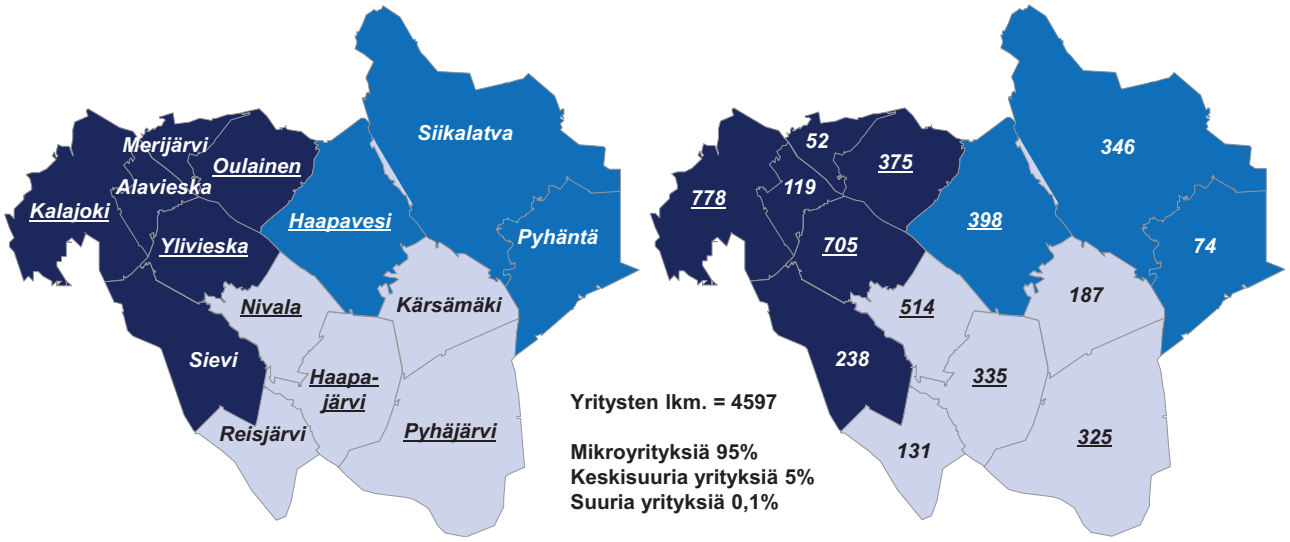

Figure 1. Oulu South municipalities and numbers of companies (Soliditet 2011)

THE IMPLEMENTATION OF SCA

For the calculation of the operational competitiveness rankings of the case companies in different groups, prospector, analyzer and defender, the analytical models are used for manufacturing strategy (MSI) (Miles & Snow, 1978). Takala states that the theory of analytical models are supported by the RAL (Responsiveness, Agility and Leanness) model by taking four main criteria into consideration, cost (C), quality (Q), time/delivery (T) and flexibility (F) (2002). The development of the analytical models is held from over 100 companies in the GMSS research group. Therefore, they have good transferability and they will provide competitiveness ranking of the case companies in this paper.

The equations below (1-4) stand for the calculations of normalized weights of four main criteria in the analytical models.

$$Q\% = \frac{Q}{Q + C + T} \tag{1}$$

$$C\% = \frac{C}{Q + C + T} \tag{2}$$

$$T\% = \frac{T}{Q + C + T} \tag{3}$$

$$F\% = \frac{F}{Q + C + T + F} \tag{4}$$

The equations (5-7) stand for the analytical models that provide the calculations of MSI of operational competitiveness in each group

The MSI model for prospector group:

$$\emptyset \sim 1 - \left(1 - Q\%^{\frac{1}{3}}\right)(1 - 0.9 * T\%)(1 - 0.9 * C\%) * F\%^{1/3} \tag{5}$$

The MSI model for analyzer group:

$$\lambda \sim 1 - (1 - F\%)[ABS[(0.95 * Q\% - 0.285) * (0.95 * T\% - 0.285) * (0.95 * C\% - 0.285)]]^{1/3} \tag{6}$$

The MSI model for defender group:

$$\varphi \sim 1 - \left(1 - C\%^{\frac{1}{3}}\right)(1 - 0.9 * T\%)(1 - 0.9 * Q\%) * F\%^{1/3} \tag{7}$$

Ranta and Takala (2007) have introduced critical factor index (CFI) into the operative management system to shape sense and respond (S&R) theory. By this way, the critical criteria of strategic adjustment that may support the strategic decision-making phase is interpreted and evaluated. The following model, BCFI, was developed by Nadler and Takala (2010) by taking the principle of CFI theory into consideration. Later, Liu, et al., (2011) developed the SCFI model that accurately models the S&R theory.

The following equations are used in the calculations of CFI, BCFI and SCFI models (8)-(11).

$$Importance\ index = \frac{Average\ of\ expectation}{10} \tag{8}$$

$$Gap\ index = \frac{Average\ of\ expectation - Average\ of\ experience}{10} - 1 \tag{9}$$

$$Development\ index = |(better - worse) * 0.9 - 1| \tag{10}$$

$$Performance\ index = \frac{Average\ of\ experience}{10} \tag{11}$$

The equations of CFI, BCFI and SCFI models are listed as follows:

$$CFI = \frac{std\{experience\} * std\{expectation\}}{Importance\ index * Gap\ index * Deelopment\ index} - 1 \tag{12}$$

$$SD\ expectation\ index = \frac{std\{expectation\}}{10} + 1 \tag{13}$$

$$SD\ experience\ index = \frac{std\{experience\}}{10} + 1 \tag{14}$$

$$BCFI = \frac{SD\ expectation\ index * SD\ experience\ index * Performance\ index}{Importance\ index * Gap\ index * Deelopment\ index} - 1 \tag{15}$$

$$SCFI = \frac{\sqrt{\frac{1}{n}\sum_{i=1}^{n}(\text{experience(i)} - 1)^2} * \sqrt{\frac{1}{n}\sum_{i=1}^{n}(\text{expectation(i)} - 10)^2} * Performance\ index}{Importance\ index * Gap\ index * Deelopment\ index} \tag{16}$$

By the SCA values, one may observe how much the resource allocation supports the company's strategy. As the SCA value approaches to 1 the consistency between resource allocation and strategy becomes stronger.

MAPE (absolute percentage error):

$$SCA = 1 - \sum_{\alpha,\beta,\gamma}\left|\frac{BS - BR}{BS}\right| \tag{17}$$

RMSE (root means squared error):

$$SCA = 1 - \sqrt{\sum_{\alpha,\beta,\gamma}\left(\frac{BS - BR}{BS}\right)^2} \tag{18}$$

MAD (maximum deviation):

$$SCA = 1 - max_{\alpha,\beta,\gamma}\left|\frac{BS - BR}{BS}\right| \tag{19}$$

CASE STUDY

In this case study, MSI and S&R data are collected from a multinational Finnish company in two phases, 3 years in the past (P) and 3 years in the future (F). The collected S&R data is examined in three groups, G1, G2 and G1&G2, to analyze their distributed and normalized values in terms of quality, cost, time and flexibility as can be observed from the following tables. The values of the multiple key categories of RAL model (Q, C, T and F) are calculated separately based on CFIs values of the classified attributes (Table 1).

Table 3. Results of informants G1

	Quality	Cost	Time	Flexibility
CFI(P)	4,52	5,19	11,05	13,31

1. Results of K/T rankings from informants G1

Company's current competitive technologies (Core) seem to be around 35%, the technologies commonly used (Basic) differ from 25% to 50% and the technologies focused on the future

(Spearhead) is observed to be roughly around 20% in average (**Figure 2**). From the technology rankings point of view the company is found to be somehow competitive; however, spearhead ranking shows that company do not aim to invest on the technologies focused on the future.

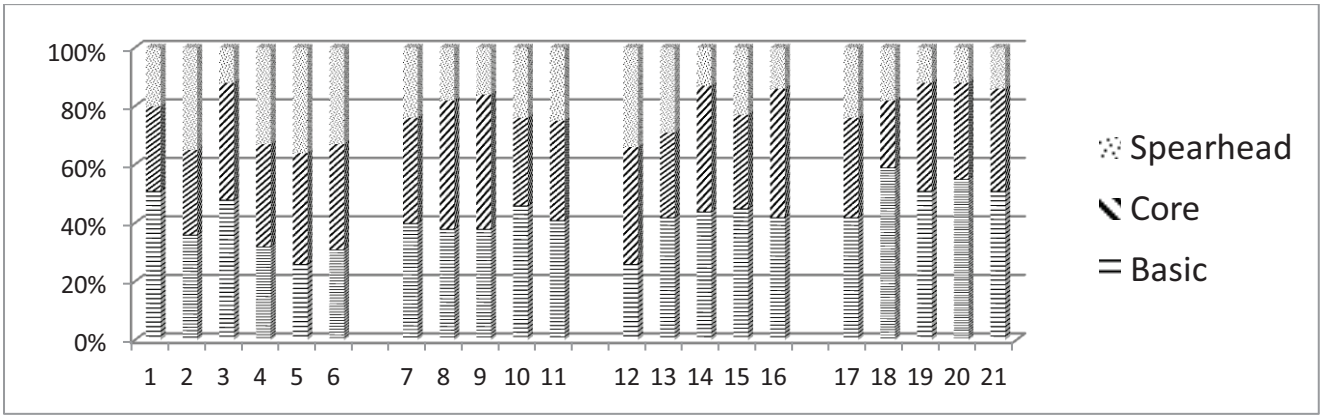

Figure 2. Knowledge/ Technology rankings

From the technology point of view, most of the attributes are going to be critical by lack of resource allocation and the attribute number 14 is going to be over resourced (**Figure 3**). Considering the K/T effects, it may be observed that while it enhances some attributes it makes it worse for others as the dominating technology ranking differs for attributes. Company may concentrate more on the right type of technologies for each attribute to keep them in balanced zone (3.17 – 6.35). Although, the overall situation is observed to be critical K/T effect has provide a positive impact in general.

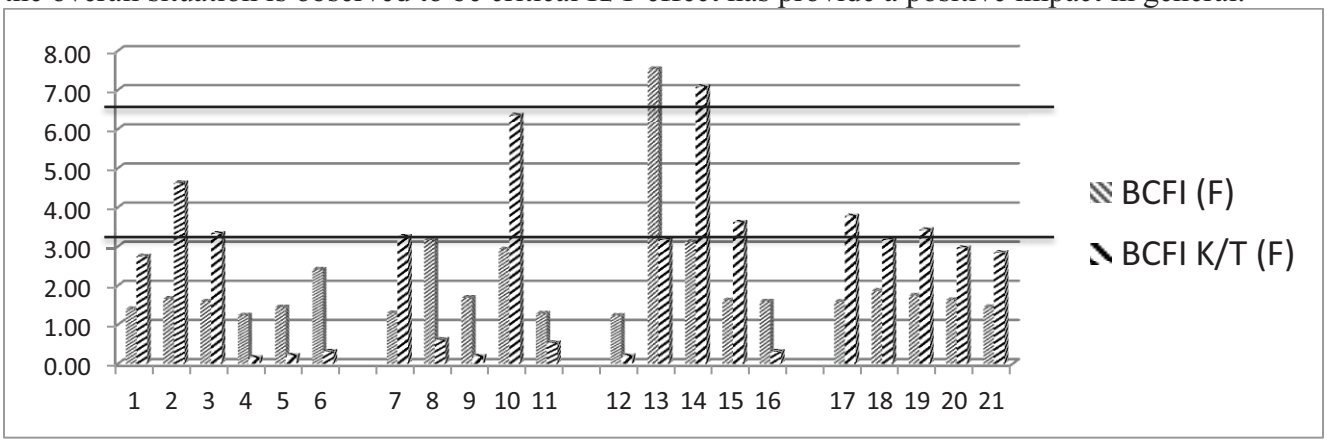

Figure 3. BCFI (F) vs BCFI K/T (F)

2. Results of K/T rankings from informants G2

Technology rankings for the attributes of G2 are seen to be slightly different compared to the answers from G1 (**Figure 2, Figure 4**). Here, participants from G2 values basic technologies more than spearhead technologies while they keep the core technologies in same level with G1. Although, there are small changes between G1 and G2 in technology rankings, the change in dominating technology will effect on the enhancement of the attributes by K/T effects.

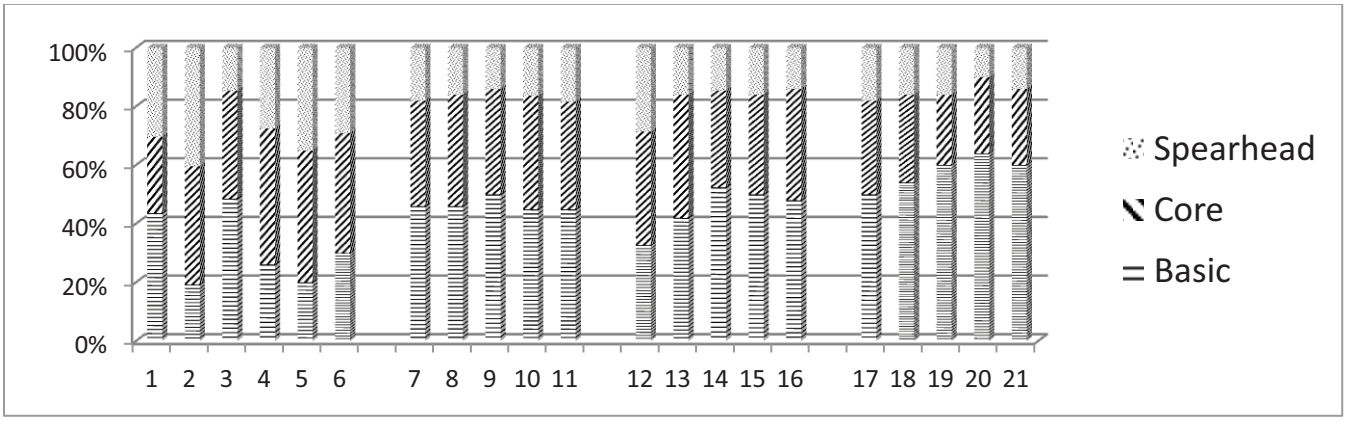

Figure 4. Knowledge/ Technology rankings

Except the attributes number 1, 11 and 14, all the attributes are going to be critical by lack of resource allocation from the technology point of view (**Figure 5**). The improvement done by K/T effects on BCFI in G1 is not observed well for the BCFI K/T values in G2 which means that K/T rankings consideration from G2 is not as effective as in G1 in general. Company should put more effort for under resourced attributes and decide on the right type of the dominating technology for each attribute.

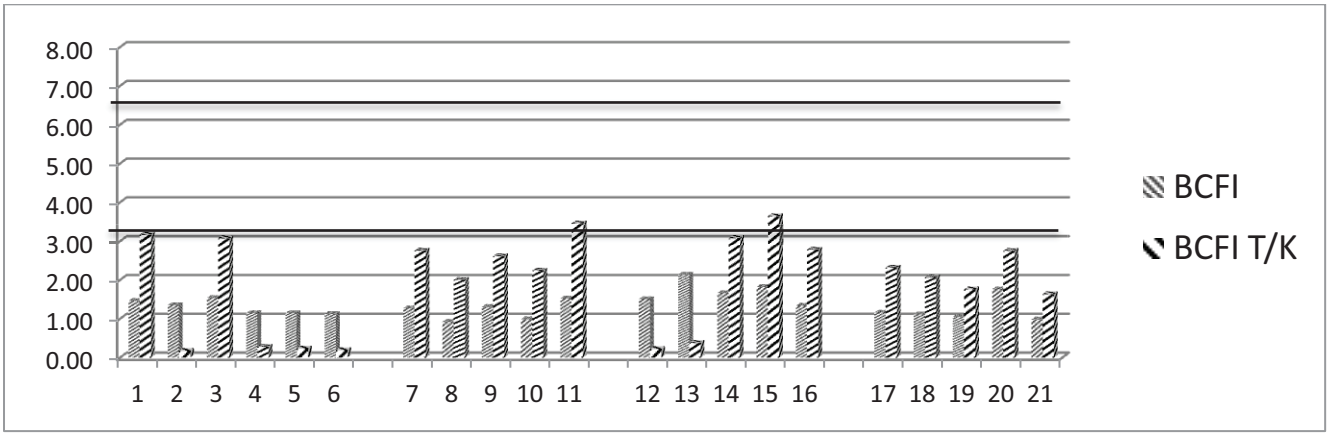

Figure 5. BCFI (F) vs BCFI K/T (F)

3. Results of K/T rankings from informants G1&G2

By analyzing the data from both groups' participants, company's core technologies seem to be around 35%, basic technologies differ from 25% to 60% and the technologies focused on the future (Spearhead) is observed to be roughly around 20% in average (**Figure 6**). It may be very clearly observed that the basic technologies are generally the dominating technology type for most of the attributes which implies that the company is not considered or going to be competitive from the technology point of view, although core technologies are around 35%.

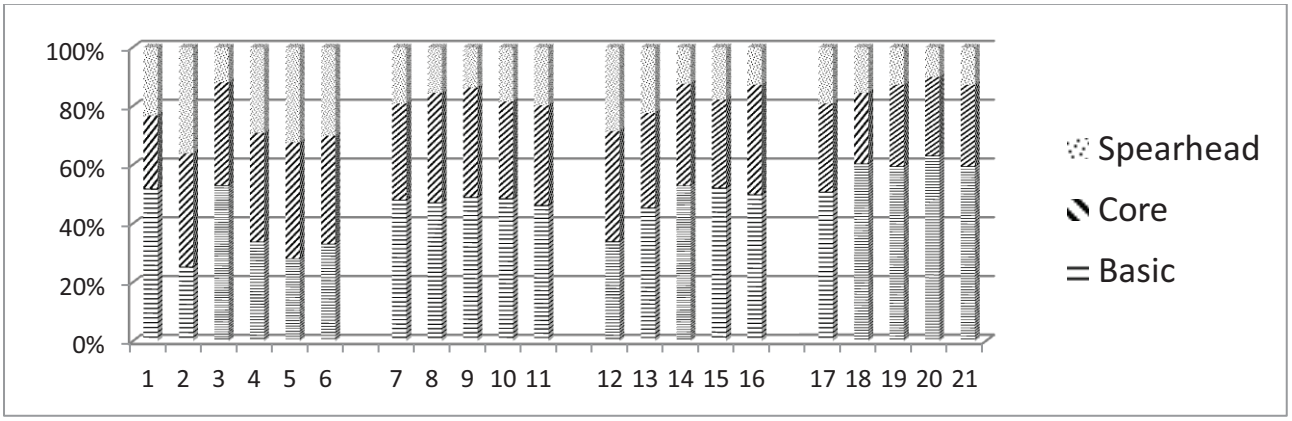

Figure 6. Knowledge/ Technology rankings

Except the attribute number 13, almost all the attributes are going to be critical by lack of resource allocation and the attribute number 13 is going to be over resourced with a small number (**Figure 7**). General situation in this figure does not seem a very bad one. Although, most of the attributes are not in the balanced zone they are quite near to be pulled to the balanced zone.

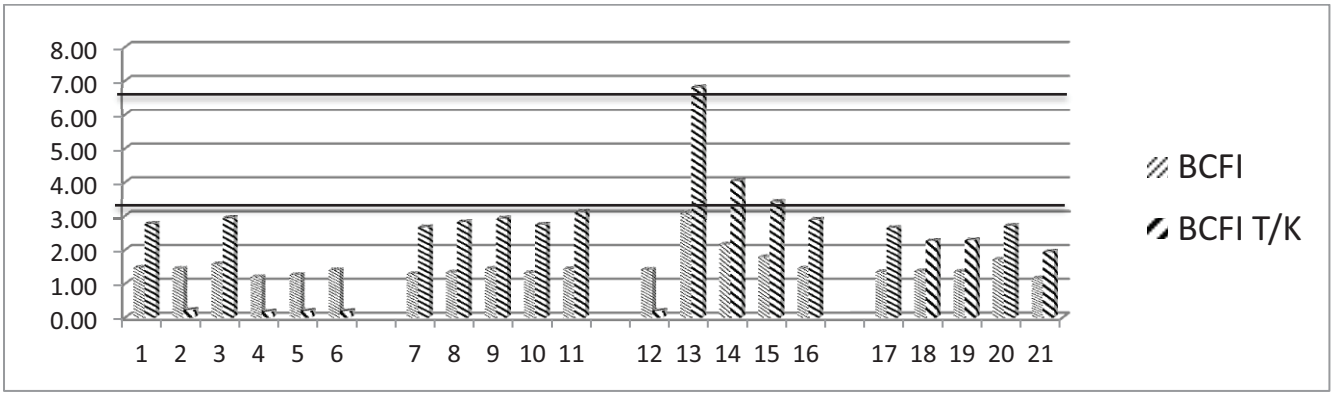

Figure 7. BCFI (F) vs BCFI K/T (F)

4. Strategy Type

Analyzer and defender strategy types are seen to be almost equally the most preferred strategy types for the company in the past case. Although, company aims to keep its operational strategy type unchanged analyzer strategy type is slightly less dominant for the future case but defender strategy type is the most dominant one (**Table 6**). It is well understood that the company is aiming to follow defender strategy type in the future case with and without K/T involvement; however, somehow it is also going to have analyzer strategy type characteristics as well in the future.

Table 6. Strategy type calculations.

	Prospector	Analyzer	Defender
G1 BCFI (P)	0,92	0,95	0,96

	Prospector	Analyzer	Defender
G1 BCFI (F)	0,78	0,87	0,89
G1 BCFI TK (F)	0,81	0,88	0,90
G2 BCFI (P)	0,95	0,97	0,97
G2 BCFI (F)	0,74	0,84	0,88
G2 BCFI TK (F)	0,77	0,86	0,89
G1-G2 BCFI (P)	0,94	0,96	0,97
G1-G2 BCFI (F)	0,74	0,84	0,88
G1-G2 BCFI TK (F)	0,76	0,86	0,89

5. SCA analyzes and Weak Market Test (WMT)

The calculated SCA values for the past case are seen to be relatively very high compared to the SCA values that are calculated for the future case (**Table 7**). In this scenario, it can be concluded that the resource allocation for attributes were partially supporting the operational strategy better; however, the resource allocation for the future scenario seems to be inadequate which means weak sustainability is unavoidable in the future operation strategies. Therefore, the decision makers are suggested to concentrate more on well distributed resource allocation between attributes.

Table 7. Calculated SCA results

	α	β	γ	MAPE	RMSE	MAD	WMT
G1 BCFI (P)	1,08	0,99	1,08	0,92	0,95	0,96	
G1 BCFI (F)	1,06	1,01	1,07	0,78	0,87	0,90	
G1 BCFI TK (F)	1,04	1,03	1,07	0,74	0,84	0,88	
G2 BCFI (P)	1,07	1,01	1,07	0,95	0,97	0,97	
G2 BCFI (F)	1,07	0,99	1,08	0,74	0,84	0,88	
G2 BCFI TK (F)	1,06	1,01	1,08	0,76	0,86	0,89	
G1-G2 BCFI (P)	1,07	0,99	1,07	0,94	0,96	0,97	0,94
G1-G2 BCFI (F)	1,07	0,99	1,08	0,74	0,84	0,88	
G1-G2 BCFI TK (F)	1,05	1,01	1,08	0,76	0,86	0,89	0,91

One other point observed from **Table 7** is the enhancement of K/T effects on SCA risk levels. Involving the K/T effect into the consideration shows a small improvement in SCA values for G2 and G1&G2 analyzes which simply indicates an automatic improvement in resource allocation. At this point it is highly suggested for the decision makers to adjust their technology rankings accordingly to improve the critically allocated resource for each attribute.

Validation of SCA formulas seem to work properly based on WMT. OEI case companies do not stand against the SCA risk levels; they approve the results with the practice. The same situation may be said for our case company, the practical SCA risk level is exactly same compared to MAPE and %2-3 higher risk level compared to RMSE and MAD in the past case. Although, there is a high risk level between WMT and MAPE the risk level is quite small in comparison of WMT and MAD in the future case. In this scenario, WMT data does not exactly fit to any of the SCA formulas. Therefore, there is a need to conduct more case studies to make a decision on which SCA formula would be more realistic.

6. K/T effects comparison with other OEI case companies

As the effects of K/T to SCA has also been examined for OEI case companies (OEI.1- OEI.7) a comparison between the results from these companies and our case company is performed. While the effect of K/T has a small enhancement, (1-3) %, to SCA values for our case company in case of G1&G2, it increases the risk level for the other OEI case companies except OEI.1 (**Figure 8**). The derived results imply that these companies cannot take the effect of K/T into account as they use weak or wrong type of the technology for most of their attributes.

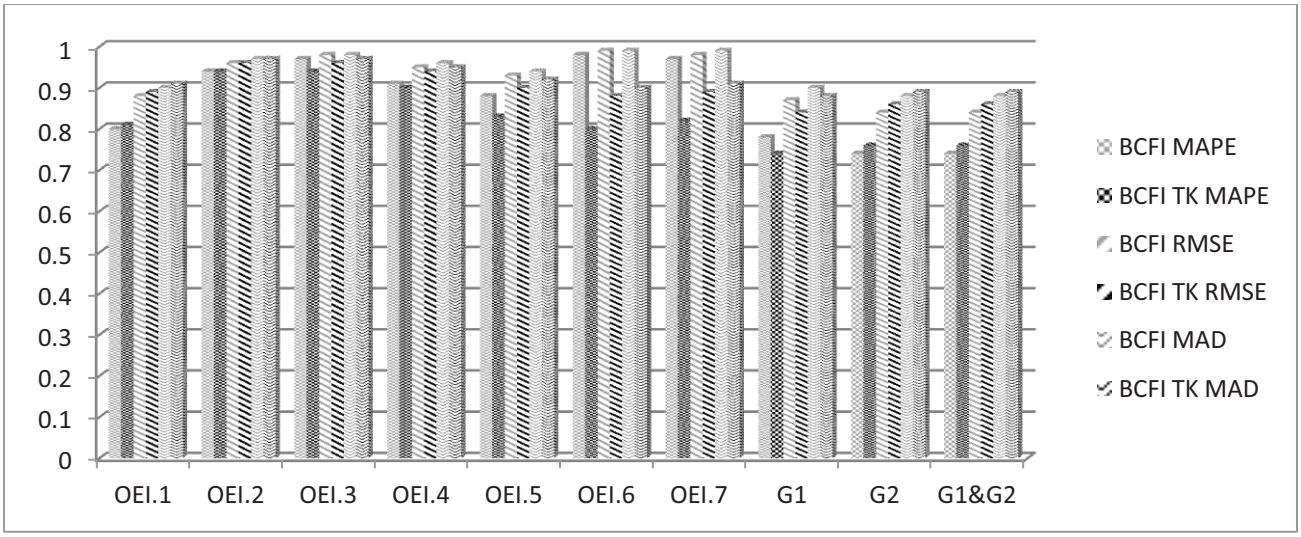

Figure 8. BCFI (F) vs BCFI K/T (F)

DISCUSSIONS

In this paper, the operations SCA evaluation may be considered as the risk probability. By achieving the SCA value, decision makers may decide on an operation strategy (among prospector, analyzer and defender operational strategy types) which causes least risk. The presented SCA method provides better sustainability, sensitivity and flexibility for the company. Moreover, it enhances its competitiveness and performance. The model provides possibility:

- To observe the right type of the operations strategies that may provide better performance for the company.
- To make the adjustments in case of the general strategy and take better strategic actions by operation with supplementary information.
- To investigate whether each unit in company follows the general strategy or not, in case of analyses for each unit separately. In case a unit is not following the general strategy, the attributes in that unit may be adjusted to converge with the company's general strategy.

Our international case company does not seem to be a competitive one in case of K/T rankings. Therefore, the enhancement of K/T to SCA values is not significantly seen in this study. The usage of the core technologies is around 35% and it might seem relatively sufficient; however, it is observed that the basic technology type is dominant for the most of the attributes. This situation shows that company is not planning to invest on the future type technologies efficiently.
Although. the model introduced in this paper provides an extensive potential and adequate practical value in case of strategic analyses and strategic decision making process it is found to be in need to

be tested with higher number of organizations in different type and size in order to find the best formula to validate the strategic decision (MAPE, RSME or MAP).

MANAGERIAL IMPLICATIONS

In this first validation that is based on WMT for OEI and our case companies, the models proposed for the calculation of K/T effects to SCA risk levels seem to work properly in practice.

CONCLUSION

The main role of this paper is to validate the effect of K/T to SCA in operations by taking the manufacturing strategy's development directions and the efficiency of resource allocation into consideration. In case study section, the analyses are performed and the recommendations are provided for the decision makers. Moreover, the analytical model presented in this paper could be considered as a great source to observe the weaknesses and strengths of the company's operations and accordingly to take required actions to keep up the sustainability of the company's development.

Although, the effect of K/T to SCA is observed to be significantly small the enhancement of K/T is not negligible in case of using right type of the dominating technology. K/T effects to SCA do not increase the risk levels and WMT is very close to the calculated SCA values in case of our case company. Therefore, K/T rankings model seems to be a valid one as it enhances resource allocation; however, more case studies need to be conducted to provide a stronger validation of K/T rankings and SCA models.

ABSTRACT

Purpose—*This study aims to examine the significance of cultural intelligence and cultural adjustment on expatriates' creative engagement. This study also extends relevant literature on expatriate management to examine the relationship between cultural intelligence, cultural adjustment, and expatriates' creative engagement through a mechanism taking into account the moderating roles of psychological climate.*
Design/methodology/approach—*The sample was collected from 328 Taiwanese expatriates working in Taiwanese MNC subsidiaries operating in China (Shanghai). Structural equation modeling in AMOS 21 and hierarchical regression (SPSS 19) were used to test six research hypotheses.*
Findings—*The SEM results indicate that cultural intelligence and cultural adjustment make significant contributions to expatriates' creative engagement. The results of a hierarchical regression analysis also confirm the moderating effects of the psychological climate. These findings suggest that cultural intelligence and psychological climate can play important roles as predictors of expatriates' creative engagement in cross-cultural environments.*
Research limitation/implications—*The main research limitations include the use of a cross-sectional research design using Taiwanese MNC subsidiaries in China as the sample and using self-reported questionnaires. Future studies can adopt a longitudinal research design or a case study to compliment the results of this study. This study focuses on the relationships between cultural intelligence, cultural adjustment, and expatriates' creative engagement through the moderating roles of psychological climate which have rarely been investigated. The findings of this study are also very important for academia and professionals in an expatriate context.*
Originality/value—*This study extends the theoretical model of cultural intelligence and psychological climate based on multiple perspectives of work-role transition, the principle of attribution, and social learning theories. Using a specific Chinese context, the current paper highlights the value and necessity of cross-cultural adjustment for successful expatriation.*

Keywords: cultural intelligence, cultural adjustment, creative engagement, psychological climate
Paper Type: Research paper

INTRODUCTION

Employee creativity has become a core competency, which helps organizations to sustain their competitive advantage (Chen, Li, and Tang, 2009). Employee creativity is of great significance to organizational effectiveness and survival (Pieterse, van Knippenberg, Schippers, and Stam, 2010). Most contemporary researchers and theorists have adopted a definition which can be described as the product or outcome of a development process (Shalley, Gilson, and Blum, 2009; Zhang and Bartol, 2010a). Creativity in the workplace is defined as being the production of novel and useful ideas or solutions in a given specific situation (Byron, Khazanchi, and Nazarian, 2010; George and Jones, 2012).

To date, most research on creativity has focused on creative performance, which refers to creative outcomes, i.e., the novel and useful ideas concerning products, services, or procedures which are ultimately produced (Shalley and Zhou, 2008; Zhang and Bartol, 2010a; Zhou and George, 2003). The present study focuses on creativity as an individual's ability to generate creative approaches to resolve problems (Hirst, Knippenberg, and Zhou, 2009). Although the consequences and antecedents of employee creativity have been well-documented by several recent studies in various local settings (Hirst *et al.*, 2009; Hon, 2011), expatriate creativity in cross-cultural settings has been largely ignored. Based on this rationale, creative engagement on the part of employees is related to the pro-active pursuit and learning of new ideas and approaches to improve individuals' achievement in the workplace (Zhang & Bartol, 2010a). In an expatriate context, expatriates' creative engagement can be defined simply as being the production of novel and useful ideas to resolve a problem, and as engagement which has the hallmarks of creative thinking and intelligent behavior.

With the growing diversity of multinational corporations (MNCs), which has resulted in their having a global presence, many modern MNCs may require or assign creative expatriates to deal with the core tasks which occur between the host and home companies (Rose and Kumar Subramaniam, 2008). The effectiveness of international assignments is of great significance to sustain organizational competitiveness, and firms may recruit expatriates who have a high degree of cultural awareness, including cultural intelligence and cultural adjustment, to enable them to effectively interact with people from different cultural backgrounds (Shannon and Begley, 2008). Such interaction seems to be difficult for expatriates and companies because cultural barriers often cause misunderstandings, which detract from efficient and effective interaction (Takeuchi, Tesluk, Yun, and Lepak, 2005). In a global context, interest in how MNCs compete when some individual expatriates deal with cultural diversity more effectively than others has gained increasing importance because of international assignments for expatriates (Shannon and Begley, 2008). Despite a growing amount of research on expatriate effectiveness in international assignments, which has included studies on expatriate performance (Kim, Kirkman, and Chen, 2008; Lee and Sukoco, 2010; Wu and Ang, 2011), there is still a lack of sufficient knowledge of the factors which influence expatriates' creative engagement.

Purposively, this present study extends the CQ and cultural adjustment literature proposed by Ang and Van Dyne (2008) in order to explore the role of CQ and its effects on cultural adjustment and expatriates' creative engagement, and also to determine how cultural adjustment

influences expatriates' creative engagement in cross-cultural environments. It also examines the moderating effects of the psychological climate in the influence of CQ on cultural adjustment and expatriates' creative engagement, and the influence of cultural adjustment on expatriates' creative engagement, respectively. It is posited that, when the psychological climate is positive, cultural intelligence will be high rather than low, and that it will be critical to cultural adjustment and expatriates' creative engagement. These research purposes are also elaborated in the research framework illustrated in Figure 1.

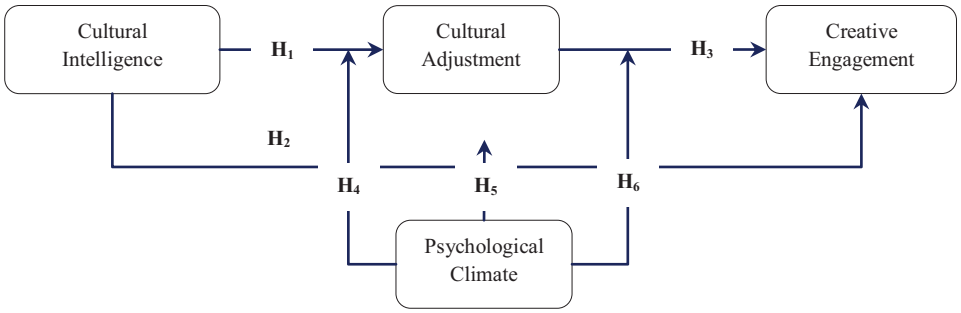

Figure 1: Influence of cultural intelligence on creative engagement

THEORETICAL FRAMEWORK AND HYPOTHESES

The influence of cultural intelligence on cultural adjustment

Cultural intelligence (CQ) plays an important role in developing cross-cultural relationships because individuals with high CQ tend to enjoy interacting with people from different cultural backgrounds (Chen, Lin, and Sawangpattanakul, 2011; Shannon and Begley, 2008). *CQ* is defined as being an individual's capability to identify or behave appropriately when adapting to new cultures (Ang *et al.*, 2007). According to Ang and Van Dyne (2008), CQ is composed of four factors (i.e., metacognitive CQ, cognitive CQ, motivational CQ, and behavioral CQ). CQ is proposed to be a key predictor of cultural adjustment, which can enable expatriates to be successful during international assignments (Kim *et al.*, 2008; Templer, Tay, and Chandrasekar, 2006). The rationale for the relationship between CQ and cultural adjustment can be explained by an attribution theory of achievement, motivation, and emotion (Weiner, 1985). The principle of attribution theory argues that individuals view ability as being a relatively stable emotion when dealing with a host cultural environment. This study argues that individuals who are able to identify, recognize, and reconcile cultural differences because of a higher level of CQ will better adjust to a new work environment and are more likely to be effective workers in the host country (Ang and Van Dyne, 2008; Kim *et al.*, 2008). Consequently, individuals with a high level of CQ are better able to effectively interact with people from a culturally-different society (Ang and Van Dyne, 2008), because it is likely that they gain more appropriate emotional satisfaction by interacting with local people (Kim *et al.*, 2008). This, in turn, is critical to their cultural adjustment. Based on the above discussion, the following hypothesis is proposed:
Hypothesis 1: Cultural intelligence has a positive influence on cultural adjustment.

The influence of cultural intelligence on expatriates' creative engagement

CQ literature demonstrates that expatriates with a strong sense of motivational CQ will facilitate cognitive processes and perform well in a variety of settings, such as those requiring high quality decision-making, goal-setting, and academic achievement, and will, in turn, achieve high levels of creative engagement (Bandura, Barbaranelli, Caprara, and Pastorelli, 2001; Luszczynska and Schwarzer, 2005). Metacognitive and cognitive CQ may influence expatriates to creatively engage in areas which require higher levels of culturally-related cognitive processing and more knowledge about the different cultural backgrounds which exist in the host country (Earley and Ang, 2003; Kim *et al.*, 2008). Behavioral CQ influences expatriates' creative engagement can be explained by social learning theory (Bandura, 1977), which suggests that individuals' interaction with other groups of people by learning about different cultural backgrounds (Tariques and Takeuchi, 2008) will influence their creative performance at work (Templer *et al.*, 2006). When expatriates understand the cultural differences in the host culture, they are more likely to effectively adapt to the new cultural setting (Chen *et al.*, 2011), which will then be likely to result in promoting a better performance in terms of their creative engagement. Therefore, this study argues that individual expatriates with a higher level of CQ will be better able to increase their generative, creative, proactive, and reactive ideas, which will lead to the effective completion of their international assignments. Based on this rationale, the following hypothesis is proposed:
Hypothesis 2: Cultural intelligence has a positive influence on expatriates' creative engagement.

The influence of cultural adjustment on expatriates' creative engagement

According to Vianen, Pater, Kristof-Brown, and Johnson (2004), cultural adjustment is conceptualized as being the degree of psychological comfort an expatriate has with various aspects of the host culture. Cultural adjustment has been primarily defined as being the degree of psychological comfort an expatriate feels in new cultural situations. In expatriation literature, Black and Stephens (1989) identify three facets of cultural adjustment, such as general adjustment—adjusting to housing, food, shopping, and other aspects of the foreigner culture, work adjustment—meeting job responsibility and performance expectations, and interactional adjustment—socializing and speaking with host-country nationals. The stronger expatriates' ability to engage in creative work, the more likely they are to become well-adjusted to a new cultural environment (Kraimer, Wayne, and Jaworski, 2001; Mol, Born, Willemsen, and Van Der Molen, 2005). It is argued that cultural adjustment may have an influence on individuals' creative engagement. Therefore, the following hypothesis is proposed:
Hypothesis 3: Cultural adjustment has a positive influence on expatriates' creative engagement.

The moderating effects of psychological climate

It was argued in the previous section that CQ influences cultural adjustment and expatriates' creative engagement, and that cultural adjustment influences expatriates' creative engagement, respectively. Further, it was suggested that these relationships may be qualified by expatriates' perception of the psychological climate in multi-cultural environments. This model applies the moderating effects of the psychological climate on the relationship between cultural intelligence, cultural adjustment, and creative engagement. In an unfamiliar or negative psychological climate,

expatriates may have less cognition about the motivation to adapt to the new cultural environment, and this may lead to negative work attitudes and outcomes, such as high turnover, job dissatisfaction, and poor performance (Parker *et al.*, 2003). The rationale of the psychological climate is addressed from the perspective of social cognitive theory (Bandura, 2001; James, Hater, Gent, and Bruni, 1978). Psychological climate is defined as expatriates' perception of the work environment in which their work behavior occurs based on their experience within an organization (James and Sells, 1981; Koys and DeCotiis, 1991).

A positive psychological climate is expected to provide a cognitive representation of expatriates' work environment which enables individuals to enhance an already high level of CQ and cultural adjustment. Expatriates with a high level of CQ and a positive psychological climate will better adjust to the new work environment in the host country, because it is likely that they will gain more emotional satisfaction by interacting with local people (Kim *et al.*, 2008). This study argues that, if individuals find a positive psychological climate in the host cultural environment, this may make the variance in expatriate CQ levels more important in relation to their adjustment and creative engagement in work. This situation may require expatriates to have a high level of CQ in order for them to adjust well and, in turn, enhance their creative engagement. Based on this rationale, the following hypotheses are proposed:

Hypothesis 4: The psychological climate moderates the relationship between cultural intelligence and cultural adjustment so that the relationship between CQ and cultural adjustment is stronger when the psychological climate is positive.

Hypothesis 5: The psychological climate moderates the relationship between cultural intelligence and expatriates' creative engagement so that the relationship between CQ and expatriates' creative engagement is stronger when the psychological climate is positive.

James et al. (2008) argue that the psychological climate is associated with employees' evaluation of different aspects of the work environment. When employees evaluate their work environment in a positive way, they tend to enhance their identification with their job and organization, and thus are more likely to display extra-role behavior which is beneficial for the organization for which they work (Wei, Han, and Hsu, 2010). Similarly, expatriates with a positive psychological climate may perceive that variances in cultural adjustment levels are more important in relation to expatriates' creative engagement. This situation will also require expatriates to have a high level of cultural adjustment so that they can engage more creatively at work. Based on this rationale, the following hypothesis is proposed:

Hypothesis 6: The psychological climate moderates the relationship between cultural adjustment and expatriates' creative engagement, so that the relationship between cultural adjustment and expatriates' creative engagement is stronger in a positive psychological climate.

METHODS

Samples and data collection

The sampling process involved two phases. Firstly, emails were sent to the human resource department of each home MNC to ask for the personal details of appropriate expatriates (i.e., Taiwanese expatriates in China) to participate in this study. A total of 68 MNCs responded. Secondly, a purposive sampling technique was adopted to send questionnaires to invite "three to four" expatriates in each department among 68 MNCs to participate in using an email-based survey. A total of 52 MNCs were collected, which included 344 expatriates from both departments. However, 16 questionnaires had to be excluded as outliers, and these were deleted using the graphic method, with a residual scatter plot in the range of ±3 standard deviation (Hair, Black, Babin, and Anderson, 2010). Finally, a total of 328 valid questionnaires from 48 MNCs were determined to be usable. The average number of expatriates in each department was 3.45, and the effective responsive rate was 35.55 percent.

Measures and variables

Cultural intelligence

The CQ self-report scale developed by Van Dyne, Ang, and Koh (2008) was adopted for the study. This consisted of a total of 20 items and four dimensions. All the items were measured on a 5-point Likert scale (1 = strongly disagree; 5 = strongly agree).

Cultural adjustment

Three sub-dimensions and 9 items of cultural adjustment adopted from Black (1988). All the items were measured on a 9-point sematic differential scale (-5= not adjusted at all; +5 = very well adjusted).

Creative engagement

Two factors and 8 items of creative engagement developed by Zhang and Bartol (2010b). All the items were measured on a 5-frequency scale (1= never, 2 = rarely, 3 = occasionally, 4 = frequently, and 5 = very frequently).

Psychological climate

Six items of the psychological climate developed by Wei, Han, and Hsu (2010) were adopted for this study. All the items were measured on a-5 point Likert scale (1 = strongly disagree; 5 = strongly agree).

The questionnaire items were translated from English to Chinese. A standard translation and back-translation procedure was performed to ensure the accuracy of the meaning of the measured

items. The details of questionnaire items and the Cronbach's alpha reliability are reported in the Appendix: Index items.

Confirmatory factor analysis (CFA)

A confirmatory factor analysis (CFA) was performed using AMOS 20 to evaluate the distinctiveness of the measures used in the present study. Anderson and Gerbing's (1988) research was adopted to assess the convergent and construct validity of the measurement model. CFA procedures have two order factor models (Koufteros, Babbar, and Kaighobadi, 2009). A first order-factor model was adopted to examine each individual research construct, and the results of this procedure indicated that the standardized loading for all items exceeded .70 and that the *t-values* were higher than 1.96 ($p < .05$), thus satisfying the threshold recommended by Hair *et al*. (2010) and Kline (2011). Then, a second-order factor CFA were conducted to examine the overall model fit of each construct. The results indicated that all research constructs were reliable and satisfied the threshold values, which exceeded .70.

Finally, the mean scores of the individual factors of each research construct (i.e., cultural intelligence, cultural adjustment, and expatriates' creative engagement) were computed to conduct the second order CFA in order to examine the overall appropriateness of the measurement model, as shown in Figure 2. The results showed that the overall goodness-of-fit assessment satisfied the threshold of $\chi^2 = 132.649$; df = 68; GFI = .949; AGFI = .910, and RMR = .048, thus indicating that the research model could be presented as a good model fit with adequate convergent validity and construct reliability (Gerbing and Anderson, 1992; Hair *et al.*, 2010).

The common method variance is adopted to validate inflated or deflated the strength of the relationship among the research constructs (Podsakoff, MacKenzie, Lee, and Podsakoff, 2003). To assess the potential impact of this form of bias in this study, discriminant validity was tested in three steps. Firstly, a Harman one-factor test was conducted (Podsakoff and Organ, 1986), which loaded all the variables into a principal component factor analysis. The results revealed that no single factor dominated (ten factors were generated with 82.5% of the total variance, with factor 1 only 28.89% of the variance). Secondly, convergent validity was demonstrated, since the average variance extracted (AVE) values for all constructs was higher than the suggested threshold value of .50 (Fornell and Larcker, 1981). Discriminant validity was determined by comparing the square root of the AVE with the Pearson's correlations among the constructs (see Table 1). All the AVE estimates can be seen to be greater than the corresponding inter-construct square correlation estimates in Table 2. Based on these results, it seems that common method bias is unlikely to be a problem with regard to the data (Gefen, Straub, and Boudreau, 2000).

RESEARCH FINDINGS AND DISCUSSION

Structural equation modeling (SEM) was applied to test the maximum likelihood estimate method and Hypotheses 1-3. The results showed (see Table 3 & Figure 3) that χ^2/df = (28.009/15) = 1.867; GFI = .983; AGFI = .948, and p = .022, were satisfied with the threshold suggested by Hair *et al.* (2010). Hypothesis 1 predicted that cultural intelligence would have a positive impact on cultural adjustment. This finding provided support for Hypothesis 1 (β = .773; p <.001; *t-value* = 13.943). The results of this study confirmed the studies of Ang and Van Dyne (2008), Kim *et al*. (2008), and Templer *et al.* (2006). Hypothesis 2 predicted that cultural intelligence would have a positive impact on expatriates' creative engagement. The results provided support for Hypothesis 2 (β=.489; p < .001; *t-value* = 5.505). Similarly, this study also found that cultural adjustment had a significant and positive influence on expatriates' creative engagement (β=.353; p <.001; *t-value* = 3.745), which provided support for Hypothesis 3. The results also suggested that the relationship between cultural intelligence and creativity engagement was mediated by cultural adjustment, which was suggested by Sobel's (1982) test, which states that the mediating effect is significant if the *z-test* statistic is higher than the threshold value of *t-value* = 1.96. As shown in Table 4, the *z* score for cultural intelligence → cultural adjustment → expatriates' creative engagement; the *z-test* = 4.159 >1.96, which indicates that the mediating effect of cultural adjustment was significant for the influence of cultural intelligence on expatriates' creative engagement.

Table 2 provides a summary of the models and results used to test Hypotheses 4-6. Since cultural intelligence is measured by using continuous variables, the regression can be used to retain the continuous nature of the variables without losing information or reducing the power to detect the interactive effects (Aiken, West, and Reno, 1991; Cohen, Cohen, West, and Aiken, 2003). However, it is possible that variables may correlate with each other (high multicollinearity), and thus, the independent variables were mean-centered to reduce these effects (Frazier, Tix, and Barron, 2004). Then, a hierarchical regression was adopted to test the moderating effects of the psychological climate.

Table 3 The moderating role of psychological climate.

Independent variables	Dependent variables

Sig. (p)	.007	.001	.000

*Note: *** p-value <.001; ** p-value <.01; * p-value <.05; significant level at t-value >1.96*

As shown in Table 3, the psychological climate has a direct effect on cultural adjustment (Model-1: β =.264; *t-value* = 5.290; p = .000) and expatriates' creative engagement (Model-2: β =.350; *t-value* = 4.667; p = .000). The results also revealed that the psychological climate moderates the influence of cultural intelligence on expatriates' creative engagement (Model-1: β =.078; *t-value* = 2.738; p = .007), which indicates support for Hypothesis 4. The psychological climate also moderates the relationship between cultural adjustment and expatriates' creative engagement (Model-2: β = .131; *t-value* = 3.374; p = .001), providing support for Hypothesis 5. Furthermore, the psychological climate was also found to moderate the relationship between cultural adjustment and expatriates' creative engagement (Model-3: β = .166; *t-value* = 3.546; p = .000), indicating support for Hypothesis 6. These moderating effects are also elaborated in Figures 4-6, respectively.

Following the procedures of Aiken *et al.* (1991) and Cohen *et al.* (2003), Figure 4 presents the moderating effect of the psychological climate and indicates that expatriates with a positive psychological climate ($\bar{Y}$ = 4.87) and higher cultural intelligence tend to achieve the highest level of cultural adjustment. Expatriates with higher cultural intelligence, but a negative psychological climate ($\bar{Y}$ = 4.35), tend to make less of a cultural adjustment. However, expatriates in a positive

psychological climate ($\bar{Y}$ = 3.894), but with lower cultural intelligence, tend to have the lowest levels of cultural adjustment. Those in a negative psychological climate with lower cultural intelligence also achieve a lower cultural adjustment. These results suggest that expatriates in a positive psychological climate can experience the highest levels of cultural adjustment in situations where they exhibit higher cultural intelligence. Thus, the above statements confirm Hypothesis 4.

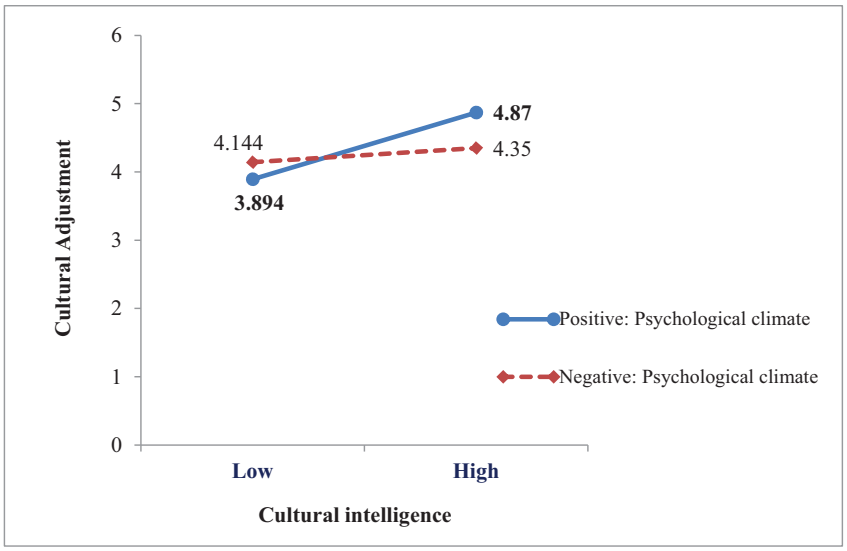

Figure 4. Hypothesis 4

Figure 5 indicates that expatriates in a positive psychological climate ($\bar{Y}$ = 4.251) and with higher cultural intelligence tend to achieve the highest level of creative engagement. As predicted, expatriates with higher cultural intelligence but in a negative psychological climate ($\bar{Y}$ = 4.088) tend to have lower creative engagement. However, expatriates in a positive psychological climate ($\bar{Y}$ = 3.191) but with lower cultural intelligence tend to have the lowest level of creative engagement. Those in a negative psychological climate and with lower cultural intelligence also achieve lower creative engagement. These results suggest that expatriates in a positive psychological climate can achieve the highest levels of creative engagement when they also have higher cultural intelligence. Thus, these statements provide support for Hypothesis 5.

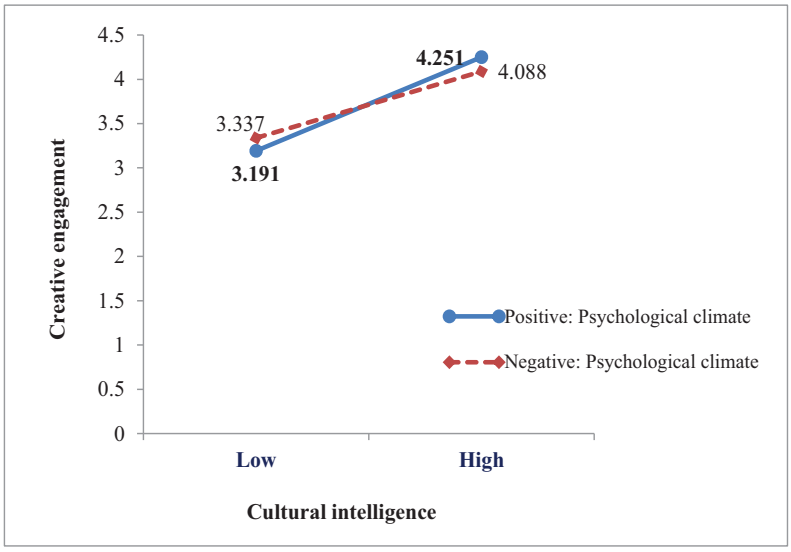

Figure 5. Hypothesis 5

Figure 6 presents the moderating role of the influence of the psychological climate on the relationship between cultural adjustment and expatriates' creative engagement. The results indicate that expatriates in a positive psychological climate ($\bar{Y} = 4.957$) and with a higher level of cultural adjustment tend to achieve the highest level of creative engagement. Expatriates with a higher level of cultural adjustment but in a negative psychological climate ($\bar{Y} = 4.616$) tend to have a lower level of creative engagement. However, expatriates in a positive psychological climate ($\bar{Y} = 4.09$) but with a lower level of cultural adjustment tend to have the lowest level of creative engagement. Those in a negative psychological climate and with a lower level of cultural adjustment also achieve a lower level of creative engagement. The results suggest that expatriates in a positive psychological climate can achieve the highest levels of creative engagement when combined with higher levels of cultural adjustment. Thus, the above rationales and discussions indicate support for Hypothesis 6.

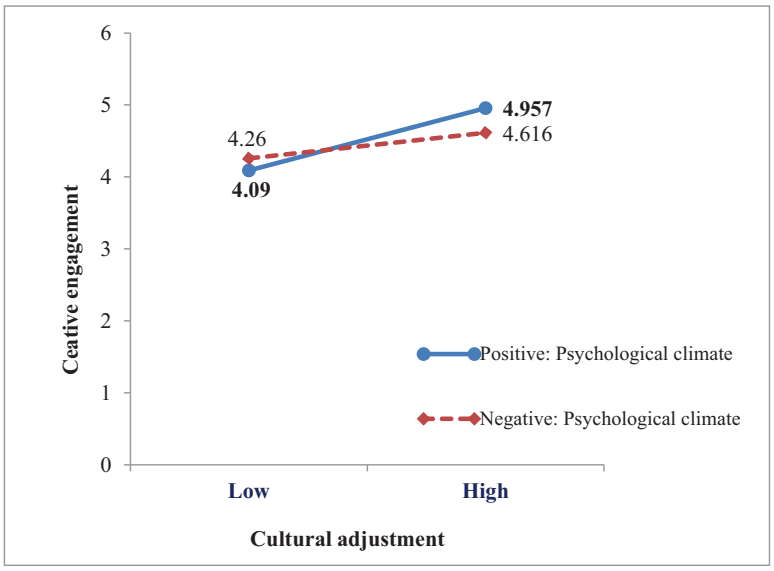

Figure 6. Hypothesis 6

RESEARCH IMPLICATIONS

The research findings of this study indicate that expatriate creativity also plays an important role in the effective performance of international assignments in 48 Taiwanese MNCs in China. Thus, the present study developed and tested a comprehensive model which encompassed the antecedents of expatriates' creative engagement in the context of an international assignment by integrating multiple social learning, social cognition, and work-role transition theories. It is critical to gain a better understanding of the factors which enable expatriates to perform effectively in cross-cultural environments (Kim *et al.*, 2008). The results indicated that all four dimensions of cultural intelligence (CQ) make a significant contribution to expatriate adjustment. This is in line with previous empirical findings, which have suggested that expatriates who are highly capable of interacting with different cultures will have a higher level of adjustment (Ang and Van Dyne, 2008; Kim *et al.*, 2008; Lee and Sukoco, 2010).

In particular, the results suggested that the relationship between CQ and expatriates' creative engagement was mediated by cultural adjustment. This was suggested by Sobel's test and was in line with Kim *et al.* (2008), who proposed that cultural adjustment plays an important role as a key mediator between cultural intelligence and expatriates' performance. Thus, it can be assumed that cultural adjustment plays an extremely critical role, having both a mediating and directing effect on the effectiveness of international assignments, including expatriates' performance (Kim *et al.*, 2008; Kraimer *et al.*, 2001; Lee and Sukoco, 2010) and expatriates' creative engagement.

Furthermore, the results of this study also indicated that the psychological climate can moderate the influence of the relationship among cultural intelligence, cultural adjustment, and expatriates' creative engagement. When the level of CQ is low, the psychological climate may lead to expatriates having a negative perception of their working environment, which results in lower

levels of cultural adjustment and creative engagement. In summary, this study suggested that expatriates who are more interested in experiencing diverse cultures, and are thus motivated to do so, will have more self-confidence in their ability to deal with new cultures, and in turn, will more effectively complete assignments. When expatriates exhibit a high capability with regard to cultural intelligence and the ability to overcome cultural differences, they are better able to work and interact with local co-workers, thus improving their ability to generate useful ideas and achieve better levels of performance. Empirically, the extension of cultural intelligence and the adjusted framework developed by previous studies to predict expatriates' creative engagement were also confirmed by this study. In addition, the overall prediction concerning the relationship among cultural intelligence, cultural adjustment, and expatriates' creative engagement was supported by social learning, social cognition, and work-role transition theories (Kim *et al.*, 2008; Takeuchi *et al.*, 2005). In addition to the expatriate context, the key antecedents of CQ may be important predictors of employees' work outcomes in service industries, such as hospitality and tourism. Because these industries require employees to interact with customers from diverse cultural backgrounds, employee CQ may influence customer satisfaction, and in turn, the performance and effectiveness of organizations (Kim *et al.*, 2008).

LIMITATIONS AND FUTURE RESEARCH

This study proposed that cultural intelligence influences cultural adjustment and expatriates' creative engagement by the mechanism of a psychological climate. It also discussed the moderating role of the psychological climate on the relationship among cultural intelligence, cultural adjustment, and expatriates' creative engagement. However, the study had some limitations which will provide interesting aspects for future research. Firstly, it focused on expatriates' creative engagement as a dependent variable, but future studies may need to include other indicators of international assignment effectiveness, such as job satisfaction, organizational commitment, and return intention. Secondly, it did not consider the effects of families' (or spouses') adjustment on expatriates' creative engagement. This topic should be addressed in future research because the existence of spouses and children can have a cross-over effect on expatriates' adjustment and creative engagement (Kim *et al.*, 2008; Takeuchi *et al.*, 2005). It is evidence to show that spousal adjustment influences cross-cultural adjustment and work-related outcomes (Shaffer and Harrison, 1998). Thus, future research should include the effects of family adjustment on the relationship among CQ, cultural adjustment, and creative engagement. Thirdly, cultural differences and cultural distance between host and home cultures should be included in the moderating effect among the relationship of CQ, cultural adjustment, and creative engagement (Kim *et al.*, 2008).

Finally, the sample in this study was predominantly Taiwanese expatriates, which focused on a Chinese context. It is suggested that future research should consider Chinese leadership styles (i.e., transformational and transactional leadership) because it is well known that leaders can influence the degree of role stress and uncertainty experienced by expatriates, which, in turn, may affect the level of cultural intelligence, cultural adjustment, and expatriates' creative engagement. Thus, future studies should test these variables in this study's model with samples from different populations. This may provide a greater insight into the phenomenon of expatriates' adjustment and creative engagement in cross-validation situations, such as Europe

versus Latin America or Asia versus Europe. These additional efforts will further enhance the validity and generalizability of the findings. In short, the research presented here contributes to an understanding of a CQ framework which can be integrated into an international assignment context.

Appendix: Index Items

Cultural intelligence (CQ)

Metacognitive CQ (α=.913; AVE=.844)

1. I am conscious of the cultural knowledge while I interact with other people from different cultural background (MetCQ1).
2. I adjust my cultural knowledge as I interact with people from a culture that is unfamiliar to me (MetCQ2).
3. I am conscious of the cultural knowledge I apply to cross-cultural interactions (MetCQ3).
4. I check the accuracy of my cultural knowledge as I interact with people from different cultures (MetCQ4).

Cognitive CQ (α=.956; AVE=.776)

1. I know the legal and economic systems of other cultures (CCQ1).
2. I know the rules (e.g., vocabulary, grammar) of other languages (CCQ2).
3. I know the cultural values and religious beliefs of other cultures CCQ3).
4. I know the marriage systems of other cultures (CCQ4).
5. I know the arts and crafts of other cultures (CCQ5).
6. I know the rules for expressing nonverbal behaviors in other cultures (CCQ6).

Motivational CQ (α=.919; AVE=.803)

1. I enjoy interacting with people from different cultures (MoCQ1).
2. I am confident that I can socialize with locals in a culture that is unfamiliar to me (MoCQ2).
3. I am sure I can deal with the stresses of adjusting to a culture that is new to me (MoCQ3).
4. I enjoy living in cultures that are unfamiliar to me (MoCQ4).
5. I am confident that I can get accustomed to the shopping conditions in a different culture (MoCQ5).

Behavioral CQ (α=.945; AVE=.782)

1. I change my verbal behavior (e.g., accent, tone) when a cross-cultural interaction requires it (BCQ1).
2. I use pause and silence differently to suit different cross-cultural situations (BCQ2).
3. I vary the rate of my speaking when a cross-cultural situation requires it (BCQ3).
4. I change my nonverbal behavior when a cross-cultural situation requires it (BCQ4).
5. I alter my facial expressions when a cross-cultural interaction requires it (BCQ5).

Cultural adjustment

General adjustment (α=.945; AVE=.782)

1. How adjusted are you to the food in foreign country? (GeAdj1)
2. How adjusted are you to shopping in foreign country? (GeAdj2)
3. How adjusted are you to the weather in foreign country? (GeAdj3)
4. How adjusted are you to generally living in foreign country? (GeAdj4)
5. How adjusted are you to the transportation system in host country? (GeAdj5)

Work adjustment (α=.873; AVE=.767)

1. How adjusted are you to your job and responsibilities? (WoAdj1)
2. How adjusted are you to working with local co-workers? (WoAdj2)

Interactional adjustment (α=.898; AVE=.821)

1. How adjusted are you to supervising foreigner subordinates? (IntAdj1)
2. How adjusted are you to working with your foreigner outside your company? (IntAdj2)

Creative Engagement

Problem identification (α=.920; AVE=.763)

1. I spend considerable time trying to understand the nature of the problem (PI1).
2. I think about the problem from multiple perspectives (PI2).
3. I decompose a difficult problem/assignment into parts to obtain greater understanding (PI3).

Idea generation (α=.955; AVE=.811)

1. I consider diverse sources of information in generating new ideas (IG1).
2. I look for connections with solutions used in seeming diverse areas (IG2).
3. I generate a significant number of alternatives to the same problem before I choose the final solution (IG3).
4. I try to devise potential solutions that move away from established ways of doing things (IG4).
5. I spend considerable time shifting through information that helps to generate new ideas (IG5).

Psychological climate *(α=.939; AVE=.679)*

1. My managers in this organization are easy to talk to about job-related problems (PSYC1).
2. My managers in this organization support subordinate delivery of new ideas (PSYC2).
3. Subordinates have effective channels to express their opinions' and 'superiors accept subordinates' suggestions and implement them (PSYC3).
4. My managers in this organization encourage subordinates to be creative (PSYC4).
5. My managers in this organization follow through on their commitments to subordinates (PSYC5).
6. My managers are quick to recognize good performance (PSYC6).

IMPLEMENTING BALANCED SCORECARD OF GOVERNMENT MIS DEPARTMENT－USING AHP AND FUZZY AHP METHODS

Yi-Hui Liang, Department of Information Management, I-Shou University, Taiwan (R.O.C.)
german@isu.edu.tw

ABSTRACT

The purpose of this study is to examine the role of the bal-anced scorecard in Government MIS Department. The frame of Government MIS Department performance applying the balanced scorecard methodol-ogy, analytic hierarchy process (AHP) and fuzzy AHP is developed by review the studies of balanced scorecard and information systems. Then, this study adopted 13 valid questionnaires in the Taiwan's Gov-ernment MIS Department to test the framework of the balanced scorecard. This study only adopts the Taiwan's Government MIS Department to vali-date the proposed measurement system. Future studies may aim other industries to evaluate Government MIS Department.

Keywords: Fuzzy theory, AHP, Balanced scorecard

INTRODUCTION

Since Executive Yuan, Republic of China implemented performance reward and performance management plan in 2003, this plan followed the Balanced Scorecard (BSC) spirit. However, Executive Yuan then consider the business properties, organi-zational culture, and management and check, so as to authorize each government department to set up its own performance evaluation process and evaluation indicators [1]。Until now, Executive Yuan does not force government departments to set up their own performance evaluation process and evaluation indicators [2].

Performance appraisal system is the most effective tool used for government reengineering. Performance appraisal aims to help people achieve their strategies, missions, visions and goals. Wu (2000)[3] supposed that good performance appraisal systems can enable government departments to allocate reasonable resources, priori-tize resource investment, further improve departmental effectiveness and efficiency, and organizational members adopt identical methods to pursue their goals, encourage their morale, and cause them to focus on organizational vision.
Balanced Scorecard (BSC), which was developed by Kaplan & Norton [4] in 1992, is a useful and popular method of identifying business performance using lag-ging and leading indicators based on the foundation of visions and strategies. Bal-anced Scorecard implies that organizational performance is evaluated not only utiliz-ing financial indicators, but also simultaneously non-financial indicators.

Satty's (1980) [5] analytical hierarchy process (AHP), which is a multi-criteria technique, is considered appropriate for solving complex decision problems [6]. The AHP is utilized in two manners with BSC: (1) choosing metrics at the beginning of the process and (2) understanding the relative importance of the metrics to a firm's managers and employees [7]. Clinton *et al.* (2002) [7] supposed the AHP is a single method that offers a means of selecting proper metrics, and this method is capable to satisfy each requirement of metric choice and scorecard construction. The AHP is based on theory and offers information on the relative weight of the BSC performance indicator [8][9].

Zadeh (1965) [10] developed fuzzy theory for handling problems involving fuzz-iness and vagueness. Lee *et al.* (2010) [11] posited that traditional BSC failed to con-solidate diverse performance indicators. Lee *et al.* (2010) [11] also suggested the fuzzy AHP method as a solution to this problem.

BSC can help managers of government organizations holistically evaluate infor-mation technology (IT) investments, as well as the performance of information sys-tem (IS) departments. This study builds a Framework for evaluating government MIS departments based on BSC. The study summarizes how to combine the BSC and fuzzy AHP to serve as a decision tool for government organization. The tool can be used not only to assess the contribution of a specific government MIS department, but also analyze the performance and direct the activities of government MIS depart-ments.

METHODOLOGY

1. Balanced Scorecard

Current strategic management suggests that there should be a strong linkage be-tween strategic plans and performance measures. Kaplan and Norton (1992)'s work [4] and determinants framework can provide this linkage. Kaplan and Norton (1992) [4] developed BSC to reform the traditional management system and as a means to evaluate corporate performance from four different perspectives, including financial, customer, internal business process and learning and growth, to measure performance. BSC suggests that systems for evaluating business performance should not only con-sider financial lagging indicators, but also customer, internal business process and learning and growth leading indicators.

Kaplan and Norton (1996) [12] indicated that BSC objectives and indicators based on vision and strategies can maintain a balance between short and long term objec-tives, financial and non-financial measures, lagging and leading indicators, and inter-nal and external performance perspectives. Kaplan and Norton (2004) [13] suggested strategy maps as a main means of describing and communicating strategies. Strategy maps clarify how to convert intangible assets, such as intangible activities contrib-uting to learning and growth, to improve organizational processes, increase customer satisfaction, and obtain better tangible outcomes, such as return on investment.

2. Research Structure and Select research variables

This study builds a Framework for evaluating government MIS departments based on BSC, AHP and fuzzy AHP.

This study adopted the dimensions and indicators which developed by Martinsons et al. (1999) [14], Liang, Hsieh, and Wang (2008)[15], and related government MIS experts to develop my proposed the dimensions and indicators. The research varia-bles are showed as Table 1.

Table 1. Research Variables

Dimension		Indicator	
Use orien-tation	1.	Build and maintain the good image and reputation with end users.	A1
	2.	Have the opportunity to develop IT.	A2
	3.	Maintain a good relation with user communities.	A3
	4.	Satisfy end user requirement	A4
	5.	Perceived the preferred IS products and services provider by end users.	A5
Business value	1.	Manage the good image and reputation.	B1
	2.	Make sure IS projects to offer business value.	B2
	3.	Control cost.	B3
	4.	Be onerous to offer the suitable IS products and services to the third party.	B4
Inner pro-cess	1.	Expect and affect the demands from end users and managers.	C1
	2.	Plan and develop IT efficiently.	C2
	3.	Operate and maintain IT applications efficiently.	C3
	4.	Obtain and test new hardware and software.	C4
	5.	Offer to satisfy the end user trainings with effective cost.	C5
	6.	Manage the IS problems effectively.	C6
Future readiness	1.	Expect and prepare the IS problems.	D1
	2.	Train and develop regularly to improve IS skills.	D2
	3.	Promote regularly IS applications mix.	D3
	4.	Increase regularly IS hardware and software.	D4
	5.	Implement cost-effective and new technological research-es which are suitable for organizations.	D5

3. The AHP and Fuzzy AHP methods

Saaty (1980) [5] developed the AHP method to resolve problems regarding choice and weight prioritization encountered during Multiple-Criteria Decision Making. The AHP method utilizes the pairwise comparison of alternatives to combine each deci-sion-maker evaluation into a final decision [11]. Zadeh (1965) [10] introduced fuzzy theory to address the vagueness of human thinking, which was oriented to the ration-ality of uncertainty

because of imprecision or fuzziness. Many studies have combined fuzzy theory with the AHP to compensate for problems introduced because of vague-ness [11][16].

The analytical steps of the AHP and fuzzy AHP methods for implementing balanced scorecard of Government MIS Departmentare showed as followings.

First, the analytical steps of the AHP method are illustrated as followings.

Step 1: Construct hierarchical framework of the BSC performance evaluation criteria

Step 2: Built pairwise comparison matrix A

Step 3: Using AHP method to calculate the weight

If get the weightmatrix W in pairwise comparison matrix A, standardize geomet-rical mean of row vectors, multiply element in every row, get geometrical mean and normalize it.

Step 4: Consistency Check

Second, the analytical steps of the fuzzy AHP method are illustrated as follow-ings.

Step 1: Construct hierarchical framework of the BSC performance evaluation criteria

From the four BSC perspectives, the hierarchical framework of the BSC perfor-mance evaluation criteria is constructed.

Step 2: Using AHP method to calculate the weight

If get the weightmatrix W in pairwise comparison matrix A, standardize geomet-rical mean of row vectors, multiply element in every row, get geometrical mean and normalize it.

Step 3: Construct Positive Reciprocal Matrix

Every evaluation member use fuzzy AHP evaluation scale to express relative weight between each dimensions and criteria, and construct fuzzy Positive Reciprocal Matrix.

Step 4: Consistency Check

The check methods are as follows:

4.1 Consistency Index (C.I.)

According to Consistency Index (C.I.), C.I=0 indicate that evaluation has perfect consistency; C.I>0 indicate that evaluation has consistency; C.I. <0.1 indicate that evaluation has evaluation has tolerant bias.

4.2 Consistency Rate (C.R.)

Saaty (1980) [5] supposed that Consistency Rate (C.R.) to evaluate the con-sistency of pairwise comparisons in a matrix among criterions. Under the condition of different rank of matrix, it produce different random index (R.I.). Under the condition of the same rank of matrix, the ratio of C.I. to R.I. is called C.R.. When C.R≤0.1, the consistency level is acceptable.

Step5: Calculate fuzzy weight value

Utilize the Lambda-Max method which Csutora and Buckley (2001) [17] pro-posed, calculate the fuzzy weight of evaluation criterions. The steps of calculation are as follows:

5.1 When α=1, use α-cut to get median Positive Reciprocal Matrix. Then, calculate the weight use AHP method to get the weight matrix.

5.2 When α=0, use α-cut to get minimum positive reciprocal matrix and maximum positive reciprocal matrix. Then, calculate the weight use AHP meth-od to obtain the weight matrix.

5.3 In order to make sure that calculated weight value is fuzzy number, there-fore, adjusted the coefficient.

5.4 After obtained adjusted coefficient, calculate minimum positive reciprocal weight matrix and maximum positive reciprocal weight matrix of every measurement dimension.

5.5 Combing adjusted minimum, maximum and median values to get the fuzzy weight in kth evaluation member and kth measurement dimension.

5.6 Utilize average method to integrate the fuzzy weight of evaluation members and measurement dimensions.

RESULTS

1. Survey Candidates

Based on previous studies on applying the BSC approach to information systems, this study used the 21 indicators as performance evaluation indicators to construct the research model and develop the questionnaire items based the model. The 20 indica-tors are showed in Table 1.

Next, take the central engineering government department as the example, and cal-culate the weights of all dimensions and indicators of the model using the AHP and Fuzzy AHP methods. The questionnaire was distributed among Director and Vice Director of the direct department, 7 Director of first-class independent unit, 3 Section Manager of the direct department, and Director of Information Technology, and a total of 13 valid questionnaires were returned and censored 2 invalid questionnaires (refusing answer, incomplete answer, or don't passing the consistency check).

2. Results of the AHP and fuzzy AHP methods

The results of using the AHP and Fuzzy AHP methods demonstrated that the im-portance weights of all dimensions were ordered as follows: internal process, user orientation, business value, and future readiness. Additionally, the results of using the AHP and Fuzzy AHP methods demonstrated that the top three importance weights of performance evaluation indicators were top three indictors are "Control cost," "Satis-fy end user demand," "Operate and maintain information technologies efficiently". However, from rank 4 to 20 performance evaluation indicators, the results of using the AHP method are different with the Fuzzy AHP method. Totally, the results of using the AHP method are slightly different with the Fuzzy AHP method. Theoretically, the Fuzzy AHP method is better than the AHP method. The result of this study is showed in Table 2.

Table 2. The results of using the AHP and Fuzzy AHP methods

Dimension	AHP weight	Fuzzy AHP weight	Indicator	AHP weight	AHP rank	Fuzzy AHP weight	Fuzzy AHP rank
User orientation	0.273	0.277	1. Build and maintain the good image and reputation with end users.	0.045	9	0.046	11
			2. Have the opportunity to develop IT.	0.032	13	0.037	15
			3. Maintain a good relation with user communities.	0.050	8	0.053	8
			4. Satisfy end user requirement	0.110	2	0.098	2
			5. Perceived the preferred IS products and services provider by end users.	0.037	12	0.043	12
Business value	0.239	0.239	1. Manage the good image and reputation.	0.044	10	0.050	10
			2. Make sure IS projects to offer business value.	0.042	11	0.050	9
			3. Control cost.	0.119	1	0.100	1
			4. Be onerous to offer the suitable IS products and services to the third party.	0.030	15	0.040	13
Inner process	0.328	0.328	1. Expect and affect the demands from end users and managers.	0.065	5	0.055	7
			2. Plan and develop IT efficiently.	0.062	7	0.060	5
			3. Operate and maintain IT applications efficiently.	0.070	3	0.064	3
			4. Obtain and test new hardware and software.	0.031	14	0.032	16
			5. Offer to satisfy the end user trainings with effective cost.	0.063	6	0.062	4

			6. Manage the IS problems effectively.	0.066	4	0.055	6
Future readiness	0.156	0.156	1. Expect and prepare the IS problems.	0.024	20	0.029	18
			2. Train and develop regularly to improve IS skills.	0.026	18	0.030	17
			3. Promote regularly IS applications mix.	0.030	16	0.029	19
			4. Increase regularly IS hardware and software.	0.025	19	0.028	20
			5. Implement cost-effective and new technological researches which are suitable for organizations.	0.028	17	0.040	14

CONCLUSIONS

The AHP method is a powerful technique that offers great promise for using the balanced scorecard for practical [6]. However, the decision makers are often uncertain in assigning the evaluation score in using the AHP method. The fuzzy AHP method can conquer this problem. Government organizations and other non-profit organiza-tions use the fuzzy AHP method is liable lead to better balanced scorecard conse-quences.

For Taiwan's information and electronic industries, the framework and methodolo-gy supply, the framework and fuzzy AHP method can serve as a useful modeling instrument in analyzing coupled improvement problems. Identifying the dimensions and performance evaluation indicators offers an important piece of information which would assist managers in Taiwan's government organizations and other non-profit organizations to better understand the main facets of MIS department performance and adopt the right action to enhance the total performance. The framework and fuzzy AHP method not only aid the companies in Taiwan's government organizations and other non-profit MIS organizations to respond to the changes much faster, but also supplies the management teams to move forward with confidence.

This study has some limitations. First, drastically changing environments influ-ences dependency relationships of dimensions and indicators and the accuracy of the proposed model. Second, compared to Miller & Doyle (1987) [18] and Saunder & Jones (1992) [19], the proposed IS evaluation dimensions and indicators more focus non-profit organizations characteristics.

ABSTRACT

Contemporary companies are facing a necessity of their continuous adaptation to new challenges posed by the environment. In order to provide the company with suitable effectiveness, it is necessary to initiate systematically coherent actions related to achieving a permanent competitive advantage. A significant role in acquiring and maintaining such an advantage is played by the company's internal resources based on knowledge, defined as corporate competences.
The paper presents the results of empirical studies performed in order to determine the activities leading to identifying and reducing competence gap in Polish enterprises. The analyses were carried out in 56 companies with the use of a specially designed questionnaire of a categorized interview. While analyzing the obtained results, special attention was paid to the method of interpreting the idea of company's effectiveness, the effect of interpreting effectiveness on company's performance, actions undertaken in order to reduce competence gap and their influence on company's effectiveness.
Finally, recommendations for managers are presented, suggesting the directions for corporate changes leading to better identification and reduction of competence gap, taking into account improved effectiveness of companies' functioning.
The paper was prepared as part of the research project of the National Center for Science - Project No. NN 115419840 "Competencies and the organizational culture of innovative enterprises in an international perspective".

Keywords: organizational competencies, competence gap, reducing competence gap, company's effectiveness
Research paper

INTRODUCTION

The advancement of globalization processes, the growing dynamics and discontinuity of the changes occurring in the environment make contemporary companies face a necessity to accept continuous adaptation to new challenges. A significant role in acquiring and maintaining a permanent competitive advantage by the companies is played by their internal resources based on knowledge, known as organizational competences.

In the economic system based on knowledge the role of such competences is, and most probably will be, increasingly important. Both the competitive position of an enterprise and its effectiveness depend to a high degree on the correct identification of competence gap and on initiating adequate actions aimed at reducing such a gap. The problem is to decide what particular activities should be undertaken and according to what criteria their effectiveness will be evaluated.

CORPORATE COMPETENCES

The term „corporate competences" has been defined in various ways, yet there is agreement that they make a significant factor determining the success of an enterprise. Most generally, competences may be characterized as the capabilities to develop, coordinate and apply the existing resources in order to implement the organization's tasks and reach its objectives (Amit & Schoemaker, 1993).

M. Bratnicki distinguishes the idea of "capabilities" which are attributed to individuals and that of "competences" which refer to the level of the whole organization. According to him, competences are supposed to integrate knowledge (individual capabilities and resources) in order to achieve some goal. Competences understood in this way are in fact capabilities of the individuals who manage the organization and have influence on taking the most vital decisions (Bratnicki, 2000). They are capabilities to acquire adequate resources, including people, and to use them properly to carry out some adopted strategy. However, they are immanently hard to imitate as a potential follower would have to copy the whole complex process of creating and accumulating such resources (Urbanek, 2011).

Competences distinguish a particular organization in its environment and provide it with a competitive advantage. Similarly to other resources determining competitiveness, competences must be valuable from the perspective of the type of business activities, they need to have the properties of rare goods and must be difficult (or/and costly) to imitate. Thus, corporate competences:

- may be understood as a possibility or a capability to acquire some definite effort at a definite level (a capability to perform particular tasks or to carry out particular objectives),
- are always of relative character and must be referred to a standard, an assumed objective or task (competences to do what? And/or in what area?),
- are manifested by one's ability to behave adequately to the requirements of a particular situation (Sitko-Lutek, 2007).

A significant role from the perspective of an enterprise is played by the so-called key competences which help companies to compete effectively on the market due to fulfilling in a better way their customers' needs. Key competences vary from ordinary ones because the former have to:

- possess a potential to be applied on different markets,
- have a significant share in creating values for the customer,
- be difficult to imitate by competitors (Hamel & Prahalad, 1990).

An analysis of key competences may be performed with the use of a model of „core competences" which considers the relationships between the resources, capabilities, competences and key competences (Gierszewska, 2005).

At the lowest level there are tangible and intangible resources as the elements which make a contribution to the chain of values, though they are of a relatively low value to the company. Among intangible assets eight basic categories have been distinguished, and these are related to technology, developing a relationship with the client, the method of drawing up contracts, data processing (e.g. specialist software), human resources, marketing, company's location and goodwill. The degree of taking advantage of the assets possessed by the company which

at the same time determines the potential of a particular organization is called capabilities. On the other hand, competences are a set of capabilities along with the know-how and result from organizing and coordinating individual links of the value chain.

COMPETENCE GAP

To a contemporary manager, competence gap plays an increasing role and it becomes necessary to identify and to reduce it. This results primarily from the fact that in the contemporary global economy competences become an asset which is decisive for the success. Competence gap may be understood as:

- „a lack or a deficiency of abilities" necessary to reach the goals and tasks of the organization or to achieve the results which the managerial staff regard to be „attainable" with the existing material and personnel resources; or achieving the results obtained by the leader or a group of the best companies in a given industry.
- the difference between the desirable (in managers' opinion) competences and the actual ones, and between the structure and the level of competences owned by the managerial staff and the desirable or required competences (Sitko-Lutek, 2007; Urbanek, 2011).

Competence gap is of a dynamic character and it seems necessary to adopt a perspective of an analysis which will take into account not only an approach in the context of widely understood organizational "resources" (or the organization's potential), but also their active utilization in order to understand this phenomenon comprehensively. Since competence gap refers to the unique competences of the organization which determine its chance to gain the competitive advantage over the other organizations and the possibilities of their practical application.

It should be stressed, however, that analyzing competence gaps occurring in the particular competence areas of an enterprise does not fully take into consideration the aspect of complexity and structurization of organizational competences. Ensuring the effectiveness of a number of organizational processes requires that the company should have at its disposal competences which make it possible to coordinate the actions implemented in different competence areas, which means that studying gaps in individual areas is usually insufficient for a full recognition of the competence gap existing in the company.

Thus it is necessary to adequately identify and analyze the signals coming from the environment, taking into account their influence on the current and future situation of the company as a whole, and also predicting on the basis of such signals the directions of the changes in the environment and core competences which condition the company's functioning in the future. However, in the practice of Polish enterprises, it turns out that although the knowledge acquired in this way is indispensable to prepare the necessary strategy and a consistent construction of a set of adequate competences, then, unfortunately, in case of many firms it does not provide a basis to design the directions for their future activities. The results of empirical studies carried out by different teams suggest that the development of many companies is a consequence of an accident, a sudden opportunity, such as a possibility to buy some exceptionally cheap tangible assets, an unexpected offer of co-operation from a big company, using aid funds from the European Union, finding a new investor, a company merger, favorable systemic solutions,

etc. (Krupski, 2007). Such an opportunity provides an impulse to act, yet it depends on the company's competences whether and to what extent the company will take advantage of it.
The identified competence gap may be reduced in many ways which include for example: acquiring tangible assets or financial resources, finding specialists on the job market, co-operation with consulting companies, training (internal and external), outsourcing (Sitko-Lutek & Skrzypek, 2009).

ENTERPRISE'S EFFECTIVENESS

Effectiveness is one of the basic categories used to assess the company's performance, however, there are significant discrepancies concerning its defining in practice. Still quite recently, the effectiveness of an enterprise was identified with its productivity understood as production volume, turnover or sales volume. However, it was observed that the effectiveness of work is affected by qualitative factors, such as e.g. the employees' qualifications, their education or experience. The effectiveness understood in this way should be assessed by means of other measures, e.g. the effects of work (quantity/quality of work) or work expenditure (costs of work, time, laboriousness or the number of the employees) (Kożusznik, 2002).

The diversity of approaches concerning the definition of effectiveness results in a number of approaches concerning its measurement. Generally, it should be stressed that the key role is played by a precise identification of the aims and expectations. The measures used here are of double character:

- predictive – they concern planning some expected results and identifying any interferences which make the results obtained different than those intended (both above and below expectations); such measures play the role of a system of early warning;
- corrective – related to creating standards of improved activities in future projects (Buchanan, 2008).

In order to make the measures genuinely significant, they have to be adapted to the organization's objectives, such as its effectiveness or productivity, and referred to suitable implementers who have real influence on the degree of the objectives' realization. In practice, effectiveness depends on many factors, which makes its assessment much more complicated.

In recent years a growing popularity among the concepts of multi-aspect assessment of the company's effectiveness has been enjoyed by the Balanced Scorecard (BSC) developed by R.S. Kaplan and D.P. Norton, in which they observed a need to adopt a holistic view on the company in the process of formulating its strategic objectives and assessing effectiveness understood as the degree of implementing the company's strategy and analyzed in four areas – apart from the financial aspects, it is necessary to take into account the market perspective (the client), internal processes and innovations and learning (Kaplan & Norton, 2005).

An interesting approach to assessing the effectiveness of an organization was put forward by G.A. Rummler and A.P. Brache (2000). Bearing in mind the fact that an organization is a system and that there are different processes implemented inside it, occurring among the individual spheres of the organization, they paid special attention to the necessity to correlate

the activities within the whole organization and to eliminate problems referring to inter-functional relationships. In their concept the effectiveness of an organization is analyzed in a two-level system – the dimension of the organization and the need for effectiveness. The level of the organization includes :

- the level of the whole organization,
- the level of the process;
- the level of the position (Rummler & Brache, 2000).

The second dimension, the need for effectiveness, is influenced by the results obtained on each level of the organization, which include :

- objectives;
- designing methods;
- management methods **(**Rummler & Brache, 2000).

As a result, nine variables are distinguished which influence the effectiveness of an organization. Thus it may be claimed that skillful effectiveness management requires a suitable formulation of the objectives, designing and managing each of the three levels: the organization, process and work place, with all the three levels being interrelated, e.g. a job cannot be adequately described without understanding the processes in which it is involved. Any attempt to define the organization's objectives without relating them to the processes and the system of employee effectiveness must end in a failure.

ORGANIZATIONAL COMPETENCIES AND THE ENTERPRISE'S EFFECTIVENESS IN THE LIGHT OF RESEARCH

1. Research methods

The empirical studies aimed, among others, at determining a set of key resources and capabilities necessary to develop and maintain a permanent competitive advantage, the methods of identifying competence gap and to take up activities towards its elimination as a result of corporate learning, to recognize differences in learning processes and also to determine factors which support or hinder the identification of changes in competence gap.

The research was done in 56 Polish companies of different size. The structure of the research sample is as follows:

- 14.3 % of the companies were small firms (employing less than 50 people),
- 51.8 % - medium-size companies (employing from 50 to 249 people),
- 33.9 % - large enterprises (employing more than 250 people);

The competences of the companies were analyzed in 9 functional areas: operating activities (manufacturing, services, trade), technology, research and development, marketing/sales, finance, human resources, supplies, quality and management (including: strategic planning, operational planning, corporate structure, corporate culture).

2. Results

Definitely, the most popular way of perceiving effectiveness in companies is identifying it with gaining a competitive advantage, increasing number of clients and increasing competitive advantage (see Table 1). None of the respondents representing small businesses believes that gaining a competitive advantage proves the company's effectiveness. In the

situation of the competitive global market gaining a competitive advantage by a small company is extremely difficult. This may be why the managerial staff, being rationalistic, do not assume that this type of organizations may gain a competitive advantage as this is a rather impossible option.

Big enterprises adopt a long-term orientation. What matters to them is implementing the plan (intended objectives). They are less oriented towards obtaining a positive financial result in a short time. As a consequence, the managerial staff in big companies see effectiveness as related to the organization's stable functioning and development.

Table 1. Understanding effectiveness in the studied companies

Specification	Total	Companies		
		Big	Medium	Small
1. Degree to which the intended objectives are met	66,1	73,68	62,07	62,50
2. Efficiency of company's functioning	50,0	52,63	48,28	50,00
3. Promptness to react to challenges and market expectations	48,2	42,11	51,72	50,00
4. Positive financial result	57,1	47,37	62,07	62,50
5. Systematic improvement of the financial performance	48,2	52,63	37,93	75,00
6. Increase in market share	57,1	52,63	58,62	62,50
7. Promptness to adapt to clients' expectations	50,0	47,37	48,28	62,50
8. Increase in clients' satisfaction	46,4	42,11	41,38	75,00
9. Increase in sales income	37,5	31,58	37,93	50,00
10. Implementing the enterprise's strategy	42,9	42,11	41,38	50,00
11. Growing number of clients	21,4	21,05	20,69	25,00
12. Improved image of the company	37,5	31,58	41,38	37,50
13. Gaining competitive advantage	28,6	36,84	31,03	0,00
14. Maintaining competitive advantage	25,0	26,32	24,14	25,00
15. Balanced functioning in the environment	14,3	10,53	17,24	12,50
16. A tool of improving the company's competitiveness	19,6	15,79	20,69	25,00

Source: own work

The companies carried out self-assessment regarding their competences, using a five-level scale (l- very low, 2- low, 3- average, 4- high, 5 – very high). The obtained results are presented in Table 2.

Table 2. The assessment of companies' potential in individual competence areas

No.	Competence area	Total	Enterprises		
			Small	Medium	Large
1.	Operating activities (manufacturing, services, trade)	3,98	4,13	3,83	4,16
2.	Technology	3,96	4,25	3,79	4,11
3.	Research and development	3,00	3,50	2,82	3,05
4.	Marketing/sales	3,79	4,13	3,55	4,00
5.	Finance	3,8	3,75	3,66	4,05
6.	Quality	4,14	4,38	4,03	4,21
7.	Human resources	3,98	4,38	3,83	4,05
8.	Supplies	3,93	4,14	3,86	3,95
9.	Management - average	3,98	4,25	3,83	4,11
10.	Management - strategic planning	3,98	4,25	3,83	4,11
11.	Management - operational planning	4,13	4,38	3,90	4,37
12.	Management - corporate structure	3,87	4,00	3,76	4,00
13.	Management - corporate culture	3,82	4,00	3,69	3,95
	Average	**3,86**	**4,11**	**3,70**	**4,00**

Source: own work

Respondents assessed the potential competence of its enterprises as almost high (average 3.86). Maximum of their potential has been assessed in small businesses (average 4.11) and only in the areas of operations and finance indicated the highest level of competence in large enterprises. It should be noted that in all areas of competence of medium-sized companies assessed the lowest. Top assessed capacity of competence in the field of quality (average 4.14) and operating activities (manufacturing, services, trade) (4.13), the least in the area of research and development (3.00).

In order to improve the effectiveness in the analyzed companies, different actions were initiated. The present study made use of sets of actions which are regarded as adequate while reducing competence gap. The activities undertaken in the companies and their effect on improving companies' potential (improved resources and capabilities) in particular functional areas in different categories of enterprises are presented in Table 3.

Table 3. The activities undertaken in the companies and their effect on improving companies' potential (improved resources and capabilities) in particular functional areas in different categories of enterprises

Functional areas / Undertaken activities		Operating activities	Techniques and technologies	Research-and-development activities	Marketing/sales	Finance	Quality	Human resources management	Supplies	Management
1.	Acquiring material resources	3,63	3,91	2,25	3,12	3,15	3,73	3,12	3,25	3,43
2.	Acquiring financial resources	3,81	3,87	2,65	3,35	3,62	3,44	2,95	2,97	3,21
3.	Introducing elements of knowledge management	3,31	3,58	2,55	3,26	3,28	3,44	3,58	2,94	3,76
4.	Recruiting specialists on the job market	3,47	3,27	2,51	3,29	3,17	3,13	3,46	2,72	3,26
5.	Acquiring competences from a business partner	2,97	3,03	2,29	2,82	2,38	2,74	2,55	2,52	2,81
6.	Cooperation with consulting companies	2,5	2,51	2,24	2,82	3,00	2,68	2,74	2,06	2,92
7.	Cooperation with research institutions	1,83	2,64	2,75	2,12	1,84	2,41	1,9	1,61	2,23
8.	Training courses	3,33	3,22	2,44	3,33	3,26	3,57	3,7	2,7	3,6
9.	Developing research-and-development potential	2,34	2,65	2,83	2,24	1,87	2,33	2,24	1,77	2,03
10.	Learning in action	3,94	3,7	3,03	3,89	3,58	3,89	3,67	3,39	3,71
11.	Outsourcing	2,75	2,17	1,79	2,00	2,13	2,10	2,36	2,00	2,10
12.	Learning from competitors	3,12	3,10	2,26	3,48	2,21	2,82	2,37	2,50	3,11

Source: own work

According to the respondents the greatest influence on the growth potential of enterprises competence was learning in action (on average in all areas of 3.64) and acquiring financial resources (3.32). The relatively least important in the growth potential of competence had cooperation with research institutions (3,15).

In the various functional areas are taken actions aimed at increasing competence potential and their efficiency evaluated in a range from an average of 3.14 in the area of techniques and technologies to 2.45 in area of research-and-development activities.

Among the methods applied to improve the competence potential and reduce competence gap the analyzed companies (see Table 4), the largest influence on improved effectiveness resulted, according to the respondents, from training (42.5%), learning in action (40%) and acquiring additional tangible assets (31.9%). The lowest advantage resulted from the companies' co-operation with research-and-development institutions (11.6%), outsourcing (13.6%) and building their own research-and-development potential (17.5%).

The meaning of the particular methods for improved effectiveness is assessed differently depending on the size of a company. Training was most important in big and small companies, while medium-size companies regarded learning in action as more vital. Big and small businesses decided that introducing elements of knowledge management was second most important issue. Small companies emphasized the role of acquiring financial assets as significantly affecting improved effectiveness of their functioning.

Table 4. Popularity of using the methods of reducing competence gap to improve company's effectiveness

Method used to reduce competence gap	Enterprises			
	Total	Big	Medium	Small
Acquiring material resources	32,85	29,47	32,07	43,75
Acquiring financial resources	31,42	24,74	29,66	53,75
Introducing elements of knowledge management	33,40	36,32	25,86	53,75
Recruiting specialists on the job market	29,64	25,79	26,55	50,00
Acquiring competences from a business partner	18,75	16,84	16,55	31,25
Cooperation with consulting companies	20,00	20,53	16,21	32,50
Cooperation with research institutions	11,61	13,68	9,31	15,00
Training courses	42,69	40,53	38,96	60,00
Developing research-and-development potential	17,48	11,58	20,34	21,25
Learning in action	39,99	34,21	42,42	45,00
Outsourcing	13,57	12,11	10,35	28,75
Learning from competitors	24,43	19,47	21,72	46,25

Source: own work

3. Conclusions

To handle dynamically developing requirements of the environment, an organization has to ensure some adequate competence potential. Thus it is necessary to monitor systematically the requirements put forward by the environment and to identify competence gap which is created. The awareness of competence gap releases the processes of its reduction. While selecting suitable actions aimed at reducing the gap, it is necessary to pay attention to the

effectiveness of undertaken activities. The knowledge and skills of the managerial staff in the company may be often insufficient to face new challenges independently. In such situations it is recommended that professional consultants should be asked for help.

The studies revealed that according to the respondents the effectiveness of their companies was influenced primarily by training, much recognition was also given to learning in action. Thus it can be concluded that the role of corporate learning is appreciated.

It seems indispensable to introduce mechanisms which would lead to permanent corporate learning and at the same time guarantee the expected level of effectiveness. In order to achieve this, the following recommendations are suggested:

- Paying special attention to identifying objectives and determining precise measures, as well as correlating them adequately in the company,
- Analyzing the obtained results in due course; when a gap is observed between the results and the intended objectives it is necessary to identify its reason and to initiate suitable corrective actions;
- Regular collaboration with consultants while providing a service, learning from them and also introducing the mechanisms of knowledge transfer in the company;
- Creating a bank of information which should be used while taking decisions and constant improvement of the organization's effectiveness.

ABSTRACT

ClueMe is a programming platform which aims to provide a new way for high school students to learn basic concepts of artificial intelligence. Its goal is to be able to provide an easy-to-use drag-and-drop interface where the user can customize programmable agents. The platform is similar to programming utilities such as Scratch and ToonTalk set in the murder-mystery deduction board game Clue (Cluedo in some markets). Users treat the characters in the game as software agents whose actions and decisions are programmed. The user may then pit his programmed agent (hereby referred to as "player") against other players or against a stock player provided.

ClueMe was divided into two components: the main game (Clue/Cluedo) and the programming interface.

The developers utilized source code written for a Clue game and modified it to allow the option of choosing players that are user-designed. The ClueMe programming interface, patterned after Scratch, utilizes tiles that restrict the allowed actions for the user based on syntactical synergy.

The project hopes to look at the efficacy of using soft programmable agents to aid in the education of Computer Science concepts at the secondary level and early tertiary level of education. The researchers hypothesize that gamifying the learning of programming agents by making players compete against other designs will motivate students to study the underlying principles of the tasks that their agents must perform to outplay others.

ABSTRACT

Enterprises must be from angle of human resources management to create the difference in the present fierce business environment of competition. The member is enterprise's most important assets; the more important thing is an administrator should grasp the staff's psychology.

This research explores the relation of organizational trust, organizational justice and organizational spirituality, further compare someone is more powerful to organizational spirituality. Use questionnaire investigation, it is supposed and then study with the statistics technology of structural equation modeling, there is apparent prediction strength forward on organizational spirituality to find organizational trust and organizational justice.

The management meaning of the conclusion offers the industry to make as strategy, offer better manpower resources management, create and organize it with staff's win-win wishing the scene.

Keywords: organizational trust, organizational justice, organizational spirituality

INTRODUCTION

Modern all enterprises need to satisfy customers to survive in the society. However, at the highly competitive pressure, good service quality and products are no longer the best method, so the route that enterprises want to have advantage of competitiveness to look for innovation.

The human resources are the most important assets in organization, only people can't lack the advantage that can't replace in enterprises either. The thinking of internal marketing has become the business administration important tactics recently. The executives of enterprises know that there are satisfactory staff that can increase the satisfactory customer. The staff's idea and attitude are questions that the administrator needs to understand.

A lot of scholars carry on research to satisfaction, commitment and identification, the purpose is to understand whether member's positive view on enterprises has influenced performance and efficiency. Organizational trust received the psychologist's attention in the 1990s, Define it is the staff that, to the colleague, executive and trust of the organization, if the higher the intensity of trust is, can infer that there is contribution to organizing even more. In addition, organizational justice theory is paid attention to the literature in most recent ten years, can be from distributive, procedural, and interactional justice comes to assess, the member feel correct or not to all activities then pay more suspicious strength to enterprises.

Organizational spirituality is a new topic, originated from the religious group, explained the staff's inner life, meaningful work and community, would like to devote it to enterprises with diligent spirit.

There was not discussed organizational trust at the same time at present, research of organizational justice and organizational spirituality, so an article will take this as the focal point to discuss their relevance.

LITERATURE REVIEW

1. Organizational trust

When conceptualized as a psychological state, trust has been defined in terms of several interrelated cognitive processes and orientations (Blau,1964). It characterized trust as a set of socially learned and socially confirmed expectations that people have of each other, of the organizations and institutions in which they live, and of the natural and moral social orders that set the fundamental understandings for their lives. Several organizational researchers have argued the usefulness of conceptualizing trust in terms of individual choice behavior in various kinds of trust dilemma situations (Meyer, 1994). From the social-capital perspective, the accumulation of social capital requires a significant amount of trust to be established in and between all levels of an organization (Sashittal, 1998).

2. Organizational justice

Organizational justice is a concept that was first described by Greenberg (1990) and is defined as an individual’s perception of, and reaction to, fairness in an organization.

According to Adam's (1965) equity theory, it is proposed that conditions of unfairness will create tension within a person, which he or she will attempt to resolve. The concept of justice is one of the important variables in organizational behavior, Organizational justice is defined as the processes and procedures being measured, regular and that the staffs find their leaders impartial, sincere and that they find the deeds logical (Niehoff et al, 1993).

3. Organizational spirituality

Interest in spirituality and religion has grown considerably in scientific and professional communities over the past three decades. While the bulk of that interest has found expression in research focusing on the relation of religion and spirituality to general health and well-being (Ashmos & Duchon, 2000).

Inner life is the strength that individual produces from inside, surmount in personal life, through the values perceived oneself. Meaningful work is that the staff find the meaning of the work and contribution to the society and affirm value and meaning of the life from working experience. Community is linking each other between the job groups, cooperate together and encourage the mutual consciousness.

4. Organizational trust, organizational justice and organizational spirituality

Through the literature discussion can get the better organizational trust and organizational justice are will improve as to organizational spirituality. Many research found the staff's organizational trust can make the whole enterprise have better performances after improving(Liu et al, 2012; Mitchell et al, 2012; Nambudiri, 2012; Wong et al, 2012).
This research address two hypothesizes:
H1: Organizational trust has forward significant influence on organizational spirituality.
H2: Organizational justice has forward significant influence on organizational spirituality.

RESEARCH DESIGN

1. Research structure

The structure chart of this research is drawn and shown as follows.

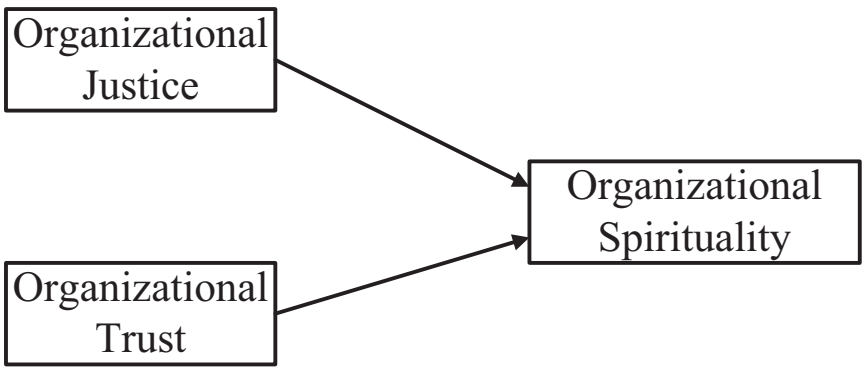

Figure 1 Research structure chart

2. Participant

Small and medium-sized enterprises are research objects in Taiwan, the questionnaire investigation used, send 500 questionnaires and retrieve 210 successful samples; the rate of recovery is 42%.

3. Research tool

There are two dimensions in organizational trust, Cognitive and affective trust. Organizational justice has three parts: distributive, procedural, and interactional justice. In addition it is inner life, meaningful work and community in organizational spirituality.

In order to examine each assumption, use AMOS 20.0 as and count tools and calculate reliability and validity.

FINDING AND DISCUSSION

1. Confirmatory factor analysis

Three main constructs are organizational trust, organizational justice and organizational spirituality. Through the analysis of CFA, composite reliability is 0.8673 of organizational trust, average variance extracted is 0.7657; Composite reliability is 0.8294 of organizational justice, average variance extracted is 0.6214; Composite reliability is 0.9154 of organizational spirituality, average variance extracted is 0.7836. Show convergent validity of three constructs are very good, compare the square root of average variance extracted and all correlations represents discriminant validity. Refer to Table 1 and Fig. 2.

Table.1 AVE & correlation

	Orgazizational Justice	Organizational Trust	Organizational Spirituality
Orgazizational Justice	0.7882		
Organizational Trust	0.6081	0.8750	
Organizational Spirituality	0.6511	0.5693	0.8852

Note: The diagonal number value is the square root of AVE

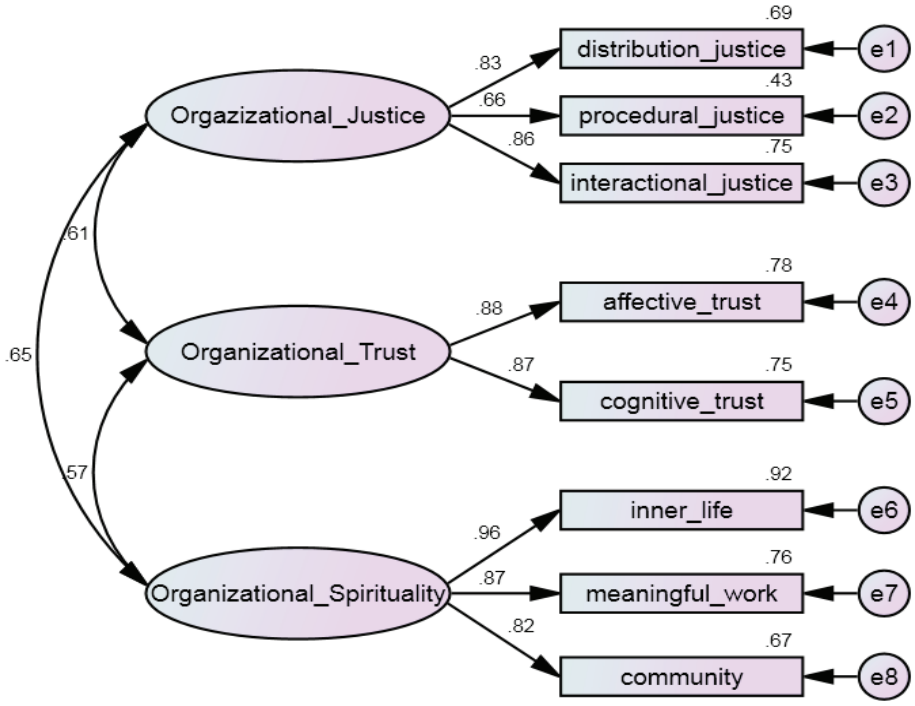

Figure 2 Confirmatory factor analysis

2. Structure model and hypothesis examined

Further hypothesis examined after Confirmatory factor analysis, finds structure model fit is good. Chi-square is 20.692, GFI is 0.978, AGFI is 0.952, CFI is 0.978, NNFI is 0.994, IFI is 0.997 and RMSEA is 0.032, all indicators reach the standard number value. In addition, use bootstrap to estimate standardized regression coefficients reaches statistically significant too, show all hypothesis gets support. Refer to Table 2 and Fig. 3.

* $p < 0.05$, ** $p < 0.01$, ***$p < 0.001$

CONCLUSION

Originally finding organizational trust, organizational justice has forward significant influence on organizational Spirituality, hypothesis gets support. The function of organizational justice is more important, so enterprises should pay attention to organizational justice more, make the staff think in enterprises that there is fair treating. In order to improve the competitiveness, enterprises should combine the strategy, human resource management and concern staff, strengthen organizational trust and organizational justice make organizational spirituality better. Propose looking for mediator or moderator to make research framework more intact in the middle of main relationship in the future.

ABSTRACT

It is known that "Knowledge Management" is associated with significant benefits which can empower organizations in the whole world especially University libraries to get more competitive in their environment. Knowledge Management Practice (KMP) and Library Users' Satisfaction (LUS) are two vital aspects of Knowledge Management (KM) which play an important role in creating organizational value. Most organizations, such as University Libraries focus on enhancing their capability of knowledge processes to create new knowledge. The aim of this paper is to test empirically levels and types of KM practice applied at Malaysian university libraries. Based on 35 questionnaires through online, a survey was administered to a Lead User group in libraries (PhD candidates) in Malaysia. This is to elicit opinion of the prime users on the linkage between Knowledge Management Practice (KMP) and Library Users' Satisfaction (LUS). SPSS software were utilized to analyze research data using reliability analysis and Pearson correlation. Results obtained show that Knowledge Management Practice (KMP) has positive influence on the Library Users' Satisfaction (LUS). However, a meaningful

linkage was observed between Library Users' Satisfaction (LUS) with two vital constructs of Knowledge Record (KRe) and Knowledge Preserving (KPr). The main contribution of the paper is to provide groundwork empirical evidence about the linkage between Knowledge Management Practice (KMP) and Library Users' Satisfaction (LUS) at Malaysian university libraries. Moreover, it reveals what is the most effective KM Practice, specifically knowledge process. For this relationship purpose, it provides organizations with some preliminary implications in order to shape their knowledge management practices. It is evinced that there is a positive and strong relationship between Knowledge Management Practice (KMP) and Library Users' Satisfaction (LUS).

Keywords: Knowledge Management Practice; Malaysia, Knowledge Record; Knowledge Preserving; University libraries; Library Users Satisfaction.

INTRODUCTION

The KM changes are evolutionary. Today, libraries are adding new processes and activities, digital resources and services while maintaining most of the old, traditional resources and services. We realize that in 21st century, libraries have gone through an evolutionary. However, libraries are still practicing the conventional process, which is to collect, process, disseminate, store and utilize information to provide service to the university community (Daneshgar & Bosanquet, 2010; Feng, Jeusfeld, & Hoppenbrouwers, 2001; Foo, Chaudhry, Majid, & Logan, 2002; Roknuzzaman & Umemoto, 2009). Whatever influences universities activity also affects the environment of academic libraries operate today. The success of Knowledge management in libraries also depends on their ability to utilize information and knowledge of its staff to better serve of the organization needs. Today, we do what we have to do as a librarian in the library to maintain the library function and relevant in time. We realize that there is a need and demand for new evolutionary of technology especially in KM processes in library environment (Feng, *et al.*, 2001). Respondents to a survey conducted by Ernst & Young in 1997 identified the following types of knowledge is about customers, knowledge about best practices and effective processes, knowledge about the company's own competencies and capabilities, knowledge about the company's own products and services, knowledge about the emerging market trends, and knowledge about competitors (C. K. Lee & Al-Hawamdeh, 2002).

In recent decades, knowledge management (KM) has been perceived as another potential viable response to the challenges that the Library and Information Science profession is facing in a continuously changing environment (Sarrafzadeh, Martin, & Hazeri, 2010). There are a number of definitions related to knowledge management practice in libraries. Tandale, *et al.* (2011) defines KM is to create a process of valuing the organization's intangible assets in order to best leverage knowledge internally and externally. Knowledge management, therefore, deals with creating, securing, capturing, coordinating, combining, retrieving, and distributing knowledge. Skyrme and Amidon (1997) defines KM as a "process or practice of creating, acquiring, capturing, sharing, and using knowledge, wherever it resides, to enhance learning and performance in organizations." Brendan (1999) broadly defined KM as a acquisition, sharing and use of knowledge within organizations, including learning processes and management information systems (MIS) or, more specifically, the explicit and systematic management of vital

knowledge associated with processes of creating, gathering, organizing, diffusion, use and exploitation. On a similar note, White (2004) defines KM as "a process of creating, storing, sharing and re-using organizational knowledge (know-how) to enable an organization to achieve its goals and objectives". In a similar view, KM is seen as distinct from both librarianship and Information Management (IM), as it includes knowledge creation and knowledge sharing, and the interplay of tacit and explicit, individual and collective knowledge (Hammer, Leonard, & Davenport, 2004; B. Martin, Hazeri, & Sarrafzadeh, 2006). However, in this study KM defines as "process of creating, acquiring, capturing, sharing, recording and preserving" knowledge. Knowledge management is a dynamic and cyclical process that involves the whole organizational processes, trying to map the existent learning, linking the essential processes and their strategy, in search of better organizational performance, development of the products and services, quality and client's management among others (Conklin, 1996; T. H. Davenport & Prusak, 2002; Wiig, 1997). Zack, *et al.,* (2009) and White (2004) hold similar opinions and view knowledge as a strategic resource. Organizations that succeed in knowledge management are likely to view knowledge as an asset and to develop organizational norms and values, which support the creation and sharing of knowledge (Rowley, 1999). It is strategic and action oriented. In the context of this study academic libraries refer to only university libraries. Wen (2005) states that to prove their relevance and value, academic libraries must strive to provide the right amount of information to the right client at the right time with a right expense of financial and human resources. With a stagnant or dwindling library budget, academic libraries have to increase their operational efficiency in order to meet the challenge. One management tool that can help in this regard is Knowledge Management (KM). Therefore, to implement Knowledge Management Practice in academic libraries is mainly driven by its mission rather than by the competition from Internet-based reference services or electronic books. From the above understanding of definitions, KM is a process of creation, acquisition, capturing, sharing, record and preserving in the library. It is obvious to say that KM does not consist of only tacit knowledge as indicated in some KM literature. It comprises both tacit and explicit knowledge, which are complementary. Jain (2007) stated that KM can be characterized as below:

- KM core process of several activities; creating, acquiring, capturing, sharing, using and re-using it;
- It includes both explicit and tacit knowledge;
- It is an ongoing activity;
- Information is the building block of KM;
- It is action oriented or application based; and,
- The main drive behind KM is to improve organizational performance.

As the practice of Knowledge Management (KM) across the world, issues' concerning knowledge processes in the library has moved to the forefront. More specifically, the objectives of this paper are formulated as follow:

RQ1. To indicate the type of knowledge management practices in the library.
RQ2. To compare a significant relationship between knowledge creation, knowledge capture, knowledge acquisition and knowledge sharing associate with Knowledge management practice.

RQ3. To recognize a significant influence of the relationship between KM practices and library users' satisfaction.

RELATED WORK

Recently, library has a lot of collections that they need to manage and offers their services and facilities to their users. It is very subjective to say that library could provide their user satisfaction when dealing or borrowing library materials. In an academic institution, library will remain central to the management of scholarly communication. It fulfills the traditional role of information supply or document delivery (Goswami, 2009). McInerney (2002) stated that knowledge is acquired actively and dynamically through sensory stimulation, listening to and observing others, reading, being aware of feelings, life experience, etc. It is this dynamic nature of knowledge that leads to the question of how something in flux, in movement and action, can be managed. With the transformation of knowledge management practice at university libraries, there are several KM practices need to emphasize to demonstrate the significant relation among processes. (Aharony, 2011; Alavi, Kayworth, & Leidner, 2006; Alavi & Leidner, 2001; Gold, Malhotra, & Segars, 2001; Ipe, 2003; Meng & Fei, 2003; Nonaka, Byosiere, Borucki, & Konno, 1994; Nonaka & Takeuchi, 1991; Townley, 2001). Knowledge is composed of the tacit experiences, ideas, insights, values and judgments of individuals as well as for the analysis of information and data. However, it may change direction and bringing more opportunities in libraries to grow or expand (Jawadekar, 2011; Kess, Phusavat, & Takala, 2008). The processes of knowledge coupled with understanding and context in LIS urged on how libraries expand the processes in KM such as knowledge creation, knowledge acquisition, knowledge capture, knowledge sharing, knowledge record, knowledge preserving and so forth. Therefore, the question "how" in this stage is reflected to the libraries itself how they manage the growing or expand of knowledge processes inside the building.

The first practice needs to be elaborated is Knowledge Creation. Maponya (2004) states that knowledge in the context of academic libraries can be created through understanding the user needs and requirements as well as understanding the university's curricula. Recent trends in education emphasizing collaboration and group study are causing a demand for new resources. The need for "knowledge creation" workspace has encouraged librarians, faculty, and computer specialists to work together to provide the necessary technology, information, and services (Gayton, 2008; MacWhinnie, 2003). In fact, the knowledge creating process is a dynamic spiral that moves from the individual to organization and inter-organization dimensions (Kess, Torkko, & Phusavat, 2007). Libraries have always provided study space, and are now including more group study facilities that have technology for access to both physical collection and electronic resources, as well as productivity software that allows students to work together to complete shared assignments. Besides, Lee (2005) and Townley (2001) found that the thrust of knowledge management is to create a process of valuing the organization's intangible assets in order to best leverage knowledge internally and externally. With this regards, a growing amount of information and knowledge involves capturing an organization's goal related knowledge as well as knowledge of it products, customers, competition, and processes, and then sharing that knowledge with the appropriate people throughout the organization. Further, knowledge management seeks to support communities of practice in creating and using knowledge.

Academic libraries as constituents of the parent university should rethink and explore ways to improve their services and become learning organizations in which to discover how to capture and share tacit and explicit knowledge within the library. The changing role of academic librarians as knowledge managers emphasizes the need to constantly update or acquire new skills and knowledge to remain relevant to the today's library environment. Academic libraries may need to restructure their functions, expand their roles and responsibilities to effectively contribute and meet the needs of a large and diverse university community (Maponya, 2004). It is important to note that for organization such as library need to determine who knows what in an organization and how that knowledge can be created and shared. For the purpose of this research, knowledge management is thus, according to Skyrme and Amidon (1997) state that the explicit and systematic management of vital knowledge and its associated processes of creating, gathering, organizing, diffusion, use and exploitation. It requires turning personal knowledge into corporate knowledge that can be widely shared throughout an organization and applied. Maija-Leena and Mirja (2005) stresses that new knowledge is based on an organization's internal information and on knowledge embedded in people/user and organizational structures and processes. This includes tacit and cultural dimensions of organizational knowing that are combined with the external information and knowledge for knowledge creation. However, interaction is a crucial part in these processes, and even internal knowledge can be combined in a totally new manner as well. Besides, it is extremely important to acquire new external information to select and assess it on the basis of its potential usefulness in research. Because university libraries are responsible for creating, acquiring, selecting, recording, preserving and providing access to the latest external knowledge for the whole academic community, they have traditionally had an important role in generative knowledge processes. However, managing all these process requires active collaboration with various user groups.

Knowledge Acquiring is crucial to the success and development of a knowledge-based system in university library. Gorniak-Kocikowska (2001) believes that knowledge has become an instrument which everyone could and should use. Therefore, the trend of libraries seems to be an acquisition of skill related to various aspects of computer technology and almost anything possible. The reason for this that much knowledge is stored in the individual heads and it is often lost if not captured elsewhere. The surest way to avoid collective loss of individual memory is to identify the expertise and the skills of staff and capture it. On top of that, participation of librarians are actually quite interesting in consulting their colleagues in conversion of tacit knowledge into tacit and/or explicit knowledge (Parirokh, Daneshgar, & Fattahi, 2008; Wagner, Otto, & Chung, 2002). Like many things else, it is likely to be a combination of both (tacit/explicit). Thus, libraries as trusted institutions should play an important role in this respect. Therefore, librarians need to be conversant and prepared for active participation in this area (Choy, 2007). As a results, Maija-Leena and Mirja (2005) revealed that university libraries be able to acquire only a small portion of the research literature published in the fields of their home universities. Besides, performing their traditional tasks of providing or access and instruction, libraries negotiate license agreements and form consortia for the acquisition of electronic materials. Academic staffs are the primary producers of electronic teaching materials. However, libraries have an excellent opportunity to support acquisition and access to these materials by digitalizing printed teaching materials and by taking responsibility for the copyright agreements. As experts in a variety of activities related to information and digital materials, librarians can

contribute to the knowledge of lecturers. They can also track down, acquire, and introduce new electronic publications of the latest research findings including those still unknown to academic staff. Librarians should not suppose that academic staff know what librarians do, but they should make every effort to interact with them in order to build good relationships (Ducas & Michaud-Oystryk, 2003). As a result researchers, teachers and students may become more aware of librarians' skills and abilities.

KM is about enhancing the use of organizational knowledge through sound practices of KM and organizational learning (B. Martin, *et al.,* 2006; J. Martin, 2009; Mavodza, 2010). Today, library is fully capable of developing and leveraging critical knowledge to improve their performance. Zack (1999) states that library becoming so complex that knowledge is fragmented, difficult to locate and share, redundant, inconsistent or not used at all. Even knowledge and expertise that can be shared is often quickly made obsolete. According to Williams, *et al.,* (2004) "when information and knowledge flow can be captured, organized and made accessible for reuse, there exists the potential for subsequent creation of new knowledge". Mavodza (2010) and Daneshgar and Bosanquet (2010) states that to facilitate the capturing and transferring of both formal and informal knowledge must through knowledge networking or system. Ani, *et al.,* (2005) found that the use of information technology (computers, telecommunication, reprography, etc.) has a special role in the modernization of library practices. With ICT, such mechanism as electronic cataloguing, electronic online public access catalogues (OPACs), electronic acquisition and serials control, electronic circulation functions, electronic distribution of commercial publications, electronic availability of raw data, multimedia information delivery systems, digitized collections and online textbooks are all now practicable with a higher degree of user satisfaction (Ani, *et al.*, 2005; Siddike, Munshi, & Sayeed, 2011; Tripathy, Patra, & Pani, 2007). Daneshgar and Bosanquet (2010) notes that there is a vast amount of knowledge relating to the Library's customers. Therefore, library management is now exploring more effective methods for organizing knowledge. It is being captured to facilitate knowledge management activities such as evaluating, sharing, and storing of the customer knowledge within the 'library'. The 'Library' expects that knowledge management activities will build a greater understanding of customers and their requirements. Hence, these requirements will hopefully lead to the delivery of more appropriate and timely services towards users' satisfaction. On the other hand, the major challenge of managing knowledge is less its creation and more its capture and integration (T. H. Davenport, De Long, & Beers, 1998). However, sometimes for understanding the user needs and being able to provide adequate services or to match services with suitable philosophies and theories it is crucial for librarians and decision makers within the library to share the knowledge which was captured from the previous phase with some experts in LIS or other related disciplines (Parirokh & Fattahi, 2009). Therefore, above all knowledge has to be captured using proper documentation, through mentoring, training, surveys, etc.

Academic libraries as constituents of the parent university should rethink and explore ways to improve their services and become learning organizations in which to discover how to capture and share tacit and explicit knowledge within the library (Maponya, 2004). The changing role of academic librarians as knowledge managers emphasizes the need to constantly update or acquire new skills and knowledge to remain relevant to the today's library environment. Academic libraries may need to restructure their functions, expand their roles and responsibilities to

effectively contribute and meet the needs of a large and diverse university community (Gurteen, 1999; Hansen, Mors, & Løvås, 2005). According to Gurteen (1999), it is also fundamental about sharing knowledge and putting that knowledge to use. Thus, to create a knowledge sharing culture it needs to encourage people to collaborate and work together more effectively, to collaborate and to share ultimately to make organizational knowledge more productive (Heiman & Nickerson, 2004). Indeed, sharing "tacit knowledge among multiple individuals with different backgrounds, perspectives, and motivations becomes a critical step for organizational knowledge creation to take place" (Nonaka & Takeuchi, 1995). However, it is necessary to establish what sharing knowledge really means (C. K. Lee & Al-Hawamdeh, 2002; Riege, 2005). This implies that not all employees need to share knowledge, because it would not be re-used or applied. A study done by Wabwezi (2011) revealed that knowledge sharing does not stop at contributing to the realization of innovation but also continues after the innovation is achieved to effect its implementation or adoption. The findings of the study also highlighted the factors that affect knowledge sharing at the university and these included organizational culture, incentives for innovation, availability of social meeting places commitment from management and sensitization. A research findings by Teh and Yong (2011) stresses that the practitioners must be aware the presence of individuals' attitude toward knowledge sharing may not lead to intention to share knowledge. Management should create a supportive atmosphere in which knowledge can be shared via effective formal communication (e.g., office's SharePoint portal server) and informal communication (e.g., forum and brainstorming sessions). In fact, facilitating knowledge sharing is a complicated task, as one of the major challenges concern is the willingness of organizational members to share their knowledge with other co-workers. Furthermore, it is also happen among librarians, lecturers and/or management in academic libraries. A survey results by Pengshan and Yongqin (2011) indicates that 85% of respondents reported 'Very Great' or 'Great' satisfaction. The study indicates that library is the core of Information Common (IC), so that library can build such an environment to encourage readers or customers sharing their knowledge. In fact, library also can take advantage of the potential during the course of the knowledge sharing to fulfill their user satisfaction. Nevertheless, there are two novel processes which have to be considered in this study. Considering the importance of Knowledge Record (KRe) and Knowledge Preserving (KPr) in knowledge process, these two processes could be an important variable, which not much discussed in literature. This novel variables hope may help to predict why people choose to record and preserve knowledge in some contexts of KM practices especially at Malaysian universities library toward their users' satisfaction.

Gandhi (2004) found that numerous employees' in organizations were asked to record their tacit knowledge and explicit knowledge (T. H. Davenport, et al., 1998; Dougherty, 1999; Nonaka & Takeuchi, 1995), whereby they have to write down step-by-step for everything they did. However, the main issue to be consider is that do they (i.e., individual or employee) really care to record their tacit and explicit knowledge?. Several employees were forced by organization themselves to record knowledge (Smiraglia, 2002) they had internalized as experience or memory. Knowledge of how records are used is therefore also important to be able to develop and design (Borglund, 2008; Borglund & Öberg, 2008; Yeo, 2005). As such, successful KM initiatives could help organizations to establish their internal benchmarks, identify and record best practices, and create an environment of continuous learning. KM systems implemented in libraries so far have not achieved these goals. Richardson (1995) agree that librarians need to

learn from the process and avoid repeating mistakes, it is vital to record what worked, what did not work, which steps in the process were useful, and what would they do differently next time. According to Al-Hawamdeh (2002) not all types of knowledge can be recorded and codified as information. Branin (2003) agreed that librarians need to extend their expertise in creating, acquisition, dissemination selecting, organizing, record, preserving and etc. (Anjanappa, Kattimani, & Jange, 2009; Cho, *et al*., 2009; Delsaerdt, 2008) whereby they must willing to get outside the routines and the walls of the traditional library and work more directly with technologists, faculty, and students. Therefore, when discuses about knowledge management practice, it is clearly dealing with a set of complex issues that are interrelated and cannot be segmented (Al-Hawamdeh, 2002). A study done by Garcia (2011) revealed that the business of libraries is facilitating knowledge transfer through the effective preservation and organization of public documents and public knowledge records to ensure that it social utilization so knowledge is effectively transferred. For that, they provide monitoring, storage, retrieval, and users' information empowerment services, and have a managerial structure, to ensure the appropriate leadership, planning, and administration of this. The important point to note by Harries (2009) is that, here (i.e. Library) dealing not just with records of actions, but also with knowledge processes and information, given meaning through content and context, and put into action working. According to author, "… If we believe that a core principle of records is that they improve accountability and good governance, then we need to consider how records management can account for, and incorporate, this social dimension and its role in the social production of knowledge. Within and between different professional communities; processes which both create and use those records". Nevertheless, the approach for records created in the course of day-to-day business of the universities was to stored and kept in hard copies as evidence of an action, decision or process. The process of record keeping provides a framework for keeping, maintaining and providing for the disposition of records and what is contained in them. Therefore, the process intended to benefit all members of staff by facilitating continuity and evaluation of services and preserving privacy (Egwunyenga, 2009).

It is important to state that Knowledge Preservation also has significant with knowledge management practice in the knowledge process. Haahr (2002) states that the preservation of knowledge, in the form of libraries allowed such communities to 'exist' despite the temporal separation of some of the members. To preserving the knowledge in the library (Dougherty, 1999), there has to be a voluntary action on behalf of the individual. Anderson (1996) found that university (i.e. Academic library) could contribute to the operational of the service through purchasing and operating a portion of the hardware and software required for the service and/or via financial support towards the preservation of key material, such as certain books and journals, much like the collections now found in physical form in university libraries are built via the purchase of selected books and journals. The process of knowledge capture, sharing, record and preserving approach is technology-dominated (Hildreth & Kimble, 2002). With the increased interest in knowledge preservation that cannot be captured and recorded, a number of researchers (e.g. (Coffman, 2010; Igbeka & Ola, 2010; Tasmin & Woods, 2008) have begun to realize that library management has poses significant challenges and the existing approaches to KM are not adequate. A study done by Ismail (2006) indicates that library preservation programs take into consideration factors such as the physical environment in which information resources are housed; disaster control; pest control; handling of the resources by library staff and users;

access control; conservation; reformatting; routine maintenance; library security and reader education. Librarians must preserve for posterity and therefore, good collections:

- Attract scholars who may come to the university to teach, for sabbatical or pursue higher degrees;
- Attract requests for document supply;
- Attract gifts from scholars and book collectors because of the confidence in the Library's preservation and access policies; and
- Make librarians proud and happy that they have discharged their duties and responsibilities well.

Nevertheless, Preservation is a professional and management responsibility. There is no access without preservation and libraries can only create and maintain bibliographic records for materials that are available. Catalogue records do not mean a thing, if libraries cannot provide the materials they describe. Nothing can be more frustrating to the researcher than to spend time at the catalogue noting call numbers but not being able to get the materials when they go looking at the stacks. They will vent their frustrations on library staff and there is nothing that library staff can do except to apologize and offer to search for the materials that they themselves fear are no longer in the library (Ismail, 2006).

Recently, there are many knowledge processes that have been introduced by prior researchers. However, only six knowledge processes were selected based on a comprehensive literature review such as Knowledge Creating (KCr), Knowledge Acquisition (KAc), Knowledge Capturing (KCa) and Knowledge Sharing (KSh). In fact, another two novel processes, which found to fulfill the gaps are Knowledge Preserving (KPr) and Knowledge Record (KRe). Furthermore, the linkages of KM practice (i.e. KCr, KAc, KCa, KSh, KRe and KPr) are becoming a main variables contributing to KM Practice against Library Users' Satisfaction.

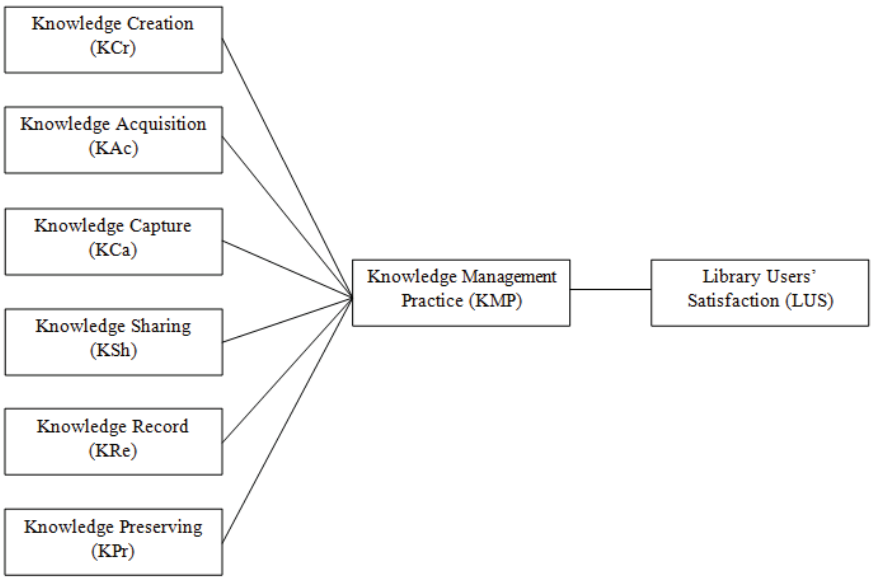

Figure 1. Theoretical Framework of KM Processes

The novelty classifications of KM process allow researchers to compare and analyze the process when dealing with KM process to fulfill their user satisfaction in the library. Karadsheh, *et al.* (2009) stated that many of the model are broad enough to provide a complete analysis of the knowledge flow in the organization. Therefore, the proposes of novelty KM process could improve the existing KM processes to provide the Knowledge Creating (KCr), Knowledge Acquisition (KAc), knowledge Capturing (KCa) and Knowledge Sharing (KSh), Knowledge Record (KRe) and Knowledge Preserving (KPr) has illustrated in figure 1. Therefore, all six processes need to be linked with KM practice to perceive whether it has a significant impact against Library Users' Satisfaction (LUS) at university libraries. Nevertheless, these processes need to be in place or cultivated strongly for the implementation of Knowledge Management practices to be a success (Al-Hawamdeh, 2002).

METHODS AND RESULTS

The selected population for this study was Malaysian University Libraries. The sample size of this pilot test is approximately 35 PhD candidates who are the lead user in Malaysian University Libraries. A total number of 35 set of questionnaires were distributed randomly to the PhD students who visited the library for a period of two weeks. This implies that each student who went to the library has the same chance of being selected to answer the questionnaire (Sekaran, 2003). Respondents were requested to return the filled-in questionnaires to the library counter. A total of 35 filled-in questionnaires were returned which showed an overall response rate of 100%.

Almost all lead users are PhD candidates. Most of the lead users answered to the pilot survey questionnaires 51.4% were male while 48.6% of them were female. This shows that most of the lead user should have a good knowledge about library such as Knowledge Creating (KCr),

Knowledge Acquisition (KAc), Knowledge Capturing (KCa), Knowledge Sharing (KSh), Knowledge Record (KRe) and Knowledge Preserving (KPr). The result indicates that 100% of the lead user rated "Yes" that KM Practice should be applied in the library. The 5-point Likert scale was divided into three ranges based on Tasmin and Woods (2007). The ranges for the extent are Low (1.0 to 2.3), Medium (2.4 to 3.7) and High (3.8 to 5.0). Figure 2 shows a higher mean score analysis, which is Knowledge Acquisition (4.21) were rated in the first place types of KM practice most applicable in the library. While, there is 4.05 of Knowledge Capture (KCa) and 4.09 is Knowledge Preserving (KPr). However, 3.95 is Knowledge Creation (KCr) was rated in the fourth place, While 3.63 is Knowledge Sharing (KSh) in the fifth and 3.59 is Knowledge Record (KRe) were the last. In sum, it was discovered that the extent of KM practices was at a higher level at Malaysian University Libraries.

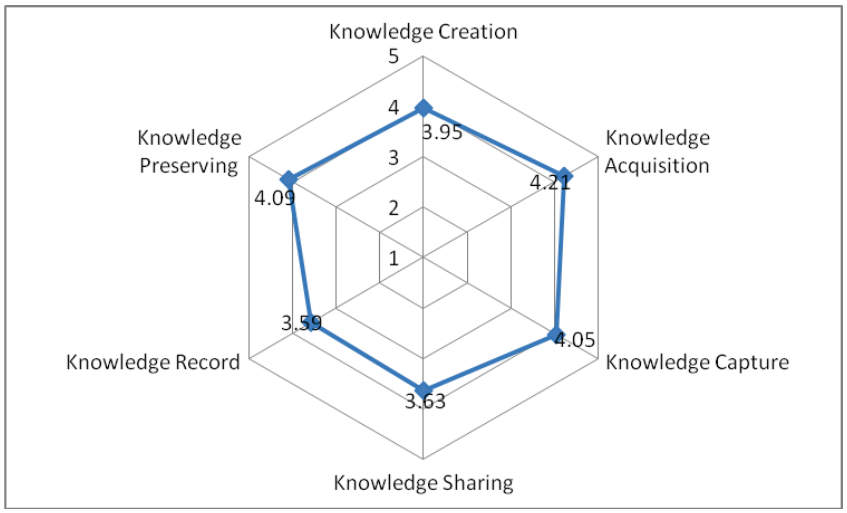

Figure 2. Types of processes in KM practice

Figure 3 shows overall mean of highly ranked journals (continuous line) which are high on elements of PhD candidates know that access to highly ranked journals is important in their study field with mean score value of 4.71. This signifies that highly ranked journals was very important to the Lead User (PhD candidates) as their core references or literature in research. Based on the survey, it is noticeable that they know how to access the highly ranked journals within my study field in time with mean score value of 3.71. This poses important interpretation that PhD candidates are knowledgeable about how to make use of high ranked journals in their study. Also, it shows that they are scholarly and knowledgeable in this PhD stage.

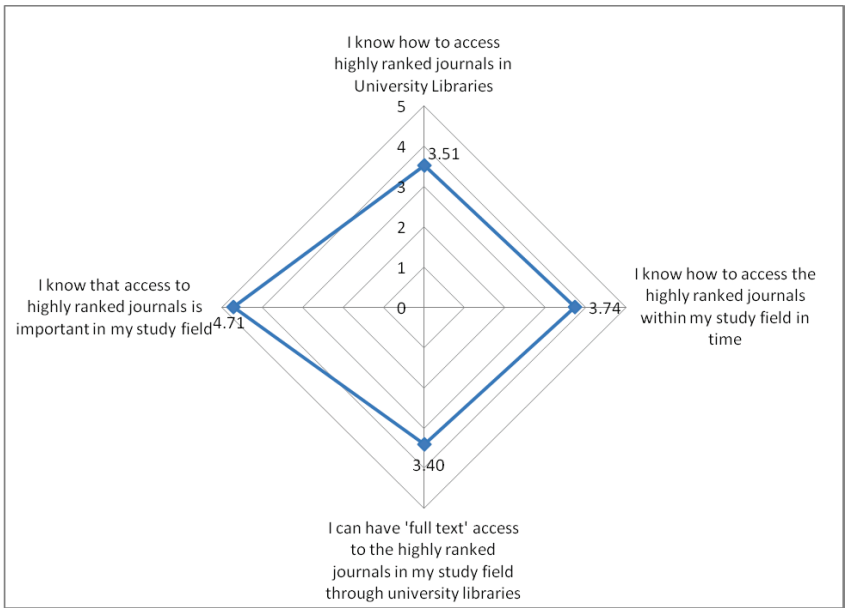

Figure 3. Overall Mean of highly ranked journals

Figure 4 indicates that only 9 out of 20 Malaysian Universities participated in this pilot survey. The majority of the Lead Users 34.3% were from Universiti Tun Hussein Onn Malaysia (UTHM), 25.7% were from Universiti Utara Malaysia (UUM). They were followed by Universiti Putra Malaysia (UPM) 14.3%, Universiti Kebangsaan Malaysia (UKM) 8.6% and Universiti Teknologi Malaysia 5.7%. Others, Universiti Sains Malaysia (USM), Universiti Teknologi MARA (UiTM), Universiti Islam Antarabangsa Malaysia (UIAM) and Universiti Malaysia Sarawak (UNIMAS) were 2.9%.

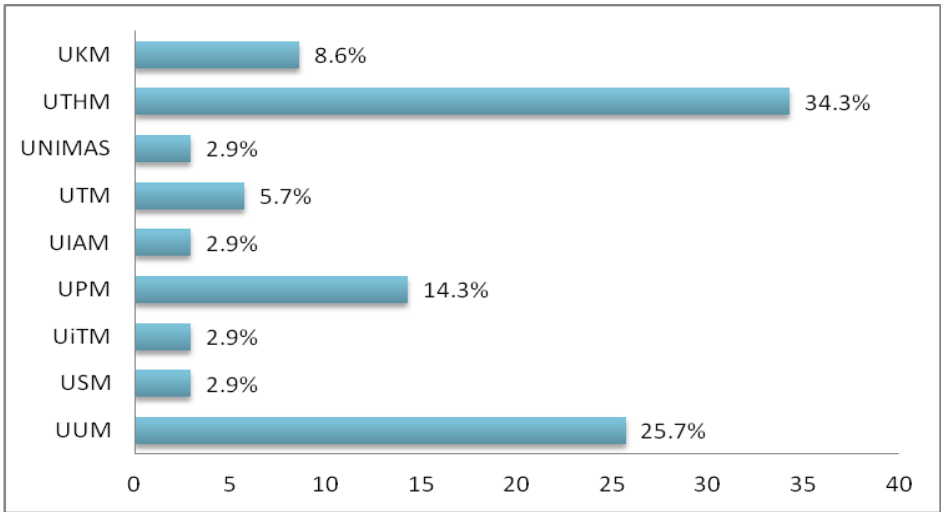

Figure 4. Malaysian Universities

Table 1 indicates that reliability assessment was made. Cronbach's Alpha coefficients were computed for each factor to access reliability of measurement. The coefficients of Alpha for all factors indicated values raging from 0.806 to 0.911. Hair, *et al.* (2006) stated that Cronbach's Alpha values of 0.60 to 0.70 are regarded as "the lower limit of acceptability". Thus, this study showed that all of the scale reliabilities in pilot test results were above accepted range of the threshold values. In fact, the questionnaire was pre-tested on 35 PhD candidates at Malaysian University Libraries to evaluate the questionnaire's validity with regard to clarity, bias, ambiguous questions, and relevance to the respective libraries.

Table 1. Reliability Analysis of Each Factor

Knowledge Management Processes	Cronbach's Alpha	No. of Indicators
1. Knowledge Creation (KCr)	0.825	6
2. Knowledge Acquisition (KAc)	0.841	5
3. Knowledge Capture (KCa)	0.817	5
4. Knowledge Sharing (KSh)	0.806	6
5. Knowledge Record (KRe)	0.911	6
6. Knowledge Preserving (KPr)	0.870	5
7. Library Users Satisfaction (LUS)	0.909	10

Table 2 indicates the correlation coefficient between Knowledge Management Practice (KMP) overall and Library Users' Satisfaction (LUS) is 0.846. In facilitating the interpretation, the coefficient of determination is found. This is simply the square of correlation coefficient implied by 100. This shows that there is a positive and significant relationship between the level of Knowledge Management Practice (KMP) overall and Library Users' Satisfaction (LUS). Thus, the significant level is 0.000 which is lower than the stated significance level 0.01. Therefore, this suggests that the relationship is statistically significant. The extent of correlation coefficient refers to Cohen and Holliday (1982).

Table 2. Overall correlations between KM Practice and Library User Satisfaction (LUS).

		LUS	KMP Overall
LUS	Pearson Correlation	1	.846**
	Sig. (2-tailed)		.000
	N	35	35
KMP Overall	Pearson Correlation	.846**	1
	Sig. (2-tailed)	.000	
	N	35	35

**. Correlation is significant at the 0.01 level (2-tailed).

Figure 5 depicts KM practices at Malaysian Non Research University (i.e. UTHM, UUM, UiTM, UNIMAS) and Research University (i.e. UKM, UPM, USM, UTM, UIAM) which shifts at higher scores on elements process of Knowledge Creation (KCr), Knowledge Acquisition (KAc), Knowledge Capture (KCa), Knowledge Sharing (KSh), Knowledge Record (KRe) and Knowledge Preserving (KPr). Comparisons mean score value for Research University elements is 4.03 (Knowledge Creation), 4.35 (Knowledge Acquisition) and 4.01 (Knowledge Capture) which is considered high at 5-points Likert scale. As such, Non Research University (NRU) mean score value is 4.12 (Knowledge Creation), 4.03 (Knowledge Acquisition), 4.00 (Knowledge Capture) and (Knowledge Preserving) which is considered high at 5-points Likert scale. This signifies that RU and NRU have values efforts to compete each others to get higher ranking in Malaysia universities. This is attributed to the fact that actual KM practices are high in practice as shown minor gap between continuous and broken lines (Tasmin, A Rahman, A Hamid, & Che Rusuli, 2010).

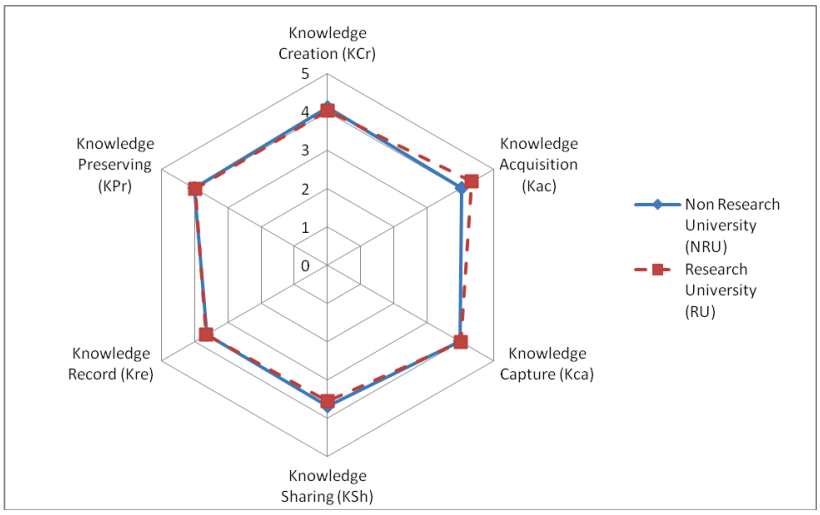

Figure 5. Comparison KM Processes among Non Research University (NRU) and Research University (RU)

It is noticeable, as shown in Figure 6 below, that elements of KM practices are quite in a close-call when comparing between the non-research and research universities. However, it is a noteworthy differential gaps at namely two elements of KM practices; KAc and KSh. It is seen that Kac for among RU is higher than those of Non-RU. One could make sense of this significant gap with the fact that most RUs are of intensively pursuing into high performance research with higher capacity of financial support, especially from the ministerial level. As such, it is not surprising the fact that KAc at RUs is higher that KAc of that Non-RUs, with a gap value of 0.32. This also signifies that RUs are at the forefront of knowledge search frontier, pursuing new areas of potential research such as linking their research with finer research institutions in the developed countries, patenting their own research outcomes and perhaps purchasing potential technology rights from other institutions. It is generally acceptable, in Malaysia universities' setting, that such KAc approaches are quite normally done in UKM, UPM and USM.

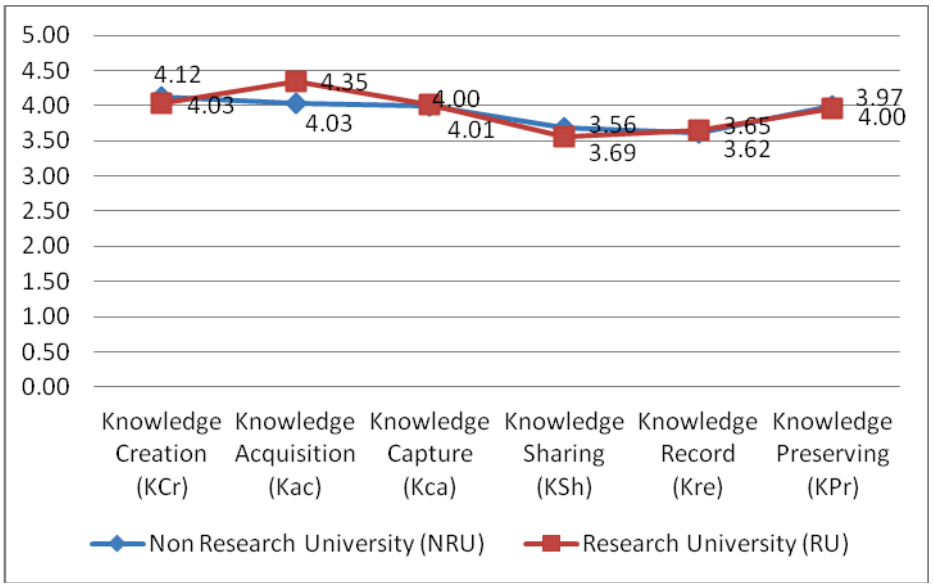

Figure 6. Trend of the KM practices at Malaysian University Libraries

However, it is interesting to notice, from Figure 6, that at element of KSh, Non-RUs are performing slightly better than the RUs. It is shown that Non-RUs are better-off at "Sharing" knowledge internally and/or sharing knowledge with other Non-RUs. One logical explanation for such a minute but significant difference with the fact that Non-RUs, in Malaysia, tend to share knowledge with each other. This perhaps, is due to the syndrome of feeling that Non-RUs must collaboratively work together to compete with better-off funded research by the research universities. In actual fact, this scenario is translated well in reality at Malaysian varsities, in which one can observe that there is good cross collaboration between UTHM, UTem and UMP in the research areas of environmental engineering and sustainable manufacturing. Based on numerical results, in 2012, such collaborative cross-nonRUs research projects have secured national grants as much as more than RM2 millions, reported by MTUN research committee. It depicts that Non-RUs tend to team-up forces (KSh) with its same-class varsities to secure better research grants in order to compete or survive against already established research varsities, in Malaysia.

DISCUSSION

This article focuses mostly on the KM processes such as Knowledge Creation (KCr), Knowledge Acquisition (KAc), Knowledge Capture (KCa), Knowledge Sharing (KSh), Knowledge Record (KRe) and Knowledge Preserving (KPr). Respondents in this study were specifically selected and PhD candidates are known as Lead User. The types of KM processes indicate that Knowledge Acquisition (KAc) is the most significantly rated by lead users, with value of 4.21. The result shows that the library has been regarded as a treasure house that attracted countless individuals for realizing their own learning and knowledge acquisition (Daneshgar & Parirokh, 2007; Lin, Gu, & Kawasaki, 2004; Ogunsola, 2011). At the library, individuals demand knowledge, and they need flexible and diversified resources. The library can utilize its abundant

amount of resources, advanced technology and facilities, and its understanding of users' demands to develop campaigns that support individuals' learning. The library has been regarded as a knowledge navigation station, because it can hold events such as exhibitions for newly published books, educational conferences, seminars, book reviews and discussion meetings.

Moreover, Knowledge Record (KRe) and Knowledge Preserving (KPr) were asked whether good to be practiced in the university libraries. The result indicates that these two variables were rated 'agree' and 'significantly important' by lead users. It shows that Knowledge Record (KRe) and Knowledge Preserving (KPr) could contribute as new processes in KM practice at university libraries. Knowledge record and knowledge preserving exists in the library but did not offers to the lead user but more to products and services in the library. However, the libraries should inform and offers users these two processes because it deals with the products and services. When user knows these two processes, it appears that the library takes into account when users requests for this knowledge. Therefore, these two processes need to address and link into KM practice as depicted in Figure 1. This result discusses about Research University (RU) and Non-Research University (NRU) as depicted in Figure 4 and Figure 5. As research universities (Figure 5), an interesting result showed that such large public institutions as UKM, USM, UTM, UKM and UIAM have applied KM processes in the level of management especially at university libraries. The result indicates that these knowledge processes applied in order to become Research University. It shows that Research University libraries have a strong products and services that contribute to higher level of user satisfaction.

For Non-Research University (Figure 6), the results show moderate of every each of KM processes. This indicates that university such as UTHM, UUM, UiTM and UNIMAS need to enhance or increase their products and services to achieve higher level of user satisfaction if they want to become a Research University (RU). Level of management especially library management needs to play role to help Non-Research University (NRU) align their dreams to become Research University (RU) in the future. The most interesting finding of this research was the statistical result of linkage between KM practice and Library Users' Satisfaction. In Pearson correlation indicates that KM practice has a significant correlation with Library Users' Satisfaction as depicted in Table 2. It shows that KM processes applied in the library need to provide satisfaction to their users when they are using products and services. In fact, all product and services provide by the library must contribute to a high satisfaction to their users. If not, they will not enjoy visits to the library and utilize product and services. Therefore, libraries need to maintain their user satisfaction with further planning and activities which could raise levels of user satisfaction every year.

CONCLUSION

This study highlights the relationship between KM practice and Library Users' Satisfaction which is positive and significant. This article has concentrated on examining this linkage between KM practice and Library Users' Satisfaction at Malaysian university libraries. Moreover, it reveals what the most effective KM processes and Library Users' Satisfaction are for this purpose. Depending on the KM practice being considered, the type of KM processes varies. So, the role played by KM practices is really significant for university libraries seeking to

gain a competitive advantage within them. The results of this study would recommend university libraries for investing efforts in the KM processes. Although, implementing the KM processes especially Knowledge Record (KRe) and Knowledge Preserving (KPr) would increase more internal library services, but it might play a substantial role for its survival. The university libraries require to improve their IT bases to be effective in determining product and service documents and developing their databases which ultimately facilitate the KM process of KM practice in the university libraries. With this increased attention comes an opportunity for academicians and researchers to participate in examining and refining new practices and processes as they emerge. The finding of this research proves that there is a positive and strong relationship between Knowledge Management Practice (KMP) and Library Users' Satisfaction (LUS). Therefore, future research has to be conducted to find out the linkage between KM practice and Library Users' Satisfaction using Structural Equation Modeling (SEM) for stronger structural point of view. In addition, this research can also be executed in other countries to explore the status of knowledge management practices in other parts of the world.

ACKNOWLEDGEMENT

The authors would like to acknowledge his PhD supervisor for guiding this paper. The authors are also indebted to the prior literature research that has been made in any anonymous journal referees related to Knowledge Management (KM) and Library and Information Sciences (LIS) environment. The author also wishes to thank the editor for extensive assistance in the final revision of the paper to be published.

AN EMPIRICAL STUDY OF USERS' CONTINUANCE INTENTION AND WORD OF MOUTH TOWARD SNA (SOCIAL NETWORK APP)

Huei-Hsia Hsu, Department of Information Management, China University of Science and Technology, Taipei, Taiwan

Chia-Cheng Chang, MS program in The Graduate School of Business and Management, China University of Science and Technology, Taipei, Taiwan

Tzu-Hong Lin, PhD student of Management College, National Taiwan University of Science and Technology, Taipei, Taiwan

ABSTRACT

There has been a long-running war going on over the mobile application and it has attracted increased attention in recent years. However, there has been little research on Social Network App (SNA). We try to extend the Expectation-Confirmation Model with the Technology Acceptance Model as the theoretical model to explain the users' continuance intention and word of mouth on SNA usage. Hypothesis testing was performed using SmartPLS on data collected with 204 Apps users. The results show that satisfaction was affected by perceived usefulness, perceived ease of use, confirmation, and the continuance intention and word of mouth were influenced by satisfaction. Theoretical and practical implications were discussed.

Keywords: Social Network App, word of mouth, continuance intention, satisfaction, perceived ease of use, perceived usefulness, confirmation

BRIEF PROFESSIONAL BIOGRAPHY

Huei-Hsia Hsu is Associate Professor of Information Management at China University of Science and Technology. Her papers have appeared in Omega and International Journal of Mobile Communications. Her research interests are in electronic commerce, mobile commerce, social networking, and management information systems.

Chia-Cheng Chang received his BS degree in Finance, from China University of Science and Technology, in 2011 and now he is in MS program in The Graduate School of Business and Management from China University of Science and Technology. His research interests include electronic commerce, mobile commerce, and social networking.

Tzu-Hong Lin is a PhD student of Management College at the National Taiwan University of Science and Technology and with more 15 years working experience in telecom and internet relevant field. He received a MBA degree in Texas A&M University in 1992. His research interests are in social networking, mobile commerce and e-commerce.

INTRODUCTION

Since 2007, more than 500 million smartphones have been activated. By the end of 2012, the cumulative number of smartphone devices activated will surge past 1 billion. According to IDC, over 3 billion smart-phone devices were adopted between 2007 and 2010, making the rate of smartphone device adoption more than four times faster than that of personal computers (Newark-French, 2012). The mobile application (App) revolution has changed the way software is distributed and used among consumers. Over 40 billion applications have already been downloaded from the App Store. People are spending ever more time in App. With App usage soaring, Social Network App (SNA) service captures the significant majority of consumers' time. App users spend more and more time of their day using Social Network App (SNA) (Newark-French, 2012).

In our study we attempted to explain the word of mouth and continue intention to SNA usage. We based our framework on Expectancy Confirmation Model (ECM) and Technology Acceptance Model (TAM). Rather than focusing solely on continuance intentions to use SNA, our study also examined the willingness of users to provide positive word of mouth about the SNA usage. The confirmatory factor analysis was employment to examine the reliability and validity of the measurement model. The model was tested by Partial Least Squares (PLS) technique. Implications for scholars and practitioners are discussed.

LITERATURE REVIEW

Expectancy Confirmation Model (ECM) is widely used to evaluate consumers' satisfaction and usage behavior in the study of consumer behavior (Tse & Wilton, 1988; Anderson & Sullivan, 1993; Patterson, Johnson, & Spreng, 1997; Bhattacherjee, 2008). ECM proposes that consumers' expectation and perceived performance determine their satisfaction (Oliver 1980, Oliver 1993). Bhattacherjee incorporates perceived usefulness from TAM with ECM to reflect users' expectation (Bhattacherjee, 2001a; Bhattacherjee, 2001b; Bhattacherjee and Premkumar, 2004). There are two internal dimensions of TAM: perceived usefulness (PU) and perceived ease of use (PEOU) (Davis et al., 1989). ECM posits two main determinants of usage behavior (satisfaction and usage intention), and two direct determinants of satisfaction (perceived usefulness and confirmation).

In the revised ECM model, user satisfaction was affected by confirmation and perceived usefulness, continuance intention was determined by satisfaction. In addition, perceived usefulness was affected by confirmation, which has a direct effect on continuance intention.

In previous studies have indicated that users' satisfaction on using specific application targets was influenced by perceived usefulness, confirmation (Sweeney and Soutar, 2001; Kang et al., 2009; Lii and Sy, 2009) and also satisfaction plays an important role in predicting user intention and word of mouth (Bhattacherjee, 2001a, Bhattacherjee et al., 2008, Kim et al., 2009).

Social Network App (SNA) as a social communicate tool belong to a specific application that calls for additional constructs, such as PEOU to be incorporated in order to fit nicely into the ECM domain. The modified ECM model enables a better explanation of SNA usage behavior.

According to ECM, continuance intention is defined as user's continuance intention to a product or service in the post- acceptance stage. The higher perceived satisfaction leads to the higher change to reuse the product or service in the future.

In this study, we defined PU as "the degree to which a person believes that using specific application system would enhance his or her specific performance" (Davis et al., 1989), PEOU as "the degree to which the prospective user expects in using specific application system to be free of effort" (Davis et al., 1989), confirmation as "users' perception of the congruence between expectation of specific application system use and its actual performance" (Bhattacherjee, 2001b).
As above, we proposed the following hypothesis:
H1: Perceived ease of use positively influences perceived usefulness.
H2: Perceived ease of use positively influences user satisfaction.
H3: Confirmation has a significant effect on perceived usefulness.
H4: Perceived usefulness has a significant effect on user satisfaction.
H5: Confirmation significantly influences user satisfaction.
H6: Perceived usefulness positively influences continuance intention.
H7: Satisfaction positively influences continuance intention.
H8: Satisfaction has a significant effect on word of mouth communication.

RESEARCH METHOD

The research model (as shown in Fig.1) is an extension of ECM with TAM. The data used to test the research model were obtained through an online survey of the users of Social Network App (SNA) service.

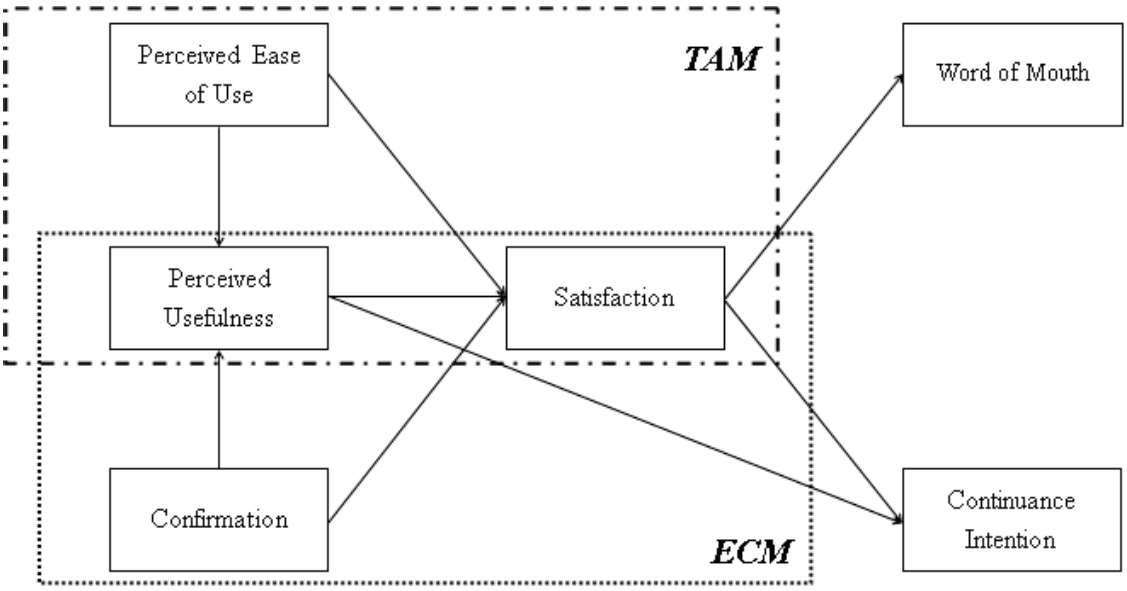

Figure 1 Research Model

METHODOLOGY

1. Measures

The constructs in this study included perceived ease of use, perceived usefulness, confirmation, users' satisfaction, word of mouth and continuance intention. We used established measures from previous literature. The five-point Likert scale, ranging from strongly disagree (1) to strongly disagree (5), was used to measure multi-item perceptual scales.

2. Data collection

We developed our self-administered questionnaire on specific platform for data collection. The existing scales from prior research were used, but modified the wording of the questionnaire in order to fit the particular context of Social Network App usage. In a pretest phase, we invited a small group of IS faculty and doctoral students to review of the survey to modify the scales and questions. The purpose of these pretests was to confirm that relevant aspects were included and to enhance the valid, reliable, and appropriate of the questionnaire. The final questionnaire of 32 items measuring 6 latent variables is presented in Appendix A.
We conducted an online survey about SNA services users' psychological factors in continuance intention. We posted the invitation messages with the URL to the online questionnaire on a number of Facebook groups and technology forums related to App experiencers.

DATA ANALYSIS AND RESULTS

The SmartPLS method was used to perform the statistical analysis in this study.

The PLS procedure (Wold, 1985) is widely adopted by IS researchers in recent years because of its ability to provides a better explanation for medium sample sizes and complex relationships. (Chin 1998).

A two-step analytical procedure (Hair et al. 1998) was used, we first examined the measurement model and then the structural model was used to conduct a path analysis and test our hypotheses. Following the two-step analytic approach, we ensure our conclusion on structural relationship was drawn from a set of measurement instruments with desirable psychometric properties.

1. Descriptive statistics

The survey data was collected in July 2012 to August 2012 to collect data for testing our hypotheses. The respondents were asked to complete the questionnaire based on their experience with Social Network App (SNA) services. The 204 responses were received in this study. The results show that 60% of the respondents were men, 26% between 41 and 55 years old, 59% held a university undergraduate degree, and had 1-2 years of experience in using Social Network App (SNA).

2. Measurement model

Convergent validity and discriminant validity of the constructs indicate the extent to which the items of a scale that are theoretically related should be related in reality. Table 1 present information concerning the estimate of reliability, the composite reliability (CR) ranged from 0.94 to 0.97 are above 0.7, which are higher than the threshold level of 0.7 suggested by Chin (1998). The Cronbach's Alpha, ranged from 0.92 to 0.97, are higher than the threshold level of 0.7 (Nunnally, 1978). The average variance extracted (AVE) ranged from 0.76 to 0.87 in our study, which are higher than the threshold level of 0.50 suggested by Fornell and Larcker (1981) suggested. The validity can be assessed by the square root of the average variance extracted (AVE) for each construct and all data were higher than the corresponding inter-construct correlations as show in Table 2. And the item loadings are greater than 0.707 (Chin, 1998). Overall, we concluded that the measures were valid.

Table 1 Construct reliability measures

Construct	Mean	Standard Deviation	Cronbach Alpha	Composite Reliability	AVE
PEU	3.89706	0.82134	0.93700	0.95052	0.76273

CI	0.58639	0.62139	0.61997	0.66171	0.71686	**0.93164**

3. Structural model

The path coefficients were yielded by PLS analysis for the structural model. The bootstrap resampling procedure was used to the testing of significance of all paths. Fig. 2 shows the results of the hypothesized structural model test. Table 3 presents the results with overall explanatory powers, estimated path coefficients, and associated t-value of the paths. The overall explanatory power of our research model had R^2 = 49.9%, 66.3%, 49.1% and 51.6% for continued intention, word of mouth, satisfaction and perceived usefulness, revealed that usage of SNA can be predicted by extended ECM with TAM.

As indicated in Table 3, the perceived ease of use and confirmation to perceived usefulness was significant with path coefficients of 0.222 and 0.584 respectively, thus hypotheses H1 and H3 were supported. The effects of perceived ease of use, perceived usefulness, and confirmation were positive relationship to satisfaction with standardized path coefficients of 0.156, 0.412, and 0.241. Hypotheses H2, H4, and H5 were thus supported. The effects of satisfaction were positive relationship to word of mouth with standardized path coefficients of 0.814. Thus, hypotheses H8 was supported. Finally, perceived usefulness and satisfaction had a direct positive relationship to continuance intention with standardized path coefficients of 0.328 and 0.446, respectively. This provided support for hypotheses H6 and H7.

DISCUSSION AND CONCLUSIONS

This study tries to extend the Oliver's ECM (1980) with Davis's TAM (1989) as the structure model. The path coefficients, including perceived ease of use to perceived usefulness, confirmation to perceived usefulness, perceived usefulness to satisfaction, perceived ease of used to satisfaction, confirmation to satisfaction, satisfaction to word of mouth, perceived usefulness to continuance intention, and satisfaction to continuance intention, are found statistically significant. These results have several implications for academic and practice.

1. Implications for academics

Our study provided an insight into factors contributing to word of mouth and continuance intention to the SNA usage. It also showed that perceived usefulness and satisfaction were the two key factors in determining a customer's continuance intention to the SNA usage. The empirical results show that the unified model supports for all of our hypotheses and has good explanatory power, implying that the integration of ECM and TAM provides a model with a theoretical basis to explain SNA usage.

2. Implications for practitioners

Users' continuance intention was significantly influenced by perceived usefulness and satisfaction (β=0.328, $p<0.001$; 0.446, $p<0.001$), which was accordant to our hypothesis. Especially, the result shows that satisfaction is the strongest predictor of users' continuance intention. It means that if users feel good on the whole to use Social Network App, the users would like to continue the use Social Network App.

However, the perceived usefulness was influenced by confirmation. It demonstrated that people would make sure that the SNA can enhance their effectiveness for life or work before used. Therefore, the confirmation plays the important role on SNA usage. Word of mouth was significantly influenced Satisfaction (β=0.814, $p<0.001$). If people feel satisfy by using SNA, he/her might be more likely to recommend or share the using experience to others. Thus, the developer should concerned that the users' evaluation because word of mouth is important in using SNA service.

SNA users' satisfaction was predicted primarily by users' SNA perceived usefulness and confirmation on a prolonged basis (β=0.412, 0.241, $p<0.001$). However, we found some interesting patterns emerge. If the SNA is benefit to the users or the SNA can enhances users living or working effectiveness, the users will feel satisfy for SNA usage. Additionally, if the user gets the benefit or help to perform many things more conveniently by using SNA, the user will feel more satisfy on it.

LIMITATIONS

It may have some limitations on this study. First, our study examined only on the effect of perceived usefulness and satisfaction to the word of mouth and continuance intention of SNA users. However, other relational constructs may affect the related

continuance intention and word of mouth. Second, the web-based forms was conducted by employed a nonrandom convenience sampling. Gathering a larger using sample an alternate survey modality and random sampling methods would be costly. The online survey method was appropriate for collecting data from participants with Internet experience and who were free of geographical constraints. Third, the findings were acquired from a single study that was targeted to a specific user group, SNA users. Finally, the sample may have been biased for the voluntarily respondents.

Appendix A. Questionnaire items used in this study

Constructs	Questionnaire items
Perceived usefulness	By using Social Network App can provide me with useful information about my work or life. Using Social Network App enhances my effectiveness my working and living effectiveness. Using Social Network App helps me perform many things more conveniently. Social Network App is of benefit to me. Overall, this Social Network App is useful.
Perceived ease of use	Learning to operate the Social Network App is easy for me. I have no problem in using Social Network App. I find the Social Network App to be easy to use. It is easy for me to become skillful at using the Social Network App. Interaction with the Social Network App does not require a lot of my mental effort. Overall, this Social Network App is easy to use.
Confirmation	My expectation with using Social Network App was satisfied as a whole. The benefit provided by Social Network App was better than what I expected. The service content delivered by Social Network App was more thoughtful than what I expected. The service level provided by Social Network App was better than I expected. Overall, the service of Social Network App mostly met my expectation.
Satisfaction	My decision to use Social Network App was a wise one. I am satisfied with using Social Network App. I feel extremely satisfied about my overall experience of using Social Network App. I think, I did the right thing by deciding to use Social Network App. It was good on the whole to use Social Network App.
Word of mouth	I will encourage friends and relatives to use Social Network App. I will recommend using Social Network App to others who seek my advice. I tell people positive things about Social Network App. I will urge my friends to use Social Network App. I will advise other people to use Social Network App. I don't hesitate to say good things about using Social Network App. I would like to share my using Social Network App experience.
Continuance Intention	In the future, I expect I will continue to use Social Network App. I prefer to continue to use Social Network App for process modeling over other process modeling grammars. If I could, I would like to continue the use Social Network App. I will frequently using Social Network App in the future

ABSTRACT

Purpose: *The purpose of the research is to examine the effect of a combination of training and training transfer factors on intentions to create new knowledge through stimulating creativity, experimentation and introduction of new products, services and processes in companies.*
Design/methodology/approach: *In the study we use quantitative research methods, based on data collected on a sample of 247 Slovenian service companies. To process the data, various multivariate statistical methods were used (factor analysis and multivariate regression analysis).*
Findings: *In the study we find positive effects of adequate quantity and quality of training and the training transfer factors on intentions to create new knowledge in an organisation. Among the training transfer factors the study reveals a relatively strong influence of organisational incentives (related to peer and especially supervisor support. The effect of training is positive and relatively strong.*
Research limitations/implications: *The study represents a starting point for exploring the relationship between training and processes of creation of new knowledge. To improve the reliability of the study, additional research should be undertaken using mixed research methods.*
Practical implications: *The study presents useful findings about the potentialities for encouraging creativity, experimenting and creating new knowledge required for further companies' development.*
Originality/value: *In the areas of research focused on training and training transfer factors there is not much work done related to the study of relationships between training and creativity, innovation and development of new products, services or processes. Most research has been focused on the questions how to promote learning, cognitive and behavioural changes, knowledge transfer and organisational performance. Therefore, we believe, that this study represents an original contribution to the promotion of training in an organisation as a means of enhancing creativity, innovation and new knowledge development.*

Keywords: Training, training transfer factors, knowledge creation

INTRODUCTION

In the literature there are quite some studies which investigate relationships between training, training transfer factors and different aspects of organisational performance. For example, research links training and training related factors to lower costs, reduced scrap, increased labour productivity (Cutcher-Gershenfeld, 1991; Bartel, 1994; Huselid, 1995), increased financial performance, sales, market share and profits (Russell *et al.,* 1985; Lane *et al.,* 2001;

Lyles and Salk, 2007), quality of products, reduced absenteeism and staff turnover, etc.(Guzzo *et al.,* 1985; Huselid, 1995; Katz *et al.,* 1983). The weak point of many of these studies is their focus on specific industries, allowing only a limited generalization of findings. In our previous study (Dermol and Čater, 2013) we confirmed positive links between training, peer support, supervisor support and organisational incentives and organisational performance mediated by organisational learning processes.

On the other hand, there are not so many studies relating training with knowledge transfer (Gupta and Govindarajan, 1991; Szulanski, 1996; Gupta and Govindarajan, 2000; Minbaeva *et al.,* 2003; Lyles and Salk, 2007), or creativity and innovation capabilities (Gupta and Singhal, 1993; Laursen and Foss, 2003; Minbaeva 2005). Abilities of creativity, innovation, new knowledge development and introduction of new products and services are crucial for success in modern world.

In the study presented in this paper we investigate the links between quality and volume of training, training transfer factors such as peer support, supervisor support and organisational incentives on one side and the existence of processes, related to creativity, innovation and new knowledge creation in an organisation on the other. In the first part of the paper we describe the constructs and indicate links between them, in the second part of the paper we present the research methodology and key findings of the analysis.

LEARNING CONSTRUCTS

1. Quality and volume of the training

Training is defined as the systematic development of skills that individuals need to perform certain work (Miglič, 2002). Individuals should take their own responsibility for their professional development but realise their learning needs in partnership with their colleagues at work and their direct superiors using different learning methods (Torrington *et al.,* 2008). Armstrong (2003) and Torrington *et al.* (2008) identify a range of different approaches to training. They state that the training may be based on different methods of teaching – both off-job methods (formal education, consultancy courses, outdoor-type courses, in-house courses, dramas and improvisations, role-plays, simulations etc.) as well as on-the-job learning methods (instructions, mentoring, self-development, self-development teams, the use of learning logs and learning contracts, e-learning, blended learning etc.).

Dechawatanapaisal and Siengthai (2006) consider that adequate opportunities for training should be offered to the employees. Garvin *et al.* (2008) say as well that all the employees in an organisation should receive periodic training. In particular, they highlight the importance of training for new employees and training in cases of special events in the organisation and emphasise the need to train employees when new business or work initiatives emerge, as well as in cases of employees' transfer to other posts or changes to the content of existing jobs. Jarvis *et al.* (2006) consider that in the past was mostly the upper levels of organizational hierarchies benefited from the training, but the situation in the last 50 years has changed. Blandy *et al.* (2000), for example, reported that the majority of organisations train 80-85% of their employees.

The quality training might be defined as customer focused, with high quality of service, controlling the process quality and with evaluation of quality (Burgarelly *et al*., 2002). The CEDEFOP (1996) notes that the quality of training reflects the quality of service, user satisfaction, quality of processes, the achievement of quality standards as well as the proper relationship between quality and price. Seyfried (1998) associates training quality with the implementation of quality objectives and with meeting standards when performing learning processes. Council of Europe (2005) emphasises that the training should address useful contents that could be used in practice. In addition to technical knowledge and technical skills training should provide some emotional skills needed to perform specific type of work as well. The quality of orientation training for new employees is determined by a clear set of learning objectives, appropriate teaching methods, integration of practical experience, relevance of learning tools, professionalism of trainers and the existence of training evaluation.

2. Supervisor support

Support provided by employees' supervisors significantly and positively affects transfer of training to a specific work context. Campbell (1969), for instance, emphasises the importance of adequate leadership styles. Bader and Bloom (1995), from practical perspectives, emphasise the need for supervisors' active participation in the processes of planning and preparation of the training. Some other authors Wieland Handy (2008) note that supervisors should promote the training transfer by explaining their employees the expectations about after-training behaviour and performance, helping them to identify opportunities to implement the newly acquired knowledge and providing information that might be helpful to their employees. Furthermore, any help offered by supervisors seems to be of a crucial importance when employees encounter problems while using the acquired knowledge.

3. Peer support

Support provided by the peers, co-workers or colleagues at work is another significant factor influencing the training transfer. It is reflected mainly through joint identification and implementation of learning opportunities and application of the acquired knowledge. Wieland Handy (2008) emphasises the need for appropriate norms within the group which involve the whole group in the learning process. Peers should play an important role in explaining and promoting learning in an organisation being patient while their colleagues are trying to implement the newly acquired knowledge in the workplace and providing the colleagues with the assistance when they need one. They have the power to promote and also to prevent the transfer of training (Holton III *et al.,* 2003).

4. Organisational incentives

Holton III *et al.* (2003) acknowledge the existence of certain organisational mechanisms which enable organisations to promote training transfer. These mechanisms comply with the factors acknowledged by Herzberg's motivation theory (Lipičnik and Možina, 1993). Among these mechanisms there are certain factors which create conditions for training transfer or/and eliminate eventual inconveniences and obstacles. On the other hand there are some factors which promote training transfer as well.

Among factors which eliminate possible inconveniences and create conditions for the training transfer some of them are related to work conditions, others to control mechanisms or mechanisms which enable feedback of information regarding performance and training transfer. Garvin *et al.* (2008) for instance emphasise the importance of adequate financial support after the training and also providing material, equipment and information which is needed for successful training transfer.
If employees on the other hand perceive training as an opportunity to increase their efficiency and personal satisfaction and align training with possibilities to gain more respect among colleagues, higher salary or other benefits, promotions and opportunity to climb up the career leader, the probability of successful training transfer is even higher. This is particularly true if organisations provide them with adequate resources and budget available (Wieland Handy, 2008).

KNOWLEDGE CREATION THROUGH CREATIVITY AND INNOVATION

The extent of creativity and experimentation leading to introduction of new products, services and processes in an organisation is positively affected by the existence of an environment which encourages learning. For example, Martins and Terblanche (2003) note that successful »organisations and leaders try to create an institutional framework in which creativity and innovation will be accepted as basic cultural norms in the midst of technological and other change«. Learning culture and appropriate managerial practices may be significant factors contributing to the extent creativity and innovations appear in an organisation (Judge *et al.,* 1997) since such culture »refers to basic assumptions [...] maintained in the continuous process of human interaction« (Martins and Terblanche, 2003) and are prescriptions for ways to perform in an organization. Martins and Terblanche (2003) recognise five crucial factors, which stimulate innovation and creativity in an organisation: strategy, structure, support mechanisms, behaviour and communication. Easterby-Smith (1990) defines experimenting organisations which generate creativity and innovation in people through the introduction of flexibility in organisational structures. Such organisations focus on unusual variations in information systems and encourage individuals to take risks (Jashapara, 2011). Kenny and Reefy (2006) recognise relationship between several cultural elements, organisation's commitment to R&D and its performance. Besides adequate resources and adequate funding, they emphasise the importance of some elements related to learning culture such as non-constraining environment, supportive management, technically competent team and appropriate strategic direction. In their research, they find a significant correlation between organisation's commitment to R&D and the number of new products and services launched. More specifically, Garvin *et al.* (2008) stress the importance of three building blocks of learning culture – supportive learning environment, leadership that reinforces learning and concrete learning processes and practices including experimentation and knowledge creation.
On the basis of described theoretical background and our believes that learning induced through learning and existence of learning transfer factors positively affects new knowledge creation in an organisation we set the following hypothesis:
Combination of training, peer support, supervisor support and organisational incentives positively influence creativity, innovation and knowledge creation in an organisation.

METHODOLOGY AND ANALYSIS

During June and July 2009 the research was carried out to measure the influences of training and training transfer factors on creation of new knowledge and introduction of new products, services and processes through stimulating creativity, experimentation and innovation. Questionnaires were sent to 1819 service organisations in Slovenia (548 large, 703 medium-sized and 568 small) located in Slovenia. We received 247 completed questionnaires (19 % from large organisations, 39 % from medium-sized and 39 % from small ones). The responsiveness was 13.6 %.

The questionnaire was developed as a combination of measurement scales found in respective literature as indicated in Table 1.

Table 1: Measurement scales (examples, number of items, authors)

Knowledge creation (KNCR) (e.g. we experiment frequently with new ways of working; we practice brainstorming retreats or camps)	4	Garvin *et al*, 2008
	2	Wang *et al.* (2007)
Volume and quality of training (TRAING) (e.g. training is of high quality, training is constantly revised and upgraded to fit the changing environment, experienced employees receive periodic training and training updates, experienced employees receive training when new initiatives are launched)	4	Dechawatanapaisal and Siengthai (2006)
	1	Vlachos (2008)
	4	Garvin *et al.* (2008)
	2	Young-Chan and Sun-Kyu (2007)
Supervisor support (SPRVSR) (e.g. supervisors show interest in what employees learn in training, supervisors meet with employees to discuss ways to apply their training to the job, supervisors meet with employees to work on problems they may have in trying to use their training)	1	Vlachos (2008) Garvin *et al.* (2008) Young-Chan and Sun-Kyu (2007)
Peer support (PEER) (e.g. employees appreciate colleagues using new skills they have learned in training, employees encourage their colleagues to use the skills they have learned in training, employees expect colleagues to use what they learn in training at work.	4	
Organisational incentives (INCENT) (e.g. when employees try new things they have learned, they know who is going to help them, when employees in this organisation do not use their training it gets noticed, after training employees get feedback from people on how well they are applying what they have learned)	2	

In the statistical analysis we follow the procedure suggested by, for example, Sakar *et al.* (2011). The relationship between the independent and dependent variables were examined by conducting exploratory factor analysis and multiple linear regression analyses. Firstly, factor analysis was implemented to calculate factor scores which were then entered into the multiple linear regression analysis as independent variables. Besides, the approach suggested by

Huselid (1995) and Minbaeva (2005) was used as well. This way we tried to recognise possible complementarities between the independent variables, i.e. possible synergetic effects of combinations of training and training transfer factors on creativity, innovation and new knowledge creation in an organisation.

As it can be seen in the Table 2, all the dependent variables positively influence creation of new knowledge in an organisation. The strongest effect seems to come from organisational incentives and from delivering trainings in an organisation. Peer support seems to have medium sized and positive effect on new knowledge creation, on the other hand, the influence of supervisor support seems to be relatively weak, nevertheless, statistically significant.

To test complementarities Huselid (1995) and Minbaeva (2005) suggest using multiplicative approach and testing a full set of interactions while controlling for main effect of individual independent variables. The analysis (see Table 2, model 2) indicates that complementarity exists between supervisor support and organisational incentives, but the interaction between these two variables is negative, meaning that the simultaneous operation of these two factors adversely affects the creation of new knowledge.

Table 2: Regression analysis

Model		Beta	Std. Error

CONCLUSIONS

The study highlights the importance of training and introduction of systematic organisational incentives for encouraging creation of new knowledge through creativity in experimentation. Peer support and especially supervisor support are not as important factors as one might think but nevertheless they have a positive effect on knowledge creation. In an organisation managers should therefore in the first place encourage systematic training and also take care of conditions for training and training transfer, especially by promoting training transfer processes and eliminating potential inconveniences and obstacles for learning.

The findings of the study are somehow in line with the findings in literature related to social networking issues which link network density and strong ties characterised by frequent communication and emotional closeness with effective inter-firm cooperation but not with knowledge creating and innovation capability. It seems that only the existence of network heterogeneity and weak ties between individuals across social units are predecessor of knowledge creating or innovation capability in an organisation (Swart, 2006). This might be the reason for rather weak relationship between creation of knowledge on one side and peer support and supervisor support on the other, as the data showed in our study. The training seems to be an opportunity to establish weak ties with external sources of knowledge, and to increase the heterogeneity of the organisation's social network. Besides, the study shows that simultaneous implementation of organisational incentives in the sense of provision of material, equipment, information, financial support and feedback needed for a successful transfer of training into the work context, and supervisor support in the sense of explanation of expectations about post-training behaviour, joint identification of learning opportunities, and provision of information that is helpful to employees, adversely affects the creation of new knowledge. This is another issue which the managers should be aware of. Too much of formalisation in this sense harm the processes of knowledge creation.

The study represents the starting point for investigation the relationships between training, training transfer factors, creativity and innovation. It is based on a sample of 247 Slovenian services companies and on qualitative research approach. We believe that the study might be improved especially in two ways – through bigger sample which would enable cross validation of the model and through the use of complementary qualitative and quantitative research methods.

ABSTRACT

Purpose: *Despite the stimulating roles of market demand and green issues to green innovation and business success, the relationships among these aspects remains controversial. The lack of the consensus on these links causes a missing research gap in the extant literature. This study aims to examine the mediating effect of green innovation and environmental performance on the relationship between market demand and firm performance in Taiwanese hybrid vehicle industry.*
Design/methodology/approach: *The Taiwanese hybrid vehicle industry was targeted as the main research scope. Using random sampling method, survey questionnaires were distributed to retailers, wholesalers, and component sale firms in the automobile industry through post, e-mails, and fax. The Structural Equation Modeling (SEM) approach was used to test the hypotheses and the theoretical model.*
Findings: *The findings prove the significant impacts between market demand and green innovation as well as environmental performance to firm performance; however, the mediating effects of green innovation and environmental performance remain insufficient.*
Practical implications: *The results strongly suggests firms to make more efforts to understand customer needs and excel their competencies in innovating products and processes in a green manner to better align green innovation initiatives with consumer values to promptly satisfy market demand and achieve more effective competitive advantages.*
Originality/value: *This research is the first of its kind to establish the theoretical model for investigating the links among market demand, green innovation, environmental performance, and firm performance in Taiwanese hybrid vehicle industry, which contributes to the understanding of green issues in this competitive industry. As such, the findings helpfully provide effective guidelines for firms in achieving first-mover advantages, market leadership, and sustainable competitiveness.*

Paper type: Research paper

INTRODUCTION

Facing currently intense customers' green demands and global environmental concerns, green innovation has been touted as an effective approach for firms to achieve a win-win status of being green and sustainably competitive (Porter and van der Linde, 1995; Pujari, 2006). Nonetheless, a continual debate on what actually composes green products has also been observed (Berchicci and Bodewes, 2005).

Worth noticing, the relationships among firms' green innovation capabilities, market demand, and performances remain controversial. Although green innovation does explicitly address environmental issues, it is far from certain whether green products can truly achieve market success (Pujari, 2006). Additionally, while market demand is suggested to be an important factor inducing green innovation (Wei and Morgan, 2004), Berthon et al. (1999) argue that listening too closely to customer voice may impair innovative sustainable product development capabilities. Simultaneously, whereas some empirical findings confirm the positive relationship between green innovation and firm performance, a major of studies have indicated otherwise (Koellinger, 2008).

Despite numerous studies on the links between green issues and performance or competitive advantage (Chiou et al., 2011), the conflicting findings have considerably illustrated a research gap on the links among market demand, green innovation, and firm performance. Therefore, this study aims to examine the link between market demand and firm performance with green innovation and environmental performance as the mediators in Taiwanese hybrid vehicle industry. As such, based on the database on Taiwan's Top 5000 largest enterprises from Taiwan Ministry of Economic Affairs, survey questionnaires were randomly conducted with retailers, wholesalers, and component sale firms in the automobile industry through mails, e-mails, and fax. By utilizing the Structural Equation Modeling (SEM) approach to test the theoretical model, this study attempts to address the following research questions:
(a) How does market demand affect green innovation and environmental performance?
(b) How can green innovation affect firm performance?

In essence, since sufficient understanding of green issues can beneficially assist firms in establishing successful operational and new product development strategies, this study provides firms with useful references for improving overall performance, gaining first-mover competitive advantages and market leadership. The findings also contribute to the knowledge of green innovation and green demands in Taiwanese hybrid vehicle industry since these issues are currently both challenges and opportunities in this competitive market.

Taiwanese hybrid vehicle industry was chosen to be the research focus for several compelling reasons. First, this important industry is currently making great efforts to apply advanced technologies in product and process development for both environmental protection and industrial advancement (Chou and Hsiao, 2005). Second, under intense pressures from green regulations, customers, and especially tremendous carbon dioxide level from vehicle exhaust, the hybrid vehicle technology in Taiwan has become a promising solution to significantly decrease reliance on oil supplies, fuel consumption, and CO2 emission as well as enhance energy efficiency and firms' green image (Fontaras and Samaras, 2007). Finally, due to several common development patterns with regional developing countries, the achieved experience in Taiwan can usefully shed light on future firm growth in Asia.

The remainder of this research begins with a brief literature review, followed by empirical research method, data analysis, results, and discussions. Finally, the study ends with conclusions, implications, and recommendations for future research.

LITERATURE REVIEW

1. Market demand

In this customer-oriented era, since customer preferences keep changing constantly, firms' capabilities in satisfying market demand refer to the extent firms understand customer needs to better anticipate their preferences and gain competitive advantage (Zhou et al., 2009).

Regarding market demand, customers are the key element driving firms' eco-innovation with the aim of delivering more value-added customer benefits (Kammerer, 2009; Horbach et al., 2012). For instance, along with current green trends, customers are observed to keep modifying their positive behaviors to reduce environmental damage, even are willing to pay higher prices for green and energy-efficient products (Chen, 2008; Chiou et al., 2011). To satisfy these green demands, firms have to innovate products and processes through implementing green technologies, eco-design, and international environmental management systems (Zhu et al., 2008; Hsu and Hu., 2011). Hence, market demand is assumed to be the key factor stimulating green innovation through inducing successful new product performance (Wei and Morgan, 2004; Chiou et al., 2011).

2. Green innovation

Increasing green concerns from public, regulations, and governments worldwide have strongly enforced firms to achieve competitive sustainability through developing new green products and advancing new green manufacturing processes to satisfy stringent green regulations and green demands and overcoming competitors with differentiation strategies (Porter and van der Linde, 1995; Pujari, 2006; Huang and Wu, 2010). Due to environmental concerns in Taiwanese hybrid vehicle industry, this study adopts the ideas of Chen et al. (2006), Chen (2008), Oltra and Saint Jean (2009), and Halila and Rundquist (2011) to define green innovation as the development and implementation of new products and processes which contribute to a sustainable environment through facilitating eco-target achievements and ecological footprint reduction throughout the entire manufacturing processes and product life cycle, which in turns effectively help firms promote productivity, corporate reputation, and image, develop new markets, and achieve first-mover advantages.

2.1 Green product innovation

Chen et al. (2006), Kammerer (2009), and Carrillo-Hermosilla et al. (2010) identify green product innovation to be the introduction of new or significantly improved products for environmental concerns (i.e. raw material use efficiency, green design, energy saving, recycling, waste minimization), being conducted under pressures of shortened product life cycle and increasing competition. With green attributes, green product innovation is perceived to be the cost-effective means for both consumers and producers (Pujari, 2006).

2.2 Green process innovation

Green process innovation is defined as the modifications in manufacturing processes and systems to produce environmentally friendly products which are closely related for eco-targets (e.g. energy saving, pollution prevention, waste recycling, and no toxicity) (Meeus and Edquist, 2006).

3. Environmental performance

Environmental performance is considered the impact of firms' activities on the natural milieu (Klassen and Whybark, 1999). In the context that the global economic growth is currently encountering extreme threats of fossil fuel exhaustibility, energy shortage, and high gas and electricity prices, energy-saving and environmental performance management have become the top-concerned priorities worldwide (Du and Liu, 2011).

4. Firm performance

This study proposes firm performance includes market share (Rex and Baumann, 2007; Li et al., 2010) and reputation (Chen, 2008; Oltra and Saint Jean, 2009) since they are considered the most important competitive factors for manufacturing firms. Interestingly, firms' reputation and environmental endeavors considerably affect customer preferences and purchasing behaviors (Oltra and Saint Jean, 2009).

4.1 Market share

The positive impacts of green innovation on corporate competitive advantages and market share enhancement have been widely confirmed (Chen et al., 2006; Iwu, 2010; Chiou et al., 2011). In support, Rubik et al. (2005) point out the main motivation for firms to conduct green innovation is to promote more transactions. As such, market share is referred to as the useful means for addressing potential aspects of consumer needs and better sales volume (Rex and Baumann, 2007; Chen, 2008).

4.2 Reputation

Reputation is considered an important intangible resource considerably affecting firms' market performance and distinguishing firms in the marketplace (Juma and Payne, 2004). In the extant literature, firm reputation has been perceived as an important basis for customers to evaluate product quality (Chang and Fong, 2010) and helps firms enhance corporate image and market value (Kwansa et al., 2008) as well as gain better customer satisfaction and loyalty and sustainable competitive advantages (Martenson, 2007).

In sum, to address the research questions, this study aims to verify the effects of market demand on firm performance through green innovation and environmental performance. Accordingly, the research framework is established as in Figure 1.

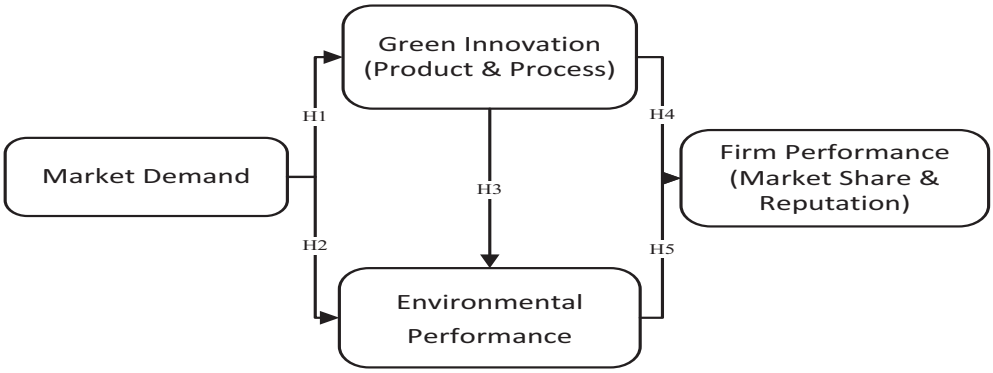

Figure 1. Research Framework

HYPOTHESIS DEVELOPMENT

1. Market demand and Green innovation

In this era, green-conscious customers have expressed more demands for energy-efficient and innovative green products (Chiou et al., 2011), even are willing to pay higher prices (Chen et al., 2008). For effective response, firms must innovate manufacturing processes and products using environmental management (Hsu and Hu., 2011). In other words, innovative product or process development undertaken for environmental reasons is strongly stimulated by market demand (Chiou et al., 2011). Accordingly, the following hypotheses are proposed.

H1-a: Market demand positively affects green product innovation.
H1-b: Market demand positively affects green process innovation.

2. Market demand and Environmental performance

Currently intense green demands have strongly enforced firms to conduct flexible and energy-efficient manufacturing strategies through adopting green management to reduce environmental damage (Chiou et al., 2011; Hsu and Hu., 2011). Since environmental performance is identified to be environmental management output (Klassen and Whybark, 1999), green management practice implementation typically improves firms' environmental performance (Zhu and Sarkis, 2004). Hence, the following hypothesis is suggested.

H2: Market demand positively affects environmental performance.

3. Green innovation and Environmental performance

Meeus and Edquist (2006) argue that firms conduct green innovation to manufacture environmentally-friendly products that can effectively eliminate environmental damage. Hence, since being closely associated with corporate environmental management and eco-target achievements (i.e. raw material use efficiency, energy saving, pollution prevention, waste minimization, reuse, and recycling), green innovation has been widely believed to

stimulate firms' environmental performance (Chen et al., 2006; Kammerer, 2009). Moreover, Carrion-Flores and Innes (2010) suggest green innovation spurs demands for improved environmental performance. Accordingly, two hypotheses are proposed.

H3-a: Green product innovation positively affects environmental performance.
H3-b: Green process innovation positively affects environmental performance.

4. Green innovation and Firm performance

Green innovation through minimizing environmental impact, CO2, and waste efficiently helps firms avoid environmentalists' protests or penalties, increase productivity, improve corporate reputation, green image, and market performance, develop new markets, and achieve first-mover competitive advantages (Porter and van der Linde, 1995; Pujari, 2006; Mu et al., 2009). Additionally, Bonini and Oppenheim (2008) verify that eco-innovation practices on energy-efficient products help firms minimize waste and promote brands, which in turn efficiently stimulate market share and new business opportunities, being reflected through the case of Toyota Prius Hybrid which has become status symbols for green-labeling products strategies. Hence, following hypotheses are established.

H4-a: Green product innovation positively affects market share.
H4-b: Green product innovation positively affects reputation.
H4-c: Green process innovation positively affects market share.
H4-d: Green process innovation positively affects reputation.

5. Environmental performance and Firm performance

Better environmental performance has been widely proven to bring numerous sustainable benefits regarding firm performance such as low-cost, differentiation, better social reputation, and legitimization (Porter and van der Linde, 1995; Lopez-Gamero et al., 2009) as well as market share and profitability enhancement (Wahba, 2008). Obviously, firms with lower emission level and better waste treatment will be able to outperform rivals with first-mover advantages and more reliable green reputation; hence, environmental performance plays a critical role to firm sustainability (Claver et al., 2007). Recent studies also confirm better environmental performance beneficially helps firms attract more resources and social support as well as expand market opportunities (Jacobs et al., 2010). Therefore, following hypotheses are put forward.

H5-a: Environmental performance positively affects market share.
H5-b: Environmental performance positively affects reputation.

RESEARCH METHODOLOGY

1. Taiwan hybrid vehicle industry

In recent years, the transport sector alarmingly accounts for 27% of the world's total energy consumption and 33.7% of total green house gas emission (Tie and Tan, 2013). Additionally, fossil fuel scarcity and environmental pressures keep increasing dramatically to unsustainable levels in a global scale (Nilsson et al., 2012). In this context, energy saving, air pollution, and

CO2 emission in the transport sector has become extremely important issues and principal governance challenges (Hui, 2010).
The Taiwanese hybrid vehicle industry was chosen for several crucial reasons. First, in addition to alarming global warming and numerous environmental threats, Taiwan is currently suffering from heavy environmental burdens due to limited land and a strong emphasis on economic development and serious air pollution and CO2 emission derived from vehicle exhaust, which in turn has placed significant pressures on vehicle manufacturers to develop environmentally friendly and energy-efficient vehicles (Pongthanaisawan and Sorapipatan, 2010). Second, Taiwan hybrid vehicle industry possesses much potential for development since manufacturing firms are becoming more social responsible and green-conscious under significant pressures from environmental regulations and green customers. Moreover, being one of the major vehicle producers worldwide, Taiwan is now attempting to apply advanced technologies in new product and process development for not only environmental protection but also industrial advancement (Chou and Hsiao, 2005). Finally, since sharing common development patterns with regional developing countries; the achieved experience in Taiwan usefully shed light on future firm growth in Asia.

2. Data collection

For empirical analysis, this study aimed to collect data from firms that were listed in Taiwan's Top 5000 largest enterprises by Taiwan Ministry of Economic Affairs in 2012. The firms chosen must have achieved certain green levels and well-recognized in the market. Survey questionnaire was employed as main research instrument. The chosen items were adopted from existing literature related to green innovation, market demand, environmental performance, and firm performance. Prior to data collection, the questionnaire was pre-tested for content validity in two stages. First, based on the idea of Cooper and Schindler (2001), two scholars in the field of green supply chain were asked to assess all construct items for ambiguity, clarity, and appropriateness; then, the questionnaire was further modified. Second, the questionnaire was mailed to three management executives in the hybrid vehicle industry to review the structure, readability, ambiguity and completeness.

Using random sampling method, questionnaires were sent to respondents that were retailers, wholesalers, and component sale firms in the automobile industry in Taiwan through post, e-mails, and fax. Out of 1000 distributed questionnaires, 223 valid questionnaires were obtained, achieving the response rate of 22.3%.

3. Questionnaire design and measures

The questionnaire (as in Table 1) contained five sections. The first section comprised basic descriptive data of participant firms. The following sections were the measurements of market demand, green innovation, environmental performance, and firm performance. All items were assessed using Likert 5-point scale (1= "strongly disagree", 5= "strongly agree").

4. Methodology

Structural Equation Modeling (SEM) methodology was utilized to test the proposed hypotheses and the theoretical model in Figure 1. SEM was selected for its capability of

incorporating incorporate both latent and observed (i.e. measured) variables while other multivariate techniques were only based on observed measurements (Byrne, 2006).

Since the measurement scales for market demand, green innovation, environmental performance, and firm performance in this research were integrated from the extant literature, it was necessary to test the appropriateness of these scales (Wong and Law, 2002). As such, this study adopted exploratory factor analysis (EFA) to test construct items, using maximum likelihood method with varimax rotation. Then, AMOS 5.0 was employed as the main statistical assessment tool. To demonstrate a reasonable model fit, a number of fit indicators were computed, including Chi-square/degrees of freedom (χ^2/d.f), Goodness-of-fit Index (GFI), Adjusted Goodness-of-fit Index (AGFI), the Normed Fit Index (NFI), Comparative Fit Index (CFI), and Root Mean Square of Approximation (RMSEA).

EMPIRICAL RESULTS AND DISCUSSIONS

1. Descriptive analysis

The main purpose of conducting demographic characteristics analysis was to briefly summarize participant firms' background features. Regarding participant firms' background, the results showed that the majority of respondent firms were with more than 25 years of operation (41.3%), turnover rate from $NT 1.5 to 5 billion (54.3%), capital of more than $NT 70 million (69.4%), and more than 201 employees in total (69.5%).

Table 1. Questionnaire constructs and variables

Constructs	Variables	References
Market demand	Customer demand	Oltra & Saint Jean (2009)
	External pressures	Zhou et al. (2009)
	Competitor pressures	
Green innovation	Green product innovation	Chen et al. (2006), Chen (2008),
	Green process innovation	Huang & Wu (2010)
Environmental performance	Reduction of air emission	Wang et al. (2004)
	Reduction of hazardous waste/scrap	Awasthi et al. (2010)
	Less consumption of gasoline/fuel	Chiou et al. (2011)
	Environmental compliance	
Firm performance	Market share	Rex & Baumann (2007)
	Reputation	Li et al. (2010)

In accordance with research purposes, the mean and standard deviations were calculated to further explain the current situation of market demand, green innovation, environmental performance, and firm overall performance in Taiwan hybrid vehicle industry. The achieved mean values in Table 2 range from 3.74 to 4.44, indicating that a wide range of Taiwanese hybrid vehicle manufacturers have already implemented and made great efforts in enhancing green innovation (4.36) and environmental management (4.44) in daily operational activities, thus have gained considerable achievements regarding firm performance (4.33). However, although market demand (3.90) has attracted increasing attention from business operators, its role on green innovation and firm performance has not been sufficiently emphasized.

2. Reliability and validity

Since the measurement scales for research constructs were adopted from previous literature, the constructs were indicated to have content validity (Wong and Law, 2002). In order to assess the scale appropriateness, this study additionally adopted an exploratory analysis (EFA), using maximum likelihood method with varimax rotation. In terms of market demand, the EFA results of 19 items showed that KMO and Bartlett test were significant (KMO=0.95, p<0.000) and two factors with eigenvalue greater than 1 were extracted. Out of 19 items, the first 7 items achieved factor loading greater than 0.5 on factor 1, indicating customer demand pressure. 12 remaining items achieved factor loading greater than 0.5 on factor 2, representing competitor pressures. Similarly, EFA results for other constructs' measurement scales showed that green innovation was consisted of green production innovation (6 items) and green process innovation (6 items). Environmental performance (5 items) and firm performance (10 items) was proven to be single factors.

Table 2. Descriptive statistics, Reliability and validity tests

Constructs	Mean	Std. Dev.	Cronbach's α
Market demand	3.90	0.91	0.899
Customer demand pressures	4.11	0.85	
External pressures	3.86	1.03	
Competitor pressures	3.74	1.09	
Green innovation	4.36	0.79	0.884
Green product innovation	4.37	0.76	
Green process innovation	4.36	0.74	
Environmental performance	4.44	0.67	0.962
Firm performance	4.33	0.77	0.885
Market share	4.23	0.89	
Reputation	4.43	0.73	

The measurement model was then tested for reliability by Cronbach's α values. As shown in Table 2, the achieved Cronbach's α values for market demand, green innovation, environmental performance, and firm performance respectively were 0.90, 0.88, 0.96, and 0.89, which were all greater than the threshold 0.7 (Nunnally, 1978; Bagozzi and Yi, 1988), indicating high internal consistency, thus reliability for all measurement indicators.

3. SEM results

3.1 Model fit test

A set of goodness-of-fit indices were calculated to demonstrate a reasonable model fit. The results of Table 3 showed the achieved values ($\chi 2/df = 2.515$, GFI= 0.99, AGFI= 0.92, NFI= 0.99, CFI= 0.99, RMSEA= 0.083), were all greater than the recommended values, indicating good model fit of the final structural model.

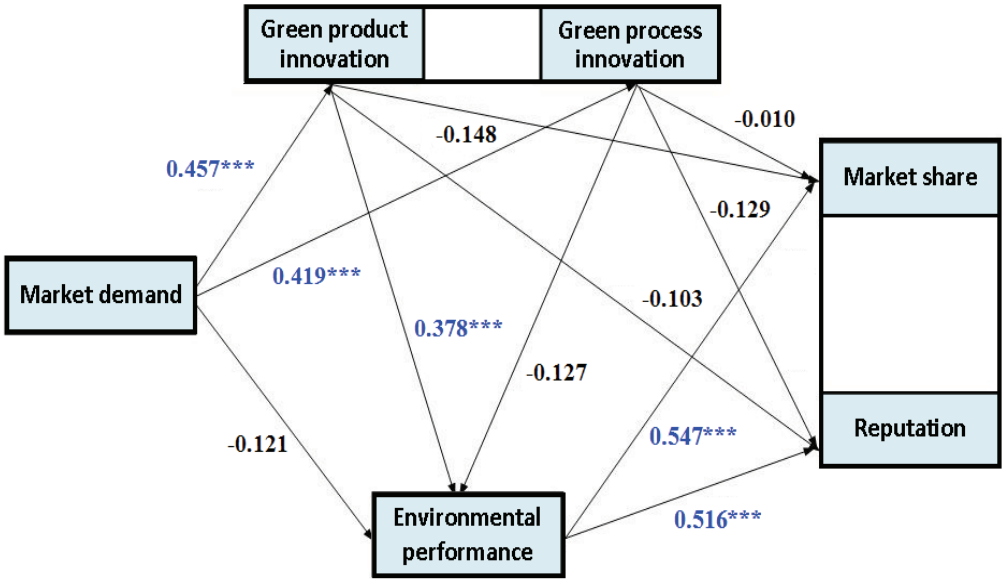
Table 3. Model fit test

	χ^2/d.f	GFI	AGFI	NFI	CFI	RMSEA
Final structural model	(5.030/2)= 2.515	0.993	0.922	0.993	0.996	0.083
Recommended values	<3	>0.9	>0.8	>0.9	>0.9	<0.1

3.2 SEM results

The structural model was used to test the proposed hypotheses and the theoretical model in Figure 1. AMOS 5.0 was utilized as the main statistic analysis tool. The final structural model with all path coefficients was illustrated in Figure 2.

The achieved results supported five out of 11 proposed hypotheses, as shown in Table 4. Specifically, market demand was found to have significant impact on green product innovation (β=0.457, p<0.001), green process innovation (β=0.419, p<0.001); hence, hypotheses H1a and H1b were supported. Additionally, green product innovation had significant impact on environmental performance (β =0.378, p<0.001), supporting hypothesis H3a. Finally, environmental performance exerted significant effects on market share (β=0.547, p<0.001) and reputation (β=0.516, p<0.001), confirming hypotheses H5a and H5b.



Note: p<0.001***

Figure 2. SEM results with path coefficient between latent constructs

However, in contrast with research expectation, no significant relationships were found between market demand and environmental performance (β=-0.121, p=0.056), green process innovation and environmental performance (β=-0.127, p=0.170), which in turn disapproved hypotheses H2 and H3b, respectively. Most surprisingly, the link between green innovation and firm performance was found to be non-significant, reflected through non-significant path coefficients between green product innovation and market share (β=-0.148, p=0.092) as well as reputation (β=-0.103, p=0.233), simultaneously between green process innovation and market share (β=-0.010, p=0.909) and reputation (β=-0.129, p=0.120), indicating hypotheses H4a, H4b, H4c, and H4d were rejected.

Table 4. Hypothesis support: Path coefficients (β)

	Hypothesis	β	Supported
H1-a	Market demand → Green product innovation	0.457***	Yes
H1-b	Market demand → Green process innovation	0.419***	Yes
H2	Market demand → Environmental performance	0.121	No
H3-a	Green product innovation → Environmental performance	0.378***	Yes
H3-b	Green process innovation → Environmental performance	0.127	No
H4-a	Green product innovation → Market share	0.148	No
H4-b	Green product innovation → Reputation	0.103	No
H4-c	Green process innovation → Market share	0.010	No
H4-d	Green process innovation → Reputation	0.129	No
H5-a	Environmental performance → Market share	0.547***	Yes
H5-b	Environmental performance → Reputation	0.516***	Yes

Note: $p<0.001$***

CONCLUSIONS, DISCUSSIONS, AND RECOMMENDATIONS

Concerning the impact of market demand, the empirical findings prove that market demand have a significant impact on green innovation. These findings are consistent with previous studies that market demand acts as the key factor stimulating green innovation through inducing successful new product development and enforcing firms to implement flexible manufacturing strategies (Chiou et al., 2011; Hsu and Hu., 2011). Nonetheless, no significant relationship was found between market demand and firms' environmental performance. After discussions with experts, this study finds that despite customer demand for vehicles with better energy-efficiency, lower air pollution and prices; however, without the implementation of green innovation, firms cannot achieve higher level of environmental performance as expected.

Regarding the impact of environmental performance on firm performance, the results strongly support previous studies (Claver et al., 2007; Wahba, 2008; Jacobs et al., 2010) by confirming its benefits in assisting firms in leading the market, outperforming rivals with of low-cost and differentiated strategies, achieving more reliable green reputation, attracting more customers, and expanding market share.

Worth noticing, this study found that green innovation had partly positive impact on environmental performance through green product innovation, but not through green process innovation. After discussion with industrial experts, green product innovation is perceived to easily and directly help firms satisfy green requirements and enhance environmental performance since being closely associated with eco-targets; meanwhile, improving the manufacturing process is considered costly projects and is not easy to implement.

Surprisingly, this study found out no significant relationships between firms' green innovation and firm performance, which in turn contributes to the existing debate in the literature. It is noted that the implementation of new green manufacturing processes and product development can be costly, which in turn sharply increase product prices. Hence, although green innovation helps firm address environmental issues, it is not ensured that the manufactured green products can truly achieve market success and higher reputation (Pujari,

2006) since customers' preferences and actual purchase behaviors sometimes conflict with their price-consciousness (Prakash, 2002; Zhou et al., 2009). Moreover, Rehfeld et al. (2007) state that there is not always strong stimulus for eco-innovation from the demand side since green products are still expensive and not all customers are willing to trade off product qualities for green attributes.

Regarding these non-significant results, after discussions with experts, these findings can be explained due to the small sample size in this study, which in turn may constraints the evaluation. Moreover, since the Taiwanese hybrid vehicle industry is still in its initial stage of replacing fuelled vehicles, customers remain low perception and favor toward its green benefits, thus results in low purchase intention and low reputation.

This research is the first of its kind to investigate the links among market demand, green innovation, environmental performance, and firm performance in Taiwan hybrid vehicle industry, which is now an important and promising industry in Taiwan society and one of the major vehicle producers worldwide. Hence, the findings beneficially contribute to the knowledge of green innovation and green demands, which in turn effectively assist firms in carrying out outstanding, differentiated, and feasible strategies to achieve better sustainability and market leadership in this competitive market.

With achieved results, this study has provided the hybrid vehicle industry in particular and all businesses in general with useful managerial focuses and guidelines for performance enhancement. By confirming the significant impact of market demand on firms' green innovation, this study strongly recommends firms to make more efforts to understand customer needs and expectations in order to better anticipate their changing preferences and align green product innovation initiatives with consumer values to promptly satisfy market demand, thus gain better performance. In addition, since market demand can be influenced by price, firms should attempt to reduce any unnecessary costs in the entire manufacturing processes to maintain stable and reasonable prices in consistent with customer needs. Moreover, since green innovation has been indicated to be an important strategy for hybrid vehicle firms to gain better sustainable advantages and attract more customers, this study implies that firms should pay more attention to excel their competencies in innovating their products and processes once attempting to lead the market. Finally, environmental performance has been proven to be adequately crucial to firm performance stimulation and business success, implying that hybrid vehicle manufacturing firms should emphatically enhance product quality and attributes in a green manner in order to produce new environmentally friendly vehicles that significantly help firms surpass competitors, grasp more customer attention, satisfaction, and purchase intention, and promote market leadership.

Nonetheless, this research remains limitations. The use of single industry has partly restricted finding generalization. Hence, future studies can expand the research scope to other Asian or international hybrid vehicle markets to achieve better findings. Additionally, since small sample size has considerably restricted the findings, this study strongly encourage the continuous collecting of data in order to complete the investigation in a more holistic way.

ABSTRACT

Purpose: *De-licensing in 1991 put the Indian automobile industry on a new growth trajectory attracting foreign auto giants to set up their production facilities in the country to take advantage of various benefits it offers. The growth in this sector continues to be a threat to the environmental degradation. In light of future environmental challenges posed, this study explores drivers and building strategic framework for Green Supply Chain Management (GrSCM) in automobile sector from the Indian context.*
Design/methodology/approach: *The literature is reviewed by studying articles published in journals during 1990 – 2013, company sustainability reports. Further Expert interviews and survey is used for collection of data from employees working in Original Equipment manufacturers and parent companies.*
Findings: *Raw material dependency, top management commitments, greenhouse gas emissions, reverse logistics, cost of operations, peer influence is the variables which will act as drivers for sustaining Green Supply Chain management. The knowledge penetration level about the subject of Green Supply Chain management among the Engineers and Managers has been found satisfactory.*
Originality/value: *This research project apart from providing valuable insights to managers and top management will also be valuable to new entrant in this sector. The project carried is a first of a kind of project in the country that involves the exhaustive study of literature review followed by Company Sustainability reports and Primary Research for identifying Drivers of Green Supply Chain Sustainability.*

Classifications: Literature review
Keywords: Green Supply Chain Management, strategic framework, Automobile industry, India.

INTRODUCTION

De-licensing in 1991 has put the Indian automobile industry on a new growth trajectory by providing various benefits and attracting foreign auto giants to set up their production facilities in the country. The growing middle class population, greater earning power coupled with strong technological capability has been propelling automobile demand for past few years. Despite economic slowdown, the Indian automobile sector has seen a high growth especially in the passenger cars segment (Indian Automobile Sector Analysis, RNCOS, 2009 [1]). Further, the country has an installed capacity of 24.27 million units with 600 organised players (contributing 77% total production) and 5800 unorganised players (Profile of Automobile Industry in India, SIAM, 2010-11 [2]). In the Indian Automobile Sector, the OEM players have the largest market share followed by replacement and exports. The production stood at 1,79,16,035 units for the year 2010-11 vis-à-vis corresponding

1,55,13,156 units for the domestic sales and 23,39,333 units for export (Indian Automobile Sector Analysis, RNCOS,2009 [1]; Profile of Automobile Industry in India, SIAM, 2010-11 [2]).
In section 2 below we attempt to examine the literature so as to understand the factors critical to the Automobile industry.

LITERATURE REVIEW

1. Definition

Since an attempt is made to understand the evolution of Green Supply Chain through the literatures from SCM. It is important to quote the differing lexicons on SCM and GrSCM. The term 'supply chain' was coined in the mid 70's. Banbury in 1975 used 'supply chain' as a term of passing on electricity towards the ultimate consumer. It was not until the 1980's, however, that the term 'supply chain management' came into context. Stevens in 1989 defined supply chain management as the integration of inbound to outbound ends of the business business functions involving the flow of materials and information (Fortes, [38]).

In the early 1990's, supply chain management evolved dramatically with the increasing importance managing relationship within the organization and with other suppliers (Harland,[36]). Slack (1991) and Christopher (1992) explains that the reason for this was the emergence of a globalised marketplace (Fortes,[38]). Green Supply chain from practitioner's point of view can be defined as integrating the ideas of green purchasing, total quality management, customer focus, continuous improvement and zero waste; life cycle analysis; environmental marketing and so on (Purba Rao,[53], Handfield and Nichols,1999) .The above factors like green purchasing, total quality management, customer focus, continuous improvement, zero waste, life cycle analysis, environmental marketing should be used by companies for empowering its employees (Kumar et al, [42]) .were integrated as The "quality revolution in the late 1980's and the supply chain revolution in the Green supply chain have been further defined as a way in which innovations in supply chain management and industrial purchasing may be considered in the context of the environment (Green et al, 1998[41]). Integrating environmental thinking into a supply chain management, including product design, material resourcing and selection, manufacturing processes, delivery of the final product to the customer as well as end of life management of these product after its useful life (Nimawat, Dheeraj, [64]; (Srivastava, [58]).

Different perspectives on the definition shows that clear consensus on the definition is yet to be achieved. Further Automotive industrial production growth has caused a significant regional and international ecological burden (Gonza´lez et al, [60]). The growth in this sector comes continues to be a threat to environmental degradation which as alarmed governments and corporate worldwide following fast realization of the deteriorating climatic conditions. Global warming caused by greenhouse gases, ozone layer depletion, haze over Asian countries, fast melting of glaciers, generation of huge amounts of liquid and solid waste, rising air, water and soil pollution levels and irreparable loss of biodiversity are impacts that can be attributed to the coordinated activities of organizations in a supply chain. Much of this arises from manufacturing organizations that continue to produce large amounts of unnecessary waste or emissions rather than investing in better technologies or practices to prevent its generation at the source (Berchicci, [3]).

Green supply chain management (GSCM) has gained momentum in recent years as a potential tool to counter the detrimental impacts of the supply chains and Western countries have adopted

very stringentmeasures to arrest the damage caused by large, global supply chains which are energy and capital inefficient and complex in design.

2. GrSCM Vs Conventional SCM

GrSCM and Conventional SCM differ in various ways. GrSCM takes considerations of ecology as well as economy as an objective, while Conventional SCM is usually concentrated on economy as a single objective. GrSCM are green, integrated and ecologically optimized while Conventional SCM does not take into consideration human toxicological effects (Luthra et al,[45]). Conventional SCM concentrates more on controlling the final product; no matter harmful its effects are to the environment during production and distribution. Ecological requirements are key criteria for products and productions and at the same time the company must assure its economic sustainability by staying competitive and profitable.An attempt to differentiate by (Luthra, Kumar.V, Kumar.S,Haleem,[45]; Ho Johnny, Shalishali, Maurice, Tseng, & Ang, 2009) as in Table 1.

Table 1: "Difference between the Green Supply Chain Management and Conventional Supply Chain Management" [Luthra, Kumar.V, Kumar.S, Haleem, 2011]

S. No	Characteristics	Green Supply Chain Management	Conventional Supply Chain Management	Researcher's
1	Objectives	Ecological and Economic	Economic	Beamon (1999)
2	Ecological Optimization	High Ecological Impacts	Integrated Approach Low ecological impacts	Gilbert (2000)
3	Supplier Selection Criteria	Ecological Aspects Long term relationship	Price Switching suppliers quickly Short term relationship	Ho Johnny et al. (2009)
4	Cost Pressure	High	Low	
5	Flexibility	Low	High	
6	Speed	Low	High	

3. GrSCM Vs Lean manufacturing methods:

Lean manufacturing is closely associated with Green Production as there is an overlap between the goals and drivers for both processes. Various lean manufacturing techniques are JIT, Six sigma, ISO 9000 & 14000. The table below shows comparison between green supply chain versus lean manufacturing techniques. It can be seen that GrSCM has more benefits when compared with lean manufacturing techniques (Table 2).

Table 2: Comparison between Lean manufacturing process vs Green manufacturing process [Bhateja et al, 2011]

Factors	Lean Manufacturing			Green Manufacturing
	JIT	SIX Sigma	ISO 9000 & ISO 14000	
Eliminate Defects	*	*		*
Reduction of Cost	*	*		*
Quality Improvement	*	*		*
Quality Standards			*	*
Improve Efficiency	*	*		*
Customers Satisfaction	*	*		*
Reduced Resource Consumption		*		*
Reducing CO2 emissions in manufacturing processes				*
Recycling programs for raw materials				*
Recycling programs for reusable components parts				*
Remanufacturing Programs				*

4. Green Design:

Green Design is the systematic consideration of design issues associated with environmental safety and health over the full product life cycle during new production and process development (Fiksel 1996). The scope of Green Design comprises many disciplines such as environmental risk management, product safety, occupational health and safety, pollution prevention, resource conservation and waste management (Srivastava,[58]). The green design takes care of selection of materials which are environmental friendly. However if the materials are not readily available appropriate composition should be specified to make the new desired material.

5. Green Manufacturing:

Green manufacturing needs to meet evolving definitions of "clean", "greener" products demanded by customers, developing recycling schemes, minimizing materials in packaging and choosing materials that have less environmental impact (Richards, [57]).Other definition of Green manufacturing given by (Chien et al., [20]) says its a manufacturing mode designed to minimize the environmental impact in the manufacturing processes of products, and the adoption of green manufacturing helps to reduce waste and pollution.Green manufacturing is also sometimes referred to initiatives for efficient use of energy, materials with an aim for eliminating pollution and waste, hence Green Manufacturing can be also referred to as "clean technologies" (Baines etall, [64]; Chiang & Tseng, 2005; Mohanty & Deshmukh, 1998; Porter & van der Linde, 1995; Rusinko, 2007; Sangwan, 2006; Sarkis & Cordeiro, 2001; Seliger & Zettl, 2008; Vachon, 2007). Reduction or elimination of hazardous substances (Cd, Pb, PBBE etc), reduction in consumption of energy (standby and in operation), recyclability (disassembly, mono-

materials, pressfit, glue, welding), packaging mass (elimination of PVC, PU, EPS) are some of the techniques which can be employed for green manufacturing (Ramakrishnan, [56]).

6. Reverse logistics:

Beamon (1999) defined Reverse Logistics (RL) as the opposite of traditional or forward logistics (Krishna et al, [52]). Dowlatshahi (2000) and Carter and Ellram (1998) define reverse logistics as a process where a manufacturer accepts previously shipped products from the point for consumption for possible recycling and re-manufacturing. Heavy industries that have complex supply chains should take into consideration the benefits of reverse logistics (RL). Collection is the first stage in the recovery process. Products are selected, collected and transported to facilities for remanufacturing (Srivastava, [60]). Thierry (1995) explained that products came from different sources and should be brought to product recovery facility to begin the converging process. Further in a highly competitive industry reverse Logistics provides firm with cost and strategic advantage (Fortes, [39]). The effective use of reverse logistics can help a firm to compete in its industry especially when confronted with intense competition and low profit margins (Dowlatshahi, [27]).

7. Waste Management:

(Bellmann and Khare, 1999) explained waste management as means of best utilization of waste material in a profitable way. In process industries there will be some wastage of production along with actual production. Different waste management issues come into context particularly around recycling and remanufacturing. Green Manufacturing in automobile ancillary industry is not only keeping control greenhouse gases emissions across the entire producing value chain. Keeping a tab on carbon emissions in house helps to standardize and improve processes, provide single platform to manage environmental compliance, consistently supply emission data for carbon credits trading, and strategically contribute towards greener manufacturing. Recycling is one of the critical activity that finds its application in automobiles. The economic and regulatory factors are main factors that drive recycling. It is mainly performed to retrieve the material content of used and non-functioning products economically (Srivastava et al [42]). Other way company can handle waste is by employing Integrated Waste Management which can be defined as selection of suitable techniques, technologies and management programs to achieve waste management goals and objectives (Nemerow and Agardy, [51]).

Green operations relates to all aspects related to product manufacturing /remanufacturing, usage, handling, logistics and waste management once the design has been finalized (Srivastava,[60]). So it can be safely said the above explained aspects of Green Manufacturing, Reverse logistics, Waste management forms the part of Green Operations.

8. Relationship between EMS and Environmental Performance

EMS in the automotive industry maybe due to regulatory policy pressure, supply chain pressures. ISO 14001 is a well known EMS certification. Inspite of certifications like ISO 14001 there exist other investment costs and barriers (P. Gonza´lez et al, [62], Watson et al, 2004). Employing ISO 14001 is not a sure shot gurantee to get improved environmental performance. Some also describe it as “ceremonial” activity (Cary Coglianese[19]). Others have stated that some organizations implement ISO 14001 for the purpose of signaling to the market that they are

environmentally responsible organizations, even though the proof of actual improvements in environmental performance is tenuous (P. Gonza´lez et al [62]).

The above discussion in the literature review can be summed up with the help of a theoretical framework (Figure 1). The proposed framework is based on the similar lines of the SCOR Model (Supply Chain Operations Reference). Since the SCOR model version 10.0 does not take into consideration research and technology development, product development the need is felt to propose a new model. Table 3 lists the variables that are derived from the literature review.

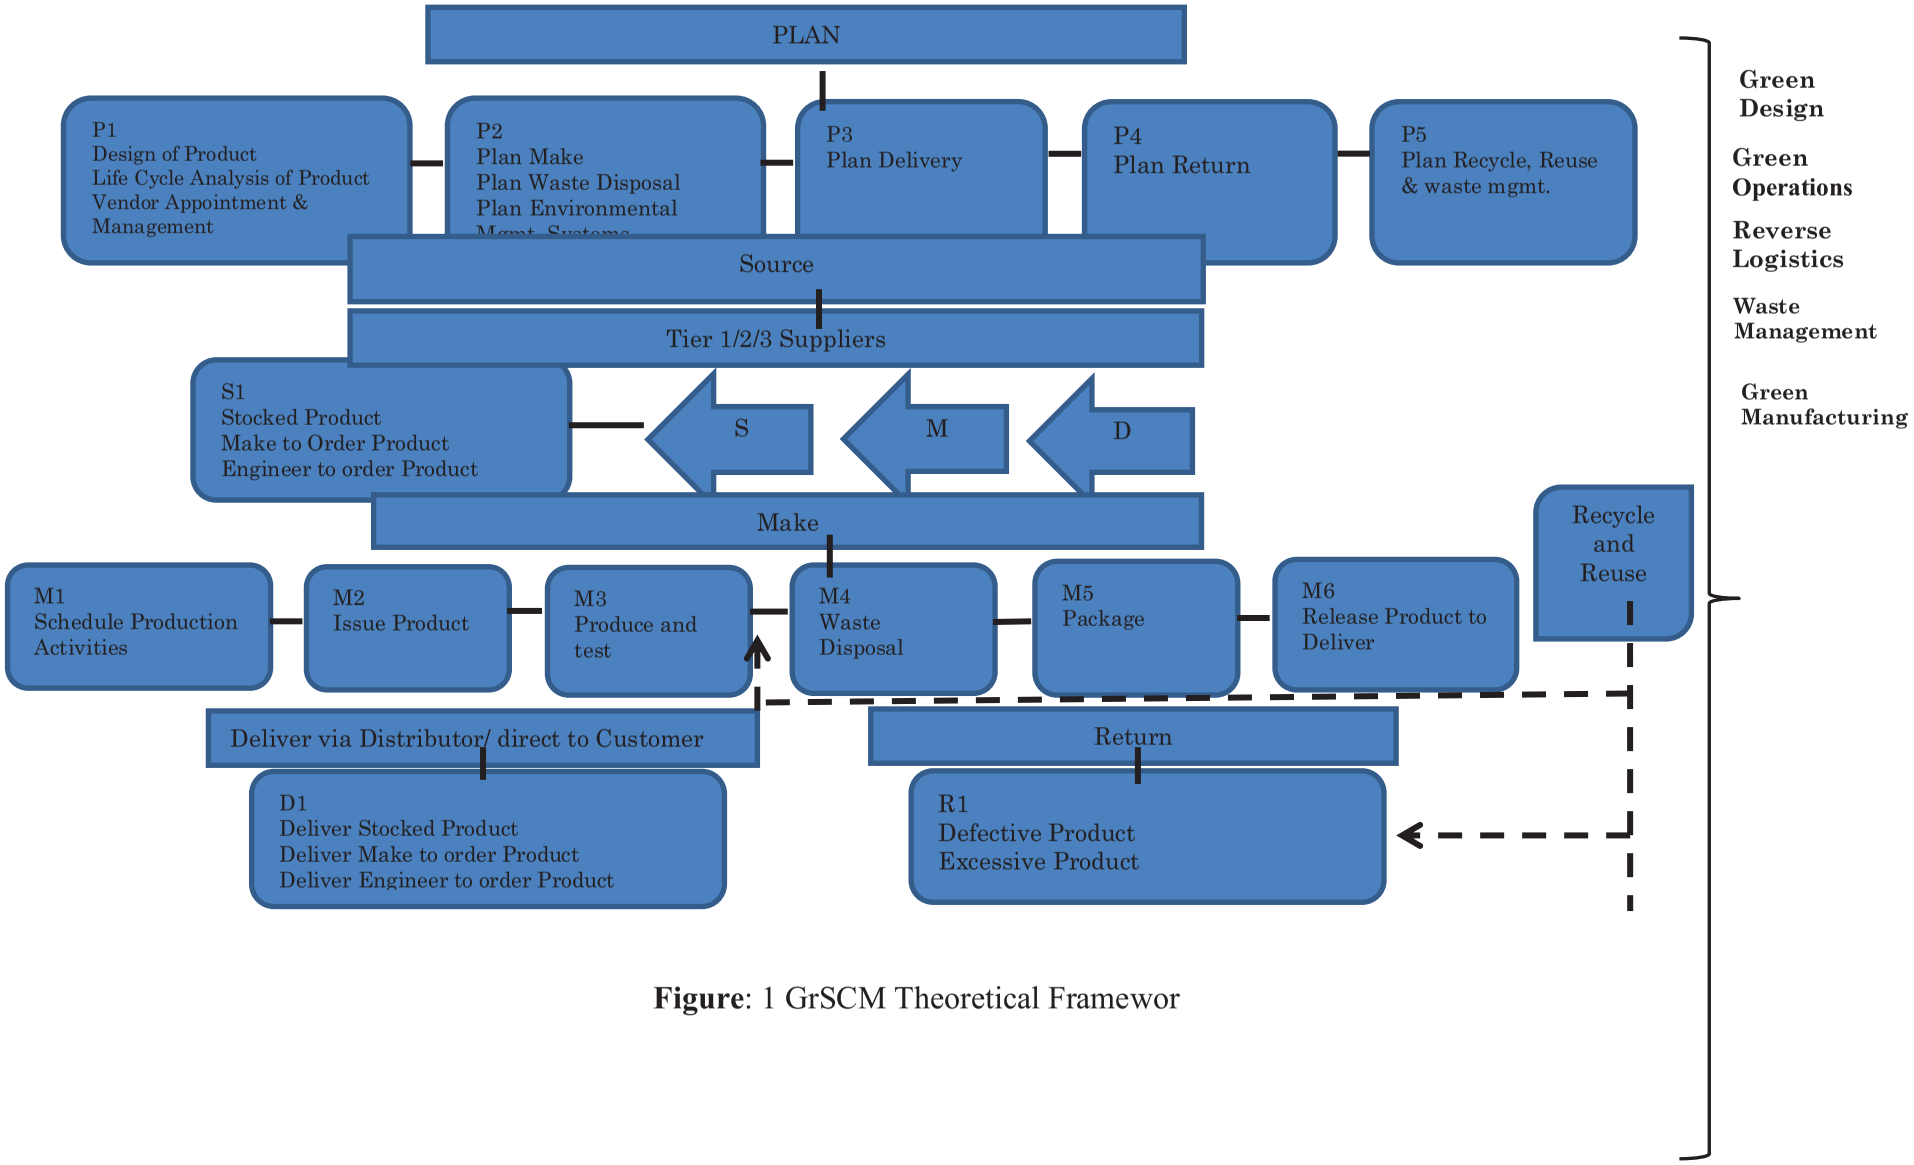

Figure: 1 GrSCM Theoretical Framewor

Table 3: Variable derived from the Literature Review

S.No	Author	Variables	Automobile related variables
1	Apratul Chandra Shukla, S.G. Deshmukh and Arun Kanda (2009);	1) Inbound Supply Chain Activities, 2) Outbound Supply Chain Activities, 3) Reverse Supply Chain Activities	All factors considered

Figure 2 identifies the unique variables which as part of the framework as derived from Table 3 could be used as a framework in sustaining GrSCM.

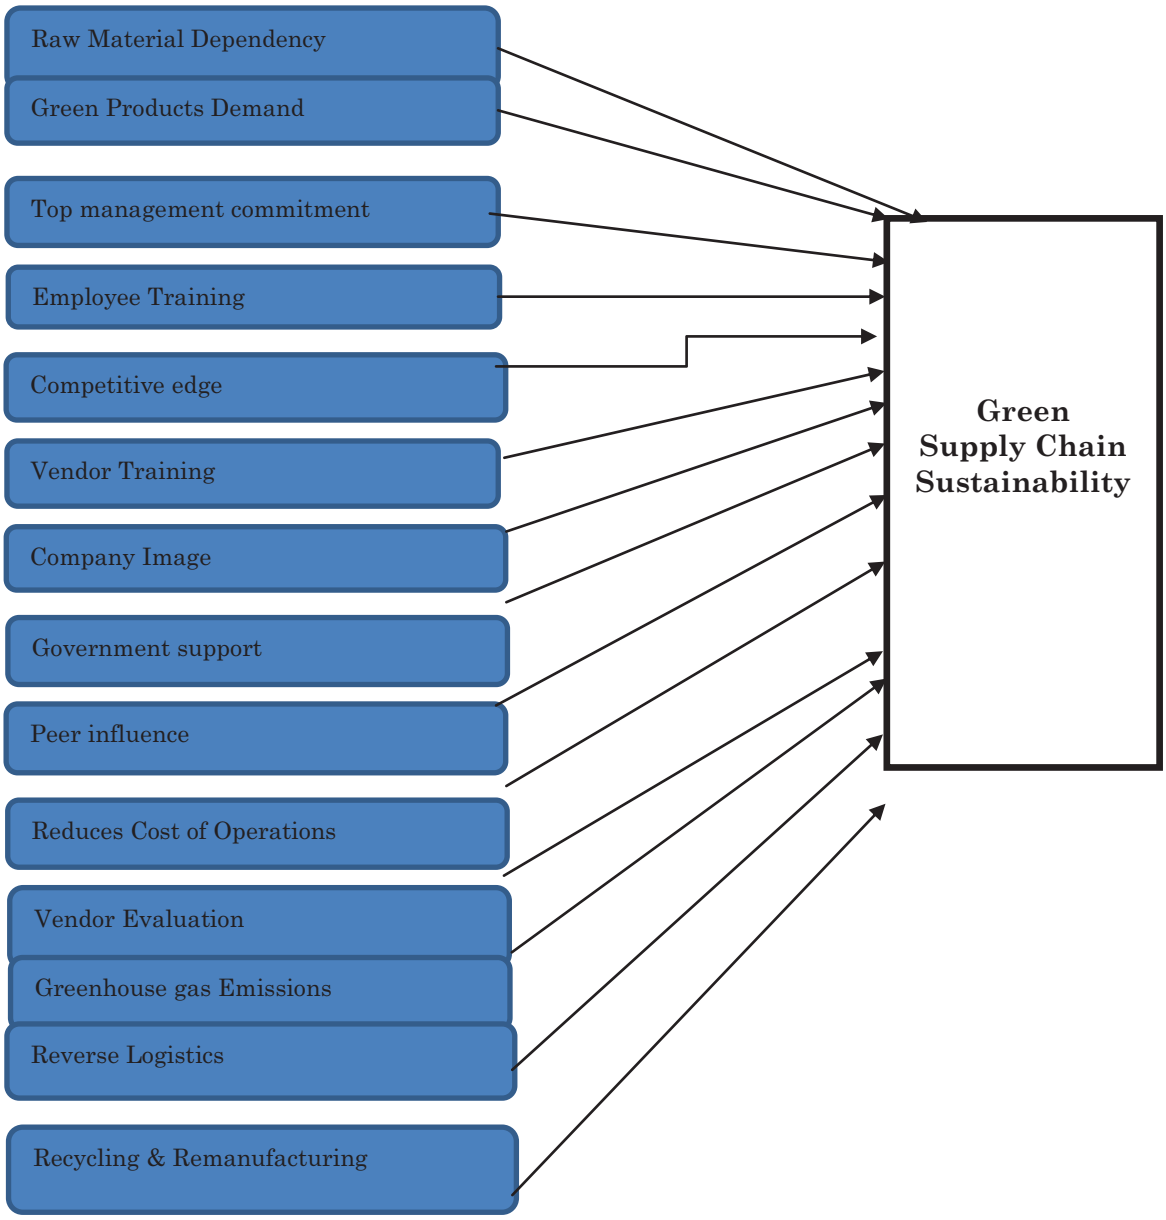

Figure 2: Unique variables for sustaining GrSCM.

CONCLUSIONS

The investigation 'What drivers are involved to sustain GrSCM for Automobile Companies in India?' has been carried out by a systematic review of GrSCM articles published in journals during 1990 – 2013. Eleven unique variables are identified for sustaining GrSCM. This include 1) GrSCM Awareness, 2) Raw material Dependency, 3) Green Products demand 4) Top management attitude towards initiate, appoint, train its employees and vendors 5) Impact on Competitive edge and Company Image, 6) Government support 7) Reduced Cost of Operation, 7) Peer influence, 8) Vendor Evaluation, 9) Greenhouse gas Emissions 10) Reverse Logistics, and 11) Recycling & Remanufacturing. From the Table 3, it can be concluded that these variables help build a

strategic framework for the drivers for implementing GrSCM in the Automobile industry. In the Indian context, to identify its validity and usability of all these variables is in progress by a survey questionnaire. The analysis of the result shall be updated by mid-April. 13.

ABSTRACT

This article will assess who are the users of public e-service are and what their traits include, and then will further discuss what the perceived key factors that encourage people to use the public e-service. Lastly, what are the main factors to sustain the user to use the public e-service will be addressed as well. There have been many studies focus on e-commerce; however, very limited discussion tries to explore the e-service provided by the public sectors. Understanding the user traits and perceived key factors of public e-service through academic research plays a crucial role when government agencies confront obstacles of promoting e-government development.

The main study area of this article will separate into two parts – "user traits" and "perceived key factors of public e-service." Although they do not come out frequently in relation to the Technology Acceptance Model, "user traits" is one of the major factors that affect people's service usage behavior. This article will take comprehensive perspective, from service marketing theory, Technology Acceptance Model, and public administration perspective to collect related user traits. As a result, this article will choose the following five critical user traits for this study: Technology Readiness; Technology Anxiety; Interpersonal Interaction Need; Tendency of Engaging in Public Affairs; and Risk Perception.

For the perceived key factors of public e-service, the following areas will be discussed:

Internet Speed, Security, User Interface, Reliability, and Consumer Response. Below is the literature review of user traits and perceived key factors of public e-service.

Keywords: E-commerce, Public E-Service, E-Government

INTRODUCTION

One of the most remarkable and dramatic changes of ICT usage in recent decades has been the explosion of interest in the Internet, with the phenomenon of e-commerce becoming, in just a few years, a principal growth area in the worldwide economy. As the use of the Web by the private sector has increased, the public sector has followed closely behind, with all developed countries and almost all developing countries now having their own websites providing services and/or promoting their policies in real-time. More and more government agencies are using websites or portals in the same way as the private sector.The digital or electronic government is a contemporary trend in the globe, and the public servants around the world are also adopting novel ways to leverage information and communication technology (ICT) to better serve their constituents (Marchionini et al., 2003).

As these websites have been seen as the first step toward e-government, they are rapidly becoming a new aspect of government. Many citizens now have a brand new experience of contacting their governments online to communicate their opinions on current issues, request or submit an application, or petition an Act.

On one hand, most e-government initiatives are aimed at improving the efficiency of public administration through ICTs. On the other hand, such initiatives are also looking at ways to govern the public in an interactive way. In other words, engaging citizens in public affairs has been treated as a serious pursuit by government agencies, and the existing relationship between government and citizens is changing from the traditional one. This is also called "e-governance," as it tries to reinforce the connection between public officials and communities, thereby leading to a stronger and more accountable and inclusive democracy.

Since the rapid development of public e-service, it is now common for service providers such as government agencies to encourage people to use their new public e-service. According to a research done by the Development and Evaluation Commission of Taiwan (2012), the percentage of people searched government policy or announcement through the internet has increased from 35.7% to 52.6% during the year 2010 to 2011. Comparatively, the percentage

of using online application (through public e-service) on governmental websites has only increased from 23.9% to 31.3% during the same year. It is then evident that the percentage of people using public e-service had not been promoted effectively. From the point of view of service providers, in order to enlarge the usage number, it is important to know who the users of public e-service are how to distribute their usage experience to achieve multiplier effects.

1. User Traits

1.1 Technology Readiness and Technology anxiety

The concept of Technology Readiness is brought by Parasuraman. It can be analyzed from people's mentality and their overall status for discovering whether this person have the tendency of using new technology. Generally speaking, people who used to internet environment should have basic knowledge of computer and network. It can be seen as one who has a competency perspective and problem-solving capability. However, technology readiness is more focusing on natural psychology level rather than the acquired ability of people.

According to Parasuraman, there are four dimensions of Technology Readiness which are optimism, innovativeness, discomfort and insecurity (Parasuraman and Colby, 2003). These are used to analyze people's motivation and inhibitions of using technology, but not competency. Optimism is to view technology and belief in a positive way while increases control, flexibility, and efficiency for people's lives. Innovation is a trend for becoming a pioneer of technology and thought. Discomfort means the feeling of being overwhelmed or perceived lack of control over technology. Insecurity is the attitude of distrust and doubtful of their own technology capability. According to above description, optimism and innovation can be seen as the motivation of using technology. On the other hand, discomfort and insecurity are the inhibitors of technology （Parasuraman and Colby, 2001）. Hence, people who like to adopt new technology usually have high motivation while having low inhibitors.

The other concept is technology anxiety which is highly related to technology readiness. According to Meuter (1994), the definition of Computer anxiety is "the fear and apprehension felt by an individual when considering the implications of utilizing computer technology or when actually using computer technology." Moreover, the technology anxiety is not only focused on above mentioned Computer anxiety, but also focused on a people's state of mind

when they are using all kind of technology related tools. In compare with Technology anxiety, Technology readiness is specially emphasized on people's willingness and capability of technology usage in opposite position.

In fact, the state of mind plays an important role of whether users would accept new technology or not. People who recognize that the efficiency of new technology, when the discomfort has occurred, they will still avoid using it（Fang and Hsu, 2005）. Apart from state of mind, the population statistics variable will affect technology anxiety as well. In the study of Lee et al. (2010), he took retail's self-checkout system as an example and indicated sex, age, and income will affect technology anxiety remarkably.

Technology Acceptance Model (Davis, 1989) explains the attitude of people using technology and their behavior, which is derived from their perceived performance to technology and perceived ease of use. In fact, these two factors can affect people's innovation of using technology or so-called technology readiness. Citrin et al. (2000) pointed out that innovation in specific individual area will have an interference effect to technology tools usage, such as internet or online shopping. Furthermore, Dabholkar and Bagozzi (2002) found that the characteristic of inherent novelty seeking will attenuate people's perceived performance toward using technology tools.

In addition, Dabholkar and Bagozzi (2002) used the terms of "self-efficacy" to explain people's attitude of using technology for self-services. In general, customers with greater self-efficacy will have more confidence in their capability of technology usage. In this case, high self-efficacy is similar to low technology anxiety. Yi and Hwang (2003) pointed out that self-efficacy can be divided into "application-specific self-efficacy" and "computer self-efficacy," which will have a positive effect on ease of use and actual use of the system respectively. Meuter et al. (2003) explained technology anxiety level will affect one's experience of using technology. The lower the technology anxiety is, the higher the satisfaction toward technology-based self-services.

To summarize, technology readiness and technology anxiety are both intrinsic factors which describe the state of mind of users in the process of using technology. In compare with other extrinsic factors such as information access, information ability, and information literacy, these intrinsic factors can explain why citizens have different percentage of internet usage in same country. In other words, given the same level of technology access, users'

intrinsic factors would have greater influence than extrinsic one.

1.2 The Need of Interpersonal Interaction

Service encounter has been seen as a major factor that affects consumers perceived the level of service quality. It has been defined broadly as a period of time during which a consumer directly interacts with a service, which means the interaction between customer and service delivery system including service employees, facilities, and other tangible factors (Bitner, 1990). Hence, a loyal customer derived from direct interaction (such as face to face contact) with service employees has played an important role in terms of service marketing.

Dabholkar（1996）used the term "need for interaction with a service employee" to explain the situation. It was defined as the importance of human interaction to the consumer in service encounters, and this interaction in a service delivery is very important to some consumers （Bateson, 1985）. In addition, under the circumstance of using self-service technology such as the ATM machine, some of the customers will avoid using it due to their tendency of needing interaction with service employees. Hence, tendency of interpersonal interaction need will affect customer's perceived ease of use attitude of using technology-based self-service（Dabholkar and Bagozzi, 2002）. Moreover, the need of interpersonal interaction will also related to some population statistic variables, such as sex and age. Generally speaking, female tend to use self-service technology with more interactive information, and at the same time looking for assistance from service employees（Burke, 2002）. As mentioned, customers with higher tendency of interpersonal interaction need, he or she will likely to avoid using any self-services machines. It is because they want to interact with employees directly. Hence, for those who with higher tendency interpersonal interaction need, providing a usage introduction of self-service machine by service employees can enhance customers' perceived of using service.

1.3 Tendency of Engaging in Public Affairs

Depending on the different research fields, tendency of engaging in public affairs (or so-call Civic engagement) has various definitions. It refers to the ways in which citizens participate in the life of a community in order to improve conditions for others or to help shape the community's future (Adler and Goggin, 2005). In "Bowling Alone," a famous book written by Putnam, he indicated that civic engagement is a basic foundation for building "Social

Capital". The form of civic engagement includes official and unofficial social activities. The former includes visiting friends, and playing poker with friends, while the latter is to engage in community service and political engagement (Putnam, 2001).

Regarding the interactive effect between technology usage and people's tendency of engaging in public affairs, it turns out to be an ambiguous relationship due to the limitation of methodology and observation of raw data（Norris, 2001）. The existing studies provide explanation of the relationship between two perspectives. One is Optimism and the other one is Pessimism or Skepticism. Norris (2001) indicated mobilization and reinforcement hypotheses based on skepticism. Mobilization hypotheses considered that the technology is able to encourage majority of people to involve in public affairs, whereas reinforcement one believed that technology will enlarge the digital divide because only those who have the power to access the information through technology will dominate the resource. As a result, Carpini's research (2000) also indicated that technology can increase the civic engagement for those who are interested in public affairs, or has involved in public affairs, however, to those who are not interested in public affairs, the technology is somehow useless or ineffective. In general, most of the researchers agree that technology causes the reinforcement effect rather than mobilization effect toward the civic engagement. For those who had already highly engaging in real world will enlarge their experience to virtual world with using technology. According to Norris's (2001) reinforcement hypotheses, people who have engaged in public affairs will tend to use public e-service and generate positive result.

1.4 Risk Perception

Risk perception is the subjective judgment that people make about the characteristics and severity of a risk. It referred to the feeling of uncertainty regarding possible negative consequences of using a product or service (Featherman and Pavlou, 2003). A formal definition is a combination of uncertainty plus seriousness of outcome involved and the expectation of losses associated with purchase and acts as an inhibitor to purchase or using behavior (cited from Featherman and Pavlou, 2003). In addition, risk perception can be viewed as a substitution behavior consequence（Featherman and Pavlou，2003）. For example, purchasing luxury can increase financial risk but reduce social risk. Under the background of public e-service or technology based self-service, there are many courses discussing about psycho-social and performance risk, as well as new subjects such as privacy risk（Featherman and Pavlou，2003）.

In addition, Dabholkar and Bagozzi（2002）referred social risk to explain the concept of "self-consciousness" in terms of using technology service. Self-consciousness will affect the outcome of perceived feeling. Their study pointed out an interesting result that if a person has higher self-consciousness, which is also higher social perceived risk, he or she will hesitate to use technology based self-service. In other word, high social perceived risk could be the reason that people are unwilling to use technology. The same result was also pointed out by Bateson's research (1985).

2. Perceived Key Factors of Public E-Service

2.1 Internet Speed, Security, and User Interface

Internet speed has been the major factor of whether the public e-service can be accepted by customers as a convenient tool. Since the rapid development of information and communication technology, Internet speed level is gradually increasing. However, whether faster Internet speed enhancing customers' willingness of public e-service usage remains as an unsolved issue. In fact, increasing Internet speed level does not mean that customers are willing to use the public e-service, the satisfaction toward Internet speed most depends on personal subjective feeling. Nevertheless, the interactive relationship between Internet speed and customers is an important issue for many scholars because few studies discussed the connection between Internet speed and customers' satisfaction (Fillion and Ekionea, 2010). In addition, it is important to construct a reliable research methodology for connecting Internet speed and customers' satisfaction effectively. According to the study of Fillion and Ekionea (2010), Internet speed plays a critical role in customer's satisfaction level. Moreover, Alpert (2008) had pointed out that Internet speed is the major factor that customers are willing to choose technology based self-service.

Security is a major factor that has great influence on customers' public e-service usage as well. Alpert (2008) indicated that the biggest reason of customers using self-service system is because they can have multiple ways to finish the transaction with high protection of privacy and easy to use. Among the reasons, privacy protection can be taken as one dimension of security. In general, although the level of security depends on which technology in used and the understanding toward technology, nevertheless; most of customers do not really want to spend too much time nor having required knowledge, such as fire wall or password verification setting (Rosada el at 2006). Hence, the only thing that customers concern in

terms of security issue is whether the public e-service provided full protection. In terms of the level or the type of protection is not in customers' consideration. Furthermore, customers' will ask public e-service providers take full responsibility of customers' security issue. If the public e-service providers failed customers' expectation, it will affect their satisfaction and willingness toward the service usage considerable.

Since the user interface is the first thing that customers encounter when using public e-service, it is another important perceived key factors of public e-service and also representing an critical intermediary role between customers and the service. Fjeld and Barendregt (2009) indicated that a good user interface should include high efficiency, high effectiveness, and high satisfaction. Zuehlke and Thiels (2008) have similar conclusion. In brief, a good user interface can encourage customers to use public e-service, and can bring higher effectiveness and feedback for the service. Furthermore, it will help to increase customer's willingness of public e-service usage as well.

2.2 Reliability and Respond

If public e-service's reliability cannot be validated by customers, they will reduce their willingness to use the service, and the service will be less likely to have high satisfaction indeed. No matter which service is purchased by customers, the reliability of service is always on the top of customers' list (Hensley and Utley 2011).In addition, Hensley and Utley (2011) pointed out with a technology tool that can increase service's reliability, and it can also enhance customers' understanding and usage tendency toward the service. Furthermore, it will strengthen the trustful relationship between customers and the service.

Consumer Response is another concept for discussing this issue.– The definition of consumer response is after customers using the service, they will give response accordingly. In addition, Pauwels (2004) pointed out the level of consumer response depends on products and the content of the service, and the major decisive factor that makes the difference is derived from the service providers. Hence, consumer response is an interactive relationship between service providers and services users, which whenever one's action will cause its counterpart to respond accordingly, and vice versa. Svensson (2002) mentioned the origin of the consumer response is designed as a research pattern which explains interaction between service providers and customers. Furthermore, a good consumer response can be viewed as customers accept the service and are willing to keep using the service.

Although there are many articles discussed about user traits and perceived key factors of public e-service, we still do not know whether these factors have anything to do with the public e-service usage. It would be useful for government's public e-service promotion if we can find out which perceived key factors plays more important role in the issue of public e-service usage. Furthermore, the research result will also help to increase the customers' willingness to use the public e-service, and to increase the satisfaction toward the service.

METHODOLOGY AND ANALYSIS

Based on literature review above, this study's research frame is as follow:

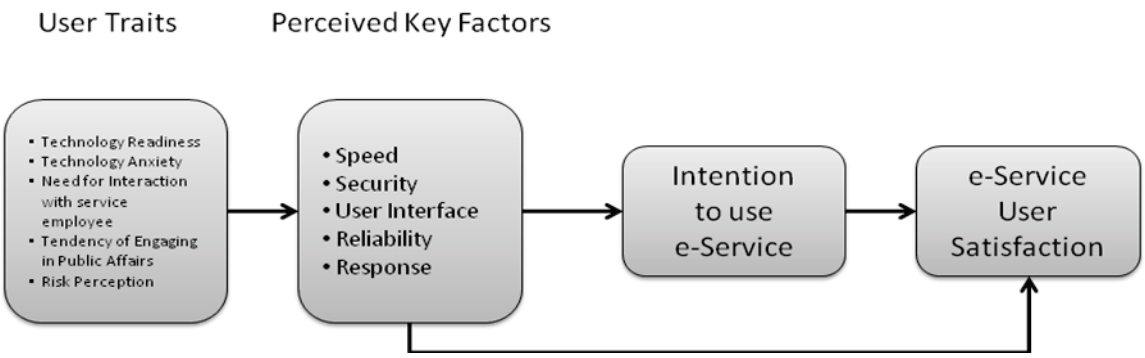

Figure 1 Research structure of the study

Many previous studies that have adopted a user-centric approach to e-government are concerned with how to provide a more convenient and continuous service to users from a system perspective. However, there is no research that explores the intrinsic characteristics and their effects on public e-services. This study tries to look into this important individual variance in terms of user traits in order to gain insight into the current user's profile, by discussing user traits and the perceived key factors of the e-service, and by examining the causality. Meanwhile, unlike previous studies that discuss from a single perspective, such as information system or service marketing, this study employs a multi-faceted analytical method by integrating different kinds of theories and perspectives. From a multi-faceted literature review, the major intrinsic determinants, such as computer self-efficacy, technology readiness, anxiety, risk perception, human contact and engagement experience, which might be influential toward the user's perceived key factors of a public e-service.

The relationship between user traits and perceived key factors has been discussed in the literature review section above. People with various characters will have different perceived

key factors toward public e-service and will have influence on the "intention to use" and user's "satisfaction". Taking technology anxiety as an example, personal character of technology anxiety will have great impact on the perceived key factors of public e-service, including Internet speed, security, user interface, reliability, and consumer response. In terms of the relationship between perceived key factors and "intention to use", it can be explained by the relationship between behavior and intention from the Technology Acceptance Model (TAM). Within TAM, the perceived usefulness and perceived ease of use has great impact on usage behavior. In this article, perceived key factors of internet speed, security, user interface, reliability, and consumer response has same effect on "intention to use" like perceived usefulness and perceived ease of use from TAM.

To verify the factors in this study, a survey was conducted by a statistic methodology called Partrial Least Squares (PLS), in order to analyze the data. The survey had been conducted for two weeks and the targeted respondents focused on the user who had used public e-service online. –We had collected 228 questionnaires while four of them were invalid so the total number of valid questionnaires is 224. The original questionnaire comes from past related article and its content is validity. Before acquiring raw data and conducting the PLS analysis, it should conduct factors analysis first for selecting the question properly. Because the original questionnaire contains over 60 questions, so it needs to take off some of the irrelevant questions for the research. –In addition, to avoid second-order problem, it have to have factor's score to represent the original factors or potential variable.– The original questionnaire include 62 questions, verify in 4 dimensions, and 15 factors. After the factor analysis, 25 questions was abandoned due to their scores was lower 0.7. –The remaining 37 questions are highly relevant to verify the dimensions, including Discomfort, Insecurity, and Innovation from technology readiness, technology anxiety, interpersonal interaction need, risk perception, and tendency of engaging in public affairs; security and consumer response of perceived key factors; public e-service intention to use and user's satisfaction.

In terms of the reliability and validity of this study, almost all dimensions' composite reliability is higher than standard 0.7 except technology readiness (0.679748) and perceived key factors of public e-service (0.665302). Regarding the validity, most of potential average variance extracted (AVE) is higher than 0.5, only technology readiness (0.424) is lower than the standard 0.5.The standard level of the whole model can be observed from communality. In general, all of the communality of the dimensions is higher than 0.3, which means the model constructed by this study is fit with the standard level.

After conducting the path analysis on all dimensions for understanding the relationship between each dimension, the result is showed in figure 2. According to the result we have, the user traits to the perceived key factors of public e-service, including interpersonal interaction need, technology anxiety, and risk perception, reaches significant level, and their path coefficients are 0.4987, 0.2838, and 0.2994. As the result, we can conclude that the user with higher interpersonal interaction need, technology anxiety, and risk perception will have higher perceived and need on security and consumer response of perceived key factors.

In addition, users' perceived key factors of public e-service is significant at "intention to use" （0.1396, $p<0.05$）.Meanwhile, users' perceived key factors of public e-service is significant at user satisfaction of public e-service（0.642, $p<0.01$）. In other word, selected two perceived key factors from this study, the security and consumer response, has impact on "intention to use" and "satisfaction" respectively. The two perceived key factors, security and consumer response, are highly influencing the satisfaction of usage in terms of e-service. It means the perceived key factors in this study are critical toward user's satisfaction. However, the relationship between perceived key factors and "intention to use" is relatively weak. "Intention to use" needs other antecedents to give more explanation power in this model. Taylor and Todd (1995) considered that other mediators like attitude, subjective norms and perceived behavior control should existed between perceived key factors and behavior intention, and the model is named "Combined TAM and TPB Model". Though this study did not mention these antecedents, it still offers a meaningful direction for the further research.

Finally, we can know from the path analysis that interpersonal interaction need and technology anxiety has significant indirect effect on "intention to use" and "satisfaction". In other word, interpersonal interaction need and technology anxiety in the model are two critical user traits. These two user traits will have considerable influence on the "intention to use" and "satisfaction" of public e-service.

Table1. Reliability and validity of this research

Dimensions	Composite Reliability	AVE	Communality
	>0.7	>0.5	>0.3
Technology Readiness	0.679748	0.424	0.424375
Technology Anxiety	0.933982	0.78	0.779854
Interpersonal Interaction Need	0.84625	0.651	0.650665
Risk Perception	0.927943	0.811	0.811482
Tendency of Engaging in Public Affairs	0.916177	0.785	0.785199
Perceived Key Factors	0.665302	0.5	0.5
Intention to Use	0.8783	0.644	0.643966
Satisfaction	0.92883	0.813	0.813182

Figure2 Result of Path Analysis

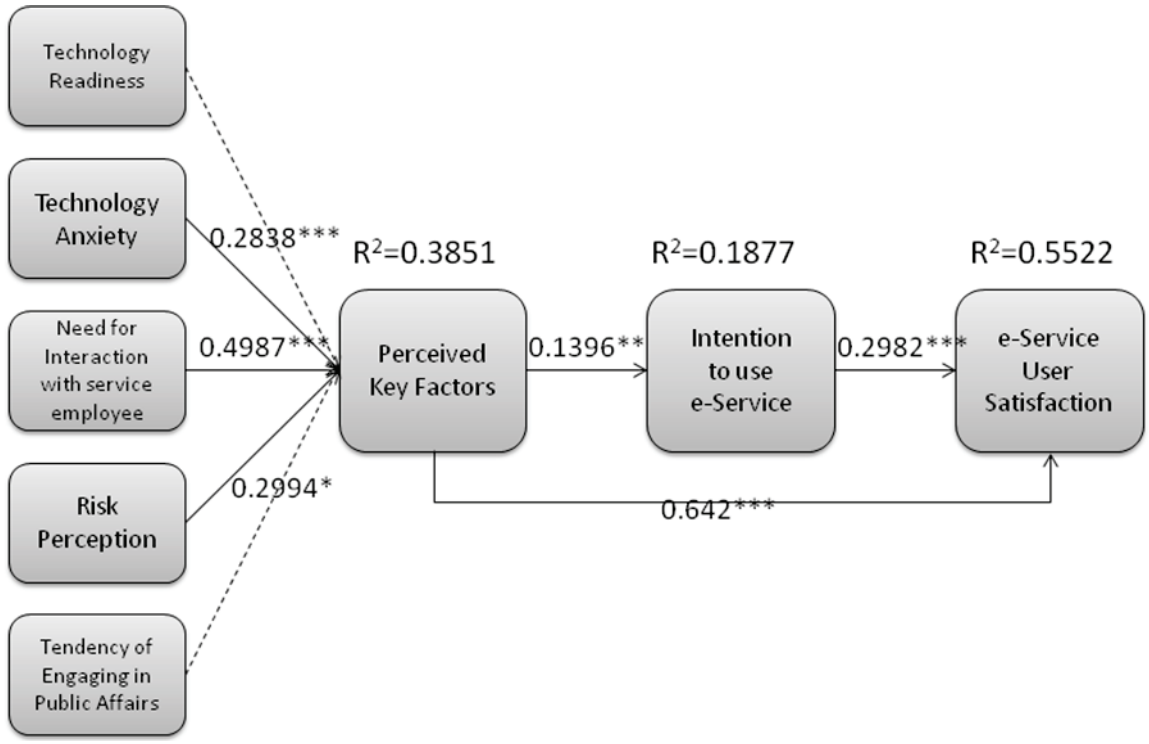

Table 2 Path analysis and statistics

Constructs	Perceive key factors of public e-service	Intention to use of public e-service		User's satisfaction of public e-service	
	Direct	Total	Direct	Total	Direct
Interpersonal interaction need	0.498741*** (8.922018)	0.069630* (1.555993)		0.498741*** (6.802200)	
Tendency of engaging in public affairs

Perceived key factors of public e-service			0.139611** (1.674042)	0.683614*** (15.915843)	0.641980*** (16.547857)

Notes: Values in parentheses are t values, *P<0.1, **P<0.05, ***P<0.01

CONCLUSION

From analysis result of the survey, we can find out the relationship between user traits and perceived key factors of public e-service are relevant, of which especially the technology anxiety, interpersonal interaction need, and risk perception are significant relevant. From the articles discussed technology anxiety, need for interaction with service employee, and risk perception, people may have intrinsic concern because for one thing customers don't understand the technology, another is because they used to interact with service employee directly, still another is because they feel about risk will come along with public e-service usage. All of these will result in low public e-service usage and affect their intention to use and user satisfaction. In addition, user traits are intrinsic factors of customers, and the starting point of deciding whether customers are willing to use public e-service. The starting point will affect extrinsic factors such as perceived key factors of public e-service, and will affect the usage willingness and the level of usage.

For those governments who provide public e-service, it is an important to consider user traits and perceived key factors while constructing public e-service and promoting the usage willingness. The government's public e-service usually doesn't have the image of good quality service.Hence, public e-service cannot have positive impact on government's public image and may produce obstacles on its policy promotion. From the point of view of policy marketing, because most of the services are taken as public good, hence it will not target customers like business marketing does (Snavely, 1991).Nevertheless, the government and other related departments still need to find out who are the users. Snavely (1991) indicated that the core of the policy marketing pattern is targeted customers which they are existed indeed. Through the analysis of this study, we can know who the users of public e-service are and what perceived key factors that they care the most, and use these research results to improve public e-service quality.

Public e-service is one of the most convenient tools of information communication.However, if the advantage of public e-service cannot be developed completely, there will be no actual outcome even with mass resource investment. If governments take user traits, including technology anxiety, interpersonal interaction need, and risk perception, and perceived key factors into consideration while providing public e-service, it will promote intention to use and user satisfaction effectively.

Understanding user traits will help us to know who are the targeted users firstly and start to plan marketing strategy of public e-service.According to Roger's (1995) diffusion of innovations theory, new technology will only be adopted by Innovators in the beginning, then spread their usage experience to other early adopters, early majority, later majority, and laggards. Hence, the promotion of public e-service needs to know who is its targeted users and defines them as innovators and through the distributing of innovators' usage experience to the public. We will have higher public e-service usage percentage effectively and efficiently.

RESEARCH RESTRICTION AND FUTURE RESEARCH DIRECTION

First, the respondents of the survey have the experience of public e-service usage in Taiwan and it was not restricted in any specific e-service area. However, due to the wide range of public e-service, it includes personal online application, information search, and governmental public procurement bid are all public e-service. In general, different services will have various perceived key factors and user traits. –It is a future task to conduct further study on specific public e-service for understanding the relationship of their user traits and perceived key factor.

Second, although this study is conducted through PLS analysis and it is possible to do further analysis of factors' relationship, the relationship among samples cannot provide any further analysis result.Because user traits are the key of this study as well, if adopted other statistics analysis, we can categorize those user traits and perceived key factors of public e-service. It will help the actual policy plan significantly. Moreover it is possible to use other research analysis with the existing raw data to have a more adequate analysis.

ABSTRACT

Purpose *– The purpose of this study is to investigate the relationships among green operations, green innovation, and environmental performance.*
Design/methodology/approach *– Data from 141 Taiwan high-tech manufacturers are collected. SEM analysis is employed to examine the relationships among green operations, green innovation, and environmental performance.*
Findings *– This study finds that Taiwan high-tech manufacturers perform various levels of green operations and, consequently, display different levels of effects on green innovation and environmental performance. In addition, positive relationships were found between green operations and green innovation and environmental performance (i.e. environmental operational performance, environmental managerial performance) and between green innovation and environmental performance.*
Practical implications *–By putting forward that the integrating of green operations and green innovation affects organizational environmental performance more positively than the sole impact of green operations on organizational environmental performance, this study has suggested manufacturers should pay more attention to develop related strategies to cope with customer demand, thus achieve better customer satisfaction and sustainable operation.*
Originality/value *– In the context that green issues are currently the novel theme for research and have attracted increasing attention from managers but there remains the lack of empirical studies among green operations, green innovation, and environmental performance, this study has contributed to the extant literature with the model combining these aspects. As such, the research findings have provided helpful academic references and managerial guidelines for firms in gaining competitive environmental performance.*

Keywords: Green Operations, Green Innovation, Environmental Performance
Paper type: Research paper

INTRODUCTION

The rapid economic growth worldwide and constantly changing advanced technologies have placed tremendous burderns on the earth's ecosystems and limited natural resources. In recent years, due to an increased environmental awareness and a goal of sustainable manufacturing, many national governments have introduced laws to reduce unnecessary environmental harm and to regulate green products, such as Waste Electrical and Electronic Equipment (WEEE) and the Restriction of Hazardous Substance (RoHS). Such these directives have strongly enforced manufacturers to focus more on green production or else lose their competitiveness. As a result, green operations have been increasingly attracting more attention and discussions worldwide. Concerning Taiwan context, since this country acts as one of the world largest export-oriented electronic OEM and ODE and has close relationships with the European Union (EU), the United States of America (USA), and Japan, environmental issues cannot be ignored due to their dramatic effects on indistries' financial performance. Hence, in order to achieve sustainable competitiveness and customer satisfaction and market leadership, Taiwanese manufacturers need to pay more attention to environmental legislation during manufacturing processes and the development of green operational models.

Green operational management refers to the close cooperatation between up-stream and down-stream manufacturers to reduce environmental damage and to use "green" as a prerequisite to extend Supply Chain Management (SCM) issues. In addition to the original emphases of SCM on cost, flexibility, speed, and quality, green operational management adds environmental criteria into raw-materials purchasing, packaging, design, manufacturing, reuse and recycling for achieving energy-conservation, emission-reduction and promoting overall environmental quality. It also takes a holistic operational model into practice and meets legislative requirements. The final goals will be improved environmental performance, increased product values, and environmental impact reduction.

Current industries worldwide are facing tremendous enforcement for the implementation of green concept into products and services, thus they have started to ask suppliers and customers to pay more attention to environmental issues. In this context, innovative product processes will effectively help solve operational and administrative burdens through reducing negative environment impact. A review on the extant literature shows that there have been numerous studies on SCM and organizational performance (Zhu and Sarkis, 2004; Hervani et al., 2005; Chien and Shih, 2007); simultaneously, green innovation has become one of critical research issues (Rao and Hult, 2005; Qi et al., 2010). Nonetheless, missing in literature is studies investigating whether the launching of green operations would affect green innovation and organizational environmental performance. Hence, this study aims at the impact of green operations on green innovation and organizational environmental performance. The achieved findings provide useful references for the industry and experts with green operations implementation and environmental protection.

LITERATURE REVIEWS AND RESEARCH HYPOTHESIS

1. Green Operations

Green operations have been lauded as an effective approach to enhance sustainability programs and to open up the distribution channel from manufacturers to suppliers (Cooper and Ellram, 1993; Van Weele, 2002). Recently, since firms worldwide have been strongly affected by shortened product life cycles and increasing amount of waste caused by the expansion of high-tech industries, firms have paid more attention to environmental protection and the search for effective GSCM (Geyer and Jackson, 2004; Hanna and Newman, 1995), aiming to better manage raw material purchasing, enhance product recycle, reuse, and remanufacture as well as economic green packaging, thus provides businesses with numerous opportunities to achieve more sustainable competitiveness and environmental damage reduction (Green et al., 1996; Narasimhan and Carter, 1998).

Green operations put environmental protection into the management system by taking "green" notions into the supply chain (Winn and Roome, 1993). Hence, through taking internal organizational practices and external relationships with suppliers into deeper consideration, green operations have been widely perceived to be closely associated with product design, raw material purchasing, product manufacturing, recycle control, and effective reduction of hazardous materials (Sarkis, 2003). In other words, green operations are an operational process from up-stream suppliers and manufacturers to down-stream customers by mutural cooperatation.

In the extant literature, the concept of green operations covers a wide range of aspects due to the existence of various GSCM practices. Due to the focus on exploring internal operationsal management process, this study defines this process as "green operations" (Zhang and Li, 2009). Frentzel and Sease (1996) refers to the ideal green operations is that each indurtry devotes to enhance cooperative relationships among employees through information sharing since this endeavor can expand green operations to the ultimate attainment.

To summarize, green operations include green design, green production, green marketing, and reverse logistics (Bhamra, 2004; Peattie, 1992; Hervani et al. 2005). Green design refers to the design of products that emphatically consider the environement impact of raw resources during the entire product life cycle through deeper focuses on product function, quality, and cost to proceed to superior quality. In other words, green design reviews product life cycle from sustainsuable angles and directly imports 3R (reduce, reuse, recycling) into the product development stage for reducing negative environmental impact (Gupta, 1995). Chen et al. (2006) regards green marketing as arousing industrial intuitive ability to reduce harmful environment factors and produce green product, to plan recycle, reuse, and renew system, establish environment-oriented and public welfare image. Drawing the blueprint of sustainable development pattern, green marketing can conduct consummers into green consumption mainstream, and promote industrial competitiveness. Fleischmann et al. (1997) defines reverse logistics as the process of transforming used products into re-usable products. Hervani et al. (2005) propose that reverse logistics differ from traditional logistics through condersidering cost and recycle value of products and components at the lowest cost to conduct the higest reuse

value.

2. Green Innovation

Green innovation is defined as organizations' implementation and introduction of new ideas, products and processes which contribute to environmental impact reduction or to specified eco-targets (Klemmer et al., 1999; Rennings, 2000; Chen, 2008; Oltra and Saint Jean, 2009). It is further involved with energy-saving, pollution prevention, waste recycling, green product designs, and corporate environmental management (Chen et al., 2006).

This study investigates environmental issues in Taiwan since Taiwanese firms have conducted green issues and most of them are OEM organizations, thus they have to meet the regulations from downstream customers. This study adopts the idea of Klemmer et al. (1999), Rennings (2000), Chen (2008), and Oltra and Saint Jean (2009) that green innovation is consisted of green product innovation, green process innovation, and green administrative innovation. Green product innovation is defined to be product innovation which is closely associated with environmental concerns (i.e. energy saving, pollution prevention, waste recycling, no toxicity, and green product designs) (Chen et al., 2006). In other words, green product innovation is viewed as a means of reducing environmental impacts during green products' entire life cycle by reducing toxics and materials used, controlling power consumption and emission release, and extending the use phase in term of recyclability (Kammerer, 2009). Green process innovation refers to the modification of the current operating processes and systems, aiming to produce new or significantly improved green products which can reduce environmental impact (Meeus and Edquist, 2006). Birkinshaw et al. (2008) refer green administrative innovations to the update of organizations' management practices using a new and eco method, thus leads to environmental impact reduction.

3. Environmental Operational Performance and Environmental Managerial Performance

According to ISO14030, orginizatinal environmental performance refers to a systematic procedure of measuring and assessing environmental performance on industry. Accordingly, ISO 14031 defines environemtal Environmental Performance Indicators (EPIs) to include Operational Performance Indicators (OPIs) and Management Performance Indicators (MPIs). Environmental operational performance reflects environmental performance on the process of operations, such as import raw material, engery, and service. It belongs to organizational facilities' hardware and design, install, operation, and maintance and the output during operational process (e.g. product, service, waste, emission (Papadopoulos and Giama, 2007). Environmental managerial performance reflects the efforts of management echelon on improving environmental operational performance. It benefits management efficiency evaluation and improving environmental performance dicesion-making and motivation (Chien and Shih, 2007). For instance, managerial performance and orginizational stratum policy, members, legislative activities, measures, procudures, decision can provide and improve the capabilities and efforts on business aspects, such as the modified measures of training, legislative demand, resource usage, environmental cost management, purchase, product R&D, and electronic-document which can affect environmental performance.

In sum, in this study, organizational environmental performance is reffered to as performance assessment focusing on environment. Hence, this study adopts Papadopoulos and Giama (2007) and Chien and Shih (2007)'s ideas to divide environmental performance into environmental operational performance and environmental managerial performance. Environmental operational performance refers to measure performance of energy and resource usage, reduce air, water, toxic waste, CO_2 emission. Environmental managerial performance points to measure improving the relationship between manufacturers and communities, and promoting industrial image.

4. Hypotheses Development

4.1 Green Operations and Green Innovation

Shrivastava (1995) points out the integration of enivironmental protection concepts into design build up the concepts for green product design, which in turn reinforences green product innovation. The main aim of green product innovation is to minimize environmental harm through green production. In support, Marcus (2007) indicates that firms' engagement in green production and green marketing will positivily affect their green manufacturing innovation and green administrative innovation. Concerning green administration innovation, Winn and Roome (1993) propose that of industry should expand this concept to the whole supply chain management and throughout green marketing to promote industrial green image and administrative innovation. As such, green marketing will bring about greater demands to customers; that is to say, green marketing has a positive impact on green product innovation (Belz and Bilharz, 2005).

In response to environmental pressures, industries need to implement green marketing to better reinforence green administrative innovation and promptly solve environmental protection problems. It is also noted that green marketing positively reinforces green administrative innovation (Newman and Breeden, 1992; Peattie, 1992; Marcus, 2007). As a result, this study establishes the first hypothesis as follows:

H1 - Green operations have a positive impact on green innovation.

4.2 Green Innovation and Environmental Performance

Porter (1991) proposes that pressures from regulation, cost reduction, and the need for environmental operational performance improvement have strongly enforced industries to develop green innovation through green product innovation, green manufacturing innovation, and green adminnistrive innovation. In addition to meet the requirement of regulation, it can reduce cost and improve. In addition, Geffen and Rothenberg (2000) point out that green product innovation, green manufacturing innovation, and green administrative innovation are the main sources of improving enivornmental operational performance. Specifically, green product innovation helps firm meet regulation requirements, promote effective resource application and industrial image (Rosa and Pierpaolo, 2010) as well as reduce different environmental problems during product life cycle through minimizing toxic material and electric comsumption (Kammerer, 2009). In other words, green product innovation has a positive impact on

environmental operational performance on each stage throughout product life cyle. In addition, green manufacturing innovation has been widely perceived as an effective means for firms in improving environmental operational performance through cleaner production, green manufacturing processes, and waste reduction (Klassen and McLaughlin, 1996), thus facilitate firms to achieve unique competitiveness and promote environmental operational performance (Edeltraud and Lilly, 2006). In line with this, Tao (2009) claims that green manufacturing innovation effectively decreases gas emission and increases energy utility rate in petrochemistry industry. Finally, Chen et al. (2006) and Shrivastava (1995) address green administrative development as a tool to help firms increase competitive benefits, reduce cost, enhance product and manufacturing innovation, increase industrial image, and promote environmental managerial performance. It is also noted that green managerial innovation positively influences envrironmental managerial performance (Kim and Srivastava, 1998). Therefore, this study proposes the following hypotheses:

H2 - Green innovation has a positive impact on environmental operational performance.

H3 - Green innovation has a positive impact on environmental managerial performance.

4.3 Green Operations and Environmental Performance

Steger (1993) propose that green operations can help firms save cost, increase market opportunity, promote usable resource efficiency, and prevent pollution which would benefits industry with better regulation compliance, higher employee motivation and effective organization, lower risk and environmental responsibility and information flow distribution. Schoell and Guiltinan (1993) indicate green marketing enhances organizational environmental image. Taylor (1992) suggests that green environmental management emphizes the adoption of positive and active attitude in order to better response to possible problems during marketing processes. It has been also widely perceived that industries which implement green environmental management and green innovation can efficiently promote environmental operational performance, reduce cost, achieve more effective environmental protection that help firms avoid the expense of environmental dispute, environmental accident, environmental ban, and the loss from customer boycott (Taylor, 1992). Moreover, Ken and Martin (2007) address that green marketing mainly focuses on minimizing negative environmental impact throughout product life cycle, implying its positive impact on environmental operational performance.

The main purpose of green operations is to manufacture green products that are closely associated to practices of renew, recycling, reuse, and resuseable disposal in the end of product life. That is to say, green products can facilitate the reduction of materials, waste, and pollution emission as well as the enhancement of resource application. Chien and Shih (2007) find that green production positively influences environmental operational and managerial performance. Tsoulfas and Pappis (2006) address that the reuse of materials can considerably save internal cost, exploit new market, and achieve competitive advantage. Theyel (2001) and Rao and Holt (2005) propose that once taking green recycle and reuse into practice, industries can effectively save material, water, and energy, thus improve oginizational environmental performance. As a result, this study establishes the following hypotheses:

H4 - Green operations have a positive impact on environmental operational performance.

H5 - Green operations have a positive impact on environmental managerial performance.

Figure 1 shows the research framework that illustrates the relationships among the green operations, green innovation, and environmental performance.

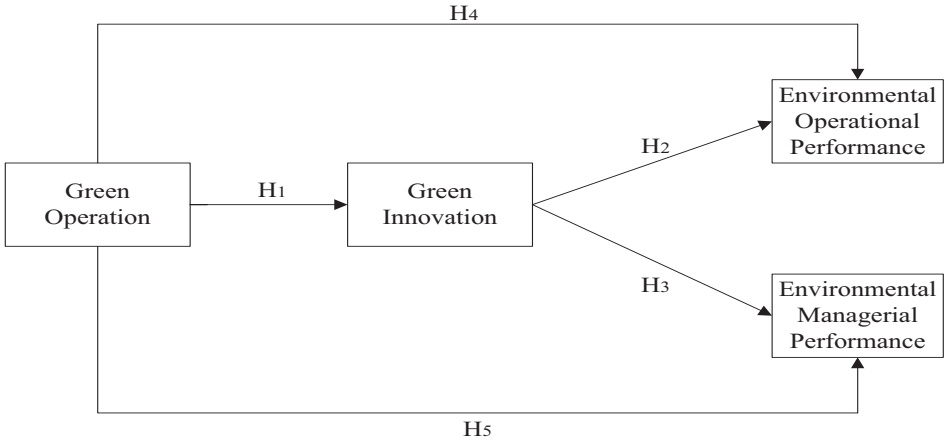

Figure 1 Conceptural Framework

RESEARCH METHODOLOGY

1. Pre-test and Questionnaires Development

The questionnaire consisted of four sections: (1) Green operations: reducing environmental impacts and testing top manager's and employee's eco-friendly concepts; (2) Green innovation: minimizing environmental pollution in SCM process compared with competitors; (3) Environmental operational performance; and (4) Environmental managerial performance. The items were modified based on pre-test interviews with five managers from the semi-conductor and computer related industries experts mentioned. Following the procedure recommended by Churchill (1979), the pre-test interviews indicated that questionnaire was appropriate to test the mediating effect of green innovation on green operations and environmental performance. A five-point Likert scale (1- "totally disagree" to 5- "totally agree") was used to measure items for green operations, green innovation, and environmental performance.

2. Data Collection

The population for this study was managers from the semi-conductor, information communication technology, and computer-related industries in Taiwan. Taiwan was chosen as the main research scope since this country is one of the major hi-tech original equipment manufacturers (OEMs) worldwide and environmental issues are currently perceived as greatly important to the above industries (Russo and Fouts, 1997). Questionnaires were sent to 587 general managers from the list of "Largest 5000 Corporations in the ranking of Taiwan". 141 valid responses were obtained from 150 received questionnaires, indicating a valid response rate of 24%.

3. Reliability and Validity Analysis

This study used SPSS12.0 and AMOS18.0 to analyze the data. For each latent construct, reliability and validity were assessed based on two-step procedure with sturctural equation modeling (SEM) approach which includes measurement model and structural model (Anderson and Gerbing, 1988). The results show that the factor loading coefficients were above 0.5, which fit the benchmark of 0.5 (Hair et al., 2010), and the SMC value were between 0.324 and 0.797, which are above the benchmark of 0.2 (Bentler and Wu, 1993), and the Cronbach's α coeefficients were between 0.812 to 0.859, which are above the benchmark of 0.7 (Nunnally, 1978). Hence, the achieved results suggest a high interna consistency, thus confirming reliability of each contruct. The AVE values were all above 0.5, indicating high convergent validity of the measurement indicators (Hair et al., 2010). This study also followed the ideas of Gaski and Nevin (1985) which are the coefficient between two latent constructs of Cronbach's α smaller than 1 and the square root of AVE are larger by paring two latent constructs suggested by Fornell and Larcker (1981). The statistic results fit the above suggestions, supporting discriminant validity.

Table 1 Correlation of Latent Variables

Variables	Green Operations	Green Innovation	Environmental operational performance	Environmental managerial performance	Composite reliability	AVE
Green Operations	.736				.904	.542
Green Innovation	.548**	.712			.858	.507
Environmental operational performance	.549**	.624**	.730		.820	.533
Environmental managerial performance	.441**	.555**	.633**	.766	.850	.586
Cronbach's α	.838	.812	.848	.859

STATISTICAL RESULTS

1. Evaluation of Rival Models

Hair et al. (2010) suggest utilizing rival models to verify the optimal hypothesis model, and then perform individual path coefficient test to confirm hypotheses. From previous liuterature, this study designs four rival models, as shown in Figure 2. The Model 1 (i.e. the completely mediated model) explored the mediating impact of green innovation in between green operations and environmental performance. Model 2 was partially mediated model which explored the impact of

green operations on green innovation; meanwhile, the paths related to environmental operational performance and environmental managerial performance were ignored. Model 3 examined the impact of green innovation on environmental operational performance and environmental managerial performance while the path related green operations were ignored. Model 4 presented the direct impact of green operations on environmental operational performance and environmental managerial performance whereas all indirect impact on path was ignored. Hypothetical model was a partially mediated model containing the impact of green operations on environmental operational performance and environmental managerial performance through the mediators of green innovation and the direct impact of green operations on environmental operational performance and environmental managerial performance. Table 2 shows the fit statics of rival model comparison. After the comparison between the path analyses of models 1-4, the hypothetical model was found to fit well with the data, indicating that green innovation should be added in between green operations and environmental operational performance and environmental managetial performance.

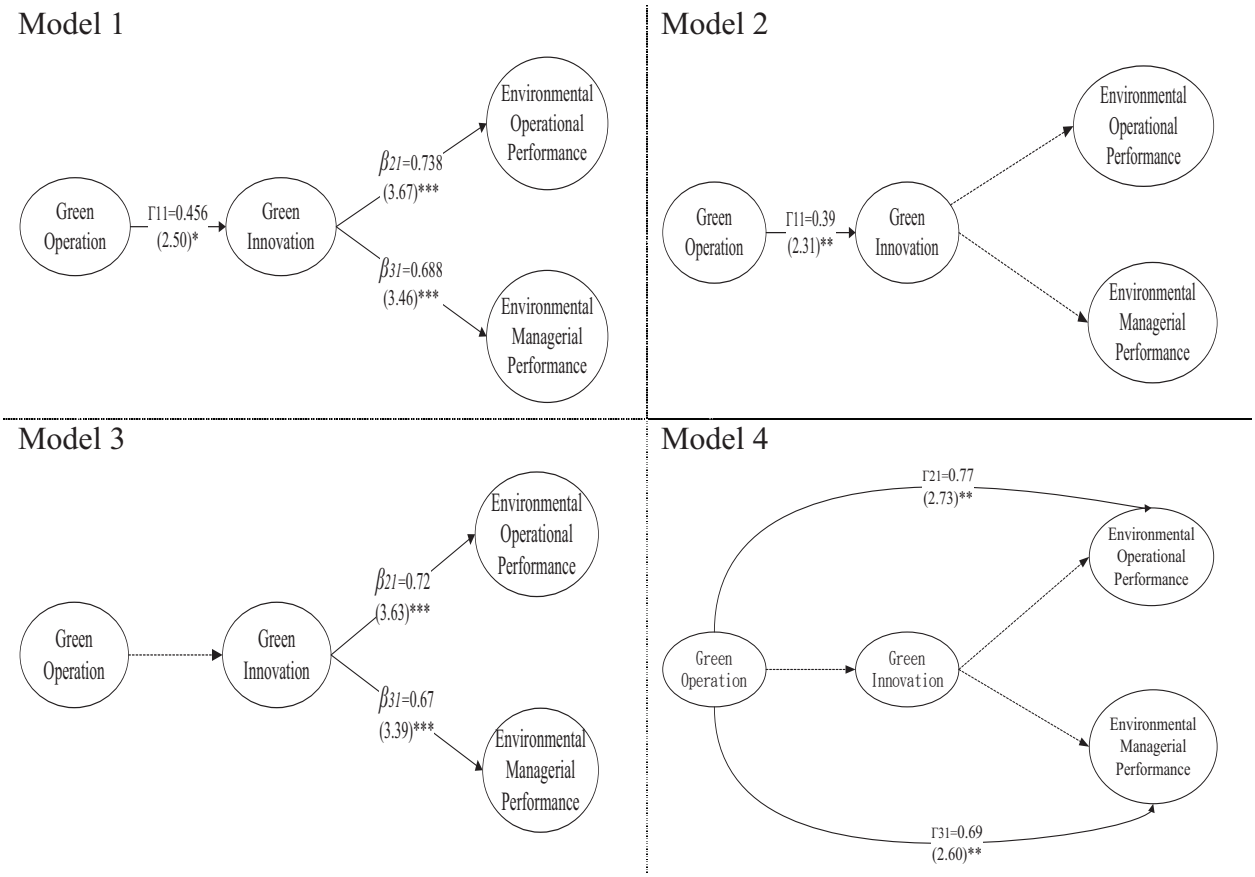

Figure 2 Rival Models

2. Overall Model Fit

This study adopted the idea of Hair et al. (2010) to choose absolute fit measures, incremental fit measures, and parsimonious fit measures to test the model fit. Absolute fit measures were to

measure overall goodness-of-fit for both the structural and measurement models collectively. Table 2 showed the achieved values for absolute fit measures respectively were x^2/df=1.24, GFI=0.865, AGFI=0.833, RMR=0.020, and RMSEA=0.042, indicating goodness-of-fit results. Incremental fit measures refered to measure goodness-of-fit that compares the current model to a specified independence nmodel to determine the degree of improvement over the null model. In Table 2, the obtained values for incremental fit measures respectively were NFI=0.702, IFI=0.924, TLI=0.910, and CFI=0.920. NFI was lower than the standardize value 0.9. Parsimonious fit measures refered to measure goodness fit representing the degree of model fit per estimated coefficient. The statistcs results of parsimonious fit measures were PNFI=0.620 and PGFI=0.698 , indicating the overall good model fit.

Table 2 Rival Model Comparison

Fit indicators	Model 1	Model 2	Model 3	Model 4	Hypothetical model	Limiting value	Fit result
Absolute Fit Measures							
x^2/df	1.25	1.69	1.317	1.565	1.24	1-5	Yes
GFI	.863	.816	.858	.836	.865	>.8	Yes
AGFI	.832	.776	.827	.799	.833	>.8	Yes
RMR	.029	.043	.032	.040	.020	<.05	Yes
RMSEA	.042	.071	.048	.64	.042	<.05	Yes
Incremental Fit Measures							
NFI	.672	.550	.652	.587	.702	>.9	No
IFI	.911	.748	.886	.797	.924	>.9	Yes
TLI（NNFI）	.896	.708	.868	.764	.910	>.9	Yes
CFI	.907	.737	.881	.789	.920	>.9	Yes
Parsimonious Fit Measures							
PNFI	.599	.495	.585	.526	.620	>.5	Yes

Figure 3 Hypothetical Structural Model

3. Empirical Result of Hypothetical Structural Model

The SEM approach was applied to test the causal relationship between lantent variables. Figure 3 shows the path analysis of hypothesized structural model. The statistics results show that green operations have positively impact on green innovation (γ11= 0.40, t = 2.27, p<0.05), green innovation has positively impact on environmental operational performance (β_{21}=0.55, t = 3.36, p<0.001), green innovation has positively influence on environmental managerial performance (β31=0.51, t= 3.39, p<0.001), green operations have positively impact on environmental operational performance (γ21=0.37, t= 2.11, p<0.05), and green operations have positively influence on environmental managerial performance (γ31 =0.33, t = 2.03, p<0.05).

Previous literature mainly explores the impact of green operations on environmental performance and the corelations among green innovation, environmental operational performance, and environmental managerial performance. However, there has been a lack of inverstigations on the mediating influence among the dimensions, which is the interest of this paper. The statistical results of all structural paths strongly supported proposed hypotheses, as shown in Table 3.

First, the hypothesis H1 is strongly supported, stating that green operations have a positive impact on green innovation. Hence, it can be confirmed that the more practice on green operations, the more high-tech firms can accelerate green innovation, which in turn helps acheive energy-saving goals, improve productive technology, enhance waste product reuse, and obtain more comtetitive advantages.

This study support hypotheses H2 and H3 that green innovation has positivily impact on environmental performance (i.e operational management, manegerial performance). Hence, through deeply considering product designs for easy recycle and reuse, emission disposal, and adjusting devision of authority, the high-tech industry can not only better save water and engry but also improve internal administration and information delivery as well as ensure industrial substantial safety.

The finding support H4 and H5 that green operations have positivily impact on environmental performance (i.e. operational management, menegerial performance). Through designing new products to reduce product life cycle impact, supervisors and employees implement emvironmental issues in daily operational and manufacturing activities to use adjusted environmental products to establish waste and material categorization systems and to practice long-term green philosophy. Simultaneously, the manufa tured green products can substantially assist firms in reducing air pollution, ing greenhouse gap emission, diminishing cost, and increasing production output.

Finally, this study aims to explore the mediating effect of green innovation on green operations and environmental performance. The empirical results show that green operations implementation can effectiveily improve environmental operational performance and environmental managerial performance through green innovation strengthening. Hence, it is suggested that green design through using improved environmental products and reusing waste

materials, green processes through effectively minimizing toxic emission and reducing waste, and green administration through falicitating internal information delivery and supporting the adoption of new environmental policies have all effectively benefit environmental performance by reducing environmental pollution, industrial safety accidents, and scarced water and engry consumption.

Table 3 Path Coeffieient and Hypothesis Testing

Hypotheses	Path coefficient	*T* value	Results
H_1 Green operations→ Green innovation	.40	2.27*	Supported
H_2 Green innovation→ Environmental operational performance	.55	3.36***	Supported
H_3 Green innovation→Environmental managerial performance	.51	3.39***	Supported
H_4 Green operations→ Environmental operational performance	.37	2.11*	Supported
H_5 Green operations→ Environmental managerial performance	.33	2.03*	Supported

CONCLUSION AND IMPLICATION

The current study mainly explores the whether the application of green operation model in high-tech industry would affect organizational environmental performance through green innovation. Through verifying the hypothetical models, this empirical study have successfully clarified the relationship between all variables and in turn addressed all research questions. The results show that the import of green operation model positively affects green innovation. In other words, the more practicable green operational model will definitely lead to the more promotional green innovation. This finding strongly supports previous studies that green operational model has a positive impact on green innovation (Winn and Roome, 1993; Ottman, 1999; Marcus, 2007). Second, this study confirms that the strengthening of green innovation will positivily affect environmtnal operational performance, hence implying that manufacturers should emphatically stimulate green innovation in order to obtain better environmental operational performance. This finding is consistent with previous research that green innovation positivily affects environmental operational performance (Geffen and Rothenberg, 2000; Rosa and Pierpaolo, 2010). Third, the achieved results suggest that the enhancement of green innovation will positivily affect environmental managerial performance, which support the extant literature (Shrivastava, 1995). Forth, better green operations are proposed to positivily affect environmtnal operational performance, which is in line with previous studies (Theyel, 2001; Chien and Shih, 2007). Finally, this study finds that better implementation of green operations can effectively improve environmental managerial performance, confirming the results obtained in previous research (Chien and Shih, 2007; Chen, 2008).

With achieved relationships among green operations, green innovation, environmental operational performance, and environmental managerial performance, this study provided several useful contributions and academic implications. Firstly, in the context that green issues are currently the novel theme for research and have attracted increasing attention from managers but there remains the lack of empirical studies among green operations, green innovation, and

environmental performance, this study has contributed to the extant literature with the model combining these aspects. Second, by putting forward that the integrating of green operations and green innovation affects organizational environmental performance more positively than the sole impact of green operations on organizational environmental performance, this study has suggested manufacturers should pay more attention to develop related strategies to better cope with customer demand, thus acehive better customer satisfaction and sutainable operation. As such, the research findings have provided helpful academic references and managerial guidelines for firms in gaining competitive environmental performance.

It is noted that nurmous industries currently set their goals on benefits regardless environmental protection, which in turn causes serious demange on environment. This study finds that green operations have a direct and positive impact on green innovation. In other words, once importing green operation model, high-tech industries will gain more benefits in propoting green innovation. Green innovation capability enhancement, in turn, facilitates the industries in skipping over the competition of Red Ocean, creating their own competitiveness, reducing environmental demange, and obtaining more benefits as well as the win-win situation between industry and environment. Moreover, this study also finds that green operations have a direct and positive impact on environmental performance through green innovation, implying that green innovation is a critical factor of promoting environmental performance in high-tech industry. Therefore, in the context that public is currently paying more attention to environmental issues in industries, once firms attempt to improve green innovation, they would definitely achive greater benefits on eco-environment and more positive industry image, thus result in better organizational operational performance and organizational managerial performance, indicating a triple-win aspects among industry, publics, and environment.

Despite the above contributions, this study remains several limitations. Due to sample restriction, future studies are encouraged to expand the sampling subjects to different industries (e.g. food industry, logistics). Since many questionnaire items regarding green operations, green innovation, and organizational performance possibly cause respondents to lose patience, further assessment for items is recommended. It is also suggested that data should be collected using vertical section and time-series methods and to explore the interations among variables in different time situation for deeply observing variations and seeking more valid results. Finally, in addition to understand the impact of different factors and results, comparative analyses may be effective to seek for reliable empirical study.

ABSTRACT

Purpose: *This study describes the sources of essential knowledge for the innovation cases in three micro companies and analyses the knowledge dynamics in these cases. This study seeks to answer the following questions: What are the sources of essential knowledge for the innovation cases in the three micro companies selected? What kind of knowledge is required in these cases, and what phases can be identified in these innovation cases? These questions are answered through a multiple case study that uses the knowledge biography technique.*
Method: *This is a multiple case study with holistic strategy. The unit of analysis is the innovation case. We analyse innovation cases in three micro companies operating in the Oulu South region. At the heart of the study is the knowledge biography technique, an innovative approach that provides a deeper understanding of knowledge dynamics in firms and regions. The empirical data was gathered through semi-structured interviews and public archives related to the case company. The interviews with key informants were mainly conducted face-to-face during fieldwork in 2013. The data was analysed using an inclusive and iterative process, and the main findings were summarised.*
Findings: *We tracked the sources of essential knowledge for the three innovation cases and the knowledge dynamics of these cases were described by using the knowledge biography method. This study will serve as an interesting benchmarking tool for any public organisation that offers business services to companies. The findings suggest that public actors should pay more attention to the case-specific needs of innovative micro companies while developing their services.*
Value: *In the future studies, it would be interesting to analyse more innovation cases using the knowledge biography technique and make comparisons among these cases.*

Category: Case study

INTRODUCTION

Knowledge is generally connected to innovation. In fact, changes in knowledge can be seen as the driving force behind innovation, and the general product/innovation lifecycle can be divided into generic phases, stages or states in multiple ways (e.g. Dean, 1950, Golder and Tellis, 2004, Markusen et al., 1986, Schutjens and Stam, 2003). This study aims to describe

the sources of knowledge that are essential for the innovation cases in three micro-companies located in Oulu South region and analyse the knowledge dynamics in these cases.

The Oulu South region is situated in the southern part of Northern Ostrobothnia in Finland. This region is not a governmental unit or area but was formed to increase inter-municipal cooperation and development and to gain the required critical mass to ensure national and international competitiveness. The region comprises three subregions and 14 municipalities, with approximately 90,000 inhabitants and 4,600 active companies. Oulu South is one of Finland's main rural areas; however, because it offers sufficient employment to its inhabitants, it is known as the 'industrialised countryside'. Furthermore, although the unemployment rate in this region is the lowest in northern Finland, it is likely to retain a large proportion of its younger population because it has the highest birth rate in Finland, despite the demographic challenge of widespread emigration from the region. This distinguishes the Oulu South region from other rural areas in Finland, many of which are dealing with significantly ageing populations.

In this study, we investigate three innovation cases in micro companies located in the Oulu South region:

Case 1. Development of a vertical lifting fabric fold-up outer door.
Case 2. Development of a method to process and convert the ash generated by power plants to end-of-waste products.
Case 3. Development of an internet application for electricity price comparison and contract rating.

This study focuses on the knowledge dynamics of these three innovation cases to garner a better understanding of how knowledge is developed and transferred at a firm level. The aim of studying knowledge dynamics is to unravel the processes of knowledge interactions and to identify the types of actors that are involved in these processes. Therefore, we defined the following research questions:

1. What are the sources of knowledge that are essential for the three innovation cases?
2. What kind of knowledge is required and what phases can be identified in the three innovation cases?

To address these research questions, multiple case studies were conducted. This was deemed the optimum approach for the purposes of our study. According to Yin (1989, p. 23), 'a case study is an empirical inquiry that investigates a contemporary phenomenon within its real-life context, when the boundaries between phenomenon and context are not evident and in which multiple sources of evidence are used'. An essential part of this study was to conduct in-depth interviews with the key informants of each innovation case. Because this study deals with interactions among actors and particularly aims to evaluate knowledge exchange and development, this was deemed the best way to obtain considerable information regarding these processes. The information obtained through the interviews was analysed by predominantly using the knowledge biography technique.

This study may enable public actors to ask essential questions for developing their services for micro companies, thereby fostering regional development and economic growth. According to Crevoisier and Jeannerat (2009, p. 1228), those regions that are capable of imagining their local activities within a global environment are categorized as innovative

regions. To be innovative, a region must be capable of matching its dynamics to the generation and utilization of knowledge.

This study is made up of five sections. In the introduction, the background, motivation, research problem and research questions are presented. In the second section, the theoretical background of the study is presented, and a brief survey of the relevant knowledge dynamics, types and phases is conducted. In the third section, the method undertaken in this study is described. In the fourth section, a description and analysis of the data garnered in case studies are undertaken; these findings are then examined in light of the research questions. In the final section, a discussion of the main results and opportunities for further research is presented.

KNOWLEDGE DYNAMICS

Knowledge is widely regarded as a useful economic resource. In this context, it has been defined as the learning process in human brains, which is generated and used in personal and collective interactions in various contexts and uses given individual and firm competences to appropriate new and necessary economically useful knowledge (Dahlström and Hedin, 2010, p. 6). Therefore, knowledge is seen as both a resource and a process, both of which are linked to the interactions that occur among actors in the concept of knowledge dynamics. According to Strambach (2008, p. 154), the visible results of knowledge dynamics are innovations in products, services or processes. Knowledge dynamics can be understood as the dynamics that emerge from the processes of creation, usage, transformation, movement and diffusion of knowledge. Knowledge is not static; rather, it is constantly changing and dependent on context and application.

For the purposes of this empirical case study, analytical, synthetic and symbolic knowledge were considered most relevant. Analytical knowledge is defined as research-based knowledge, which is developed through scientific exploration. Synthetic knowledge is considered a combination of analytical and (perhaps) symbolic knowledge. Engineering knowledge is a good example of synthetic knowledge, because it is derived from application and scientific research. Symbolic knowledge is largely recognised in research on cultural or creative industries. It deals with ideas, symbols and socially constructed commodities. It has been referred to as the knowledge about representation (Asheim and Coenen, 2006, Strambach, 2008).

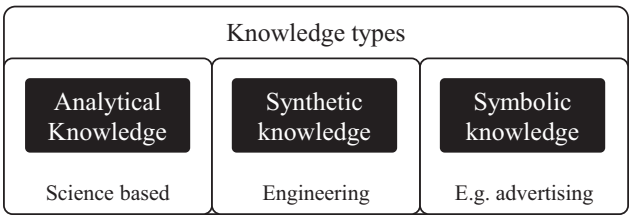

Figure 1. Types of knowledge

Knowledge phases seldom progress linearly. Usually, development progresses in such a way that various phases occur at the same time. In fact, there may even be loops between these phases. To understand the complexity of knowledge dynamics as a part of the process of innovation, the following three knowledge phases are examined in this study: exploration, examination and exploitation.

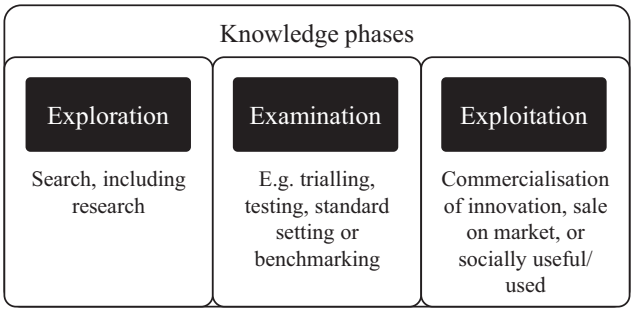

Figure 2. Knowledge phases

The exploration phase is often described as the first step in the knowledge chain. This phase usually involves searching for new knowledge or maintaining and developing existing knowledge. Examination is a testing phase in which the veracity and applicability of the knowledge is considered. Exploitation is regarded as a 'selling' and 'using' phase in which knowledge is applied to a situation in return for financial, status, position or recognition gains (Halkier et al., 2010, Strambach, 2008).

METHODOLOGY

We used a multiple case study with holistic strategy. The case study followed the process presented in Figure 1.

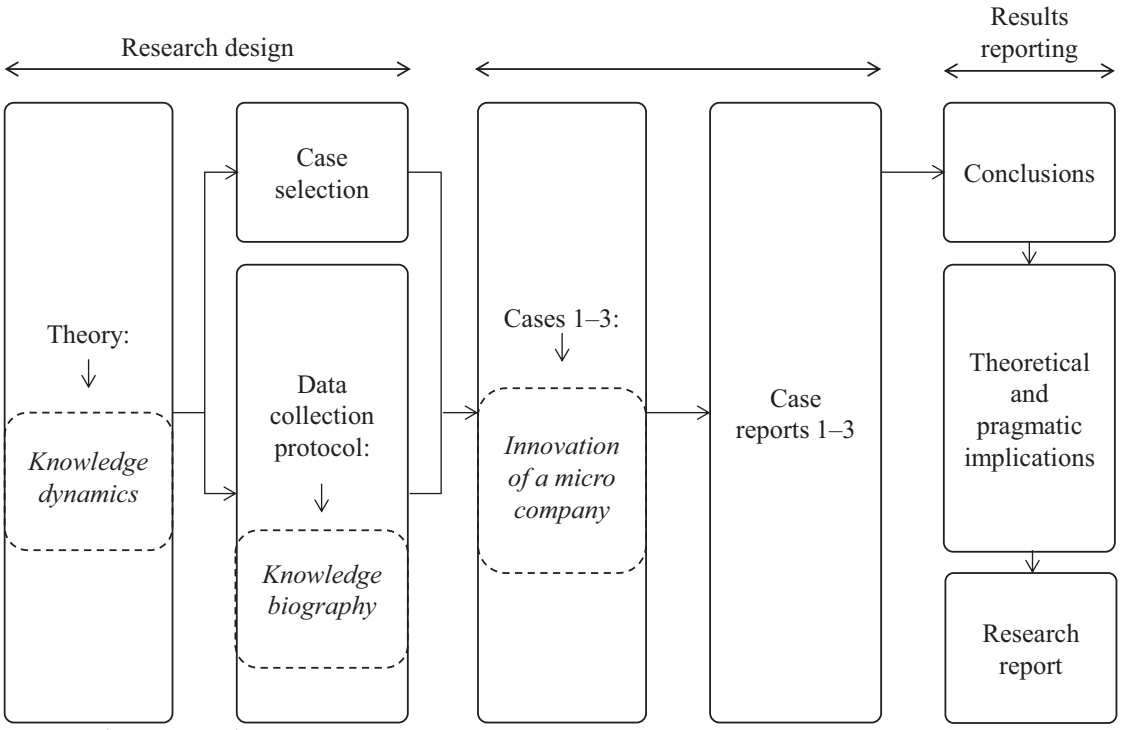

Figure 3. The research process

The study analysed the process of innovation cases in three micro companies. The definition of a micro company (and SME) is different in different contexts. The US context, for example, offers many definitions of SME, depending on the industry. For example, in some industries, an SME is defined as any company having fewer than 500 employees. In the European context, an SME is defined as any company having fewer than 250 employees. The

same disparity applies to micro companies and should be taken into account when studying the SME-related literature. Ayyagari et al. (2007) cover this topic in their globally focused, statistical study on SMEs (p. 416): 'The term SME covers a wide range of definitions and measures, varying from country to country and varying between sources reporting SME statistics. Some of the commonly used criteria are the number of employees, total net assets, sales, and investment level. However, the most common basis for definition is employment, and here again, there is variation in defining the upper and lower size limit of an SME. Despite this variance, a large number of sources define an SME to have a cut-off of 250 employees'. Because of the European context of this case study, we utilise the European definition. Within the SME category, the European Union defines medium-sized firms as having 50-249 employees, small firms as having 10-49 employees and micro-firms as having 0-9 employees (Storey, 2003).

In this study, the empirical data was gathered through semi-structured interviews and public archives related to each company in question. Most of the interviews with key informants were conducted face-to-face during fieldwork. The questionnaires were designed to obtain information from the informants on various questions including the following: How did the innovation process develop from idea to product? What important knowledge interactions occurred during the development of the product? Who were the main actors involved in the development process? Where were they located? What type of knowledge did they contribute to the process? What core knowledge was involved in the genesis and development of this innovation? How did the core knowledge of the innovation arise and how was it developed?

The knowledge biography technique—an innovative approach that provides a deeper understanding of knowledge dynamics in firms and regions—was used as the main technique for interpreting and analysing the data. The essential sources of knowledge for each innovation case were tracked, and interviews were used to obtain basic information regarding the time and space dimensions of the knowledge dynamics that occurred as a part of the cases. The knowledge biography technique permitted us to capture the diversity of the social environment of each firm to determine the precise manner in which knowledge was transmitted and information was exchanged from various partners inside and outside the firm (Dahlström and Hedin, 2010, p. 11).

CASE STUDIES

In this section, we describe the essential knowledge sources for the three innovation cases and analyse the knowledge dynamics in these cases. Moreover, the detailed knowledge biography of each innovation case is presented.

The three innovation cases analysed in this study are as follows:
Case 1. Development of a vertical lifting fabric fold-up outer door.
Case 2. Development of a method to process and convert the ash generated by power plants to end-of-waste products.
Case 3. Development of an internet application for electricity price comparison and contract rating.

Case 1

Innovation case 1 is the development of a vertical lifting fabric fold-up outer door. Based on the data obtained from the interviews, three innovation phases were identified:
1. First version, 1993–1998
2. Product development, 1999–2004
3. Marketing and internationalisation, 2005–

Figure 4 illustrates the innovation phases and key knowledge interactions among the actors in case 1. The owner of the innovation remained the same (i.e. company 1) during the development process.

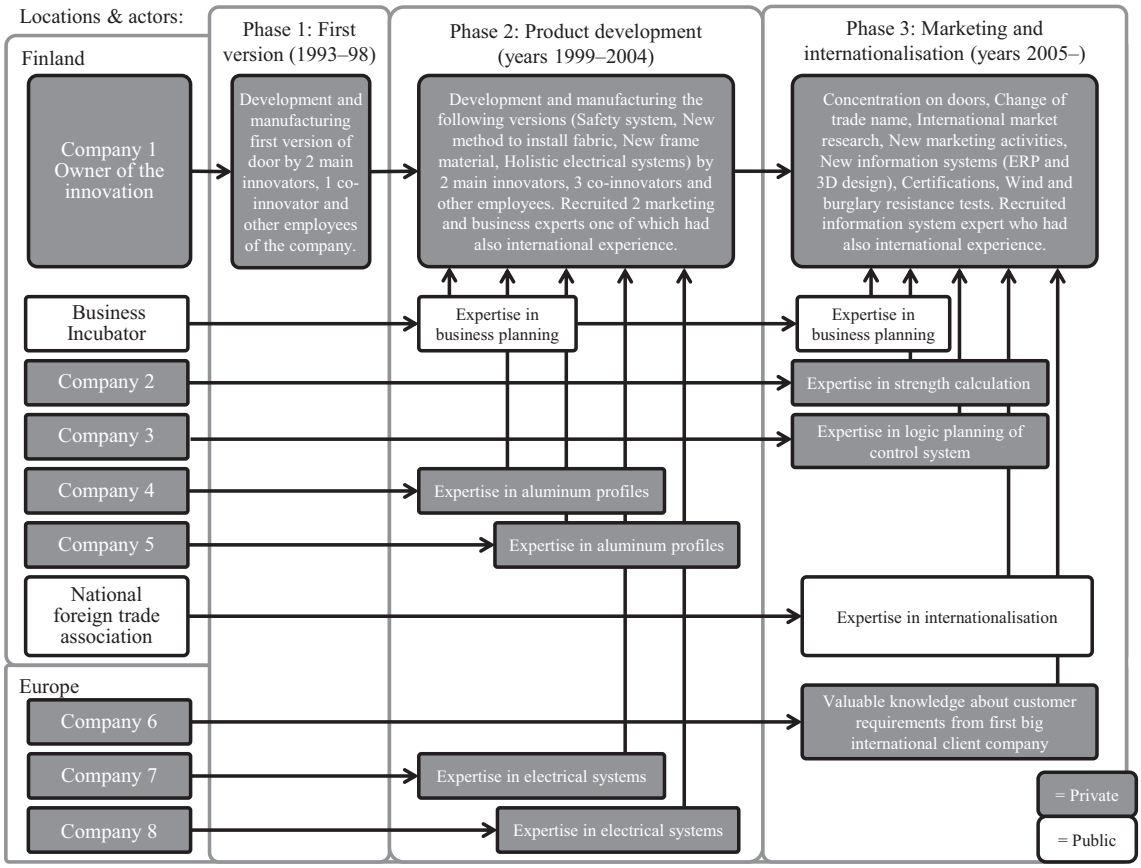

Figure 4. Knowledge biography of innovation case 1

The idea was based on the following question posed by one customer in 1993: 'Could you make us an outer door with a basic structure that is similar to your indoor divider wall?' Two main innovators made a plan for modifying the divider wall to outer door. Subsequently, the first version of outer door was manufactured and sold to the customer in 1993. The entire planning and manufacturing process was completed by the staff of company 1 in phase 1.

The employees of company 1, who had considerable experience in manufacturing tailor-made sunblinds, sunshades and divider walls, contributed the most important knowledge to the development process. In phase 2, the expertise of several external experts was introduced to the process. In phase 3, internationalisation expertise was introduced to the development process by a public organisation and knowledge regarding customer requirements was introduced to process by the first big international client company***Case 2***

Innovation case 2 is the development of a processing method for ash from power plants. Based on the data obtained from the interviews, three innovation phases were identified:
1. Ideation, 2002–2008
2. Product development and marketing, 2009–2011
3. Commercialisation, 2012–

Figure 5 illustrates the innovation phases and key knowledge interactions among the actors in case 2. Two individuals (i.e. the main innovators) were the owners of the innovation in phase 1. Subsequently, the company (i.e. company 1), which was founded in 2009 by the main innovators, was the owners of the innovation.

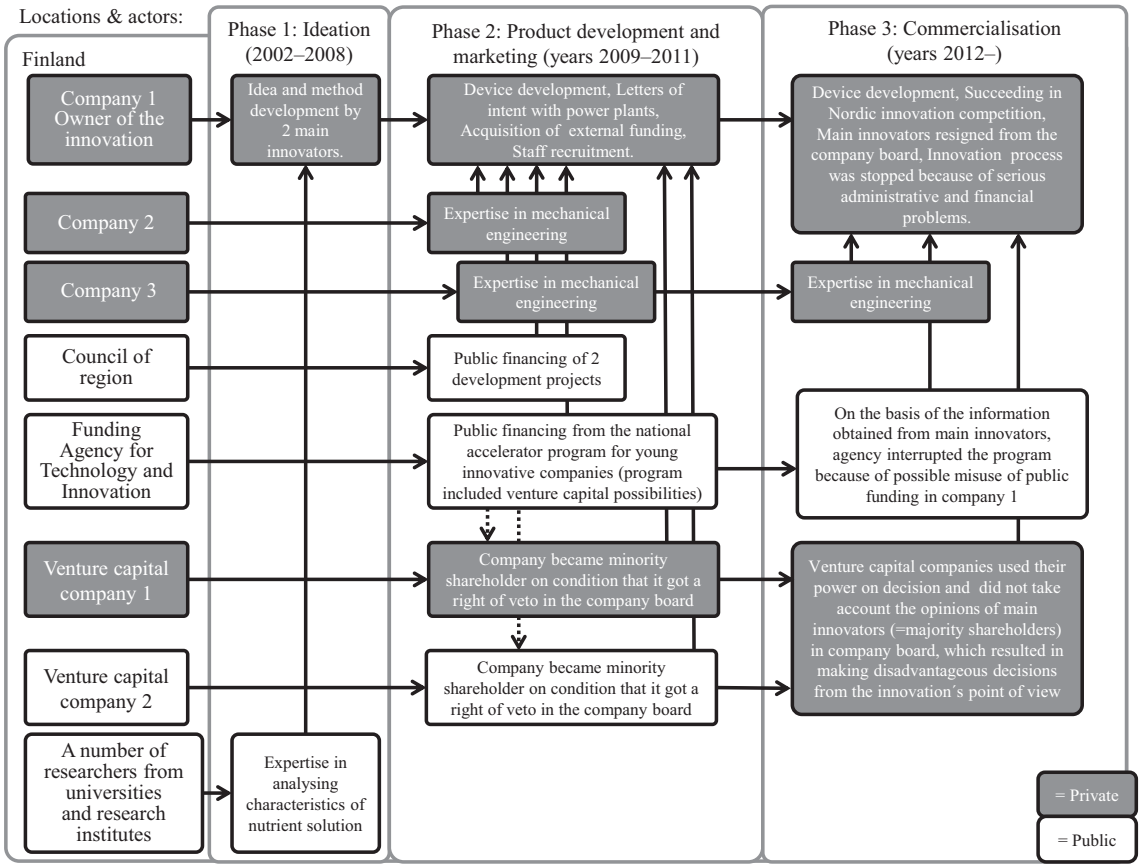

Figure 5. Knowledge biography of innovation case 2

The innovation idea was based on a research that was initiated in the 1960s on the utilisation of ash in forest fertilization by one of the main innovators. In 2002, he asked the other main innovator to help him commercialise the nutrient solution, which he had been successful in separating from ash. The other main innovator immediately noticed the business possibilities associated with possessing expertise in ash processing. Subsequently, the main innovators independently began developing the method of ash processing in phase 1. The objective was to create a method and device that enables the processing and conversion of ash to end-of-waste products. The Ash generated by power plants is classified as waste, which causes significant waste handling costs for power plants.

The most important knowledge was introduced in the development process by the two main innovators, one of whom had significant working experience in the research sector. The other

main innovator had considerable and varied experience in business, development and planning. He had a many-sided education and had also made 15 patented inventions. External experts mainly participated in the process in phase 2 when the construction of the device was in progress. Public actors participated to the process mainly by financing the development of the method and device. In this case, the influence of the venture capital companies was especially noteworthy. The venture capital companies displaced the main innovators from the operational decision-making in the board of the company 1, which caused serious administrative and financial problems and at the end the failure of the entire development process.

Case 3

Innovation case 1 is the development of an internet application for electricity price comparison and contract rating. Based on the data obtained from the interviews, three innovation phases were identified:
1. Ideation, 2007–2009
2. Product development, 2010–2012
3. Commercialisation, 2013–

Figure 6 illustrates the innovation phases and key knowledge interactions among the actors in case 3. One individual (i.e. main innovator) was the owner of the innovation in phase 1. Subsequently, the company (i.e. company 1), which was founded in 2010 by the main innovator, was the owner of the innovation.

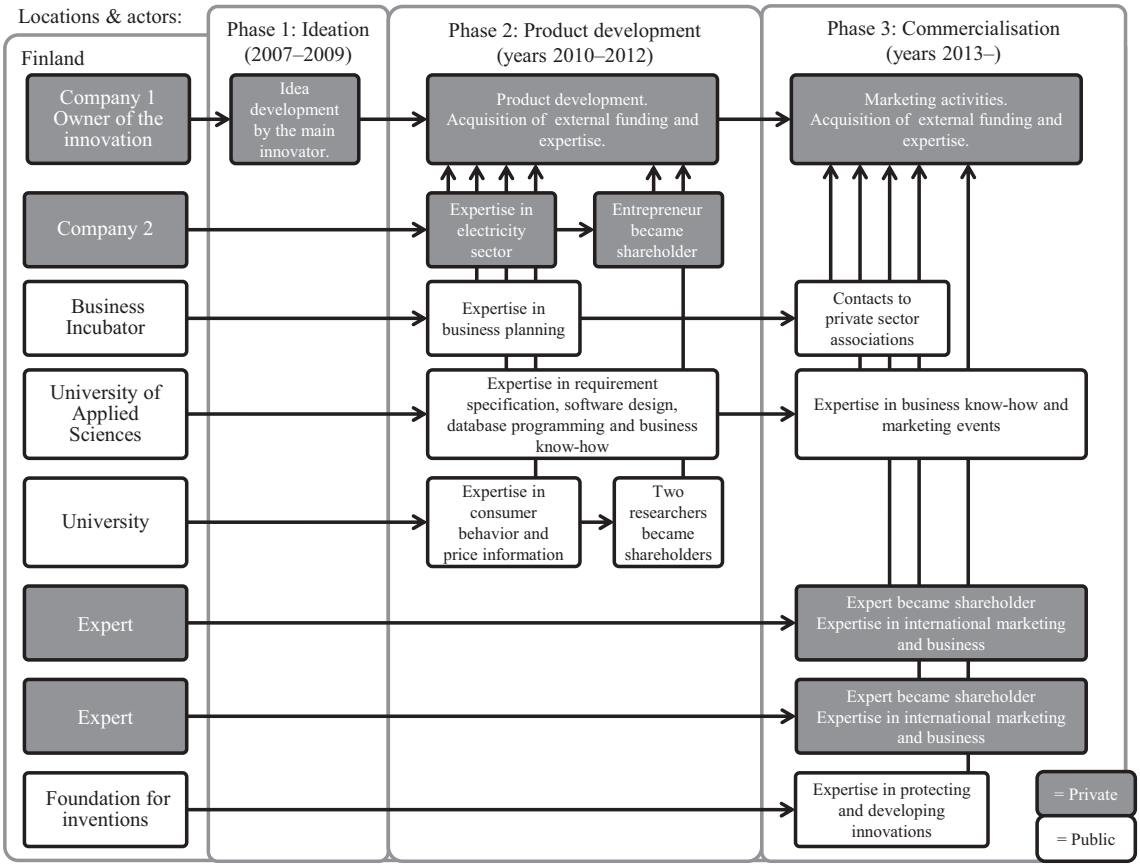

Figure 6. Knowledge biography of innovation case 3

The main innovator got the idea of developing an internet application for electricity price comparison and contract rating in 2007 while working in a company that operated as an electricity supplier. At the time, the public believed that traditional internet applications for electricity price comparison only provided a minor benefit to the consumers. This belief of the public gave the innovator the insight that the criteria for price formation in the electricity sector are very non-transparent for customers. The main innovator also noticed that there was no internet service in the market that transparently presents the criteria for electricity price formation and contract rating. The main innovator independently developed the idea further in phase 1, after which he resigned from his job and founded a new company (i.e. company 1).
The most important knowledge was introduced in the development process by the main innovator, who had extensive and varied working experience in the electricity sector and was a certified electronics technician. In phases 2 and 3, several external experts brought many-sided expertise to the process. Public actors played an important role, especially in phase 2.

DISCUSSION

This study described how the innovation process develops from the conception of an idea to a product in three innovation cases and analyses the knowledge dynamics within those processes. The detailed knowledge biographies of the three innovation cases, as presented in the previous chapter, answered research question 1.

Figures 7–9 briefly answer research question 2. In Figures 7–9, the innovation processes occur within a framework of knowledge types and knowledge phases (See Figures 1 and 2), according to the theoretical analysis conducted in this study.

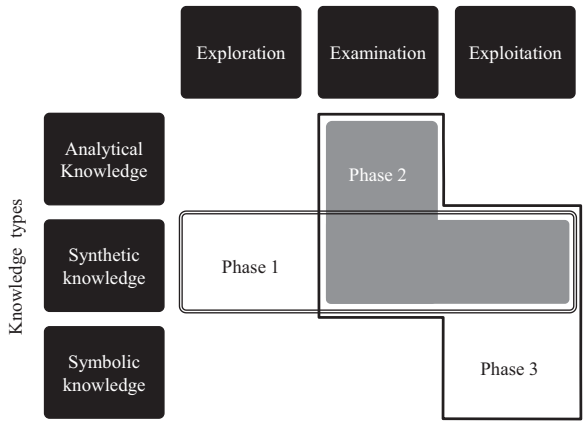

Figure 7. Case 1: The phases of the innovation process, projected through knowledge types and knowledge phases

In case 1, during the first phase of the innovation process (first version), synthetic knowledge was essential and all the knowledge phases (exploration, examination and exploitation) were identified. The entire planning and manufacturing process was done by the staff, which had extensive experience in tailor-made manufacturing. The first version of the door was manufactured straight to the customer, which means that no prototypes were made. The second phase (product development) was an examinative and exploitative knowledge phase in which both analytical and synthetic knowledge was essential. External expertise was necessary when the door improvements were in progress. Two marketing experts were recruited by company 1 in phase 2, which accelerated the innovation process. The third phase

(marketing and internationalisation) was an examinative and exploitative knowledge phase and all knowledge types were essential. External expertise was especially required in internationalisation activities. One expert was recruited in phase 3 to help in planning and using the new information systems.

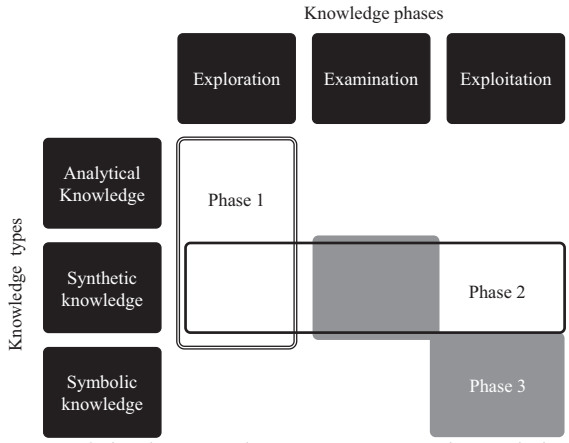

Figure 8. Case 2: The phases of the innovation process, projected through knowledge types and knowledge phases

In case 2, the first phase of the innovation process (ideation) was clearly an explorative knowledge phase in which both analytical and synthetic knowledge was essential. The main innovators were successful in independently developing the idea further because they had many-sided working experience and education. In the second phase (product development and marketing), synthetic knowledge was essential and all the knowledge phases (exploration, examination and exploitation) were identified. External expertise was required for device development and construction. The business experience of the other main innovator was useful when negotiating about letters of intent with power plants in phase 2. The third phase (commercialisation) was an examinative and exploitative knowledge phase in which synthetic and symbolic knowledge was essential. In phase 3, the peculiar behaviour of the venture capital companies resulted in the failure of the entire development process.

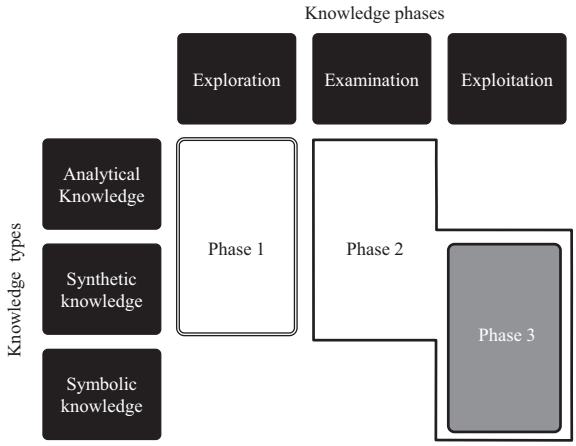

Figure 9. Case 3: The phases of the innovation process, projected through knowledge types and knowledge phases

In case 3, the first phase of the innovation process (ideation) was clearly an explorative knowledge phase in which both analytical and synthetic knowledge was essential. The main

innovator was successful in independently developing the idea further, because he had many-sided knowledge about the electricity sector. The second phase (product development) was much more complex; it was an examinative and exploitative knowledge phase wherein all knowledge types were essential. External experts introduced important knowledge to the process, especially for the planning and programming of the application. The third phase (commercialisation) represents the exploitative knowledge phase. In this phase, symbolic and synthetic knowledge was decisive. In this phase, external experts introduced important business and marketing knowledge to the process.

In cases 2 and 3, the owner of the innovation was a young company, which partially explains the fact that public actors and public funding were more important in the innovation process in these cases. The owner of the innovation in case 1 was an old company, which acted independently during the process. In case 1, other companies provided a large part of the expertise that was required during the process and numerous public actors were involved. In cases 2 and 3, the companies made several prototypes of the product; however, in case 1, the company manufactured the first version of the door straight to the customer. Despite the differences in the three cases, the basis of the innovations in all the three cases was the extensive working experience of the main innovators. It is also noteworthy that in all three cases, the companies naturally collaborated with the actors outside their home region.

The findings of this study suggest that while developing their services, public actors should pay more attention to catering to the case-specific needs of innovative micro companies. The results of this study show how micro companies can function effectively with limited financial and human resources.

In future studies, it would be interesting to use the knowledge biography technique to examine more innovation cases in micro companies. We hope to refine and develop this technique and subsequently apply it to future studies. We also suggest that future research examines the results of similar analyses made in micro companies in other countries.

ACKNOWLEDGEMENTS

This study is an essential part of the Entrepreneurship Research and Development of RDI in Oulu South Region –project. The authors are grateful for the project funding supported by the Council of Oulu Region, the Kerttu Saalasti Foundation, the Nivala-Haapajärvi subregion, the Ylivieska subregion, the Haapavesi-Siikalatva subregion, the Central Ostrobothnian University of Applied Sciences, the Educational Municipal Federation JEDU and the European Regional Development Fund. We highly appreciate the organisations and persons involved in the study who shared their experiences.

Harri Jokela is a Researcher at the Oulu Southern Institute at the University of Oulu. He has an MSc in Agriculture and Forestry. His primary interest areas are the development of micro-companies and small- and medium-sized enterprises (SMEs) in rural areas and regional development. In recent years, he has been involved in many projects in the area of regional development.

Eija-Riitta Niinikoski is a Development Manager at the Oulu Southern Institute at the University of Oulu. She has an MA in Theology. Her primary interest areas are regional development, the role of higher education institutions in regional development, internationalization processes and the development of micro companies and SMEs in rural areas and the management and leadership of expert organizations. Niinikoski has been responsible for many development projects; she has also been involved in several international projects.

Dr Matti Muhos is a Research Director at the Oulu Southern Institute at the University of Oulu. He has a Doctoral degree in Industrial Engineering and Management, and he participates in the editorial processes of several international journals. His primary research areas are growth and internationalization of technology-intensive SMEs, including configurations and management viewpoints, development of micro-companies and SMEs, technology-intensive companies, agility, internationalization processes for SMEs and technology management. Muhos has worked on several international projects and has written over 60 publications in the form of journal articles, book contributions, refereed conference papers and technical papers.

ABSTRACT

In knowledge-based economy, continuous innovation is the key to sustainable competitive advantage. Innovation can strengthen the sustainable growth and productivity of a country and increase national productivity as well in the global market through creation of new ideas and opportunities. Innovation is extremely dependent on the availability of knowledge, therefore the complexity created by the explosion of richness and reach of knowledge has to be identified and managed to ensure successful knowledge creation. The purpose of this paper is to construct a knowledge creation framework. A further study will be undertaken using this constructed framework for collecting and analysing data. The framework shows that knowledge creation is influenced by organizational knowledge and market knowledge. Organizational knowledge always becomes obsolete and it should be updated by market knowledge and new created knowledge via technological advancement in order to maintain its up-to-date information.

Keywords: Organizational Knowledge, Market Knowledge, Knowledge Creation

INTRODUCTION

Today market is very dynamic and very high competitive. The market preferences are changing all the time. An organization has to know the market tendencies in order to compete in a very fragile environment. Nonaka and Tekeuchi (1996) stated that in today economy where the only certainty is uncertainty, where competitors grow more and more, customers' preferences are changing and technology develops quickly. Hence, knowledge becomes the source of competitive advantage. Management scholars agree that knowledge has emerged as the critical resource. However, knowledge is not something new, it has been used and exchanged within organizations. Therefore, organizations have to recognize, understand and manage it effectively and efficiently in order to transform that knowledge to become the source of competitive advantage and convert it to be tangible assets of organizations (Davenport & Prusak, 1997).

Davenport and Prusak (1997, p.5) defined knowledge as ‘‘a flux mix of framed experience, values, contextual information, and expert insights providing a framework for evaluating and incorporating new experiences and information. It originates and is applied in the minds of knower. In organizations, knowledge often becomes embedded not only in explicit form, documents or repositories, but also embedded in individual. Thus, knowledge derives from individuals' experiences, values, beliefs, attitudes, and memory that define the individual's know-how within an organization. Knowledge is invisible and intangible, and thus it is not captured very well by any of the traditional techniques that corporations master in their everyday operations. However, scholars are still debating about definition of knowledge and where it belongs to (Stenmark, Winter 2000-2001; Nonaka and Takeuchi, 1996). Tsoukas and Vladimirou (2001) give a picture of knowledge more realistic. They define knowledge is a transformation of individual distinction into actions within a context and it becomes a distinctive production factor that has a huge impact on productivity, innovation, and product development. Thus, many organizations are practising knowledge management to discover new knowledge internally and externally to sustain their competitiveness in the market and make it as a critical source of product input and innovation.

KNOWLEDGE MANAGEMENT

Knowledge management (KM) becomes a hot issue of today business and those who are ignoring this aspect will be left behind (Drucker, 1999). Knowledge management significantly influences strategy formulation and implementation (Grant, 1996a; Zander and Kogut, 1995). Whilst the literature reveals a diverse range of knowledge management definitions and perspectives (Brown and Duguid, 2000; Grant, 1996b; Spender, 1996b), the acknowledged generic management intention is to improve the ‘‘wisdom’’ of the organization to enable improved decision making, and increase innovation, performance, and sustainable competitiveness outcomes (Nonaka and Takeuchi, 1996; Davenport and Prusak, 1997). KM and related strategy concepts are promoted as important and necessary components for organizations to survive and maintain their competitive keenness. It has become necessary for managers and executives to address KM (Goodman & Chinowasky, 1997). KM is considered a prerequisite for higher productivity and flexibility in both the private and the public sectors.

Knowledge management is a necessity due to changes in the environment such as increasing globalization of competition, speed of information and knowledge aging, dynamics of both product and process innovations, and competition through buyer markets (Day, 1994). It promises to help companies to be faster, more efficient, or more innovative than the competition. Also, the term ‘‘management’’ implies that knowledge management deals with the interactions between the organization and the environment and the ability of the organization to react and act (Nonaka & Toyama, 2003). This is particularly true in knowledge-intensive work such as the design and development of products, where knowledge is both a key ingredient as well as a key outcome of the work. Product differentiation requires the rigorous application of theoretical and practical knowledge from various sources, and for this reason the proper management of knowledge can influence the results significantly.

KNOWLEDGE BASED VIEW OF KNOWLEDGE CREATION

The resource-based view (RBV) regards knowledge as a vital organizational resource (Barney, 1991). Organizations that are aware of their knowledge resources possess a valuable, unique resource that is difficult to imitate and can be exploited to achieve a sustainable competitive advantage (Alavi & Leidner, 2003). However, Nonaka & Toyama (2003) argued that RBV ignores the aspect of market knowledge. According to the dialectic knowledge creation, an organization is full of contradiction within and outside firm. Hence, an organization should find a mechanism to balance it but not to control it (Nonaka & Toyama, 2003; Takeuchi & Nonaka, 2004).

Knowledge-based view (KBV) aims at developing a comprehensive view of knowledge that could shed light on organizational creativity, learning, innovation, and change (Nonaka & Krogh, 2009). The existing research suggests that knowledge creation has strong implications for the development of organizational competitive advantage. For example, researchers such as Nonaka and Takeuchi (1996), Ravichandran and Rai (2003) indicate that individuals' abilities to generate new knowledge constitute increasingly rare and socially complex capabilities that contribute to competitive advantage of an organization over its competitors. This notion is supported by other research findings suggesting that successful knowledge creation and implementation will help improve the efficiency and effectiveness of organizational operations (Coff, 2003).

KBV is a contemporary approach to strategic management that guides attention toward the understanding of the management of an organization's core knowledge (Ling, Liau, & Hsing, 2005). Organizational knowledge and related organizational learning processes, such as knowledge creation, represent the core elements of innovative organizations (Inkpen & Tsang, 2005). Knowledge has become the most important strategic input and valuable asset for innovation activities, playing a prominent role in the development of innovative organizations (Nonaka & Teece, 2001). According to KBV, knowledge is continually renewed and replenished (Brown & Eisenhardt, 1997).

The knowledge-creation process starts with socialization where the tacit knowledge of customers and competitors is acquired through field building. That knowledge is then externalized through dialog into explicit knowledge to be shared within an organization. Next, the explicit knowledge is in a form appropriate to be diffused throughout the organization and combined with other existing knowledge. Subsequently, an organization's workers internalize these complex sets of explicit knowledge, and then determine the most favourable application to be put in action. Thus, when an organization is considered a source of knowledge creation, the promotion of the knowledge-creation process expressed by the SECI model becomes an important part of the organization's strategic management. Organizational knowledge is created and restructured in an upward spiral—beginning at the individual level, then moving up to the group level, and finally to the organizational level (Nonaka & Teakeuchi, 1996; Nonaka & Krogh, 2009). This spiral process takes place both intra-organizationally and inter-organizationally as knowledge is transferred beyond organizational boundaries and knowledge from different organizations interacts to create new knowledge. According to Sanchez (2005, p. 28), management must therefore "create broadly based knowledge sharing and learning processes that stimulate and draw on the learning of all individuals and groups in generating the best possible flow of new ideas for their

organizations". According to the knowledge-based view, a firm's primary purpose is the integration of knowledge, and the creation and deployment of dynamic capabilities (Grant, 1996a).

SOURCES OF NEW KNOWLEDGE

The introduction of new products and services is a critical issue of organizational performance and survival (Damanpour, 1991). By introducing new products and services, organizations can establish new markets and technologies (Burgelman, 1991) and adapt and change to meet new market demands (Brown & Eisenhardt, 1995). Hargadon and Fanelli (2002) have divided sources of knowledge into two streams; organizational knowledge which is static and market knowledge which is dynamic.

1. Organizational Knowledge

Organizational knowledge becomes an important factor for knowledge creation (Park, Ribiere, & Schulte Jr, 2004). It is defined as the capability members of an organization have developed to draw distinctions in the process of carrying out their work by enacting sets of generalizations based on collective understandings and experiences (Tsoukas & Vladimirou, 2001). The internal created knowledge can develop new skills, ideas and uniqueness, and difficult for competitors to imitate (Nonaka & Teakeuchi, 1996). Thus, the creation of new knowledge is essential for the success of organizations competing in dynamic environments (Kogut and Zander, 1992). Hedlund and Nonaka (1993) highlight that creating and exploiting knowledge within an organization revolves around the integration of tacit and explicit knowledge and the transfer and transformation of knowledge between internal organization knowledge and market knowledge. Thus, organizations have to adapt the market knowledge and transform it to become organizational knowledge.

The primary source of organizational knowledge is organizational culture, employees' knowledge, procedures and information technology that comprise a firm's climate that informally, and perhaps tacitly, define how the firm is to develop and use knowledge which in turn will affect the creation of new knowledge (Wang, Su, & Yang, 2011, Tsoukas & Vladimirou, 2001).

1.1 Organizational Culture

The concept of organizational culture began seriously in the 1980s (Cameron & Quinn, 2006). They argue that organizations have taken for granted and ignore organizational culture as an important factor. Many researchers have argued that organizational performance has a positive relation with organizational culture (DeLong and Fahey, 2000). Organizational behaviour is determined more by its culture than directives from senior management and the implementation of strategies in many organizations is affected if they are at odds with the organization's culture (Jarnagin and Slocum, 2007). According to Tsoukas and Vladimirou (2001) find that employees' judgement in diagnosing problems has been crucially shaped by the overall company culture. This makes employees to internalize a set of values which help them shape their actions accordingly.

Organizational culture is an important issue in both academic research and management practice because it is the most important factor that can make the organization succeed or fail (Schein, 2004). Culture might be one of the strongest and most stable strength within the organizational context (Schein, 2004). According to Schein (2004), organizational culture is the most critical factor controlling an organization's capacity, effectiveness, survival and success. Schein (2004) defines organizational culture as a pattern of shared basic assumptions that the group learned as it solved its problems of external adaptation and internal integration that has worked well enough to be considered valid and, therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems. This definition gives a reason why the culture is important in the success of the operations and activities of the organization.

Many studies proposed that organizational culture can play a key role in supporting or hindering successful application of knowledge creation (Rhodes, Hung, Lok, Lien, & Wu, 2008). A study conducted by Al-Adaileh & Al-Atawi (2011) to investigate the impact of organizational culture on the knowledge creation process in the Saudi Telecom Company (STC) has a statiscally significance.

1.2 Employees' Knowledge

Many philosohers ackknowledged that there are two types of knowledge in organization; tacit and explicit knowledge (Davenport & Prusak, 1997; Nanaka & Krogh, 2009; Nonaka & Teakeuchi, 1996; Nonaka & Teece, 2001). The debate among those philosophers is on whether tacit knowledge is inidivual essence or organizational knowledge. However, Tsoukas & Vladimirou (2001) do not make any differences for both types of knowledge. They argued that both types of knowledge are necessary for organizational knowledge.

Tacit knowledge is knowledge that cannot be easily captured by any information system. It only exists in people's hands and minds, and manifests itself through their actions. Therefore, tacit knowledge has drawn the interest from many knowledge management researchers. Stenmark (Winter, 2000-2001) suggested that an organization should observe and recognize it through the actions instead of identify, capture and make it explicit.

The tacit knowledge of employees should be reflective in the form of actions so that the process of knowledge creation will happen. In other words, it is a process of internalization which is mentioned by Nonaka (1995) in the knowledge creation spiral. Tsoukas & Vladimirou (2001) suggest that in order to make employees' tacit knowledge reflective, an organization should have some mechanism such as training, supervision, and knowledge sharing among employess.

Employees need to develop their skills in order to become effective in their job. The required skills can be developed through training. Once, employees a develop a set of diagnostic skills which over time become instrumentalized tacit (Tsoukas & Vladimirou, 2001). This enables them to think quickly and effectively. According SECI, training is a process of internalization in knowledge creation process (Nonaka, Toyoma, & Konno, 2000). Internalization is the process of embodying explicit knowledge into tacit knowledge. Through internalization, explicit knowledge created is shared throughout an organization and converted into tacit knowledge by individuals. Training programs can help trainees to understand an organization

and themselves. By reading documents or manuals about their jobs and the organization, and by reflecting upon them, trainees can internalize the explicit knowledge and will enrich their tacit knowledge. When knowledge is internalized to become part of individuals' tacit knowledge bases in the form of shared mental models or technical know-how, it becomes a valuable asset.

1.3 Organizational Routines

Besides the employees' skills and experience. An organization needs a wirtten procedure, tacit knowledge, to be a guidline for effective work and good quality output. Employees will refer to the written procedures or manual in completing their tasks and jobs. A study conducted by Tsoukas & Vladimirou (2001) on customer operators in Patafon shows that wirtten manuals provide information for the operators on going issues and current network problems. This makes operators can handle customers queries. Operators mostly agreed that most of the knowledge contains in company's manuals. This type of knowledge will make employess doing their tasks for efficeintly and effectively. The written manual is stored in an organization's memory in the form of tacit knowledge.

Written Manual and procedures also become an integrating mechanism of an organizational knowledge cross-functional collaboration. A study undertaken by Sobek, Loker and Ward (1998) found that Toyota established coordinating mechanisms, including standardized reporting, and documentation, formalized work processes, problem-solving meetings. Integration among its different units. Those written procedures were also adopted by Southwest and BMW to integrate the knowledge among members of their cross-functional teams (BusinessWeek, 2006).

1.4 Technological System

The delevolpment of sophisticated corporate information system makes an organization to retrieve needed information very quickly and on time. This system is very important especially in service providing organization such as telephone operator department. Any delay in response to customers will make customers dissatrisfied with the service. Tsoukas & Vladimirou (2001) found that telephone operators will retreive customers' profile very quickly. Ideally, an organizational member will have all information they needed. Without a solid IT infrastructure, an organization cannot enable its employees to share information on a large scale. Yet the trap that most organizations fall into is not a lack of IT, but rather too much focus on IT.

Information technological system becomes one of the critical success factors in implementing knowledge management (Hasnali, 2002). The study shows that ICT has a significant positive influence on the processes of knowledge creation (Lopez-Nicolas & Soto-Acosta, 2010). The study in small innovative hi-tech firms shows that the use of IT assists in creating new knowledge (Spraggon & Bodolica, 2008). IT represents a valuable tool where individual, group and organizational knowledge is continuously codified, stored, diffused and renewed. It also represents a significant source of organizational learning and knowledge creation.

The study of Yang, Chen and Wang (2012) on the impacts of information technology on knowledge management practice in construction industry shows that levels of IT application

are positively associated with projects' levels of knowledge management. Additionally, project outcomes can be achieved with higher levels of knowledge management. The findings also indicate IT application affects on project performance in terms of schedule and cost success as well as quality and safety performance.

2. Market Knowledge

In general, there are two basic sources of knowledge. The first appears when firm conducts learning with unexplored with an organization, which is called internal source. Second, an organization explores new knowledge from outside an organization which comes from external source (Nonaka & Teakeuchi, 1996). According to knowledge based view of the firm, external knowledge acquisition from market environment becomes one of the critical means for knowledge creation in order to achieve competitive advantage (Nonaka & Teakeuchi, 1996). In this study we refer external knowledge as market knowledge. Market knowledge is not explicit but rather than difficult to codify and communicate (Nonaka,1995).The prior research shows that the acquisition of market knowledge leads to short-term improvements in sales and profitability growth, market share, new product success, customer satisfaction and return on assets (Slater & Narver, 1994).Outside sources of knowledge are critical to the innovation process in general (Cohen and Levinthal, 1990) and in particular in the context of changing knowledge environments. Organizations can acquire information and knowledge from their interactions with a variety of external sources which includes customers and competitors (Day, 1994). The advantages of market knowledge acquisition are worthwhile since dynamic environments may cause obsolescence in firm's current knowledge and capabilities (Nonaka, 1995). The ability to capture market knowledge leads to active acquisition and distribution of the needs and responses of the market, the position of competitors and customer preferences (Day, 1994). This implies that an organization that correctly identifies, collects, and uses information about customer and competitor conditions is deemed to be knowledgeable about the market.

Knowledge and capability value can be eroded by external changes (Collins, 1994). Thus, it is the environment, through opportunities and threats, which determines the real value of organizational knowledge (Priem and Butler, 2001). Therefore, if supply-side, demand-side or macroeconomic factors change, then knowledge value also may vary. As Nonaka (1995) points out that any organization that dynamically deals with a changing environment ought not only to process information efficiently but also create information and knowledge. An organization needs to continually acquire new market knowledge as the seeds for future market development. The inability to respond to market changes quickly makes an organization hard to survive in the competitive world (Kumar, Jones, Venkatesan, & Leone, 2011). Therefore, it is critical for managers to identify and understand market changes in order to sustain performance. De Geus (1988) pointed out that the sustainable advantage of an organization is its ability to learn and anticipate market trends faster than its competitors.

The organizational knowledge is useful at a certain period of time when market environment changes, it needs to acquire and create new knowledge in order to update the existing knowledge within an organization and to sustain the competitive advantage (Nonaka & Teakeuchi, 1996). Thus, they enable an organization to build a value-creating strategy (Barney, 1991). Moreover, when organizational capabilities are embedded in firm's tacit and

collective knowledge, the factor market threats of imitation, substitution, dissipation and appropriation may decrease (Barney, 1991).
The determining factors in the dynamic market environment are customers and business partners including competitors (Day, 1994). A study by Belkahla and Triki (2011) found that organizations perceive employees as corporate knowledge, meanwhile customers and competitors are market knowledge and become sources of competitive advantage in creating new knowledge.

2.1 Customer Knowledge

The voice of the customer is deployed throughout the product planning and design stages (Franceschini and Rossetto, 2002). It will become an input in the product design and development (Zairi and Youssef, 1998). Any changes in customers' demands may negatively affect the value of current marketing capabilities. The literature suggests that the primary objective of an organization is to deliver superior customer value, which is based on knowledge gathered from customer analyses and disseminated throughout the organization (Narver & Slater, 1990). The understanding of customer needs, preferences and market trends enables the organization to identify and develop capabilities for long term performance (Day, 1994) because the organization has information on customers' implicit needs to fulfill customers' satisfaction.

The collection of customer needs and preference can be done by incorporating customer's voice into every aspect of the organization's activities and rapid sharing and disseminating the knowledge of the organization's customers. The sharing of this information within an organization makes the firm well positioned to develop organizational memory (Kumar, Jones, Venkatesan, & Leone, 2011).

2.2 Competitor Knowledge

A considerable body of marketing thought suggests that competitor knowledge should improve an organization's performance by enabling the firm to position its strengths against rivals' weaknesses (Slater & Narver, 1994). Besides, customers' implicit needs and preferences, an organization also needs to analyze competitors' strength, weaknesses, capability and strategy in order to sustain competitiveness in the market. This rivalry view is also shared by prominent theorists in management and economics, who argue that an organization's performance largely depends on its ability to "beat the competition" either by manipulating an industry's structural parameters, as in competitive forces theory (Porter, 1980), or by developing difficult-to-imitate competencies, as in the resource-based perspective (Barney 1991). Specific competitor knowledge may result from an in-depth analysis of the behavior, products, and strategies (De Luca & Atuahene-Gima, 2007).

However, some researchers viewed that the rivalry is not the only approach to gather competitor knowledge (Luo, Rindfleisch, & Tse, 2007). They argued that alliances with competitors are another approach to create market knowledge. For example, Sony, IBM, and Toshiba are co-developing the cell chip to serve as the brains of the PlayStation 3 console (BusinessWeek, 2005).

To sum up, environmental dynamism may cause obsolescence in firm's current knowledge base, eroding its competitive advantage (O'Reilly & Tushman, 2008). To avoid this damage, organizations need to carry out an explorative learning that enables them to reconfigure their capabilities base (Lavie, 2006). Thus, market knowledge acquisition by firms may be considered as a key element for explorative learning development (Lavie, 2006). Therefore, any organization which deals with changing environment efficiently, it will create new knowledge as a source of competitive advantage.

NEW KNOWLEDGE

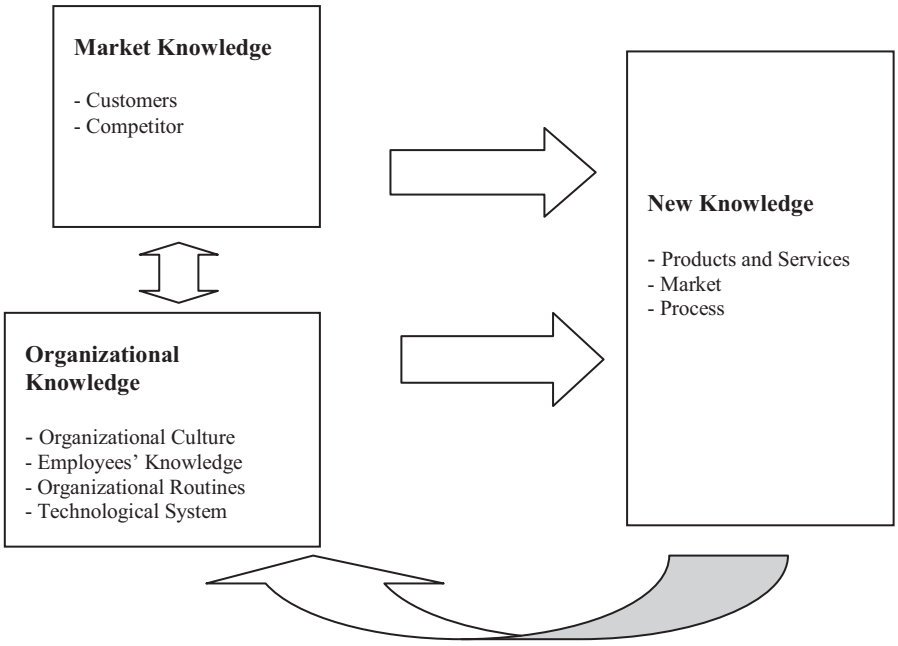
An organization can develop value and potential to sustain competitive advantage by creating knowledge (Bryant, 2005). Spender (1996a) emphasizes the importance of knowledge creation in knowledge-based views of the organization. He holds that there are two predominant goals of organization which are the generation and application of knowledge. Tsoukas and Mylonopoulos (2004) noted that an organization that has the ability to create knowledge develops a capability that is dynamic and unique and that potentially underpins continuous organizational learning. This is supported by empirical findings that knowledge creation is critical to a range of organizational processes supporting competitive advantage, including new product development and dynamic capability evolution (Smith, Collins, & Clark, 2005).

According to KBV, knowledge creation is a synthesizing process between organizational knowledge and market knowledge (Nonaka & Toyama, 2003; Takeuchi & Nonaka, 2004). The processes involved in knowledge creation are not only organization-specific, but also socially complex (Coff, 2003). KBV argues that RBV fails to capture the dynamic process through which organizational members interact with the environment (Nonaka & Toyama, 2003). Knowledge should be viewed from different angles through environmental interaction and externalization of personal knowledge. An organization will create new knowledge by assimilating and integrating organizational knowledge and market knowledge (Nonaka & Toyama, 2003; Takeuchi & Nonaka, 2004). Knowledge is produced through the synergy of four activities: problem solving, implementing and integrating, experimenting, and importing knowledge (Leonard & Sensiper, 1998). According to KBV, the knowledge creation is a spiral process. The organizational knowledge will be updated when there is new information or the market environment changes (Takeuchi & Nonaka, 2004). Therefore, the new created new knowledge will renew the existing knowledge in the organization by the advancement of technology.

There are not many literatures discussing about the dimensions of new knowledge. Most of the literatures discussed new knowledge in the form its tacitness and explicitness. New knowledge may be translated into many forms such as in products or services, in process and in technology (Cooper, 1998). Schumpeter (1934) suggested five dimensions in which new knowledge is translated namely new products and services, new method of production, new markets, new sources of supply and new organizational forms. Miller & Friesen (1983) focused on four dimensions: new product and services, new method of production, risk taking by key executives and seeking solution. While Capon, Farley, Hulbert, & Lehmann (1992) suggested three dimensions: market, strategic tendency to pioneer and technological advancement. Wang and Ahmed (2004) suggested five dimensions of new knowledge; products and services, market, process, behaviour and strategy. We decided to take

dimensions introduced by Wang and Ahmed (2004) in our framework. However, this framework excludes strategy because it is still debateable among researchers (Wang & Ahmed, 2004).

Figure 1 The Framework of Knowledge Creation



1. Products and Services Outcome

Innovative products and services present an opportunity for business expansion and success (Henard & Szymanski, 2001). New knowledge in products and services allow companies to establish dominant position in the competitive marketplace, and afford new entrants an opportunity to gain a foothold in the market (Danneels & Kleinschmidt, 2001). New knowledge is crucial to new product creativities (Yang, 2007). Innovation, which harnesses new knowledge or reconfigures existing knowledge, can yield new ideas and products (Grant, 1996a), while at the same time yielding projects competent to the customers (Rastogi, 2002).

2. Market Outcome

Market is highly related to new product, and often studied as product-market innovativeness (Schumpeter, 1934; Cooper, 1973; Miller, 1983). New knowledge of market refers to the discovery of new market which is related to market research, advertising and promotion (Andrews and Smith, 1996), as well as identification of new market opportunities and entry into new markets (Ali, Krapfel, & Labahn, 1995). They can enter a market or identify a new market niche and launch products with cutting-edge technological content.

3. Process Outcome

The discovery of new knowledge can lead to process innovativeness which captures the introduction of new production methods, new management approaches and new technology

that can be used to improve production and management process (Wang & Ahmed, 2004). Process outcome is mainly driven by the needs of production and can be said to be primarily efficiency-driven (Bergfors & Larsson, 2009). As a result, an organization can exploit their resources and recombine its resources for optimizing the competitive advantage in production. Besides the implementation of new approach, new process also can lead to the reduction of production costs, higher production yields, improvement of production volumes and product recoveries and environment-friendly production (Lager, 2002).

CONCLUSION

In today fast changing business world, innovation has become the mainstay of every organization. The nature of global economic growth has been changed by the speed of innovation, which has been made possible by rapidly evolving technology, shorter product lifecycles and a higher rate of new product development. Organizations have to ensure that their business strategies are innovative to build and sustain competitive advantage. Innovation is a capacity to move beyond current ways of doing things and current ways of operating companies to move beyond the best practice to shape best practice Innovation can strengthen the sustainable growth and productivity of a country and increase national productivity as well in the global market through creation of new ideas and opportunities.

Innovation has, however, become increasingly complex due to changing customer needs, extensive competitive pressure and rapid technological change. The complexity of innovation has also been increased by growth in the amount of knowledge available to organizations as basis for innovation. It is extremely dependent on the availability of knowledge and therefore the complexity created by the explosion of richness and reach of knowledge has to be identified and managed to ensure successful innovation**.** Knowledge as embodied in human capital becomes a central to economic development. There is a reason to believe that the nature of the organizational knowledge and market knowledge have an effect on organization's growth.

PERSONAL VALUES AND GIFT GIVING: THE CASE OF CHOOSING A RESTAURANT FOR HOSTING DINNER

Peeraya Lekkumporn, Marketing Department, Faculty of Business Administration, Kasetsart University, Thailand
Email: Peeraya.Lekkumporn@gmail.com

ABSTRACT

Learning on how people choosing a product or service remains an attractive topic for marketers for ages; nonetheless, how people utilize their cognitive structure when selecting products or services might be even more interesting. In this study, the cognitive structure of consumers was examined when choosing a restaurant for hosting dinner for their friends or family-members. Consumers' cognitive structure in this study could be seen as the structure of Gift Giving Behaviour (GGB) because choosing a restaurant for others could be seen as gifting. From the literatures of GGB, the eight factors were achieved as the GGB structure: Attitude toward Behaviour (AB), Subjective Norm (SN), Perceived Behavioural Control (PBC), Self-Identity toward Other (SIO), Self-Identity toward Self (SIS), Anticipated Emotion (AE), Purchase-Decision Involvement (PDI) and Symbolic of Gift (SG). Additionally, Personal Value (PV) which has been founded as an influencer for GGB also included in this study as the antecedent of GGB structure.

Accordingly, this study aims to explain the relationship between Personal Value (PV) and Gift Giving Behaviour (GGB). Hosting a dinner for the closed relationship such as friend and family member is employed as a context for this study, so as to restrict GGB for intangible gift, occasional gifting, and with closed relationship. Kahle's List of Value (LOV) was utilized as PVs construct such as Warm Relationship with Others (WR), Self Respect (SR), Self Fulfilment (SF), Sense of Accomplishment (SA), Fun and Enjoyment (FE), Sense of Belonging (SB), Being Well-Respected (BR), Security (SC), and Excitement (EC). Since GGB is one of voluntary behavior which directly related to Theory of Planned Behaviour (TPB), some criteria from TPB were in cooperated. Thus GGB construct consists of nine criteria which three factors were extracted from GGB such as Motivation of GGB (MG), Gift-Selection Effort (GE), Information Searching (IS) and six factors of TPB were included such as Attitude toward Behaviour (AB), Subjective Norm (SN), Perceived Behavioural Control (PBC), Intensity of intention (II), Self-Identity (SI), and Anticipated Emotion (AE). The total of 638 respondents from web-based survey was captured in Australia. Structural Equation Modeling (SEM) was applied as a tool for analysis the data. Regard to the AMOS output, the final model of six PVs and eight GGB factors was accepted. The six PVs were Warm Relationship with Others (WR), Sense of Accomplishment (SA), Sense of Belonging (SB), Being Well-Respected (BR), Security (SC), and Excitement (EC). The eight factors of GGB construct were Attitude toward Behaviour (AB), Subjective Norm (SN), Perceived Behavioural Control (PBC), Self-Identity toward Other (SIO), Self-Identity toward Self (SIS), Purchase-Decision Involvement (PDI) and Symbolic of Gift (SG).The results confirmed the previous study of Beatty, Kahle, and Homer in 1991 that the PVs has influence on GGB. Also it elaborated how each PVs affect differently on each factor of GGB construct. For example, people who held two PVs such as Warm Relationship to Others (WR) and Excitement (EC) as their primary PV tend to choose a gift utilizing Attitude toward Behaviour (AB) more than the

others. This study contributes to both theoretical and managerial perspectives. The relationship of each PVs and each factor of GGB was drawn. As well as the GGB construct was proposed. For marketing managers, the PV-based segmentation could be used for better understanding customers and planning marketing strategy in gift market.

Keyword: Personal Values, Gift giving, Customer psychology, Cognitive Construct,

Consumer Behaviour, Structural Equation Modeling

INTRODUCTION

Gift-Giving Behaviour (GGB) was revealed in anthropology in 1924 by Marcel Mauss's seminal essay (Sherry, 1983). In 1979, the concept of Gift-Giving Behaviour (GGB) was established by Belk (1979) and since then to be continues in the spotlight in various disciplines such as sociology, anthropology, psychology, sociology, ethnography, economics and consumer behaviour. However, a limited number of studies looked at the antecedent of GGB, for example Beatty et al. (1991) who mentioned PV as an antecedent of GGB. Further studies of GGB and personal value (PV), tend to focus on cultural factors, especially in Asian, which personal values in these studies were linked to cultural value such as Japan (S. E. Beatty, Kahle, Utsey, & Keown, 1993; Lotz, Shim, & Gehrt, 2003), Hong Kong (Yau, Chan, & Lau, 1999), Korean (Jackson & Kwon, 2006; Park, 1998), and Chinese (Qian, Razzaque, & Keng, 2007). Therefore, there is a need to explore PV as antecedent of GGB beyond the cultural aspect.

This study aims to investigate the relationship of GGB and PV, particularly for intangible gift. The intangible gift is rarely to be explored in GGB literature (Clarke, 2007, 2008), and thus needs more attention. This study investigates how consumers choose a restaurant for hosting dinner to identify the factors that important for PV and GGB relationship. An interesting result has been found and will be presented overleaf.

The Relationship between Personal Value and Gift Giving Behaviour

Gift-Giving Behaviour (GGB) is an interesting behaviour because of two reasons. It is not only being the unique behaviour that integrates society, but also GGB is a universal behaviour which can happen across the world, no matter what nation or culture. Additionally the antecedents of GGB is very attractive to investigate because it is not a behaviour that the giver would consider only the self, but other situational conditions such as who is the recipient, what is the occasion, and / or how close of relationship between the giver and recipient are also involved in that consideration. Consequently, understanding the antecedent of GGB can lead to be more understanding about the sequential aspects of GGB such as motivation of GGB.

In social science, the main focus of the researchers is on fundamental matter of all aspects of GGB such as component of GGB, perspectives of GGB, function of GGB, and motivation of GGB. Particularly, the motivation of GGB can explain why people buy gifts. This study suggested that the answer underpinning GGB lends itself into two aspects; occasional and spontaneous. In occasional, people buy gift because of occasions, so GGB of this event involves norm or ritual in some extents. Thus, the motivation of GGB in this event can be

located somewhere between voluntary and obligatory continuum proposed by Goodwin, Smith, and Spiggle (1990) depending on values held by the individual. For example, if a person perceives the occasion as a main driver to give gift, such person seems to be forced by ritual or norm as an obligatory for GGB. In contrast, if a person perceives the occasion as an opportunity to express self-concept or self's feeling toward a recipient through the gift, that person tends to give the gift with the real desire or voluntary. However, in practical, such person might be motivated by both obligatory and voluntary motivation in some extents for some situations. In spontaneous, people buy gift with no occasions, so there is no forces from norm or ritual. Hence, the motivation of GGB is seemingly purely coming from the giver's desire which may be seen as voluntary.

Another main matter which is interested by number of consumer researchers is how people buy gifts such as gift-purchasing involvement, effort, brand, channel, and motivation. When people make a real decision for gift-selection, they tend to take one more continuum, not voluntary or obligatory, into their considerations: maximising self-satisfaction, agonistic, and maximising the pleasure of recipient, altruistic (Sherry, 1983). When the giver purchases the gift to reflect predominantly self-concern such as the giver's self-concept, status, and / or preference, the agonistic motivation would be applied. On the other hand, the altruistic motivation would be operated when the giver purchases the gift which predominantly refers to the recipient-concern such as the recipient's taste, status, and / or need. Additionally, the traditional gift which symbol of the particular occasion such as utilitarian gifts for new-wedding couple or chocolates and flowers for Valentine's day might be driven by the norms motivation (Wolfinbarger, 1990). Accordingly, a giver has at least, three choices of motivation to select the gifts; agonistic, altruistic, and norms, and two choices of motivation to give gifts; voluntary and obligatory (see Figure 1). The questions are that when and how each of those motivation or the mixture motivations will be applied.

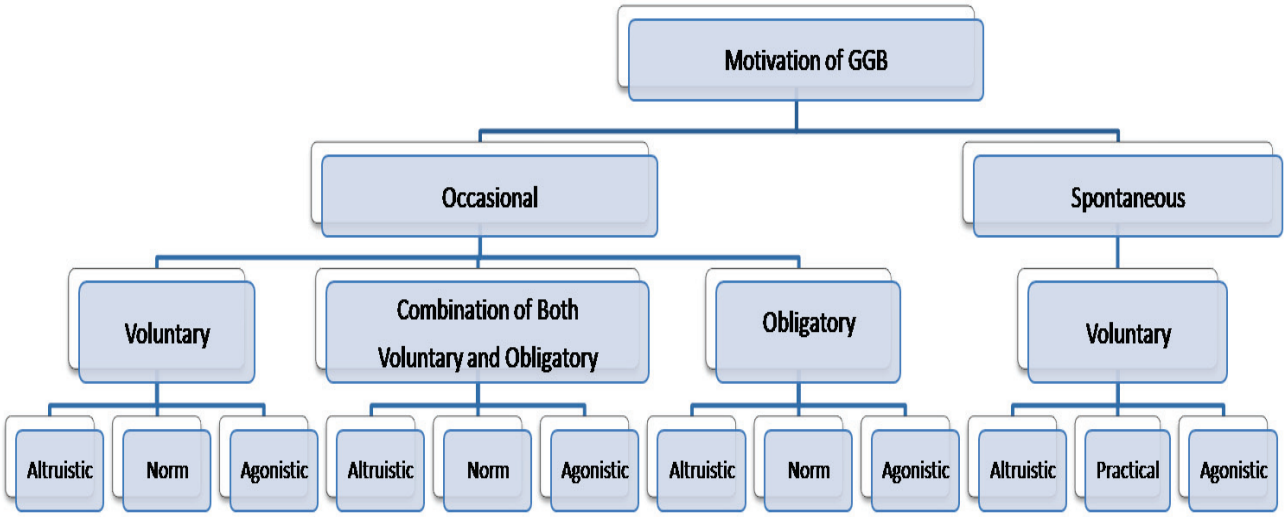

Figure 1: Motivation of GGB
Source: adapted from Goodwin et al., 1990; Sherry, 1983; Wolfinbarger, 1990; Wolfinbarger and Yale, 1993

To fulfil one's values in life, the person can be motivated to engage in particular behaviours such as gift-giving (S. E. Beatty, et al., 1991). Thus, personal values (PV) can determine the

motivation of GGB as the antecedent of GGB. This interpretation could be supported by theoretical and empirical studies. For theoretical support, Rokeach (1986) defined a value as one type of belief which is located in the central belief system of person (p.124). Thus a value seems to be the most important belief of a person. Also values serve as standards or criteria to guide not only action, but also judgement, choice, attitude, evaluation, argument, exhortation, and rationalization (Williams, 1979, p. 16). Hence, PV can be seen as the antecedent of GGB. For empirical supportive study, Beatty et al.(1991) disposed that certain PV influence certain GGB.

However, a limited number of studies looked at the antecedent of GGB. As mentioned, only the study of Beatty et al.(1991) was mentioned PV as an antecedent of GGB. Although, later, there were a number of the extended studies of GGB and PV, those studies tend to be diversified across culture, especially in Asian, which personal values in these studies were linked to cultural value such as Japan (S. E. Beatty, et al., 1993; Lotz, et al., 2003), Hong Kong (Yau, et al., 1999), Korean (Jackson & Kwon, 2006; Park, 1998), and Chinese (Qian, et al., 2007). More importantly, there is no study about GGB construct. Only one study of Qian et al. (2007) which mainly investigated GGB in China is seemingly like providing some kind of GGB construct. Chinese GGB construct consisted of six Chinese values which are reciprocity, human obligations (renqing), relationship (guanxi), destiny / fate (yuan), family orientation, and face (mianzi), and four dimensions of GGB which are importance of GGB, gift-selection effort, amount of GGB, and brand orientation. Since the main objectives of Quain et al.(2007)'s study is to explore the GGB of Chinese in the occasion of the Chinese New Year and examine the effect of Chinese cultural values toward GGB, so the GGB construct provided in this study was generated for such objectives and only for Chinese context. All in all, this shows a shortage of literature investigating construct of GGB and antecedent of GGB which is very crucial piece of information toward a development of GGB study (S. E. Beatty, Yoon, Grunert, & Helgeson, 1996; Larsen & Watson, 2001).

The gaps of GGB literature which is to be investigated in this study is not only the antecedent of GGB, but also the literature of intangible gift. Despite the two kind of gifts: tangible and intangible gifts are specified in the literature (Belk, 1979; Belk & Coon, 1993; Strass, 1964 cited in Goodwin, et al., 1990, p. 692; Sherry, 1983), the intangible gift is rarely to be explored (Clarke, 2007, 2008). Mostly GGB literature bias to disclose about the tangible gift, so Clarke (2007, 2008) called for more study about intangible gift . Furthermore, in order to precisely identify the GGB construct, all three factors which impact GGB need to be restricted. Those factors are the nature of the gift (Belk, 1979; Otnes, Lowrey, & Kim, 1993; Sherry, 1983), the relationship between the giver and the recipient (Belk, 1979; Wagner, Ettenson, & Verrier, 1990; Wolfinbarger, 1990), and the nature of the occasion (Belk,1982; Heeler et al, 1979). Particularly, the occasion of GGB in the parental literature utilised in general occasion (S. E. Beatty, et al., 1991), so it might be referred to occasional or spontaneous GGB. Unspecific occasion of GGB in the parental literature might allow other influential factors to play a part in the findings. Consequently, the examination of GGB construct of this study is chosen to conduct for the intangible gift such a restaurant choice for dinner, for the close relationship between host and guest such as a closed-friend or a family-member, and for the occasional GGB such a hosting dinner for the guest's visit.

CONCEPTUAL FRAMEWORK

PVs Construct

The PVs construct was retrieved from the List of Values (LOV) scales proposed by Kahle (1983). The LOV scales comprise *self -respect* (SR), *security* (SC), *warm relationship with others* (WR), *sense of accomplishment* (SA), *self –fulfilment* (SF), *sense of belonging* (SB), *being well-respected* (BR), *fun and enjoyment in life* (FE), and *excitement* (EC). The LOV scale was found to be more relevant to consumer behaviour in daily life than the Rokeach Value Survey (RVS) proposed by Rokeach (1973) and the Values And Life Style (VALS) scale developed at SRI International by Mitchell (1983), which was favoured by a number of researchers a few decades ago (S. Beatty, E., Kahle, Homer, & Misra, 1985; Kahle, Beatty, & Homer, 1986). As the LOV scales consist of nine values, compared to 18 instrumental values in RVS and 34 items in VALS, the LOV scale is easier to administer in surveys. In addition, the nine LOV scales were adopted as the PVs construct in the majority of the relevant literature (S. E. Beatty, et al., 1991; S. E. Beatty, et al., 1993; S. E. Beatty, et al., 1996). Therefore, using LOV scales for the PVs construct is more likely to provide reliability, ease of usage, comparability, and generalization of the results.

Kahle (1983) also distinguished a further two perspectives within each of the nine dimensions of value: the internal or external source of control, and the personal, interpersonal or non-personal source of fulfilment, as shown in Table 1. The person who maintains an internal source of control over such aspects as *warm relationship with others, self respect, self fulfilment, sense of accomplish, fun and enjoyment in life,* and *excitement* presents the internal strength to deal with life's problems. The person who perceives an external source of control over *sense of belonging, being well-respected,* and *security* tends to rely more on fate and luck when tackling the same problems in life. As a consequence, the internal control person believes they can control their life whereas the external control person might feel totally different. This aspect of value can be related with another aspect of value, the source of fulfilment (Kahle, 1983).

The various sources of fulfilment – interpersonal, personal, and non-personal – provide a further means for categorising the nine values. Kahle (1983) explains that if the source of fulfilment does not involve a person in relation to fun, success, and security, these values were respectively categorised in terms of non-personal fulfilment of the values *fun and enjoyment in life*, *sense of accomplish*, and *security*. When the source of fulfilment is a person, the individual can receive fulfilment from the self (personal fulfilment) or from another individual (interpersonal fulfilment). The personal fulfilment values consist of *self respect, self fulfilment,* and *being well-respected.* The interpersonal fulfilment values include *warm relationship with others* and *sense of belonging* (Kahle, 1983).

Table 1: Category of LOV with Source of Control and Source of Fulfilment

Source of Fulfilment	Source of Control	
	Internal	**External**
Interpersonal	Warm Relationship with Others (WR)	Sense of Belonging (SB)
Personal	Self Respect (SR) Self Fulfilment (SF)	Being Well-Respected (BR)
Non-personal	Sense of Accomplishment (SA) Fun and Enjoyment (FE) Excitement (EC)	Security (SC)

GGB Construct

In this study, not only the factors from GGB literature are considered, but also the factors from related theory such as Theory of Planned Behaviour (TPB) (Ajzen, 1991) are also included. Theory of Planned Behaviour (TPB) is well-established theory predicting the actual behavior from the intention (Ajzen,1991). Voluntary is the key condition to consider which behavior can be predicted by TPB because the voluntary reflects the intention to perform the particular behavior. GGB is one of the voluntary behaviour in some extents. Normally, people volunteer to select and give a gift even though the norm of occasion or social ritual might play apart. Thus they have intention to perform GGB in some ways. Therefore some factors from TPB literature are incorporated.

Regard to GGB literature, there are three extrinsic criteria affecting on GGB such as the nature of the gift (Belk, 1979; Otnes, et al., 1993; Sherry, 1983), the relationship between the giver and the recipient (Belk, 1979; Wagner, et al., 1990; Wolfinbarger, 1990), and the nature of the occasion (Belk,1982; Heeler et al, 1979). Nonetheless there is only one intrinsic criterion which is the individuality of the giver. However, the only source of intrinsic criterion can be divided into nine factors which are described as the following.

***Attitude toward Behaviour*:** "Attitude is a relatively enduring organization of interrelated beliefs that describe, evaluate, and advocate action with respect to an object or situation with each belief having cognitive, affective, and behavioural components" (Rokeach, 1986, p. 132). Based on the concept of the TPB, people intend to perform a certain behaviour when they have a positive attitude towards such behaviour (Ajzen, 2005). This is the reason why this variable was chosen as one of determinants to predict the behavioural intention in GGB. Providing more than just conceptual support for this variable, some empirical studies have also approved the relationship between attitude toward behaviour and actual behaviour. Macklin and Walker (1988) have provided partial support for idea that attitude impacts on GGB. Although they only found a significant relationship between a negative attitude towards GGB that resulted in spending less money and time on gift-selection, this study still provides some confirmation of the importance of the *attitude toward behaviour* and GGB. The reason for the lack of any significance established in regard to a positive attitude towards GGB (termed the 'joy' of gift-giving) might be related to the effect of other situational

factors on gift-selection, such as the closeness of relationship. However, the role of *attitude toward behaviour* as the determinant of GGB was fully confirmed in the study of Park (1998). In the context of both Korean and American cultures, he observed that the negative *attitude toward behaviour* is related to the obligatory motivation to perform GGB while the positive *attitude toward behaviour* is related to a voluntary motivation to perform GGB. Accordingly, the conceptual and empirical evidence suggests the importance of *attitude toward behaviour* in GGB and is therefore included in the GGB construct.

***Subjective Norm*:** A *subjective norm* is based on the person's perception of social pressure to perform or not perform a given behaviour (Ajzen, 2005). Based on the TPB, people intend to perform a behaviour when they experience social pressure to perform it (Ajzen, 2005). Belk (1979) found that only four percent of GGB is related to no specific occasion, therefore, as the vast majority of GGB is oriented to occasions, it is clear that norms or traditions exert a strong influence on selecting gifts. He also found that the norm-governed occasion influenced both the price of gift (for example, the higher amount spent on wedding gifts) and the type of gift (for example, birthday gifts are often uniquely personal, whereas wedding gifts tend to be more practical. The particular importance of *subjective norms* toward GGB in Asian cultures tends to be strengthened by the influence of cultural values wherein norms or rituals are embedded in PVs, such as face saving, reciprocity and group conformity (Qian, et al., 2007; Yau, et al., 1999). Therefore, the *subjective norm* should play an important role in GGB.

***Perceived Behavioural Control*:** Ajzen (2005) provides a definition of *perceived behavioural control* as the ability to perform the behaviour of interest. Based on the TPB, people intend to perform behaviours such as GGB when they believe they have the means (capability) and opportunities (controllable) to do it (Ajzen, 2005). Although the literature concerning the relationship between GGB and *perceived behavioural control* has not yet been investigated, the conceptual compatibility between GGB and TPB concepts is evident enough to include *perceived behavioural control* in the GGB construct.

***Intensity of Intention*:** In the TRA and TPB, the intention or willingness to perform any volitional behaviour such as GGB can be used to predict the actual behaviour (Ajzen, 2005; Fishbein & Ajzen, 1975). The willingness to perform GGB is similar to the concept of voluntary and obligatory motivations to give gifts (Goodwin, et al., 1990), so the variable of *intensity of intention* is consistent with the GGB construct.

In addition to the incorporation of TPB components of *attitude toward behaviour, subjective norms, perceived behavioural control*, and *intensity of intention* as fundamental elements in the construct of GGB, the extended TPB components such as *self-identity* and *anticipated emotion* should also be considered for inclusion due to the complexity of the GGB concept. Indeed, although the *self-identity* and *anticipated emotion* dimensions are drawn from the extended TPB construct, the underpinning principle of these two dimensions actually originates from the concept of GGB. Hence, the two variables of *self-identity* and *anticipated emotion* can be implemented in this study.

***Self-identity*:** Biddle, Bank, and Slavings (1987) defined *self-identity* as "the labels people use to describe themselves" (p. 326). Similarly, Hagger and Chatzisarantis (2006) note that *self-identity* is a set of enduring characteristics that people ascribe to themselves. Hagger et al (2007) state that *self-identity* influences behavioural intention and thereby serves as a

source of information when people plan to perform a given behaviour. A number of studies in social sciences and psychology acknowledge the impact of *self-identity* (self concept) on behaviour (Hagger, Anderson, Kyriakaki, & Darkings, 2007). In particular, GGB can symbolically demonstrate the *self-identity* or self concept of a giver or recipient, or both (Belk, 1979; Sherry, 1983; Wolfinbarger, 1990). Furthermore, *self-identity* has been proposed as the determinant of the gift-selection process in the balance theory of Belk (1976). Evidence from the available literature clearly demonstrates that *self-identity* is a vital element of the GGB construct.

***Anticipated Emotion*:** Emotions or feelings can play an important role in the GGB as they can be seen as a primary form of communicative message between giver and recipient (Belk, 1979; Sherry, 1983; Wolfinbarger, 1990). In Belk's (1979) study of GGB it was revealed that only 19 percent of respondents perceived GGB as not enjoyable and less than 2 percent actually disliked the activity. This clearly illustrates the importance of emotions and feelings in GGB. Furthermore, it also was found that gift-givers directed their focus on others when selecting a gift (Belk, 1979). Thus it can be assumed that the giver expects a positive response from the recipient in terms of *anticipated emotion*. Similarly, French et al. (2005) discussed 'anticipated affect' as the feelings or emotions that respondents expect to feel about the consequences of a behaviour. Apart from the closeness in the relationship between a giver and a recipient, a number of studies have shown that the strength of feelings or emotions attached to the gift are revealed in giving expressive gifts or gifts of higher value (Belk, 1979; Komter & Vollebergh, 1997; Wagner, et al., 1990; Wolfinbarger, 1990). The *anticipated emotion* is mentioned as a crucial factor in the experience of GGB (Clarke, 2008). Hence, *anticipated emotion* should be one of the determinants in the GGB construct.

All in all, six factors of TPB are included in the GGB construct: four factors from the original TPB – *attitude toward behaviour, subjective norms, perceived behavioural control, intensity of intention*; and two taken from extended TPB – *self-identity* and *anticipated emotion*. However, the GGB construct is quite unique in that the giver considers not only the dimension of the self but also the influential factors that play a part in the decision-making processes of purchasing a gift. Therefore, relying on the TPB model alone will not adequately capture the essence of the GGB construct. Following careful examination of studies previously undertaken in this research area, three additional dimensions of the GGB construct are proposed: *motivation of GGB, information searching*, and *gift-selection effort*.

***Motivation of GGB*:** Motivation is defined as an internal factor that arouses, directs, and integrates a person's behaviour in a given set of circumstances in order to achieve some goal (Murray, 1964). The importance of the *motivation of GGB* has been mentioned in most studies of GGB (Belk, 1979; Goodwin, et al., 1990; Sherry, 1983; Wolfinbarger, 1990; Wolfinbarger & Yale, 1993). However, as proposed, there are two types of motivation involved in GGB: motivation to give gifts and motivation to select gifts. The first motive is clearly compatible with the concept of intensity of intention that is already included in the GGB construct. In addition, the agonistic and altruistic motivations to select gifts are also included in the GGB construct.

***Gift-Selection Effort*:** The *gift-selection effort* was the most frequently examined factor in the relevant literature on the GGB construct (S. E. Beatty, et al., 1991; S. E. Beatty, et al., 1993; S. E. Beatty, et al., 1996; Qian, et al., 2007). It is also the most frequently used for

comparisons between purchasing a gift and purchasing for self (Belk, 1982; Heeler, Francis, Okechuku, & Reid, 1979). The research evidence therefore suggests that *gift-selection effort* constitutes an important dimension of the GGB construct.

***Information Searching*:** This variable can be seen as another dimension of the *gift-selection effort*, but it is more important and more specific to the actual process of decision-making when selecting a gift. However, despite its important role in the decision-making process of selecting gifts, this dimension is rarely mentioned in the GGB literature (Heeler, et al., 1979; Horne & Winakor, 1995). As the purpose of the GGB construct is to demonstrate the decision-making involved in gift-selection or gift-purchasing, the variable of *information searching* adds an important dimension to the GGB construct. The absence of attested scales due to the lack of focus on this dimension in the GGB literature, the scale of 'in-store' *information searching* was used as a guideline (Laroche, Cleveland, & Browne, 2004).

In total, nine dimensions representing the GGB construct are utilized in this study: *attitude toward behavior* (AB), *subjective norms* (SN), *perceived behavioural control* (PBC), *intensity of intention* (II), *self-identity* (SI), *anticipated emotion* (AE), *motivation of GGB* (MG), *information searching* (IS), and *gift-selection effort* (GE) as shown in Figure 2.

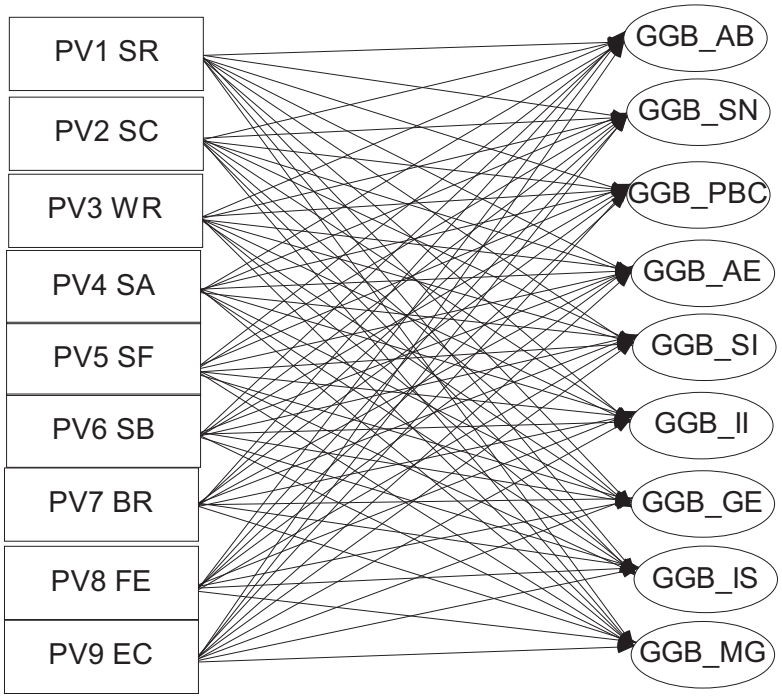

Figure 2: Conceptual Framework

METHODOLOGY

In this study, the multi-item rating scales are applied to measure the underlying construct. The main items to be measured in this study consisted of two constructs: the PV and GGB constructs, as illustrated in Figure 2. Both of the operationalized constructs in this study were derived from the literature. Existing measures were adopted wherever possible. However, some new measures were developed for cases not covered by the existing literature, such as intensity of intention and information searching. The items for the new measures were generated on the basis of conceptual definitions derived from the theoretical construct and the relevant literature. Therefore, the constructs were operationalized with a combination of original, adapted and new items. We work closely with marketing research firm to conduct an online survey. We distributed the web-based questionnaire to the panels with 2 criteria. The respondents must not be a student or unemployed person who leads to limiting a budget to make an appropriate restaurant choice for hosting dinner. This criterion was set up since the issue about the student sample has been raised by number of studies in GGB (Park, 1998; Roberts, 1990; Saad & Gill, 2003). We developed the screening question at the beginning of the questionnaire to avoid this type of respondent. In addition, the respondents must live in Australia (country-specific panels) to make sure about the hosting dinner as a ritual or norm in Australian culture. As a result, 638 qualified respondents were responded back within one month from 15 July 2008 to 12 July 2008. Structural Equation Modelling (SEM) was utilized in analysis the data including Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA). Table 2 illustrates the demographic details of the 638 respondents of this study.

Table 2: Demographic profile of the respondents

Demographic	Frequency	Percentage (%)
Gender		
Female	306	48
Male	332	52
Total	638	100
Age		
Below 24 years old	61	9.6
25-34 years old	127	19.9
35-44 years old	174	27.3
45-54 years old	155	24.3
55-64 years old	116	18.2
65 years old and above	5	0.8
Total	638	100
Approximate Annual Household Income		
Less than $20,000	25	3.9
$20,000 to $40,000	105	16.5
$41,000 to $60,000	109	17.1
$61,000 to $90,000	165	25.9
$91,000 to $110,000	107	16.8
$110,000 to $150,000	82	12.9
more than $150,000	45	7.1

Data Analysis

In this study, SEM was utilized to examine the extent of each PV influence each of GGB constructs. The exogenous variables were independent variables which in this study, nine PVs were exogenous. The PVs construct was retrieved from the List of Values (LOV) scales proposed by Kahle (1983) comprising of *self -respect* (SR), *security* (SC), *warm relationship with others* (WR), *sense of accomplishment* (SA), *self-fulfilment* (SF), *sense of belonging* (SB), *being well-respected* (BR), *fun and enjoyment in life* (FE), and *excitement* (EC). The role of exogenous variable was to predict endogenous variables which were represented by nine dimensions of GGB: *attitude toward behavior* (AB), *subjective norms* (SN), *perceived behavioural control* (PBC), *intensity of intention* (II), *self-identity* (SI), *anticipated emotion* (AE), *motivation of GGB* (MG), *information searching* (IS), and *gift-selection effort* (GE). The hypothesis was that each PV has impact toward each GGB as shown in the figure of conceptual framework.

From EFA, there was slightly rearranged of some items in GGB construct which result to rename those constructs. They were labelled as *attitude toward behaviour* (AB), *subjective norms* (SN), *perceived behavioural control* (PBC), *self-identity toward self* (SIS), *self-identity toward others* (SIO), *anticipated emotion* (AE), *purchase-decision involvement* (PDI), *self-experienced motivation* (SM), and *symbolic of gift* (SG). Table 3 summarizes the factor loadings for the condensed forty-three item scale. The significant loading of all the items on the single factor indicates uni-dimensionality. Furthermore, the value of Cronbach's

alpha ranged between 0.683 and 0.931, which exceeds or equals the minimum acceptable value of 0.7 (Nunnally, 1978). Overall, this GGB construct displayed validity and reliability.

Table 3: EFA Output of GGB Construct (KMO=0.929, VAR= 68.10)									
Items	**Components**								
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**
Factor 1: Attitude toward Behaviour (AB): Cronbach's alpha=0.910, EV=13.624, VAR=32.439									
The feeling about choosing a restaurant for hosting dinner: Negative/Positive	0.670								
The feeling about choosing a restaurant for hosting dinner: Reluctant/Enthusiastic	0.780								
The feeling about choosing a restaurant for hosting dinner: Unimportant/Important	0.693								
The feeling about choosing a restaurant for hosting dinner: Useful/Useless	0.929								
The feeling about choosing a restaurant for hosting dinner: Bored/Excited	0.937								
The feeling about choosing a restaurant for hosting dinner: Unpleasant/Pleasant	0.758								
Factor 2: Subjective Norms (SN): Cronbach's alpha=0.832, EV=3.550, VAR=8.451									
People who are important to me choose a restaurant for hosting dinner in the same way as me.		0.870							
People in my life whose opinions I value consider the same criteria as I do in choosing a restaurant for hosting dinner.		0.852							
Many people choose a restaurant for hosting dinner in the same way as me.		0.835							
Most people who are important to me would approve my choice of restaurant.		0.567							
Factor 3: Perceived Behavioural Control (PBC): Cronbach's alpha=0.892, EV=2.262, VAR=5.386									
For me, choosing a restaurant for hosting dinner would be easy/difficult			0.879						
I am confident in choosing the right restaurant to satisfy my guest's preference.			0.784						
If I want to, I can choose the most appropriate restaurant for hosting dinner.			0.738						
I feel that I have control over the choice of restaurant for hosting dinner.			0.793						
It is mostly up to me to choose a restaurant for hosting dinner			0.614						
Factor 4: Anticipated Emotion (AE): Cronbach's alpha=0.931, EV=2.043, VAR=4.864									
The guest would feel about the selected restaurant: Excited				0.755					
The guest would feel about the selected restaurant: Delighted				0.849					
The guest would feel about the selected restaurant: Happy				0.782					

The guest would feel about the selected restaurant: Satisfied				0.731					
The guest would feel about the selected restaurant: Proud				0.910					
The guest would feel about the selected restaurant: Grateful				0.855					
The guest would feel about the selected restaurant: Impressed				0.870					
Factor 5: Self-Identity toward Others (SIO): Cronbach's alpha=0.739, EV=1.977, VAR=4.707									
You perceive yourself as: Easygoing					0.649				
You perceive yourself as: Respectful					0.836				
You perceive yourself as: Generous/Kind					0.835				
Factor 6: Self-Identity toward Self (SIS): Cronbach's alpha=0.740, EV=1.583, VAR=3.770									
You perceive yourself as: Egocentric						0.856			
You perceive yourself as: Pretentious						0.825			
You perceive yourself as: Altruistic						0.646			
You perceive yourself as: Show Off						0.691			
Factor 7: Purchase-Decision Involvement: Cronbach's alpha=0.889, EV=1.338, VAR=3.187									
I collect a lot of information about restaurants before making a final choice							0.777		
I consider restaurant reviews from leading magazines/newspapers before making a final choice							0.720		
The amount of time I spend comparing restaurants is worth the effort.							0.618		
I search for more information about restaurants than what is provided by media.							0.842		
I really have to do research on the restaurants in order to find out what is good and bad about them.							0.857		
I put a lot of time and effort into my choice of restaurant.							0.810		
I choose a restaurant very carefully.							0.686		
It is important to initially check out the restaurant before deciding to go there.							0.667		
Factor 8: Self-Experienced Motivation (SM): Cronbach's alpha=0.683, EV=1.192, VAR=2.837									

I choose the restaurant that I like.								0.562	
I tend to take my guest dining out in my favourite restaurant.								0.858	
When choosing a restaurant for hosting dinner, I am inclined to choose a restaurant that I have previously visited.								0.851	
Factor 9: Symbolic of Gift (SG): Cronbach's alpha=0.786, EV=1.032, VAR=2.457									
I choose the restaurant that reflects my personality and status.									0.766
I choose the restaurant that reflects my guest's personality and status.									0.811
I choose the restaurant that reflects my feelings toward the guest.									0.595

CFA was conducted for the model of the GGB construct derived from the EFA previously described and PVs construct derived from the well-established scale of LOV(Kahle, 1983). A measurement model was drawn and tested (see Figure 3.1) and the output showed that $X^2(1229)=4274.71$, GFI=.779, AGFI=.753, CFI=.865, TLI=.854, and RMSEA=.062 (see Table 4). Although RMSEA was acceptable, all goodness of fit indexes illustrated poor fit to the data. Hence, the model was re-specified as shown in Figure 3.2. The best outcome of thirty-seven items for nine factors was maintained in this construct except for the *self-experienced motivation* (SM) factor, which is removed because of the high correlation and high residual covariance amongst them. The new output illustrated: $X^2(593)=1562.88$, GFI=.882, AGFI=.860, CFI=.932, TLI=.924, and RMSEA=.051 which displayed a fairly good fit of this construct as shown in Table 4. The construct ranged their standardized loading from 0.567 to .940, which was acceptable (Hair et al., 1998) as shown in Table 5. In conclude, the six PVs and the eight GGBs were maintained in the construct.

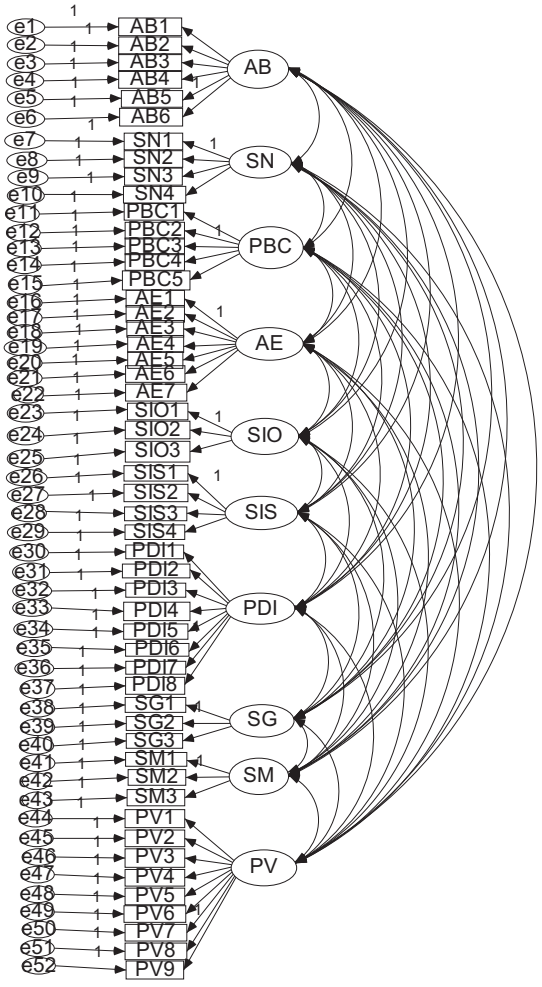

Figure 3.1: Null Measurement Model

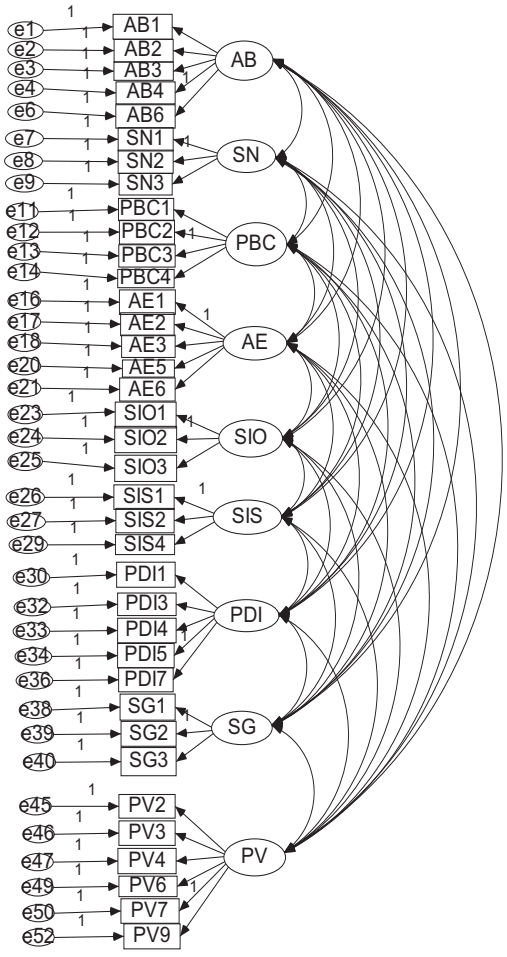

Figure 3.2: Measurement Model

Key: AB=Attitude toward Behaviour, SN=Subjective Norms, PBC=Perceived Behavioural Control, SIS=Self-Identity toward Self, SIO=Self-Identity toward Others, AE=Anticipated Emotion, PDI=Purchase-Decision Involvement, SG=symbolic of gift, and PV=personal Values

Table 4: Comparison of the outputs from original and modified PVs Constructs

	X^2 with DF	**X^2/DF**	**GFI**	**AGFI**	**CFI**	**TLI**	**RMSEA**
Model 3.1	X^2 (1229)=4274.71	3.48	0.779	0.753	0.865	0.854	0.062
Model 3.2	X^2 (593)=1592.88	2.636	0.882	0.860	0.932	0.924	0.051

The structural model of path diagram between two constructs was prepared prior to analysis, as shown in Figure 4. The exogenous variables were the following independent variables: *security* (SC), *warm relation with others* (WR), *sense of accomplishment* (SA), *sense of belonging* (SB), *being well-respected* (BR), and *excitement* (EC). The role of exogenous variables was to predict the endogenous variables, represented by the eight dimensions of GGB: *attitude toward behaviour* (AB), *subjective norms* (SN), *perceived behavioural control* (PBC), *self-identity toward self* (SIS), *self-identity toward others* (SIO), *anticipated emotion* (AE), *purchase-decision involvement* (PDI), and *symbolic of gift* (SG). The AMOS output of the structural model demonstrated: $X^2(566) = 1529.34$, $X^2/DF = 2.702$, GFI=.886, AGFI=.858, CFI=.933, TLI= .921 and RMSEA=.052. Although the values of RMSEA, CFI, and TLI presented a relatively good fit, some of the other fit indexes showed relatively mediocre fit to the data.

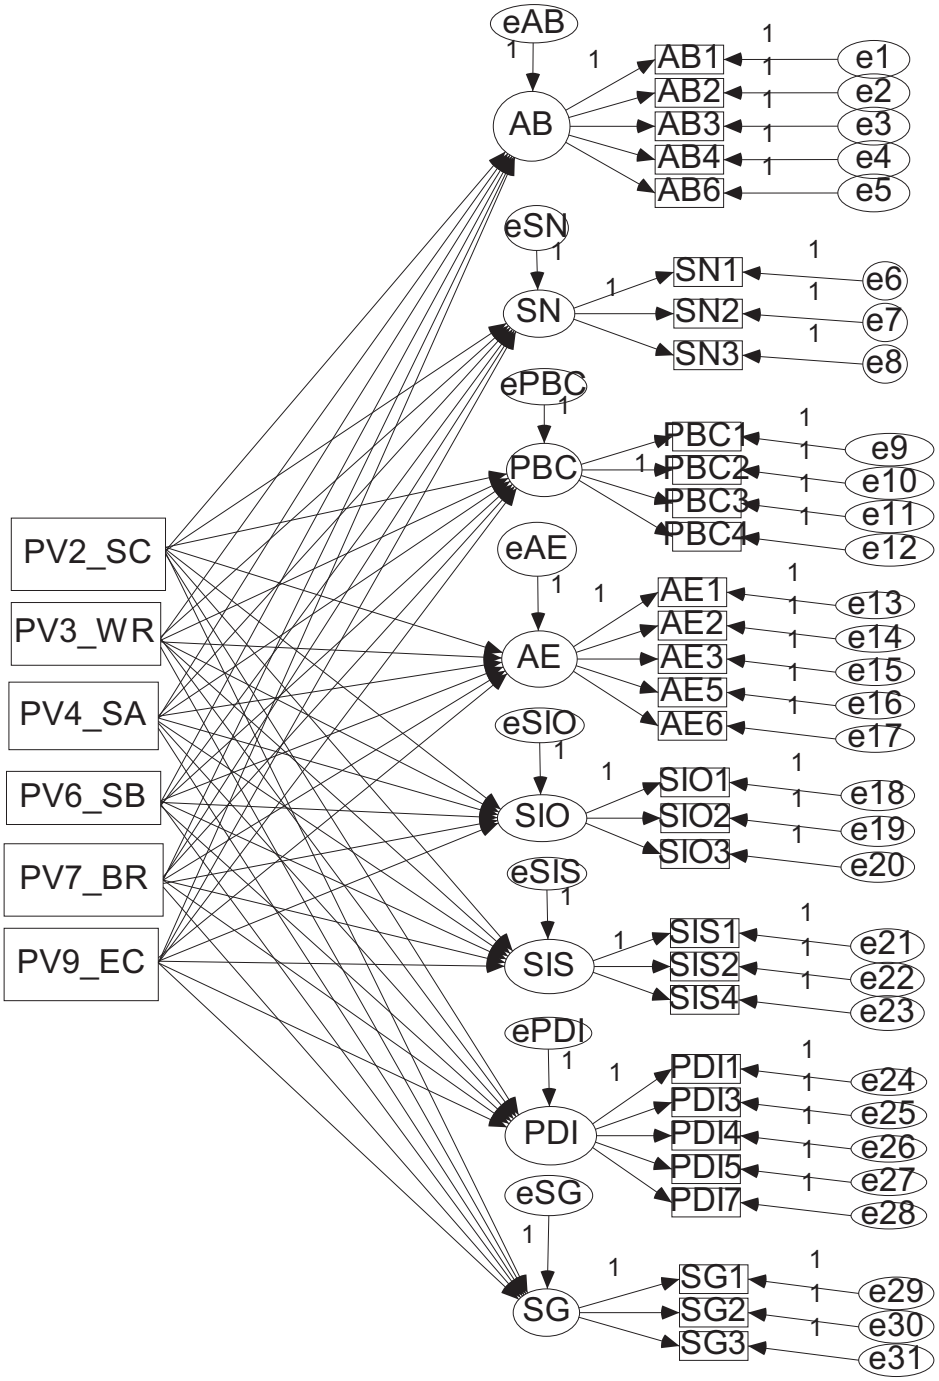

Figure 4: Structural Model for the constructs of PVs and GGB

Key: AB=Attitude toward Behaviour, SN=Subjective Norms, PBC=Perceived Behavioural Control, SIS=Self-Identity toward Self, SIO=Self-Identity toward Others, AE=Anticipated Emotion, PDI=Purchase-Decision Involvement, and SG=symbolic of gift

RESULTS

The assumption that PVs as antecedent of GGB was supported by the confirmation of the construct between the PV and the GGB. The PVs-GGBs construct composed of 6 PVs (*security* (SC), *warm relation with others* (WR), *sense of accomplishment* (SA), *sense of belonging* (SB), *being well-respected* (BR), and *excitement* (EC)) and 8 dimensions of GGB (*attitude toward behaviour* (AB), *subjective norms* (SN), *perceived behavioural control* (PBC), *self-identity toward self* (SIS), *self-identity toward others* (SIO), *anticipated emotion* (AE), *purchase-decision involvement* (PDI), and *symbolic of gift* (SG)). Additionally, it was confirmed that certain values influence certain dimensions of the GGB construct.The output of relationships between those 2 constructs was demonstrated in Table 5.

Those results can be discussed within two aspects. The first one is focus on PV aspect and the other one is concentrate on GGB aspect. Regard to the focus of this study mainly on PVs influence GGB, so this discussion will be concentrated on PV aspect (see in Table 6). The most obvious conclusion is Excitement (EC) reflects the highest number of significant relationships while Sense of Accomplishment (SA) relates to the lowest. People who hold EC as their main value tend to actively engage in GGB because they tend to consider more dimensions when performing GGB, which is opposite to people who hold SA. In terms of the EC characteristic, GGB might be perceived as one of enjoyable and exciting behaviour because the individual who rates EC highly prefers to spend time in enjoyable and exciting activities more than others (Kahle, 1983), so people who hold EC value seem to strive for this behaviour. It is worth noting that in previous studies (S. E. Beatty, et al., 1991; S. E. Beatty, et al., 1993; S. E. Beatty, et al., 1996), the EC value was underrepresented for two reasons: it was either included with Fun and Enjoyment (FE) or, in some studies, this combination was eliminated from analysis altogether because of too few respondents. On the other hand, the SA characteristic is a 'male-oriented' goal that represents a devotion of more time to accomplishing 'career-oriented' tasks (Kahle, 1983), so GGB might not be considered an important activity for this kind of person (Fischer & Arnold, 1990). In contrast, GGB has been perceived as a female task (Caplow, 1982; Saad & Gill, 2003; Sherry & McGrath, 1989), so males are traditionally less involved in this kind of activity. Thus SA might be the PV that involves GGB the least. The only reason when the SA value relates to GGB might be seen as an obligatory occasion, when it is necessary to give gifts. That is reflected in the absence of Attitude toward Behaviour (AB).

Table 6: Integration of relationship between PVs and GGB construct

Secondly, although Warm Relationship with Others (WR) represented the second highest significant relationship after the EC value, it still can confirm the previous studies that people who hold the WR value have a strong preference for involvement in GGB (S. E. Beatty, et al., 1991; S. E. Beatty, et al., 1993; S. E. Beatty, et al., 1996). Supported by Kahle (1983) is the notion that the WR value involves a great deal of mutual give and take as well as sensitivity to others' feelings, so people who hold this value have a strong desire for involvement in interpersonal activity such as GGB. Interestingly, people who hold the Being Well-Respected (BR) value displayed the same significant relationships as those who valued WR, except in regard to Attitude toward Behaviour (AB), which means that the BR value may also reflect involvement with GGB to similar levels as those with the WR value, even if their attitude indicates the opposite. This group of values reflect a desire to be respected or approved by others, so GGB is a tool to establish such respect or approval for them. They did not attach any specific attitude when performing GGB, so that is the reason why the BR value did not have a significant relationship with the AB construct. It is interesting to note whether this group of respondents prefer choosing a utilitarian or expressive gift compared to those who value WR. The GGB literature (Johnson, 1974; Wagner, et al., 1990; Wolfinbarger, 1990) indicates there is a likelihood that utilitarian gifts will be chosen by this group because it does not contain any personal feeling. Besides, due to the lack of AB, the GGB for this group might occur only in response to the occasion mode or, in other words, under obligatory motivations. Similar to the BR value, the people who hold the Security (SC) value also show high involvement with GGB in order to feel secure within society. Proponents of this can be seen as the significant relationships in same categories of the BR such as PBC, AE, and SI. Due to an absence of the AB construct, they give gifts based on traditional, ritual or common practice in order to feel secure in their place within society.

Finally, the people who hold the Sense of Belonging (SB) value differ significantly from those in other categories. Normally, all kinds of PVs illustrated a significant relationship with PBC and AE, which can be seen as fundamental criteria that are considered when performing GGB; however, these two criteria were absent from people who hold the BR value. Instead, the other two criteria, PDI and SG, which are rarely considered important by almost all other value groups, play a significant role in the BR value. This might stem from the attempt to belong to a particular group in society, so the SB group try to please other people through GGB. This can be reflected in the significant relationship with both Purchase-Decision Involvement (PDI) and Symbolic of Gift (SG). The SB group put a lot of effort into searching information and interprets the meaning of the gift in their giving behaviour. However, similar

to the BR, SC and SA groups, the SB group perceive GGB as a tool for them to receive some sense of belonging in return for their GGB, which is the reason why the AB value is absent from this group as well. All in all, with the exception of SA and SB values, all PVs have a significant relationship with PBC, AE and SI. This may be evident that the primary concerns of people in GGB circumstances mostly are about their own resources, the recipient's emotion, and self-identity.

CONTRIBUTION, LIMITATION AND FUTURE RESEARCH

The contribution of this study can be distinguished into theoretical and practical aspects. In theoretical contribution, as outlined in the previous section, only the WR and EC values illustrated a significant relationship with AB, so it might be concluded that it is only individuals who hold these two PVs that apply their real desire when performing GGB. In other words, only individuals from the WR and EC groups apply voluntary motivation when they give a gift. Based on this conclusion, we propose that AB can be used to predict motivation to give a gift, whether voluntary or obligatory (Goodwin, et al., 1990). Furthermore it seems that SN should be utilised as another predictor of motivation to give a gift as well because it shows the force from other people in order to perform GGB. Thus it can indicate the level of obligatory perceived by individual. However, due to the specific context of this study of gift-giving in a close relationship, SN might not play a significant role for this situation. Nonetheless, the direction of effect between AB and SN should be opposite in order to identify voluntary or obligatory motivation. For example, if any PV has positive AB (+AB), it should have negative SN (-SN) in order to apply purely voluntary motivation. In contrast, negative AB (-AB) and positive SN (+SN) should represent obligatory motivation. In some situations, AB (+AB) and SN (+SN) can be both positive, which represents the mixture of voluntary and obligatory motivation. Therefore, future study should examine whether SN can be used with AB in order to predict the motivation to give a gift and whether the relationship between AB and SN can predict the motivation to give a gift.

Similarly, SIO and SIS also can be used to predict the altruistic or agonistic motivation to select a gift (Sherry, 1983). The person who has SIO tends to consider other people more than the person who has SIS. Thus their motivation when selecting a gift seems to be more altruistic than agonistic. On the other hand, the person who has SIS is more likely to agonistically select a gift according to their own preference rather than that of the recipient. In other words, if a person perceives their self-identity in relation to others (+SIO) more than toward self (-SIS), that person demonstrates altruistic motivation. In contrast, if a person perceives their self-identity predominantly in relation to self (+SIS) rather than others (-SIO), that person would be more likely to be driven by agonistic motivation. From this study we conclude that, when selecting a gift, the SC and SB values that showed a significant relationship with SIO are more likely to reflect altruistic motivations whereas the EC value, which showed a significant relationship with SIS is more likely to reflect agonistic motivations. The WR and BR values, which illustrated a significant relationship with both SIO and SIS can be seen as utilising combination of both motivations.

All in all, certain PVs can lead to certain 'motivations to give gifts' and 'motivations to select gifts'. The findings of this thesis show that the SC and BR values demonstrate altruistic motivations. This might be explained by the fact that they are both external sources of control values, so they consider the recipient's interests in order to please their recipient and receive a

sense of security and respect in return. Although both WR and EC values reflect voluntary motivations, the WR value led to altruistic while the EC value led to agonistic motivations. The SA value did not involve any motivation at all. The SB value displayed only non-altruistic motivation. Finally, the EC value reflected both voluntary and obligatory motivations. Therefore, we can conclude that each PV can lead to different motivation to give and select a gift. In addition, the voluntary motivation to give a gift can lead to both altruistic and agonistic motivations to select a gift, which is supported by the study undertaken by Park (1998).

However, this study can be seen as the first study of GGB construct, so the need for future research to be further examined in other context such as GGB for distant relationship might be fruitful. Additionally, the interesting points from this study should be more investigated such as: the most important dimension of GGB construct such as *perceive behavioural control*, *anticipated emotion*, and *self-identity* are still valid in other context; or the role of subjective norm might be increasing in GGB for distant relationship; or the warm relationship with others value in GGB for distant relationship might illustrate the impact toward symbolic of gift and purchase-decision involvement; or the differences of the gift choice from each continuum of PV and motivation. As important as testing the GGB construct, the need to develop the well-defined scale for GGB is also benefit for the further research.

More than segmenting target market, PV can be engaged in other marketing activities such as media and promotional event selection. PV segmentation is included as one of the psychographic segmentation (Tynan & Drayton, 1987). Since the psychographic segmentation focus on lifestyle, activities, interests, opinions, needs, and values (Tynan & Drayton, 1987), so the implication for marketing communication is directly relevant. Marketing managers could be planned the media exposure and promotional event engaging more precise and effective when applying psychographic segmentation. From the study of Beatty et al.(1985) in USA, certain value dictated certain media preferences, leisure activities, and some behaviour such as GGB. Therefore the advantage of PV segmentation as of psychographic segmentation is obviously seen as the tool for generating marketing communication plan. From our findings in this study, we can draw a summary of relationships between each PV and the various dimensions of the GGB construct and restaurant preference, as outlined in Table 7.

Since this is the first study of this particular aspect of GGB, there are few limitations which need to be considered. The lack of well-defined of GGB measurement scales from literatures (S. E. Beatty, et al., 1996; Larsen & Watson, 2001) might limit the efficacy of the model. Particularly, the antecedent of GGB such as GGB construct has not been explored, so the scales had to be developed from other literatures such as TPB. Consequently, due to the conceptual compatibility between GGB and TPB, the practical compatibility might need to be validated. The construct of TPB has been borrowed as part of the model, but the context of GGB which lends more affective behaviour can cause more complexity and might not be perfectly fitted with some of the components from TPB. Also the generalisation of the model might be limited because this study was examined in only one context, obligatory GGB toward the close relationship within only Australia. Therefore, to validate this model, further research in other GGB context and countries is to be required.

Table 7: Summary of PVs, GGB and Restaurant Preference

PV	Corresponding GGB Dimension	Restaurant Preference
Security (SC)	-Perceived Behavioural Control (+PBC) -Anticipated Emotion (+AE) -Self-Identity toward Others (+SIO)	Individuals with dominant SC values... -believed they can select the proper restaurant choice for their guest. -expected the guest will be perceived a positive feeling from this hosting dinner. -tended to select the restaurant which their guest preferred.
Warm Relationship with Others (WR)	-Attitude toward Behaviour (+AB) -Perceived Behavioural Control (+PBC) -Anticipated Emotion (+AE) -Self-Identity toward Others (+SIO) -Self-Identity toward Self (-SIS)	Individuals with dominant WR values... -enjoyed selecting a restaurant for hosting a dinner. -believed they can select the proper restaurant choice for their guest. -expected the guest will be perceived a positive feeling from this hosting dinner. -tended to select the restaurant which is the most favourite of their guest only. -seemed not to select the restaurant from merely their preference.
Sense of Accomplishment (SA)	-Perceived Behavioural Control (+PBC) -Anticipated Emotion (+AE)	Individuals with dominant SA values... -believed they can select the proper restaurant choice for their guest. -expected the guest will be perceived a positive feeling from this hosting dinner.
Sense of Belonging (SB)	-Self-Identity toward Others (-SIO) -Purchase-Decision Involvement (+PDI) -Symbolic of Gift (+SG)	Individuals with dominant SB values... -seemed not to select the restaurant which they preferred. -devoted their time for searching and screening a lot of information about restaurant before choosing

PV	Corresponding GGB Dimension	Restaurant Preference
		the appropriate restaurant. -tended to consider about meaning of restaurant such as personality and status when selecting a restaurant for their guest.
Being Well Respected (BR)	-Perceived Behavioural Control (+PBC) -Anticipated Emotion (+AE) -Self-Identity toward Others (+SIO) -Self-Identity toward Self (-SIS)	Individuals with dominant BR values... -believed they can select the proper restaurant choice for their guest. -expected the guest will be perceived a positive feeling from this hosting dinner. -tended to select the restaurant which is the most favourite of their guest only. -seemed not to select the restaurant from merely their preference.
Excitement (EC)	-Attitude toward Behaviour (+AB) -Subjective Norms (+SN) -Perceived Behavioural Control (+PBC) -Anticipated Emotion (+AE) -Self-Identity toward Self (+SIS) -Purchase-Decision Involvement (+PDI) -Symbolic of Gift (+SG)	Individuals with dominant EC values... -enjoyed selecting a restaurant for hosting a dinner. -considered opinion from others in order to select a proper restaurant. -believed they can select the proper restaurant choice for their guest. -expected the guest will be perceived a positive feeling from this hosting dinner. -tended to select the restaurant which was aligned to their preference. -devoted their time for searching and screening a lot of information about restaurant before choosing the appropriate restaurant. -tended to consider about meaning of restaurant such as personality and status when selecting a restaurant

PV	Corresponding GGB Dimension	Restaurant Preference
		for their guest. -Also it is possible that the selected restaurant might be the most popular restaurant in the town or 'talk of the town' in order to perceive feeling of excitement.

CONCLUSION

The primary aim of this study was to develop and validate the GGB construct. Through rigorous explorative and confirmatory approaches, a multi-dimensional GGB construct was successfully developed with the following dimensions: *attitude toward behaviour, subjective norm, perceived behavioural control, anticipated emotion, self-identity toward others, self-identity toward self, purchase-decision involvement,* and *symbolic of gift*. This study also explored the relationship between personal values and the GGB construct. Analysis of structural model of such relationships demonstrates that a variety of different relationships exist between each of the dimensions of PVs and each of the dimensions of GGB. This newly developed GGB construct will assist researchers in better understanding the behaviour of consumers when purchasing gifts. Marketers will also benefit from the insights that such a multi-dimensional model can provide when formulating their marketing strategies to better attract consumers who are selecting and purchasing gifts for close friends and relatives.

ABSTRACT

This article focuses on a study whose thesis was to ascertain whether current bankruptcy forecasting models are effective in relation to companies involved in international commercial road transport. In the case of the international commercial road transport sector, the best foreign model – in terms of overall performance – was the Altman III model with 80% accuracy, followed by the Altman II model with a performance rating of 77.5% for this sector. These results, in effective identification of bankrupt and solvent companies by the use of foreign discriminant models, indicate limited accuracy in their application under the structural and legal conditions in Poland. During research regarding the effectiveness of contemporary models, it was observed that there are Polish discriminant models that are based on multiple tests (with regard to commercial entities), which can be utilized in assessing bankruptcy risk in the considered sector. The best Polish models for assessing bankruptcy risk in the commercial road transport sector were the Poznan (Hamrol and others) models and the Hadasik IV model which had a performance assessment of 82.5%. In the case of other models, their performance ran at lower percentages and therefore could not be considered for analyzing commercial entities in the studied sector.

Keywords: bankruptcy, bankruptcy forecast, discriminant analysis

RANGE AND RESEARCH METHODOLOGY

The study encompassed 60 corporate entities in the international road transport industry in the years 2007 to 2010, incorporated in the Polish Republic as limited liability companies, using their balances and profit and loss accounts. The sample selection was governed by purposive-random format. For the two phase study, sixty companies were selected wherein for the first phase, 20 ‘bankrupted in 2009’ companies were randomly chosen. A further 20 were chosen having continuous activity; and for this determinant model construction phase, the data from 40 companies for 2007 and 2008 was examined; two full ‘pre-bankruptcy’ accounting periods were scrutinized. The commonalities of these 40 companies were utilized in examining the effectiveness of foreign and domestic determinant models. For the second phase of the study, another 20 companies, which were declared bankrupt in 2011, were randomly chosen. The same ‘continual activity’ group of the first phase was utilized but with the change that the data of both bankrupt and operating companies now pertained to 2009 and 2010. The collated data was used to verify the determinant model for a specific industry. The study took into account bankrupt companies which issued annual financial reports for at least

3 full accounting periods in *Monitor Polski B* (a Polish government daily regarding finances, reports, etc.) before petitioning a court to declare bankruptcy, and also were characterized by deficit spending (negative net worth) and financial losses. The contrasted side, those companies which were operational in 2011 since at least January 1, 2005, had comparable asset values to the bankrupt group with differentials no greater than 500,000. PLN. In 2009, Poland had 51 international transport companies declare bankruptcy; solvent - 529 companies.

The established bankrupt group was then organized ascending, according to their National Court Register number, and twenty companies were chosen at random. Every second company was chosen beginning with the company in fifth position. The 'in operation' group was randomly established, also in that after being ordered by registration number, every twenty-sixth company was chosen beginning with the company in fourth position. In 2011, there were 49 companies in the international commercial road transport industry which declared bankruptcy; of these, once organized in ascending order, every second company was drawn beginning with the fifth position. To assess accuracy of company classification, an assessment accuracy matrix was applied to the discriminant model, a tool which presents summaries pertaining to index accuracy (see, among others [Card 1992, pp. 431-439], [Congalton 1991, pp. 35-46], [Li, Racine 2007, p. 240]). This accuracy tool is the square 'k x k' matrix where 'k' equals the number of deciding classes. Matrix rows reflect correct decision classification, and the matrix column represents the determinant model estimates. The general matrix classification scheme, utilizing discriminant analysis to assess the accuracy of a prediction model to foresee bankruptcy, is shown in Table 1.

Table 1. Assessment Matrix for Discriminant Model Accuracy

	Anticipated Model-Based Classification	
Factual Company Classification	Bankruptcy Risk	No Bankruptcy Risk
Bankruptcy Risk	Correct Classification	Incorrect Classification
No Bankruptcy risk	Incorrect Classification	Correct Classification

Source: original on the basis of Altman E. I., (1996), Financial Ratios, Discriminant Analysis and the Prediction of Corporate Bankruptcy, *Journal of Finance*, No 4, Vol. XXIII, pp. 598-599.

This presentation of the results pertaining to forecast accuracy allows the determination of the model's effectiveness. In the case of determinant analysis, three types of effectiveness and incorrect classification. In the case of 'model effectiveness', we see [Prusak 2004, p. 6]:

Effectiveness - First Degree (SP_2) establishes the percent of accurately classified companies at risk of bankruptcy, determined according to the formula –

$$SP_1 = \frac{P_1}{P_1 + NP_1} \cdot 100\%$$

Effectiveness – Second Degree (SP_2) establishes what percent of all analyzed companies as not-at-risk of bankruptcy were identified accurately, based on the formula –

$$SP_2 = \frac{P_2}{P_2 + NP_2} \cdot 100\%$$

Overall Effectiveness (SP_0) – demonstrates what percent of all companies analyzed were classified correctly by the model. The formula enabling effectiveness determination is –

$$SP_0 = \frac{P_1 + P_2}{P_1 + NP_1 + P_2 + NP_2} \cdot 100\%$$

Where the formulae use these symbols:

P_1 – anticipated number of bankrupted companies classified as 'at risk',
P_2 – anticipated number of operational companies classified as 'not at risk',
NP_1 – number of operational companies classified as 'at risk',
NP_2 – number of bankrupted companies classified as 'not at risk'.

Determining the validity of the model and its forecast degree of error, in the test group and the group used for formulating the model, enabled model assessment with regard to practical applicability.

STUDY RESULTS

Research regarding performance assessment of constructed discriminant models, both those for the Polish and foreign markets, was an issue of interest for many researchers, among them Stasiewski [1996, Rachunkowość nr 12], Gasza [1997, Bank i Kredyt nr 3], Rogowski [1997, Bank i Kredyt nr 6], Koralun-Bereźnicka [2006, ZN KZ i F nr 69] and many others. They indicated a need to develop a discriminant model specifically for Polish conditions where the imminent bankruptcy discriminant models for highly developed economies showed low accuracy in anticipating bankruptcy of Polish enterprises.

It bears noting that the Polish discriminant models were formulated over a period of 'a couple' of decades, during which time many significant changes occurred in the methods of corporate management; the commercial milieu has changed and the Polish market continues to transform. These transformations signaled the need for application verification of models for forecasting, or anticipation of, imminent bankruptcy (see [Grice, Dugan, 2001, p. 122], [Sojak, Stawicki, 2001, pp. 45-52]). Accuracy assessment of discriminant models for Polish market conditions have been undertaken, among others, by Kisielińska [2010, pp. 17-31], Waszkowski [2011, pp. 96-106], Czapiewski [2009, pp. 118-128], Stefański i Sabuhoro [2006, pp. 225-246], Grzegorzewska i Runowski [2008, pp. 83-90], Juszczyk [2010, pp. 572-584], Balina [2009, pp. 161-174; 2012a, pp. 225-263; 2012b, 231-238], Dec [2008, p. 129], and their results have indicated lowered accuracy -- shortly after their introduction -- in differentiating potential fiscal failures and solvent enterprises. Accuracy verification was undertaken on the basis of varied companies in a given industry profile. It bears mentioning that rarely is there a Polish discriminant model available to indicate potential bankruptcy for a specific industry profile. An exception is the research carried out by Stefanski [2011, pp. 131-139], who examined the applicability of Polish discriminant models to assess bankruptcy potential for Polish securities banks listed by the Warsaw Stock Exchange, as well as Juszczyk[1], who carried out effectiveness verification for Polish and foreign determinant bankruptcy models for the transport sector. Resulting from the current trend for bankruptcy analysis from a particular industrial perspective [Sojak, Stawicki, 2001, pp. 89-102], it would seem appropriate to verify Polish and foreign bankruptcy models for corporate entities in three distinctly different industries.

[1] For more see [Juszczyk, 2010, pp. 572-584].

As the authors have put to use financial data of limited liability companies, further examination will exclude models constructed for publicly owned (joint stock) or other lawful incorporation. The parameters pertaining to this current study have restricted the number of bankruptcy prognostic models that can be examined, and verification of foreign bankruptcy prognosticating models has been restricted to Altman II, Altman III, Springete, Legault and van Frederikslust I models.

Concurrently the applicability of Polish models for predicting corporate bankruptcy in the above mentioned industry was undertaken maintaining the given parameters. The qualifying models were: Pogodziński and Sojak, Gajdki and Stos I, Gajdki and Stos II, Hadasik I, Hadasik II, Hadasik III, Hadasik IV, Wierzba, Stępień and Strąk I, Stępień and Strąk II, Stępień and Strąk III, Stępień and Strąk IV, Hołda, INE PAN (Mączyński and Zawadzki) I, INE PAN (Mączyński and Zawadzki) II, INE PAN (Mączyński and Zawadzki) III, INE PAN (Mączyński and Zawadzki) IV, INE PAN (Mączyński and Zawadzki) V, INE PAN (Mączyński and Zawadzki) VI, INE PAN (Mączyński and Zawadzki) VII, Appenzeller and Szarzec I, Appenzeller and Szarzec II, Poznański, Prusak I, Prusak II, Prusak IV oraz Juszczyk.

ACCURACY ASSESSMENT OF SELECTED FOREIGN DISCRIMINANT MODELS

The accuracy verification of the foreign models as the pertained to the analyzed industry was begun with judgment of applicability in the context of anticipating bankruptcy. The effectiveness of Altman's models (I, II, III), Springete's. Legault's, and van Fredrikslust's models are shown in Table 2.

Table 2 – Accuracy of Foreign Models in Forecasting Bankruptcy Risk for Companies in the International Transport Sector [%]

Model	SP_1	SP_2	SP_0
Altman II	85.0	70.0	77.5
Altman III	60.0	100.0	80.0
Springete	70.0	25.0	47.5
Legault	35.0	100.0	67.5
van Fredrikslust I	100.0	0.0	50.0

Source: own research.

For companies involved in international commercial road transport, the highest accuracy was found in Altman's III model (80%), followed by Altman's II model (77.5%), and Legault's model (67.5%). It should be noted that these results deviate from Altman's indicated general accuracy in his own studies [1968, pp. 589-609; 1983, pp. 89-102]. If the model is to be judged as useful, its general accuracy should be greater than 80% [Korol, Prusak 2005, pp. 19-34]. Therefore, applying foreign models to international transport companies which have their headquarters in Poland should be undertaken with caution since the error risk is at least 20% - a relatively high level.

ACCURACY ASSESSMENT OF POLISH COMMERCIAL SECTOR DETERMINANT MODELS

To uncover company bankruptcy risk factors in the studied commercial branches, an examination of models developed in Poland was undertaken for accuracy. The results of that rating are presented in Table 3.

Table 3 – Accuracy of Polish Models in Forecasting Bankruptcy for International Road Transport Companies [%]

Model	SP_1	SP_2	SP_0	Model	SP_1	SP_2	SP_0
Pogodzińska i Sojak	85.0	5.0	45.0	INE PAN I	100.0	10.0	55.0
Gajdki i Stos I	50.0	50.0	50.0	INE PAN II	85.0	45.0	65.0
Gajdki i Stos II	30.0	90.0	60.0	INE PAN III	85.0	45.0	65.0
Hadasik I	95.0	60.0	77.5	INE PAN IV	90.0	50.0	70.0
Hadasik II	80.0	70.0	75.0	INE PAN V	95.0	30.0	62.5
Hadasik III	80.0	80.0	80.0	INE PAN VI	80.0	50.0	65.0
Hadasik IV	65.0	100.0	**82.5**	INE PAN VII	70.0	85.0	77.5
Wierzba	75.0	65.0	70.0	Appenzeller and Szarzec I	80.0	50.0	65.0
Stępień and Strąk I	80.0	65.0	72.5	Appenzeller and Szarzec II	80.0	45.0	62.5
Stępień andStrąk II	60.0	95.0	77.5	Poznański	80.0	85.0	**82.5**
Stępień and Strąk III	90.0	0.0	45.0	Prusak I	50.0	90.0	70.0
Stępień and Strąk IV	45.0	95.0	70.0	Prusak III	40.0	85.0	62.5
Hołda	100.0	0.0	50.0	Prusak IV	80.0	20.0	50.0
Juszczyk	60.0	80.0	70.0				

Source: own research.

In the case of international commercial road transport, the highest accuracy (82.5%) was seen in two models: Posnański and Hadasik IV.
In the case of twenty out twenty-seven Polish models examined with regard to forecasting potential bankruptcies and solid operations, significant variation was observed between the first and second orders tests, which in effect limit their use in predicting bankruptcy in the given commercial branch.

Noted should be that the Polish models, and foreign as well, gave varying results oscillating between 76.7% (Altman III), and 49.2% (Stepien and Strak III). This indicates a significant potential for confusion and incorrect readings regarding potential bankruptcy or solvent operation occurring from availability of models and their various indications.

The construction of a highly accurate determinant model for the international commercial road transport companies with headquarters in Poland was undertaken as a result of the major inadequacy of most Polish and foreign models in assessing bankruptcy risk.

CONCLUSIONS AND RECOMMENDATIONS

In the case of the international commercial road transport sector, the best foreign model – in terms of overall performance – was the Altman III model with 80% accuracy, followed by the Altman II model with a performance rating of 77.5% for this sector. These results, in effective identification of bankrupt and solvent companies by the use of foreign discriminant models, indicate limited accuracy in their application under the structural and legal conditions in Poland.

During research regarding the effectiveness of contemporary models, it was observed that there are Polish discriminant models that are based on multiple tests (with regard to commercial entities), which can be utilized in assessing bankruptcy risk in the considered sector. The best Polish models for assessing bankruptcy risk in the commercial road transport sector were the Poznan (Hamrol and others) models and the Hadasik IV model which had a performance assessment of 82.5%. In the case of other models, their performance ran at lower percentages and therefore could not be considered for analyzing commercial entities in the studied sector.

ABSTRCT

ERP is the integrating all businesses function of financial and manufacturing module which has Material Requirement Planning is the backbone to support module of manufacturing in ERP which runs on single database in a client-server environment thus can manage centralize data in order to record, monitor and report for every activity in organization at single point for real-time access so ERP is not concern only manufacturing anymore but embrace all business function. One of the most important modules in ERP system is production planning which apply the manufacturing planning and control theories such as master production schedule (MPS) and material requirement planning (MRP). However, implementing MRP/MRPII in ERP system often cited as failure in many places due to many reason such as different workflow in actual environment and ERP environment, inflexibility of ERP software in accommodating frequently changes demand from customer. Based on previous research, it identified one of the major problems in failing production planning module in ERP system as the workflow difference between theory and ERP system (Open source ERP). The conclusion was that the information presented in ERP system is totally different than general table format of MPS & MRP related theories. The information presented in ERP system lack of critical information that help production planner to make a quick and better decision such as Is overtime needed to complete the job on time? or Should produce certain product to stock for future use etc. User can find out the information but requires access many screens with note taking.

This research extended the previous research by conducting similar research on leading ERP package, Oracle R12 with MPS & MRP related theories. Unlike, open source ERP system, the results show that in Oracle R12, there are information table for production planner to use like MRP table. Even though Oracle R12 tables are differences (more information) than MRP/MPS table in theories, at least production planner can immediately make a decision. However, the problems still be found in Training material on MRP & MPS in Oracle R12. The training materials were not followed the theoretical workflow. As a result, the user has lack of a depth understanding in information presented in Oracle R12 leading to slower decision making process than it should be.
